Gain Degrade Low	Allows you to set the low gain degrade threshold. The range is from 3 to 22-dBm.
Gain Degrade High	Allows you to set the high gain degrade threshold. The range is from 3 to 22-dBm.

C.2.30.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-573 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.30.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-574 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.30.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-575 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Currently Shutdown	Indicates whether the laser is currently shut down.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.

Table C-575 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.31 Slot Properties—OPT-BST-E

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

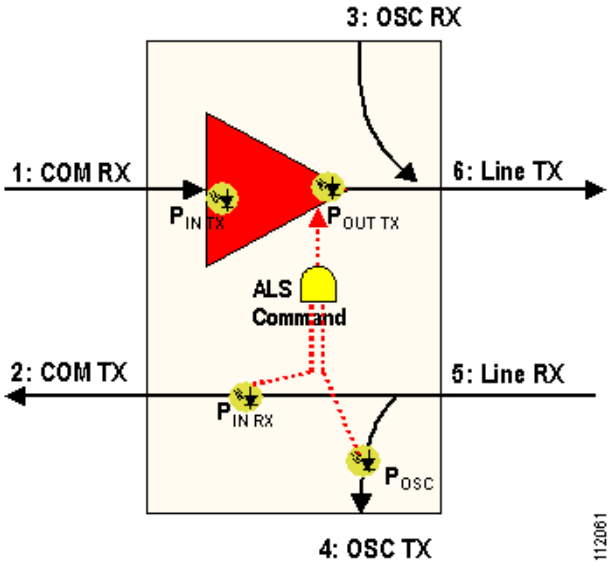
The Enhanced Optical Booster Amplifier (OPT-BST-E) card supports the transmission of 32 channels in the C-band on the ONS 15454 SONET and ONS 15454 SDH platforms. The OPT-BST-E card provides optical amplification in the line where a +1 dBm per channel power in fiber with the full 64-channel grid is required.

Compared to the standard amplifier card (OPT-BST), the enhanced card provides a a higher optical output power, up to a maximum of 20-dBm, to address longer unregenerated distances using the ONS 15454 platform.

Through the Power Restyling feature, six new levels of Optical Service Channel (OSC) power can be monitored. Prime Optical supports all of the six new parameters on all optical interfaces of cards supported by ONS 15454 SONET and ONS 15454 SDH.

The following figure shows the block diagram.

Figure C-42 OPT-BST-E Module



For the OPT-BST-E module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Amplified Line, Inventory, Alarm Behavior, and Auto Laser Shutdown.

C.2.31.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.31.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-576 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.

Table C-576 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.31.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-577 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can contain up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Warning Thresh 15 Min	
Port Number	The port number.

Table C-577 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold. The range for each port is: • Port 1: –31 to 13-dBm • Port 2: –42 to 11-dBm • Port 3: N/A • Port 4: –43 to –2-dBm • Port 5: N/A
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold
OSC Power Failure High	Allows you to set the high OSC power failure threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.

C.2.31.4 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-578 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.

Table C-578 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Total Output Power	Shows the current power level per port.
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold. The range is from –5 to 23-dBm.
Power Degrade High	Allows you to set the high power degrade threshold. The range is from –5 to 23-dBm.

Table C-578 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Power Degrade Low	Allows you to set the low power degrade threshold. The range is from –5 to 23-dBm.
Gain Degrade Low	Allows you to set the low gain degrade threshold. The range is from 10 to 28-dBm.
Gain Degrade High	Allows you to set the high gain degrade threshold. The range is from 6 to 24-dBm.

C.2.31.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-579 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.31.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-580 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.31.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-581 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Currently Shutdown	Indicates whether the laser is currently shut down.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.

Table C-581 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.32 Slot Properties—OPT-BST-L

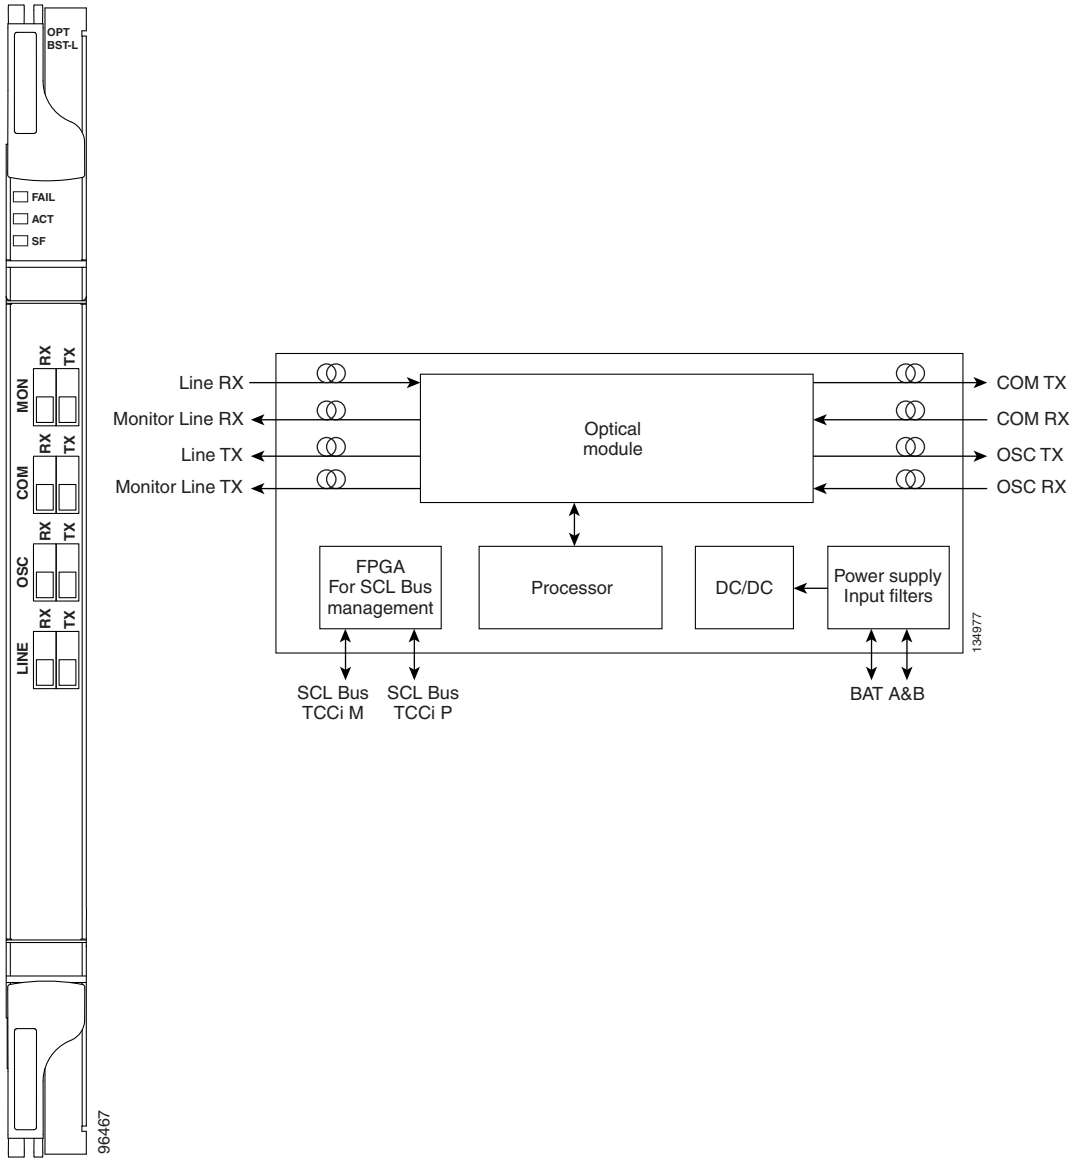
The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

This section describes the OPT-BST-L amplifier card. The OPT-BST-L standard gain range is from 8 to 20 dB in the controllable gain tilt mode, and from 20 to 27 dB in the uncontrolled gain tilt mode. The OPT-BST-L is designed to support 64 channels at 50-GHz channel spacing, but currently is limited to 32 channels at 100 GHz spacing. The OPT-BST-L is an L-band DWDM EDFA with OSC add-and-drop capability. The card is particularly well suited for use in networks that employ dispersion shifted (DS) fiber or SMF-28 single-mode fiber. When an ONS 15454 has an OPT-BST-L installed, you only need the OSCM to process the OSC. You can install the OPT-BST-L in slots 1 to 6 and 12 to 17. To control the gain tilt, the OPT-BST-L is equipped with a built-in VOA.

Note The optical splitters each have a ratio of 1:99. The result is that the power at the MON TX and MON RX ports is about 20 dB lower than the power at the COM TX and COM RX ports.

The following figure shows the block diagram.

Figure C-43 OPT-BST-L Faceplate



For the OPT-BST-L module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Amplified Line, Inventory, Alarm Behavior, and Auto Laser Shutdown.

C.2.32.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.32.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-582 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.32.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-583 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-583 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Power	Shows the current power level per port.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-583 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Power Failure Low	Allows you to set the low power failure threshold. The range for each port is: • Port 1: –31 to 13-dBm • Port 2: –42 to 11-dBm • Port 3: N/A • Port 4: –43 to –2-dBm • Port 5: N/A
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.32.4 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-584 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Total Output Power	Shows the current power level per port.

Table C-584 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold. The range is from –5 to 23-dBm.
Power Degrade High	Allows you to set the high power degrade threshold. The range is from –5 to 23-dBm.
Power Degrade Low	Allows you to set the low power degrade threshold. The range is from –5 to 23-dBm.
Gain Degrade Low	Allows you to set the low gain degrade threshold. The range is from 10 to 28-dBm.
Gain Degrade High	Allows you to set the high gain degrade threshold. The range is from 6 to 24-dBm.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.32.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-585 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.32.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-586 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.32.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-587 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Currently Shutdown	Indicates whether the laser is currently shut down.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.33 Slot Properties—OPT-EDFA-17 and OPT-EDFA-24

The OPT-EDFA-17 and OPT-EDFA-24 cards are 20-dBm (17/24 dBm gain) output power, C-band, DWDM EDFA amplifiers/preamplifiers. They do not contain mid-stage access loss for a Dispersion Compensation Unit (DCU). The OPT-EDFA-17 and OPT-EDFA-24 cards provide a noise-figure optimized version of the EDFA amplifiers to cope with new modulation formats such as PM-DQPSK, which does not need dispersion compensation. To control gain tilt, a VOA is used. The VOA can also be used to attenuate the signal to the DCU to a reference value. The amplifier module also includes the OSC add (TX direction) and drop (RX direction) optical filters.

The OPT-EDFA-17 and OPT-EDFA-24 cards share the same hardware platform and firmware architecture, and differ only in operative optical gain, which is 17dB and 24dB, respectively.

The OPT-EDFA-17 and OPT-EDFA-24 cards support 80 channels at 50-GHz channel spacing in the C-band (that is, the 1528.77 nm to 1566.72 nm wavelength range). When an ONS 15454 has an OPT-EDFA-17 or OPT-EDFA-24 card installed, an OSCM card is needed to process the OSC. You can install the OPT-AMP-C card in Slots 1 to 6 and 12 to 17. Slots 2 to 6 and Slots 12 to 16 are the default slots for provisioning an OPT-EDFA-17 or OPT-EDFA-24 card as a preamplifier, and slots 1 and 17 are the default slots for provisioning an OPT-EDFA-17 or OPT-EDFA-24 card as a booster amplifier.

The card's features include:

- Embedded Gain Flattening Filter
- Constant pump current mode (test mode)
- Constant output power mode
- Constant gain mode
- Nondistorting, low-frequency transfer function
- ASE compensation in Constant Gain and Constant Output Power modes
- Fast transient suppression
- Programmable tilt
- Full monitoring and alarm handling capability
- Gain range with gain tilt control of 5 to 17 dB (for OPT-EDFA-17) and 12 to 24 dB (for OPT-EDFA-24)
- Extended gain range (with uncontrolled tilt) of 17 to 20 dB (for OPT-EDFA-17) and 24 to 27 dB (for OPT-EDFA-24)
- Optical Safety Remote Interlock (OSRI)
- Automatic Alarm Shutdown (ALS)

You can also create a DWDM side for these cards. See "7.12.12 Creating Side Objects" section on page 7-343.

You can view the following properties for these cards:

- C.2.33.1 Identification

- C.2.33.2 Module View
- C.2.33.3 Alarm Behavior
- C.2.33.4 Auto Laser Shutdown
- C.2.33.5 Optical Line
- C.2.33.6 Inventory
- C.2.33.7 Optical Amplified Line

C.2.33.1 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-588 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.33.2 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.33.3 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-589 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.33.4 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-590 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Currently Shutdown	Indicates whether the laser is currently shut down.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.33.5 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-591 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Power	Shows the current power level per port.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.

Table C-591 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure threshold. The range for each port is: • Port 1: –31 to 13-dBm • Port 2: –42 to 11-dBm • Port 3: N/A • Port 4: –43 to –2-dBm • Port 5: N/A
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.33.6 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-592 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.33.7 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-593 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-593 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Total Output Power	Shows the current power level per port.
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	

Table C-593 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold. The range is from –5 to 23-dBm.
Power Degrade High	Allows you to set the high power degrade threshold. The range is from –5 to 23-dBm.
Power Degrade Low	Allows you to set the low power degrade threshold. The range is from –5 to 23-dBm.
Gain Degrade Low	Allows you to set the low gain degrade threshold. The range is from 10 to 28-dBm.
Gain Degrade High	Allows you to set the high gain degrade threshold. The range is from 6 to 24-dBm.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

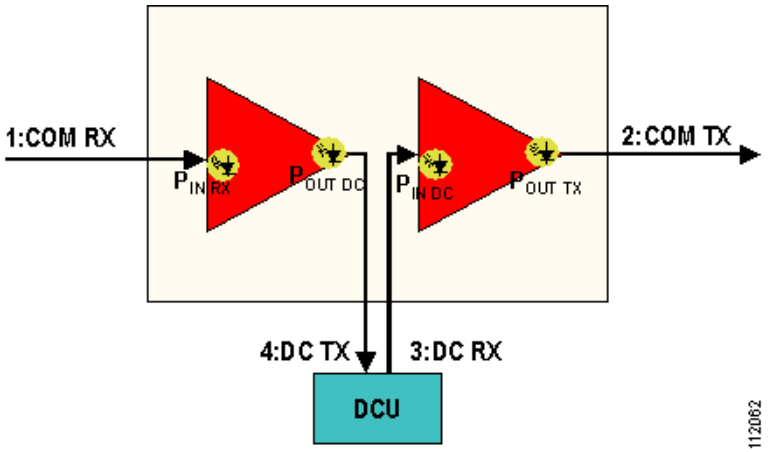
C.2.34 Slot Properties—OPT-PRE

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Optical Preamplifier (OPT-PRE) module is a single-slot card that has six LC-PC-II optical connectors. The card features true variable gain, fast transient suppression, and configurable maximum output power. The OPT_PRE card offers full monitoring and alarm handling capability with configurable thresholds. The card supports optical safety functionality by signal loss detection and alarm, fast power down control, and reduced maximum output power in safe power mode.

The following figure shows the block diagram.

Figure C-44 OPT_PRE Module



For the OPT_PRE module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Amplified Line, Inventory, and Alarm Behavior.

C.2.34.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.34.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-594 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.34.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-595 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.

C.2.34.4 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-596 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Total Output Power	Shows the current power level per port.
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
DCU Insertion Loss	The dispersion compensation unit (DCU) insertion loss.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.

Table C-596 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.

C.2.34.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-597 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.34.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-598 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

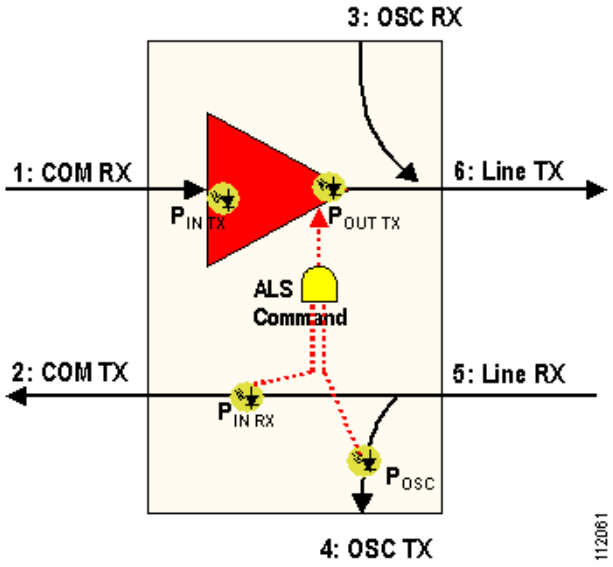
C.2.35 Slot Properties—OSC-CSM

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Optical Service Channel and Combiner/Separator Module (OSC-CSM) is a single-slot card with a 1510 nm OC-3 optical transceiver interface. The OSC-CSM is used to multiplex and demultiplex the service channel to and from the wavelength division multiplexing (WDM) signal. The OSC_CSM features a VOA in the transmit path and a 100BASE-T FE user data channel. The OSC-CSM also distributes the synchronous clock to all NEs on the ring.

The following figure shows the block diagram.

Figure C-45 OSC-CSM



For the OSC-CSM card, the slot properties pane displays the following properties: Module View, Identification, Line, Optical Line, Inventory, Alarm Behavior, and Auto Laser Shutdown.

C.2.35.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.35.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-599 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.35.3 Line

The Line Properties pane allows you to view and update line card information.

Table C-600 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port No.	The port number.
Port Name	The port name.
SD BER	The signal degrade bit error rate.
SF BER	The signal fail bit error rate.
Type	The port type (SONET or SDH).
PJSTSMon#	The STS that will be used for pointer justification. If set to zero, no STS is used.

Table C-600 Field Descriptions for the Line Properties Pane (continued)

Field	Description
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state.
Line Thresh 15 Minute - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count - line.
Line Thresh 1 Day - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Section Thresh 15 Min, Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Section Thresh 1 Day, Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.

Table C-600 Field Descriptions for the Line Properties Pane (continued)

Field	Description
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.

C.2.35.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-601 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	The port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Line Direction (*available in CTM R7.2 and earlier*)	The direction of the line (west-to-east or east-to-west).
Type	The port type.
Power	The laser power.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref	The VOA reference power.
VOA Power Calib	The VOA calibration power.
VOA Attenuation Ref	The VOA reference attenuation.
OSC Power	Shows the current optical service channel (OSC) power level per port.
VOA Attenuation Calib	The VOA calibration attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	The lower power threshold.
Power High	The upper power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.

Table C-601 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	The lower power threshold.
Power High	The upper power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	The lower power failure threshold.
Power Degrade High	The upper power degrade threshold.
Power Degrade Low	The lower power degrade threshold.
VOA Degrade High	The upper VOA degrade threshold.
VOA Degrade Low	The lower VOA degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Failure High	Allows you to set the high OSC power failure threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.

C.2.35.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-602 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.35.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-603 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.

Table C-603 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.35.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-604 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Currently Shutdown	Indicates whether the laser is currently shut down.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.36 Slot Properties—OTU2_XP

The OTU2_XP card is a four-port, XFP-based multirate (OC-192/STM-64, 10GE, 10G FC) transponder for the ONS 15454 SONET and SDH platforms. The OTU2_XP card supports multiple configurations. The following table describes the different configurations supported by the OTU2_XP card and the ports that must be used for these configurations.

Table C-605 OTU2_XP Card Configurations and Ports

Configuration	Port 1	Port 2	Port 3	Port 4
2 x 10G transponder	Client port 1	Client port 2	Trunk port 1	Trunk port 2
2 x 10G standard regenerator (with enhanced FEC [E-FEC] on only one port)	Trunk port 1	Trunk port 2	Trunk port 1	Trunk port 2
1 x 10G E-FEC regenerator (with E-FEC on two ports)	Not used	Not used	Trunk port	Trunk port
1 x 10G splitter-protected transponder	Client port	Not used	Trunk port (working)	Trunk port (protect)

All four ports are ITU-T G.709 compliant and support 40 channels (wavelengths) at 100-GHz channel spacing in the C-band (that is, the 1530.33 nm-to-1561.42 nm wavelength range).

The OTU2_XP card can be installed in slots 1 to 6 or slots 12 to 17. The OTU2_XP card is a single-slot card with four ports. The ports support SR, IR2, LR2, and ZR XFPs.

Caution Fan-tray assembly 15454E-CC-FTA (SDH shelf)/15454-CC-FTA (SONET shelf) must be installed on a shelf where the OTU2_XP card is installed.

A new mode for 10GE LAN-to-WAN has been added for cards and ports in the Card Configuration panel. When the OTU2_XP card is provisioned in the 10GE LAN-to-WAN mode, the card takes 10GE LAN traffic as input (from client port 1) and provides 10GE WAN traffic as output (from trunk port 3).

The following table describes the configuration supported by the OTU2_XP card for the LAN-to-WAN conversion feature and the ports that must be configured.

Table C-606 OTU2_XP Card Configuration and Ports for LAN-to-WAN Feature

Configuration	Port 1-3	Port 2-4
10GE LAN-to-WAN	10GE LAN-to-WAN	Transponder
	10GE LAN-to-WAN	Regenerator

Note Port 2 supports OC192, 10GE, and 10FC rates and does not support 10G FC PM monitoring.

Prime Optical supports IB_5G, OC-192, 10G FC, and 10GE payloads on the OTU2_XP card. PM and TCA are not supported for the IB_5G payload type.

Perform the following steps to provision the payloads:

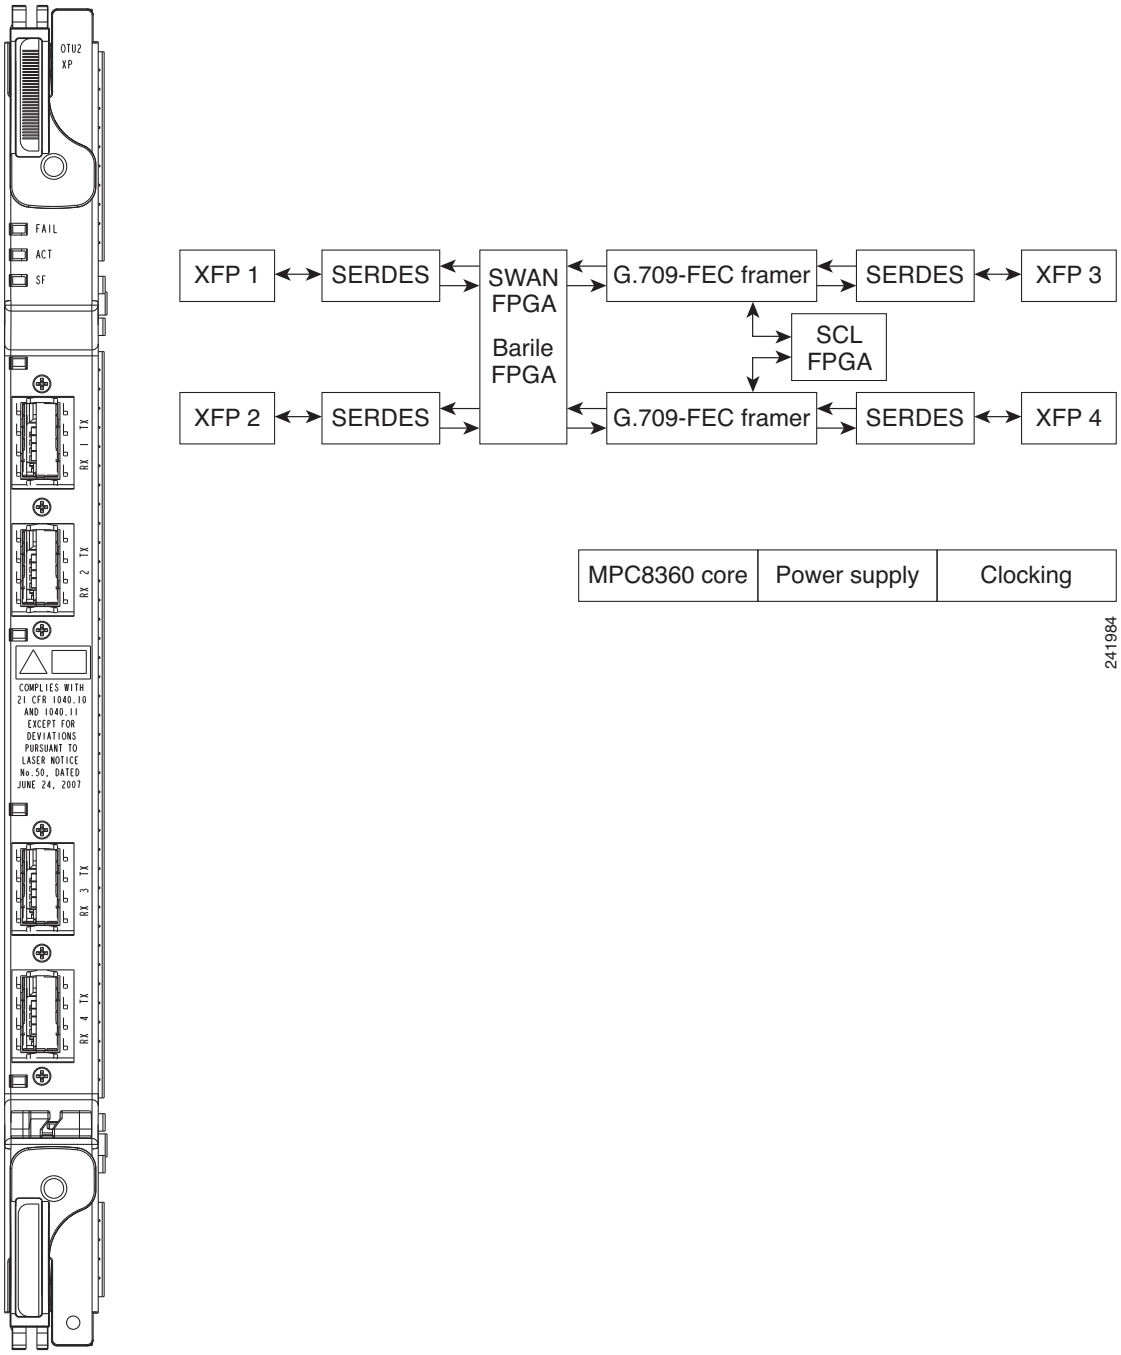
Step 1 Click the **PPM** Properties pane and create a PPM for port 1.

Step 2 Provision the rate IB_5G by selecting the rate from the **Port Rate** drop-down list.

Note By default, FEC and G.709 OTN are enabled. If they are disabled, you cannot provision the rate IB_5G.

The following figure shows the OTU2_XP faceplate and block diagram.

Figure C-46 OTU2_XP Card Faceplate and Block Diagram



For the OTU2_XP card, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, Path, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

C.2.36.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.2.36.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-607 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The equipment administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.36.3 Card

The Card Properties pane allows you to view and update card information.

Table C-608 Field Descriptions for the Card Properties Pane

Field	Description

Card Mode	Choose one of the following card configuration options:
	• Transponder—Provisions the card as a 10G transponder.
	• Standard Regen—Provisions the card as a 10G standard regenerator.
	• Enhanced FEC—Provisions the card as a 10GE-FEC regenerator.
	• Mixed—Provisions the card for mixed port modes.
	• 10GE LAN to WAN—Provisions the card for 10GE LAN to WAN.
	Note 10GE LAN to WAN can be configured only on ports 1 to 3, and only if the payloads for PPM 1 and PPM 3 are provisioned.
	If you change the card mode from Transponder to 10GE LAN to WAN, you are prompted with the following message:
	`Changing the OTU2_XP card mode to "10GE LAN to WAN" will reboot the card. Do you want to continue?`
	If you change the card mode from 10GE LAN to WAN to Transponder, you are prompted with the following message:
	`Changing the OTU2_XP card from "10GE LAN to WAN" will reboot the card and delete the pluggable ports 1 and 3. Do you want to continue?`
	If you change the card mode from Transponder to Enhanced FEC, you are prompted with the following message:
	`Changing the card to EFEC mode will cause the ports 1 and 2 to be disabled. Do you want to continue?`
	Click **Yes** to continue or **No** to cancel the operation.

Port Mode 1-3	Choose Transponder or Standard Regen. **Note** Port mode is editable only when the card configuration is Mixed.
Termination Mode 1-3	Allows you to set the mode of termination. • If 10GE LAN to WAN is selected as the card configuration, the termination mode is Line and it is not editable. • If Standard or Enhanced FEC Regen is selected as the card configuration, the termination mode is Transparent and it is not editable. • If Transponder is selected as the card configuration, the termination mode defaults to Transparent. **Note** Termination mode can be configured only for SONET/SDH payload types.
Framing Type 1-3	*Display only.* Displays the framing type, which depends on the payload type that is configured in the PPM Properties pane.

Table C-608 Field Descriptions for the Card Properties Pane (continued)

Field	Description
AIS/Squelch Configuration 1-3	Allows you to configure the remote client to squelch or send an AIS signal. • If Transponder, Standard Regen, or 10GE LAN to WAN is selected as the card configuration, this parameter defaults to Squelch. • For Mixed card configuration, the AIS/Squelch Configuration depends on the port mode you selected. **Note** AIS/Squelch can be configured only for SONET/SDH payload types.
Regen Line Name 1-3	• *Display only* when transponder or 10GE LAN to WAN is selected as the card configuration. • If Standard Regen is selected as the card configuration, you can set the regeneration line name. **Note** For Mixed card configuration, the Regen Line Name depends on the port mode you selected.
ODU Transparency 1-3	Choose Transparent Standard Use or Cisco Extended Use. • If Transponder or 10GE LAN to WAN is selected as the card configuration, this parameter defaults to Cisco Extended Use. • Choose Transparent Standard Use or Cisco Extended Use if Standard Regen or Enhanced FEC is selected as the card configuration type. **Note** For Mixed card configuration, the ODU Transparency depends on the port mode you selected.
Proactive Protection Regen 1-3	Allows you to enable or disable the proactive protection regen mode.
Port Mode 2-4	Choose Transponder or Standard Regen if the card configuration is 10GE LAN to WAN. **Note** You cannot choose the same port mode for ports 1 to 3 and ports 2 to 4.
Termination Mode 2-4	• Choose Transparent, Line, or Section if the card configuration type is Transponder. • If Standard or Enhanced FEC Regen is selected as the card configuration, the termination mode is Transparent and it is not editable. • If Transponder is selected as the card configuration, the termination mode defaults to Transparent. **Note** Termination mode can be configured only for SONET/SDH payload types.
Framing Type 2-4	*Display only.* Displays the framing type, which depends on the payload type that is configured in the PPM Properties pane.
AIS/Squelch Configuration 2-4	Allows you to configure the remote client to squelch or send an AIS signal. • If Transponder is selected as the card configuration, choose squelch or AIS. • If Standard Regen is selected as the card configuration, this parameter defaults to AIS. **Note** AIS/Squelch can be configured only for SONET/SDH payload types.
Regen Line Name 2-4	• *Display only* when Transponder is selected as the card configuration. • If Standard Regen is selected as the card configuration, you can set the regeneration line name. **Note** For Mixed card configuration, the Regen Line Name depends on the port mode you selected.

Table C-608 Field Descriptions for the Card Properties Pane (continued)

Field	Description
ODU Transparency 2-4	• If Transponder is selected as the card configuration, this parameter defaults to Cisco Extended Use. • Choose Transparent Standard Use or Cisco Extended Use if Standard Regen or Enhanced FEC is selected as the card configuration. **Note** For Mixed card configuration, the ODU Transparency depends on the port mode you selected.
Proactive Protection Regen 2-4	Allows you to enable or disable the proactive protection regen mode.

C.2.36.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-609 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.36.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.36.5 Line

The Line Properties pane allows you to configure line information.

If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.36.5.1 SONET Line Tab, page C-466
- C.2.36.5.2 Ports Tab, page C-466
- C.2.36.5.3 Section Trace Tab, page C-467

- C.2.36.5.4 Line Thresh 1 Day Tab, page C-468
- C.2.36.5.5 Line Thresh 15 Min Tab, page C-468
- C.2.36.5.6 Section Thresh 1 Day Tab, page C-469
- C.2.36.5.7 Section Thresh 15 Min Tab, page C-469
- C.2.36.5.8 Ethernet Tab, page C-470
- C.2.36.5.9 STS Thresh 1 Day Tab, page C-470
- C.2.36.5.10 STS Thresh 15 Min Tab, page C-471
- C.2.36.5.11 RMON Thresholds Tab, page C-471

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.36.5.12 SDH Line Tab, page C-472
- C.2.36.5.13 Ports Tab, page C-472
- C.2.36.5.14 Section Trace Tab, page C-473
- C.2.36.5.15 RS Thresh 1 Day Tab, page C-473
- C.2.36.5.16 RS Thresh 15 Min Tab, page C-473
- C.2.36.5.17 MS Thresh 1 Day Tab, page C-474
- C.2.36.5.18 MS Thresh 15 Min Tab, page C-474
- C.2.36.5.19 VC4 Thresh 1 Day Tab, page C-474
- C.2.36.5.20 VC4 Thresh 15 Min Tab, page C-475
- C.2.36.5.21 Ethernet Tab, page C-475
- C.2.36.5.22 RMON Thresholds Tab, page C-476

C.2.36.5.1 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-610 Field Descriptions for the SONET Line Tab

Field	Description
Port No.	Displays the port number.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Displays the framing type.

C.2.36.5.2 Ports Tab

The Ports tab allows you to view and change the port settings.

Table C-611 Field Descriptions for the Ports Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.

Table C-611 Field Descriptions for the Ports Tab (continued)

Field	Description
Admin State	Shows the administration state of the port: In Service (IS), Automatic In Service (IS, AINS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.36.5.3 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-612 Field Descriptions for the Section Trace Tab

Field	Description
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string of 1 or 16 bytes.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.36.5.4 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold information for the card.

Table C-613 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.5.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold information for the card.

Table C-614 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.5.6 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold information on the EC1 port.

Table C-615 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.5.7 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute section threshold information for the card.

Table C-616 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.5.8 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information. This tab is available only when the OTU2_XP card is configured with the TEN_GE payload type.

Table C-617 Field Descriptions for the Ethernet Tab

Field	Description
Port No.	Displays the port number.
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Max. Size	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (default). If you do not want to permit jumbo-size Ethernet frames, select 1548.
Incoming MAC Address	Allows you to edit the incoming MAC address.
Flow Control	Enables or disables flow control messaging with its peer port. When enabled, the port can send and receive PAUSE frames when buffer congestion occurs. When disabled, no PAUSE frames are transmitted and the PAUSE frames received are discarded. Values are: • ON—(Default) Flow control is enabled • OFF—Flow control is disabled **Note** The flow control property is available only when 10GE LAN to WAN card mode is configured.
Client Distance	Sets the fiber distance between the client of OTU2_XP card and the LAN port that is connected to the OTU2_XP client port. Values are: • 10 km (default) • 30 km **Note** The client distance property is available only when 10GE LAN to WAN card mode is configured.

C.2.36.5.9 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change the near-end 1-day synchronous transport signal threshold information for the card.

Table C-618 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS No.	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
FC-P	Displays the failure count path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.5.10 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change the near-end 15-minute synchronous transport signal threshold information for the card.

Table C-619 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS No.	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
FC-P	Displays the failure count path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.5.11 RMON Thresholds Tab

The RMON Thresholds tab allows you to view, create, and delete RMON threshold settings for the OTU2_XP card. This tab is available only when the OTU2_XP card is configured with the TEN_GE or 10 GFC payload type.

Table C-620 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index No.	Displays the optical port number.
Slot	Displays the slot.
Port	Displays the port.
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising or Falling.

Table C-620 Field Descriptions for the RMON Thresholds Tab (continued)

Field	Description
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Displays the Ethernet threshold sample period, in seconds.
Rising Thresholds	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresholds	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.
Create	Click the **Create** button to create an RMON threshold.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.2.36.5.12 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the card.

Table C-621 Field Descriptions for the SDH Line Tab

Field	Description
Port No.	Displays the optical port number.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.

C.2.36.5.13 Ports Tab

The Ports tab allows you to view and change the port settings.

Table C-622 Field Descriptions for the Ports Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Admin State	Shows the administration state of the port: In Service (IS), Automatic In Service (IS, AINS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).

C.2.36.5.14 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-623 Field Descriptions for the Section Trace Tab

Field	Description
Port No.	The port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.36.5.15 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day near-end regeneration section threshold information for the card.

Table C-624 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored second regenerator section.
BBE-RS	Background block error regenerator section.
UAS-RS	Unavailable seconds regenerator section.

C.2.36.5.16 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute near-end regeneration section threshold information for the card.

Table C-625 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored second regenerator section.
BBE-RS	Background block error regenerator section.
UAS-RS	Unavailable seconds regenerator section.

C.2.36.5.17 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day multiplex section threshold information for the card.

Table C-626 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port No.	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored second multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.

C.2.36.5.18 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute multiplex section threshold information for the card.

Table C-627 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable second multiplexer section.

C.2.36.5.19 VC4 Thresh 1 Day Tab

The VC4 Thresh 1 Day tab allows you to view and update the near-end 1-day VC4 threshold settings of the port.

Table C-628 Field Descriptions for the VC4 Thresh 1 Day Tab

Field	Description
VC No.	The VC number. Displays as VC4-*x*, where *x* equals 1, 2, 3, or 4.
CV-P	Errored block/byte errors corrected–high-order path.
BBE-HP	Background block errors–high-order path.
ES-HP	Errored seconds–high-order path.
SES-HP	Severely errored seconds–high-order path.
UAS-HP	Unavailable seconds–high-order path.

C.2.36.5.20 VC4 Thresh 15 Min Tab

The VC4 Thresh 15 Min tab allows you to view and update the near-end 15-minute VC4 threshold settings of the port.

Table C-629 Field Descriptions for the VC4 Thresh 15 Min Tab

Field	Description
VC No.	The VC number. Displays as VC4-*x*, where *x* equals 1, 2, 3, or 4.
CV-P	Errored block/byte errors corrected–high-order path.
BBE-HP	Background block errors–high-order path.
ES-HP	Errored seconds–high-order path.
SES-HP	Severely errored seconds–high-order path.
UAS-HP	Unavailable seconds–high-order path.

C.2.36.5.21 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information. This tab is available only when the OTU2_XP card is configured with the TEN_GE payload type.

Table C-630 Field Descriptions for the Ethernet Tab

Field	Description
Port No.	Displays the port number.
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Max. Size	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (default). If you do not want to permit jumbo-size Ethernet frames, select 1548.
Incoming MAC Address	Allows you to edit the incoming MAC address.
Flow Control	Enables or disables flow control messaging with its peer port. When enabled, the port can send and receive PAUSE frames when buffer congestion occurs. When disabled, no PAUSE frames are transmitted and the PAUSE frames received are discarded. Values are: • ON—(Default) Flow control is enabled • OFF—Flow control is disabled **Note** The flow control property is available only when 10GE LAN to WAN card mode is configured.
Client Distance	Sets the fiber distance between the client of OTU2_XP card and the LAN port that is connected to the OTU2_XP client port. Values are: • 10 km (default) • 30 km **Note** The client distance property is available only when 10GE LAN to WAN card mode is configured.

C.2.36.5.22 RMON Thresholds Tab

The RMON Thresholds tab allows you to view, create, and delete RMON threshold settings for the OTU2_XP card. This tab is available only when the OTU2_XP card is configured with the TEN_GE or 10 GFC payload type.

Table C-631 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index No.	Displays the optical port number.
Slot	Displays the slot.
Port	Displays the port.
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising or Falling.
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period (sec)	Displays the Ethernet threshold sample period, in seconds.
Rising Thresholds (count)	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresholds (count)	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.
Create	Click the **Create** button to create an RMON threshold.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.2.36.6 Path

The Path Properties pane contains the following tabs:

- C.2.36.6.1 SONET Tab, page C-476
- C.2.36.6.2 J1 Path Trace Tab, page C-477

C.2.36.6.1 SONET Tab

The SONET tab allows you to view and change the SONET path settings for the OTU2_XP module.

Table C-632 Field Descriptions for the SONET Tab

Field	Descriptions
Port No.	Displays the port number.
SF BER Level	Sets the signal fail bit error rate.
SD BER Level	Sets the signal degrade bit rate.

Note The SDH tab is displayed if the card is installed on an ONS 15454 SDH NE.

C.2.36.6.2 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and update J1 path trace information.

Table C-633 Field Descriptions for the J1 Path Trace Tab

Field	Descriptions
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note These properties are affected only when 10GE LAN to WAN card mode is configured.

C.2.36.7 OTN

The OTN Properties pane contains the following tabs:

- C.2.36.7.1 OTN Line Tab, page C-477
- C.2.36.7.2 G.709 Thresh 15 Min Tab, page C-478
- C.2.36.7.3 G.709 Thresh 1 Day Tab, page C-479
- C.2.36.7.4 FEC Thresh 15 Min Tab, page C-480
- C.2.36.7.5 FEC Thresh 1 Day Tab, page C-480
- C.2.36.7.6 Trail Trace Identifier Tab, page C-480

C.2.36.7.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-634 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	Displays the port number.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.

Table C-634 Field Descriptions for the OTN Line Tab (continued)

Field	Description
No Fixed Stuff	Disables or enables fixed stuffing used in 10 GE-over-OTN G.709 mapping. When 10 GE is mapped over G.709, the overall bit rate is approximately 11.09 Gb/s. If a fixed pattern of stuffing bits is used in this mapping, the rate can be lowered to 11.04 Gb/s. 10 GE over OTN G.709 works with or without fixed stuffing. **Note** This parameter applies only to 10 GE signals in transponder card configurations. For all other card configurations, this parameter is display-only.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.36.7.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information and allows you to change these card threshold values.

Table C-635 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.

Table C-635 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.7.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information and allows you to change these card threshold values.

Table C-636 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.

Table C-636 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.7.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-637 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.36.7.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-638 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.36.7.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-639 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.36.8 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table C-640 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The port state must be OOS_MT before you can configure the loopback type.

C.2.36.9 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-641 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur.	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.

Table C-641 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
Rec. Pulse Int.	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Currently Shut Down	Indicates whether the laser is currently shut down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.36.10 Optical Thresh

The Optical Thresh Properties pane contains the following tabs:

- C.2.36.10.1 TCA 15 Min Tab, page C-482
- C.2.36.10.2 TCA 1 Day Tab, page C-482
- C.2.36.10.3 Alarm Thresh Tab, page C-483

C.2.36.10.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of the card.

Table C-642 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.10.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of the card.

Table C-643 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.

Table C-643 Field Descriptions for the TCA 1 Day Tab (continued)

Field	Description
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.10.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-644 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.36.11 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-645 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.36.12 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-646 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands. For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD. **Note** If you choose 10GE LAN to WAN as the card configuration, Y-cable protection is not supported.

C.2.36.13 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-647 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.37 Slot Properties—PSM

The slot properties pane displays information about the Protection Switching Module (PSM) that is selected in the NE Explorer. Use this properties pane to change the card properties.

The PSM performs splitter protection functions. During transmission, the card has a hardware splitter that duplicates the incoming signal from the two protected ports. On the receiving side, the card provides a switch to receive one of the two input signals that can be received on the COM-TX client ports.

In case of a single fiber cut, the VOA implements bidirectional switching after the splitter function. After a near-end signal loss detection, bidirectional switching is implemented with a far-end switch. The protection switching card does not require creation of a protection group to work.

The PSM provides the following features:

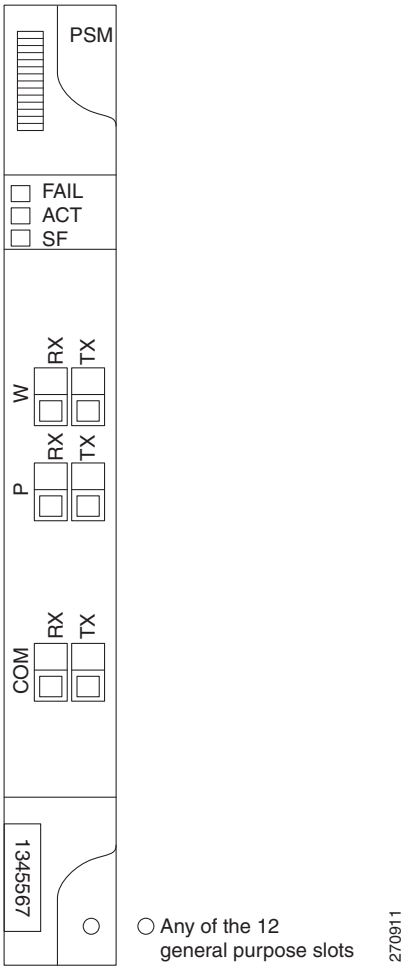
- TX section:
  - Splits input optical channels to both working and protection lines
  - Forces remote site switch by opening one of the two lines (puts the related VOA in the AVS)

- RX section:
  - Selects signals from the working or protection line, where each line is monitored through a photodiode
  - Balances the two line losses by changing the VOA attenuation value simultaneously with the changed switch state
- Bidirectional unit that operates over the C-band of the optical spectrum (wavelengths from 1529 nm to 1562.5 nm)
- Single-slot card with three LEDs on the front panel
- Six LC-PC-II optical connectors on the front panel
- Threshold crossing alerts (TCAs)
- Performance monitoring: thirty-two 15-minute intervals and two 24-hour intervals
- Equipped in any node from slots 1 to 6 and 12 to 17. It can also be equipped in a different shelf from its peer. Protection group creation is not required for management purposes.
- COM-RX, W-RX, and P-RX ports provide power measurement capability (for example, the 32WSS COM-RX port). These ports support optical PM, power failure, low power indication alarms, and related thresholds crossing alarms.
- COM-TX, W-TX, and P-TX are MSTP aggregated ports with VOAs (for example, AD_4C EXP-TX port). These ports support optical PM, power failure, low power indication alarms, and all the provisioning parameters that are associated to a VOA in attenuation control mode. All VOAs equipped by the PSM work only in controlled attenuation, including OCH protection schemes. The VOA attenuation calibration parameter can be changed in all traffic conditions.

Note VOA degrade alarms are not supported because a photodiode is available only after the VOA phase.

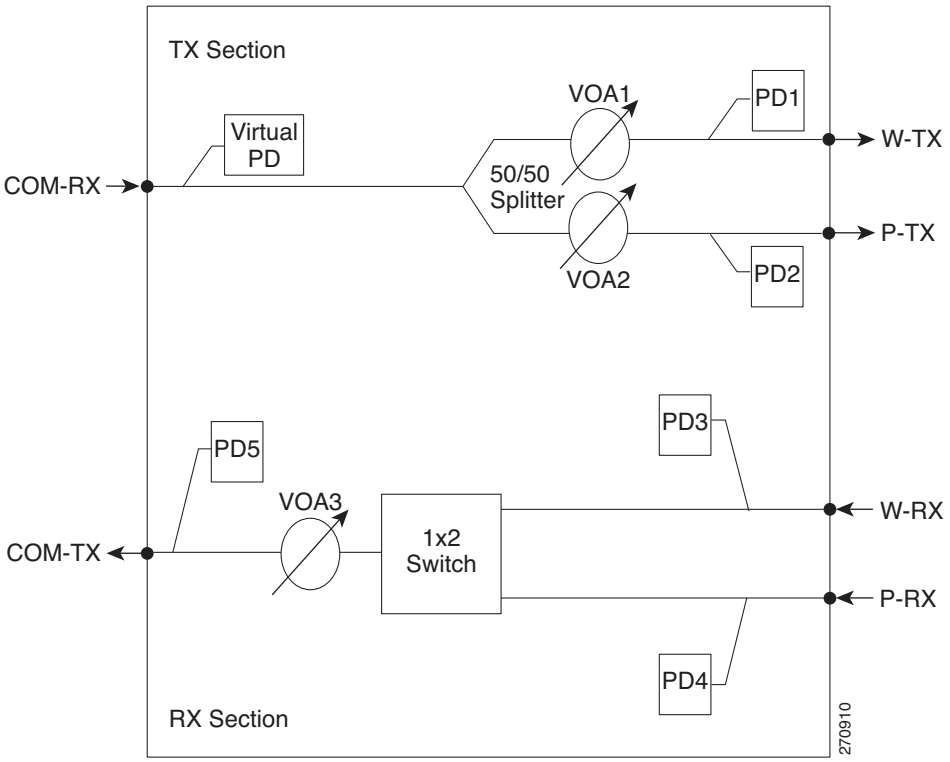
The following figure shows the PSM faceplate.

Figure C-47 PSM Faceplate



The following figure shows a simplified block diagram of the PSM.

Figure C-48 PSM Block Diagram



The optical VOA controls in a closed loop are performed by the PSM software. Under normal conditions, VOA1 and VOA2 function in an open loop at 0 dB attenuation. In a path section protection topology, during a restart of the standby path in Automatic Power Reduction (APR) mode, the corresponding VOA in the TX path works in power control mode. The optical power is limited to +8-dBm. Under normal conditions, VOA3 functions in attenuation control mode (closed loop).

For the PSM, the slot properties pane displays the following properties: Module View, Identification, Card, Optical Line, Auto Laser Shutdown, Protection, and Alarm Behavior.

C.2.37.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.37.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-648 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The equipment administration state. It can be: • IS—In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.37.3 Card

The Card Properties pane allows you to select the mode of the PSM card. The modes can be Normal or Standalone.

C.2.37.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-649 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.

Table C-649 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS • IS, AINS • OOS, DSBLD • OOS, MT If the card mode is set to Standalone, the administrative state is In Service (IS) or Unlocked (for the ONS 15454 SDH). If the card mode is set to Normal, the administrative state is In Service, Automatic In Service (IS, AINS).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*. If the card mode is set to Standalone, the service state is IS-NR. If the card mode is set to Normal, the service state is OOS-AU, AINS.
Power	Shows the current power level per port.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Ref	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low (dBm)	Allows you to set the low power failure threshold.

Table C-649 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
VOA Degrade High	The upper VOA degrade threshold.
VOA Degrade Low	The lower VOA degrade threshold.

C.2.37.5 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Note The Auto Laser Shutdown Properties pane is configurable only if the PSM card is configured in path protection mode. In other configurations, this Properties pane is empty.

Table C-650 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur.	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int.	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Currently Shut Down	Indicates whether the laser is currently shut down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.37.6 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-651 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.37.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-652 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.38 Slot Properties—RAMAN-CTP and RAMAN-COP

(Cisco ONS 15454 M2 and ONS 15454 M6 only)

The single-slot RAMAN-CTP and RAMAN-COP cards support counter and copropagating RAMAN amplification on very long unregenerated spans.

The cards manage up to 96 ITU-T, 50-GHz spaced channels over the C-band of the optical spectrum (wavelengths from 1528.77 nm to 1566.72 nm). The counter-propagating RAMAN-CTP card is the master unit. The copropagating RAMAN-COP card is the slave unit and can be used only when the counter-propagating unit is present.

The RAMAN-CTP and RAMAN-COP units must be installed in adjacent slots (Slots 2 and 3, 4 and 5, or 6 and 7) in the Cisco ONS 15454 M6 chassis and Slots 2 and 3 in the Cisco ONS 15454 M2 chassis.

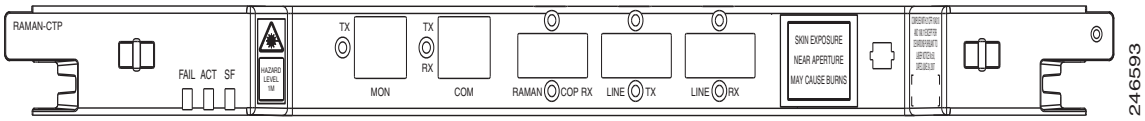
The RAMAN-CTP unit is provided with three E-2000 PS PC connectors for the LINE-TX, LINE-RX, and RAMAN-COP-RX ports and three LC-UPC-II connectors for the COM-TX, COM-RX, and MON-TX ports. The RAMAN-COP unit is provided with one E-2000 PS PC connector. The E2000 PS PC patchcord is used to connect the RAMAN-COP unit to the RAMAN-COP-RX port on the RAMAN-CTP unit.

The features of the RAMAN-CTP and RAMAN-COP units include:

- RAMAN section—1000 mW total pump power for four pumps and two wavelengths
- Embedded distributed feedback (DFB) laser at 1568.77 nm to be used for optical safety and link continuity (in RAMAN-CTP card only)
- Photodiodes to enable monitoring of RAMAN pump power
- Photodiodes to enable monitoring of the DFB laser and signal power (in RAMAN-CTP card only)

- Hardware managed automatic laser shutdown (ALS) for optical laser safety
- Hardware output signals for loss of signal (LOS) monitoring at input photodiodes
- RAMAN pump back reflection detector to check for excessive back reflection

Figure C-49 RAMAN-CTP Faceplate



The RAMAN-COP card has only one optical port located on the faceplate. RAMAN-TX is the RAMAN copropagating output port.

Figure C-50 shows the RAMAN-COP card faceplate.

Figure C-50 RAMAN-COP Faceplate

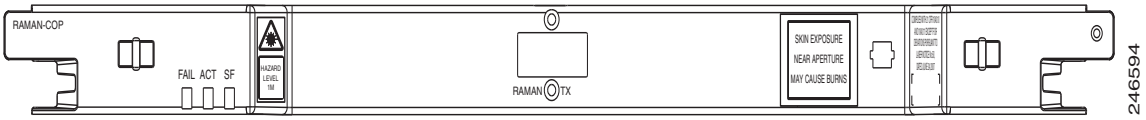


Figure C-51 shows a block diagram of how the RAMAN-CTP card functions.

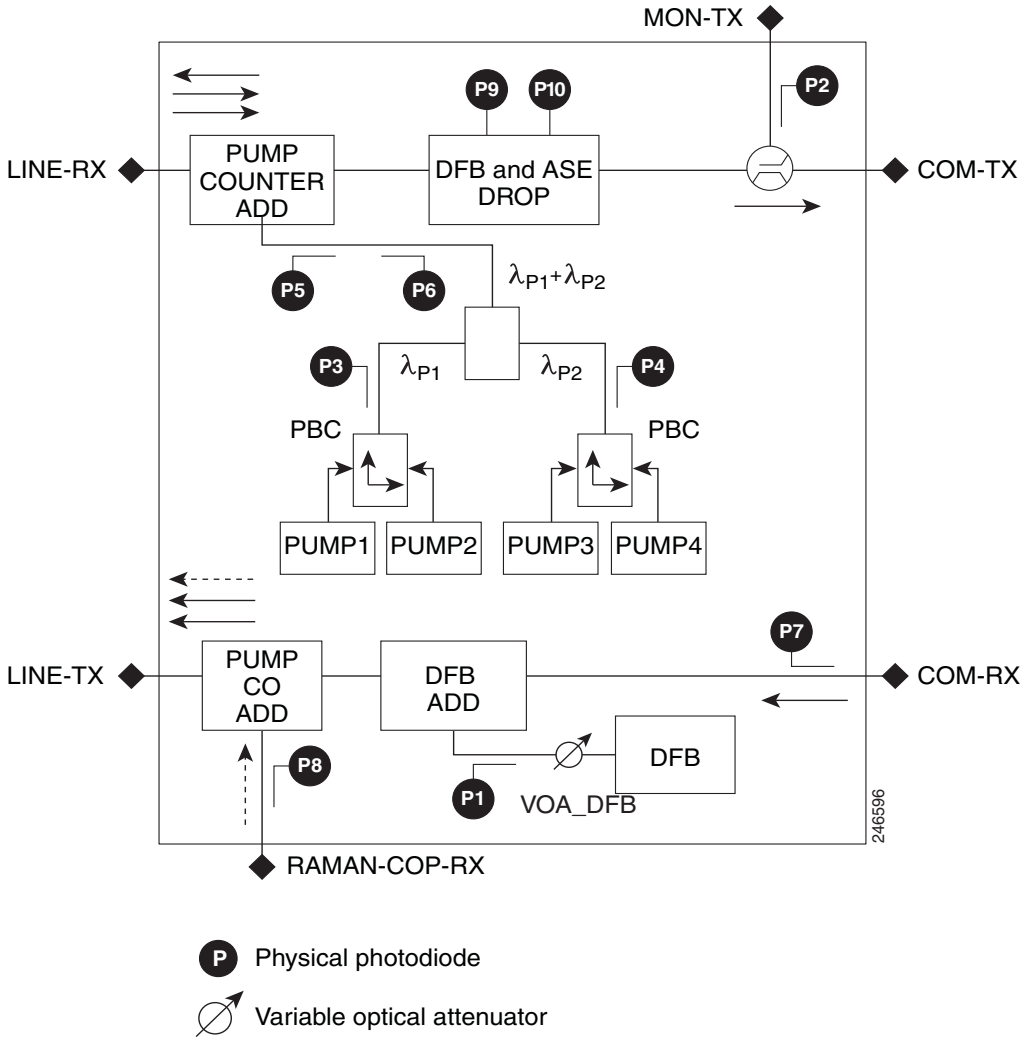
Figure C-51 RAMAN-CTP Functional Block Diagram



Four Raman pump lasers (two for each wavelength) are combined internally and launched in-fiber at the LINE-RX port, thereby counter-propagating with the DWDM signal.

The two pump lasers at the same nominal central wavelength, power, and polarization are made orthogonally polarized by the polarization beam combiner (that rotates one of the laser beams) and then coupled, resulting in a depolarized beam. A DFB laser at 1568.77 nm is used for optical safety. Optical filters for DFB add and drop are present.

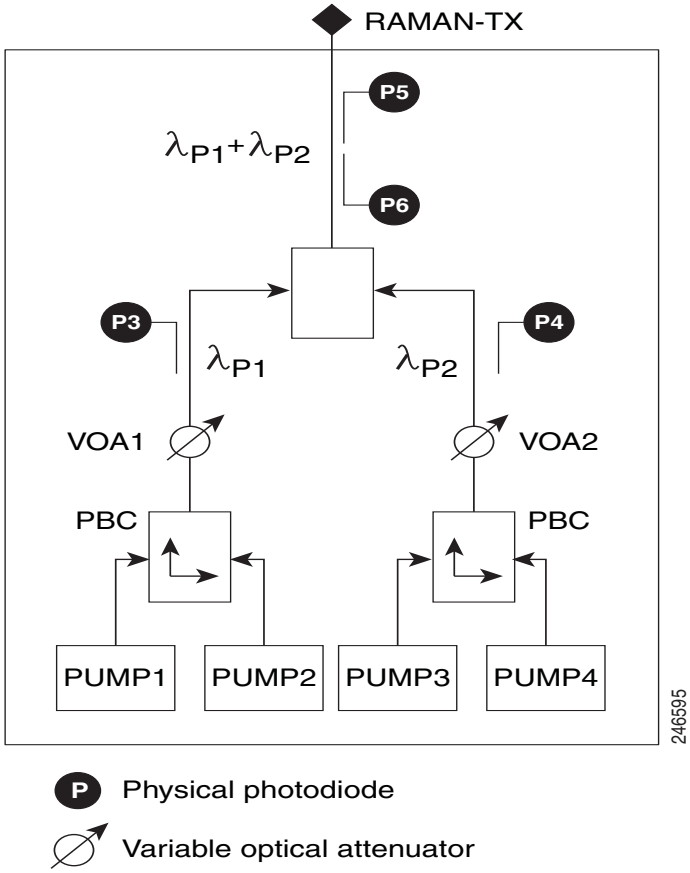
The DFB signal generated by the DFB laser is transmitted in-fiber, co-propagating with the DWDM signal. A MON-TX port monitors the DWDM signal at the COM-TX port. A total of ten photodiodes are provided, allowing monitoring of RAMAN pump (RP) power, DWDM signal power, and DFB signal power in each section of the card.

P8 measures the co-propagating RP power in-fiber (when the RAMAN-COP unit is present), while P6 detects the amount of RP power backscattered by the LINE-RX connector and transmission fiber. P1 measures the DFB signal power transmitted in-fiber while P9 and P10 measures the DFB signal and ASE power respectively, which is received from the other line site.

The insertion loss of the main optical path and the relative optical attenuation of the monitor port is stored in non-volatile memory of the card.

Figure C-52 shows a block diagram of how the RAMAN-COP card functions.

Figure C-52 15454-M-RAMAN-COP Functional Block Diagram



Four RAMAN pump lasers (two for each wavelength) are combined internally and launched in-fiber at the LINE-TX port of the counter-propagating unit, thereby co-propagating with the DWDM signal.

The two pump lasers at the same nominal central wavelength, power, and polarization are made orthogonally polarized by the polarization beam combiner (that rotates one of the laser beams) and then coupled, resulting in a depolarized beam.

A total of four photodiodes are provided, allowing the monitoring of RP power. In particular, P6 detects the amount of RP power backscattered by the LINE-RX connector and transmission fiber.

The slot properties pane displays the following properties: Identification, Module View, Card, Alarm Behavior, Auto Laser Shutdown, Installation, Inventory Protection, and Optical RAMAN Line.

C.2.38.1 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-653 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.38.2 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-654 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
Type	Displays the port type.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Displays the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Displays the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Currently Shutdown	Indicates whether the laser is currently shut down.

C.2.38.3 Installation

The Installation Properties pane displays installation information.

Table C-655 Field Descriptions for the Installation Properties Pane

Field	Description
Username	Provides the string for user login for the setup.
Status	Displays whether Raman is tuned or not tuned.
Gain	Displays the actual Raman gain.
Actual Tilt	Displays the actual Raman tilt.
Date	Displays the date and time for the setup.
Power	Displays the Raman pump total power.

Table C-655 Field Descriptions for the Installation Properties Pane (continued)

Field	Description
Ratio	Displays the Raman pump ratio.
Fiber Cut Recovery	Displays the status of the Restore from Fiber Cut operation. Valid values are: • Not Need • Failed • Executed • Pending
Fiber Cut Date	Displays the date when the Restore from Fiber Cut operation was executed.
S1 Low	Displays the power at node B when wavelength 1 is switched on at node A and the power is low.
S1 High	Displays the power at node B when wavelength 1 is switched on at node A and the power is high.
S2 Low	Displays the power at node B when wavelength 2 is switched on at node A and the power is low.
S2 High	Displays the power at node B when wavelength 2 is switched on at node A and the power is high.

C.2.38.4 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-656 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.38.5 Optical Line

Note The Optical Line Properties pane applies to RAMAN-CTP only.

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-657 Field Descriptions for the Optical Line Properties Pane

Tab	Description
Parameters	
Port Number	The port number.
Type	The port type.
Port Name	The port name.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity.

Table C-657 Field Descriptions for the Optical Line Properties Pane (continued)

Tab	Description
Power	Shows the current power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min and Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Threshold	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.

C.2.38.6 Optical Raman Line

The Optical Raman Line Properties pane allows you to view and update optical Raman line information.

Table C-658 Field Descriptions for the Optical Raman Line

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.

Table C-658 Field Descriptions for the Optical Raman Line (continued)

Field	Description
Ratio	Displays the RAMAN pump ratio in percentage value.
Power Set-point	Displays the RAMAN pump expected total power.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Min	Allows you to set the low power threshold.
Power Max	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Min	Allows you to set the low power threshold.
Power Max	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.

C.2.39 Slot Properties—SMR-C

The single-slot, 40-channel, single module ROADM (SMR-C) cards integrate the following functional blocks on a single line card:

- Optical preamplifier
- Optical booster amplifier
- Optical service channel (OSC) filter
- 2x1 wavelength cross-connect (WXC) or 4x1 WXC
- Optical channel monitor (OCM)

The SMR-C cards are available in two versions:

- 40-SMR1-C—Includes a 100-GHz, 1x2 WXC unit with integrated preamplifier unit (single erbium-doped fiber amplifier [EDFA]).
- 40-SMR2-C—Includes a 100-GHz, 1x4 WXC unit with integrated preamplifier and booster amplifier units (double EDFA).

The optical amplifier units in the SMR-C cards provide the following features:

- Embedded gain flattening filter.
- Midstage access for dispersion compensation unit (applicable only for preamplifier EDFA).
- Fixed output power mode.
- Fixed gain mode.
- Nondistorting, low-frequency transfer function.
- Amplified spontaneous emissions (ASE) compensation in fixed gain and fixed output power mode.
- Fast transient suppression.
- Programmable tilt (applicable only for preamplifier EDFA).
- Full monitoring and alarm handling capability.
- Optical safety support through signal-loss detection and alarm at any input port, fast power-down control, and reduced maximum output power in safe power mode.
- EDFA section calculates the signal power by taking into account the expected ASE power contribution to the total output power. The signal output power or the signal gain can be used as feedback signals for the EDFA pump power control loop.

The 1x2 WXC unit (40-SMR1-C card) provides the following features:

- Selection of individual wavelength of the aggregated 100-GHz signal from either the EXP-RX or ADD-RX ports
- Automatic VOA shutdown (AVS) blocking state on each wavelength and port
- Per-channel power regulation based on external OCM unit
- Open-loop, path attenuation control for each wavelength and port

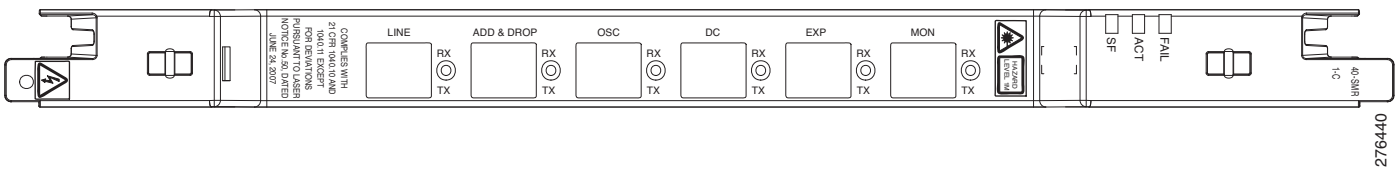
The 1x4 WXC unit (40-SMR2-C card) provides the following features:

- Selection of individual wavelength of the aggregated 100-GHz signal from either the EXP*i*-RX (where *i* = 1, 2, 3) or ADD-RX ports
- AVS blocking state on each wavelength and port
- Per-channel power regulation based on external OCM unit
- Open-loop, path attenuation control for each wavelength and port

The OCM unit provides per-channel optical power monitoring at EXP-RX, ADD-RX, DROP-TX, and LINE-TX ports.

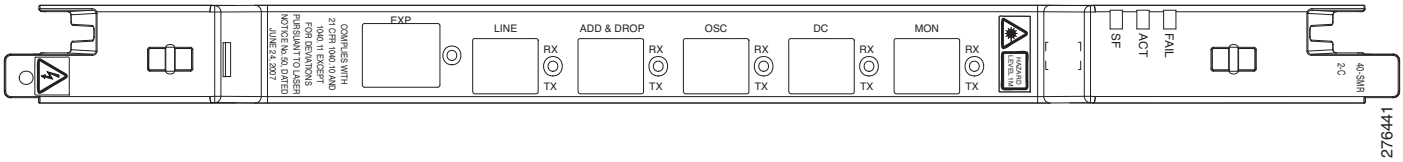
The following figure shows the faceplate of the 40-SMR1-C card.

Figure C-53 40-SMR1-C Faceplate



The following figure shows the faceplate of the 40-SMR2-C card.

Figure C-54 40-SMR2-C Faceplate



The slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Optical Amplified Line, Alarm Behavior, Auto Laser Shutdown, Inventory, Maintenance, and Wavelength Power.

C.2.39.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.39.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-659 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-659 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.39.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.39.3.1 Parameters Tab, page C-501
- C.2.39.3.2 OCH Thresh 15 Min Tab, page C-502
- C.2.39.3.3 OCH Thresh 1 Day Tab, page C-502
- C.2.39.3.4 Alarm Thresh Tab, page C-503

C.2.39.3.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical channels. To view optical channels, select the wavelength from the wavelength drop-down list and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-660 Field Descriptions for the Parameters Tab

Field	Description
Circuit Name	Optical channel name.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
From	Displays the port from which the circuit starts.
Power From	Displays the power of the port to which the circuit starts.
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
To	Displays the port to which the circuit is connected.
Power To	Displays the power of the port to which the circuit is connected.
Attenuator Value	Displays the value of an external attenuator required by DWDM network design.

Table C-660 Field Descriptions for the Parameters Tab (continued)

Field	Description
Force Channel	Allows you to start the channel by moving the VOA from Open to Closed loop. You can force VOA only when the Force Channel Status is in the Unlocked state.
Force Channel Status	Displays the channel status. The different statuses are: • Unlocked—Can force channel startup. • Locked—Cannot force channel startup as the device is under control of other functions like Optical safety. • Forced—Channel startup has already been forced.

C.2.39.3.2 OCH Thresh 15 Min Tab

The OCH Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation. To view optical channels, select both wavelength and port type from the drop-down lists and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-661 Field Descriptions for the OCH Thresh 15 Min Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.39.3.3 OCH Thresh 1 Day Tab

The OCH Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation. To view optical channels, select both wavelength and port type from the drop-down lists and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-662 Field Descriptions for the OCH Thresh 1 Day Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.39.3.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation. To view optical channels, select both wavelength and port type from the drop-down lists and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-663 Field Descriptions for the Alarm Thresh Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Failure Low (dBm)	Displays the threshold of low power failure on the channel port. The crossing of this threshold generates an LOS-P alarm.
Power Degrade High (dBm)	Allows you to set the high power settings.
Power Degrade Low (dBm)	Allows you to set the low power settings.

C.2.39.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.39.4.1 Parameters Tab, page C-504
- C.2.39.4.2 Warning Thresh 15 Min Tab, page C-504

- C.2.39.4.3 Warning Thresh 1 Day Tab, page C-505
- C.2.39.4.4 Alarm Thresh Tab, page C-505

C.2.39.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-664 Field Descriptions for the Parameters Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS, AINS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Active Channels	Indicates how many channels the card/port is carrying. The value generally reflects the number of provisioned channels passing through the port.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA. The value is not provisionable and is read from the card.
VOA Attenuation Ref.	Shows the attenuation reference value of the VOA. The value is established by the manufacturer.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, per channel, if necessary. The sum of the Power Reference and Power Calibration, for each single channel, defines the Power Set Point.
OSC Power	Displays the OSC power of the port. The values can be: • 40SMR1-C card—OSC POWER is read on ports 5, 6, 9, and 10. For the other ports, the value is N.A. • SMR2—OSC POWER is read on the ports 3, 4, and 7. For the other ports, the value is N.A.
Attenuator Value	Displays the value of an external attenuator required by DWDM network design

C.2.39.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-665 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.

C.2.39.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-666 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.

C.2.39.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-667 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Failure Low	Allows you to set the low power failure threshold.

Table C-667 Field Descriptions for the Alarm Thresh Tab (continued)

Field	Description
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.

C.2.39.5 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information. The Properties pane contains the following tabs:

- C.2.39.5.1 Parameters Tab, page C-506
- C.2.39.5.2 Warning Thresh 15 Min Tab, page C-507
- C.2.39.5.3 Warning Thresh 1 Day Tab, page C-507
- C.2.39.5.4 Alarm Thresh Tab, page C-508

C.2.39.5.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-668 Field Descriptions for the Parameters Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Total Output Power	Shows the current power level per port.
Channel Power Ref.	Shows the channel power setpoint.

Table C-668 Field Descriptions for the Parameters Tab (continued)

Field	Description
Output Power Setpoint	Shows the total optical power going to the amplifier.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Signal Output Power	Shows the current output power leaving the amplifier, including the ASE contribution.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
OSC Power	Displays the OSC power of the port. The values can be: • SMR1—For port 5, 6, 9, and 10. • SMR2—For port 3, 4, and 7.
DCU Insertion Loss	The dispersion compensation unit (DCU) insertion loss.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.

C.2.39.5.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-669 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold. **Note** This field is applicable only for port 8 of 40-SMR2-C cards.
OSC Power High	Allows you to set the high OSC power threshold. **Note** This field is applicable only for port 8 of 40-SMR2-C cards.

C.2.39.5.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-670 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold. **Note** This field is applicable only for port 8 of 40-SMR2-C cards.
OSC Power High	Allows you to set the high OSC power threshold. **Note** This field is applicable only for port 8 of 40-SMR2-C cards.

C.2.39.5.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-671 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, which can be: • 40-SMR1-C—DC-TX, DC-RX, OSC-TX, OSC-RX, ADD-RX, DROP-TX, LINE-RX, EXP-TX, and EXP-RX. • 40-SMR2-C—EXP-TX 1-1, EXP-RX 1-2, EXP-TX 1-3, and EXP-TX 1-4.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure High	Allows you to set the high OSC power failure threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.
Pwr OSC Failure	Shows the optical power failure threshold for the OSC.

C.2.39.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-672 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.39.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-673 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
Type	Displays the port type. Values are: • ADD RX—Used to add channels. • DROP-TX—Used to drop channels. • EXP RX—Receives an optical signal from another SMR module in the same NE. • EXP TX—Sends an optical signal to the another SMR module in the same NE. • OSC-TX—Transmits the optical service channel to the OSCM or OSC-CSM. • OSC-RX—Receives the optical service channel from the OSCM or OSC-CSM. • LINE TX—Sends an aggregate optical signal for transmission outside of the NE. • LINE RX—Receives the optical signal from another node in the network.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.

Table C-673 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
Currently Shutdown	Indicates whether the laser is currently shut down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.39.8 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-674 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.39.9 Maintenance

The Maintenance Properties pane allows you to display the insert and return values for each wavelength.

Table C-675 Field Descriptions for the Maintenance Properties Pane

Field	Description
Insert Value	
Target Power	Displays the default target power, in dBm. The value is retrieved from the ANS parameter for the side where the card is inserted. You can edit this field with a new value as needed.
Input Port	Displays the input port number.
Wavelength	Displays the wavelength assigned to the channel. Maintenance mode is known as lambda zero. You can use this mode when you do not want to use one of the system channels. For example, maintenance can be used in a degree upgrade when the system is up and running. Also, during installation, you can use maintenance or one of the system channels, depending on your site requirements.
Return Value LINE-TX on Selected Wavelength	
Actual Power	Displays the value returned by the card. This field indicates that the power on the cross-connection was created with the selected lambda and the incoming port that is calculated on the LINE-TX port.
Refresh	Updates the actual power that is displayed in the Actual Power field.
Delete	Stops the unit from working in maintenance mode for the given port and lambda. You must click Delete when maintenance is complete. Exiting this screen without clicking Delete does not stop the maintenance mode.

C.2.39.10 Wavelength Power

The Wavelength Power Properties pane displays wavelength power data. To view optical channels, select the port type from the port drop-down list and click **Retrieve**.

Table C-676 Field Descriptions for the Wavelength Power Properties Pane

Field	Description
Wavelength	Displays the wavelength number.
Measured Power	Displays the power.
Status	Displays the status.
Used	Whether or not the wavelength is being used. Values are Yes and No.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.40 Slot Properties—T-DCU (TDC-CC and TDC-FC)

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The T-DCU is a card that compensates for chromatic dispersion (CD) of the transmission fiber. The T-DCU enables faster troubleshooting of the network. The T-DCU card provides a selectable set of discrete negative chromatic dispersion values to compensate for chromatic dispersion of the transmission line. The card operates over the entire C-band (in the range of 1529.0 nm to 1562.5 nm) and monitors the optical power at the input and the output ports. The T-DCU provides two line cards with a varied set of tunable wavelengths to compensate for CD:

- TDC-CC (Coarse T-DCU)—Provides 16 values of CD ranging from 0 to –1650 ps/nm with a granularity of 110 ps/nm in the C-band spectrum.
- TDC-FC (Fine T-DCU)—Provides 16 values of CD ranging from 0 to –675 ps/nm with a granularity of 45 ps/nm in the C-band spectrum.

The TDC-CC and TDC-FC cards have the following high-level features:

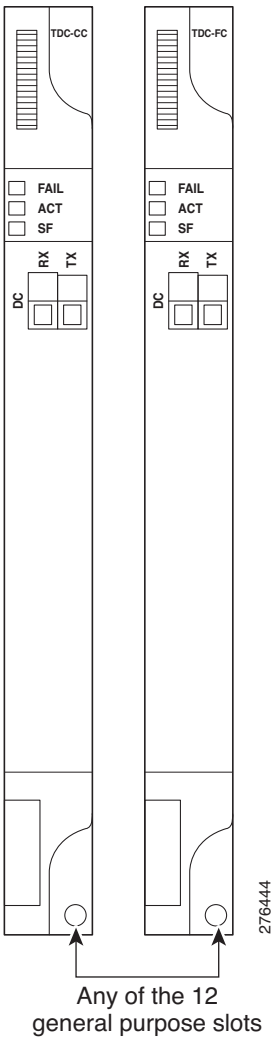
- Single slot card with three LEDs on the front panel.
- Two LC-PC-II optical connectors on the front panel.
- Operates in slots 1 to 6 and 12 to 17.
- Operates over the C-band (wavelengths from 1529 nm to 1562.5 nm) of the optical spectrum.
- Allows up to 16 provisionable CD values for chromatic dispersion compensation.
- Connects to OPT-PRE, OPT-AMP-C, OPT-RAMP-C, and OPT-RAMP-CE amplifiers and 40-SMR-1 and 40-SMR-2 cards.
- Supports performance monitoring and alarm handling for selectable thresholds.
- Allows monitoring and provisioning using CTC, SNMP, or TL1.

The TDC-CC and TDC-FC cards monitor the Optical Input Power and Optical Output Power of the fiber. The cards monitor the insertion loss from the input (DC-RX) to the output (DC-TX) port, with the help of the two photodiodes PD1 and PD2. The cards report the minimum, average, and maximum power statistics of each of the monitored ports or channels. The performance data is recorded in 15-minute and 24-hour intervals.

Note The PM data is stored on a wrap-around basis at 32 x 15-minute and 2 x 24-hour intervals.

The following figure shows the faceplate of a TDC-CC and TDC-FC card.

Figure C-55 TDC-CC and TDC-FC Faceplate



Note In the T-DCU card faceplate, the coarse T-DCU is identified with the label "TDC-CC." The fine T-DCU is identified with the label "TDC-FC."

Each card has one set of optical ports located on the faceplate.

The slot properties pane displays the following properties: Module View, Identification, Optical Line, Alarm Behavior, Card, and Inventory.

C.2.40.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.40.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-677 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.40.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-678 Field Descriptions for the Optical Line Properties Pane

Tab	Description
Parameters	
Port Number	The port number.
Type	The port type.
Port Name	The port name.

Table C-678 Field Descriptions for the Optical Line Properties Pane (continued)

Tab	Description
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity.
Power	Shows the current power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min and Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Threshold	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.

C.2.40.4 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-679 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Port Number	Displays the card port number.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.40.5 Card

The Card Properties pane allows you to view and update the compensation value.

C.2.40.6 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-680 Field Descriptions for the Inventory Properties Pane

Field	Description
PID	Displays the product ID (PID) code.
VID	Displays the version ID (VID) code.
Vendor ID	The ID of the vendor.
Part Number	The part number that is printed on the top of the card.
FW Version	The revision number of the software used by the ASIC chip installed on the card.
HW Version	The hardware version number.
Serial Number	The serial number that is unique to each card.
IL01 (LINE RX->TX)	The insertion loss between the specified ports.
IL-REF	The reference insertion loss.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.41 Slot Properties—TXP_MR_10E

The TXP_MR_10E card is a multirate transponder for the ONS 15454 platform. The card is fully backward compatible with the TXP_MR_10G card. It processes one 10-Gb/s signal (client side) into one 10-Gb/s, 100-GHz DWDM signal (trunk side) that is tunable over four wavelength channels (spaced at 100 GHz on the ITU grid) in the C-band and tunable over eight wavelength channels (spaced at 50 GHz on the ITU grid) in the L-band. There are eight versions of the C-band card, with each version covering four wavelengths, for a total coverage of 32 wavelengths. There are five versions of the L-band card, with each version covering eight wavelengths, for a total coverage of 40 wavelengths.

The TXP_MR_10E_C cards are multirate transponders for the ONS 15454 platform. The cards are fully backward compatible with the TXP_MR_10G and TXP_MR_10E cards. They process one 10-Gb/s signal (client side) into one 10-Gb/s, 100-GHz DWDM signal (trunk side). The TXP_MR_10E_C is tunable over the entire set of C-band wavelength channels (82 channels spaced at 50 GHz on the ITU grid). The advantage of these cards over previous versions (TXP_MR_10G and TXP_MR_10E) is that there is only one version of each card (one C-band version) instead of several versions needed to cover each band.

Note When an MLSE transponder module is installed on the TXP_MR_10E_C card, Prime Optical displays the card as TXP_MR_10EX.

You can install these cards in slots 1 to 6 and 12 to 17 and provision the cards in a linear configuration, BLSR/MS-SPRing, path protection/SNCP, or regenerator. The card can be used in the middle of BLSR/MS-SPRing or 1+1 spans when the card is configured for transparent termination mode.

The TXP_MR_10E card features a 1550-nm tunable laser (C-band) or a 1580-nm tunable laser (L-band) for the trunk port and a separately orderable ONS-XC-10G-S1 1310-nm or ONS-XC-10G-L2 1550-nm laser XFP module for the client port.

Note When the ONS-XC-10G-L2 XFP is installed, the TXP_MR_10E card must be installed in slots 6, 7, 12, or 13.

Prime Optical supports IB_5G payload on the TXP_MR_10E card. PM and TCA are not supported for the IB_5G payload type.

Perform the following steps to provision the payloads:

Step 1 Click the **PPM** Properties pane and create a PPM for port 1.

Step 2 Provision the rate IB_5G by selecting the rate from the **Port Rate** drop-down list.

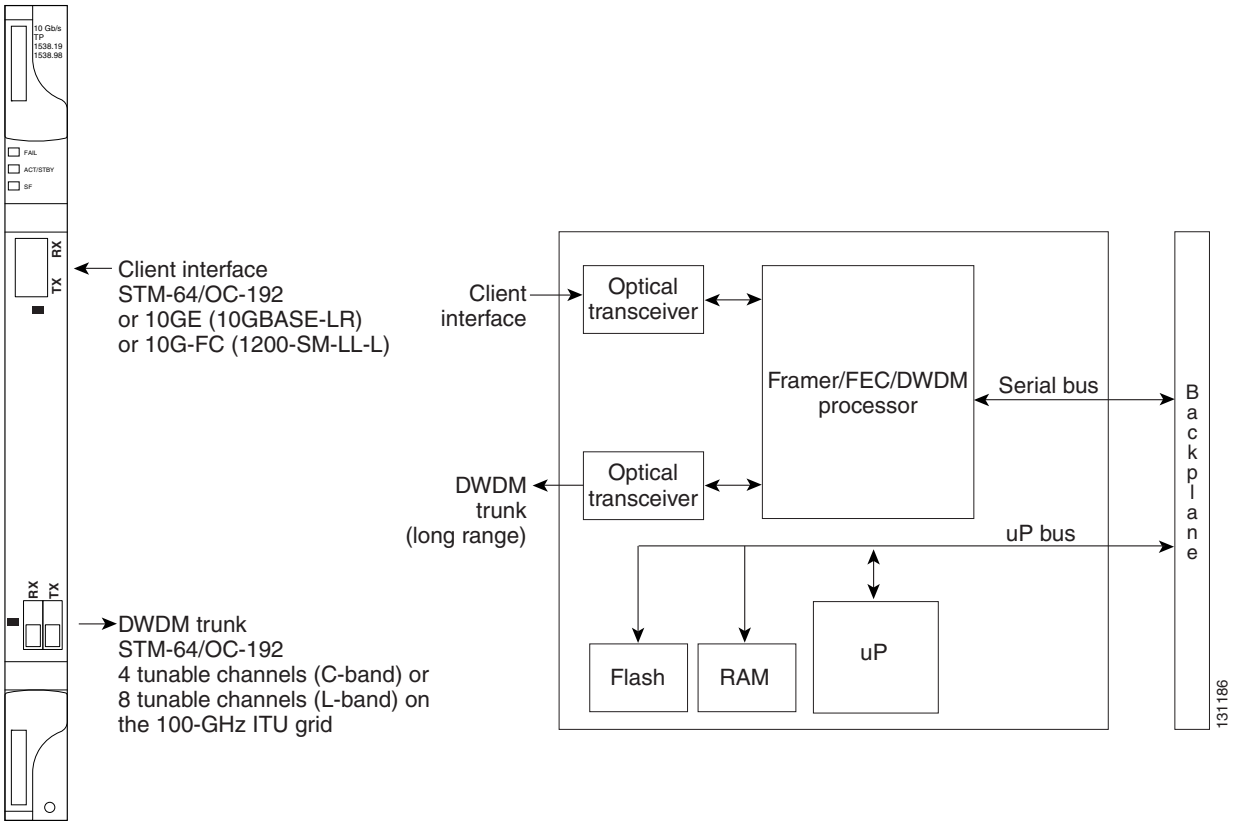
Note By default, FEC and G.709 OTN are enabled. If they are disabled, you cannot provision the rate IB_5G.

The key features of the TXP_MR_10E card are:

- A tri-rate client interface (available through the ONS-XC-10G-S1 XFP, ordered separately)
  - OC-192 (SR1)
  - 10GE (10GBASE-LR)
  - 10G-FC (1200-SM-LL-L)
- OC-192 to ITU-T G.709 OTU2 provisionable synchronous and asynchronous mapping

On its faceplate, the TXP_MR_10E card contains two transmit and receive connector pairs, one for the trunk port and one for the client port. Each connector pair is labeled.

Figure C-56 TXP_MR_10E Faceplate and Block Diagram



For the card selected, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

Note The properties shown depend on the NE configuration.

C.2.41.1 Module View

The Module View displays a graphic that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.41.2 Identification

The Identification Properties pane allows you to view and update identification information.

Table C-681 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The equipment administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.41.3 Card

The Card Properties pane allows you to view and update card information.

Table C-682 Field Descriptions for the Card Properties Pane

Field	Description
Termination Mode	Allows you to set the mode of termination.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Regeneration Peer Slot	Allows you to select like cards so that you can configure a regeneration peer group.
Regeneration Group Name	(Optional) Allows you to set the name of the regeneration group.

C.2.41.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-683 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.41.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.41.5 Line

The Line Properties pane allows you to configure line information.

If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.41.5.1 10G FibCh. Line Config Tab, page C-520
- C.2.41.5.2 10GE Line Config Tab, page C-521
- C.2.41.5.3 Section Trace Tab, page C-523
- C.2.41.5.4 SONET Line Tab, page C-523
- C.2.41.5.5 Section Thresh 15 Min Tab, page C-524
- C.2.41.5.6 Section Thresh 1 Day Tab, page C-525
- C.2.41.5.7 Line Thresh 15 Min Tab, page C-525
- C.2.41.5.8 Line Thresh 1 Day Tab, page C-526
- C.2.41.5.9 Wavelength Trunk Settings Tab, page C-526
- C.2.41.5.10 Error Decorrelator Settings Tab, page C-527
- C.2.41.5.11 RMON Thresholds Tab, page C-527

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.41.5.12 10G FibCh. Line Config Tab, page C-528
- C.2.41.5.13 10GE Line Config Tab, page C-529
- C.2.41.5.14 Section Trace Tab, page C-530
- C.2.41.5.15 SDH Line Tab, page C-531
- C.2.41.5.16 RS Thresh 15 Min Tab, page C-532
- C.2.41.5.17 RS Thresh 1 Day Tab, page C-533
- C.2.41.5.18 MS Thresh 15 Min Tab, page C-533
- C.2.41.5.19 MS Thresh 1 Day Tab, page C-533
- C.2.41.5.20 Wavelength Trunk Settings Tab, page C-534
- C.2.41.5.21 Error Decorrelator Settings Tab, page C-534
- C.2.41.5.22 RMON Thresholds Tab, page C-535

Note The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

C.2.41.5.1 10G FibCh. Line Config Tab

The 10G FibCh. Line Config tab allows you to provision the 10G FiberChannel PPM parameters of a TXP_MR_10E card.

Table C-684 Field Descriptions for the 10G FibCh. Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-684 Field Descriptions for the 10G FibCh. Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.41.5.2 10GE Line Config Tab

The 10GE Line Config tab allows you to provision the 10GE PPM parameters of a TXP_MR_10E card.

Table C-685 Field Descriptions for the 10GE Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.

Table C-685 Field Descriptions for the 10GE Line Config Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.
Incoming MAC Address	Allows you to edit the incoming MAC address.
Max. Size	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (default). If you do not want to permit jumbo-size Ethernet frames, select 1548.

C.2.41.5.3 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-686 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is either 1 or 16 bytes.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.41.5.4 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-687 Field Descriptions for the SONET Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Provides Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Msg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Type	Displays the type of port.

Table C-687 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.41.5.5 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute section threshold information for the card.

Table C-688 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.

Table C-688 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.5.6 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day section threshold information for the card.

Table C-689 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.5.7 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold information for the card.

Table C-690 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.

Field	Description
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.5.8 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold information for the card.

Table C-691 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.5.9 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-692 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.

Table C-692 Field Descriptions for the Wavelength Trunk Settings Tab (continued)

Field	Description
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.41.5.10 Error Decorrelator Settings Tab

Note This tab appears only when the MLSE transponder module is installed.

The Error Decorrelator Settings tab allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-693 Field Descriptions for the Error Decorrelator Settings Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.41.5.11 RMON Thresholds Tab

The RMON Thresholds tab allows you to view RMON thresholds for the MXP_MR_10DME-C and MXP_MR_10DME-L cards.

Table C-694 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period (sec)	Displays the sample period, in seconds.
Rising Thresholds (count)	Displays the number of occurrences for the rising threshold.

Table C-694 Field Descriptions for the RMON Thresholds Tab (continued)

Field	Description
Falling Thresholds (count)	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.41.5.12 10G FibCh. Line Config Tab

The 10G FibCh. Line Config tab allows you to provision the 10G FiberChannel PPM parameters of a TXP_MR_10E card.

Table C-695 Field Descriptions for the 10G FibCh. Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-695 Field Descriptions for the 10G FibCh. Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.41.5.13 10GE Line Config Tab

The 10GE Line Config tab allows you to provision the 10GE PPM parameters of a TXP_MR_10E card.

Table C-696 Field Descriptions for the 10GE Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.

Table C-696 Field Descriptions for the 10GE Line Config Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.41.5.14 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-697 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	The port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.41.5.15 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the card.

Table C-698 Field Descriptions for the SDH Line Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
State	Displays the port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked,automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled,automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled,disabled. • locked,maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled,maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.

Table C-698 Field Descriptions for the SDH Line Tab (continued)

Field	Description
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.41.5.16 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute regeneration section threshold for the card.

Table C-699 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port Number	The port number.
EB-RS	Errored blocks regenerator section.

Table C-699 Field Descriptions for the RS Thresh 15 Min Tab (continued)

Field	Description
ES-RS	Errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
SES-RS	Severely errored seconds regenerator section.
UAS-RS	Unavailable seconds regenerator section.

C.2.41.5.17 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day regeneration section threshold for the card.

Table C-700 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored second regenerator section.
UAS-RS	Unavailable seconds regenerator section.

C.2.41.5.18 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute multiplex section threshold for the card.

Table C-701 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable second multiplexer section.

C.2.41.5.19 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day multiplex section threshold for the card.

Table C-702 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored second multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.

C.2.41.5.20 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-703 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.41.5.21 Error Decorrelator Settings Tab

Note This Properties pane appears only when the MLSE transponder module is installed.

The Error Decorrelator Settings tab allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-704 Field Descriptions for the Error Decorrelator Settings Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.41.5.22 RMON Thresholds Tab

The RMON Thresholds tab allows you to view RMON thresholds for the MXP_MR_10DME-C and MXP_MR_10DME-L cards.

Table C-705 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period (sec)	Displays the sample period, in seconds.
Rising Thresholds (count)	Displays the number of occurrences for the rising threshold.
Falling Thresholds (count)	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.41.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for the card. The Properties pane contains the following tabs:

- C.2.41.6.1 OTN Line Tab, page C-535
- C.2.41.6.2 G.709 Thresh 15 Min Tab, page C-536
- C.2.41.6.3 G.709 Thresh 1 Day Tab, page C-537
- C.2.41.6.4 FEC Thresh 15 Min Tab, page C-538
- C.2.41.6.5 FEC Thresh 1 Day Tab, page C-538
- C.2.41.6.6 Trail Trace Identifier Tab, page C-538

C.2.41.6.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-706 Field Descriptions for the OTN Line Tab

Field	Description
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
Asynch/Synch Mapping	The card can perform multiplexing per ITU-T G.709. The ODUK (client SONET/SDH payload) can be mapped to the optical channel (OTUK) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.41.6.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-707 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.

Table C-707 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.6.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-708 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.

Table C-708 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.6.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-709 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.41.6.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-710 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.41.6.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-711 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.41.7 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table C-712 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

C.2.41.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-713 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.

Table C-713 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.41.9 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.41.9.1 TCA 15 Min Tab, page C-540
- C.2.41.9.2 TCA 1 Day Tab, page C-540
- C.2.41.9.3 Alarm Thresh Tab, page C-541

C.2.41.9.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of the card.

Table C-714 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.9.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of the card.

Table C-715 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.

Table C-715 Field Descriptions for the TCA 1 Day Tab (continued)

Field	Description
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.9.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-716 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.41.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table C-717 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.

Table C-717 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.41.11 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-718 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.41.12 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-719 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.42 Slot Properties—TXP_MR_10E_C

The TXP_MR_10E_C cards are multirate transponders for the ONS 15454 platform. The cards are fully backward compatible with the TXP_MR_10G and TXP_MR_10E cards. They processes one 10-Gb/s signal (client side) into one 10-Gb/s, 100-GHz DWDM signal (trunk side). The TXP_MR_10E_C is tunable over the entire set of C-band wavelength channels (82 channels spaced at 50 GHz on the ITU grid).

The advantage of these cards over previous versions (TXP_MR_10G and TXP_MR_10E) is that there is only one version of each card (one C-band version) instead of several versions needed to cover each band.

You can install TXP_MR_10E_C cards in slots 1 to 6 and 12 to 17 and provision the cards in a linear configuration, BLSR/MS-SPRing, path protection/SNCP, or regenerator. The cards can be used in the middle of BLSR/MS-SPRing or 1+1 spans when the cards are configured for transparent termination mode.

The TXP_MR_10E_C card features a universal transponder 2 (UT2) 1550-nm tunable laser (C-band) for the trunk port and a separately orderable ONS-XC-10G-S1 1310-nm or ONS-XC-10G-L2 1550-nm laser XFP module for the client port.

Note When the ONS-XC-10G-L2 XFP is installed, the TXP_MR_10E_C card must be installed in a high-speed slot (slot 6, 7, 12, or 13).

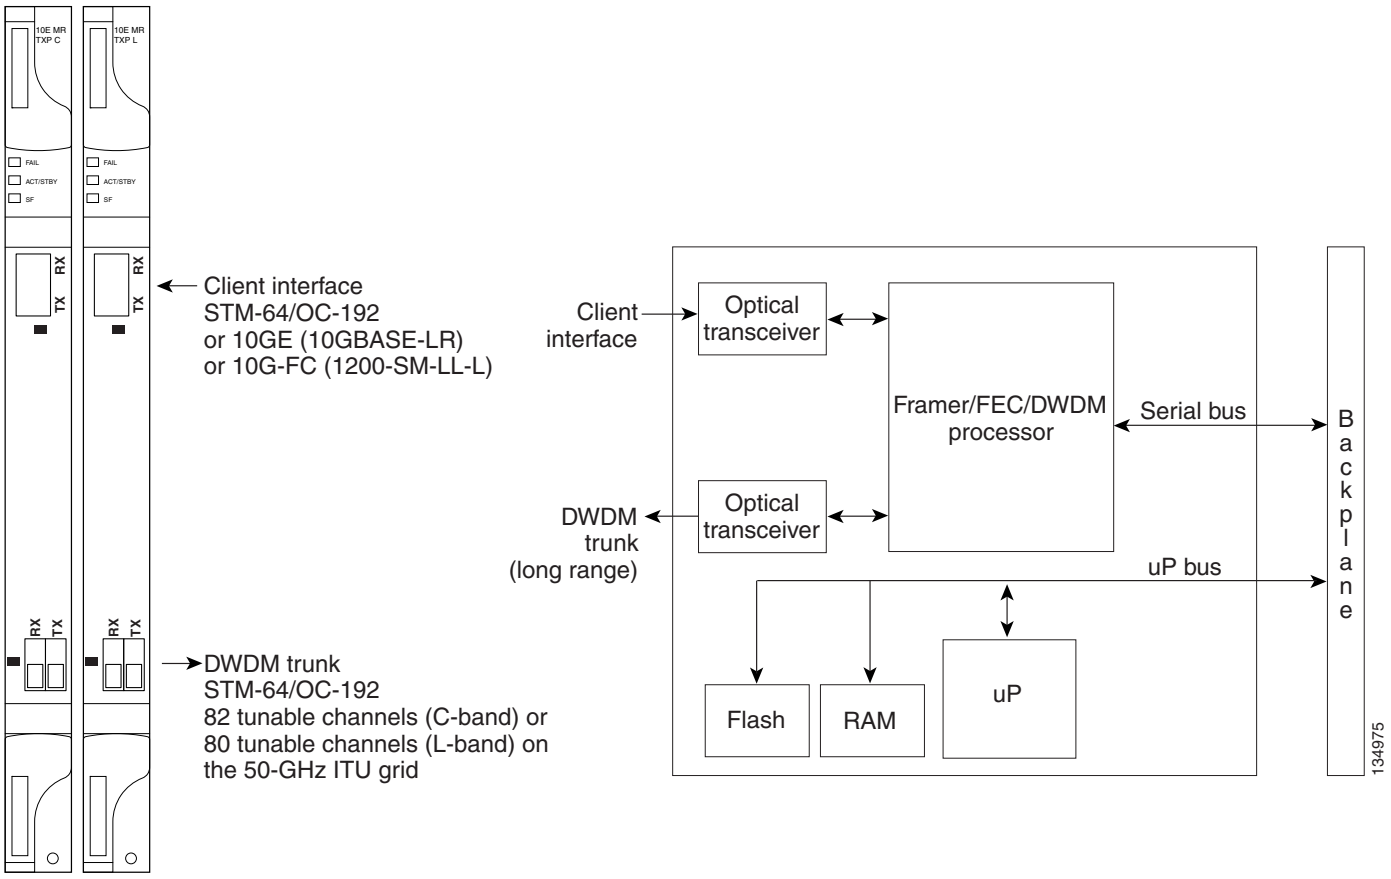
The key features of the TXP_MR_10E_C card are:

- A tri-rate client interface (available through the ONS-XC-10G-S1 XFP, ordered separately):
  - OC-192 (SR1)
  - 10GE (10GBASE-LR)
  - 10G-FC (1200-SM-LL-L)
- A UT2 module tunable through the entire C-band. The channels are spaced at 50 GHz on the ITU grid.
- OC-192 to ITU-T G.709 OTU2 provisionable synchronous and asynchronous mapping.

On its faceplate, the TXP_MR_10E_C card contains two transmit and receive connector pairs, one for the trunk port and one for the client port. Each connector pair is labeled.

The following figure shows the card faceplates.

Figure C-57 TXP_MR_10E_C and TXP_MR_10E_L Faceplates



For the card selected, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

Note The properties shown depend on the NE configuration.

C.2.42.1 Module View

The Module View displays a graphic that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.42.2 Identification

The Identification Properties pane allows you to view and update identification information.

Table C-720 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The equipment administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.42.3 Card

The Card Properties pane allows you to view and update card information.

Table C-721 Field Descriptions for the Card Properties Pane

Field	Description
Termination Mode	Allows you to set the mode of termination.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Regeneration Peer Slot	Allows you to select like cards so that you can configure a regeneration peer group.
Regeneration Group Name	(Optional) Allows you to set the name of the regeneration group.

C.2.42.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-722 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.42.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.42.5 Line

The Line Properties pane allows you to configure line information.

If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.42.5.1 Section Trace Tab, page C-547
- C.2.42.5.2 SONET Line Tab, page C-547
- C.2.42.5.3 Section Thresh 15 Min Tab, page C-548
- C.2.42.5.4 Section Thresh 1 Day Tab, page C-549
- C.2.42.5.5 Line Thresh 15 Min Tab, page C-549
- C.2.42.5.6 Line Thresh 1 Day Tab, page C-550
- C.2.42.5.7 Wavelength Trunk Settings Tab, page C-550
- C.2.42.5.8 Error Decorrelator Settings Tab, page C-551

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.42.5.9 10G FibCh. Line Config Tab, page C-551
- C.2.42.5.10 10GE Line Config Tab, page C-552
- C.2.42.5.11 Section Trace Tab, page C-553

- C.2.42.5.12 SDH Line Tab, page C-554
- C.2.42.5.13 RS Thresh 15 Min Tab, page C-555
- C.2.42.5.14 RS Thresh 1 Day Tab, page C-556
- C.2.42.5.14 RS Thresh 1 Day Tab, page C-556
- C.2.42.5.15 MS Thresh 15 Min Tab, page C-556
- C.2.42.5.16 MS Thresh 1 Day Tab, page C-556
- C.2.42.5.17 Wavelength Trunk Settings Tab, page C-557
- C.2.42.5.18 Error Decorrelator Settings Tab, page C-557
- C.2.42.5.19 RMON Thresholds Tab, page C-558

Note The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

C.2.42.5.1 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card. Select a port and click the **Modify** button to edit the trace.

Table C-723 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is either 1 or 16 bytes.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.42.5.2 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-724 Field Descriptions for the SONET Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance

Table C-724 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Displays the port type.
Provides Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Msg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.42.5.3 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold information for the card.

Table C-725 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.

Table C-725 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.42.5.4 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold information for the card.

Table C-726 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.42.5.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near-end 15-minute line threshold information for the card.

Table C-727 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.

Table C-727 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.42.5.6 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold information for the card.

Table C-728 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.42.5.7 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-729 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.

Table C-729 Field Descriptions for the Wavelength Trunk Settings Tab (continued)

Field	Description
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.42.5.8 Error Decorrelator Settings Tab

The Error Decorrelator Settings tab allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-730 Field Descriptions for the Error Decorrelator Settings Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.42.5.9 10G FibCh. Line Config Tab

The 10G FibCh. Line Config tab allows you to provision the 10G FiberChannel PPM parameters of a card.

Table C-731 Field Descriptions for the 10G FibCh. Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-731 Field Descriptions for the 10G FibCh. Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.42.5.10 10GE Line Config Tab

The 10GE Line Config tab allows you to provision the 10GE PPM parameters.

Table C-732 Field Descriptions for the 10GE Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.

Table C-732 Field Descriptions for the 10GE Line Config Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.42.5.11 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-733 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	The port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.42.5.12 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the card.

Table C-734 Field Descriptions for the SDH Line Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.

Table C-734 Field Descriptions for the SDH Line Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.42.5.13 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute regeneration section threshold for the card.

Table C-735 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.

Table C-735 Field Descriptions for the RS Thresh 15 Min Tab (continued)

Field	Description
SES-RS	Severely errored seconds regenerator section.
UAS-RS	Unavailable seconds regenerator section.

C.2.42.5.14 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day regeneration section threshold for the card.

Table C-736 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored second regenerator section.
UAS-RS	Unavailable seconds regenerator section.

C.2.42.5.15 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute multiplex section threshold for the card.

Table C-737 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable second multiplexer section.

C.2.42.5.16 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day multiplex section threshold for the card.

Table C-738 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored second multiplexer section.

Table C-738 Field Descriptions for the MS Thresh 1 Day Tab (continued)

Field	Description
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.

C.2.42.5.17 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-739 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.42.5.18 Error Decorrelator Settings Tab

Note This Properties pane appears only when the MLSE transponder module is installed.

The Error Decorrelator Settings tab allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-740 Field Descriptions for the Error Decorrelator Settings Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.42.5.19 RMON Thresholds Tab

The RMON Thresholds tab allows you to view RMON thresholds for the MXP_MR_10DME-C and MXP_MR_10DME-L cards.

Table C-741 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period (sec)	Displays the sample period, in seconds.
Rising Thresholds (count)	Displays the number of occurrences for the rising threshold.
Falling Thresholds (count)	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.42.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for multirate transponder cards. If you provisioned the payloads DVB-ASI or ISC1, all other subtabs except OTN Line are blank.

Note OTN is supported only for trunk ports.

Table C-742 Field Descriptions for the OTN Properties Pane

Field	Description
OTN Line	
Port No.	The port number.
G.709 OTN	Disables or enables the G.709 OTN feature. If you provisioned the new payloads, the field displays the current status of the G.709 OTN feature: enabled or disabled.

Table C-742 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
FEC	Disables or enables forward error correction. If you provisioned the new payloads, this field displays the status of forward error correction: enabled or disabled. **Note** OTN must be enabled before you can enable FEC.
Asynch/Synch Mapping	
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.
G.709 Thresh 15 Min	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
G.709 Thresh 1 Day	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.

Table C-742 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
FEC Thresh 15 Minutes	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
FEC Thresh 1 Day	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in one-day intervals.
Uncorrectable Words	Displays the uncorrectable words in one-day intervals.
Trail Trace Identifier	
Port No.	The port number.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch alarms.
Current Transmit String	Displays the current transmit string.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.42.7 Loopback

The Loopback Properties pane allows you to view and update card loopback information.

Table C-743 Field Descriptions for the Loopback Properties Pane

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance

Table C-743 Field Descriptions for the Loopback Properties Pane (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.42.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown (ALS) parameters.

Table C-744 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.42.9 Optical Threshold

The Optical Threshold Properties pane allows you to view and update optical threshold information.

Table C-745 Field Descriptions for the Optical Threshold Properties Pane

Field	Description
TCA 15 Min	
Port Number	Displays the port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.

Table C-745 Field Descriptions for the Optical Threshold Properties Pane (continued)

Field	Description
Reset to Defaults button	Resets the value of the port parameters to the default value.
TCA 1 Day	
Port Number	Displays the port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Alarm Threshold	
Port Number	Displays the port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.42.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-746 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
DWDM/Payload	
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.42.11 Protection

The Protection Properties pane allows you to view and update card protection group information.

Note When using protection groups, you can provision only the working port.

Table C-747 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups. Y-cable (TXP_MR_2.5G) and splitter (TXPP_MR_2.5G) protection groups are supported.
Protection Group Details	Displays details about the selected protection groups, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

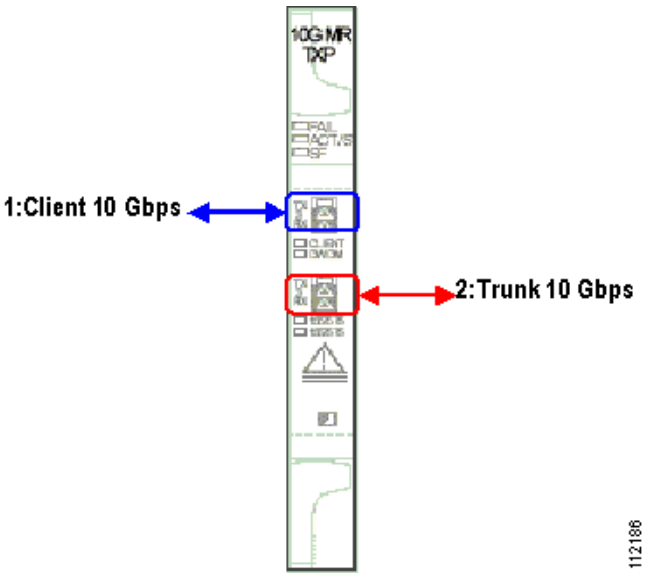
C.2.43 Slot Properties—TXP_MR_10G

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 10-Gb/s Transponder–100-GHz–Tunable xx.xx-xx.xx card (TXP_MR_10G) processes one 10-Gb/s signal (client side) into one 10-Gb/s, 100-GHz DWDM signal (trunk side). It provides one 10-Gb/s port per card that can be provisioned for an STM64/OC-192 short reach (1310 nm) signal, compliant with ITU-T G.707, G.709, ITU-T G.691, Telcordia GR-253-CORE, or a 10 GE BASE-LR, compliant to IEEE 802.3.

The following figure shows the card faceplate.

Figure C-58 TXP_MR_10G Module



For the TXP_MR_10G module, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, SONET Line, SDH Line, Ether Line, and Protection. The properties shown depend on the NE configuration.

C.2.43.1 Module View

The Module View displays a graphic of the TXP_MR_10G that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.43.2 Identification

The Identification Properties pane allows you to view and update TXP_MR_10G identification information.

Table C-748 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.

Table C-748 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Vendor ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.43.3 Card

The Card Properties pane allows you to view and update card information.

Table C-749 Field Descriptions for the Card Properties Pane

Field	Description
Termination Mode	Allows you to set the mode of termination.
Regeneration Peer Slot	Allows you to select like cards so that you can configure a regeneration peer group.
Regeneration Group Name	(Optional) Allows you to set the name of the regeneration group.

C.2.43.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM for TXP_MR_10G cards.

Table C-750 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.43.5 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for TXP_MR_10G cards.

Table C-751 Field Descriptions for the OTN Properties Pane

Field	Description
G.709 Thresh 15 Min	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
G.709 Thresh 1 Day	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.

Table C-751 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
Reset to Defaults button	Resets the value of the port parameters to the default value.
FEC Thresh 15 Minutes	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
FEC Thresh 1 Day	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in one-day intervals.
Uncorrectable Words	Displays the uncorrectable words in one-day intervals.
Trail Trace Identifier	
Port No.	The port number.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.
OTN Line	
Port No.	The port number.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.43.6 Loopback

The Loopback Properties pane allows you to view and update TXP_MR_10G loopback information.

Table C-752 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.

Table C-752 Field Descriptions for the Loopback Properties Pane (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.43.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-753 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.43.8 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings.

Table C-754 Field Descriptions for the Optical Thresh Properties Pane

Field	Description
Warning 15 Min	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold.
Tx Power Low	Displays the lower transmit power threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Warning 1 Day	
Port Number	Displays the port number.

Table C-754 Field Descriptions for the Optical Thresh Properties Pane (continued)

Field	Description
Tx Power High	Displays the upper transmit power threshold.
Tx Power Low	Displays the lower transmit power threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Alarm Threshold	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold.
Tx Power Low	Displays the lower transmit power threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.43.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update TXP_MR_10G alarm profile information.

Table C-755 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.

Table C-755 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
GFP	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.43.10 SONET Line

The SONET Line Properties pane allows you to configure SONET line information. If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs and fields. If the card is installed on an ONS 15454 SDH NE, see C.2.43.11 SDH Line, page C-572.

Note The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

Table C-756 Field Descriptions for the SONET Line Properties Pane

Field	Description
Section Threshold 15 Minutes	
Port Number	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Section Threshold 1 Day	
Port Number	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds sections section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Threshold 15 Minutes	
Port Number	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.

Table C-756 Field Descriptions for the SONET Line Properties Pane (continued)

Field	Description
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Threshold 1 Day	
Port Number	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Wavelength Trunk Settings	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.
Section Trace	
Port Number	The port number.
Trace Mode	Allows you to set the trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Modify	Allows you to change the section trace settings for TXP_MR_10G cards. Select a trace and click the **Modify** button to open the Modify Trace window.
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.

Table C-756 Field Descriptions for the SONET Line Properties Pane (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.

C.2.43.11 SDH Line

The SDH Line Properties pane allows you to configure SDH line information. If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs and fields. If the card is installed on an ONS 15454 SONET NE, see the SONET Line section.

Note The following information is the same if the payload is SONET on an ONS 15454 SDH NE.

Table C-757 Field Descriptions for the SDH Line Properties Pane

Field	Description
Section Trace	
Port Number	The port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.

Table C-757 Field Descriptions for the SDH Line Properties Pane (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
RS Threshold 15 Minutes - Near End	
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
BBE-RS	Background block error regenerator section.
SES-RS	Severely errored second regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
RS Threshold 1 Day - Near End	
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
SES-RS	Severely errored seconds regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Threshold 15 Minutes - Near End, Far End	
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Threshold 1 Day - Near End, Far End	

Table C-757 Field Descriptions for the SDH Line Properties Pane (continued)

Field	Description
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Wavelength Trunk Settings	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.

C.2.43.12 Ether Line

The Ether Line Properties pane allows you to configure Ethernet line information.

Table C-758 Field Descriptions for the Ether Line Properties Pane

Field	Description
Line Config	
Port Number	The port number.
Port Name	Allows you to enter a port name.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Incoming MAC Address	Allows you to edit the incoming MAC address.
Max Frame	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (default). If you do not want to permit jumbo-size Ethernet frames, select 1548.
Thresholds	
Index Number	Displays the index number.
Slot	Displays the slot.
Port	Displays the port.

Table C-758 Field Descriptions for the Ether Line Properties Pane (continued)

Field	Description
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising and Falling.
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Displays the Ethernet threshold sample period, in seconds.
Rising Thresh	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresh	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.

C.2.43.13 Protection

The Protection Properties pane allows you to view and update TXP_MR_10G protection group information.

Table C-759 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock-out switching, or lock-on switching.

C.2.43.14 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the TXP_MR_10G card.

Table C-760 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.44 Slot Properties—PTF_10GE_4

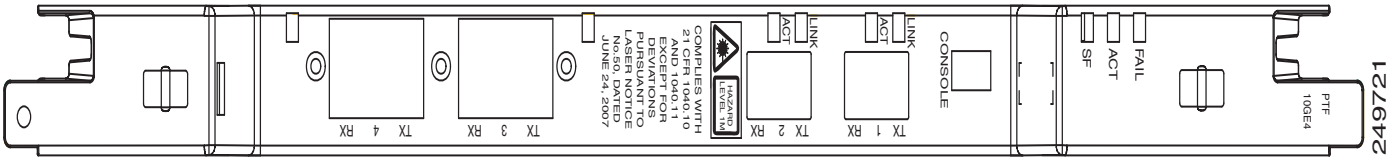
The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The PTF_10GE_4 card is a single-slot card with two 10 GE SFP+ ports and two 10 GE XFP ports. The XFP ports on the PTF_10GE_4 card support the OTN protocol. The SFP+ ports on the PTF_10GE_4 card can serve as normal ports or InterConnect (IC) ports.

On the CPT 600 shelf, install the redundant PTF_10GE_4 cards in slots 4 and 5. There can be up to two PTF_10GE_4 cards on the CPT 600 shelf. The two PTF_10GE_4 cards on the CPT 600 shelf can both be in active mode with both cards carrying the traffic. On the CPT 200 shelf, install the fabric card in slot 2 or 3.

The following figure shows the PTF_10GE_4 faceplate.

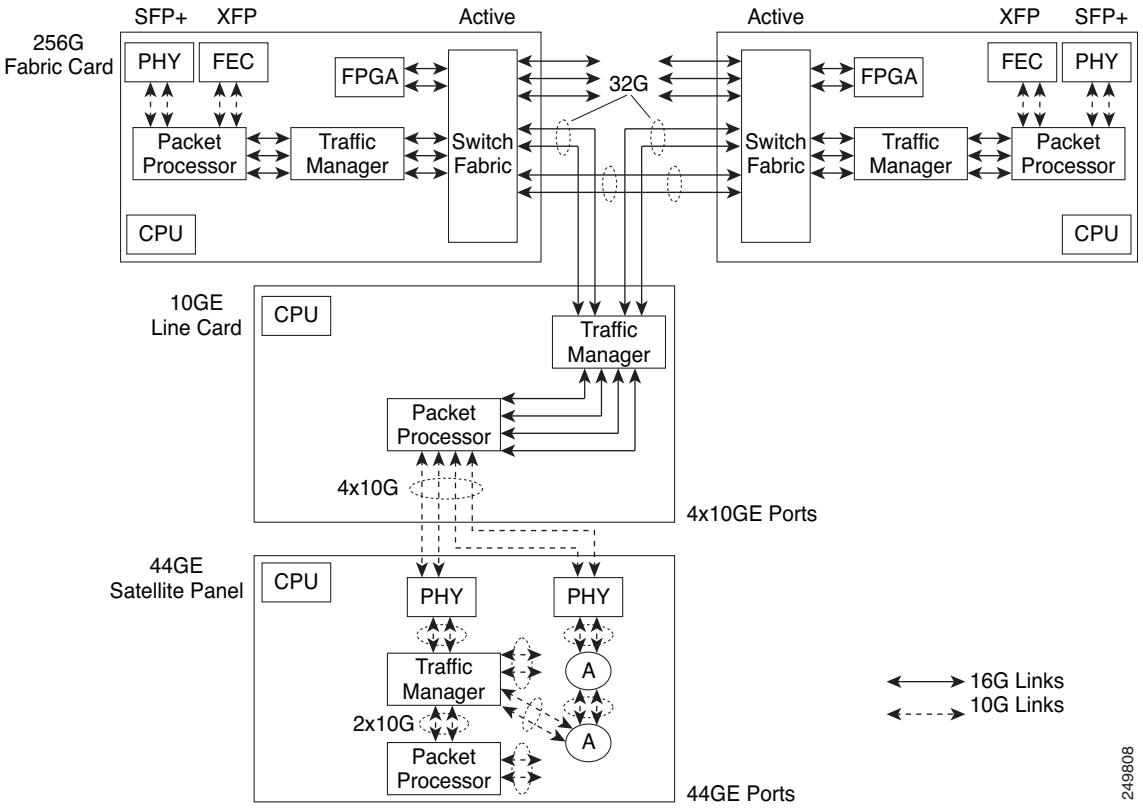
Figure C-59 PTF_10GE_4 Card Faceplate



For the PTF_10GE_4 card, the slot properties pane displays the following properties: Identification, Module View, Alarm Behavior, Ether Ports, Info, Loopback, Optical Thresh, OTN, PPM, and RMON Thresholds.

The following figure shows the CPT System block diagram.

Figure C-60 CPT System Block Diagram



C.2.44.1 Identification

The Identification Properties pane allows you to view and update PTF_10GE_4 identification information.

Table C-761 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
HW Revision	Displays the hardware version number of the card.
Serial No.	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table C-761 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Admin State	The port administration state. It can be: • IS—In Service • OOS, MT—Out of Service, Maintenance
Service State	*Display only.* Sets the service state that indicates the operational state of the channel group. The Service State can be: • IS-NR—In Service–Normal. • OOS-MA, DSBLD—Out of Service and Management, Disabled.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. You can choose an alarm profile for the card from the drop-down list. Values are Default and Inherited. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.44.2 Module View

The Module View displays a graphic of the PTF_10GE_4 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).
Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.44.3 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-762 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.

Table C-762 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.44.4 Ether Ports

The Ether Ports Properties pane contains the following tabs:

- C.2.44.4.1 Ports Tab, page C-579
- C.2.44.4.2 Ethernet Tab, page C-580
- C.2.44.4.3 Layer 2 Protocols, page C-581

C.2.44.4.1 Ports Tab

Table C-763 Field Descriptions for the Ports Tab

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Admin State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.

Table C-763 Field Descriptions for the Ports Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • EW • LW • SW • LRM • ER • LR • SR (short reach, up to 2 km distance) • ZR • IR 2 • LR 2 • DWDM • CWDM40km
Wavelength	Allows you to provision the wavelength frequency.

C.2.44.4.2 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information.

Table C-764 Field Descriptions for the Ethernet Tab

Field	Description
Port	Displays the port number.
MTU	Displays the maximum transfer unit, which is the largest acceptable packet size configured for that port. The maximum setting is 9000 and the default size is 1500. The MTU value is 0 until the packet-over-SONET (POS) port is used in creating a circuit.
Link State	Displays the physical port state. Possible values are Up and Down.
Expected Speed	Displays the expected speed. Possible values are 10 Mbps, 100 Mbps, and Auto. If expected speed is set to Auto, you cannot enable selective autonegotiation.
Expected Duplex	Displays the port's expected duplex setting. Possible values are Full, Half, and Auto. If expected duplex is set to Auto, you cannot enable selective autonegotiation.
Flow Control	Displays the negotiated flow control mode. Possible values are None, Symmetrical, and Asymmetrical.
Interconnect Mode	—
Operating Speed	Displays the actual operating speed.
Operating Duplex	Displays the expected duplex setting of the port.

Table C-764 Field Descriptions for the Ethernet Tab (continued)

Field	Description
Operating Flow Control	Displays the value of the flow control.
Carrier Delays (ms)	—

C.2.44.4.3 Layer 2 Protocols

The Layer 2 Protocols tab allows you to view and modify actions for Layer 2 protocols.

Table C-765 Field Descriptions for the Layer 2 Protocols Tab

Field	Description
Port	Displays the port number.
CDP	Displays the Layer 2 action configured for CDP. To modify the action, click the cell and select the action from the drop-down list.
DOT1X	Displays the Layer 2 action configured for DOT1X. To modify the action, click the cell and select the action from the drop-down list.
DTP	Displays the Layer 2 action configured for DTP. To modify the action, click the cell and select the action from the drop-down list.
LACP	Displays the Layer 2 action configured for LACP. To modify the action, click the cell and select the action from the drop-down list.
PAGP	Displays the Layer 2 action configured for PAGP. To modify the action, click the cell and select the action from the drop-down list.
VTP	Displays the Layer 2 action configured for VTP. To modify the action, click the cell and select the action from the drop-down list.
STP	Displays the Layer 2 action configured for STP. To modify the action, click the cell and select the action from the drop-down list.

C.2.44.5 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-766 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.44.6 Loopback

The Loopback Properties pane allows you to view and update PTF_10GE_4 loopback information.

Table C-767 Field Descriptions for the Loopback Properties Pane

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Admin State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.44.7 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.44.7.1 TCA 15 Min Tab, page C-582
- C.2.44.7.2 TCA 1 Day Tab, page C-583
- C.2.44.7.3 Alarm Thresh Tab, page C-583

C.2.44.7.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-768 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.44.7.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-769 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.44.7.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-770 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.44.8 OTN

The OTN Properties pane contains the following tabs:

- C.2.44.8.1 OTN Line Tab, page C-583
- C.2.44.8.2 G.709 Thresh 15 Min Tab, page C-584
- C.2.44.8.3 G.709 Thresh 1 Day Tab, page C-585
- C.2.44.8.4 FEC Thresh 15 Min Tab, page C-586
- C.2.44.8.5 FEC Thresh 1 Day Tab, page C-586
- C.2.44.8.6 Trail Trace Identifier Tab, page C-586

C.2.44.8.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-771 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	Displays the port number. If you set the payload as OTU2 in the PPM Properties pane, a new port is added to the OTN Line tab.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.44.8.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information and allows you to change these card threshold values.

Table C-772 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.

Table C-772 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.44.8.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information and allows you to change these card threshold values.

Table C-773 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.

Table C-773 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.44.8.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-774 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.44.8.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-775 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.44.8.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-776 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. For more information, see 7.2.21 Modifying Traces, page 7-177.
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.44.9 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-777 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
PPM No.	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the equipment type that the slot is provisioned for.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the identifier of the plugin module and the port number.
Rate	Displays the rate of the port inside the pluggable entity.

C.2.44.9.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.44.10 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the PTF_10GE_4 card.

Table C-778 Field Descriptions for the RMON Thresholds

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the POS ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.45 Slot Properties—AR_MXP, AR_XP and AR_XPE

The Any-Rate Muxponder (AR_MXP) and Any-Rate Xponder (AR_XP) cards are supported on ONS 15454, ONS 15454 M2, and ONS 15454 M6 platforms. The AR_MXP card supports a bandwidth of up to 10 Gbps, and the AR_XP card supports a bandwidth of up to 20 Gbps. The AR_MXP and AR_XP cards aggregate a mix of client SAN services (FICON, ESCON, ISC3-STP, and Fiber Channel), Ethernet (GE, FE), OCn (OC3/STM-1, OC12/STM-4, and OC48/STM-16), OTU1, and video (SD-SDI, HD-SDI, and 3G-SDI) into one 10.0 Gbps signal on the trunk side.

The cards support aggregation of the following signal types:

- SONET/SDH:
  - STM-1/OC-3
  - STM-4/OC-12
  - STM-16/OC-48

- OTN:
  - OTU-1
  - OTU-2 (OTU1E/OTU2E)
- Ethernet:
  - Fast Ethernet (FE)
  - Gigabit Ethernet (GE)
- SAN:
  - Enterprise Systems Connection (ESCON)
  - 1-Gigabit Fiber Channel or fiber connectivity (FICON)
  - 2-Gigabit Fiber Channel or FICON
  - 4-Gigabit Fiber Channel or FICON
  - 8-Gigabit Fiber Channel or FICON
  - 1-Gigabit ISC3-STP
  - 2-Gigabit ISC3-STP
- Video:
  - SD-SDI (270 Mb/s)
  - HD-SDI (1.485 Gb/s)
  - Third-generation SDI (3G-SDI) (2.970 Gb/s)

The AR_MXP and AR_XP cards pass all SONET/SDH overhead bytes transparently.

Caution The AR_MXP and AR_XP cards can be damaged if dropped. Handle them with care.

Table C-779 shows the input data rate for each client interface, and the encapsulation method. The digital wrapper function (ITU-T G.709 compliant) formats the DWDM wavelength so that it can be used to set up GCCs for data communications, enable FEC, or facilitate PM. The AR_MXP and AR_XP cards work with the OTN devices defined in ITU-T G.709. The client can be OTU1 with standard G.975 FEC or disabled FEC. The cards provide standard 4 x OTU1-to-OTU2 multiplexing. The OTU2 card is equipped with standard G.709 FEC, E-FEC I.4, E-FEC I.7, and disabled FEC. The cards support ODU1-to-OTU1 or OTU2 multiplexing, an industry standard method for asynchronously mapping a SONET/SDH payload into a digitally wrapped envelope.

Table C-779 AR_MXP and AR_XP Client Interface Data Rates and Encapsulation

Client Interface	Input Data Rate	GFP Encapsulation
OC3/STM1	155 Mb/s	—
OC12/STM4	622 Mb/s	—
OC48/STM16	2.488 Gb/s	—
FE	100 Mb/s	GFP-F
GE	1.125 Gb/s	GFP-F
1GFC	1.06 Gb/s	GFP-T
2GFC	2.125 Gb/s	GFP-T

Table C-779 AR_MXP and AR_XP Client Interface Data Rates and Encapsulation (continued)

Client Interface	Input Data Rate	GFP Encapsulation
4GFC	4.25 Gb/s	GFP-T
8GFC	8.5 Gb/s	GFP-T
OTU1	2.66 Gb/s	—
OTU2	11.09 Gb/s	—
ESCON	200 Mb/s	GFP-T
1G ISC3-STP	1.06 Gb/s	GFP-T
2G ISC3-STP	2.125 Gb/s	GFP-T
HD-SDI	1.485 Gb/s	GFP-F
SD-SDI	270 Mb/s	GFP-F
3G-SDI	2.970 Gb/s	GFP-F

The AR_MXP and AR_XP cards support the following operating modes:

- Multiple Operating Modes—The AR_MXP or AR_XP cards can be configured into multiple operating modes. The cards are equipped with pluggables for client and trunk options, and offer a large variety of configurations.
- Operating Mode-to-Client Payload Mapping—Each operating mode supports a specific set of client payloads.

A single AR_MXP or AR_XP card can be configured into multiple operating modes. Criteria for selecting a particular operating mode are defined by the network-level design. CTP helps you to choose the appropriate operating mode, each of which is divided into two categories based on trunk rate:

  - Low rate (< 5G)
  - High rate (> 5G)

When you configure the operating modes, make sure that:

  - The OCHCC circuit is created.
  - The same operating mode is configured at both ends.
  - For MXP_DME, MXPP_DME, MXP_MR, MXPP_MR, MXP-4x2.5-10G, and MXPP-4x2.5-10G operating modes, the port numbers are the same on both ends.
  - ODU and TS match on both ends.
  - For Y-cable protection, the ports are 1:1 protected at both ends.
  - If Auto port is selected, autosensing is enabled at both ends.
  - If Auto port is selected, the supported payload is configured.

Table C-780 and Table C-781 lists the supported payloads for each operating mode.

Table C-780 AR_MXP and AR_XP Card Supported Client-Payload Mapping—SONET/SDH, Ethernet, OTU1, and FC

Card Mode	Rate	SONET/SDH			Ethernet			OTU1	FC				
		OC3/STM1	OC12/STM4	OC48/STM16	FE	GE	10GE/OTU2	OTU1	FICON 1G/FC1G	FICON 2G/FC2G	FICON 4G/FC4G	FICON 8G/FC8G	ESCON
TXP_MR	LOW	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes	Yes	No	Yes
	HIGH	No	No	No	No	No	Yes	No	No	No	No	Yes	No
TXPP_MR	LOW	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes	No	No	Yes
	HIGH	No	No	No	No	No	No	No	No	No	No	No	No
MXP_DME	HIGH	No	No	No	No	Yes	No	No	Yes	Yes	Yes	No	No

MXPP_DME	HIGH	No	No	No	No	No	No
MXP_MR	LOW	No	No	No	No	No	No
	HIGH	No	No	No	Yes	Yes	No

Table C-781 AR_MXP and AR_XP Card Supported Client-Payload Mapping—ISC and Video (continued)

Card Mode	Rate	ISC			Video		
		ISC-1	ISC3_STP_1G	ISC3_STP_2G	SD-SDI	HD-SDI	3G-SDI
MXPP_MR	LOW	No	No	No	No	No	No
	HIGH	No	No	No	Yes	Yes	No
MXP-4x2.5-10G	HIGH	No	No	No	No	No	No
MXPP-4x2.5-10G	HIGH	No	No	No	No	No	No
MXP-VD-10G	HIGH	No	No	No	No	No	Yes
REGEN	HIGH	No	No	No	No	No	No
	LOW	No	No	No	No	No	No

The AR_MXP and AR_XP cards support the following key features:

- Autosensing—The AR_MXP and AR_XP cards support autosensing of client payloads. The line card analyzes the received client signal and configures the payload on the client port automatically without user intervention.

  The autosensing feature is supported on the Gigabit Ethernet, OC-3/STM-1, OC-12/STM-4, and OC-48/STM-16 payloads. The following operating card modes support the autosensing feature:

  - TXP (low rate)
  - TXPP (low rate)
  - MXP_MR (low and high rate)
  - MXPP_MR (high rate)

  Prime Optical supports the configuration of all provisioning parameters supported by the autosensing payload. However, creation and deletion of circuits are the only configurations supported on the autosensing payload.

- Video multiplexing—The AR_XP card supports the capability to multiplex SD-SDI, HD-SDI, and 3G-SDI signals over the OTU2 trunk interface, allowing for maximum wavelength bandwidth, full transparency for uncompressed signals, and reduced latency. This feature is not supported on the AR_MXP card.
- Regenerator mode—You can regenerate 10-Gigabit Ethernet over OTU2e signals with standard G.975 FEC, disabled FEC, I.4, or I.7 EFEC mode. You can configure ODU transparency between the Cisco Extended Use or Transparent Standard Use and REGEN card mode.
- High-speed GCCs—The AR_MXP and AR_XP cards support the provisioning of GCC channel on OTN (OTU1/OTU2)-enabled client and trunk ports. You can create a maximum of 5 GCC channels on the Cisco ONS 15454 shelf and 10 GCC channels on the Cisco ONS 15454 M2 or Cisco ONS 15454 M6 shelf. The high-speed GCC enables you to create the GCC when both the NE and FE line cards are on the Cisco ONS 15454 M2, or Cisco ONS 15454 M6 shelf. You can select the legacy GCC on the Cisco ONS 15454 shelf on one side and the Cisco ONS 15454, Cisco ONS 15454 M2, or Cisco ONS 15454 M6 shelf on the other side.
- Y-cable and splitter protection—Y-cable protection between the same card type is supported only on ports with the same port number and signal rate. Y-cable protection is provided at the client port level. When using the AR_MXP or AR_XP card on a storage ISL link, use it with a Cisco MDS

storage switch to avoid a 15-to-20-second traffic hit. With Brocade Condor-based platforms, you can avoid this 15-to-20-second traffic hit by increasing the bouncing timer to 100 ms for the front-end port. Splitter protection is provided at the trunk-port level.

Note AR_MXP and AR_XP cards support Y-cable protection only when the card is provisioned in an unprotected card mode.

- Licensing—The AR_MXP and AR_XP cards offer you unprecedented flexibility. The cards support a wide range of applications and configurations. To help you take advantage of such flexibility and lower capital expenditures (CapEx) on your network, Cisco provides a licensing model for AR_MXP and AR_XP cards. For more information on licensing, see the *Cisco ONS 15454 DWDM Licensing Configuration Guide*.

Figure C-61 shows the AR_MXP and AR_XP faceplates.

The AR_MXP and AR_XP cards have eight SFP ports and two XFP ports. The client ports are SFP (2.5 G)- or XFP (10 G)-based ports. The trunk ports are SFP (2.5 G)- or XFP (10 G)-based ports.

You can tune the AR_MXP or AR_XP card to any wavelength over the C-band by inserting the required DWDM SFP or XFP on client or trunk ports. The AR_MXP or AR_XP card supports pluggable SFPs or XFPs on the client and trunk ports. For optical termination, each XFP/SFP uses two LC connectors, which are labeled TX and RX on the faceplate.

Figure C-61 AR_MXP and AR_XP Faceplates

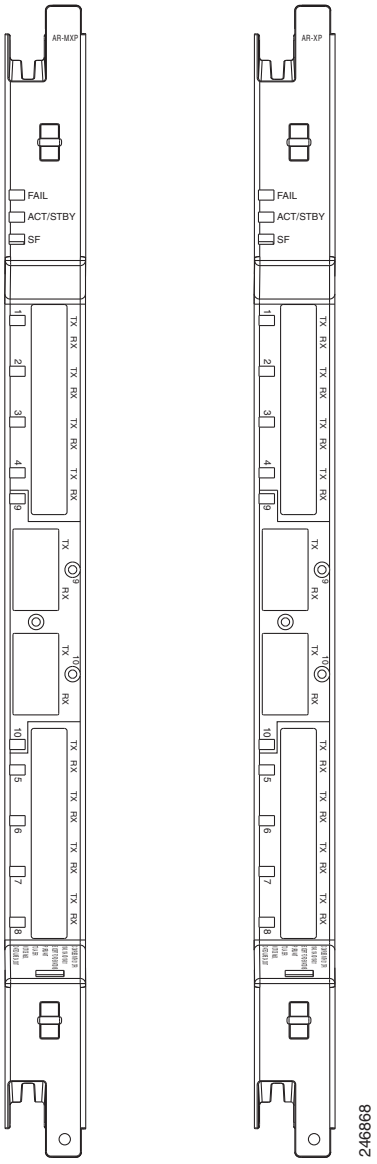

Figure C-62 AR_XPE Faceplate

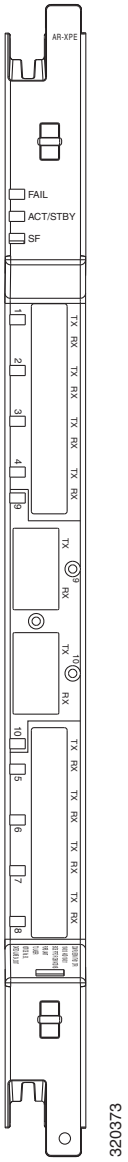


Caution Using direct fiber loopbacks causes irreparable damage to AR_MXP and AR_XP cards. You must use a fiber attenuator ranging 15-25 dB when working with the cards in a loopback on the trunk port.

You can install AR_MXP and AR_XP cards in Slot 1 to Slot 6 and Slot 12 to Slot 17 of the Cisco ONS 15454 chassis, Slot 2 to Slot 7 of the Cisco ONS 15454 M6 chassis, and Slot 2 and Slot 3 of the Cisco ONS 15454 M2 chassis. The AR_MXP and AR_XP cards' client port interoperates with all existing TXP or MXP (OTU2 trunk) cards. The AR_MXP card enables you to configure eight SFP clients and one XFP trunk or only two XFP ports. The AR_XP card enables you to configure all SFP and XFP ports without limitations.

The slot properties pane displays the following properties: Module View, Identification, Card, Alarm Behavior, Auto Laser Shutdown, Info, Line, Loopback, Optical Thresholds, OTN, PPM, and Protection.

C.2.45.1 Module View

The Module View displays a graphic of the AR_MXP and AR_XP that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its ports. Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.45.2 Identification

The Identification Properties pane allows you to view and update AR_MXP and AR_XP identification information.

Table C-782 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State, Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.45.3 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update alarm profiles assigned to ports and PPM on AR_XP and AR_MXP cards.

Table C-783 Field Descriptions for the Alarm Behavior Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Force Profile	When clicked, forces all ports and PPM to the alarm profile in the selected row of the table.
Port/PPM Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.

C.2.45.4 Auto Laser Shutdown Tab

The Auto Laser Shutdown tab allows you to view and update optical card auto laser shutdown (ALS) parameters.

Table C-784 Field Descriptions for the Auto Laser Shutdown Tab

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.45.5 Card

The Card mode tab allows you to view the operating modes and the ODU interfaces that are provisioned. The Properties pane displays the following subtabs:

- C.2.45.5.1 Operating Modes, page C-598
- C.2.45.5.2 ODU Interfaces, page C-598

C.2.45.5.1 Operating Modes

A single AR_MXP, AR_XP or AR_XPE card can be configured into multiple operating modes.

Table C-785 Field Descriptions for the Operating Mode Tab

Field	Description
Card Mode	Displays the card mode.
Rate	Displays the port rate.
Client Trunk Mapping	Displays the client trunk ports mapping.
Trunk Ports	Displays the trunk ports involved in the card mode.
Client Ports	Displays the client ports involved in the card mode.
Bandwidth Used	Bandwidth used by provisioned payload for the operating mode.
Bandwidth Utilization of Provisioned Configurations	
Bandwidth Utilization	Total bandwidth used by operating modes.

ODU Utilization	Click the **ODU Utilization** button. The ODU Utilization dialog box shows the graphical representation of how payloads are encapsulated into the ODU layer of the OTN frame. The payloads positioned into the frame are displayed in green.
	When the card mode selected has zero bandwidth, the following error message is displayed:
	`Bandwidth is not allocated for the current configuration mode.`
	`Bandwidth is allocated after PPM payloads are provisioned. If the configuration mode is set to MXP_MR, bandwidth is only allocated after a circuit is created.`
	When the card mode selected is RGN or MXP_VD_10G, the following error message is displayed:
	`ODU utilization is not supported for the selected mode.`
	Click **Cancel** to cancel the operation.
	For AR_XPE card, clicking the ODU Utilization button displays the graphical representation of how payloads are encapsulated into the ODU layer of the OTN frame. These details are displayed only when ONE_GE or FC1G payloads have been provisioned for that card mode. You cannot edit the ODU utilization dialog box. The ODU-1 Time Slot allocation for each payload is displayed in green. For 1GE and FC1G payload types, the ODU-0 Time Slot allocation is displayed in green.

C.2.45.5.2 ODU Interfaces

When 1GE and 1GFC payloads are provisioned, the ODU Interface tab shows the mapping of ODU0 objects with the corresponding Client and Trunk ports.

Note The ODU Interfaces tab is enabled for AR_XPE cards only.

Table C-786 Field Descriptions for the ODU Interfaces Tab

Field	Description
ODU Objects	Physical representation of the ODU involved on the provisioned operating mode.
Trunk Ports	Displays the trunk ports number which maps to the virtual ODU0 object.
ODU1	Displays the ODU1 frame number which contains the corresponding ODU0 frame.
ODU0	Displays the ODU0 frame number within a ODU1 frame.
Client Ports	Displays the client ports that have been provisioned for each operating mode.

C.2.45.6 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-787 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.45.7 Line

The Line Properties pane allows you to configure line information. If the card is installed on an ONS 15454 SONET NE, the Line Properties pane contains the following tabs:

- C.2.45.7.1 Ports Tab, page C-600
- C.2.45.7.2 SONET Line Tab, page C-601
- C.2.45.7.3 Auto Ports Tab, page C-603
- C.2.45.7.4 Section Thresh 15 Min Tab, page C-603
- C.2.45.7.5 Section Thresh 1 Day Tab, page C-603
- C.2.45.7.6 Line Thresh 15 Min Tab, page C-604
- C.2.45.7.7 Line Thresh 1 Day Tab, page C-604
- C.2.45.7.8 Section Trace Tab, page C-605
- C.2.45.7.9 RMON Thresholds, page C-605
- C.2.45.7.10 Ethernet Line Tab, page C-606

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.45.7.11 Ports Tab, page C-607
- C.2.45.7.12 SDH Line Tab, page C-607
- C.2.45.7.13 Auto Ports Tab, page C-609
- C.2.45.7.14 RS Thresh 15 Min Tab, page C-610
- C.2.45.7.15 RS Thresh 1 Day Tab, page C-610

- C.2.45.7.16 MS Thresh 15 Min Tab, page C-610
- C.2.45.7.17 MS Thresh 1 Day Tab, page C-611
- C.2.45.7.18 Section Trace Tab, page C-611
- C.2.45.7.19 RMON Thresholds, page C-612
- C.2.45.7.20 Ethernet Line Tab, page C-612

C.2.45.7.1 Ports Tab

The ports tab allows you to view and change the port settings.

Table C-788 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.
Administration State	**Note** The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Termination Mode	Sets the mode of operation. (This option is available only for SONET/SDH payloads).
Video Type	Video.

Table C-788 Field Descriptions for the Ports Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • Autoprovision—The system automatically provisions the reach from the pluggable port module (PPM) reach value on the hardware. • I1—Intermediate reach • S1—Short reach, up to a 15-km distance • S2—Short reach, up to a 40-km distance • L1—Long reach, up to a 40-km distance • L2—Long reach, up to a 80-km distance • L3—Long reach, up to a 80-km distance • CWDM— CWDM reach • MM—Multimode reach • ULH—Ultra-long haul (ULH) • DWDM—DWDM reach
Wavelength	Allows you to provision the wavelength frequency: • First tunable wavelength • Further wavelengths: – 850 nm through 1561.83 nm – 100-GHz ITU spacing – CWDM spacing

C.2.45.7.2 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-789 Field Descriptions for the SONET Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance

Table C-789 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Type	Defines the port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
SyncMsgIn	Sets the EnableSync card parameter. Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • Autoprovision—The system automatically provisions the reach from the pluggable port module (PPM) reach value on the hardware. • I1—Intermediate reach • S1—Short reach, up to 15-km distance • S2—Short reach, up to 40-km distance • L1—Long reach, up to 40-km distance • L2—Long reach, up to 80-km distance • L3—Long reach, up to 80-km distance • CWDM—CWDM reach • MM—Multimode reach • ULH—Ultra-long haul (ULH) • DWDM—DWDM reach
Wavelength	Allows you to provision the wavelength frequency. • First tunable wavelength • Further wavelengths: – 850 nm through 1561.83 nm – 100-GHz ITU spacing – CWDM spacing

C.2.45.7.3 Auto Ports Tab

The Auto Ports tab allows you to enables autosensing for AR_MXP or AR_XP cards.

Table C-790 Field Descriptions for the Auto Ports Tab

Field	Description
Port No.	The port number.
Auto Sensing	If checked, enables autosensing.
Actual Port Type	Displays the autosensing signal type.

C.2.45.7.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change 15-minute near-end section thresholds for the AR_MXP or AR_XP cards.

Table C-791 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change 1-day near-end section thresholds for the AR_MXP or AR_XP cards.

Table C-792 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.6 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change 15-minute near- and far-end line thresholds for the AR_MXP or AR_XP cards.

Table C-793 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.7 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change 1-day near- and far-end line thresholds for the AR_MXP or AR_XP cards.

Table C-794 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.

Table C-794 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.8 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for AR_MXP or AR_XP cards.

Table C-795 Field Descriptions for the Section Trace Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. See 7.2.21 Modifying Traces, page 7-177 for more information.
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Default button	Resets the value of the port parameters to the default value.

C.2.45.7.9 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the AR_MXP or AR_XP cards.

Table C-796 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Add button	Click **Add** to add the RMON thresholds.
Remove button	Click **Remove** button to delete the threshold. It is possible to delete more than one RMON threshold.
Index No.	Displays the selected interface number. Click the Index No. field to sort the data.
Slot	Displays the selected card.
Port	Displays the port on the selected card.

Table C-796 Field Descriptions for the RMON Thresholds Properties Pane (continued)

Field	Description
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the POS ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.45.7.10 Ethernet Line Tab

The Ethernet Line tab allows you to view Ethernet line information.

Table C-797 Field Descriptions for the Ethernet Line Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.
ProvidesSync	Sets the ProvidesSync card parameter. If checked, the card is provisioned as a network element (NE) timing reference.
SyncMsgIn	Sets the EnableSync card parameter. Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.
Termination Mode	Sets the mode of operation. (This option is available only for SONET/SDH payloads).
Video Type	Video.
Send DoNotUse	When checked, sends a DUS message on the S1 byte.
MTU	Sets the maximum size of the Ethernet frames accepted by the port. The port must be in OOS/locked state.
Speed	Sets the expected speed of the ports.
Duplex	(Display only) Displays expected duplex capability of ports.
Auto negotiation	If checked, enables autonegotiation on the same port.
ESMC Enable	Enables the timing to be taken from the Ethernet port.

C.2.45.7.11 Ports Tab

The Ports tab allows you to view and change the port settings for SDH platform.

Table C-798 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.
Administration State	**Note** The port administrative state. It can be: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked, automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled, automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled, disabled. • locked, maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled, maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Termination Mode	Sets the mode of operation. (This option is not applicable on 10x10G_LC, 100G_LC_C, or CFP_LC cards).
Video Type	Video. (This option is not applicable on 10x10G_LC, 100G_LC_C, or CFP_LC cards).
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. **Note** The reach distance options depend on the card selected.
Wavelength	Allows you to provision the wavelength: • First tunable wavelength: the system automatically provision the first wavelength supported by the PPM • 850nm, 1310nm and 1550nm wavelengths • DWDM wavelengths: ranging from 1528.77nm to 1566.72nm at 50GHz ITU spacing • CWDM wavelengths: 1470nm, 1490nm, 1510nm, 1530nm, 1570nm, and 1590nm

C.2.45.7.12 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the card.

Table C-799 Field Descriptions for the SDH Line Tab

Field	Description
Port No.	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.

Table C-799 Field Descriptions for the SDH Line Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.45.7.13 Auto Ports Tab

The Auto Ports tab allows you to enable autosensing for AR_MXP or AR_XP cards.

Table C-800 Field Descriptions for the Auto Ports Tab

Field	Description
Port No.	The port number.
Auto Sensing	If checked, enables autosensing.
Actual Port Type	Displays the autosensing signal type.

C.2.45.7.14 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute regeneration section threshold for the card.

Table C-801 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.15 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day regeneration section threshold for the card.

Table C-802 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.16 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end multiplex section threshold for the card.

Table C-803 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.

Table C-803 Field Descriptions for the MS Thresh 15 Min Tab (continued)

Field	Description
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.17 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day near- and far-end multiplex section threshold for the card.

Table C-804 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.7.18 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the AR_MXP or AR_XP cards.

Table C-805 Field Descriptions for the Section Trace Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. See 7.2.21 Modifying Traces, page 7-177 for more information.
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Default button	Resets the value of the port parameters to the default value.

C.2.45.7.19 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the AR_MXP or AR_XP cards.

Table C-806 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Add button	Click **Add** to add the RMON thresholds.
Remove button	Click **Remove** button to delete the threshold. It is possible to delete more than one RMON threshold.
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, the falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the POS ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.45.7.20 Ethernet Line Tab

The Ethernet Line tab allows you to view Ethernet line information.

Table C-807 Field Descriptions for the Ethernet Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
ProvidesSync	Sets the ProvidesSync card parameter. If checked, the card is provisioned as a network element (NE) timing reference.
SyncMsgIn	Sets the EnableSync card parameter. Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.

Table C-807 Field Descriptions for the Ethernet Line Tab (continued)

Field	Description
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.
Termination Mode	Sets the mode of operation. (This option is available only for SONET/SDH payloads).
Video Type	Video.
Send DoNotUse	When checked, sends a DUS message on the S1 byte.
MTU	Sets the maximum size of the Ethernet frames accepted by the port. The port must be in OOS/locked state.
Speed	Sets the expected speed of the ports.
Duplex	(Display only) Displays expected duplex capability of ports.
Auto negotiation	If checked, enables autonegotiation on the same port.
ESMC Enable	Enables the timing to be taken from the Ethernet port.

C.2.45.8 Loopback

The Loopback Properties pane allows you to view and update AR_MXP and AR_XP loopback information.

Table C-808 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number (1 to 10).
Port Name	Allows you to add a name for the optical port.
Admin State	Allows you to select the administration state of the port: In Service (IS), Out of Service (OOS), or Out of Service-Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State, Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.45.9 Optical Thresholds

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane displays the following tabs:

- C.2.45.9.1 Alarm Thresholds Tab, page C-613
- C.2.45.9.2 TCA 15 Min Tab, page C-614
- C.2.45.9.3 TCA 1 Day Tab, page C-614

C.2.45.9.1 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select thresholds for alarm generation.

Table C-809 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Port No.	The port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.9.2 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-810 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port No.	The port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.9.3 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-811 Field Descriptions for the TCA 1 Day Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Port No.	The port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.

Table C-811 Field Descriptions for the TCA 1 Day Tab (continued)

Field	Description
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.10 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for AR_MXP and AR_XP cards. The Properties pane displays the following tabs:

- C.2.45.10.1 OTN Line Tab, page C-615
- C.2.45.10.2 G.709 Thresh 15 Min Tab, page C-616
- C.2.45.10.3 G.709 Thresh 1 Day Tab, page C-617
- C.2.45.10.4 FEC Thresh 15 Min Tab, page C-618
- C.2.45.10.5 FEC Thresh 1 Day Tab, page C-618
- C.2.45.10.6 Trail Trace Identifier Tab, page C-619
- C.2.45.10.7 Proactive Protection Regen Tab, page C-619

C.2.45.10.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-812 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	The port number.
G.709 OTN	Displays the G.709 OTN feature.
FEC	Displays the forward error correction.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.
Asynch/Synch Mapping	The card can perform multiplexing per ITU-T G.709. The ODUK (client SONET/SDH payload) can be mapped to the optical channel (OTUK) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
OTU Mapping	The client payload mapping to the trunk. **Note** ODU1E and ODU2E mapping is supported only if the card mode is TXP_MR and client payload is 10GE.
ProvidesSync	If checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Allows you to set the EnableSync card parameter. Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.

Table C-812 Field Descriptions for the OTN Line Tab (continued)

Field	Description
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.
SendDoNotUse	If checked, sends a DUS message on the S1 byte.
ODU Transparency	The ODU overhead byte configuration. • If Transponder is selected as the card configuration, this parameter defaults to Cisco Extended Use. • Choose Transparent Standard Use or Cisco Extended Use if Standard Regen or Enhanced FEC is selected as the card configuration. **Note** For Mixed card configuration, the ODU Transparency depends on the port mode you selected.

C.2.45.10.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-813 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.

Table C-813 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.10.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-814 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	

Table C-814 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.10.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-815 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port No.	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.10.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-816 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port No.	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in one-day intervals.
Uncorrectable Words	Displays the uncorrectable words in one-day intervals.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.45.10.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-817 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. For more information, see 7.2.21 Modifying Traces, page 7-177.
Port No.	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.45.10.7 Proactive Protection Regen Tab

The Proactive Protection Regen tab allows you to provision proactive protection regen for the card.

Note Proactive protection regen is supported only when the AR_MXP or AR_XP card is in high-rate REGEN card mode.

Table C-818 Field Descriptions for the Proactive Protection Regen Tab

Field	Description
Port No.	Displays port number information.
Trigger Threshold	Sets the maximum BER threshold to trigger proactive protection.
Trigger Window (ms)	Sets the duration for which BER is monitored before triggering the proactive protection. The trigger window value must be a multiple of: • 10 ms for trigger thresholds between 1E-3 and 6E-6 • 100 ms for trigger threshold between 5E-6 to 1E-7 Trigger window must be less than or equal to 10000 ms.
Revert Threshold	Sets the revert threshold value of BER. **Note** Revert Threshold settings must be less than the Trigger Threshold values.

Table C-818 Field Descriptions for the Proactive Protection Regen Tab (continued)

Field	Description
Revert Window (ms)	Sets the duration for which BER is monitored for settings that are less than the revert threshold value before which proactive protection provided to the router is removed. Revert Window value must be at least 2000ms and a multiple of: • 10ms for a revert threshold of 1E-4 to 6E-7 • 100ms for a revert threshold of 5E-7 to 5E-8. The revert window must be less than or equal to 10000ms.
Enable Proactive Protection	Allows you to enable or disable proactive protection. Possible values are: • Enable • Disable The enable proactive protection is disabled by default.

C.2.45.11 PPM

The PPM Properties pane allows you to view and provision the ports inside the PPM.

Table C-819 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
PPM No.	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service (only when PPM is pre-provisioned) • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the port number for the PPM in the Pluggable Port Modules area.
Rate	Displays the port rate for the PPM in the Pluggable Port Modules area.

C.2.45.11.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.45.12 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-820 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.

C.2.46 Slot Properties—10x10G_LC, 100G_LC_C, and CFP_LC

The 10x10G_LC, 100G_LC_C, and CFP_LC cards are supported on ONS 15454 M2, and ONS 15454 M6 platforms. The slot properties pane displays information about the Cisco ONS 15454 M2 or ONS 15454 M6 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties. The single-slot 10x10G_LC and 100G_LC_C cards and the double-slot CFP_LC cards are connected to the backplane.

The 100G-LC-C, 10x10G-LC, and CFP-LC cards support the following key features:

- Operating Modes—The 100G-LC-C, 10x10G-LC, and CFP-LC cards can be configured into multiple operating modes. The cards can be equipped with pluggables for client and trunk options, and offer a large variety of configurations. When you configure the 100G-LC-C, 10x10G-LC, or CFP-LC card into multiple operational modes, make sure that the following tasks are completed:
  - The card must be preprovisioned and the modes must be configured. None of the modes are provisioned on the card by default. All operating modes are created on the card level. These are card-specific provisioning, which decides the behavior of a particular card.
  - Depending on the card mode selected, the supported payload for that particular card mode must be provisioned on the PPMs.
  - The payloads can be provisioned after configuring the operational mode on the card.

Each operating mode can be configured using the specific set of cards and client payloads. Table C-821 describes how each mode can be configured, the supported payloads, and the valid port pair for a specific operating mode.

Table C-821 Operating Modes and Supported Payloads for 100G-LC-C, 10x10G-LC, and CFP-LC Cards

Card (provisioning executed on this card)	Operational Mode	Peer Card (connected through backplane)	Supported Client Payloads	Valid Card Slot	Valid Peer Card Slot
100G-LC-C	TXP-100G (Standalone 100GE Transponder)	—	100GE, OTU4	M2—Slots 2 and 3 M6—Slots 2 to 7	—
	RGN-100G (100G Regenerator)	100G-LC-C card	— Regeneration of any 100 G configuration	M2—Slot-2 M2-—Slot-3 M6—Slot-2 M6—Slot-3 M6—Slot-4 M6—Slot-5 M6—Slot-6 M6—Slot-7	M2—Slot-3 M2—Slot-2 M6—Slot-3 M6—Slot-2 M6—Slot-5 M6—Slot-4 M6—Slot-7 M6—Slot-6
10x10G-LC	MXP-10x10G (10x10G Muxponder)	100G-LC-C card	OC192/STM-64, 10GE-LAN Phy, 10GE-WAN Phy (using OC192), OTU2, OTU2e, 8G FC, 10G FC, FICON	M2—Slot-2 M2-—Slot-3 M6—Slot-2 M6—Slot-3 M6—Slot-4 M6—Slot-5 M6—Slot-6 M6—Slot-7	M2—Slot-3 M2—Slot-2 M6—Slot-3 M6—Slot-2 M6—Slot-5 M6—Slot-4 M6—Slot-7 M6—Slot-6
	RGN-10G (5x10G Regenerator)	—	10GE-LAN Phy, OTU2, OC192/STM64, 10GE-WAN Phy, OTU2, OTU2e, 8G FC/FICON, 10G FC/FICON	M2—Slots 2 and 3 M6—Slots 2 to 7	—
	TXP-10G (5x10G Transponder)	—	10GE-LAN Phy, OTU2e, OC192/STM64, 10GE-WAN Phy, OTU2, OTU2e, 8G FC/FICON, 10G FC/FICON	M2—Slots 2 and 3 M6—Slots 2 to 7	—
	LOW-LATENCY	—	TEN_GE, FC10G	—	—
	FANOUT	—	TEN_GE, OTU2	—	—

Table C-821 Operating Modes and Supported Payloads for 100G-LC-C, 10x10G-LC, and CFP-LC Cards

Card (provisioning executed on this card)	Operational Mode	Peer Card (connected through backplane)	Supported Client Payloads	Valid Card Slot	Valid Peer Card Slot
CFP-LC	2x40G Muxponder	100G-LC-C card	OTU3/40GE-LAN Phy	M6—Slot-3 M6—Slot-5	M6—Slot 2 or 5 M6—Slot 4 or 7
	CFP-TXP (100G Transponder)—One port	100G-LC-C card	OTU4, 100GE	M6—Slot-3 M6—Slot-5	M6—Slot 2 or 5 M6—Slot 4 or 7
	CFP-TXP (100G Transponder)—Two ports	Two 100G-LC-C cards	OTU4, 100GE	M6—Slot-3 M6—Slot-5	M6—Slot 2 or 5 M6—Slot 4 or 7

Note 100G_LC_C card refers to the 15454-M 100G-LC-C card, 10x10G-LC refers to the 15454-M-10x10G LC card, and CFP-LC refers to the 15454-M-CFP-LC card.

- GCCs—The 100G_LC_C, 10x10G_LC, and CFP_LC cards support the provisioning of GCC channel on both client and trunk: OTU2, OTU3 and OTU4 ports. You can create a maximum of 1 GCC channel for 100G and 10 GCC channels for 10X10G card on the Cisco ONS 15454 M2 or Cisco ONS 15454 M6 shelf. The high-speed GCC enables you to create the GCC when both the NE and FE line cards are on the Cisco ONS 15454 M2 or Cisco ONS 15454 M6 shelf. You can select the legacy GCC on the Cisco ONS 15454 shelf on one side and the Cisco ONS 15454, Cisco ONS 15454 M2, or Cisco ONS 15454 M6 shelf on the other side. The 100G-LC-C, 10x10G-LC, and CFP-LC cards work with the OTN devices defined in ITU-T G.709. The Digital Wrapper function (ITU-T G.709-compliant) formats the DWDM wavelength so that it can be used to set up GCCs for data communications, enable FEC, or facilitate performance monitoring. The GCC rate for the card is as follows:
  - 10x10G_LC—192 k and 1200 k
  - 100G_LC_C—192 k (virtual port only), 400 k, and 1200 k
  - CFP_LC—192 k

  For more information on GCC, see 6.5.9 Create, Edit, and Delete GCC.
- Y-cable protection—Y-cable protection between the same card type is supported only on ports with the same port number and signal rate. The Y-cable protection scheme is aimed to protect the client signal. Two TXP (or MXP) cards on a single DWDM shelf are required to implement this type of protection mechanism. The two client ports of the two TXP (or MXP) cards are configured in Y-cable Protection Group.

  The protection mechanism is based on the following:
  - TXP_10G—10x10G_LC only for 10GE and 8GFC payloads in standalone configuration.
  - MXP_10x10G—10x10G_LC and 100G_LC_C cards only for 10GE and 8GFC payloads in a peer configuration.
  - CFP_MXP—CFP_LC and 100G_LC_C cards only for 40GE payload in a peer configuration.
  - CFP_TXP—CFP_LC and 100G_LC_C only for 100GE payload in a peer configuration.

  For more information on Protection, see B.9.1.6 Protection.

- Signal Types—The 100G_LC_C, 10x10G_LC, and CFP_LC cards supports the following client signal types:

  For 100G_LC_C card:

  - 100 Gigabit Ethernet and OTU4
  - OTU4 from BP OTL4.10 (interconnect with 100G-LC-C and CFP client)
  - 100 Gigabit Ethernet from BP CAUI (interconnect with CFP client)
  - 3 x OTU3e(255/227) from BP OTL3.4 (interconnect with 10 x10G client)
  - 2 x OTU3 from BP OTL3.4 (interconnect with CFP client)
  - 2 x 40 Gigabit Ethernet from BP XLAUI (interconnect with CFP client)

  For 10x10G_LC card:

  - OC-192/STM-64 (9.95328 Gbps)
  - 10 Gigabit Ethernet WAN PHY (9.95328 Gbps)
  - 10 Gigabit Ethernet LAN PHY (10.3125 Gbps)
  - 10 G FC (10.518 Gbps)
  - 8 G FC
  - OTU-2
  - G.709 overclocked to transport 10 Gigabit Ethernet as defined by ITU-T G. Sup43 Clause 7.2 (11.0491 Gbps)

  For CFP_LC card:

  - 100 Gigabit Ethernet
  - 40 Gigabit Ethernet
  - OTU-3
  - OTU-4

The following figure shows the 10x10G_LC card faceplate.

The following figure shows the 100G_LC_C card faceplate.

The following figure shows the CFP_LC card faceplate.

For the 10x10G_LC, 100G_LC_C, and CFP_LC module, the slot properties pane displays the following properties: Module View, Identification, Card, Alarm Behavior, Auto Laser Shutdown, Backplane Loopback, Info, Line, Loopback, Optical Thresholds, OTN, and PPM.

C.2.46.1 Module View

The Module View displays a graphic of the 10x10G_LC, 100G_LC_C, and CFP_LC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its ports. Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.46.2 Identification

The Identification Properties pane allows you to view and update 10x10G_LC, 100G_LC_C, and CFP_LC identification information.

Table C-822 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administrative State	The card administrative state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State, Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.46.3 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update alarm profiles assigned to ports and PPM on 10x10G_LC, 100G_LC_C, and CFP_LC.

Table C-823 Field Descriptions for the Alarm Behavior Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Force Profile	When clicked, forces all ports and PPM to the alarm profile in the selected row of the table.
Port/PPM Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.

C.2.46.4 Auto Laser Shutdown Tab

The Auto Laser Shutdown tab allows you to view and update optical card auto laser shutdown (ALS) parameters for 10x10G_LC, 100G_LC_C, and CFP_LC.

Table C-824 Field Descriptions for the Auto Laser Shutdown Tab

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.46.5 Backplane Loopback Tab

The Backplane Loopback tab allows you to view and configure the loopback on the backplane connections on 10x10G_LC, 100G_LC_C, and CFP_LC.

Table C-825 Field Descriptions for the Backplane Loopback Tab

Field	Description
Admin State	The card administrative state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance • IS—In Service
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State, Status_Attribute*.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.46.6 Card

The Card mode tab allows you to view the operating modes that are provisioned.

Table C-826 Field Descriptions for the Card Mode Tab

Field	Description
Card Mode	Displays the operating mode that has been provisioned on the card.
Client Ports	Displays the client ports that have been provisioned for the selected card configuration.
Trunk Ports	Displays the trunk ports that have been provisioned for the selected card configuration.
Peer Card	Displays the shelf and slot number of the peer card that is set up for a specific card configuration. If the peer card is not set up, “None” or “N/A” is displayed for the operating modes that requires no peer card for configuration.
Create	Displays the Operating Mode Configuration creation dialog box to configure a new card mode. Click the **Create** button to create a new operating configuration mode. For more details on creating configurations, see 6.5.7 Creating Configurations.
Delete	Click the **Delete** button to delete the selected card configuration. **Note** The Delete button is enabled only when at least one operating mode is configured.

Table C-826 Field Descriptions for the Card Mode Tab (continued)

Field	Description
Add Peer Card	Allows addition of another 100_LC_C card to the CFP_TXP card configuration with only one peer card configured. The Add Peer button will be enabled only if the CFP card is configured with CFP-TXP card mode with one peer card. For more information on adding peer cards, see 6.5.8 Adding a Peer Card. **Note** This field is unavailable when CFP_LC is configured in Muxponder mode.
Remove Peer Card	Allows deletion of an existing 100_LC_C peer card from a CFP_TXP when it is configured with two 100G_LC_C peer cards. The Remove Peer button will be enabled only if the CFP card is configured with CFP-TXP card mode with two peer cards. Click the **Remove Peer** button to open the dialog showing the available peer cards and the mapped port with corresponding radio buttons. Choose a peer card to remove. **Note** This field is unavailable when CFP_LC is configured in Muxponder mode.

C.2.46.7 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-827 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.46.8 Line

The Line Properties pane allows you to configure line information. If the card is installed on an ONS 15454 SONET NE, the Line Properties pane contains the following tabs:

- C.2.46.8.1 Ports Tab, page C-629
- C.2.46.8.2 SONET Line Tab, page C-630
- C.2.46.8.3 Section Thresh 15 Min Tab, page C-631
- C.2.46.8.4 Section Thresh 1 Day Tab, page C-631
- C.2.46.8.5 Line Thresh 15 Min Tab, page C-632
- C.2.46.8.6 Line Thresh 1 Day Tab, page C-632
- C.2.46.8.7 Section Trace Tab, page C-633
- C.2.46.8.8 Ethernet Tab, page C-633
- C.2.46.8.9 RMON Thresholds, page C-635

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.46.8.10 Ports Tab, page C-636
- C.2.46.8.11 SDH Line Tab, page C-637

- C.2.46.8.12 RS Thresh 15 Min Tab, page C-638
- C.2.46.8.13 RS Thresh 1 Day Tab, page C-639
- C.2.46.8.14 MS Thresh 15 Min Tab, page C-639
- C.2.46.8.15 MS Thresh 1 Day Tab, page C-639
- C.2.46.8.16 Section Trace Tab, page C-640
- C.2.46.8.17 Ethernet Tab, page C-640
- C.2.46.8.18 RMON Thresholds, page C-642

Note The Section Trace, SONET Line, Section Thresholds, Line Thresholds, SDH Line, RS Thresholds, and MS Thresholds tabs are displayed for 10x10G_LC cards only when you create an OC192 payload.

C.2.46.8.1 Ports Tab

The ports tab allows you to view and change the port settings.

Table C-828 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.
Administration State	**Note** The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Video Type	Video. (This option is not applicable on 10x10G_LC, 100G_LC_C, or CFP_LC cards).
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. **Note** The reach distance options depend on the card and pluggables selected.

Table C-828 Field Descriptions for the Ports Tab (continued)

Field	Description
Wavelength	Allows you to provision the wavelength: • First tunable wavelength: the system automatically provision the first wavelength supported by the PPM • 850nm, 1310nm and 1550nm wavelengths • DWDM wavelengths: ranging from 1528.77nm to 1566.72nm at 50GHz ITU spacing • CWDM wavelengths: 1470nm, 1490nm, 1510nm, 1530nm, 1570nm, and 1590nm
Overclock	Allows you to enable or disable overclock mode. Enable overclock mode to set the data rate to FC 10G for PPM.
Mapping Mode	Sets the mapping mode.

C.2.46.8.2 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the 10x10G_LC card.

Table C-829 Field Descriptions for the SONET Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Type	Defines the port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
SyncMsgIn	Sets the EnableSync card parameter. Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.

Table C-829 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR-MM • SR1 • IR2 • LR2 • DWDM—DWDM reach
Wavelength	Allows you to provision the wavelengths: • First tunable wavelength: the system automatically provision the first wavelength supported by the PPM • 850nm, 1310nm, and 1530nm wavelengths • DWDM wavelengths: ranging from 1528.77nm to 1566.72nm at 50GHz ITU spacing • CWDM wavelengths: 1470nm, 1490nm, 1510nm, 1530nm, 1570nm, and 1590nm.
Send DoNotUse	When checked, sends a DUS message on the S1 byte.

C.2.46.8.3 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change 15-minute near-end section thresholds of the 10x10G_LC card.

Table C-830 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.4 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change 1-day near-end section thresholds of the 10x10G_LC card.

Table C-831 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change 15-minute near- and far-end line thresholds of the 10x10G_LC card.

Table C-832 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.6 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change 1-day near- and far-end line thresholds of the 10x10G_LC card.

Table C-833 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.7 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for 10x10G_LC card.

Table C-834 Field Descriptions for the Section Trace Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. See 7.2.21 Modifying Traces, page 7-177 for more information.
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Default button	Resets the value of the port parameters to the default value.

C.2.46.8.8 Ethernet Tab

The Ethernet tab allows you to view the Ethernet line information.

Note The Ethernet tab is displayed depending on the following criteria:

- For 10x10G_LC card—When the payload is TEN_GE.
- For 100G_LC_C card—When the payload is ONEHUNDRED_GE provisioned on 100G_LC_C in standalone operating mode or FORTY_GE/ONEHUNDRED_GE provisioned on the CFP_LC peer card.

Table C-835 Field Descriptions for the Ethernet Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
Video Type	Video. (This option is not applicable on 10x10G_LC, 100G_LC_C, or CFP_LC cards).
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • TEN_GE payload – TEN_GE SR – TEN_GE LR – TEN_GE ER – TEN_GE ZR – DWDM • FORTY_GE payload – 40GBASE-FR – 40GBASE-LR4 • ONEHUNDRED_GE payload – 100GBASE_SR10

Table C-835 Field Descriptions for the Ethernet Tab (continued)

Field	Description
Wavelength	Allows you to provision the wavelength: • First tunable wavelength: the system automatically provision the first wavelength supported by the PPM • 850nm, 1310nm, and 1530nm wavelengths • DWDM wavelengths: ranging from 1528.77nm to 1566.72nm at 50GHz ITU spacing • CWDM wavelengths: 1470nm, 1490nm, 1510nm, 1530nm, 1570nm, and 1590nm.
Termination Mode	Sets the mode of operation. (This option is not applicable on 10x10G_LC, 100G_LC_C, or CFP_LC cards).
MTU	Maximum transmission unit (MTU). The largest acceptable packet size configured for that port. The default value is 1548.
Incoming MAC Address	Allows you to edit the incoming MAC address.
Mapping	Displays the client trunk ports mapping. Available options are: • GFB • CBR • Transparent

C.2.46.8.9 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the 10x10G_LC and 100G_LC_C cards.

Note The RMON thresholds tab is displayed depending on the following criteria:

- For 10x10G_LC card when a data payload is provisioned (TEN_GE, 8GFC, 10GFC).
- For 100G_LC_C card when the payload is ONEHUNDRED_GE provisioned on 100G_LC_C in standalone operating mode or FORTY_GE/ONEHUNDRED_GE provisioned on the CFP_LC peer card.

Table C-836 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Add button	Click **Add** to add the RMON thresholds.
Remove button	Click **Remove** button to delete the threshold. It is possible to delete more than one RMON threshold.
Index No.	The number which is automatically assigned by the system to the RMON Threshold. Click the Index No. field to sort the data.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.

Table C-836 Field Descriptions for the RMON Thresholds Properties Pane (continued)

Field	Description
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. The falling threshold must be lower than the rising threshold.
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.46.8.10 Ports Tab

The ports tab allows you to view and change the port settings.

Table C-837 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.
Administration State	**Note** The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Video Type	Video.

Table C-837 Field Descriptions for the Ports Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • Autoprovision—The system automatically provisions the reach from the pluggable port module (PPM) reach value on the hardware. • I1—Intermediate reach • S1—Short reach, up to a 15-km distance • S2—Short reach, up to a 40-km distance • L1—Long reach, up to a 40-km distance • L2—Long reach, up to a 80-km distance • L3—Long reach, up to a 80-km distance • CWDM— CWDM reach • MM—Multimode reach • ULH—Ultra-long haul (ULH) • DWDM—DWDM reach
Wavelength	Allows you to provision the wavelength frequency: • First tunable wavelength • Further wavelengths: – 850 nm through 1561.83 nm – 100-GHz ITU spacing – CWDM spacing
Overclock	Allows you to enable or disable overclock mode. Enable overclock mode to set the data rate to FC 10G for PPM.
Mapping Mode	Sets the mapping mode.

C.2.46.8.11 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the 10x10G_LC card.

Table C-838 Field Descriptions for the SDH Line Tab

Field	Description
Port No.	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-838 Field Descriptions for the SDH Line Tab (continued)

Field	Description
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR-MM (short reach, up to 2 km distance) • I1 • S2 • L2 • DWDM
Wavelength	Allows you to provision the wavelength frequency.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.

C.2.46.8.12 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute regeneration section threshold for the 10x10G_LC card.

Table C-839 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.13 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day regeneration section threshold for the 10x10G_LC card.

Table C-840 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.14 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end multiplex section threshold for the 10x10G_LC card.

Table C-841 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.15 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day near- and far-end multiplex section threshold for the 10x10G_LC card.

Table C-842 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.

Table C-842 Field Descriptions for the MS Thresh 1 Day Tab (continued)

Field	Description
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.8.16 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the 10x10G_LC card.

Table C-843 Field Descriptions for the Section Trace Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. See 7.2.21 Modifying Traces, page 7-177 for more information.
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Default button	Resets the value of the port parameters to the default value.

C.2.46.8.17 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information.

Note The Ethernet tab is displayed on the following criteria:

- For 10x10G_LC card when the payload is TEN_GE.
- For 100G_LC_C card when the payload is ONEHUNDRED_GE provisioned on 100G_LC_C in standalone operating mode or FORTY_GE/ONEHUNDRED_GE provisioned on the CFP_LC peer card.

Table C-844 Field Descriptions for the Ethernet Tab

Field	Description
Port Number	Displays the PPM and port number.
Port Name	Displays the name of the port.

Table C-844 Field Descriptions for the Ethernet Tab (continued)

Field	Description
Administration State	The port administration state. It can be: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked, automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled, automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled, disabled. • locked, maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled, maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
Video Type	Video.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** Note The reach distance options that appear in the drop-down list depend on the card selected. • EW • LW • SW • LRM • ER • LR • SR (short reach, up to 2 km distance) • ZR • IR 2 • LR 2 • DWDM • CWDM40km
Wavelength	Allows you to provision the wavelength frequency.
Termination Mode	Sets the mode of operation. (This option is available only for SONET/SDH payloads).
MTU	Maximum transmission unit (MTU). The largest acceptable packet size configured for that port. The default value is 1548.
Incoming MAC Address	Allows you to edit the incoming MAC address.
Mapping	Displays the client trunk ports mapping.

C.2.46.8.18 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the 10x10G_LC and 100G_LC_C cards.

Note The RMON Thresholds tab is displayed depending on the following criteria:

- For 10x10G_LC card when a data payload is provisioned (TEN_GE, 8GFC, 10GFC).
- For 100G_LC_C card when the payload is ONEHUNDRED_GE provisioned on 100G_LC_C in standalone operating mode or FORTY_GE/ONEHUNDRED_GE provisioned on the CFP_LC peer card.

Table C-845 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Add button	Click **Add** to add the RMON thresholds.
Remove button	Click **Remove** button to delete the threshold. It is possible to delete more than one RMON threshold.
Index No.	The number which is automatically assigned by the system to the RMON Threshold.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. The falling threshold must be lower than the rising threshold.
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.46.9 Loopback

The Loopback Properties pane allows you to view and update 10x10G_LC and 100G_LC_C loopback information.

Table C-846 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number (1 to 10).
Port Name	Displays the name of the port.
Admin State	Allows you to select the administration state of the port: In Service (IS), Out of Service (OOS), or Out of Service-Maintenance (OOS_MT), In Service (IS), and Automatic In Service (AINS).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State, Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.46.10 Optical Thresholds

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane displays the following tabs:

- C.2.46.10.1 Alarm Thresholds Tab, page C-643
- C.2.46.10.2 TCA 15 Min Tab, page C-643
- C.2.46.10.3 TCA 1 Day Tab, page C-644

C.2.46.10.1 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select thresholds for alarm generation.

Table C-847 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
Port No.	The port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold.
Tx Power Low	Displays the lower transmit power threshold.
CD High	Displays the Chromatic Dispersion upper threshold. **Note** This is supported only on 100G_LC card trunk port.
CD Low	Displays the Chromatic Dispersion lower threshold. **Note** This is supported only on 100G_LC card trunk port.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.10.2 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-848 Field Descriptions for the TCA 15 Min Tab

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
Port No.	The port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
OSNR Power High	Displays the upper Optical Signal To Noise Ratio threshold. **Note** This is supported only on 100G_LC card trunk port.
OSNR Power Low	Displays the lower Optical Signal To Noise Ratio threshold. **Note** This is supported only on 100G_LC card trunk port.
PMD High	Displays the upper Polarization Mode Dispersion threshold. **Note** This is supported only on 100G_LC card trunk port.
PMD Low	Displays the lower Polarization Mode Dispersion threshold. **Note** This is supported only on 100G_LC card trunk port.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.10.3 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-849 Field Descriptions for the TCA 1 Day Tab

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
Port No.	The port number.
Laser Bias High	Displays the upper laser bias threshold.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
OSNR Power High	Displays the upper Optical Signal To Noise Ratio threshold. **Note** This is supported only on 100G_LC card trunk port.

Table C-849 Field Descriptions for the TCA 1 Day Tab (continued)

Field	Description
OSNR Power Low	Displays the lower Optical Signal To Noise Ratio threshold. **Note** This is supported only on 100G_LC card trunk port.
PMD High	Displays the upper Polarization Mode Dispersion threshold. **Note** This is supported only on 100G_LC card trunk port.
PMD Low	Displays the lower Polarization Mode Dispersion threshold. **Note** This is supported only on 100G_LC card trunk port.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.11 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for 10x10G_LC and 100G_LC_C. The Properties pane displays the following tabs:

- C.2.46.11.1 OTN Line Tab, page C-645
- C.2.46.11.2 G.709 Thresh 15 Min Tab, page C-646
- C.2.46.11.3 G.709 Thresh 1 Day Tab, page C-647
- C.2.46.11.4 FEC Thresh 15 Min Tab, page C-648
- C.2.46.11.5 FEC Thresh 1 Day Tab, page C-648
- C.2.46.11.6 Trail Trace Identifier Tab, page C-648

C.2.46.11.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-850 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	The port number.
G.709 OTN	Displays the G.709 OTN feature.
FEC	Displays the forward error correction.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.
ProvidesSync	If checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Allows you to set EnableSync card parameter. Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.

C.2.46.11.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-851 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
SM (OTUK) Near End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.

Table C-851 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.11.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-852 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
SM (OTUK) Near End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	

Table C-852 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.11.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-853 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Port No.	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.11.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-854 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Port No.	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in one-day intervals.
Uncorrectable Words	Displays the uncorrectable words in one-day intervals.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.46.11.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-855 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Filter button	Click the Filter button to filter the data displayed in the table.
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. For more information, see 7.2.21 Modifying Traces, page 7-177.
Port No.	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.46.11.7 Proactive Protection Regen Tab

The Proactive Protection Regen tab allows you to provision proactive protection regen for the card.

Note Proactive protection regen is supported only when the 100GC_LC card is in high-rate REGEN or TXP card mode.

Table C-856 Field Descriptions for the Proactive Protection Regen Tab

Field	Description
Port No.	Displays port number information.
Trigger Threshold	Sets the maximum BER threshold to trigger proactive protection.
Trigger Window (ms)	Sets the duration for which BER is monitored before triggering the proactive protection. The trigger window value must be a multiple of: • 10 ms for trigger thresholds between 1E-3 and 6E-6 • 100 ms for trigger threshold between 5E-6 to 1E-7 Trigger window must be less than or equal to 10000 ms.
Revert Threshold	Sets the revert threshold value of BER. **Note** Revert Threshold settings must be less than the Trigger Threshold values.

Table C-856 Field Descriptions for the Proactive Protection Regen Tab (continued)

Field	Description
Revert Window (ms)	Sets the duration for which BER is monitored for settings that are less than the revert threshold value before which proactive protection provided to the router is removed. Revert Window value must be at least 2000ms and a multiple of: • 10ms for a revert threshold of 1E-4 to 6E-7 • 100ms for a revert threshold of 5E-7 to 5E-8. The revert window must be less than or equal to 10000ms.
Enable Proactive Protection	Allows you to enable or disable proactive protection.

C.2.46.12 PPM

The PPM Properties pane allows you to view and provision the ports inside the PPM for the 100G_LC_C card.

Table C-857 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
PPM No.	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual pluggable unit that is installed on the card.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service (only when PPM is pre-provisioned) • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the port number for the PPM in the Pluggable Port Modules area.
Rate	Displays the port rate for the PPM in the Pluggable Port Modules area.

C.2.46.12.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box for more information.

Note To create sublanes for the CFP_LC card, see Table C-53.

C.3 Electrical Cards

This section describes the following electrical cards supported within Prime Optical:

- C.3.1 Slot Properties—DS-1-14, page C-651
- C.3.2 Slot Properties—DS1-28/DS3-EC1-3, page C-658
- C.3.3 Slot Properties—DS1-84/DS3-EC1-3, page C-683
- C.3.4 Slot Properties—DS-1N, page C-707
- C.3.5 Slot Properties—DS-3-12, page C-711
- C.3.6 Slot Properties—DS-3E, page C-715
- C.3.7 Slot Properties—DS-3i, page C-719
- C.3.8 Slot Properties—DS-3i-N-12, page C-724
- C.3.9 Slot Properties—DS-3XM-6, page C-729
- C.3.10 Slot Properties—DS-N, page C-736
- C.3.11 Slot Properties—DS1_E1_56, page C-737
- C.3.12 Slot Properties—DS3_EC1_48, page C-746
- C.3.13 Slot Properties—DS3XM-12, page C-761
- C.3.14 Slot Properties—E-1, page C-774
- C.3.15 Slot Properties—E1_21_E3_DS3_3 and E1_63_E3_DS3_3, page C-778
- C.3.16 Slot Properties—E1-42, page C-801
- C.3.17 Slot Properties—E1-63 (ONS 15305 CTC), page C-808
- C.3.18 Slot Properties—E1-8 (ONS 15305 CTC), page C-810
- C.3.19 Slot Properties—E1-N-14, page C-812
- C.3.20 Slot Properties—E3-12, page C-820
- C.3.21 Slot Properties—E3T3_6 (ONS 15305 CTC), page C-824
- C.3.22 Slot Properties—EC1-12, page C-826
- C.3.23 Slot Properties—FMEC-E3/DS-3, page C-831

C.3.1 Slot Properties—DS-1-14

The slot properties pane displays information about the Cisco ONS 15310 CL, Cisco ONS 15310 MA SONET, Cisco ONS 15327, or Cisco ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS-1-14 card provides 14 Telcordia-compliant GR-499 DS-1 ports. Each port operates at 1.544 Mb/s over a 100-ohm twisted-pair copper cable.

For the DS-1-14 module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, VT, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.1.1 Module View

The Module View displays a graphic of the DS-1 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.1.2 Identification

The Identification Properties pane allows you to view and update DS-1 identification information.

Table C-858 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.1.3 Line

The Line Properties pane allows you to view and update DS-1 optical line performance monitoring information.

Table C-859 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number (1 to 14).
Port Name	Allows you to add a name for the optical port.
SF BER	Sets the signal failure bit error rate. Values are: • 1E-3 • 1E-4 (default) • 1E-5

Table C-859 Field Descriptions for the Line Properties Pane (continued)

Field	Description
SD BER	Sets the signal deterioration bit error rate. Values are: • 1E-5 • 1E-6 • 1E-7 (default) • 1E-8 • 1E-9
Line Type	Allows you to select the line framing type. Values are: • D4 (default) • ESF—Extended Super Frame • Unframed
Line Coding	Allows you to define the DS-1-14 transmission coding type. Values are: • AMI—Alternate Mark Inversion (default) • B8ZS—Bipolar 8-zero Substitution
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are: • 0–131 (default) • 132–262 • 263–393 • 394–524 • 525–655
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
AINS Soak	Automatic in-service soak. The amount of valid input signal in *hh.mm*, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
AINS Soak Count Down	Displays the remaining time of valid input signal in *hh.mm*, after which the card becomes in service (IS) automatically. The range is from 0 to 48 hours, in 15-minute increments.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS-V for DS-1 AIS	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.
Line Threshold 15 Minutes	

Table C-859 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Port Number	The optical port number (1 to 14).
CV-L	Coding violations line (near-end only). The default is 13340.
ES-L	Errored seconds line. The default is 65.
SES-L	Severely errored seconds line (near-end only). The default is 10.
LOSS-L	Loss of signal seconds line (near-end only). The default is 10.
Line Threshold 1 Day	
Port Number	The optical port number (1 to 14).
CV-L	Coding violations line (near-end only). The default is 133400.
ES-L	Errored seconds line. The default is 648.
SES-L	Severely errored seconds line (near-end only). The default is 100.
LOSS-L	Loss of signal seconds line (near-end only). The default is 10.
Path Threshold 1 Day	
Near End	
Displays the following near-end 1-day path threshold information.	
Port Number	The optical port number (1 to 14).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal–path information.
AISS-P	Alarm indication signal seconds path.
UAS-P	Unavailable seconds path.
Far End	
Displays the following far-end 1-day path threshold information.	
Port Number	The optical port number (1 to 14).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
ESA-P	Errored seconds type A path.
ESB-P	Errored seconds type B path.
CSS-P	Controlled slip seconds path.
SEFS-P	Severely errored framing seconds path.
Path Threshold 15 Minutes	
Near End	
Displays the following near-end 15-minute path threshold information.	
Port Number	The optical port number (1 to 14).

Table C-859 Field Descriptions for the Line Properties Pane (continued)

Field	Description
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
AISS-P	Alarm indication signal seconds path.
UAS-P	Unavailable seconds path.
Far End	
Displays the following far-end 15-minute path threshold information.	
Port Number	The optical port number (1 to 14).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
ESA-P	Errored seconds type A path.
ESB-P	Errored seconds type B path.
CSS-P	Controlled slip seconds path.
SEFS-P	Severely errored framing seconds path.

C.3.1.4 STS

The STS Properties pane allows you to view and update DS-1 synchronous transport signal (STS) information.

Table C-860 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path. The default is 15.
ES-P	Errored seconds path. The default is 12.
SES-P	Severely errored seconds path. The default is 3.
UAS-P	Unavailable seconds path. The default is 10.
FC-P	Failure count path. The default is 10.
STS Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path. The default is 125.
ES-P	Errored seconds path. The default is 100.
SES-P	Severely errored seconds path. The default is 7.

Table C-860 Field Descriptions for the STS Properties Pane (continued)

Field	Description
UAS-P	Unavailable seconds path. The default is 10.
FC-P	Failure count path. The default is 10.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.1.5 VT

The VT Properties pane allows you to view and update DS-1 virtual tributary information.

Table C-861 Field Descriptions for the VT Properties Pane

Field	Description
VT Threshold 15 Minutes	
VT Number	The VT number.
CV-V	Coding violations–VT path. The default is 15.
ES-V	Errored seconds–VT path. The default is 12.
SES-V	Severely errored seconds–VT path. The default is 3.
UAS-V	Unavailable seconds–VT path. The default is 10.
VT Threshold 1 Day	
VT Number	The VT number.
CV-V	Coding violations–VT path. The default is 125.
ES-V	Errored seconds–VT path. The default is 100.
SES-V	Severely errored seconds–VT path. The default is 7.
UAS-V	Unavailable seconds–VT path. The default is 10.
Customer Info	
VT Number	The VT number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.1.6 Loopback

The Loopback Properties pane allows you to view and update DS-1 loopback information.

Table C-862 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number (1 to 14).
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.3.1.7 Protection

The Protection Properties pane allows you to view and update DS-1 protection group information.

Table C-863 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.1.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-1 alarm profile information.

Table C-864 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.1.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table C-865 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.

Table C-865 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

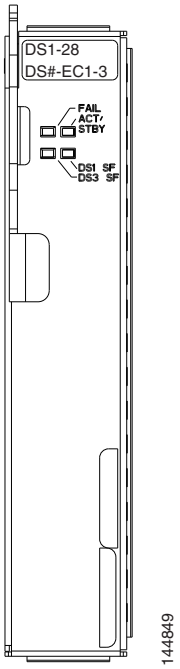
C.3.2 Slot Properties—DS1-28/DS3-EC1-3

The ONS 15310 MA SONET DS1-28/DS3-EC1-3 card provides 28 Telcordia-compliant, GR-499 DS-1 ports per card, and three DS-3/EC-1 ports. Each DS-1 port operates at 1.544 Mb/s. Each DS-3/EC-1 port operates at 44.736 Mb/s over a single 75-ohm 728A or equivalent coaxial span. This card can operate as a working or protect card in 1:N protection schemes, where N is less than or equal to 2.

The DS1-28/DS3-EC1-3 card can be installed in slots 1, 2, 5, and 6. Cards installed in slots 1 and 2 correspond with BIC A, and cards in slots 5 and 6 correspond with BIC B.

The following figure shows the DS1-28/DS3-EC1-3 card faceplate.

Figure C-63 DS1-28/DS3-EC1-3 Card Faceplate



For the DS1-28/DS3-EC1-3 module, the slot properties pane displays the following properties: Module View, Identification, DS-1, Broadband Ports, DS-3, EC1, Protection, and Info.

C.3.2.1 Module View

The Module View displays a graphic of the DS1-28/DS3-EC1-3 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.3.2.2 Identification

The Identification Properties pane allows you to view and update DS1-28/DS3-EC1-3 identification information.

Table C-866 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.

Table C-866 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.2.3 DS-1

The DS-1 Properties pane allows you to view and update DS-1 information for the card. The DS-1 Properties pane contains the following tabs:

- C.3.2.3.1 Line Config Tab, page C-660
- C.3.2.3.2 Line Thresh 15 Min Tab, page C-662
- C.3.2.3.3 Line Thresh 1 Day Tab, page C-662
- C.3.2.3.4 Electric Path Thresh 15 Min Tab, page C-663
- C.3.2.3.5 Electric Path Thresh 1 Day Tab, page C-664
- C.3.2.3.6 STS Thresh 15 Min Tab, page C-665
- C.3.2.3.7 STS Thresh 1 Day Tab, page C-665
- C.3.2.3.8 VT Thresh 15 Min Tab, page C-666
- C.3.2.3.9 VT Thresh 1 Day Tab, page C-666
- C.3.2.3.10 Alarm Behavior Tab, page C-667
- C.3.2.3.11 Loopback Tab, page C-667
- C.3.2.3.12 J1 Path Trace Tab, page C-668
- C.3.2.3.13 Customer Info Tab, page C-668

C.3.2.3.1 Line Config Tab

The Line Config tab allows you to view and update line configuration information.

Table C-867 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the optical port.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1N transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
SF BER	Sets the signal failure bit error rate.
SD BER	Sets the signal deterioration bit error rate.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Provides Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Message	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Enable Retiming	When checked, retimes the transmit clock to the clock reference of the NE, removing the asynchronous relationship between electrical line and SONET transport time domains for the electrical path. When unchecked, leaves the port as *through-timed*, which means that the transmit clock is extracted from the DS-1/E1 data in the SONET payload coming from the backplane.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS-V for DS1-AIS/Defects	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.

Table C-867 Field Descriptions for the Line Config Tab (continued)

Field	Description
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.
Admin SSM	Overrides the synchronization status message (SSM) synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU. Admin SSM allows you to override the STU value with one of the following: • PRS—Primary Reference Source (Stratum 1) • ST2—Stratum 2 • TNC—Transit node clock • ST3E—Stratum 3E • ST3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4 • DUS—Do not use for timing synchronization • RES—Reserved; quality level set by user

C.3.2.3.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the port.

Table C-868 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

C.3.2.3.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the port.

Table C-869 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

C.3.2.3.4 Electric Path Thresh 15 Min Tab

The Electric Path Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute electrical path threshold settings for the card.

Table C-870 Field Descriptions for the Electric Path Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
FC-P	Failure count path.

Table C-870 Field Descriptions for the Electric Path Thresh 15 Min Tab (continued)

Field	Description
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.2.3.5 Electric Path Thresh 1 Day Tab

The Electric Path Thresh 1 Day tab allows you to view and change the near- and far-end 1-day electrical path threshold settings for the card.

Table C-871 Field Descriptions for the Electric Path Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
FC-P	Failure count path.
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.

Table C-871 Field Descriptions for the Electric Path Thresh 1 Day Tab (continued)

Field	Description
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.2.3.6 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the port.

Table C-872 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.2.3.7 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the port.

Table C-873 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.

Table C-873 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.2.3.8 VT Thresh 15 Min Tab

The VT Thresh 15 Min tab displays near- and far-end 15-minute VT threshold information.

Table C-874 Field Descriptions for the VT Thresh 15 Min Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.
Far End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.

C.3.2.3.9 VT Thresh 1 Day Tab

The VT Thresh 1 Day tab displays near- and far-end 1-day VT threshold information.

Table C-875 Field Descriptions for the VT Thresh 1 Day Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.
Far End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.

C.3.2.3.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-876 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.2.3.11 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-877 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.

Table C-877 Field Descriptions for the Loopback Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15310 MA SONET. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.2.3.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-878 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.2.3.13 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-879 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.2.4 Broadband Ports

The Broadband Ports Properties pane allows you to view the DS-3 or EC1 port information.

Table C-880 Field Descriptions for the Broadband Ports Properties Pane

Field	Description
DS-3	
Port Number	Displays the DS-3 port number.
Rate	Displays the rate that the port is provisioned for.
EC1	
Port Number	Displays the EC1 port number.
Rate	Displays the rate that the port is provisioned for.

C.3.2.5 DS3

The DS-3 Properties pane allows you to view and update DS-3 information for the card. The DS-3 Properties pane contains the following tabs:

- C.3.2.5.1 Line Config Tab, page C-669
- C.3.2.5.2 Line Thresh 15 Min Tab, page C-670
- C.3.2.5.3 Line Thresh 1 Day Tab, page C-670
- C.3.2.5.4 PBit Thresh 15 Min Tab, page C-671
- C.3.2.5.5 PBit Thresh 1 Day Tab, page C-671
- C.3.2.5.6 CPBit Thresh 15 Min Tab, page C-671
- C.3.2.5.7 CPBit Thresh 1 Day Tab, page C-672
- C.3.2.5.8 STS Thresh 15 Min Tab, page C-673
- C.3.2.5.9 STS Thresh 1 Day Tab, page C-673
- C.3.2.5.10 Alarm Behavior Tab, page C-674
- C.3.2.5.11 Loopback Tab, page C-674
- C.3.2.5.12 J1 Path Trace Tab, page C-675
- C.3.2.5.13 Customer Info Tab, page C-675

C.3.2.5.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the port.

Table C-881 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Line Length (feet)	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-3i transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.2.5.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the port.

Table C-882 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Displays the unavailable seconds line.

C.3.2.5.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the port.

Table C-883 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.

Table C-883 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.

C.3.2.5.4 PBit Thresh 15 Min Tab

The PBit Thresh 15 Min tab displays near-end 15-minute PBit path threshold information on the card.

Table C-884 Field Descriptions for the PBit Thresh 15 Min Tab

Field	Description
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal path
AISS-P	Alarm indication signal seconds path
UAS-P	Displays the unavailable seconds path information.

C.3.2.5.5 PBit Thresh 1 Day Tab

The PBit Thresh 1 Day tab displays near- and far-end 1-day PBit path threshold information on the card.

Table C-885 Field Descriptions for the PBit Thresh 1 Day Tab

Field	Description
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal path information.
AISS-P	Alarm indication signal seconds path
UAS-P	Displays the unavailable seconds path information.

C.3.2.5.6 CPBit Thresh 15 Min Tab

The CPBit Thresh 15 Min tab displays near- and far-end 15-minute CPBit path threshold information on the card.

Table C-886 Field Descriptions for the CPBit Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.2.5.7 CPBit Thresh 1 Day Tab

The CPBit Thresh 1 Day tab displays near- and far-end 1-day CPBit path threshold information on the card.

Table C-887 Field Descriptions for the CPBit Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.2.5.8 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the port.

Table C-888 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.2.5.9 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the port.

Table C-889 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.

Table C-889 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.2.5.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-890 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.2.5.11 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-891 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.2.5.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-892 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.2.5.13 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-893 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.2.6 EC1

The EC1 Properties pane allows you to view node near-end and far-end performance on an EC1 card to detect possible performance problems.

The EC1 Properties pane contains the following tabs:

- C.3.2.6.1 Line Config Tab, page C-676
- C.3.2.6.2 Line Thresh 15 Min Tab, page C-676
- C.3.2.6.3 Line Thresh 1 Day Tab, page C-677
- C.3.2.6.4 Section Thresh 15 Min Tab, page C-677
- C.3.2.6.5 Section Thresh 1 Day Tab, page C-678
- C.3.2.6.6 STS Thresh 15 Min Tab, page C-678
- C.3.2.6.7 STS Thresh 1 Day Tab, page C-679
- C.3.2.6.8 Alarm Behavior Tab, page C-680
- C.3.2.6.9 STS Config Tab, page C-680
- C.3.2.6.10 Loopback Tab, page C-680

- C.3.2.6.11 Section Trace Tab, page C-681
- C.3.2.6.12 J1 Path Trace Tab, page C-681
- C.3.2.6.13 Customer Info Tab, page C-682

C.3.2.6.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the EC1 port.

Table C-894 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
PJSTSMon#	Sets the EC-1 port that will be used for pointer justification. Values are Off or 1.
Line Length (feet)	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Rx Equalization	For early EC1 card versions, equalization can be turned off if the line length is short or the environment is extremely cold; Rx Equalization should normally be set to On (checked, default).
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.2.6.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the EC1 port.

Table C-895 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Far End	

Table C-895 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.

C.3.2.6.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the EC1 port.

Table C-896 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.
UAS-L	Displays the unavailable seconds line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.3.2.6.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold information on the EC1 port.

Table C-897 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.

Table C-897 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.3.2.6.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold information on the EC1 port.

Table C-898 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.3.2.6.6 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the port.

Table C-899 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.

Table C-899 Field Descriptions for the STS Thresh 15 Min Tab (continued)

Field	Description
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.2.6.7 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the port.

Table C-900 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.

Table C-900 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.2.6.8 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-901 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.2.6.9 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the EC1 port.

Table C-902 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

C.3.2.6.10 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-903 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-903 Field Descriptions for the Loopback Tab (continued)

Field	Description
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.2.6.11 Section Trace Tab

The Section Trace tab allows you to change the EC1 port section trace settings.

Table C-904 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.3.2.6.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-905 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

Table C-905 Field Descriptions for the J1 Path Trace Tab (continued)

Field	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.2.6.13 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-906 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.2.7 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-907 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock-out switching, or lock-on switching.

C.3.2.8 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-908 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

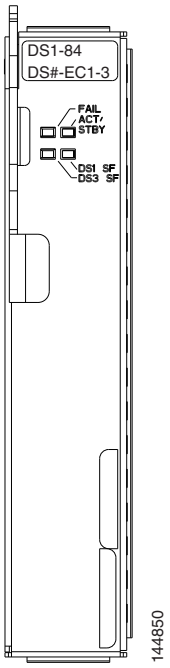
C.3.3 Slot Properties—DS1-84/DS3-EC1-3

The ONS 15310 MA SONET DS1-84/DS3-EC1-3 card provides 84 Telcordia-compliant, GR-499 DS-1 ports per card, and three DS-3/EC-1 ports. Each DS-1 port operates at 1.544 Mb/s. Each DS-3/EC-1 port operates at 44.736 Mb/s over a single 75-ohm 728A or equivalent coaxial span. This card can operate as a working or protect card in 1:N protection schemes, where N is less than or equal to 2.

The DS1-84/DS3-EC1-3 card can be installed in slots 1, 2, 5, and 6. Cards installed in slots 1 and 2 correspond with BIC A, and cards in slots 5 and 6 correspond with BIC B.

The following figure shows the DS1-84/DS3-EC1-3 card faceplate.

Figure C-64 DS1-84/DS3-EC1-3 Card Faceplate



For the DS1-84/DS3-EC1-3 module, the slot properties pane displays the following properties: Module View, Identification, DS-1, Broadband Ports, DS-3, EC1, Protection, and Info.

C.3.3.1 Module View

The Module View displays a graphic of the DS1-84/DS3-EC1-3 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).
Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.3.3.2 Identification

The Identification Properties pane allows you to view and update DS1-84-DS3-EC1-3 identification information.

Table C-909 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.3.3 DS1

The DS-1 Properties pane allows you to view and update DS-1 information for the card. The DS-1 Properties pane contains the following tabs:

- C.3.3.3.1 Line Config Tab, page C-685
- C.3.3.3.2 Line Thresh 15 Min Tab, page C-686
- C.3.3.3.3 Line Thresh 1 Day Tab, page C-686
- C.3.3.3.4 Electric Path Thresh 15 Min Tab, page C-687
- C.3.3.3.5 Electric Path Thresh 1 Day Tab, page C-688
- C.3.3.3.6 STS Thresh 15 Min Tab, page C-689
- C.3.3.3.7 STS Thresh 1 Day Tab, page C-689
- C.3.3.3.8 VT Thresh 15 Min Tab, page C-690
- C.3.3.3.9 VT Thresh 1 Day Tab, page C-690
- C.3.3.3.10 Alarm Behavior Tab, page C-691
- C.3.3.3.11 Loopback Tab, page C-691

- C.3.3.3.12 J1 Path Trace Tab, page C-692
- C.3.3.3.13 Customer Info Tab, page C-692

C.3.3.3.1 Line Config Tab

The Line Config tab allows you to view and update line configuration information.

Table C-910 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the optical port.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1N transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
SF BER	Sets the signal failure bit error rate.
SD BER	Sets the signal deterioration bit error rate.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Provides Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Message	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Enable Retiming	When checked, retimes the transmit clock to the clock reference of the NE, removing the asynchronous relationship between electrical line and SONET transport time domains for the electrical path. When unchecked, leaves the port as *through-timed*, which means that the transmit clock is extracted from the DS-1/E1 data in the SONET payload coming from the backplane.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS-V for DS1-AIS/Defects	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.

Table C-910 Field Descriptions for the Line Config Tab (continued)

Field	Description
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.
Admin SSM	Overrides the synchronization status message (SSM) synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU. Admin SSM allows you to override the STU value with one of the following: • PRS—Primary Reference Source (Stratum 1) • ST2—Stratum 2 • TNC—Transit node clock • ST3E—Stratum 3E • ST3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4 • DUS—Do not use for timing synchronization • RES—Reserved; quality level set by user

C.3.3.3.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the port.

Table C-911 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

C.3.3.3.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the port.

Table C-912 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

C.3.3.3.4 Electric Path Thresh 15 Min Tab

The Electric Path Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute electrical path threshold settings for the card.

Table C-913 Field Descriptions for the Electric Path Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
FC-P	Failure count path.

Table C-913 Field Descriptions for the Electric Path Thresh 15 Min Tab (continued)

Field	Description
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.3.3.5 Electric Path Thresh 1 Day Tab

The Electric Path Thresh 1 Day tab allows you to view and change the near- and far-end 1-day electrical path threshold settings for the card.

Table C-914 Field Descriptions for the Electric Path Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
FC-P	Failure count path.
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.

Table C-914 Field Descriptions for the Electric Path Thresh 1 Day Tab (continued)

Field	Description
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.3.3.6 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the port.

Table C-915 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.3.3.7 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the port.

Table C-916 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.

Table C-916 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.3.3.8 VT Thresh 15 Min Tab

The VT Thresh 15 Min tab displays near- and far-end 15-minute VT threshold information.

Table C-917 Field Descriptions for the VT Thresh 15 Min Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.
Far End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.

C.3.3.3.9 VT Thresh 1 Day Tab

The VT Thresh 1 Day tab displays near- and far-end 1-day VT threshold information.

Table C-918 Field Descriptions for the VT Thresh 1 Day Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.
Far End	
VT Number	Displays VT number information.
CV	Displays the coding violations–VT path information.
ES	Displays the errored seconds–VT path information.
SES	Displays the severely errored seconds–VT path information.
UAS	Displays the unavailable seconds–VT path information.
FC	Failure count.

C.3.3.3.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-919 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.3.3.11 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-920 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.

Table C-920 Field Descriptions for the Loopback Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15310 MA SONET. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.3.3.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-921 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.3.3.13 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-922 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.3.4 Broadband Ports

The Broadband Ports Properties pane allows you to view the DS-3 or EC1 port information.

Table C-923 Field Descriptions for the Broadband Ports Properties Pane

Field	Description
DS-3	
Port Number	Displays the DS-3 port number.
Rate	Displays the rate that the port is provisioned for.
EC1	
Port Number	Displays the EC1 port number.
Rate	Displays the rate that the port is provisioned for.

C.3.3.5 DS3

The DS-3 Properties pane allows you to view and update DS-3 information for the card. The DS-3 Properties pane contains the following tabs:

- C.3.3.5.1 Line Config Tab, page C-693
- C.3.3.5.2 Line Thresh 15 Min Tab, page C-694
- C.3.3.5.3 Line Thresh 1 Day Tab, page C-694
- C.3.3.5.4 PBit Thresh 15 Min Tab, page C-695
- C.3.3.5.5 PBit Thresh 1 Day Tab, page C-695
- C.3.3.5.6 CPBit Thresh 15 Min Tab, page C-696
- C.3.3.5.7 CPBit Thresh 1 Day Tab, page C-696
- C.3.3.5.8 STS Thresh 15 Min Tab, page C-697
- C.3.3.5.9 STS Thresh 1 Day Tab, page C-697
- C.3.3.5.10 Alarm Behavior Tab, page C-698
- C.3.3.5.11 Loopback Tab, page C-698
- C.3.3.5.12 J1 Path Trace Tab, page C-699
- C.3.3.5.13 Customer Info Tab, page C-699

C.3.3.5.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the DS3 port.

Table C-924 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Line Length (feet)	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1N transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.3.5.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the port.

Table C-925 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.

C.3.3.5.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the EC1 port.

Table C-926 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.
UAS-L	Displays the unavailable seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.

C.3.3.5.4 PBit Thresh 15 Min Tab

The PBit Thresh 15 Min tab allows you to view and change the near-end 15-minute PBit path threshold information on the card.

Table C-927 Field Descriptions for the PBit Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.3.3.5.5 PBit Thresh 1 Day Tab

The PBit Thresh 1 Day tab displays near- and far-end 1-day PBit path threshold information on the card.

Table C-928 Field Descriptions for the PBit Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal path information.

Table C-928 Field Descriptions for the PBit Thresh 1 Day Tab (continued)

Field	Description
AISS-P	Alarm indication signal seconds path
UAS-P	Displays the unavailable seconds path information.

C.3.3.5.6 CPBit Thresh 15 Min Tab

The CPBit Thresh 15 Min tab displays near- and far-end 15-minute CPBit path threshold information on the card.

Table C-929 Field Descriptions for the CPBit Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.3.5.7 CPBit Thresh 1 Day Tab

The CPBit Thresh 1 Day tab displays near- and far-end 1-day CPBit path threshold information on the card.

Table C-930 Field Descriptions for the CPBit Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the optical port number.

Table C-930 Field Descriptions for the CPBit Thresh 1 Day Tab (continued)

Field	Description
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.3.5.8 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the port.

Table C-931 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.3.5.9 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the port.

Table C-932 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.

Table C-932 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.3.5.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update DS-3 port alarm profile information.

Table C-933 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.3.5.11 Loopback Tab

The Loopback tab allows you to view and update DS-3 port loopback information.

Table C-934 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

Table C-934 Field Descriptions for the Loopback Tab (continued)

Field	Description
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a DS-3 port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.3.5.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information on the DS-3 port.

Table C-935 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.3.5.13 Customer Info Tab

The Customer Info tab displays the DS-3 port customer information.

Table C-936 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.3.6 EC1

The EC1 Properties pane allows you to view node near-end and far-end performance on an EC1 card to detect possible performance problems.

The EC1 Properties pane contains the following tabs:

- C.3.3.6.1 Line Config Tab, page C-700
- C.3.3.6.2 Line Thresh 15 Min Tab, page C-701
- C.3.3.6.3 Line Thresh 1 Day Tab, page C-701
- C.3.3.6.4 Section Thresh 15 Min Tab, page C-702
- C.3.3.6.5 Section Thresh 1 Day Tab, page C-702
- C.3.3.6.6 STS Thresh 15 Min Tab, page C-702
- C.3.3.6.7 STS Thresh 1 Day Tab, page C-703
- C.3.3.6.8 Alarm Behavior Tab, page C-704
- C.3.3.6.9 STS Config Tab, page C-704
- C.3.3.6.10 Loopback Tab, page C-705
- C.3.3.6.11 Section Trace Tab, page C-705
- C.3.3.6.12 J1 Path Trace Tab, page C-705
- C.3.3.6.13 Customer Info Tab, page C-706

C.3.3.6.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the EC1 port.

Table C-937 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
PJSTSMon#	Sets the EC-1 port that will be used for pointer justification. Values are Off or 1.
Line Length (feet)	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Rx Equalization	For early EC1 card versions, equalization can be turned off if the line length is short or the environment is extremely cold; Rx Equalization should normally be set to On (checked, default).
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.3.6.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the EC1 port.

Table C-938 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.3.3.6.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the EC1 port.

Table C-939 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.

Table C-939 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.3.3.6.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold information on the EC1 port.

Table C-940 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.3.3.6.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold information on the EC1 port.

Table C-941 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.3.3.6.6 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the port.

Table C-942 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.

Table C-942 Field Descriptions for the STS Thresh 15 Min Tab (continued)

Field	Description
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.3.6.7 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the port.

Table C-943 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.

Table C-943 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.3.6.8 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-944 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.3.6.9 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the EC1 port.

Table C-945 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

C.3.3.6.10 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-946 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.3.6.11 Section Trace Tab

The Section Trace tab allows you to change the EC1 port section trace settings.

Table C-947 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.3.3.6.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-948 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.

Table C-948 Field Descriptions for the J1 Path Trace Tab (continued)

Field	Description
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.3.6.13 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-949 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.3.7 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-950 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock-out switching, or lock-on switching.

C.3.3.8 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-951 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.4 Slot Properties—DS-1N

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS-1N transmux card can accept up to six DS-3 signals and convert each signal to 28 VT1.5s. Conversely, the card can take 28 T-1s and multiplex them into a channeled C-bit or M23 framed DS-3. Unlike the DS-3-12 and DS-3N-12 cards, the DS-1N allows circuit mapping at the VT level.

For the DS-1N module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, VT, Loopback, Protection, and Alarm Behavior.

C.3.4.1 Module View

The Module View displays a graphic of the DS-1N that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.3.4.2 Identification

The Identification Properties pane allows you to view and update DS-1N identification information.

Table C-952 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.4.3 Line

The Line Properties pane allows you to view and update DS-1N optical line performance monitoring information.

Table C-953 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the optical port.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1N transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS-V for DS-1 AIS	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
BLSR Ext. Byte	Select an alternate BLSR byte. Choices are Z2, E2, or F1.
Line Threshold 15 Minutes	
Port Number	The optical port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
Line Threshold 1 Day	
Port Number	The optical port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
Path Threshold 15 Minutes	
Port Number	The optical port number.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.

Table C-953 Field Descriptions for the Line Properties Pane (continued)

Field	Description
AIS-P	Alarm indication signal path.
UAS-P	Unavailable seconds path.
Path Threshold 1 Day	
Port Number	The optical port number.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
AIS-P	Alarm indication signal path.
UAS-P	Unavailable seconds path.

C.3.4.4 STS

The STS Properties pane allows you to view and update DS-1N Synchronous Transport Signal (STS) information.

Table C-954 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
STS Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Customer Info	
VC Number	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.
J1 Path Trace	
Port Number	Displays the port number.

Table C-954 Field Descriptions for the STS Properties Pane (continued)

Field	Description
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.

C.3.4.5 VT

The VT Properties pane allows you to view and update DS-1N virtual tributary information.

Table C-955 Field Descriptions for the VT

Field	Description
VT Threshold 15 Minutes	
VT Number	The VT number.
CV-V	Coding violations–VT layer.
ES-V	Errored seconds–VT layer.
SES-V	Severely errored seconds–VT layer.
UAS-V	Unavailable seconds–VT layer.
VT Threshold 1 Day	
VT Number	The VT number.
CV-V	Coding violations–VT layer.
ES-V	Errored seconds–VT layer.
SES-V	Severely errored seconds–VT layer.
UAS-V	Unavailable seconds–VT layer.

C.3.4.6 Loopback

The Loopback Properties pane allows you to view and update DS-1N loopback information.

Table C-956 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

C.3.4.7 Protection

The Protection Properties pane allows you to view and update DS-1N protection group information.

Table C-957 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.4.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-1N alarm profile information.

Table C-958 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Displays a global alarm profile for the card from the drop-down list.
Port Number	Displays the DS-1N port number.
Alarm Profile	Displays an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.5 Slot Properties—DS-3-12

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS-3-12 cards (DS-3-12, DS-3N-12) provide 12 Telcordia-compliant GR-499 DS-3 ports per card. Each port operates at 44.736 Mb/s over a single 75-ohm 728A or equivalent coaxial span. The DS-3N-12 supports the same features as the DS-3-12 but can also provide 1:N protection (where N is less than or equal to 5).

For the DS-3-12 module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, Loopback, Protection, and Alarm Behavior.

C.3.5.1 Module View

The Module View displays a graphic of the DS-3 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.5.2 Identification

The Identification Properties pane allows you to view and update DS-3 identification information.

Table C-959 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.5.3 Line

The Line Properties pane allows you to view and update DS-3 optical line performance monitoring information.

Table C-960 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number (1 to 12).
Port Name	Allows you to add a name for the optical port.
SF BER	Sets the signal failure bit error rate.
SD BER	Sets the signal deterioration bit error rate.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-960 Field Descriptions for the Line Properties Pane (continued)

Field	Description
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Line Threshold 15 Minutes	
Port Number	The optical port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Line Threshold 1 Day	
Port Number	The optical port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.

C.3.5.4 STS

The STS Properties pane allows you to view and update DS-3 STS information.

Table C-961 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
STS Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Customer Info	
STS Number	The STS number.

Table C-961 Field Descriptions for the STS Properties Pane (continued)

Field	Description
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.5.5 Loopback

The Loopback Properties pane allows you to view and update DS-3 loopback information.

Table C-962 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.3.5.6 Protection

The Protection Properties pane allows you to view and update DS-3 protection group information.

Table C-963 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.5.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-3 alarm profile information.

Table C-964 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.6 Slot Properties—DS-3E

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 DS-3E cards (DS-3-12E, DS-3N-12E) provide 12 Telcordia-compliant ports per card. Each port operates at 44.736 Mb/s over a single 75-ohm 728A or equivalent coaxial span. The DS-3-12E card provides enhanced performance monitoring functions. Default thresholds are based on recommendations in GR-820-CORE, Section 5.0. The DS-3N-12E card supports the same features as the DS-3-12E but can also provide 1:N protection (where N is less than or equal to 5).

For the DS-3E module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.6.1 Module View

The Module View displays a graphic of the DS-3 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.6.2 Identification

The Identification Properties pane allows you to view and update DS-3 identification information.

Table C-965 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table C-965 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.6.3 Line

The Line Properties pane allows you to view and update DS-3 optical line performance monitoring information.

Table C-966 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the optical port.
SF BER	Sets the signal failure bit error rate.
SD BER	Sets the signal deterioration bit error rate.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Line Threshold 15 Minutes	
Port Number	The optical port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Line Threshold 1 Day	
Port Number	The optical port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.

C.3.6.4 STS

The STS Properties pane allows you to view and update DS-3 synchronous transport signal (STS) information.

Table C-967 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
STS Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.6.5 Loopback

The Loopback Properties pane allows you to view and update DS-3 loopback information.

Table C-968 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.3.6.6 Protection

The Protection Properties pane allows you to view and update DS-3 protection group information.

Table C-969 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.6.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-3 alarm profile information.

Table C-970 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.6.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-971 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
VC4 Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.7 Slot Properties—DS-3i

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS-3i-N-12 cards provide twelve DS-3 ports. Each port operates at 44.736 Mb/s. The DS-3i-N-12 uses B3ZS error monitoring and enhanced performance monitoring, including P-Bit and CP-Bit monitoring.

For the DS-3i module, the slot properties pane displays the following properties: Module View, Identification, Line, VC-3, VC-4, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.7.1 Module View

The Module View displays a graphic of the DS-3i that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.7.2 Identification

The Identification Properties pane allows you to view and update DS-3i identification information.

Table C-972 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.7.3 Line

The Line Properties pane allows you to view and update DS-3i line performance monitoring information.

Table C-973 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the port number.
Port Name	Allows you to add a name for the port.
SD BER	Sets the signal deterioration bit error rate.
SF BER	Sets the signal failure bit error rate.
Line Type	Allows you to select the line framing type.
Detected Line Type	Displays the detected line type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0–225 (default) or 226–450.
Line Coding	Allows you to define the DS-3i transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Line Threshold 15 Minutes	
Port Number	Displays the port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal seconds line.
Line Threshold 1 Day	
Port Number	Displays the port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal seconds line.
DS-3 PBit Path Threshold 15 Minutes	
Port Number	Displays the port number.
CV-P/EB-P	Coding violations/errored blocks path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.

Table C-973 Field Descriptions for the Line Properties Pane (continued)

Field	Description
UAS-P	Unavailable seconds path.
AISS-P	AIS seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
DS-3 PBit Path Threshold 1 Day	
Port Number	Displays the port number.
CV-P/EB-P	Coding violations/errored blocks path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	AIS seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
DS-3 CPBit Path Threshold 15 Minutes	
Port Number	Displays the port number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
SAS-P	Severely errored frame/alarm indication signal path *(far-end only)*.
DS-3 CPBit Path Threshold 1 Day	
Port Number	Displays the port number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
SAS-P	Severely errored frame/alarm indication signal path *(far-end only)*.

C.3.7.4 VC-3

The VC-3 Properties pane allows you to view and update DS-3i VC-3 information.

Table C-974 Field Descriptions for the VC-3 Properties Pane

Field	Description
Threshold 15 Minutes	
VC Number	The VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.

Table C-974 Field Descriptions for the VC-3 Properties Pane (continued)

Field	Description
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Threshold 1 Day	
VC Number	The VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Customer Info	
VC Number	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.7.5 VC-4

The VC-4 Properties pane allows you to view and update DS-3i VC-4 information.

Table C-975 Field Descriptions for the VC-4 Properties Pane

Field	Description
Threshold 15 Minutes	
VC Number	The VC number. Displays as VC4-*x*, where *x* equals 1, 2, 3, or 4.
EB-HP/BEC-HP	Errored block/byte errors corrected–high-order path.
BBE-HP	Background block errors–high-order path.
ES-HP	Errored seconds–high-order path.
SES-HP	Severely errored seconds–high-order path.
UAS-HP	Unavailable seconds–high-order path.
Threshold 1 Day	
VC Number	The VC number. Displays as VC4-*x*, where *x* equals 1, 2, 3, or 4.
EB-HP/BEC-HP	Errored block/byte errors corrected–high-order path.
BBE-HP	Background block errors–high-order path.
ES-HP	Errored seconds–high-order path.
SES-HP	Severely errored seconds–high-order path.
UAS-HP	Unavailable seconds–high-order path.

C.3.7.6 Loopback

The Loopback Properties pane allows you to view and update DS-3i loopback information.

Table C-976 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Inhibit Loopback	Allows you to prevent loopback functionality.

C.3.7.7 Protection

The Protection Properties pane allows you to view and update DS-3i protection group information.

Table C-977 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.7.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-3i alarm profile information.

Table C-978 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.7.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-979 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
VC4 Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.8 Slot Properties—DS-3i-N-12

The slot properties pane displays information about the Cisco ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS-3i-N-12 cards provide twelve DS-3 ports. Each port operates at 44.736 Mb/s. The DS-3i-N-12 uses B3ZS error monitoring and enhanced performance monitoring, including P-Bit and CP-Bit monitoring.

For the DS-3i module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.8.1 Module View

The Module View displays a graphic of the DS-3i that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.8.2 Identification

The Identification Properties pane allows you to view and update DS-3i identification information.

Table C-980 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.8.3 Line

The Line Properties pane allows you to view and update DS-3i line performance monitoring information.

Table C-981 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the port number (1 to 12).
Port Name	Allows you to add a name for the port.
SD BER	Sets the signal deterioration bit error rate.
SF BER	Sets the signal failure bit error rate.
Line Type	Allows you to select the line framing type.
Detected Line Type	Displays the detected line type.
Line Length	Displays the length of the line.
Line Coding	Allows you to define the DS-3i transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-981 Field Descriptions for the Line Properties Pane (continued)

Field	Description
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Line Threshold 15 Minutes	
Port Number	Displays the port number (1 to 12).
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
LOSS-L	Loss of signal seconds line.
Line Threshold 1 Day	
Port Number	Displays the port number (1 to 12).
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
LOSS-L	Loss of signal seconds line.
DS-3 PBit Path Threshold 15 Minutes	
Port Number	Displays the port number (1 to 12).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	AIS seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
DS-3 PBit Path Threshold 1 Day	
Port Number	Displays the port number (1 to 12).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	AIS seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
DS-3 CPBit Path Threshold 15 Minutes	
Port Number	Displays the port number (1 to 12).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
SAS-P	Severely errored frame/alarm indication signal path.

Table C-981 Field Descriptions for the Line Properties Pane (continued)

Field	Description
DS-3 CPBit Path Threshold 1 Day	
Port Number	Displays the port number (1 to 12).
CV-P	Coding violations paths path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
SAS-P	Severely errored frame/alarm indication signal path.

C.3.8.4 STS

The STS Properties pane allows you to view and update DS-3 synchronous transport signal (STS) information.

Table C-982 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
STS Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.8.5 Loopback

The Loopback Properties pane allows you to view and update DS-3i loopback information.

Table C-983 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number (1 to 12).
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Inhibit Loopback	Allows you to prevent loopback functionality.

C.3.8.6 Protection

The Protection Properties pane allows you to view and update DS-3i protection group information.

Table C-984 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.8.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-3i alarm profile information.

Table C-985 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.8.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-986 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.9 Slot Properties—DS-3XM-6

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS-3XM-6 card provides six Telcordia-compliant GR-499-CORE M13 multiplexing functions. The DS-3XM-6 converts six framed DS-3 network connections to 28x6 or 168 VT1.5s. Unlike the DS-3-12 and DS-3N-12 cards, the DS-3XM-6 allows circuit mapping at the VT level.

For the DS-3XM-6 module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, VT, DS-1, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.9.1 Module View

The Module View displays a graphic of the DS-3XM-6 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.9.2 Identification

The Identification Properties pane allows you to view and update DS-3XM-6 identification information.

Table C-987 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.9.3 Line

The Line Properties pane allows you to view and update DS-3XM-6 optical line performance monitoring information.

Table C-988 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number (1 to 6).
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal deterioration bit error rate.
SF BER	Sets the signal failure bit error rate.
Line Type	Allows you to select the line framing type. Values are: • M13 (default) • C BIT
Line Coding	Allows you to define the DS-3XM transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-988 Field Descriptions for the Line Properties Pane (continued)

Field	Description
AINS Soak	Automatic in-service soak. The amount of valid input signal in *hh.mm*, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically. The range is from 0 to 48 hours, in 15-minute increments.
Line Threshold 15 Minutes	
Port Number	Displays the optical port number (1 to 6).
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal seconds line.
Line Threshold 1 Day	
Port Number	Displays the optical port number (1 to 6).
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal seconds line.
PBit Path Threshold 15 Minutes	
Port Number	Displays the optical port number (1 to 6).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
AIS-P	Alarm indication signal path.
UAS-P	Unavailable seconds path.
PBit Path Threshold 1 Day	
Port Number	Displays the optical port number (1 to 6).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
AIS-P	Alarm indication signal path.
UAS-P	Unavailable seconds path.
Port Number	Displays the optical port number (1 to 6).
CPBit Path Threshold 15 Minutes	
Port Number	Displays the optical port number (1 to 6).
CV-P	Coding violations path.

Table C-988 Field Descriptions for the Line Properties Pane (continued)

Field	Description
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
UAS-P	Unavailable seconds path.
CPBit Path Threshold 1 Day	
Port Number	Displays the optical port number (1 to 6).
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
UAS-P	Unavailable seconds path.

C.3.9.4 STS

The STS Properties pane allows you to view and update DS-3XM-6 STS information.

Table C-989 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
STS Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.9.5 VT

The VT Properties pane allows you to view and update DS-3XM-6 virtual tributary information.

Table C-990 Field Descriptions for the VT Properties Pane

Field	Description
VT Threshold 15 Minutes	
VT Number	Displays the VT number.
CV-V	Coding violations–VT path.
ES-V	Errored seconds–VT path.
SES-V	Severely errored seconds–VT path.
UAS-V	Unavailable seconds–VT path.
VT Threshold 1 Day	
VT Number	Displays the VT number.
CV-V	Coding violations–VT path.
ES-V	Errored seconds–VT path.
SES-V	Severely errored seconds–VT path.
UAS-V	Unavailable seconds–VT path.
Customer Info	
VT Number	The VT number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.9.6 DS-1

The DS-1 Properties pane allows you to view and update DS-3XM-6 virtual tributary information.

Table C-991 Field Descriptions for the DS-1 Field Properties Pane

Field	Description
Path Threshold 15 Minutes	
Port Number	Displays the optical port number (1 to 6).
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
SAS-P	Severely errored frame/alarm indication signal path.
AISS-P	Alarm indication signal seconds path.
UAS-P	Unavailable seconds path.
Path Threshold 1 Day	
Port Number	Displays the optical port number (1 to 6).
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.

Table C-991 Field Descriptions for the DS-1 Field Properties Pane (continued)

Field	Description
SAS-P	Severely errored frame/alarm indication signal path.
AISS-P	Alarm indication signal seconds path.
UAS-P	Unavailable seconds path.
Customer Info	
VT Number	The VT number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.9.7 Loopback

The Loopback Properties pane allows you to view and update DS-3XM-6 loopback information.

Table C-992 Field Descriptions for the Loopback Properties Pane

Subfield	Description
DS-1	
Port Number	Displays the optical port number (1 to 6).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15454. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Derived State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT). **Note** The Derived State field is available only for release 3.4.
DS-3	
Port Number	Displays the port number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT). **Note** The State field is available only for release 3.4.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15454. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a DS-3 port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.9.8 Protection

The Protection Properties pane allows you to view and update DS-3XM-6 protection group information.

Table C-993 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.9.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS-3XM-6 alarm profile information.

Table C-994 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.9.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-995 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.10 Slot Properties—DS-N

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

For the DS-N module, the slot properties pane displays the following properties: Module View, Identification, and Protection.

C.3.10.1 Module View

The Module View displays a graphic of the DS-N that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.3.10.2 Identification

The Identification Properties pane allows you to view and update DS-N identification information.

Table C-996 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the card revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.10.3 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-997 Field Descriptions for the Protection Properties Pane

Field	Description
State of Slot *x*	Displays the state of the selected slot and of the companion DS-N slot.
Switch	Click to switch the selected slot from its current state to the other states.
Lock	Click to lock the selected slot into its current state.
Unlock	Click to unlock the current slot from its current state.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.11 Slot Properties—DS1_E1_56

The slot properties pane displays information about the ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS1_E1_56 card provides 56 Telcordia-compliant, GR-499 DS-1 ports per card, or 56 E1 ports per card. Each port operates at 1.544 Mb/s (DS-1) or 2.048 Mb/s (E1). The DS1_E1_56 card operates as a working or protect card in 1:N protection schemes, where N <= 2. The DS1_E1_56 card can be used with the XCVT, XC10G, or XC-VXC-10G cross-connect cards.

Caution When a protection switch moves traffic from the DS1_E1_56 working/active card to the DS1_E1_56 protect/standby card, ports on the now active/standby card cannot be taken out of service. Lost traffic can result if you take a port out of service, even if the DS1_E1_56 standby card no longer carries traffic.

Note This module works only in a high-density ONS chassis backplane.

For the DS1_E1_56 module, the slot properties pane displays the following properties: Module View, Identification, Card, Line, STS, VT, Loopback, Protection, Alarm Behavior, J1 Path Trace, and Info.

C.3.11.1 Module View

The Module View displays a graphic of the DS1_E1_56 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.11.2 Identification

The Identification Properties pane allows you to view and update DS1_E1_56 line card identification information.

Table C-998 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.11.3 Card

The Card Properties pane allows you to provision the encapsulation, port usage and retiming, and VT mapping for the DS1_E1_56 card.

Table C-999 Field Descriptions for the Card Properties Pane

Field	Description
Transport Mode	Sets encapsulation to SONET mode or AU4 mode. SONET mode transports DS-1s in VT1.5s; AU4 mode transports DS-1s and E1s in a structured VC4 payload (STS-3c). The transport mode changes depending on the operating mode. **Note** Switching from one transport mode to another is not allowed if any circuit exists on any port or if any port is in service.
Operating Mode	Sets the port usage: • All DS-1—All 56 ports are to be used as DS-1 ports. Ports 1 to 28 have retiming capability. In this mode, the Retiming Enabled value is always enabled. • All E1—All 56 ports are to be used as E1 ports. Ports 1 to 21 have retiming capability. In this mode, the Retiming Enabled value can be enabled or disabled. The restrictions on switching between these restrictions are based on existing circuits, ports being in service, and port usage as an NE reference source.
Retiming Enabled	When checked, sets the retime transmission of data out to the plesiochronous digital hierarchy (PDH) line.
Port to VT Mapping	Selects the ordering in which DS-1 ports are mapped into the VT1.5s within an STS-1. This setting applies to a group of DS-1 ports associated with the same STS-1. • GR-253 interleaves the DS-1 ports into the DS-1-14-compatible VT1.5. In this mapping, sequential DS-1 port numbers are mapped to interleave the 7 VT groups of VT1.5s. Interleaving by VT group essentially means that the DS-1 ports follow the order of transmission of the VT1.5s, as indicated in GR-253. • INDUSTRY maps sequential DS-1 port numbers to fill each VT group in order. The operating mode All E1 always corresponds to INDUSTRY. **Note** The Port to VT Mapping field is editable only when the operating mode is set to All DS-1.

C.3.11.4 Line

The Line Properties pane allows you to view and update DS1_E1_56 line performance monitoring information.

Table C-1000 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the port number (1 to 56).
Port Name	Allows you to add a name for the port.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal failure bit error rate.
SD BER	Sets the signal deterioration bit error rate.

Table C-1000 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Line Type	Allows you to select the line framing type: ESF, D4, UNFRAMED, AUTO_PROVISION_FMT, or J_ESF.
Line Coding	Defines the transmission coding type: B8ZS or AMI.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
Provides Sync	When checked, the port is provisioned as an NE timing reference.
Enable Sync Message	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Enable Retiming	When checked, retimes the transmit clock to the clock reference of the NE, removing the asynchronous relationship between electrical line and SONET transport time domains for the electrical path. When unchecked, leaves the port as *through-timed*, which means that the transmit clock is extracted from the DS-1/E1 data in the SONET payload coming from the backplane.
Admin SSM	Overrides the synchronization status message (SSM) synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU. Admin SSM allows you to override the STU value with one of the following: • PRS—Primary Reference Source (Stratum 1) • ST2—Stratum 2 • TNC—Transit node clock • ST3E—Stratum 3E • ST3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4 • DUS—Do not use for timing synchronization • RES—Reserved; quality level set by user
Line Length	Defines the distance (in feet) from the backplane connection to the next termination point.
FDL Mode	Sets the mode for far-end loopbacks and far-end performance monitoring.
DS-1 Mapping	Sets the mapping mode: • Asynchronous—DS-1 transport over SONET uses asynchronous mapping into VT1.5 (within a VT-structured STS-1 synchronous payload envelope [SPE]). • Byte Synchronous—DS-1 transport over SONET uses byte-synchronous mapping into VT1.5 (within a VT-structured STS-1 SPE). • Japan Byte Synchronous—E1 transport over SONET uses asynchronous mapping into VT2 (within a VT-structured STS-1 SPE).
Send AIS-V for DS-1 AIS	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.

Table C-1000 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Line Threshold 15 Minutes	
Near End	
Port Number	The optical port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds line.
Line Threshold 1 Day	
Port Number	The optical port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds line.
Path Thresh 15 Min	
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.

Table C-1000 Field Descriptions for the Line Properties Pane (continued)

Field	Description
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
FC-P	Displays the failure count path information.
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.
Path Thresh 1 Day	
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
FC-P	Displays the failure count path information.
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.

Table C-1000 Field Descriptions for the Line Properties Pane (continued)

Field	Description
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.11.5 STS

The STS Properties pane allows you to view and update DS1_E1_56 STS information.

Table C-1001 Field Descriptions for the STS Properties Pane

Field	Description
STS Threshold 15 Minutes	
Near End, Far End	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
FC-P	Failure count path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
STS Threshold 1 Day	
Near End, Far End	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
FC-P	Failure count path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.11.6 VT

The VT Properties pane allows you to view and update DS1_E1_56 virtual tributary information.

Table C-1002 Field Descriptions for the VT Properties Pane

Field	Description
VT Thresh 15 Minutes, Near End and Far End	
VT No.	Displays VT number information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
CV-V	Displays the coding violations–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.
VT Thresh 1 Day, Near End and Far End	
VT No.	Displays VT number information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
CV-V	Displays the coding violations–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.
Customer Info	
VT No.	The VT number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.11.7 Loopback

The Loopback Properties pane allows you to view and update DS1_E1_56 loopback information.

Table C-1003 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15454. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.

Table C-1003 Field Descriptions for the Loopback Properties Pane (continued)

Field	Description
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a DS-3 port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.11.8 Protection

The Protection Properties pane allows you to view and update DS1_E1_56 protection group information.

Table C-1004 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.11.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS1_E1_56 alarm profile information.

Table C-1005 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.11.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1006 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.11.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the DS1_E1_56 card.

Table C-1007 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.12 Slot Properties—DS3_EC1_48

The slot properties pane displays information about the Cisco ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS3_EC1_48 card is a high-density I/O card with 48 ports that may function as a DS-3 or EC1 interface. This allows users to provision the card at port level instead of card level. Each of the DS-3 interfaces operates at 44.736 Mb/s over a single 75-ohm coaxial span. Each of the EC1 interfaces operates at 51.840 Mb/s over a single 75-ohm coaxial span.

Note This module works only in a high-density backplane.

For the DS3_EC1_48 module, the slot properties pane displays the following properties: Module View, Identification, Broadband Ports, DS-3, EC1, Protection, and Info.

C.3.12.1 Module View

The Module View displays a graphic of the DS3_EC1_48 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.12.2 Identification

The Identification Properties pane allows you to view and update DS3_EC1_48 identification information.

Table C-1008 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.12.3 Broadband Ports

The Broadband Ports Properties pane allows you to view the DS-3 or EC1 port information.

Table C-1009 Field Descriptions for the Broadband Ports

Field	Description
DS-3	
Port Number	Displays the DS-3 port number.
Rate	Displays the rate that the port is provisioned for.

Table C-1009 Field Descriptions for the Broadband Ports (continued)

Field	Description
EC1	
Port Number	Displays the EC1 port number.
Rate	Displays the rate that the port is provisioned for.

C.3.12.3.1 Provision Pluggable Dialog Box

In the Broadband Ports Properties pane, click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to create DS-3 or EC1 ports inside the DS3_EC1_48 card.

Table C-1010 Field Descriptions for the Provision Pluggable Dialog Box—PPM

Field	Description
Port Number	Select a port number (1 to 48) from the pull-down menu.
Port Rate	Select a port. You can choose either DS-3 or EC1 from the pull-down menu.

You can also delete a DS-3 or EC1 port listed under the Broadband Ports Properties pane. Select a DS-3 port listed in the DS-3 area or an EC1 port listed in the EC1 area; then click the **Delete** button.

C.3.12.4 DS-3

The DS-3 Properties pane allows you to view and update DS-3 information for the DS3_EC1_48 card. The DS-3 Properties pane contains the following tabs:

- C.3.12.4.1 Line Config Tab, page C-749
- C.3.12.4.2 Line Thresh 15 Min Tab, page C-749
- C.3.12.4.3 Line Thresh 1 Day Tab, page C-749
- C.3.12.4.4 PBit Path Thresh 15 Min Tab, page C-750
- C.3.12.4.5 PBit Path Thresh 1 Day Tab, page C-750
- C.3.12.4.6 CPBit Path Thresh 15 Min Tab, page C-751
- C.3.12.4.7 CPBit Path Thresh 1 Day Tab, page C-751
- C.3.12.4.8 STS Thresh 15 Min Tab, page C-752
- C.3.12.4.9 STS Thresh 1 Day Tab, page C-752
- C.3.12.4.10 Alarm Behavior Tab, page C-753
- C.3.12.4.11 Loopback Tab, page C-753
- C.3.12.4.12 J1 Path Trace Tab, page C-754
- C.3.12.4.13 Customer Info Tab, page C-754

C.3.12.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the DS-3 port.

Table C-1011 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the optical port.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are: • 0–225 • 226–450
Line Type	Allows you to select the line framing type.
Detected Line Type	Displays the detected line type.
Line Coding	Allows you to define the transmission coding type.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.12.4.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute threshold settings of the DS-3 port.

Table C-1012 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line (near-end only).
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line (near-end only).
LOSS-L	Displays the loss of signal seconds line (near-end only).

C.3.12.4.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day threshold settings of the DS-3 port.

Table C-1013 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line (near-end only).
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line (near-end only).
LOSS-L	Displays the loss of signal seconds line (near-end only).

C.3.12.4.4 PBit Path Thresh 15 Min Tab

The PBit Path Thresh 15 Min tab allows you to view and change near-end 15-minute PBit path threshold settings of the DS-3 port.

Table C-1014 Field Descriptions for the PBit Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.3.12.4.5 PBit Path Thresh 1 Day Tab

The PBit Path Thresh 1 Day tab allows you to view and change near-end 1-day PBit path threshold settings of the DS-3 port.

Table C-1015 Field Descriptions for the PBit Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.3.12.4.6 CPBit Path Thresh 15 Min Tab

The CBit Path Thresh 15 Min tab allows you to view and change near- and far-end 15-minute CBit path threshold settings of the DS-3 port.

Table C-1016 Field Descriptions for the CPBit Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.12.4.7 CPBit Path Thresh 1 Day Tab

The CBit Path Thresh 1 Day tab allows you to view and change near- and far-end 1-day CBit path threshold settings of the DS-3 port.

Table C-1017 Field Descriptions for the CPBit Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.12.4.8 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute synchronous transport signal (STS) information for the DS-3 port.

Table C-1018 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.12.4.9 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the DS-3 port.

Table C-1019 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.

Table C-1019 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.12.4.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update DS-3 port alarm profile information.

Table C-1020 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.12.4.11 Loopback Tab

The Loopback tab allows you to view and update DS-3 port loopback information.

Table C-1021 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a DS-3 port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.12.4.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information on the DS-3 port.

Table C-1022 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.12.4.13 Customer Info Tab

The Customer Info tab displays the DS-3 port customer information.

Table C-1023 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.12.5 EC1

The EC1 Properties pane allows you to view node near-end and far-end performance on an EC1 card to detect possible performance problems. The EC1 Properties pane contains the following tabs:

- C.3.12.5.1 Line Config Tab, page C-755
- C.3.12.5.2 Line Thresh 15 Min Tab, page C-755
- C.3.12.5.3 Line Thresh 1 Day Tab, page C-756
- C.3.12.5.4 Section Thresh 15 Min Tab, page C-756
- C.3.12.5.5 Section Thresh 1 Day Tab, page C-757
- C.3.12.5.6 Path Thresh 15 Min Tab, page C-757
- C.3.12.5.7 Path Thresh 1 Day Tab, page C-758
- C.3.12.5.8 Alarm Behavior Tab, page C-759
- C.3.12.5.9 STS Config Tab, page C-759
- C.3.12.5.10 Loopback Tab, page C-759
- C.3.12.5.11 J1 Path Trace Tab, page C-760

- C.3.12.5.12 Customer Info Tab, page C-760
- C.3.12.5.13 Section Trace Tab, page C-760

C.3.12.5.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the EC1 port.

Table C-1024 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
PJSTSMon#	Sets the EC-1 port that will be used for pointer justification. Values are Off or 1.
Line Length (feet)	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Rx Equalization	For early EC1 card versions, equalization can be turned off if the line length is short or the environment is extremely cold; Rx Equalization should normally be set to On (checked, default).
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.12.5.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the EC1 port.

Table C-1025 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.
Far End	
Port Number	Displays the optical port number.

Table C-1025 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.3.12.5.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the EC1 port.

Table C-1026 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.
UAS-L	Displays the unavailable seconds line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.3.12.5.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold information on the EC1 port.

Table C-1027 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.

Table C-1027 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.3.12.5.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold information on the EC1 port.

Table C-1028 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.3.12.5.6 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change near- and far-end 15-minute path threshold information on the EC1 port.

Table C-1029 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Positive pointer justification count-VC4 path detected.
NPJC-Pdet	Negative pointer justification count-VC4 path detected.
PPJC-Pgen	Positive pointer justification count-VC4 path generated.
NPJC-Pgen	Negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.

Table C-1029 Field Descriptions for the Path Thresh 15 Min Tab (continued)

Field	Description
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.12.5.7 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change near- and far-end 1-day path threshold information on the EC1 port.

Table C-1030 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Positive pointer justification count-VC4 path detected.
NPJC-Pdet	Negative pointer justification count-VC4 path detected.
PPJC-Pgen	Positive pointer justification count-VC4 path generated.
NPJC-Pgen	Negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.

Table C-1030 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.12.5.8 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and change EC1 port alarm profile information.

Table C-1031 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.12.5.9 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the EC1 port.

Table C-1032 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

C.3.12.5.10 Loopback Tab

The Loopback tab allows you to view and change EC1 port loopback information.

Table C-1033 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

Table C-1033 Field Descriptions for the Loopback Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.12.5.11 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information on the EC1 port.

Table C-1034 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.12.5.12 Customer Info Tab

The Customer Info tab displays EC1 port customer information.

Table C-1035 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.12.5.13 Section Trace Tab

The Section Trace tab allows you to change the EC1 port section trace settings.

Table C-1036 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.3.12.6 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-1037 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.12.7 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the DS3_EC1_48 card.

Table C-1038 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.13 Slot Properties—DS3XM-12

The slot properties pane displays information about the Cisco ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The DS3XM-12 card provides 12 Telcordia-compliant GR-499-CORE M13 multiplexing functions. The DS3XM-12 converts twelve framed DS-3 network connections to 28x12 or 336 VT1.5s.

For the DS3XM-12 module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, VT, DS-1, Loopback, Protection, Alarm Behavior, J1 Path Trace, and Info.

C.3.13.1 Module View

The Module View displays a graphic of the DS3XM-12 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.13.2 Identification

The Identification Properties pane allows you to view and update identification information.

Table C-1039 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Backplane Rate	Allows you to select STS12, STS48, STS96, or STS192 as the backplane rate.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.13.3 Line

The Line Properties pane allows you to view and update optical line performance monitoring information. The Line Properties pane contains the following tabs:

- C.3.13.3.1 Line Config Tab, page C-763

- C.3.13.3.2 Line Thresh 15 Min Tab, page C-763
- C.3.13.3.3 Line Thresh 1 Day Tab, page C-764
- C.3.13.3.4 PBit Path Thresh 15 Min Tab, page C-764
- C.3.13.3.5 PBit Path Thresh 1 Day Tab, page C-764
- C.3.13.3.6 CPBit Path Thresh 15 Min Tab, page C-765
- C.3.13.3.7 CPBit Path Thresh 1 Day Tab, page C-765

C.3.13.3.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the DS3XM-12 card.

Table C-1040 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.13.3.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute threshold settings of the DS3XM-12 card.

Table C-1041 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line (near-end only).
ES-L	Displays the errored seconds line.

Table C-1041 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
SES-L	Displays the severely errored seconds line (near-end only).
LOSS-L	Displays the loss of signal seconds line (near-end only).

C.3.13.3.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day threshold settings of the DS3XM-12 card.

Table C-1042 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line (near-end only).
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line (near-end only).
LOSS-L	Displays the loss of signal seconds line (near-end only).

C.3.13.3.4 PBit Path Thresh 15 Min Tab

The PBit Thresh 15 Min tab allows you to view and change the near-end 15-minute PBit path threshold information on the card.

Table C-1043 Field Descriptions for the PBit Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.3.13.3.5 PBit Path Thresh 1 Day Tab

The PBit Path Thresh 1 Day tab allows you to view and change the near-end 1-day PBit path threshold information on the DS3XM-12 card.

Table C-1044 Field Descriptions for the PBit Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.3.13.3.6 CPBit Path Thresh 15 Min Tab

The CBit Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute CBit path threshold information on the DS3XM-12 card.

Table C-1045 Field Descriptions for the CPBit Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.13.3.7 CPBit Path Thresh 1 Day Tab

The CBit Thresh 1 Day tab allows you to view and change the near- and far-end 1-day CBit path threshold information on the DS3XM-12 card.

Table C-1046 Field Descriptions for the CPBit Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port Number	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.3.13.4 STS

The STS Properties pane allows you to view and update DS3XM-12 Synchronous Transport Signal (STS) information. The STS Properties pane contains the following tabs:

- C.3.13.4.1 STS Thresh 15 Min Tab, page C-766
- C.3.13.4.2 STS Thresh 1 Day Tab, page C-767
- C.3.13.4.3 Customer Info Tab, page C-767

C.3.13.4.1 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute STS information for the DS3XM-12 card.

Table C-1047 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

Table C-1047 Field Descriptions for the STS Thresh 15 Min Tab (continued)

Field	Description
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.13.4.2 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the DS3XM-12 card.

Table C-1048 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.3.13.4.3 Customer Info Tab

The Customer Info tab displays the customer information.

Table C-1049 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	Displays the customer ID.
Service ID	Displays the service ID.

C.3.13.5 VT

The VT Properties pane allows you to view and update DS3XM-12 virtual tributary information. The VT Properties pane contains the following tabs:

- C.3.13.5.1 VT Thresh 15 Min Tab, page C-768
- C.3.13.5.2 VT Thresh 1 Day Tab, page C-768
- C.3.13.5.3 Customer Info Tab, page C-769

C.3.13.5.1 VT Thresh 15 Min Tab

The VT Thresh 15 Min tab displays near- and far-end 15-minute VT threshold information.

Table C-1050 Field Descriptions for the VT Thresh 15 Min Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.
Far End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.

C.3.13.5.2 VT Thresh 1 Day Tab

The VT Thresh 1 Day tab displays near- and far-end 1-day VT threshold information.

Table C-1051 Field Descriptions for the VT Thresh 1 Day Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.
Far End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.

Table C-1051 Field Descriptions for the VT Thresh 1 Day Tab (continued)

Field	Description
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.

C.3.13.5.3 Customer Info Tab

The Customer Info tab displays the customer information.

Table C-1052 Field Descriptions for the Customer Info Tab

Field	Description
VT Number	Displays VT number information.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.13.6 DS-1

The DS-1 Properties pane allows you to view and update DS3XM-12 DS-1 information. The DS-1 Properties pane contains the following tabs:

- C.3.13.6.1 DS-1 Config Tab, page C-769
- C.3.13.6.2 Path Thresh 15 Min Tab, page C-769
- C.3.13.6.3 Path Thresh 1 Day Tab, page C-770

C.3.13.6.1 DS-1 Config Tab

The DS-1 Config tab allows you to view and change the DS-1 configuration settings for the DS3XM-12 card.

Table C-1053 Field Descriptions for the DS-1 Config Tab

Field	Description
Port Number	Displays the port number information.
Port Name	Allows you to add a name for the optical port. The name can contain up to 32 alphanumeric or special characters. By default, the port name is blank.
Line Type	Allows you to select the line framing type.
FDL Mode	Allows you to select the facility data link mode.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.13.6.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path threshold information for the DS3XM-12 card.

Table C-1054 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the port number information.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number information.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.13.6.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path threshold information for the DS3XM-12 card.

Table C-1055 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number information.
CV-P	Displays the coding violations path information.

Table C-1055 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number information.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
CSS-P	Displays the controlled slip seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
SEFS-P	Displays the severely errored framing seconds path information.
ESNE	Displays the network performance errored seconds (near end) during a fixed measurement interval.
SESNE	Displays the network performance severely errored seconds (near end) during a fixed measurement interval.
UASNE	Displays the network performance unavailable seconds (near end) during a fixed measurement interval.
ESFE	Displays the network performance errored seconds (far end) during a fixed measurement interval.
SESFE	Displays the network performance severely errored seconds (far end) during a fixed measurement interval.
UASFE	Displays the network performance unavailable seconds (far end) during a fixed measurement interval.

C.3.13.7 Loopback

The Loopback Properties pane allows you to view and update DS3XM-12 loopback information. The Properties pane contains the following tabs:

- C.3.13.7.1 DS-3 Tab, page C-771
- C.3.13.7.2 DS-1 Tab, page C-772

C.3.13.7.1 DS-3 Tab

The DS-3 tab allows you to view and change the DS-3 loopback information of the DS3XM-12 card.

Table C-1056 Field Descriptions for the DS-3 Tab

Subfield	Description
Port Number	Displays the optical port number.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15454. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a DS-3 port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.13.7.2 DS-1 Tab

The DS-1 tab allows you to view and change the DS-1 loopback information of the DS3XM-12 card.

Table C-1057 Field Descriptions for the DS-1 Tab

Subfield	Description
Port Number	Displays the optical port number.
Derived State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT). **Note** The Derived State field is available only for release 3.4.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).
Send Code	Allows you to select No Code (default) or Line Loop Code. Selecting Line Loop Code inserts a line loop activate Far End Action Code (FEAC) in the CBIT overhead transmitting to the connected facility. This code initiates a loopback from the facility to the ONS 15454. Selecting No Code sends a line loop deactivate FEAC code to the connected equipment, which removes the loopback. You can also insert an FEAC for the 28 individual DS-1 circuits transmuxed into a DS-3 circuit.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.13.8 Protection

The Protection Properties pane allows you to view and update DS3XM-12 protection group information.

Table C-1058 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.13.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update DS3XM-12 alarm profile information.

Table C-1059 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.13.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1060 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.13.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the DS3XM-12 card.

Table C-1061 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.14 Slot Properties—E-1

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH E-1 cards (E-1-N-14) provide 14 E-1 ports. Each port operates at 2.048 Mb/s.

For the E-1 card, the slot properties pane displays the following properties: Module View, Identification, Line, VC-12, Loopback, Protection, and Alarm Behavior.

C.3.14.1 Module View

The Module View displays a graphic of the E-1 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.14.2 Identification

The Identification Properties pane allows you to view and update E-1 identification information.

Table C-1062 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.

Table C-1062 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.14.3 Line

The Line Properties pane allows you to view and update E-1 line performance monitoring information.

Table C-1063 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the port number.
Port Name	Allows you to add a name for the port.
SD BER	Sets the signal deterioration bit error rate.
SF BER	Sets the signal failure bit error rate.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the E1 transmission coding type.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Threshold 15 Minutes	
Port Number	Displays the port number
CV-L	Coding violations - line
ES-L	Errored seconds - line
SES-L	Severely errored seconds - line
Line Threshold 1 Day	
Port Number	Displays the port number
CV-L	Coding violations - line

Table C-1063 Field Descriptions for the Line Properties Pane (continued)

Field	Description
ES-L	Errored seconds - line
SES-L	Severely errored seconds - line
Path Threshold 15 Minutes - Near End, Far End	
Port Number	Displays the port number
CV-P/EB-P	Coding violations/errored bits - path
BBE-P	Background block errors - path
ES-P	Errored seconds - path
SES-P	Severely errored seconds - path
UAS-P	Unavailable seconds - path
AISS-P	Alarm indication signal seconds - path
Path Threshold 1 Day - Near End, Far End	
Port Number	Displays the port number
CV-P/EB-P	Coding violations/errored bits - path
BBE-P	Background block errors - path
ES-P	Errored seconds - path
SES-P	Severely errored seconds - path
UAS-P	Unavailable seconds - path
AISS-P	Alarm indication signal seconds - path

C.3.14.4 VC-12

The VC-12 Properties pane allows you to view and update E-1 VC-12 information.

Table C-1064 Field Descriptions for the VC-12 Properties Pane

Field	Description
Threshold 15 Minutes - Near End, Far End	
VC Number	The VC number
EB	Errored bits
BBE	Background block errors
ES	Errored seconds
SES	Severely errored seconds
UAS	Unavailable seconds
Threshold 1 Day - Near End, Far End	
VC Number	The VC number
EB	Errored bits
BBE	Background block errors
ES	Errored seconds

Table C-1064 Field Descriptions for the VC-12 Properties Pane (continued)

Field	Description
SES	Severely errored seconds
UAS	Unavailable seconds
Customer Info	
VC Number	The VC number
Customer ID	The user-defined customer ID number
Service ID	The user-defined service ID number

C.3.14.5 Loopback

The Loopback Properties pane allows you to view and update E-1 loopback information.

Table C-1065 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.3.14.6 Protection

The Protection Properties pane allows you to view and update E-1 protection group information.

Table C-1066 Field descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.14.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E-1 alarm profile information.

Table C-1067 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.

Table C-1067 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.15 Slot Properties—E1_21_E3_DS3_3 and E1_63_E3_DS3_3

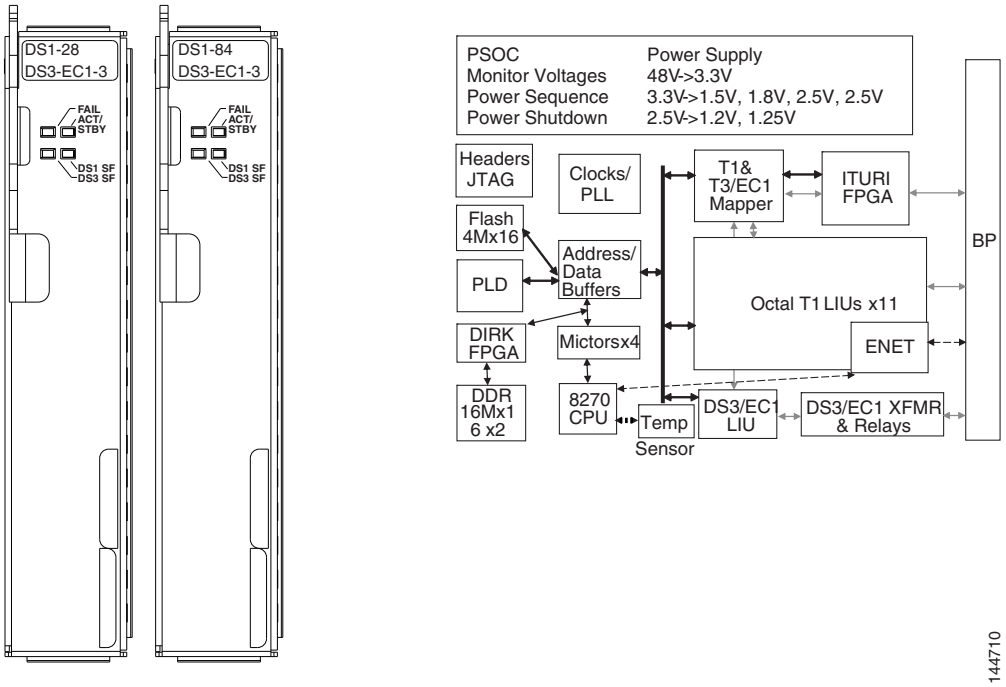
The ONS 15310 MA SDH E1_21_E3_DS3_3 and E1_63_E3_DS3_3 cards provide 21 and 63 Telcordia-compliant E1 ports, and three E3/DS-3 ports. Each E1 port operates at 2.048 Mb/s. Each E3/DS-3 port operates at 34.368 Mb/s/44.736 Mb/s over a single 75-ohm, 728-A or equivalent coaxial span. These cards can operate as working or protect cards in 1:1 protection schemes.

In addition, the E1_21_E3_DS3_3 card provides retiming, so that any outgoing E1 signal can be retimed to eliminate accumulated jitter and wander at the point of egress from a synchronous network. Any incoming E1 signal from the transport element can also be used as a timing source.

The E1_21_E3_DS3_3 and E1_63_E3_DS3_3 cards can be installed in slots 1, 2, 5, and 6. Cards installed in slots 1 and 2 correspond with the electrical interface assembly (EIA) installed on side A at the rear of the shelf assembly, and cards in slots 5 and 6 correspond with the EIA installed on side B.

The following figure shows the E1_21_E3_DS3_3 and E1_63_E3_DS3_3 card faceplates and block diagram.

Figure C-65 E1_21_E3_DS3_3 and E1_63_E3_DS3_3 Card Faceplates and Block Diagram



For the E1_21_E3_DS3_3 and E1_63_E3_DS3_3 cards, the slot properties pane displays the following properties: Module View, Identification, Broadband Ports, E1, DS3, E3, Protection, and Info.

C.3.15.1 Module View

The Module View displays a graphic of the E1_21_E3_DS3_3 or E1_63_E3_DS3_3 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphics.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its ports. Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the module.

C.3.15.2 Identification

The Identification Properties pane allows you to view and update E1_21_E3_DS3_3 or E1_63_E3_DS3_3 card identification information.

Table C-1068 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.

Table C-1068 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.15.3 Broadband Ports

The Broadband Ports Properties pane allows you to view, create, and delete DS-3 and E3 broadband ports.

Table C-1069 Field Descriptions for the Broadband Ports

Field	Description
Create	Click the **Create** button to launch the Create Port dialog box and create a new broadband port. Use the **Port Number** drop-down list to choose an available port. Use the **Port Rate** drop-down list to specify the port rate (DS-3 or E3). After making your selections, click **OK**.
Delete	Click the **Delete** button to delete an existing DS-3 or E3 broadband port.
E3/DS3	
Port Number	Displays the DS-3 or E3 port number.
Rate	Displays the rate that the slot is provisioned for.

C.3.15.4 E1

The E1 Properties pane allows you to view and update E1 information for the card. The E1 Properties pane contains the following tabs:

- C.3.15.4.1 Line Config Tab, page C-781
- C.3.15.4.2 Line Thresh 15 Min Tab, page C-782
- C.3.15.4.3 Line Thresh 1 Day Tab, page C-782
- C.3.15.4.4 Electric Path Thresh 15 Min Tab, page C-783
- C.3.15.4.5 Electric Path Thresh 1 Day Tab, page C-783
- C.3.15.4.6 VC LO Thresh 15 Min Tab, page C-784
- C.3.15.4.7 VC LO Thresh 1 Day Tab, page C-784

- C.3.15.4.8 Alarm Behavior Tab, page C-785
- C.3.15.4.9 Loopback Tab, page C-785
- C.3.15.4.10 J1 Path Trace Tab, page C-786
- C.3.15.4.11 Customer Info Tab, page C-786

C.3.15.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the port.

Table C-1070 Field Descriptions for the Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the transmission coding type.
Admin State	The port administration state. It can be: • Unlocked • Locked, disabled • Locked, maintenance • Unlocked, automatic in service
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Send DoNot Use	When checked, sends a do not use (DUS) message on the S1 byte.
Provides Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Message	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS-V for DS1-AIS/Defects	When checked, sends an AIS-V instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.

Table C-1070 Field Descriptions for the Line Config Tab (continued)

Field	Description
Admin SSM	If the node does not receive an SSM signal, it defaults to STU. Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
SA Bit	Transmits the SSM message.

C.3.15.4.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold settings of the port.

Table C-1071 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port No.	Port number.
EB-L	Errored blocks line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.4.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold settings of the port.

Table C-1072 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Port No.	Port number.
EB-L	Errored blocks line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.4.4 Electric Path Thresh 15 Min Tab

The Electric Path Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute electric path threshold settings of the port.

Table C-1073 Field Descriptions for the Electric Path Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Port number.
BBE	Background block errors.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	Alarm indication signal seconds path.
Far End	
Port No.	Port number.
BBE	Background block errors.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.4.5 Electric Path Thresh 1 Day Tab

The Electric Path Thresh 1 Day tab allows you to view and change the near- and far-end 1-day electric path threshold settings of the port.

Table C-1074 Field Descriptions for the Electric Path Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Port number.
BBE	Background block errors.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	Alarm indication signal seconds path.
Far End	
Port No.	Port number.
BBE	Background block errors.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.

Table C-1074 Field Descriptions for the Electric Path Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Unavailable seconds path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.4.6 VC LO Thresh 15 Min Tab

The VC LO Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute VC low order threshold settings of the port.

Table C-1075 Field Descriptions for the VC LO Thresh 15 Min Tab

Field	Description
Near End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Far End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.4.7 VC LO Thresh 1 Day Tab

The VC LO Thresh 1 Day tab allows you to view and change the near- and far-end 1-day VC low order threshold settings of the port.

Table C-1076 Field Descriptions for the VC LO Thresh 1 Day Tab

Field	Description
Near End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.

Table C-1076 Field Descriptions for the VC LO Thresh 1 Day Tab (continued)

Field	Description
FC	Failure count.
Far End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.4.8 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-1077 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.15.4.9 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-1078 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be locked, Maintenance before you can configure the loopback type.

Table C-1078 Field Descriptions for the Loopback Tab (continued)

Field	Description
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.3.15.4.10 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-1079 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
VC4 No.	Displays the VC4 number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.15.4.11 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-1080 Field Descriptions for the Customer Info Tab

Field	Description
STS	
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.
VT	
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.15.5 DS3

The DS3 Properties pane allows you to view and update DS-3 information for the card. The DS3 Properties pane contains the following tabs:

- C.3.15.5.1 Line Config Tab, page C-787
- C.3.15.5.2 Line Thresh 15 Min Tab, page C-788
- C.3.15.5.3 Line Thresh 1 Day Tab, page C-788
- C.3.15.5.4 PBit Thresh 15 Min Tab, page C-788
- C.3.15.5.5 PBit Thresh 1 Day Tab, page C-789
- C.3.15.5.6 CPBit Thresh 15 Min Tab, page C-789
- C.3.15.5.7 CPBit Thresh 1 Day Tab, page C-789
- C.3.15.5.8 VC4 Thresh 15 Min Tab, page C-790
- C.3.15.5.9 VC4 Thresh 1 Day Tab, page C-791
- C.3.15.5.10 VC LO Thresh 15 Min Tab, page C-791
- C.3.15.5.11 VC LO Thresh 1 Day Tab, page C-792
- C.3.15.5.12 Alarm Behavior Tab, page C-792
- C.3.15.5.13 Loopback Tab, page C-793
- C.3.15.5.14 J1 Path Trace Tab, page C-793
- C.3.15.5.15 Customer Info Tab, page C-794

C.3.15.5.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the port.

Table C-1081 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the port.
Port Name	Allows you to add a name for the port.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.15.5.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold settings of the port.

Table C-1082 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
EB-L	Displays the errored blocks line information.
ES-L	Displays the errored seconds line information.
SES-L	Displays the severely errored seconds line information.
LOSS-L	Displays the loss of signal line information.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold settings of the port.

Table C-1083 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
EB-L	Displays the errored blocks line information.
ES-L	Displays the errored seconds line information.
SES-L	Displays the severely errored seconds line information.
LOSS-L	Displays the loss of signal line information.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.4 PBit Thresh 15 Min Tab

The PBit Thresh 15 Min tab displays 15-minute PBit path threshold information of the port.

Table C-1084 Field Descriptions for the PBit Thresh 15 Min Tab

Field	Description
Port No.	Displays the port number.
EB-P	Displays the errored blocks path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.5 PBit Thresh 1 Day Tab

The PBit Thresh 1 Day tab displays 1-day PBit path threshold information of the port.

Table C-1085 Field Descriptions for the PBit Thresh 1 Day Tab

Field	Description
Port No.	Displays the optical port number.
EB-P	Displays the errored blocks path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.6 CPBit Thresh 15 Min Tab

The CPBit Thresh 15 Min tab displays near- and far-end 15-minute CPBit path threshold information of the port.

Table C-1086 Field Descriptions for the CPBit Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the port number.
EB-P	Displays the errored blocks path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the port number.
EB-P	Displays the errored blocks path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal–path information.
UAS-P	Displays the unavailable seconds path information.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.7 CPBit Thresh 1 Day Tab

The CPBit Thresh 1 Day tab displays near- and far-end 1-day CPBit path threshold information of the port.

Table C-1087 Field Descriptions for the CPBit Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the port number.
EB-P	Displays the errored blocks path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the port number.
EB-P	Displays the errored blocks path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal–path information.
UAS-P	Displays the unavailable seconds path information.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.8 VC4 Thresh 15 Min Tab

The VC4 Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute VC4 threshold settings of the port.

Table C-1088 Field Descriptions for the VC4 Thresh 15 Min Tab

Field	Description
Near End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Far End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.9 VC4 Thresh 1 Day Tab

The VC4 Thresh 1 Day tab allows you to view and change the near- and far-end 1-day VC4 threshold settings of the port.

Table C-1089 Field Descriptions for the VC4 Thresh 1 Day Tab

Field	Description
Near End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Far End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.10 VC LO Thresh 15 Min Tab

The VC LO Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute VC low order threshold settings of the port.

Table C-1090 Field Descriptions for the VC LO Thresh 15 Min Tab

Field	Description
Near End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Far End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.

Table C-1090 Field Descriptions for the VC LO Thresh 15 Min Tab (continued)

Field	Description
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.11 VC LO Thresh 1 Day Tab

The VC LO Thresh 1 Day tab allows you to view and change the near- and far-end 1-day VC low order threshold settings of the port.

Table C-1091 Field Descriptions for the VC LO Thresh 1 Day Tab

Field	Description
Near End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Far End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.5.12 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-1092 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.

Table C-1092 Field Descriptions for the Alarm Behavior Tab (continued)

Field	Description
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.15.5.13 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-1093 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.15.5.14 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-1094 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
VC4 Number	Displays the VC4 number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

Table C-1094 Field Descriptions for the J1 Path Trace Tab (continued)

Field	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.15.5.15 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-1095 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.15.6 E3

The E3 Properties pane allows you to view and update E3 information for the card. The E3 Properties pane contains the following tabs:

- C.3.15.6.1 Line Config Tab, page C-794
- C.3.15.6.2 Line Thresh 15 Min Tab, page C-795
- C.3.15.6.3 Line Thresh 1 Day Tab, page C-795
- C.3.15.6.4 Electric Path Thresh 15 Min Tab, page C-796
- C.3.15.6.5 Electric Path Thresh 1 Day Tab, page C-796
- C.3.15.6.6 VC4 Thresh 15 Min Tab, page C-796
- C.3.15.6.7 VC4 Thresh 1 Day Tab, page C-797
- C.3.15.6.8 VC LO Thresh 15 Min Tab, page C-797
- C.3.15.6.9 VC LO Thresh 1 Day Tab, page C-798
- C.3.15.6.10 Alarm Behavior Tab, page C-799
- C.3.15.6.11 Loopback Tab, page C-799
- C.3.15.6.12 J1 Path Trace Tab, page C-800
- C.3.15.6.13 Customer Info Tab, page C-800

C.3.15.6.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the port.

Table C-1096 Field Descriptions for the Line Config Tab

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Admin State	The port administration state. It can be: • Unlocked • Locked, disabled • Locked, maintenance • Unlocked, automatic in service
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.15.6.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold settings of the port.

Table C-1097 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port No.	Displays the port number.
EB-L	Displays the errored blocks line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Displays the loss of signal line.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold settings of the port.

Table C-1098 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Port No.	Displays the port number.
EB-L	Displays the errored blocks line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.

Table C-1098 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
LOSS-L	Displays the loss of signal line.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.4 Electric Path Thresh 15 Min Tab

The Electric Path Thresh 15 Min tab allows you to view and change the 15-minute electrical path threshold settings of the port.

Table C-1099 Field Descriptions for the Electric Path Thresh 15 Min Tab

Field	Description
Port No.	Port number.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.5 Electric Path Thresh 1 Day Tab

The Electric Path Thresh 1 Day tab allows you to view and change the 1-day electrical path threshold settings of the port.

Table C-1100 Field Descriptions for the Electric Path Thresh 1 Day Tab

Field	Description
Port No.	Port number.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.6 VC4 Thresh 15 Min Tab

The VC4 Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute VC4 threshold settings of the port.

Table C-1101 Field Descriptions for the VC4 Thresh 15 Min Tab

Field	Description
Near End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.

Table C-1101 Field Descriptions for the VC4 Thresh 15 Min Tab (continued)

Field	Description
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Far End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.7 VC4 Thresh 1 Day Tab

The VC4 Thresh 1 Day tab allows you to view and change the near- and far-end 1-day VC4 threshold settings of the port.

Table C-1102 Field Descriptions for the VC4 Thresh 1 Day Tab

Field	Description
Near End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Far End	
VC-4 Number	VC-4 number.
EB-HP	Errored blocks–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
FC-HP	Failure count–higher-order path.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.8 VC LO Thresh 15 Min Tab

The VC LO Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute VC low order threshold settings of the port.

Table C-1103 Field Descriptions for the VC LO Thresh 15 Min Tab

Field	Description
Near End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Far End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.9 VC LO Thresh 1 Day Tab

The VC LO Thresh 1 Day tab allows you to view and change the near- and far-end 1-day VC low order threshold settings of the port.

Table C-1104 Field Descriptions for the VC LO Thresh 1 Day Tab

Field	Description
Near End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.
FC	Failure count.
Far End	
VT No.	VT number.
EB	Errored blocks.
ES	Errored seconds.
SES	Severely errored seconds.
UAS	Unavailable seconds.

Table C-1104 Field Descriptions for the VC LO Thresh 1 Day Tab (continued)

Field	Description
FC	Failure count.
Reset To Defaults	Resets the value of the parameters to the default value.

C.3.15.6.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update port alarm profile information.

Table C-1105 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.15.6.11 Loopback Tab

The Loopback tab allows you to view and update port loopback information.

Table C-1106 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Send Code	Allows you to send loopback commands to the far end.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.
Inhibit FE Loopback	If the Inhibit FE Loopback check box is checked for a port, that port will ignore any FEAC line loop codes and will not loop back. The port can still be put into loopback manually using the Loopback Type column even if the Inhibit FE Loopback check box is selected. Only DS-3 ports can be configured to inhibit responding to FEAC loopback commands.

C.3.15.6.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-1107 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
VC4 Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.3.15.6.13 Customer Info Tab

The Customer Info tab displays the port customer information.

Table C-1108 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the synchronous transport signal number.
Customer ID	The customer ID.
Service ID	The service ID.

C.3.15.7 Protection

The Protection Properties pane allows you to view and update E1_21_E3_DS3_3 or E1_63_E3_DS3_3 protection group information.

Table C-1109 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays the list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.15.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E1_21_E3_DS3_3 or E1_63_E3_DS3_3 card.

Table C-1110 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.16 Slot Properties—E1-42

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 42-port ONS 15454 SDH E1-42 card provides 42 ITU-compliant, G.703 E-1 ports. Each port of the E1-42 card operates at 2.048 Mb/s over a 120-ohm, twisted-pair copper cable. Front mount electrical connection is done using the FMEC E1-120 NP card for unprotected operation, the FMEC E1-120PROA for 1:3 protection in the left side of the shelf, or the FMEC E1-120PROB for 1:3 protection on the right side of the shelf.

For the E1-42 module, the slot properties pane displays the following properties: Module View, Identification, Line, VC-12, VC-4, Loopback, Protection, Alarm Behavior, J1 Path Trace, and Info.

C.3.16.1 Module View

The Module View displays a graphic of the E1-42 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphics.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its ports. Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the module.

C.3.16.2 Identification

The Identification Properties pane allows you to view and update E1-42 card identification information.

Table C-1111 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.

Table C-1111 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.16.3 Line

The Line Properties pane allows you to view and update E1-42 optical line performance monitoring information. The Line Properties pane contains the following tabs:

- C.3.16.3.1 Line Config Tab, page C-802
- C.3.16.3.2 MS Thresh 15 Min Tab, page C-803
- C.3.16.3.3 MS Thresh 1 Day Tab, page C-803
- C.3.16.3.4 Elect Path Thresh 15 Min Tab, page C-803
- C.3.16.3.5 Elect Path Thresh 1 Day Tab, page C-804

C.3.16.3.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the E1-42 card.

Table C-1112 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Line Type	Sets the line framing type.
Line Coding	Allows you to define the transmission coding type.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.

Table C-1112 Field Descriptions for the Line Config Tab (continued)

Field	Description
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.16.3.2 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view the 15-minute multiplexer section threshold of the E1-42 card.

Table C-1113 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number
EB-L	Errored blocks line
ES-L	Errored seconds line
SES-L	Severely errored seconds line
LOSS-L	Loss of signal line

C.3.16.3.3 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view the 1-day multiplexer section threshold of the E1-42 card.

Table C-1114 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number
EB-L	Errored blocks line
ES-L	Errored seconds line
SES-L	Severely errored seconds line
LOSS-L	Loss of signal line

C.3.16.3.4 Elect Path Thresh 15 Min Tab

The Elect Path Thresh 15 Min tab allows you to view the near- and far-end 15-minute electrical path threshold settings of the E1-42 card.

Table C-1115 Field Descriptions for the Elect Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number
EB-P	Errored blocks path
BBE-P	Background block errors path

Table C-1115 Field Descriptions for the Elect Path Thresh 15 Min Tab (continued)

Field	Description
ES-P	Errored seconds path
SES-P	Severely errored seconds path
UAS-P	Unavailable seconds path
AISS-P	Alarm indication signal seconds - path
Far End	
Port Number	Displays the port number
EB-P	Errored blocks path
BBE-P	Background block errors path
ES-P	Errored seconds path
SES-P	Severely errored seconds path
UAS-P	Unavailable seconds path
AISS-P	Alarm indication signal seconds - path

C.3.16.3.5 Elect Path Thresh 1 Day Tab

The Elect Path Thresh 1 Day tab allows you to view the near- and far-end 1-day electrical path threshold settings of the E1-42 card.

Table C-1116 Field Descriptions for the Elect Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number
EB-P	Errored blocks path
BBE-P	Background block errors path
ES-P	Errored seconds path
SES-P	Severely errored seconds path
UAS-P	Unavailable seconds path
AISS-P	Alarm indication signal seconds path
Far End	
Port Number	Displays the port number
EB-P	Errored blocks path
BBE-P	Background block errors path
ES-P	Errored seconds path
SES-P	Severely errored seconds path
UAS-P	Unavailable seconds path
AISS-P	Alarm indication signal seconds path

C.3.16.4 VC-12

The VC-12 Properties pane allows you to view and update E1-42 VC-12 information. The Properties pane contains the following tabs:

- C.3.16.4.1 Thresh 15 Min Tab, page C-805
- C.3.16.4.2 Thresh 1 Day Tab, page C-805
- C.3.16.4.3 Customer Info Tab, page C-806

C.3.16.4.1 Thresh 15 Min Tab

The Thresh 15 Min tab allows you to view the near- and far-end 15-minute path threshold settings of the E1-42 card.

Table C-1117 Field Descriptions for the Thresh 15 Min Tab

Field	Description
Near End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Far End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.

C.3.16.4.2 Thresh 1 Day Tab

The Thresh 1 Day tab allows you to view the near- and far-end 1-day path threshold settings of the E1-42 card.

Table C-1118 Field Descriptions for the Thresh 1 Day Tab

Field	Description
Near End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.

Table C-1118 Field Descriptions for the Thresh 1 Day Tab (continued)

Field	Description
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Far End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.

C.3.16.4.3 Customer Info Tab

The Customer Info tab allows you to view customer information.

Table C-1119 Field Descriptions for the Customer Info Tab

Field	Description
VC Number	Displays the VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.16.5 VC-4

The VC-4 Properties pane allows you to view and update E1-42 VC-4 information. The Properties pane contains the Customer Info tab.

C.3.16.5.1 Customer Info Tab

The Customer Info tab allows you to view customer information.

Table C-1120 Field Descriptions for the Customer Info Tab

Field	Description
VC Number	Displays the VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.16.6 Loopback

The Loopback Properties pane allows you to view and update E1-42 loopback information.

Table C-1121 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port for terminal loopback (Inward) or Facility (Line), or clear the current loopback (None).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.16.7 Protection

The Protection Properties pane allows you to view and update E1-42 protection group information.

Table C-1122 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays the list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.16.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E1-42 alarm profile information.

Table C-1123 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to all ports	When clicked, forces all the ports to the selected alarm profile.

C.3.16.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table C-1124 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
VC4 Number	Displays the VC number.

Table C-1124 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents the machine-generated J1/J2 payload label byte.

C.3.16.10 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E1-42 card.

Table C-1125 Field Descriptions for the Info Properties Pane

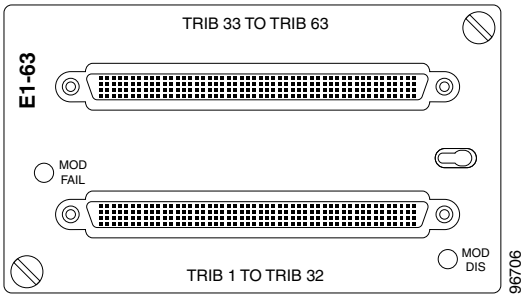
Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.17 Slot Properties—E1-63 (ONS 15305 CTC)

The Cisco ONS 15305 CTC E1-63 module contains 63 E1 interfaces. The E1 traffic is mapped into VC-12 containers and multiplexed together. Two high-density, LFH-type connectors are used to interface the 63 E1s: 32 interfaces in the bottom connector, and 31 interfaces in the top connector (one pair remains unconnected). The module supports transparent data (G.703) and ISDN PRA. The following figure shows the module diagram.

Figure C-66 High-Density 63xE1 Module, E1-63



For the E1-63 module, the slot properties pane displays the following properties: Module View, Identification, Line, and Loopback.

C.3.17.1 Module View

The Module View displays a graphic of the E1-63 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.3.17.2 Identification

The Identification Properties pane allows you to view and update E1-63 identification information.

Table C-1126 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Displays the alarm profile for the port.

C.3.17.3 Line

The Line Properties pane allows you to view and update line card information.

Table C-1127 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Line Type	Allows you to select the line framing type: pra, tra, or pra-fixed.
Line Coding	Allows you to define the transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.17.4 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table C-1128 Field Descriptions for the Loopback Properties Pane

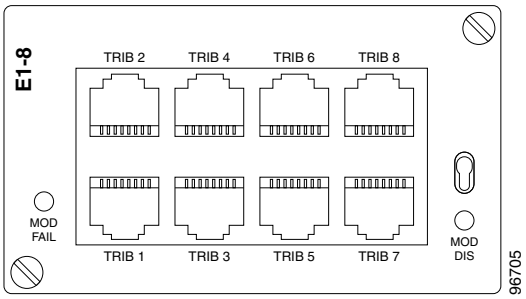
Field	Description
Port Number	Displays the port number.
Administration State	Allows you to select the administration state of the port: In Service (IS) or Out of Service (OOS).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.18 Slot Properties—E1-8 (ONS 15305 CTC)

The Cisco ONS 15305 CTC E1-8 module contains eight E1 interfaces. The E1 traffic is mapped into VC-12 containers and multiplexed together. The physical interface uses an RJ-45 connector and supports only a 120-ohm differential interface. The module does not contain any IP functionality. The interface supports both transparent data (G.703) and the NT functionality of ISDN PRA according to ETSI 300 233. The following figure shows the module diagram.

Figure C-67 E1 Tributary Module, E1-8



For the E1-8 module, the slot properties pane displays the following properties: Module View, Identification, Line, and Loopback.

C.3.18.1 Module View

The Module View displays a graphic of the E1-8 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.3.18.2 Identification

The Identification Properties pane allows you to view and update E1-8 identification information.

Table C-1129 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Displays the alarm profile for the port.

C.3.18.3 Line

The Line Properties pane allows you to view and update line card information.

Table C-1130 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Line Type	Allows you to select the line framing type: pra, tra, or pra-fixed.
Line Coding	Allows you to define the transmission coding type as HDB3.

Table C-1130 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.18.4 Loopback

The Loopback Properties pane allows you to view and update E1-8 loopback information.

Table C-1131 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Allows you to select the administration state of the port: In Service (IS) or Out of Service (OOS).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.19 Slot Properties—E1-N-14

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 14-port ONS 15454 SDH E1-N-14 card provides 14 ITU-compliant, G.703 E-1 ports. Each port of the card operates at 2.048 Mb/s over a 120-ohm, twisted-pair copper cable (with FMEC-E1) or over a 75-ohm unbalanced coaxial cable (with FMEC-E1).

For the E1-N-14 module, the slot properties pane displays the following properties: Module View, Identification, Line, VC-12, VC-4, Loopback, Protection, Alarm Behavior, J1 Path Trace, and Info.

C.3.19.1 Module View

The Module View displays a graphic of the E1-N-14 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphics.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its ports. Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the module.

C.3.19.2 Identification

The Identification Properties pane allows you to view and update E1-N-14 card identification information.

Table C-1132 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.19.3 Line

The Line Properties pane allows you to view and update E1-N-14 optical line performance monitoring information. The Line Properties pane contains the following tabs:

- C.3.19.3.1 Line Config Tab, page C-814
- C.3.19.3.2 MS Thresh 15 Min Tab, page C-814
- C.3.19.3.3 MS Thresh 1 Day Tab, page C-814
- C.3.19.3.4 Elect Path Thresh 15 Min Tab, page C-815
- C.3.19.3.5 Elect Path Thresh 1 Day Tab, page C-815

C.3.19.3.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the E1-N-14 card.

Table C-1133 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Line Type	Sets the line framing type.
Line Coding	Allows you to define the transmission coding type.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.19.3.2 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view the 15-minute multiplexer section threshold of the E1-N-14 card.

Table C-1134 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
EB-L	Errored blocks line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line.

C.3.19.3.3 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view the 1-day multiplexer section threshold of the E1-N-14 card.

Table C-1135 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
EB-L	Errored blocks line.
ES-L	Errored seconds line.

Table C-1135 Field Descriptions for the MS Thresh 1 Day Tab (continued)

Field	Description
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line.

C.3.19.3.4 Elect Path Thresh 15 Min Tab

The Elect Path Thresh 15 Min tab allows you to view the near- and far-end 15-minute electrical path threshold settings of the E1-N-14 card.

Table C-1136 Field Descriptions for the Elect Path Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
EB-P	Errored blocks path.
BBE-P	Background block errors path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	Alarm indication signal seconds path.
Far End	
Port Number	Displays the port number.
EB-P	Errored blocks path.
BBE-P	Background block errors path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	Alarm indication signal seconds path.

C.3.19.3.5 Elect Path Thresh 1 Day Tab

The Elect Path Thresh 1 Day tab allows you to view the near- and far-end 1-day electrical path threshold settings of the E1-N-14 card.

Table C-1137 Field Descriptions for the Elect Path Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
EB-P	Errored blocks path.
BBE-P	Background block errors path.
ES-P	Errored seconds path.

Table C-1137 Field Descriptions for the Elect Path Thresh 1 Day Tab (continued)

Field	Description
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	Alarm indication signal seconds path.
Far End	
Port Number	Displays the port number.
EB-P	Errored blocks path.
BBE-P	Background block errors path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
AISS-P	Alarm indication signal seconds path.

C.3.19.4 VC-12

The VC-12 Properties pane allows you to view and update E1-N-14 VC-12 information. The Properties pane contains the following tabs:

- C.3.19.4.1 Thresh 15 Min Tab, page C-816
- C.3.19.4.2 Thresh 1 Day Tab, page C-817
- C.3.19.4.3 Customer Info Tab, page C-817

C.3.19.4.1 Thresh 15 Min Tab

The Thresh 15 Min tab allows you to view the near- and far-end 15-minute path threshold settings of the E1-N-14 card.

Table C-1138 Field Descriptions for the Thresh 15 Min Tab

Field	Description
Near End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Far End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.

Table C-1138 Field Descriptions for the Thresh 15 Min Tab (continued)

Field	Description
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.

C.3.19.4.2 Thresh 1 Day Tab

The Thresh 1 Day tab allows you to view the near- and far-end 1-day path threshold settings of the E1-N-14 card.

Table C-1139 Field Descriptions for the Thresh 1 Day Tab

Field	Description
Near End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Far End	
VC Number	Displays the VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.

C.3.19.4.3 Customer Info Tab

The Customer Info tab allows you to view customer information.

Table C-1140 Field Descriptions for the Customer Info Tab

Field	Description
VC Number	Displays the VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.19.5 VC-4

The VC-4 Properties pane allows you to view and update E1-N-14 VC-4 information. The Properties pane contains the Customer Info tab.

C.3.19.5.1 Customer Info Tab

The Customer Info tab allows you to view customer information.

Table C-1141 Field Descriptions for the Customer Info Tab

Field	Description
VC Number	Displays the VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.19.6 Loopback

The Loopback Properties pane allows you to view and update E1-N-14 loopback information.

Table C-1142 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Loopback Type	Allows you to configure a port for terminal loopback (Inward) or Facility (Line), or clear the current loopback (None).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.19.7 Protection

The Protection Properties pane allows you to view and update E1-N-14 protection group information.

Table C-1143 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays the list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.19.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E1-N-14 alarm profile information.

Table C-1144 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to all ports	When clicked, forces all the ports to the selected alarm profile.

C.3.19.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table C-1145 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
VC4 Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents the machine-generated J1/J2 payload label byte.

C.3.19.10 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E1-N-14 card.

Table C-1146 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.20 Slot Properties—E3-12

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH E3-12 cards provides twelve E3 ports. Each port operates at 34.368 Mb/s.

For the E3-12 module, the slot properties pane displays the following properties: Module View, Identification, Line, VC-3, VC-4, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.20.1 Module View

The Module View displays a graphic of the E3-12 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.20.2 Identification

The Identification Properties pane allows you to view and update E3-12 identification information.

Table C-1147 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.20.3 Line

The Line Properties pane allows you to view and update E3-12 line performance monitoring information.

Table C-1148 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the port number.
Port Name	Allows you to add a name for the port.
SD BER	Sets the signal deterioration bit error rate.
SF BER	Sets the signal failure bit error rate.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Threshold 15 Minutes	
Port Number	Displays the port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Line Threshold 1 Day	
Port Number	Displays the port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal line; number of 1-second intervals containing one or more LOS defects.
Path Threshold 15 Minutes	
Port Number	Displays the port number.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
Path Threshold 1 Day	
Port Number	Displays the port number.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.

C.3.20.4 VC-3

The VC-3 Properties pane allows you to view and update E3-12 VC-3 information.

Table C-1149 Field Descriptions for the VC-3 Properties Pane

Field	Description
Threshold 15 Minutes	
VC Number	The VC number.
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Threshold 1 Day	
VC Number	The VC number
EB-LP	Errored blocks–low-order path.
BBE-LP	Background block errors–low-order path.
ES-LP	Errored seconds–low-order path.
SES-LP	Severely errored seconds–low-order path.
UAS-LP	Unavailable seconds–low-order path.
Customer Info	
VC Number	The VC number
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.20.5 VC-4

The VC-4 Properties pane allows you to view and update E3-12 VC-4 information.

Table C-1150 Field Descriptions for the VC-4 Properties Pane

Field	Description
Threshold 15 Minutes	
VC Number	The VC number. Displays as VC4-*x*, where *x* equals 1, 2, 3, or 4.
EB-HP	Errored blocks–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
Threshold 1 Day	
VC Number	The VC number. Displays as VC4-*x*, where *x* equals 1, 2, 3, or 4.

Table C-1150 Field Descriptions for the VC-4 Properties Pane (continued)

Field	Description
EB-HP	Errored blocks–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.

C.3.20.6 Loopback

The Loopback Properties pane allows you to view and update E3-12 loopback information.

Table C-1151 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.3.20.7 Protection

The Protection Properties pane allows you to view and update E3-12 protection group information.

Table C-1152 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.20.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E3-12 alarm profile information.

Table C-1153 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.

Table C-1153 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.20.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve E3-12 J1 path trace information.

Table C-1154 Field Descriptions for the J1 Path Trace Properties Pane

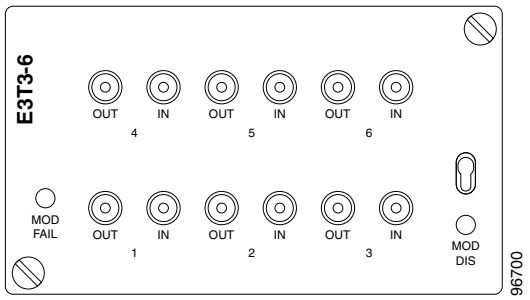
Field	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.21 Slot Properties—E3T3_6 (ONS 15305 CTC)

The Cisco ONS 15305 CTC E3T3_6 module contains six E3 interfaces. The E3 traffic is mapped into VC-3 containers and multiplexed together. The interfaces can be configured to E3 or T3. The physical connector for the interface is the miniature 1.0/2.3 type. The module does not contain any IP functionality. The interface supports transparent data (G.703). The following figure shows the module diagram.

Figure C-68 Hex E3/T3 Tributary Module, E3T3_6



For the E3T3_6 module, the slot properties pane displays the following properties: Module View, Identification, Line, and Loopback.

C.3.21.1 Module View

The Module View displays a graphic of the E3T3_6 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.3.21.2 Identification

The Identification Properties pane allows you to view and update E3T3_6 identification information.

Table C-1155 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Displays the alarm profile for the port.

C.3.21.3 Line

The Line Properties pane allows you to view and update line card information.

Table C-1156 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Line Type	Allows you to select the line framing type: pra, tra, or pra-fixed.
Line Coding	Allows you to define the transmission coding type.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.3.21.4 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table C-1157 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Allows you to select the administration state of the port: In Service (IS) or Out of Service (OOS).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.22 Slot Properties—EC1-12

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties. The EC1-12 provides 12 STS-1 electrical ports. Each port operates at 51.840 Mb/s.

For the EC1_12 module, the slot properties pane displays the following properties: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

C.3.22.1 Module View

The Module View displays a graphic of the EC1_12 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.3.22.2 Identification

The Identification Properties pane allows you to view and update EC1-12 identification information.

Table C-1158 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.3.22.3 Line

The Line Properties pane allows you to view and update EC1-12 optical line performance monitoring information.

Table C-1159 Field Descriptions for the Line Properties Pane

Subfield	Description
Line Config	
Port Number	Displays the EC1-12 part number (1 through 12).
Port Name	Allows you to add a name for the optical port. The name can contain up to 32 alphanumeric or special characters. By default, the port name is blank.
SF BER	Sets the signal failure bit error rate.
SD BER	Sets the signal deterioration bit error rate.
PJStsMon#	Allows you to set the STS that will be used for pointer justification. If set to zero, no STS is used.

Table C-1159 Field Descriptions for the Line Properties Pane (continued)

Subfield	Description
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Rx Equalization	For early EC1-12 card versions, equalization can be turned off if the line length is short or the environment is extremely cold; Rx Equalization should normally be set to On (checked, default).
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of valid input signal in *hh.mm*, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically. The range is from 0 to 48 hours, in 15-minute increments.
Line Threshold 15 Minutes	
Port Number	The optical port number (1 to 12).
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
PSC	Protection switching count (near-end only).
PSD	Protection switching duration (near-end only).
PPJC-PDET	Positive pointer justification count, STS path detected.
PPJC-PGEN	Positive pointer justification count, STS path generated.
NPJC-PDET	Negative pointer justification count, STS path detected.
NPJC-PGEN	Negative pointer justification count, STS path generated.
Line Threshold 1 Day	
Port Number	The optical port number (1 to 12).
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
PSC	Protection switching count (near-end only).
PSD	Protection switching duration (near-end only).
PPJC-PDET	Positive pointer justification count, STS path detected.
PPJC-PGEN	Positive pointer justification count, STS path generated.
NPJC-PDET	Negative pointer justification count, STS path detected.

Table C-1159 Field Descriptions for the Line Properties Pane (continued)

Subfield	Description
NPJC-PGEN	Negative pointer justification count, STS path generated.
Section Threshold 15 Minutes	
Port Number	Displays the optical port number (1 to 12).
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Section Threshold 1 Day	
Port Number	Displays the optical port number (1 to 12).
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.

C.3.22.4 STS

The STS Properties pane allows you to view and update EC1-12 synchronous transport signal (STS) information.

Table C-1160 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	Displays the STS number, intermediate path protection monitoring (IPPM), and XC loopback status.
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.

Table C-1160 Field Descriptions for the STS Properties Pane (continued)

Field	Description
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.3.22.5 Loopback

The Loopback Properties pane allows you to view and update EC1-12 loopback information.

Table C-1161 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number (1 to 12).
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.3.22.6 Protection

The Protection Properties pane allows you to view and update EC1-12 protection group information.

Table C-1162 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.3.22.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update EC1-12 alarm profile information.

Table C-1163 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.

Table C-1163 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.3.22.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table C-1164 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.3.23 Slot Properties—FMEC-E3/DS-3

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH FMEC-E3/DS-3 card provides front-mount electrical connection for 12 ITU-compliant, G.703 E-3 or DS-3 ports. With the FMEC-E3/DS-3 card, each interface of an E3-12 card operates at 34.368 Mb/s. Each interface of a DS-3i-N-12 card operates at 44.736 Mb/s over a 75-ohm unbalanced coaxial 1.0/2.3 miniature coaxial connector.

For the FMEC-E3/DS-3 module, the slot properties pane displays Module View and Identification properties.

C.3.23.1 Module View

The Module View displays a graphic of the FMEC-E3/DS-3 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

C.3.23.2 Identification

The Identification Properties pane allows you to view and update FMEC-E3/DS-3 identification information.

Table C-1165 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4 Ethernet Cards

This section describes the following Ethernet cards supported within Prime Optical:

- C.4.1 Slot Properties—CE-100T-8 (ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH), page C-833
- C.4.2 Slot Properties—CE-100T-8 (ONS 15454 SONET), page C-839
- C.4.3 Slot Properties—CE-100T-8 (ONS 15454 SDH), page C-846
- C.4.4 Slot Properties—CE-1000-4 (ONS 15454 SDH and ONS 15454 SONET), page C-853
- C.4.5 Slot Properties—CE-MR-6, page C-861
- C.4.6 Slot Properties—CE-MR-10, page C-870
- C.4.7 Slot Properties—E10/100T-4, page C-878
- C.4.8 Slot Properties—E1000-2, page C-882
- C.4.9 Slot Properties—E1000-2-G, page C-885
- C.4.10 Slot Properties—E100T-12, page C-889
- C.4.11 Slot Properties—E100T-G, page C-892
- C.4.12 Slot Properties—E100-8 (ONS 15305 CTC), page C-895
- C.4.13 Slot Properties—E100-WAN-8 (ONS 15305 CTC), page C-897
- C.4.14 Slot Properties—ETH1000, page C-900

- C.4.15 Slot Properties—G1000-2, page C-902
- C.4.16 Slot Properties—G1000-4, page C-906
- C.4.17 Slot Properties—GE-2 (ONS 15305 CTC), page C-911
- C.4.18 Slot Properties—GigE-WAN-2 (ONS 15305 CTC), page C-913
- C.4.19 Slot Properties—ML-100T-8, page C-916
- C.4.20 Slot Properties—ML1000-2, page C-922
- C.4.21 Slot Properties—ML100T-12, page C-932
- C.4.22 Slot Properties—ML100X-8, page C-942
- C.4.23 Slot Properties—ML-MR-10, page C-951
- C.4.24 Slot Properties—MS-ISC-100T, page C-959
- C.4.25 Slot Properties—RAN-SVC, page C-961
- C.4.26 Slot Properties—PT_10GE_4, page C-966
- C.4.27 Slot Properties—PTSA_GE, page C-974

C.4.1 Slot Properties—CE-100T-8 (ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH)

The slot properties pane displays information about the Cisco ONS 15310 CL, Cisco ONS 15310 MA SONET, or Cisco ONS 15310 MA SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The CE-100T-8 card is a subset of the ML-100T-8 card and provides an L1 mapping mode of operation. The card provides G-series-like behavior, but adds low- and high-order VCAT and link capacity adjustment scheme (LCAS) features, as well as GFP. The CE-100T-8 card on the ONS 15310 CL, ONS 15310 MA SONET, and ONS 15310 MA SDH interfaces interoperate with the CE-100T-8 card on the ONS 15454 platform. The card supports concatenation functions to construct transport trails (for example, STS-3c) for carrying packet data. The card provides contiguous, low-order, and high-order virtual concatenation. The CE-100T-8 card has its own PID and CLEI, and a port count that ranges from 1 to 8.

For the CE-100T-8 module, the slot properties pane displays the following properties, some of which apply only to a specific NE type: Module View, Identification, Line, Ether Loopback, Thresholds, Alarm Behavior, J1 Path Trace, and Info.

C.4.1.1 Module View

The Module View displays a graphic of the CE-100T-8 module that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.4.1.2 Identification

The Identification Properties pane allows you to view and update CE-100T-8 identification information.

Table C-1166 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.1.3 Line

The Line Properties pane allows you to view and update line performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.1.3.1 Ether Line Tab, page C-834
- C.4.1.3.2 POS Line Tab, page C-835

C.4.1.3.1 Ether Line Tab

The Ether Line tab allows you to view and change the Ethernet line settings of the CE-100T-8 card.

Table C-1167 Field Descriptions for the Ether Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	Shows the administration state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).

Table C-1167 Field Descriptions for the Ether Line Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.
Expected Speed	Displays the expected speed for the Ethernet ports. Values are Auto, 10 Mb/s, and Configurable.
Operating Speed	Displays the operating speed for the Ethernet ports. Values are Auto, 10 Mb/s, and NonConfigurable.
Expected Duplex	Expected setting of the port.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Enable Flow Control	Check this check box to enable flow control for the selected port.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
802.1Q VLAN CoS	Sets the IEEE 802.1Q standard VLAN class of service (CoS) threshold for priority queueing. Values are 0 through 7; 0 is the lowest priority and 7 is the highest priority.
IP ToS	Sets the IP type of service (ToS) byte value for priority queueing. Values are 0 through 255.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.1.3.2 POS Line Tab

The POS Line tab allows you to view and change the POS line settings of the CE-100T-8 card.

Table C-1168 Field Descriptions for the POS Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	Shows the administration state of the port: In Service (IS), Out of Service, Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.

Table C-1168 Field Descriptions for the POS Line Tab (continued)

Field	Description
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

C.4.1.4 Ether Loopback

The Loopback Properties pane allows you to view and update CE-100T-8 Ether loopback information.

Table C-1169 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.1.5 Thresholds

The Thresholds Properties pane allows you to view and create thresholds. The Thresholds Properties pane contains the following tabs:

- C.4.1.5.1 POS Ports Tab, page C-836
- C.4.1.5.2 Ether Ports Tab, page C-837

C.4.1.5.1 POS Ports Tab

The POS Ports tab allows you to view the thresholds for the POS ports.

Table C-1170 Field Descriptions for the POS Ports Tab

Field	Description
Index Number	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.

Table C-1170 Field Descriptions for the POS Ports Tab (continued)

Field	Description
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Threshold	Displays the number of occurrences for the rising threshold.
Falling Threshold	Displays the number of occurrences for the falling threshold field. In most cases, a falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.1.5.2 Ether Ports Tab

The Ether Ports tab allows you to view the thresholds for the Ethernet ports.

Table C-1171 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Threshold	Displays the number of occurrences for the rising threshold.
Falling Threshold	Displays the number of occurrences for the falling threshold field. In most cases, a falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the Ethernet ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.1.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information. The Alarm Behavior Properties pane contains the following tabs:

- C.4.1.6.1 Ether Alarm Behavior Tab, page C-838

- C.4.1.6.2 POS Alarm Behavior Tab, page C-838

C.4.1.6.1 Ether Alarm Behavior Tab

The Ether Alarm Behavior tab allows you to view and update Ether alarm profile information.

Table C-1172 Field Descriptions for the Ether Alarm Behavior Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.1.6.2 POS Alarm Behavior Tab

The POS Alarm Behavior tab allows you to view and update POS alarm profile information.

Table C-1173 Field Descriptions for the POS Alarm Behavior Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.1.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1174 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Mem Num	Displays the virtual concatenation (VCAT) member number.

Table C-1174 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.1.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CE-100T-8.

Table C-1175 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.2 Slot Properties—CE-100T-8 (ONS 15454 SONET)

The slot properties pane displays information about the Cisco ONS 15454 SONET module that is installed in the slot selected in the NE Explorer tree. Use this properties pane to change the card properties.

The CE-100T-8 is a Layer 1 mapper card with eight 10/100 Ethernet ports. It maps each port to a unique SONET circuit in a point-to-point configuration.

The CE-100T-8 cards allow you to provision and manage an Ethernet private line service as if it were a traditional SONET line. CE-100T-8 card applications include providing carrier-grade transparent LAN services (TLS), Ethernet private line services, and high-availability transport.

The CE-100T-8 card is a standard ONS line card and supports ITU-T G.707 and Telcordia GR-253-based standards for SONET. It offers the same carrier-class level of features and reliability as SONET optical cards or electrical line cards.

For the ONS 15454 SONET CE-100T-8 card, the slot properties pane displays the following properties: Module View, Identification, Line, Ether Loopback, Thresholds, Alarm Behavior, J1 Path Trace, and Info.

C.4.2.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that allows you to reset, delete, or change the card.

C.4.2.2 Identification

The Identification Properties pane allows you to view and update CE-100T-8 identification information.

Table C-1176 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.2.3 Line

The Line Properties pane allows you to view and update performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.2.3.1 Ether Line Tab, page C-841
- C.4.2.3.2 POS Line Tab, page C-841

C.4.2.3.1 Ether Line Tab

The Ether Line tab allows you to view and change the Ethernet line settings of the CE-100T-8 card.

Table C-1177 Field Descriptions for the Ether Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	Shows the administration state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.
Expected Speed	Displays the expected speed for the Ethernet ports. Values are Auto, 10 Mb/s, and Configurable.
Operating Speed	Displays the operating speed for the Ethernet ports. Values are Auto, 10 Mb/s, and NonConfigurable.
Expected Duplex	Expected setting of the port.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Enable Flow Control	Check this check box to enable flow control for the selected port.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
802.1Q VLAN CoS	Sets the IEEE 802.1Q standard VLAN class of service (CoS) threshold for priority queueing. Values are 0 through 7; 0 is the lowest priority and 7 is the highest priority.
IP ToS	Sets the IP type of service (ToS) byte value for priority queueing. Values are 0 through 255.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.2.3.2 POS Line Tab

The POS Line tab allows you to view and change POS line settings of the CE-100T-8 card.

Table C-1178 Field Descriptions for the POS Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	Shows the administration state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.

Table C-1178 Field Descriptions for the POS Line Tab (continued)

Field	Description
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

C.4.2.4 Ether Loopback

The Ether Loopback Properties pane allows you to view and update loopback information.

Table C-1179 Field Descriptions for the Ether Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Displays the status of the line. The line can be in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.2.5 Thresholds

The Thresholds Properties pane allows you to view thresholds and create new ones. The Properties pane contains the following tabs:

- C.4.2.5.1 POS Ports Tab, page C-843
- C.4.2.5.2 Ether Ports Tab, page C-843

C.4.2.5.1 POS Ports Tab

The POS Ports tab allows you to view the thresholds for the POS ports.

Table C-1180 Field Descriptions for the POS Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.2.5.2 Ether Ports Tab

The Ether Ports tab allows you to view the thresholds for the Ethernet ports.

Table C-1181 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.

Table C-1181 Field Descriptions for the Ether Ports Tab (continued)

Field	Description
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create RMON thresholds for the Ethernet ports.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.4.2.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information. The Alarm Behavior Properties pane contains the following tabs:

- C.4.2.6.1 Ether Alarm Behavior Tab, page C-844
- C.4.2.6.2 POS Alarm Behavior Tab, page C-845

C.4.2.6.1 Ether Alarm Behavior Tab

The Ether Alarm Behavior tab allows you to view and update Ether alarm profile information.

Table C-1182 Field Descriptions for the Ether Alarm Behavior Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.

Table C-1182 Field Descriptions for the Ether Alarm Behavior Tab (continued)

Field	Description
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.2.6.2 POS Alarm Behavior Tab

The POS Alarm Behavior tab allows you to view and update POS alarm profile information.

Table C-1183 Field Descriptions for the POS Alarm Behavior Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.2.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1184 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Mem Num	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.2.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CE-100T-8.

Table C-1185 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.3 Slot Properties—CE-100T-8 (ONS 15454 SDH)

The slot properties pane displays information about the Cisco ONS 15454 SDH module that is installed in the slot selected in the NE Explorer tree. Use this properties pane to change the card properties.

The CE-100T-8 is a Layer 1 mapper card with eight 10/100 Ethernet ports. It maps each port to a unique SDH circuit in a point-to-point configuration.

The CE-100T-8 cards allow you to provision and manage an Ethernet private line service as if it were a traditional SDH line. CE-100T-8 card applications include providing carrier-grade transparent LAN services (TLS), Ethernet private line services, and high-availability transport.

The CE-100T-8 card is a standard ONS line card and supports ITU-T G.707 and Telcordia GR-253-based standards for SDH. It offers the same carrier-class level of features and reliability as SDH optical cards or electrical line cards.

For the ONS 15454 SDH CE-100T-8 card, the slot properties pane displays the following properties: Module View, Identification, Line, Ether Loopback, Thresholds, Alarm Behavior, J1 Path Trace, and Info.

C.4.3.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that allows you to reset, delete, or change the card.

C.4.3.2 Identification

The Identification Properties pane allows you to view and update CE-100T-8 identification information.

Table C-1186 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.

Table C-1186 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.3.3 Line

The Line Properties pane allows you to view and update performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.3.3.1 Ether Line Tab, page C-847
- C.4.3.3.2 POS Line Tab, page C-848

C.4.3.3.1 Ether Line Tab

The Ether Line tab allows you to view and change the Ethernet line settings of the CE-100T-8 card.

Table C-1187 Field Descriptions for the Ether Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.

Table C-1187 Field Descriptions for the Ether Line Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.
Expected Speed	Displays the expected speed for the Ethernet ports. Values are Auto, 10 Mb/s, and Configurable.
Operating Speed	Displays the operating speed for the Ethernet ports. Values are Auto, 10 Mb/s, and NonConfigurable.
Expected Duplex	Expected setting of the port.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Enable Flow Control	Check this check box to enable flow control for the selected port.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
802.1Q VLAN CoS	Sets the IEEE 802.1Q standard VLAN class of service (CoS) threshold for priority queueing. Values are 0 through 7; 0 is the lowest priority and 7 is the highest priority.
IP ToS	Sets the IP type of service (ToS) byte value for priority queueing. Values are 0 through 255.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.3.3.2 POS Line Tab

The POS Line tab allows you to view and change POS line settings of the CE-100T-8 card.

Table C-1188 Field Descriptions for the POS Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.

Table C-1188 Field Descriptions for the POS Line Tab (continued)

Field	Description
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

C.4.3.4 Ether Loopback

The Ether Loopback Properties pane allows you to view and update loopback information.

Table C-1189 Field Descriptions for the Ether Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.3.5 Thresholds

The Thresholds Properties pane allows you to view thresholds and create new ones. The Properties pane contains the following tabs:

- C.4.3.5.1 POS Ports Tab, page C-850

- C.4.3.5.2 Ether Ports Tab, page C-851

C.4.3.5.1 POS Ports Tab

The POS Ports tab allows you to view the RMON thresholds for the POS ports.

Table C-1190 Field Descriptions for the POS Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.3.5.2 Ether Ports Tab

The Ether Ports tab allows you to view the RMON thresholds for the Ethernet ports.

Table C-1191 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create RMON thresholds for the Ethernet ports.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.4.3.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information. The Alarm Behavior Properties pane contains the following tabs:

- C.4.3.6.1 Ether Alarm Behavior Tab, page C-851
- C.4.3.6.2 POS Alarm Behavior Tab, page C-852

C.4.3.6.1 Ether Alarm Behavior Tab

The Ether Alarm Behavior tab allows you to view and update Ether alarm profile information.

Table C-1192 Field Descriptions for the Ether Alarm Behavior Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.3.6.2 POS Alarm Behavior Tab

The POS Alarm Behavior tab allows you to view and update POS alarm profile information.

Table C-1193 Field Descriptions for the POS Alarm Behavior Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.3.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1194 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Mem Num	Displays the virtual concatenation (VCAT) member number.

Table C-1194 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.3.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CE-100T-8.

Table C-1195 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.4 Slot Properties—CE-1000-4 (ONS 15454 SDH and ONS 15454 SONET)

The CE-1000-4 is a data line card for the ONS 15454 SONET and ONS 15454 SDH NEs that enables private line Ethernet and Gigabit Ethernet services. The CE-1000-4 card has four IEEE 802.3-compliant Gigabit Ethernet ports at the ingress, and an integrated Ethernet over SONET/SDH mapper with equal number of virtual ports at the egress, to send and receive Ethernet packets over a SONET/SDH network.

The interface media type is determined by the GBICs module installed, and on a per-port basis. The CE-1000-4 card supports standard compliant ITU-T G.7041 Generic Framing Procedure (GFP), and ITUT G.707 HO virtual concatenation (VCAT). There is no support for LCAS.

The CE-1000-4 card is managed by TL1, SNMP, CTC, and Prime Optical.

The slot properties pane displays information about the Cisco ONS 15454 SDH card that is installed in the slot selected in the NE Explorer tree. Use this properties pane to change the card properties.

For the CE-1000-4 card, the slot properties pane displays the following properties: Module View, Identification, Line, Gigabit Ether Line Loopback, Thresholds, Alarm Behavior, J1 Path Trace, GBIC Inventory, and Info.

C.4.4.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that allows you to reset, delete, or change the card.

C.4.4.2 Identification

The Identification Properties pane allows you to view and update CE-1000-4 identification information.

Table C-1196 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.4.3 Line

The Line Properties pane allows you to view and update performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.4.3.1 Gigabit Ether Line Tab, page C-854
- C.4.4.3.2 POS Line Tab, page C-855

C.4.4.3.1 Gigabit Ether Line Tab

The Gigabit Ether Line tab allows you to view and change the Ethernet line settings of the CE-1000-4 card.

Table C-1197 Field Descriptions for the Gigabit Ether Line Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.

Table C-1197 Field Descriptions for the Gigabit Ether Line Tab (continued)

Field	Description
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Flow Control Status	Displays the negotiated flow control status.
Auto Negotiation	Allows you to enable the card to match the speed and duplex mode of a partner node.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Water Marks	Water marks can be Custom, Low Latency, or Default.
Flow Control Low	Displays the minimum flow control.
Flow Control High	Displays the maximum flow control.
Link Integrity Disable	If this check box is checked, the Link Integrity Timer field for the corresponding port number will be disabled.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.4.3.2 POS Line Tab

The POS Line tab allows you to view and change POS line settings of the CE-1000-4 card.

Table C-1198 Field Descriptions for the POS Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.

Table C-1198 Field Descriptions for the POS Line Tab (continued)

Field	Description
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

C.4.4.4 Gigabit Ether Line Loopback

The Gigabit Ether Line Loopback Properties pane allows you to view and update loopback information.

Table C-1199 Field Descriptions for the Gigabit Ether Line Loopback

Field	Description
Port Number	Displays the port number.
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.4.5 Thresholds

The Thresholds Properties pane allows you to view thresholds and create new ones. The Properties pane contains the following tabs:

- C.4.4.5.1 POS Ports Tab, page C-857
- C.4.4.5.2 Ether Ports Tab, page C-858

C.4.4.5.1 POS Ports Tab

The POS Ports tab allows you to view the RMON thresholds for the POS ports.

Table C-1200 Field Descriptions for the POS Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.

Table C-1200 Field Descriptions for the POS Ports Tab (continued)

Field	Description
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.4.5.2 Ether Ports Tab

The Ether Ports tab allows you to view the RMON thresholds for the Ethernet ports.

Table C-1201 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.

Table C-1201 Field Descriptions for the Ether Ports Tab (continued)

Field	Description
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create RMON thresholds for the Ethernet ports.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.4.4.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information. The Alarm Behavior Properties pane contains the following tabs:

- C.4.4.6.1 POS Ports Tab, page C-859
- C.4.4.6.2 Ether Ports Tab, page C-859

C.4.4.6.1 POS Ports Tab

The POS Ports tab allows you to view and update alarm profile information.

Table C-1202 Field Descriptions for the POS Ports Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.4.6.2 Ether Ports Tab

The Ether Ports tab allows you to view and update alarm profile information.

Table C-1203 Field Descriptions for the Ether Ports Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.4.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1204 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number information.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Mem Num	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.4.8 GBIC Inventory

The GBIC Inventory Properties pane allows you to view GBIC inventory information.

Table C-1205 Field Descriptions for the GBIC Inventory Properties Pane

Field	Description
Port Number	Displays the GBIC card port number.
Equipment Type	Displays the equipment type the slot is provisioned for.
Serial Number	Displays the GBIC serial number that is unique to each GBIC.
CLEI Code	Displays the CLEI code.
Hardware Part Number	Displays the manufacturer's part number.
Hardware Revision	Displays the hardware revision number.

Table C-1205 Field Descriptions for the GBIC Inventory Properties Pane (continued)

Field	Description
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Vendor ID	Displays the ID of the vendor.

C.4.4.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CE-1000-4.

Table C-1206 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.5 Slot Properties—CE-MR-6

The slot properties pane displays information about the Cisco ONS 15310 MA SONET or ONS 15310 MA SDH module that is installed in the slot selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Carrier Ethernet Multirate 6 (CE-MR-6) card provides six IEEE 802.3-compliant 10/100/1000-Mb/s Gigabit Ethernet ports at the ingress. At the egress, the CE-MR-6 card provides an integrated Ethernet-over-SONET mapper with six virtual ports to transfer Ethernet packets over a SONET network.

The CE-MR-6 card uses pluggable SFPs to transport Ethernet traffic over a SONET network. The Ethernet frames are encapsulated using the ITU-T generic framing procedure (GFP) (with or without CRC) or LAN extension (LEX), the point-to-point protocol (PPP) with high-level data link control (HDLC).

The Ethernet ports automatically configure to operate at either half or full duplex and can determine whether to enable or disable flow control. The Ethernet ports can also be oversubscribed using flow control.

The CE-MR-6 card supports the link capacity adjustment scheme (LCAS), which allows hitless dynamic adjustment of SONET link bandwidth. The CE-MR-6 card's LCAS is hardware-based, but the CE-MR-6 also supports software LCAS (SW-LCAS). This makes it compatible with ML-series cards, which support only SW-LCAS, along with the CE-100T-8 cards. The CE-MR-6 card also supports the nonlink capacity adjustment scheme (no-LCAS). The CE-MR-6 card supports both flexible and fixed VCAT groups (VCG). Prime Optical supports the FE payload on RAD SFPs.

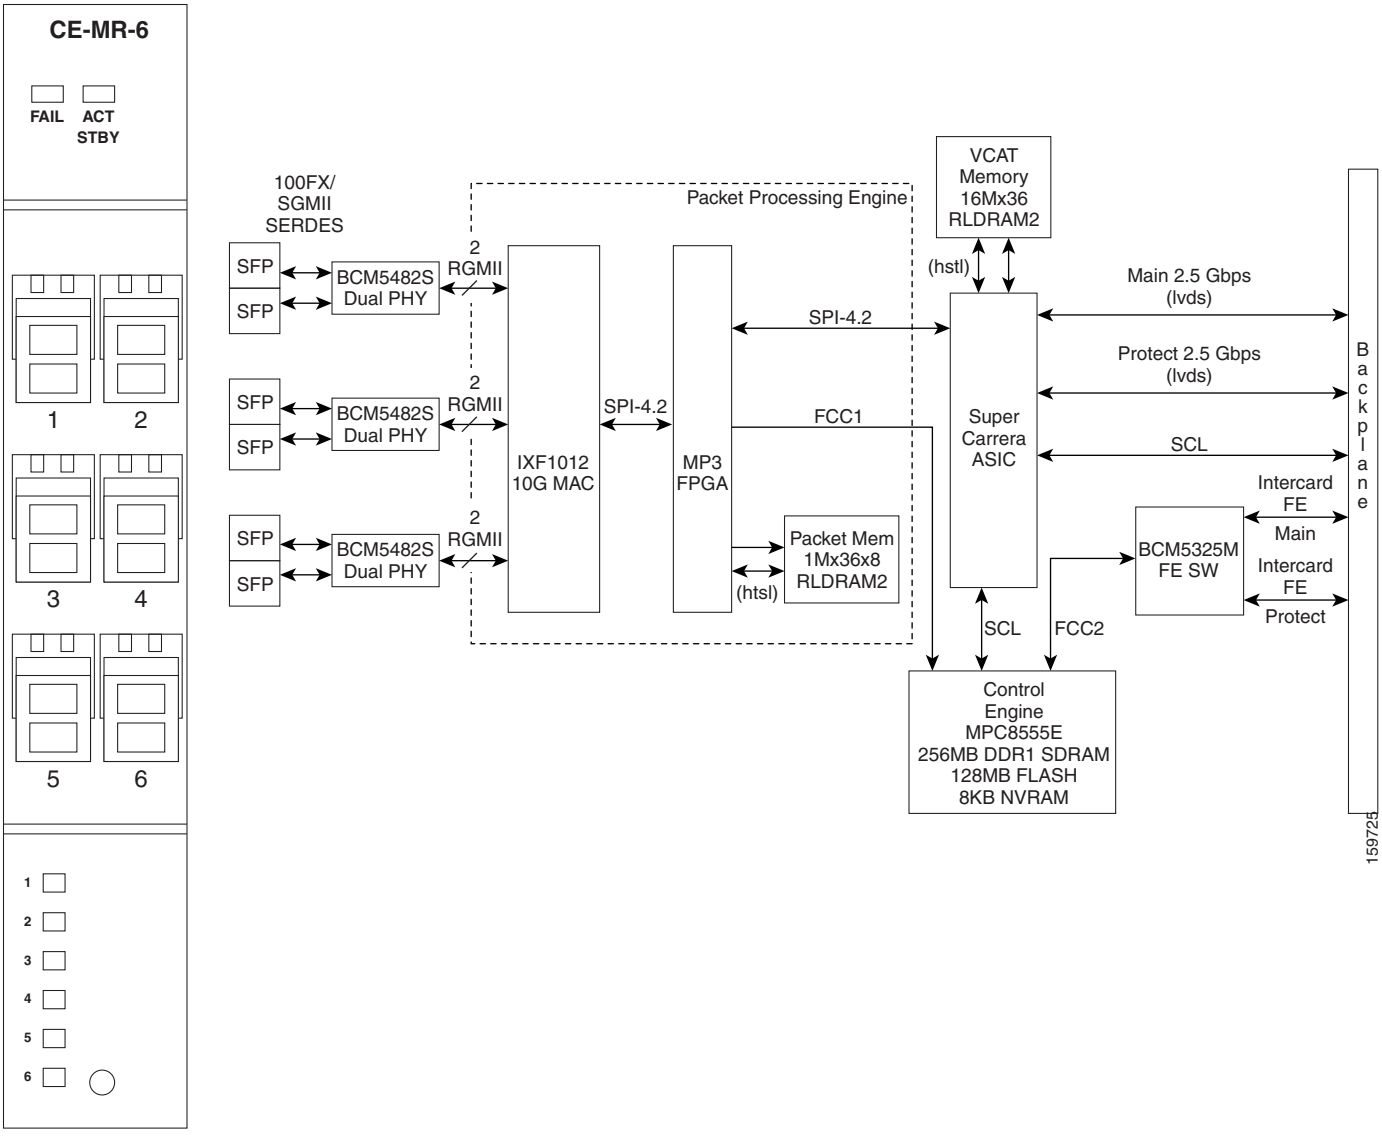
The Ethernet frames can be mapped into:

- T1X1 G.707-based high-order virtual concatenated (HO VCAT) payloads

  - STS-3c-*n*v, where *n* is 1 to 7
  - STS-1-*n*v, where *n* is 1 to 21
- T1X1 G.707-based low-order virtual concatenated (LO VCAT) payloads
  - VT1.5-*n*v, where *n* is 1 to 64
- Contiguously concatenated (CCAT) SONET payloads
  - Standard CCAT sizes (STS-1, STS-3c, STS-12c, STS-24c, and STS-48c)
  - Nonstandard CCAT sizes (STS-6c and STS-9c)

The following figure shows the CE-MR-6 card faceplate and block diagram.

Figure C-69 CE-MR-6 Faceplate and Block Diagram



For the CE-MR-6 card, the slot properties pane displays the following properties: Module View, Identification, Line, Ether Loopback, Thresholds, Alarm Behavior, J1 Path Trace, GBIC Inventory, and Info.

C.4.5.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the card is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that allows you to reset, delete, or change the card.

C.4.5.2 Identification

The Identification Properties pane allows you to view and update CE-MR-6 identification information.

Table C-1207 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service, unlocked or locked–maintenance. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Card Mode	Specify the mode setting for the internal STS/VC allocation method on the card. Values are: • Automatic—Implies internal selection of time slot index numbers by the node. • Manual—Implies user-selected index numbers.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.5.3 Line

The Line Properties pane allows you to view and update CE-MR-6 performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.5.3.1 Ether Line Tab, page C-864
- C.4.5.3.2 POS Line Tab, page C-864

C.4.5.3.1 Ether Line Tab

The Ether Line tab allows you to view and change the Ethernet line settings of the CE-MR-6 card.

Table C-1208 Field Descriptions for the Ether Line Tab

Field	Description
Port Number	Displays the port number (1 to 6).
Port Name	Allows you to add a name for the port.
Administration State	Allows you to change the administrative state of the port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.
Expected Speed	Displays the expected speed for the Ethernet ports. Values are Auto, 10 Mb/s, 100 Mb/s, and 1000 Mb/s.
Operating Speed	Displays the operating speed for the Ethernet ports.
Expected Duplex	Expected setting of the port. Values are Auto, Full, and Half.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Enable Flow Control	Check this check box to enable flow control for the selected port.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
802.1Q VLAN CoS	Sets the IEEE 802.1Q standard VLAN class of service (CoS) threshold for priority queueing. Values are 0 through 7; 0 is the lowest priority and 7 is the highest priority.
IP ToS	Sets the IP type of service (ToS) byte value for priority queueing. Values are 0 through 255.
Enable Auto Negotiate	When checked, the port negotiates with the mating port to set its own rate. If unchecked, the port operating rate does not work with the mate unless the port rates match.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.5.3.2 POS Line Tab

The POS Line tab allows you to view and change POS line settings for the CE-MR-6 card.

Table C-1209 Field Descriptions for the POS Line Tab

Field	Description
Port Number	Displays the port number (1 to 6).
Port Name	Allows you to add a name for the port.

Table C-1209 Field Descriptions for the POS Line Tab (continued)

Field	Description
Administration State	Allows you to change the administrative state of the port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

C.4.5.4 Ether Loopback

The Ether Loopback Properties pane allows you to view and update CE-MR-6 loopback information.

Table C-1210 Field Descriptions for the Ether Loopback Properties Pane

Field	Description
Port Number	Displays the port number (1 to 6).
Administration State	Allows you to configure the status of the line.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS MT or locked, maintenance before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.5.5 Thresholds

The Thresholds Properties pane allows you to view CE-MR-6 thresholds and create new ones. The Properties pane contains the following tabs:

- C.4.5.5.1 POS Ports Tab, page C-866
- C.4.5.5.2 Ether Ports Tab, page C-866

C.4.5.5.1 POS Ports Tab

The POS Ports tab allows you to view the thresholds for the POS ports.

Table C-1211 Field Descriptions for the POS Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Thresholds	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Thresholds	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.5.5.2 Ether Ports Tab

The Ether Ports tab allows you to view the thresholds for the Ethernet ports.

Table C-1212 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.

Table C-1212 Field Descriptions for the Ether Ports Tab (continued)

Field	Description
Variable	The MIB variable to monitor.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Thresholds	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Thresholds	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create RMON thresholds for the Ethernet ports.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.4.5.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information. The Alarm Behavior Properties pane contains the following tabs:

- C.4.5.6.1 POS Ports Tab, page C-867
- C.4.5.6.2 Ether Ports Tab, page C-868

C.4.5.6.1 POS Ports Tab

The POS Ports tab allows you to view and update POS alarm profile information.

Table C-1213 Field Descriptions for the POS Ports Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.

Table C-1213 Field Descriptions for the POS Ports Tab (continued)

Field	Description
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.5.6.2 Ether Ports Tab

The Ether Ports tab allows you to view and update Ethernet alarm profile information.

Table C-1214 Field Descriptions for the Ether Ports Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.5.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1215 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Member Number	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.5.8 GBIC Inventory

The GBIC Inventory Properties pane displays GBIC inventory information for new SFPs and old Ethernet SFPs that are plugged into the CE-MR-6 card. The card supports the following SFPs:

- ONS-SE-100-BX10U
- ONS-SE-100-BX10D
- ONS-SI-100-FX
- ONS-SI-100-LX10
- ONS-SI-GE-SX
- ONS-SI-GE-LX
- ONS-SI-GE-ZX
- ONS-SE-ZE-EL

Table C-1216 Field Descriptions for the GBIC Inventory Properties Pane

Field	Description
Port Number	Displays the GBIC card port number.
Equipment Type	Displays the equipment type the slot is provisioned for.
Serial Number	Displays the GBIC serial number that is unique to each GBIC.
CLEI Code	Displays the CLEI code.
Hardware Part Number	Displays the manufacturer's part number.
Hardware Revision Number	Displays the hardware revision number.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Vendor ID	Displays the ID of the vendor.

C.4.5.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CE-MR-6 card.

Table C-1217 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.6 Slot Properties—CE-MR-10

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH module that is installed in the slot selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Carrier Ethernet Multirate 10 (CE-MR-10) card provides ten IEEE 802.3-compliant 10/100/1000-Mb/s Gigabit Ethernet ports at the ingress. At the egress, the CE-MR-10 card provides an integrated Ethernet over SDH mapper with ten virtual ports to transfer Ethernet packets over an SDH network.

The CE-MR-10 card uses pluggable SFPs to transport Ethernet traffic over an SDH network. SFP modules are offered as separate orderable products for flexibility.

The Ethernet frames are encapsulated using the ITU-T generic framing procedure (GFP) (with or without CRC) or LEX, the point-to-point protocol (PPP) with high-level data link control (HDLC).

The Ethernet ports automatically configure to operate at either half or full duplex and can determine whether to enable or disable flow control. The Ethernet ports can also be oversubscribed using flow control.

The CE-MR-10 card supports the link capacity adjustment scheme (LCAS), which allows hitless dynamic adjustment of SDH link bandwidth. The CE-MR-10 card's LCAS is hardware-based, but the CE-MR-10 also supports software LCAS (SW-LCAS). This makes it compatible with ML-series cards, which support only SW-LCAS, along with G-series and CE-series cards. The CE-MR-10 card also supports the nonlink capacity adjustment scheme (no-LCAS). The CE-MR-10 card supports both flexible and fixed VCAT groups (VCG). Prime Optical supports the FE payload on RAD SFPs.

The Ethernet frames can be mapped into:

- High-order virtual concatenated (HO VCAT) payloads
  - STS-1-*m*v, where *m* is 1 to 21
  - STS-3c-*m*v where *m* is 1 to 7
  - VC-4-*m*v, where *m* is 1 to 7
- Low-order virtual concatenated (LO VCAT) payloads
  - VC3-*m*v, where *m* is 1 to 21
  - VC12-*m*v, where *m* is 1 to 63
  - VT1.5-*m*v, where *m* is 1 to 64

Note SW-LCAS is not supported on VC12-*m*v or VT1.5-*m*v payloads.

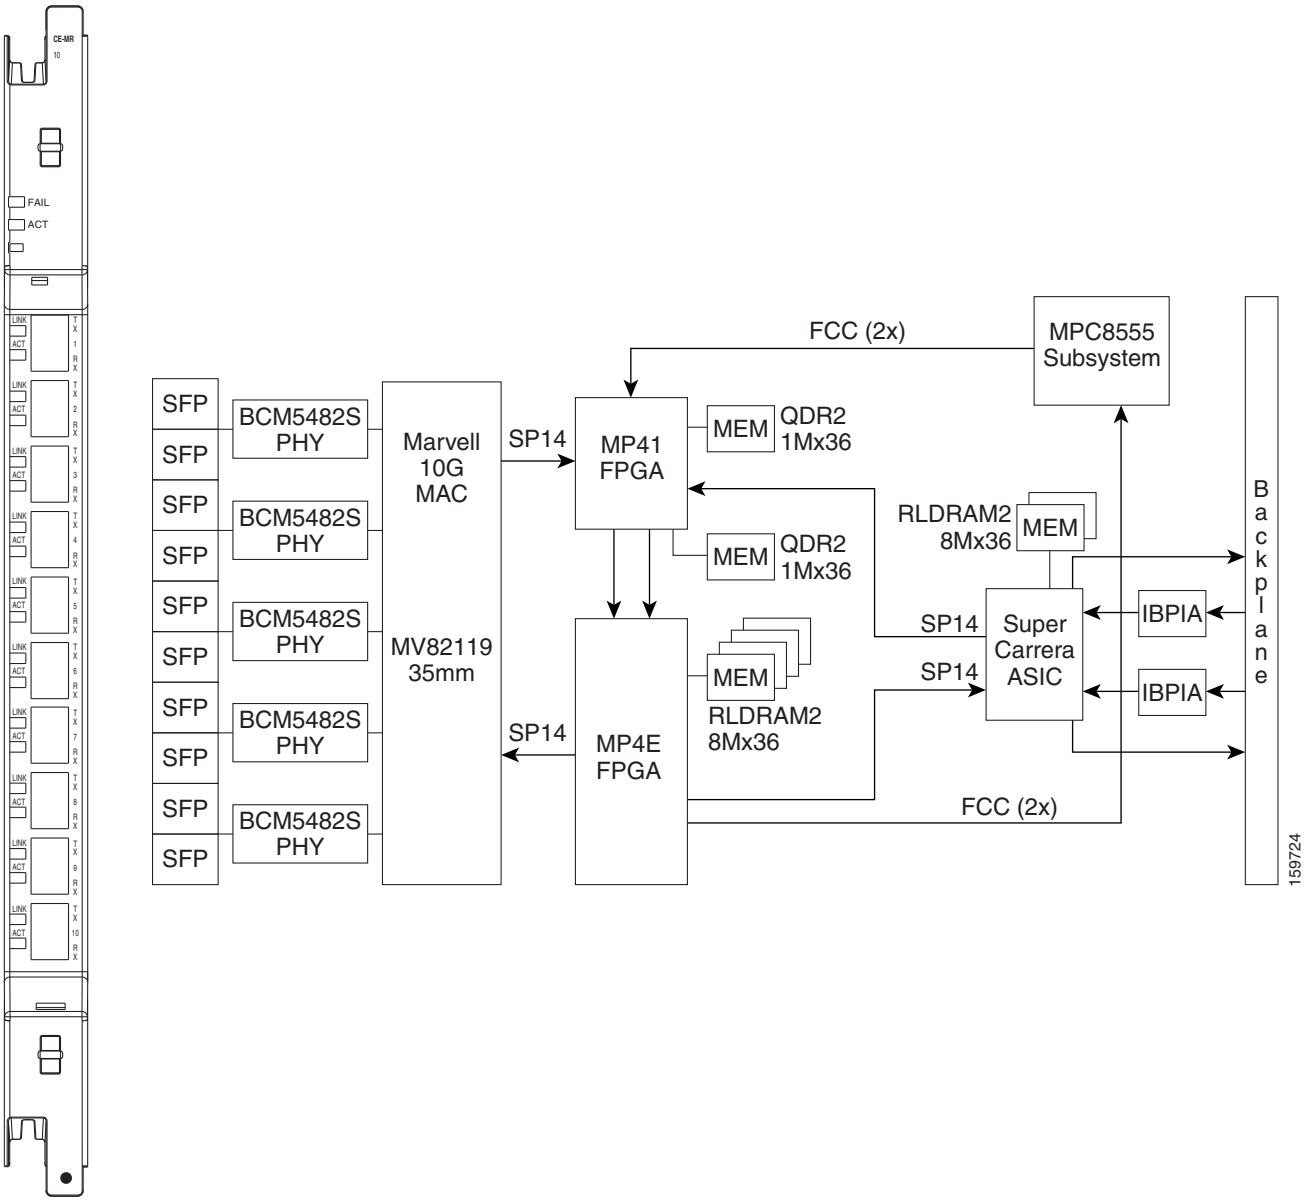
- High-order contiguously concatenated (CCAT) SONET payloads
  - STS-1, STS-3c, STS-6c, STS-9c, STS-12c, STS24c, and STS-48c
- CCAT SDH payloads
  - VC-3, VC-4, VC-4-2c, VC-4-3c, VC-4-4c, VC-4-8c, and VC-4-16c

To configure a CE-MR-10 card circuit, refer to the "Create Circuits and Low-Order Tunnels" chapter in the *Cisco ONS 15454 SDH Procedure Guide.*

The CE-MR-10 card provides multiple management options through CTC, Prime Optical, TL1, and SNMP.

The following figure shows the CE-MR-10 card faceplate and block diagram.

Figure C-70 CE-MR-10 Faceplate and Block Diagram



For the CE-MR-10 card, the slot properties pane displays the following properties: Module View, Identification, Line, Ether Loopback, Thresholds, Alarm Behavior, J1 Path Trace, GBIC Inventory, and Info.

C.4.6.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the card is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that allows you to reset, delete, or change the card.

C.4.6.2 Identification

The Identification Properties pane allows you to view and update CE-MR-10 identification information.

Table C-1218 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service, unlocked or locked–maintenance. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Card Mode (*ONS 15454 SONET only*)	Specify the mode setting for the internal STS/VC allocation method on the card. Values are: • Automatic—Implies internal selection of time slot index numbers by the node. • Exposed—Implies user-selected index numbers.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.6.3 Line

The Line Properties pane allows you to view and update CE-MR-10 performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.6.3.1 Ether Line Tab, page C-873
- C.4.6.3.2 POS Line Tab, page C-873

C.4.6.3.1 Ether Line Tab

The Ether Line tab allows you to view and change the Ethernet line settings of the CE-MR-10 card.

Table C-1219 Field Descriptions for the Ether Line Tab

Field	Description
Port Number	Displays the port number (1 to 10).
Port Name	Allows you to add a name for the port.
Administration State	Allows you to change the administrative state of the port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.
Expected Speed	Displays the expected speed for the Ethernet ports. Values are Auto, 10 Mb/s, 100 Mb/s, and 1000 Mb/s.
Operating Speed	Displays the operating speed for the Ethernet ports.
Expected Duplex	Expected setting of the port. Values are Auto, Full, and Half.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Enable Flow Control	Check this check box to enable flow control for the selected port.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
802.1Q VLAN CoS	Sets the IEEE 802.1Q standard VLAN class of service (CoS) threshold for priority queueing. Values are 0 through 7; 0 is the lowest priority and 7 is the highest priority.
IP ToS	Sets the IP type of service (ToS) byte value for priority queueing. Values are 0 through 255.
Enable Auto Negotiate	When checked, the port negotiates with the mating port to set its own rate. If unchecked, the port operating rate does not work with the mate unless the port rates match.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.6.3.2 POS Line Tab

The POS Line tab allows you to view and change POS line settings for the CE-MR-10 card.

Table C-1220 Field Descriptions for the POS Line Tab

Field	Description
Port Number	Displays the port number (1 to 8).
Port Name	Allows you to add a name for the port.
Administration State	Allows you to change the administrative state of the port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-1220 Field Descriptions for the POS Line Tab (continued)

Field	Description
AINS Soak	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up and Down.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

C.4.6.4 Ether Loopback

The Ether Loopback Properties pane allows you to view and update CE-MR-10 loopback information.

Table C-1221 Field Descriptions for the Ether Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Allows you to configure the status of the line.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS MT or locked, maintenance before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.6.5 Thresholds

The Thresholds Properties pane allows you to view CE-MR-10 thresholds and create new ones. The Properties pane contains the following tabs:

- C.4.6.5.1 POS Ports Tab, page C-875
- C.4.6.5.2 Ether Ports Tab, page C-875

C.4.6.5.1 POS Ports Tab

The POS Ports tab allows you to view the thresholds for the POS ports.

Table C-1222 Field Descriptions for the POS Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	The MIB variable to monitor.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Thresholds	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Thresholds	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.6.5.2 Ether Ports Tab

The Ether Ports tab allows you to view the thresholds for the Ethernet ports.

Table C-1223 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	The index number.
Slot	Select a slot for the new threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.

Table C-1223 Field Descriptions for the Ether Ports Tab (continued)

Field	Description
Variable	The MIB variable to monitor.
Alarm Type	Select an alarm type for the new threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new threshold. The sample period is measured in seconds.
Rising Thresholds	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Thresholds	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).
Create	Click the **Create** button to create RMON thresholds for the Ethernet ports.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.4.6.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information. The Alarm Behavior Properties pane contains the following tabs:

- C.4.6.6.1 POS Ports Tab, page C-876
- C.4.6.6.2 Ether Ports Tab, page C-877

C.4.6.6.1 POS Ports Tab

The POS Ports tab allows you to view and update POS alarm profile information.

Table C-1224 Field Descriptions for the POS Ports Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.

Table C-1224 Field Descriptions for the POS Ports Tab (continued)

Field	Description
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.6.6.2 Ether Ports Tab

The Ether Ports tab allows you to view and update Ethernet alarm profile information.

Table C-1225 Field Descriptions for the Ether Ports Tab

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.6.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1226 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Member Number	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.6.8 GBIC Inventory

The GBIC Inventory Properties pane allows you to view GBIC inventory information for the CE-MR-10 card.

Table C-1227 Field Descriptions for the GBIC Inventory Properties Pane

Field	Description
Port Number	Displays the GBIC card port number.
Equipment Type	Displays the equipment type the slot is provisioned for.
Serial Number	Displays the GBIC serial number that is unique to each GBIC.
CLEI Code	Displays the CLEI code.
Hardware Part Number	Displays the manufacturer's part number.
Hardware Revision Number	Displays the hardware revision number.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Vendor ID	Displays the ID of the vendor.

C.4.6.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CE-MR-10 card.

Table C-1228 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.7 Slot Properties—E10/100T-4

The slot properties pane displays information about the Cisco ONS 15327 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The E10/100T-4 card provides four Layer 2 switched, autosensing, 10/100BaseT Ethernet interfaces. Each interface supports full-duplex operation for a maximum bandwidth of 200 Mb/s per port.

For the E10/100T-4 module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, VLAN, Alarm Behavior, Thresholds, and Info.

C.4.7.1 Module View

The Module View displays a graphic of the E10/100T-4 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to delete, change, or reset the module.

C.4.7.2 Identification

The Identification Properties pane allows you to view and update E10/100T-4 identification information.

Table C-1229 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port’s service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.7.3 Port

The Port Properties pane allows you to view and update E10/100T-4 port information.

Table C-1230 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port.
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.7.4 Line

The Line Properties pane allows you to view and update E10/100T-4 line performance monitoring information.

Table C-1231 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each Ethernet port. Valid choices for the E100T-12/E100T-G card are Auto, 10 Half, 10 Full, 100 Half, or 100 Full. Valid choices for the E1000-2/E1000-2-G card are 1000 Full or Auto.
Status	Displays the current optical line status.

C.4.7.5 VLAN

The VLAN Properties pane allows you to view and update E10/100T-4 VLAN information.

Table C-1232 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

C.4.7.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E10/100T-4 alarm profile information.

Table C-1233 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the E10/100T-4 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.7.7 Thresholds

The Thresholds Properties pane allows you to create, view, and delete E10/100T-4 thresholds.

Table C-1234 Field Descriptions for the Threshold Properties

Field	Description
Index #	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new Ether threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	Select a variable for the new Ether threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new Ether threshold. Available alarm types are Rising, Falling, and Rising and Falling.
Sample Type	Select a sample type for the new Ether threshold. Available sample types are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Enter a sample period for the new Ether threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new Ether threshold. The value must be equal to or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ether threshold. The value must be equal to or less than the rising threshold value.
Create	Click the **Create** button to create a E10/100T-4 thresholds.
Delete	Select an E10/100T-4 threshold from the list displayed and click the **Delete** button.

C.4.7.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E10/100T-4 card.

Table C-1235 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.8 Slot Properties—E1000-2

The slot properties pane displays information about the Cisco ONS 15454 or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 and ONS 15454 SDH E1000-2 cards incorporate Layer 2 switching, while the G-series card is a straight mapper card. The ONS 15454 E-series cards include the E100T-12/E100T-G and E1000-2/E1000-2-G. E-series cards support VLAN, IEEE 802.1Q, spanning tree, and IEEE 802.1D. An ONS 15454 holds a maximum of ten Ethernet cards, which can be inserted in any multipurpose slot.

For the E1000-2 module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, VLAN, Alarm Behavior, Thresholds, and Info.

C.4.8.1 Module View

The Module View displays a graphic of the E1000-2 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.8.2 Identification

The Identification Properties pane allows you to view and update E1000-2 identification information.

Table C-1236 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.

Table C-1236 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.8.3 Port

The Port Properties pane allows you to view and update E1000-2 port information.

Table C-1237 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port.
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.8.4 Line

The Line Properties pane allows you to view and update E1000-2 line performance monitoring information.

Table C-1238 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.

Table C-1238 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Mode	Allows you to select the appropriate mode for each Ethernet port. Valid choices for the E100T-12/E100T-G card are Auto, 10 Half, 10 Full, 100 Half, or 100 Full. Valid choices for the E1000-2/E1000-2-G card are 1000 Full or Auto.
Status	Displays the current optical line status.

C.4.8.5 VLAN

The VLAN Properties pane allows you to view and update E1000-2 VLAN information.

Table C-1239 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

C.4.8.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E1000-2 alarm profile information.

Table C-1240 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the ETH1000-2 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.8.7 Thresholds

The Thresholds Properties pane allows you to create, view, and delete E1000-2 thresholds.

Table C-1241 Field Descriptions for the Threshold Properties

Field	Description
Index #	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new Ether threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.

Table C-1241 Field Descriptions for the Threshold Properties (continued)

Field	Description
Variable	Select a variable for the new Ether threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new Ether threshold. Available alarm types are Rising, Falling, and Rising and Falling.
Sample Type	Select a sample type for the new Ether threshold. Available sample types are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Enter a sample period for the new Ether threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new Ether threshold. The value must be equal to or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ether threshold. The value must be equal to or less than the rising threshold value.
Create	Click the **Create** button to create a E1000-2 thresholds.
Delete	Select an E1000-2 threshold from the list displayed and click the **Delete** button.

C.4.8.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E1000-2 card.

Table C-1242 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.9 Slot Properties—E1000-2-G

The slot properties pane displays information about the Cisco ONS 15454 or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 and ONS 15454 SDH E1000-2-G cards incorporate Layer 2 switching, while the G-series card is a straight mapper card. The ONS 15454 E-series cards include the E100T-12/E100T-G and E1000-2/E1000-2-G. E-series cards support VLAN, IEEE 802.1Q, spanning tree, and IEEE 802.1D. An ONS 15454 holds a maximum of ten Ethernet cards, which can be inserted in any multipurpose slot.

For the E1000-2-G module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, VLAN, Alarm Behavior, Thresholds, and Info.

C.4.9.1 Module View

The Module View displays a graphic of the E1000-2-G that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the module.

C.4.9.2 Identification

The Identification Properties pane allows you to view and update E1000-2-G identification information.

Table C-1243 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.9.3 Port

The Port Properties pane allows you to view and update E1000-2-G port information.

Table C-1244 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.

Table C-1244 Field Descriptions for the Port Properties Pane (continued)

Field	Description
Queue Priority	Allows you to select the priority queue for the port.
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.9.4 Line

The Line Properties pane allows you to view and update E1000-2-G line performance monitoring information.

Table C-1245 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each Ethernet port. Valid choices for the E100T-12/E100T-G card are Auto, 10 Half, 10 Full, 100 Half, or 100 Full. Valid choices for the E1000-2/E1000-2-G card are 1000 Full or Auto.
Status	Displays the current optical line status.

C.4.9.5 VLAN

The VLAN Properties pane allows you to view and update E1000-2-G VLAN information.

Table C-1246 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

C.4.9.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E1000-2-G alarm profile information.

Table C-1247 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the E1000-2-G port number.

Table C-1247 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.9.7 Thresholds

The Thresholds Properties pane allows you to create, view, and delete E1000-2-G thresholds.

Table C-1248 Field Descriptions for the Threshold

Field	Description
Index #	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new Ether threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	Select a variable for the new Ether threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new Ether threshold. Available alarm types are Rising, Falling, and Rising and Falling.
Sample Type	Select a sample type for the new Ether threshold. Available sample types are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Enter a sample period for the new Ether threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new Ether threshold. The value must be equal to or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ether threshold. The value must be equal to or less than the rising threshold value.
Create	Click the **Create** button to create a E1000-2-G thresholds.
Delete	Select an E1000-2-G threshold from the list displayed and click the **Delete** button.

C.4.9.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E1000-2-G card.

Table C-1249 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.10 Slot Properties—E100T-12

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 and ONS 15454 SDH E100T-12 cards incorporate Layer 2 switching, while the G-series card is a straight mapper card. The ONS 15454 E-series cards include the E100T-12/E100T-G and E1000-2/E1000-2-G. E-series cards support VLAN, IEEE 802.1Q, spanning tree, and IEEE 802.1D. An ONS 15454 holds a maximum of ten Ethernet cards, which can be inserted in any multipurpose slot.

For the E100T-12 module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, VLAN, Alarm Behavior, Thresholds, and Info.

C.4.10.1 Module View

The Module View displays a graphic of the E100T-12 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.10.2 Identification

The Identification Properties pane allows you to view and update E100T-12 identification information.

Table C-1250 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table C-1250 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.10.3 Port

The Port Properties pane allows you to view and update E100T-12 port information.

Table C-1251 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port.
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.10.4 Line

The Line Properties pane allows you to view and update E100T-12 line performance monitoring information.

Table C-1252 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each Ethernet port. Valid choices for the E100T-12/E100T-G card are Auto, 10 Half, 10 Full, 100 Half, or 100 Full. Valid choices for the E1000-2/E1000-2-G card are 1000 Full or Auto.
Status	Displays the current optical line status.

C.4.10.5 VLAN

The VLAN Properties pane allows you to view and update E100T-12 VLAN information.

Table C-1253 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

C.4.10.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E100T-12 alarm profile information.

Table C-1254 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the ETH100 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.10.7 Thresholds

The Thresholds Properties pane allows you to create, view, and delete E100T-12 thresholds.

Table C-1255 Field Descriptions for the Threshold Properties

Field	Description
Index #	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new Ether threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	Select a variable for the new Ether threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new Ether threshold. Available alarm types are Rising, Falling, and Rising and Falling.
Sample Type	Select a sample type for the new Ether threshold. Available sample types are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Enter a sample period for the new Ether threshold. The sample period is measured in seconds.

Table C-1255 Field Descriptions for the Threshold Properties (continued)

Field	Description
Rising Threshold	Enter a rising threshold for the new Ether threshold. The value must be equal to or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ether threshold. The value must be equal to or less than the rising threshold value.
Create	Click the **Create** button to create a E100T-12 thresholds.
Delete	Select an E100T-12 threshold from the list displayed and click the **Delete** button.

C.4.10.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the E100T-12 card.

Table C-1256 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.11 Slot Properties—E100T-G

The slot properties pane displays information about the Cisco ONS 15454 or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

Use the E100T-G cards when the XC10G card is in use. The ONS 15454 and ONS 15454 SDH use E100T-G cards for Ethernet (10 Mb/s) and Fast Ethernet (100 Mb/s). Each card provides 12 switched, IEEE 802.3-compliant, 10/100BaseT Ethernet ports that can independently detect the speed of an attached device (autosense) and automatically connect at the appropriate speed. The ports autoconfigure to operate at either half or full duplex and determine whether to enable or disable flow control.

The ONS 15454 and ONS 15454 SDH incorporate Layer 2 switching, while the G-series card is a straight mapper card. The ONS 15454 E-series cards include the E100T-12/E100T-G and E1000-2/E1000-2-G. E-series cards support VLAN, IEEE 802.1Q, spanning tree, and IEEE 802.1D. An ONS 15454 holds a maximum of ten Ethernet cards, which can be inserted in any multipurpose slot.

For the E100T-G module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, VLAN, and Alarm Behavior.

C.4.11.1 Module View

The Module View displays a graphic of the E100T-G that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.11.2 Identification

The Identification Properties pane allows you to view and update E100T-G identification information.

Table C-1257 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.11.3 Port

The Port Properties pane allows you to view and update E100T-G port information.

Table C-1258 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port.
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.11.4 Line

The Line Properties pane allows you to view and update E100T-G line performance monitoring information.

Table C-1259 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each Ethernet port. Valid choices for the E100T-12/E100T-G card are Auto, 10 Half, 10 Full, 100 Half, or 100 Full. Valid choices for the E1000-2/E1000-2-G card are 1000 Full or Auto.
Status	Displays the current optical line status.

C.4.11.5 VLAN

The VLAN Properties pane allows you to view and update E100T-G VLAN information.

Table C-1260 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

C.4.11.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update E100T-G alarm profile information.

Table C-1261 Field Descriptions for the Alarm Behavior Properties Pane

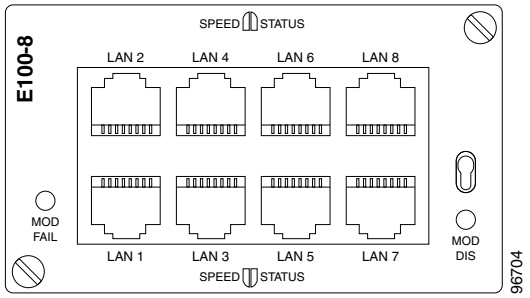
Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the ETH100 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.12 Slot Properties—E100-8 (ONS 15305 CTC)

The E100-8 module contains eight Ethernet interfaces that support both 10Base-T and 100Base-TX according to the IEEE 802.3 specification. The interfaces support half- and full-duplex modes. The interfaces are connected to an integrated Ethernet switch. The physical interface uses an RJ-45 connector. Every interface also has an LED that signals the status of the link. The module supports IP interface only. The following figure shows the module diagram.

Figure C-71 LAN 10/100Base TX Module, E100-8



For the E100-8 module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, and VLAN.

C.4.12.1 Module View

The Module View displays a graphic of the E100-8 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.12.2 Identification

The Identification Properties pane allows you to view and update E100-8 identification information.

Table C-1262 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.

Table C-1262 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Card Mode	Displays the card mode as multicard Ether Switch group, single-card Ether Switch group, or Port Mapped.
Alarm Profile	Displays the alarm profile for the port.

C.4.12.3 Port

The Port Properties pane allows you to view and update port information.

Note The ONS 15305 supports only a partial Rapid Spanning Tree Protocol (RSTP) implementation that offers the same type of service as, for example, PortFast on Cisco equipment. The partial RSTP implementation does not support creation of a spanning tree among bridges; however, partial RSTP configures customer-facing ports for forwarding mode without having to wait for two times the forwarding delay as is the case with normal Spanning Tree Protocol (STP). To prevent loops in the network, normal STP must be running. RSTP should be used only on ports that face end-user equipment. If the ONS 15305 detects normal STP bridge protocol data units (BPDUs) on an interface configured for RSTP, the node switches back to normal STP for that interface.

Table C-1263 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port. You can select from, 0 (Low), 1 (Low), 2 (Low), 3 (Low), 4 (High), 5 (High), 6 (High), or 7 (High).
STP Enabled	When checked, indicates that STP is enabled for the card.
STP State	Displays the current STP state.

C.4.12.4 Line

The Line Properties pane allows you to view and update line card information.

Table C-1264 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.

Table C-1264 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Mode	Allows you to select the appropriate mode for each port. Valid choices are Auto, 10 Half, 10 Full, 100 Half, or 100 Full.
Status	Displays the current optical line status.

C.4.12.5 VLAN

The VLAN Properties pane allows you to view and update VLAN information.

Table C-1265 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

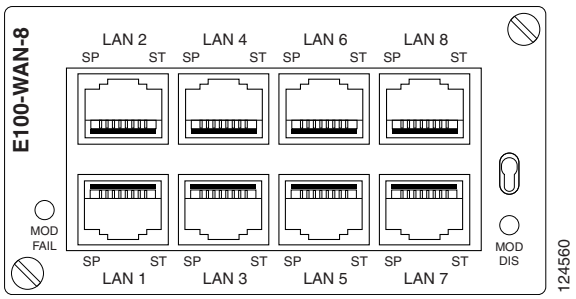
Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.13 Slot Properties—E100-WAN-8 (ONS 15305 CTC)

The E100-WAN-8 module is a tributary module that supports both optical and electrical Ethernet interfaces. The module contains eight LAN Ethernet interfaces that support both 10Base-T and 100Base-TX according to the IEEE 802.3 specification. The interface supports half- and full-duplex modes.

The physical interface is RJ-45 connectors. Every interface has two LEDs; one LED indicates the link status and the other LED indicates the link speed. The module includes up to 16 Ethernet-to-SDH mappers. The module supports both L1 and L2 services. The following figure shows the module diagram.

Figure C-72 LAN 10/100Base-TX Module with Mapper, E100-WAN-8



For the E100-WAN-8 module, the slot properties pane displays the following properties: Module View, Identification, Ether Line, Ether Port, WAN Line, and VLAN.

C.4.13.1 Module View

The Module View displays a graphic of the E100-WAN-8 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.13.2 Identification

The Identification Properties pane allows you to view and update E100-WAN-8 identification information.

Table C-1266 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Card Mode	Displays the card mode as multicard Ether Switch group or Port Mapped.
Alarm Profile	Displays the alarm profile for the port.

C.4.13.3 Ether Line

The Ether Line Properties pane allows you to configure Ether line information.

Table C-1267 Field Descriptions for the Ether Line Properties Pane

Field	Description
Port Number	The port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each port. Valid choices are Auto, 10 Half, 10 Full, 100 Half, or 100 Full.
Status	Displays the current optical line status.

C.4.13.4 Ether Port

The Ether Port Properties pane allows you to view and update port information.

Table C-1268 Field Descriptions for the Ether Port

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port. You can select from, 0 (Low), 1 (Low), 2 (Low), 3 (Low), 4 (High), 5 (High), 6 (High), or 7 (High).
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.13.5 WAN Line

The WAN Line Properties pane allows you to view and configure wide-area network (WAN) line information.

Table C-1269 Field Descriptions for the WAN Line

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.

C.4.13.6 VLAN

The VLAN Properties pane allows you to view and update VLAN information.

Table C-1270 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. Select –- for all the other VLAN rows in that Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must attached to exactly one untagged VLAN.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.14 Slot Properties—ETH1000

The slot properties pane displays information about the Cisco ONS 15327, ONS 15454 SONET, or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 and ONS 15454 SDH ETH1000 cards incorporate Layer 2 switching, while the G-series card is a straight mapper card. The ONS 15454 E-series cards include the E100T-12/E100T-G and E1000-2/E1000-2-G. E-series cards support VLAN, IEEE 802.1Q, spanning tree, and IEEE 802.1D. An ONS 15454 holds a maximum of ten Ethernet cards, which can be inserted in any multipurpose slot.

For the ETH1000 module, the slot properties pane displays the following properties: Module View, Identification, Port, Line, VLAN, and Alarm Behavior.

C.4.14.1 Module View

The Module View displays a graphic of the ETH1000 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.14.2 Identification

The Identification Properties pane allows you to view and update ETH1000 identification information.

Table C-1271 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Card Mode	Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.14.3 Port

The Port Properties pane allows you to view and update ETH1000 port information.

Table C-1272 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port.
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the port.
STP State	Displays the current STP state.

C.4.14.4 Line

The Line Properties pane allows you to view and update ETH1000 line performance monitoring information.

Table C-1273 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each Ethernet port. Valid choices for the card are 1000 Full or Auto.
Status	Displays the current optical line status.

C.4.14.5 VLAN

The VLAN Properties pane allows you to view and update ETH1000 VLAN information.

Table C-1274 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. Select –- for all the other VLAN rows in that Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must attached to exactly one untagged VLAN.

C.4.14.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update ETH1000 alarm profile information.

Table C-1275 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the ETH1000 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.15 Slot Properties—G1000-2

The slot properties pane displays information about the Cisco ONS 15327 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15327 G1000-2 card reliably transports Ethernet and IP data across a SONET backbone. The G1000-2 card maps up to two Gigabit Ethernet interfaces onto a SONET transport network. A single card provides scalable and provisionable transport bandwidth at the signal levels up to STS-48c per card. The card provides line rate forwarding for all Ethernet frames (unicast, multicast, and broadcast) and can be configured to support jumbo frames (defined as a maximum of 10,000 bytes).

For the G1000-2 module, the slot properties pane displays the following properties: Module View, Identification, Port, Loopback, Thresholds, Alarm Behavior, J1 Path Trace, and Info.

C.4.15.1 Module View

The Module View displays a graphic of the G1000-2 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.15.2 Identification

The Identification Properties pane allows you to view and update G1000-2 identification information.

Table C-1276 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.15.3 Port

The Port Properties pane allows you to view and update G1000-2 port information.

Table C-1277 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Port Name	Allows you to add a name for the optical port.
Max Frame	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (the default). If you do not want to permit jumbo-size Ethernet frames, select 1548.

Table C-1277 Field Descriptions for the Port Properties Pane (continued)

Field	Description
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Auto Negotiation	Allows you to enable the card to match the speed and duplex mode of a partner node.
Negotiation Status	Displays the result of the most-recent autonegotiation. The type of flow control that was negotiated will be displayed.
Media Type	Indicates the type of SFP installed.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Water Marks	Watermarks can either be Custom, Low Latency, or Default.
Flow Control Low	Displays the minimum flow control.
Flow Control High	Displays the maximum flow control.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.4.15.4 Loopback

The Loopback Properties pane allows you to view and update G1000-2 loopback information.

Table C-1278 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Allows you to select the administration state of the port: In Service (IS) or Out of Service (OOS).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

C.4.15.5 Thresholds

The Thresholds Properties pane allows you to create, view, and delete G1000-2 thresholds.

Table C-1279 Field Descriptions for the Threshold Properties

Field	Description
Index #	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new Ether threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	Select a variable for the new Ether threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new Ether threshold. Available alarm types are Rising, Falling, and Rising and Falling.

Table C-1279 Field Descriptions for the Threshold Properties (continued)

Field	Description
Sample Type	Select a sample type for the new Ether threshold. Available sample types are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Enter a sample period for the new Ether threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new Ether threshold. The value must be equal to or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ether threshold. The value must be equal to or less than the rising threshold value.
Create	Click the **Create** button to create a G1000-2 thresholds.
Delete	Select a G1000-2 threshold from the list displayed and click the **Delete** button.

C.4.15.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update G1000-2 alarm profile information.

Table C-1280 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the G1000-2 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.15.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve G1000-2 J1 path trace information.

Table C-1281 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

C.4.15.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the G1000-2 card.

Table C-1282 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.16 Slot Properties—G1000-4

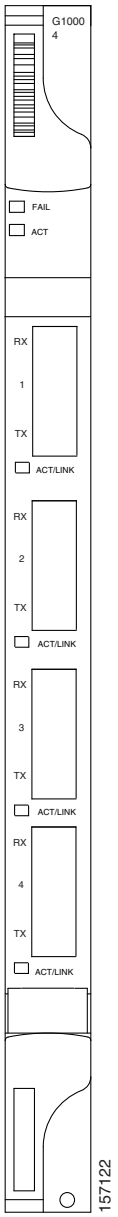
The slot properties pane displays information about the Cisco ONS 15327, ONS 15454 SONET, or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SONET G1000-4 card reliably transports Ethernet and IP data across a SONET backbone. The G1000-4 card maps up to four Gigabit Ethernet interfaces onto a SONET transport network. A single card provides scalable and provisionable transport bandwidth at the signal levels up to STS-48c per card. The card provides line rate forwarding for all Ethernet frames (unicast, multicast, and broadcast) and can be configured to support jumbo frames (defined as a maximum of 10,000 bytes).

For ONS 15454 SDH NEs, the G1000-4 card provides four ports of IEEE-compliant, 1000-Mb/s interfaces. Each interface supports full-duplex operation for a maximum bandwidth of 1 Gb/s or 2 Gb/s bidirectional per port, and 2.5 Gb/s or 5 Gb/s bidirectional per card. Each port autonegotiates for full duplex and 802.3x flow control. The G1000-4 card uses GBIC modular receptacles for the optical interfaces.

The following figure shows the card faceplate.

Figure C-73 G1000-4 Module



For the G1000-4 module, the slot properties pane displays the following properties: Module View, Identification, Port, Loopback, Thresholds, Alarm Behavior, J1 Path Trace, and Info.

C.4.16.1 Module View

The Module View displays a graphic of the G1000-4 that is installed in the slot. In the module graphic the small arrows indicate the transponder mode. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.16.2 Identification

The Identification Properties pane allows you to view and update G1000-4 identification information.

Table C-1283 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Current Bandwidth Usage	Displays the current bandwidth utilization in terms of STS or VC-4 usage.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.16.3 Port

The Port Properties pane allows you to view and update G1000-4 port information.

Table C-1284 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Port Name	Allows you to add a name for the optical port.
Max Frame	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (the default). If you do not want to permit jumbo-size Ethernet frames, select 1548.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Auto Negotiation	Allows you to enable the card to match the speed and duplex mode of a partner node.
Negotiation Status	Displays the result of the most-recent autonegotiation. The type of flow control that was negotiated will be displayed.
Media Type	Indicates the type of SFP installed.

Table C-1284 Field Descriptions for the Port Properties Pane (continued)

Field	Description
Administration State	Displays the status of the line. The line can be In Service (IS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Transponder Port	Ports in the transponding mode.
Transponder Mode	The GigE Ethernet Transponder can be set for 3 different operation modes: • Two ports bidirectional transponder mode (Tx and Rx of one port can be mapped into Rx and Tx of another port) • One port bidirectional transponding mode (Ethernet frames received at port Rx will be transmitted out at the same port Tx) • Two ports unidirectional transponding mode (Ethernet frames received at one port Rx will be transmitted out at another port Tx). In the module view the small arrows indicate the transponder mode (see the module graphic in the Module View description).
Water Marks	Adjustable buffers for flow control.
Flow Control Low	Flow control low value.
Flow Control High	Flow control high value.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Link Integrity Disable	If this check box is checked, the Link Integrity Timer field for the corresponding port number will be disabled.
Link Integrity Timer	Set the link integrity timer for the port. Enter a range from 200 to 5000 milliseconds, in increments of 100 milliseconds. Enabling link integrity ensures that links are never broken.

C.4.16.4 Loopback

The Loopback Properties pane allows you to view and update G1000-4 loopback information.

Table C-1285 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Allows you to select the administration state of the port: In Service (IS) or Out of Service (OOS).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

C.4.16.5 Thresholds

The Thresholds Properties pane allows you to create, view, and delete G1000-4 thresholds.

Table C-1286 Field Descriptions for the Thresholds Properties Pane

Field	Description
Index #	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new Ether threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	Select a variable for the new Ether threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new Ether threshold. Available alarm types are Rising, Falling, and Rising and Falling.
Sample Type	Select a sample type for the new Ether threshold. Available sample types are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period	Enter a sample period for the new Ether threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new Ether threshold. The value must be equal or greater than the Falling Threshold value.
Falling Threshold	Enter a falling threshold for the new Ether threshold. The value must be equal or less than the rising threshold value.

C.4.16.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update G1000-4 alarm profile information.

Table C-1287 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the G1000-4 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.16.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve G1000-4 J1 path trace information.

Table C-1288 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.

Table C-1288 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Column	Description
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

C.4.16.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the G1000-4 card.

Table C-1289 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

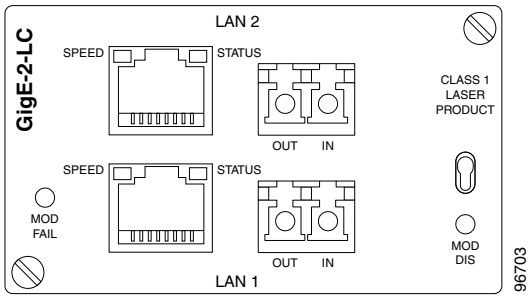
Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.17 Slot Properties—GE-2 (ONS 15305 CTC)

The slot properties pane displays information about the Cisco ONS 15305 CTC slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The GE-2 module contains two Gigabit Ethernet (GE) interfaces that meet the 1000Base-LX specification in IEEE 802.3. This interface is a long-haul interface based on single-mode fiber. The physical connector is an LC connector. The following figure shows the card faceplate.

Figure C-74 Dual Optical LAN 1000BASE-LX, GE-2 Module



For the GE-2 module, the slot properties pane displays the following properties: Module View, Identification, Line, Port, and VLAN.

C.4.17.1 Module View

The Module View displays a graphic of the GE-2 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.4.17.2 Identification

The Identification Properties pane allows you to view and update GE-2 identification information.

Table C-1290 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Card Mode	Displays the card mode as, multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards.
Alarm Profile	Displays the alarm profile for the port.

C.4.17.3 Line

The Line Properties pane allows you to view and update line card information.

Table C-1291 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to add a name for the port.
Mode	Allows you to select the appropriate mode for each port. Valid choices are Auto, 10 Half, 10 Full, 100 Half, 100 Full, 1000 Half, or 1000 Full.
Status	Displays the current optical line status.

C.4.17.4 Port

The Port Properties pane allows you to view and update port information.

Table C-1292 Field Descriptions for the Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.
Queue Priority	Allows you to select the priority queue for the port. You can select from, 0 (Low), 1 (Low), 2 (Low), 3 (Low), 4 (High), 5 (High), 6 (High), or 7 (High).
STP Enabled	When checked, indicates that Spanning Tree Protocol (STP) is enabled for the card.
STP State	Displays the current STP state.

C.4.17.5 VLAN

The VLAN Properties pane allows you to view and update VLAN information.

Table C-1293 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must be attached to at least one untagged VLAN.

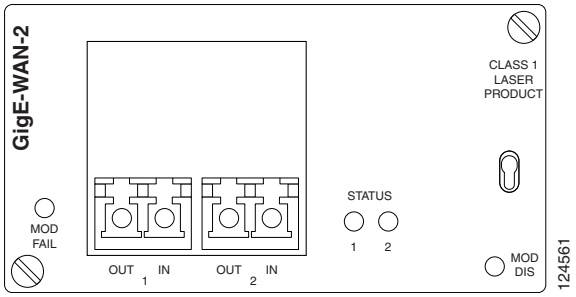
Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.18 Slot Properties—GigE-WAN-2 (ONS 15305 CTC)

The slot properties pane displays information about the Cisco ONS 15305 CTC slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The GigE-WAN-2 module is a tributary module that supports both optical and electrical Gigabit Ethernet interfaces. It supports up to two interfaces and includes up to two Gigabit Ethernet-to-SDH mappers. The module supports both L1 and L2 services. The following figure shows the module diagram.

Figure C-75 Dual Optical LAN 1000Base-LX Module with Mapper, GigE-WAN-2



For the GigE-WAN-2 module, the slot properties pane displays the following properties: Module View, Identification, Ether Line, Ether Port, WAN Line, and VLAN.

C.4.18.1 Module View

The Module View displays a graphic of the GigE-WAN-2 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the card.

C.4.18.2 Identification

The Identification Properties pane allows you to view and update identification information.

Table C-1294 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Card Mode	Displays the card mode as multicard Ether Switch group or Port Mapped.
Alarm Profile	Displays the alarm profile for the port.

C.4.18.3 Ether Line

The Ether Line Properties pane allows you to configure Ether line information.

Table C-1295 Field Descriptions for the Ether Line Properties Pane

Field	Description
Port Number	The port number.
Port Name	Allows you to enter a port name.
Mode	Allows you to set the mode for the port to 1000 Full.
Status	Displays the current optical line status.

C.4.18.4 Ether Port

The Ether Port Properties pane allows you to view and update port information.

Table C-1296 Field Descriptions for the Ether Port Properties Pane

Field	Description
Port Number	Displays the card port number.
Enabled	When checked, the corresponding port is enabled.

C.4.18.5 WAN Line

The WAN Line Properties pane allows you to view and configure wide-area network (WAN) line information.

Table C-1297 Field Descriptions for the WAN Line

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.

C.4.18.6 VLAN

The VLAN Properties pane allows you to view and update VLAN information.

Table C-1298 Field Descriptions for the VLAN Properties Pane

Field	Description
VLAN	Displays the name of the VLAN.
Port *x*	If a port is a member of only one VLAN, select Untag from the Port column. Select –- for all the other VLAN rows in that Port column. The VLAN with Untag selected can connect to the port, but other VLANs cannot access that port. If a port is a trunk port, it connects multiple VLANs to an external device, such as a switch, which also supports trunking. A trunk port must have tagging (802.1Q) enabled for all VLANs that connect to that external device. Select Tagged at all VLAN rows that need to be trunked. Select Untag at one or more VLAN rows in the trunk port column that do not need to be trunked; for example, the default VLAN. Each Ethernet port must attached to exactly one untagged VLAN.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.19 Slot Properties—ML-100T-8

The slot properties pane displays information about the Cisco ONS 15310 CL, Cisco ONS 15310 MA SONET, or Cisco ONS 15310 MA SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ML-100T-8 card provides feature parity with the ONS 15454 ML card features. The ML-100T-8 card interoperates with ML-series cards as a hub node, and also interoperates with other ML cards on an RPR ring. The card also supports concatenation functions to construct transport trails (for example, VC-4-4c) for carrying packet data. The card provides contiguous, low-order, and high-order virtual concatenation. The ML-100T-8 card has its own PID and CLEI, and a port count that ranges from 0 to 7.

For the ML-100T-8 module, the slot properties pane displays the following properties: Module View, Identification, Configuration, POS, Ether, Alarm Behavior, L2 Service Drops, Card Parameters, Thresholds, J1 Path Trace, and Info.

C.4.19.1 Module View

The Module View displays a graphic of the ML-100T-8 module that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.4.19.2 Identification

The Identification Properties pane allows you to view and update ML-100T-8 identification information.

Table C-1299 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table C-1299 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.19.3 Configuration

The Configuration Properties pane allows you to upload or download a configuration file for the ML-100T-8 card.

Table C-1300 Field Descriptions for the Configuration Properties Pane

Field	Description
IOS Startup Config	
Source	Displays the source of the configuration file.
Host	Displays the host machine where the configuration file is stored, or the location where the file will be downloaded.
Filename	Displays the name of the configuration file.
Directory	Displays the directory on the host machine for the configuration file.
Time Stamp	Displays the date and time of the file upload or download. The time stamp shows the time on the NE, not the time on the Prime Optical server. **Note** You can update the time stamp on the NE in the node-level NE Explorer > Identification Properties pane.
IOS Config File	
CTX >> File	Click this button to download the file from the CTX card to the host machine. Select Local or Server in the CTX >> File dialog box to designate a location for the file.
File >> CTX	Click this button to upload the file from the host machine to the CTX card. Select Local or Server in the File >> CTX dialog box to designate a location for the file.
Launch CLI	Click this button to launch the command-line interface (CLI).
Microcode	
Microcode	Configure the ML-series card with one of the following microcode images: • Base—Enables base features, which include IP multicast routing and IP fragmentation. • Enhanced—Enables Ethernet Relay Multipoint Service (ERMS), enhanced packet statistics, and enhanced Dual RPR Interconnect (DRPRI). This disables IP fragmentation and IP multicast routing features supported by the base microcode image. • MPLS—Enables Multiprotocol Label Switching (MPLS). **Note** After changing the microcode, you should reset the card manually.
Hostname	

Table C-1300 Field Descriptions for the Configuration Properties Pane (continued)

Field	Description
Hostname	Enter the hostname of the device where you want to upload or download a configuration file for the card.
IOS Access	
Enable Console Port Access	Allows you to enable access to ML cards through the console port. If this field is disabled, you cannot connect to the ML card through the console port.
Enable RADIUS Relay	Allows you to enable access to ML cards through the RADIUS relay server.

C.4.19.4 POS

The POS Properties pane allows you to view and update ML-100T-8 POS port information.

Table C-1301 Field Descriptions for the POS

Field	Description
POS Ports	
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the state of the port. Values are Up and Down.
Link State	Displays the link state. Values are Up and Down.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
POS Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
CoS Accounting	Indicates whether or not PM is enabled on the POS.

C.4.19.5 Ether

The Ether Properties pane allows you to view and update ML-100T-8 Ethernet port information.

Table C-1302 Field Descriptions for the Ether

Field	Description
Ether Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the name of the port.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN.
Link State	Displays the physical port state. Values are UP and DOWN.
Operating Speed	Displays the operating speed for the ports.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Fast Ethernet Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
Speed	Displays the operating speed for the ports.
Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Flow Control (Send)	Negotiated flow control mode, which configures the send traffic flow operation. Flow control works only with policing. Values and their impact on traffic flow are: • Desired—Allow but do not require flow-control packets on port • Off—Disable flow-control packets on port • On—Enable flow-control packets on port (works only with policing)
CoS Accounting	Indicates whether or not PM is enabled on the port.

C.4.19.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information for POS and Ethernet ports.

Table C-1303 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.

Table C-1303 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.19.7 L2 Service Drops

The L2 Service Drops Properties pane allows you to view L2 service drop configuration settings. Click the **Show QoS Parameters** button to open the QoS for L2 Service Drop Port table, which shows the QoS for the selected drop.

Table C-1304 Field Descriptions for the L2 Service Drops Properties Pane

Field	Description
Port No.	The port number.
Port Sub Interface	The port subinterface.
Topology Name	The topology name.
SP VLAN ID	The service provider VLAN ID.
Customer ID	The customer ID.
Service ID	The service ID.
Bridge Group	The bridge group.
Port Type	The port type (UNI or NNI).
Connection Type	The connection type (Dot1Q, Untagged, or QinQ).
Policing	The QoS policy configured on the selected front port interface or subinterface. Supported values are CIR/PIR and Best Effort.
RSTP	When checked, RSTP is enabled.

C.4.19.8 Card Parameters

The Card Parameters Properties pane allows you to view card parameter settings.

Table C-1305 Field Descriptions for the Card Properties Pane Parameters

Field	Description
Port Number	The port number.
Port Sub Interface	The port subinterface.
Bridge Group	The bridge group.
CIR	The committed information rate. The range is from 96000 to 800000000 bits per second.
CIR Burst	The maximum CIR burst. The default is 8000 bytes; the range is from 8000 to 64000 bytes.
PIR	The peak information rate. The range is from 96000 to 800000000 bits per second. PIR should be greater than or equal to CIR.

Table C-1305 Field Descriptions for the Card Properties Pane Parameters (continued)

Field	Description
PIR Burst	The maximum PIR burst. The default is 64000 bytes; the range is from 8000 to 64000 bytes. PIR burst should be greater than or equal to CIR burst.
CCOSTRANSMIT	This keyword comes from the grammar file for the police command. For confirm action, the set-cos-transmit keyword specifies the set cos value. This value is used to determine the QoS configured on the front port of the ML card. A CCOSTRANSMIT value of 0 means a best effort policy has been configured for this port (FE/GE_IN). Other values are: 1: Best Effort (for Policy_Qos_Out) 2: CIR 3: CONTROL 4: VOICE 5: VIDEO 6: VOICE_VIDEO 7: MISSION_CRITICAL 8: SP_MANAGEMENT The card parameters shown on the NE Explorer are only for Policy_FE/GE_IN, meaning CCOSTRANSMIT is 0 or 2 (what VLAN provisioning supports).

C.4.19.9 Thresholds

The Thresholds Properties pane allows you to view and create RMON thresholds for POS and Ethernet ports.

Table C-1306 Field Descriptions for the Thresholds Properties Pane

Field	Description
Index Number	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Threshold	Displays the number of occurrences for the rising threshold.
Falling Threshold	Displays the number of occurrences for the falling threshold field. In most cases, a falling threshold is set lower than the rising threshold.

Table C-1306 Field Descriptions for the Thresholds Properties Pane (continued)

Field	Description
Create	Click the **Create** button to create RMON thresholds for the port.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.4.19.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1307 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

C.4.19.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the ML-100T-8 card.

Table C-1308 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.20 Slot Properties—ML1000-2

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Gigabit Ethernet (ML1000-2) Layer 3 switch processes up to 5.7 Mb/s. The card is integrated into the ONS 15454 SONET or ONS 15454 SDH. An ONS 15454 SONET with a 10-gigabit cross-connect card (XC10G) can host the ML1000-2 card in any traffic card slot, but an ONS 15454 SONET with a

cross-connect card (XC) or cross-connect virtual tributary card (XCVT) can only host the ML1000-2 card in the four traffic slots. An ONS 15454 SDH can host the ML1000-2 card in any traffic card slot with any cross-connect card.

For the ML1000-2 module, the slot properties pane displays the following properties: Module View, Identification, Configuration, POS, Ether, Alarm Behavior, L2 Service Drops, Card Parameters, Thresholds, J1 Path Trace, Info, and Port Channel. The properties shown depend on the NE configuration.

C.4.20.1 Module View

The Module View displays a graphic of the ML1000-2 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.20.2 Identification

The Identification Properties pane allows you to view and update ML1000-2 card identification information.

Table C-1309 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-1309 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Card Mode	Select the card mode. It can be one of the following: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode; maps a client frame into one GFP frame. • RPR 802.17—IEEE 802.17 Resilient Packet Ring (RPR) standard, which specifies the data traffic protection and spatial reuse over ring architecture. The RPR ring architecture is highly scalable and provides efficient transfer of packet-based traffic across a network. It is suitable for data, voice, and video applications. ⚠ **Caution** If you change the card mode to RPR 802.17, you must reload the barebone configuration on the ML card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.20.3 Configuration

The Configuration Properties pane allows you to upload or download a configuration file for the ML1000-2 card.

Table C-1310 Field Descriptions for the Configuration Properties Pane

Field	Description
IOS Startup Config	
Source	Displays the source of the configuration file.
Host	Displays the host machine where the configuration file is stored, or the location where the file will be downloaded.
Filename	Displays the name of the configuration file.
Directory	Displays the directory on the host machine for the configuration file.
Time Stamp	Displays the date and time of the file upload or download. The time stamp shows the time on the NE, not the time on the Prime Optical server. **Note** You can update the time stamp on the NE in the node-level NE Explorer > Identification Properties pane.
IOS Config File	
TCC >> File	Click this button to download the file from the TCC card to the host machine. Select **Local** or **Server** in the TCC >> File dialog box to designate a location for the file. **Note** If you select Server, the file is saved in the $CTMROOT/IosConfig directory.
File >> TCC	Click this button to upload the file from the host machine to the TCC card. Select Local or Server in the File >> TCC dialog box to designate a location for the file.
Launch CLI	Click this button to launch the command-line interface (CLI).
Hostname	

Table C-1310 Field Descriptions for the Configuration Properties Pane (continued)

Field	Description
Hostname	Displays the hostname that was configured through the Cisco IOS CLI. You can enter a different value for the hostname if required.
Microcode	
Microcode	Configure the ML-series card with one of the following microcode images. Select either: • Base—Enables base features, which include IP multicast routing and IP fragmentation. • Enhanced—Enables Ethernet Relay Multipoint Service (ERMS), enhanced packet statistics, and enhanced Dual RPR Interconnect (DRPRI). This disables IP fragmentation and IP multicast routing features supported by the base microcode image. **Note** After changing the microcode, you should reset the card manually.
IOS Access	
Enable Console Port Access	Allows you to enable access to ML cards through the console port. If this field is disabled, you cannot connect to the ML card through the console port.
Enable RADIUS Relay	Allows you to enable access to ML cards through the RADIUS relay server.

C.4.20.4 POS

The POS Properties pane allows you to view and update ML1000-2 POS port information.

Table C-1311 Field Descriptions for the POS Properties Pane

Field	Description
POS Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the name of the port.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN. **Note** The Administration State field displays “DOWN” whenever a circuit is not provisioned. To see the actual administration state of the port, view the POS Properties pane > POS Provisioning tab. The Interface State attribute shows the actual Administration State value.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. Maximum setting is 9000 and the default size is 1500. The MTU value will display 0 until the POS port is used in creating a circuit.

Table C-1311 Field Descriptions for the POS Properties Pane (continued)

Field	Description
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
RPR Span	
Port Number	Displays the port number.
Port Name	Displays the name of the port. You can edit the port name.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the automatic in-service soak time, which is the amount of valid input signal, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
Span Interface	Displays the direction of the RPR span, either RPR_EAST or RPR_WEST.
State	Displays the state of the east and west spans.
Framing Type	Indicates the framing type, which is RPR 802.17.
Jumbo	Displays a value of true, which indicates that jumbo frame support is applied on all of the ML cards participating in the 802.17 RPR topology. Jumbo frame support is set at the ring level and carried in the attribute discovery messages.
Edge	Indicates the existence of a protection edge in an open ring. Values are: • EDGE—The selected RPR has a protection edge in an open ring. • NO_EDGE—The selected RPR does not have a protection edge in an open ring.
POS Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
CoS Accounting	Indicates whether or not PM is enabled on the POS.
RPR Span Provisioning	
Port Number	Displays the port number.
Interface State	Check the Interface State check box to bring up the interface. Leave the check box unchecked to shut down the interface. When the interface is shut down, no traffic can flow through it.

C.4.20.5 Ether

The Ether Properties pane allows you to view and update ML1000-2 Ethernet port information.

Table C-1312 Field Descriptions for the Ether

Field	Description
Ether Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the name of the port.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Operating Speed	Displays the operating speed for the ports.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Optics	Displays the SFP physical media type. Values are Unplugged, 1000 SX, and 1000 LX.
Gigabit Ethernet Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Speed	Displays the operating speed for the ports.
Flow Control (Send)	Negotiated flow control mode, which configures the send traffic flow operation. Flow control works only with policing. Values and their impact on traffic flow are: • Desired—Allow but do not require flow-control packets on port • Off—Disable flow-control packets on port • On—Enable flow-control packets on port (works only with policing)
Flow Control (Receive)	Negotiated flow control mode, which configures the receiving traffic flow operation. Values and their impact on traffic flow are: • Desired—Allow but do not require flow-control packets on port • Off—Disable flow-control packets on port • On—Enable flow-control packets on port (works only with policing)
CoS Accounting	Indicates whether or not PM is enabled on the port.

C.4.20.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update ML1000-2 alarm profile information for the POS and Ethernet ports and RPR spans.

Table C-1313 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Equipment State	Displays the equipment state.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.20.7 L2 Service Drops

The L2 Service Drops Properties pane allows you to view L2 service drop configuration settings. Click the **Show QoS Parameters** button to open the QoS for L2 Service Drop Port table, which shows the QoS for the selected drop.

Table C-1314 Field Descriptions for the L2 Service Drops Properties Pane

Field	Description
Port No.	The port number.
Port Sub Interface	The port subinterface.
Topology Name	The topology name.
SP VLAN ID	The service provider VLAN ID.
Customer ID	The customer ID.
Service ID	The service ID.
Bridge Group	The bridge group.
Port Type	The port type (UNI or NNI).
Connection Type	The connection type (Dot1Q, Untagged, or QinQ).
Policing	The QoS policy configured on the selected front port interface or subinterface. Supported values are CIR/PIR and Best Effort.
RSTP	When checked, RSTP is enabled.

C.4.20.8 Card Parameters

The Card Parameters Properties pane allows you to view card parameter settings.

Table C-1315 Field Descriptions for the Card Properties Pane Parameters

Field	Description
Port No.	The port number.
Port Sub Interface	The port subinterface.
Bridge Group	The bridge group.
CIR	The committed information rate. The range is from 96000 to 800000000 bits per second.
CIR Burst	The maximum CIR burst. The default is 8000 bytes; the range is from 8000 to 64000 bytes.
PIR	The peak information rate. The range is from 96000 to 800000000 bits per second. PIR should be greater than or equal to CIR.
PIR Burst	The maximum PIR burst. The default is 64000 bytes; the range is from 8000 to 64000 bytes. PIR burst should be greater than or equal to CIR burst.
CCOSTRANSMIT	This keyword comes from the grammar file for the police command. For confirm action, the set-cos-transmit keyword specifies the set cos value. This value is used to determine the QoS configured on the front port of the ML card. A CCOSTRANSMIT value of 0 means a best effort policy has been configured for this port (FE/GE_IN). Other values are: • 1: Best Effort (for Policy_Qos_Out) • 2: CIR • 3: CONTROL • 4: VOICE • 5: VIDEO • 6: VOICE_VIDEO • 7: MISSION_CRITICAL • 8: SP_MANAGEMENT The card parameters shown on the NE Explorer are only for Policy_FE/GE_IN, meaning CCOSTRANSMIT is 0 or 2 (what VLAN provisioning supports).

C.4.20.9 Thresholds

The Thresholds Properties pane allows you to view remote monitoring (RMON) thresholds and create new RMON thresholds to allow Prime Optical to monitor ML POS counts.

Table C-1316 Field Descriptions for the Thresholds Properties Pane

Field	Description
Index Number	The index number.
Interface Name	The interface name. Currently, only POS0 and POS1 are supported.
Direction	The direction of the reported statistics. Currently, only output is supported.
COS	The class of service level. Supported levels are 0 to 7.

Table C-1316 Field Descriptions for the Thresholds Properties Pane (continued)

Field	Description
Sample Period	The sample period, in seconds.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).

C.4.20.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1317 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Member Number	Displays the virtual concatenation (VCAT) member number.

C.4.20.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the ML1000-2.

Table C-1318 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

C.4.20.12 Port Channel

The Port Channel Properties pane allows you to configure the port channel interface on ML1000-2 cards. Port channel (also known as *link aggregation*) is a trunking technology that groups together multiple full-duplex IEEE 802.3 Gigabit Ethernet/Fast Ethernet interfaces to provide fault-tolerant high-speed links between switches, routers, and servers. Port channel forms a single higher bandwidth routing or bridging endpoint and was designed primarily for host-to-switch connectivity.

Table C-1319 Field Descriptions for the Port Channel Properties Pane

Field	Description
Port Channel Table	
Create	Opens the Create Port Channel ID dialog box, which allows you create a new port channel. Each ML1000-2 card supports up to two port channels. A maximum of two Gigabit Ethernet ports can bundle into one Gigabit Ethernet Channel (GEC) and provide 2-Gb/s full-duplex aggregate capacity on the ML1000-2 card. See 7.10.19.1 Creating a Port Channel, page 7-319. **Note** The Create button is dimmed if two port channels have already been created.
Modify	Opens the Modify Port Channel ID dialog box, which allows you to modify an existing port channel. See 7.10.19.2 Modifying a Port Channel, page 7-320.
Delete	Deletes the selected port channel. **Note** You cannot delete an aggregate link that contains active members. You must first disaggregate all of the associated members from the port channel, then delete the empty port channel.
Channel ID	Displays the port channel ID, which identifies the port channel interface. Prime Optical generates the ID automatically; the range is from 1 to 64.
Admin State	Displays the status of the port channel interface (Up or Down).
MTU	Displays the maximum transmission unit (MTU) size, which is the largest acceptable packet size configured for the port channel interface. The range is from 64 to 9000 bytes; the default is 1500 bytes.
Hold Queue In	Displays the size of the memory packets input queue. The range is from 0 to 4096 bytes.
Hold Queue Out	Displays the size of the memory packets output queue. The range is from 0 to 4096 bytes.
Port Channel Members Table	
Add	Opens the Add Port Channel Member on Port Channel ID dialog box, which allows you to add members to a port channel. See 7.10.19.4 Creating a Port Channel Member, page 7-321.
Modify	Opens the Modify Port Channel Member on Port Channel ID dialog box, which allows you to modify an existing port channel member. See 7.10.19.5 Modifying a Port Channel Member, page 7-322.
Remove	Removes the selected member from the port channel.
Port No.	Displays the port number, which identifies the port channel member.

Table C-1319 Field Descriptions for the Port Channel Properties Pane (continued)

Field	Description
LACP Priority	Displays the number that Link Aggregation Control Protocol (LACP) uses with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating. The range is from 1 to 65535.
LACP Mode	Defines the LACP packets exchange mode between different ports: • Transparent—LACP is not enabled. • Active—Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets. • Passive—Places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP negotiation. In this mode, the port channel group attaches the interface to the bundle.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.21 Slot Properties—ML100T-12

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Fast Ethernet (ML100T-12) Layer 3 switch processes up to 5.7 Mb/s. The card is integrated into the ONS 15454 SONET or ONS 15454 SDH. An ONS 15454 SONET with a 10-gigabit cross-connect card (XC10G) can host the ML100T-12 card in any traffic card slot, but an ONS 15454 SONET with a cross-connect card (XC) or cross-connect virtual tributary card (XCVT) can only host the ML100T-12 card in the four traffic slots. An ONS 15454 SDH can host the ML100T-12 card in any traffic card slot with any cross-connect card.

For the ML100T-12 module, the slot properties pane displays the following properties: Module View, Identification, Configuration, POS, Ether, Alarm Behavior, L2 Service Drops, Card Parameters, Thresholds, J1 Path Trace, Info, and Port Channel. The properties shown depend on the NE configuration.

C.4.21.1 Module View

The Module View displays a graphic of the ML100T-12 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.21.2 Identification

The Identification Properties pane allows you to view and update ML100T-12 card identification information.

Table C-1320 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Card Mode	Select the card mode. It can be one of the following: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode; maps a client frame into one GFP frame. • RPR 802.17—IEEE 802.17 Resilient Packet Ring (RPR) standard, which specifies the data traffic protection and spatial reuse over ring architecture. The RPR ring architecture is highly scalable and provides efficient transfer of packet-based traffic across a network. It is suitable for data, voice, and video applications. **Caution** If you change the card mode to RPR 802.17, you must reload the barebone configuration on the ML card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.21.3 Configuration

The Configuration Properties pane allows you to upload or download a configuration file for the ML100T-12 card.

Table C-1321 Field Descriptions for the Configuration Properties Pane

Field	Description
IOS Startup Config	
Source	Displays the source of the configuration file.
Host	Displays the host machine where the configuration file is stored, or the location where the file will be downloaded.
Filename	Displays the name of the configuration file.
Directory	Displays the directory on the host machine for the configuration file.
Time Stamp	Displays the date and time of the file upload or download. The time stamp shows the time on the NE, not the time on the Prime Optical server. **Note** You can update the time stamp on the NE in the node-level NE Explorer > Identification Properties pane.
IOS Config File	
TCC >> File	Click this button to download the file from the TCC card to the host machine. Select **Local** or **Server** in the TCC >> File dialog box to designate a location for the file. **Note** If you select Server, the file is saved in the $CTMROOT/IosConfig directory.
File >> TCC	Click this button to upload the file from the host machine to the TCC card. Select Local or Server in the File >> TCC dialog box to designate a location for the file.
Launch CLI	Click this button to launch the command-line interface (CLI).
Microcode	
Microcode	Configure the ML-series card with one of the following microcode images. Select either: • Base—Enables base features, which include IP multicast routing and IP fragmentation. • Enhanced—Enables Ethernet Relay Multipoint Service (ERMS), enhanced packet statistics, and enhanced Dual RPR Interconnect (DRPRI). This disables IP fragmentation and IP multicast routing features supported by the base microcode image. **Note** After changing the microcode, you should reset the card manually.
IOS Access	
Enable Console Port Access	Allows you to enable access to ML cards through the console port. If this field is disabled, you cannot connect to the ML card through the console port.
Enable RADIUS Relay	Allows you to enable access to ML cards through the RADIUS relay server.

C.4.21.4 POS

The POS Properties pane allows you to view and update ML100T-12 POS port information.

Table C-1322 Field Descriptions for the POS Properties Pane

Field	Description
POS Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the port name.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN. **Note** The Administration State field displays "DOWN" whenever a circuit is not provisioned. To see the actual administration state of the port, view the POS Properties pane > POS Provisioning tab. The Interface State attribute shows the actual Administration State value.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Maximum transmission unit, which is the largest acceptable packet size configured for that port. The maximum setting is 9000; the default size is 1500. The MTU value will display 0 until the POS port is used to create a circuit.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
RPR Span	
Port Number	Displays the port number.
Port Name	Displays the name of the port. You can edit the port name.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the automatic in-service soak time, which is the amount of valid input signal, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
Span Interface	Displays the direction of the RPR span, either RPR_EAST or RPR_WEST.
State	Displays the state of the east and west spans.
Framing Type	Indicates the framing type, which is RPR 802.17.
Jumbo	Displays a value of true, which indicates that jumbo frame support is applied on all of the ML cards participating in the 802.17 RPR topology. Jumbo frame support is set at the ring level and carried in the attribute discovery messages.
Edge	Indicates the existence of a protection edge in an open ring. Values are: • EDGE—The selected RPR has a protection edge in an open ring. • NO_EDGE—The selected RPR does not have a protection edge in an open ring.

Table C-1322 Field Descriptions for the POS Properties Pane (continued)

Field	Description
POS Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
CoS Accounting	Indicates whether or not PM is enabled on the POS.
RPR Span Provisioning	
Port Number	Displays the port number.
Interface State	Check the Interface State check box to bring up the interface. Leave the check box unchecked to shut down the interface. When the interface is shut down, no traffic can flow through it.

C.4.21.5 Ether

The Ether Properties pane allows you to view and update ML100T-12 Ethernet port information.

Table C-1323 Field Descriptions for the Ether

Field	Description
Ether Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the port name.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Operating Speed	Displays the operating speed for the ports. Values are Auto, 10 Mb/s, and 100 Mb/s.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Fast Ethernet Provisioning—This area displays the ML card attributes retrieved and provisioned through the IOS CLI interface.	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Speed	Displays the administrative speed value set into the card.
Duplex	Actual setting of the port. Values are Auto, Full, and Half.

Table C-1323 Field Descriptions for the Ether (continued)

Field	Description
Flow Control (Send)	Negotiated flow control mode, which configures the send traffic flow operation. Flow control works only with policing. Values and their impact on traffic flow are: • Desired—Allow but do not require flow-control packets on port • Off—Disable flow-control packets on port • On—Enable flow-control packets on port (works only with policing)
CoS Accounting	Indicates whether or not PM is enabled on the POS.

C.4.21.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update ML100T-12 alarm profile information for the POS and Ethernet ports and RPR spans.

Table C-1324 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Equipment State	Displays the equipment state.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.21.7 L2 Service Drops

The L2 Service Drops Properties pane allows you to view L2 service drop configuration settings. Click the **Show QoS Parameters** button to open the QoS for L2 Service Drop Port table, which shows the QoS for the selected drop.

Table C-1325 Field Descriptions for the L2 Service Drops Properties Pane

Field	Description
Port Number	The port number.
Port Sub Interface	The port subinterface.
Topology Name	The topology name.
SP VLAN ID	The service provider VLAN ID.
Customer ID	The customer ID.
Service ID	The service ID.
Bridge Group	The bridge group.

Table C-1325 Field Descriptions for the L2 Service Drops Properties Pane (continued)

Field	Description
Port Type	The port type (UNI or NNI).
Connection Type	The connection type (Dot1Q, Untagged, or QinQ).
Policing	The QoS policy configured on the selected front port interface or subinterface. Supported values are CIR/PIR and Best Effort.
RSTP	When checked, RSTP is enabled.
CIR	The committed information rate (CIR) range is from 96000 to 800000000 bits per second.
CIR Burst	The CIR burst default value is 8000 bytes; the range is from 8000 to 64000 bytes.
PIR	The peak information rate (PIR) range is from 96000 to 800000000 bits per second. PIR should be greater than or equal to CIR.
PIR Burst	The PIR burst default value is 64000 bytes; the range is from 8000 to 64000 bytes. PRI burst should be greater than or equal to CIR burst.
Best Effort Max Value	The Cisco best effort maximum value default is 96000 bits per second.
Best Effort Burst	Max CIR burst value. The default is 8000 bytes.

C.4.21.8 Card Parameters

The Card Parameters Properties pane allows you to view card parameter settings.

Table C-1326 Field Descriptions for the Card Properties Pane Parameters

Field	Description
Port Number	The port number.
Port Sub Interface	The port subinterface.
Bridge Group	The bridge group.
CIR	The committed information rate. The range is from 96000 to 800000000 bits per second.
CIR Burst	The maximum CIR burst. The default is 8000 bytes; the range is from 8000 to 64000 bytes.
PIR	The peak information rate. The range is from 96000 to 800000000 bits per second. PIR should be greater than or equal to CIR.

Table C-1326 Field Descriptions for the Card Properties Pane Parameters (continued)

Field	Description
PIR Burst	The maximum PIR burst. The default is 64000 bytes; the range is from 8000 to 64000 bytes. PIR burst should be greater than or equal to CIR burst.
CCOSTRANSMIT	This keyword comes from the grammar file for the police command. For confirm action, the set-cos-transmit keyword specifies the set cos value. This value is used to determine the QoS configured on the front port of the ML card. A CCOSTRANSMIT value of 0 means a best effort policy has been configured for this port (FE/GE_IN). Other values are: • 1: Best Effort (for Policy_Qos_Out) • 2: CIR • 3: CONTROL • 4: VOICE • 5: VIDEO • 6: VOICE_VIDEO • 7: MISSION_CRITICAL • 8: SP_MANAGEMENT The card parameters shown on the NE Explorer are only for Policy_FE/GE_IN, meaning CCOSTRANSMIT is 0 or 2 (what VLAN provisioning supports).

C.4.21.9 Thresholds

The Thresholds Properties pane allows you to view remote monitoring (RMON) thresholds and create new RMON thresholds to allow Prime Optical to monitor ML POS counts.

Table C-1327 Field Descriptions for the Thresholds Properties Pane

Field	Description
Index Number	The index number.
Interface Name	The interface name. Currently, only POS0 and POS1 are supported.
Direction	The direction of the reported statistics. Currently, only output is supported.
COS	The class of service level. Supported levels are 0 to 7.
Sample Period	The sample period, in seconds.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.

Table C-1327 Field Descriptions for the Thresholds Properties Pane (continued)

Field	Description
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).

C.4.21.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1328 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the circuit type.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Member Number	Displays the virtual concatenation (VCAT) member number.

C.4.21.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the ML100T-12 card.

Table C-1329 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

C.4.21.12 Port Channel

The Port Channel Properties pane allows you to configure the port channel interface on ML100T-12 cards. Port channel (also known as *link aggregation*) is a trunking technology that groups together multiple full-duplex IEEE 802.3 Gigabit Ethernet/Fast Ethernet interfaces to provide fault-tolerant high-speed links between switches, routers, and servers. Port channel forms a single higher bandwidth routing or bridging endpoint and was designed primarily for host-to-switch connectivity.

Table C-1330 Field Descriptions for the Port Channel Properties Pane

Field	Description
Port Channel Table	
Create	Opens the Create Port Channel ID dialog box, which allows you create a new port channel. Each ML100T-12 card supports up to six Fast Ethernet Channels (FECs). A maximum of four Fast Ethernet ports can bundle into one FEC and provide bandwidth scalability up to 400-Mb/s full-duplex Fast Ethernet for the ML100T-12 card. See 7.10.19.1 Creating a Port Channel, page 7-319. **Note** The Create button is dimmed if six port channels have already been created.
Modify	Opens the Modify Port Channel ID dialog box, which allows you to modify an existing port channel. See 7.10.19.2 Modifying a Port Channel, page 7-320.
Delete	Deletes the selected port channel. **Note** You cannot delete an aggregate link that contains active members. You must first disaggregate all of the associated members from the port channel, then delete the empty port channel.
Channel ID	Displays the port channel ID, which identifies the port channel interface. Prime Optical generates the ID automatically; the range is from 1 to 64.
Admin State	Displays the status of the port channel interface (Up or Down).
MTU	Displays the maximum transmission unit (MTU) size, which is the largest acceptable packet size configured for the port channel interface. The range is from 64 to 9000 bytes; the default is 1500 bytes.
Hold Queue In	Displays the size of the memory packets input queue. The range is from 0 to 4096 bytes.
Hold Queue Out	Displays the size of the memory packets output queue. The range is from 0 to 4096 bytes.
Port Channel Members Table	
Add	Opens the Add Port Channel Member on Port Channel ID dialog box, which allows you to add members to a port channel. See 7.10.19.4 Creating a Port Channel Member, page 7-321.
Modify	Opens the Modify Port Channel Member on Port Channel ID dialog box, which allows you to modify an existing port channel member. See 7.10.19.5 Modifying a Port Channel Member, page 7-322.
Remove	Removes the selected member from the port channel.
Port No.	Displays the port number, which identifies the port channel member.

Table C-1330 Field Descriptions for the Port Channel Properties Pane (continued)

Field	Description
LACP Priority	Displays the number that Link Aggregation Control Protocol (LACP) uses with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating. The range is from 1 to 65535.
LACP Mode	Defines the LACP packets exchange mode between different ports: • Transparent—LACP is not enabled. • Active—Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets. • Passive—Places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP negotiation. In this mode, the port channel group attaches the interface to the bundle.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.22 Slot Properties—ML100X-8

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH card slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ML100X-8 card is functionally equivalent to the ML-100T-12 card but with eight SFP Ethernet ports. The FX feature is an 8-port 100 Mb/s ML module and two corresponding 802.3ah-compliant optical SFPs that operate in the ONS 15454.

For the ML100X-8 module, the slot properties pane displays the following properties: Module View, Identification, Configuration, POS, Ether, Alarm Behavior, L2 Service Drops, Card Parameters, Thresholds, J1 Path Trace, Info, and Port Channel. The properties shown depend on the NE configuration.

C.4.22.1 Module View

The Module View displays a graphic of the ML100X-8 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.22.2 Identification

The Identification Properties pane allows you to view and update ML100X-8 card identification information.

Table C-1331 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Card Mode	Select the card mode. It can be one of the following: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode; maps a client frame into one GFP frame. • RPR 802.17—IEEE 802.17 Resilient Packet Ring (RPR) standard, which specifies the data traffic protection and spatial reuse over ring architecture. The RPR ring architecture is highly scalable and provides efficient transfer of packet-based traffic across a network. It is suitable for data, voice, and video applications. **Caution** If you change the card mode to RPR 802.17, you must reload the barebone configuration on the ML card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.22.3 Configuration

The Configuration Properties pane allows you to upload or download a configuration file for the ML100X-8 card.

Table C-1332 Field Descriptions for the Configuration Properties Pane

Field	Description
IOS Startup Config	
Source	Displays the source of the configuration file.
Host	Displays the host machine where the configuration file is stored, or the location where the file will be downloaded.
Filename	Displays the name of the configuration file.
Directory	Displays the directory on the host machine for the configuration file.
Time Stamp	Displays the date and time of the file upload or download. The time stamp shows the time on the NE, not the time on the Prime Optical server. **Note** You can update the time stamp on the NE in the node-level NE Explorer > Identification Properties pane.
IOS Config File	
TCC >> File	Click this button to download the file from the TCC card to the host machine. Select **Local** or **Server** in the TCC >> File dialog box to designate a location for the file. **Note** If you select Server, the file is saved in the $CTMROOT/IosConfig directory.
File >> TCC	Click this button to upload the file from the host machine to the TCC card. Select Local or Server in the File >> TCC dialog box to designate a location for the file.
Launch CLI	Click this button to launch the command-line interface (CLI).
Microcode	
Microcode	Configure the ML-series card with one of the following microcode images. Select either: • Base—Enables base features, which include IP multicast routing and IP fragmentation. • Enhanced—Enables Ethernet Relay Multipoint Service (ERMS), enhanced packet statistics, and enhanced Dual RPR Interconnect (DRPRI). This disables IP fragmentation and IP multicast routing features supported by the base microcode image. **Note** After changing the microcode, you should reset the card manually.
IOS Access	
Enable Console Port Access	Allows you to enable access to ML cards through the console port. If this field is disabled, you cannot connect to the ML card through the console port.
Enable RADIUS Relay	Allows you to enable access to ML cards through the RADIUS relay server.

C.4.22.4 POS

The POS Properties pane allows you to view and update ML100X-8 POS port information.

Table C-1333 Field Descriptions for the POS Properties Pane

Field	Description
POS Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the name of the port.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN. **Note** The State field displays "Down" whenever a circuit is not provisioned. To see the actual administration state of the port, view the POS Properties pane > POS Provisioning tab. The Interface State attribute shows the actual Administration State value.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. Maximum setting is 9000 and the default size is 1500. The MTU value will display 0 until the POS port is used in creating a circuit.
Framing Type	Shows the encapsulation type. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • None—No framing type.
RPR Span	
Port Number	Displays the port number.
Port Name	Displays the name of the port. You can change the port name.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the automatic in-service soak time, which is the amount of valid input signal, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
Span Interface	Displays the direction of the RPR span, either RPR_EAST or RPR_WEST.
State	Displays the state of the east and west spans.
Framing Type	Indicates the framing type, which is RPR 802.17.
Jumbo	Displays a value of true, which indicates that jumbo frame support is applied on all of the ML cards participating in the 802.17 RPR topology. Jumbo frame support is set at the ring level and carried in the attribute discovery messages.
Edge	Indicates the existence of a protection edge in an open ring. Values are: • EDGE—The selected RPR has a protection edge in an open ring. • NO_EDGE—The selected RPR does not have a protection edge in an open ring.

Table C-1333 Field Descriptions for the POS Properties Pane (continued)

Field	Description
POS Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
CoS Accounting	Indicates whether or not PM is enabled on the POS.
RPR Span Provisioning	
Port Number	Displays the port number.
Interface State	Check the Interface State check box to bring up the interface. Leave the check box unchecked to shut down the interface. When the interface is shut down, no traffic can flow through it.

C.4.22.5 Ether

The Ether Properties pane allows you to view and update ML100X-8 Ethernet port information.

Table C-1334 Field Descriptions for the Ether

Field	Description
Ether Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the name of the port.
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Enter the soak time in hours from 0 to 48, and in minutes from 0 to 45 (in 15-minute increments).
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.
Operating Speed	Displays the operating speed for the ports. Values are Auto, 10 Mb/s, and 100 Mb/s.
Operating Duplex	Actual setting of the port. Values are Auto, Full, and Half.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Optics	Displays the SFP physical media type. Values are Unplugged, Plugged In, 1000 SX, and 1000 LX. Pluggables to the ML100X-8 card are not noted in the Equipment Inventory table. Instead, pluggables are indicated in the Optics field. The Optics field displays “Unknown” if there are no pluggables, and “Plugged In” if there is pluggable equipment. The Optics field does not specify the exact equipment.
Fast Ethernet Provisioning	
Port Number	Displays the port number.
Interface State	Status of the interface (up or shut down). When the interface is shut down, no traffic can flow through it.
MTU Size	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

Table C-1334 Field Descriptions for the Ether (continued)

Field	Description
Flow Control (Send)	Negotiated flow control mode, which configures the send traffic flow operation. Flow control works only with policing. Values and their impact on traffic flow are: • Desired—Allow but do not require flow-control packets on port • Off—Disable flow-control packets on port • On—Enable flow-control packets on port (works only with policing)
CoS Accounting	Indicates whether or not PM is enabled on the POS.

C.4.22.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update ML100X-8 alarm profile information for the POS and Ethernet ports and RPR spans.

Table C-1335 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Equipment State	Displays the equipment state.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.22.7 L2 Service Drops

The L2 Service Drops Properties pane allows you to view L2 service drop configuration settings. Click the **Show QoS Parameters** button to open the QoS for L2 Service Drop Port table, which shows the QoS for the selected drop.

Table C-1336 Field Descriptions for the L2 Service Drops Properties Pane

Field	Description
Port No.	The port number.
Port Sub Interface	The port subinterface.
Topology Name	The topology name.
SP VLAN ID	The service provider VLAN ID.
Customer ID	The customer ID.
Service ID	The service ID.
Bridge Group	The bridge group.

Table C-1336 Field Descriptions for the L2 Service Drops Properties Pane (continued)

Field	Description
Port Type	The port type (UNI or NNI).
Connection Type	The connection type (Dot1Q, Untagged, or QinQ).
Policing	The QoS policy configured on the selected front port interface or subinterface. Supported values are CIR/PIR and Best Effort.
RSTP	When checked, RSTP is enabled.

C.4.22.8 Card Parameters

The Card Parameters Properties pane allows you to view card parameter settings.

Table C-1337 Field Descriptions for the Card Properties Pane Parameters

Field	Description
Port	The port number.
Port Sub Interface	The port subinterface.
Bridge Group	The bridge group.
CIR	The committed information rate. The range is from 96000 to 800000000 bits per second.
CIR Burst	The maximum CIR burst. The default is 8000 bytes; the range is from 8000 to 64000 bytes.
PIR	The peak information rate. The range is from 96000 to 800000000 bits per second. PIR should be greater than or equal to CIR.
PIR Burst	The maximum PIR burst. The default is 64000 bytes; the range is from 8000 to 64000 bytes. PIR burst should be greater than or equal to CIR burst.
CCOSTRANSMIT	This keyword comes from the grammar file for the police command. For confirm action, the set-cos-transmit keyword specifies the set cos value. This value is used to determine the QoS configured on the front port of the ML card. A CCOSTRANSMIT value of 0 means a best effort policy has been configured for this port (FE/GE_IN). Other values are: • 1: Best Effort (for Policy_Qos_Out) • 2: CIR • 3: CONTROL • 4: VOICE • 5: VIDEO • 6: VOICE_VIDEO • 7: MISSION_CRITICAL • 8: SP_MANAGEMENT The card parameters shown on the NE Explorer are only for Policy_FE/GE_IN, meaning CCOSTRANSMIT is 0 or 2 (what VLAN provisioning supports).

C.4.22.9 Thresholds

The Thresholds Properties pane allows you to view remote monitoring (RMON) thresholds and create new RMON thresholds to allow Prime Optical to monitor ML POS counts.

Table C-1338 Field Descriptions for the Thresholds Properties Pane

Field	Description
Index Number	The index number.
Interface Name	The interface name. Currently, only POS0 and POS1 are supported.
Direction	The direction of the reported statistics. Currently, only output is supported.
COS	The class of service level. Supported levels are 0 to 7.
Sample Period	The sample period, in seconds.
Variable	The MIB variable to monitor. Supported variables are cportQosDropPkts and cportQosDropOctets in the cportQosStatsTable in CISCO-PORT-QOS-MIB.
Sample Type	The sample type (relative or absolute). Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Rising Threshold	The number of occurrences for the rising threshold. **Note** For a rising type of alarm, the measured value must move from below the falling threshold to above the rising threshold. For example, if a network is running below a falling threshold of 400 collisions every 15 seconds and a problem causes 1001 collisions in 15 seconds, the excess occurrences trigger an alarm.
Falling Threshold	The number of occurrences for the falling threshold. In most cases, a falling threshold is set lower than the rising threshold. A falling threshold is the counterpart to a rising threshold. When the number of occurrences is above the rising threshold and then drops below a falling threshold, it resets the rising threshold. For example, when the network problem that caused 1001 collisions in 15 minutes subsides and creates only 799 collisions in 15 minutes, occurrences fall below a falling threshold of 800 collisions. This resets the rising threshold so that if network collisions again spike over 1000 per 15-minute period, an event again triggers when the rising threshold is crossed. An event is triggered only the first time a rising threshold is exceeded (otherwise a single network problem might cause a rising threshold to be exceeded multiple times and cause a flood of events).

C.4.22.10 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1339 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS/VC Number	Displays the STS or VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).

Table C-1339 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
C2	Represents a machine-generated J1/J2 payload label byte.
VCAT Member Number	Displays the virtual concatenation (VCAT) member number.

C.4.22.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the ML100X-8.

Table C-1340 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

C.4.22.12 Port Channel

The Port Channel Properties pane allows you to configure the port channel interface on ML100X-8 cards. Port channel (also known as *link aggregation*) is a trunking technology that groups together multiple full-duplex IEEE 802.3 Gigabit Ethernet/Fast Ethernet interfaces to provide fault-tolerant high-speed links between switches, routers, and servers. Port channel forms a single higher bandwidth routing or bridging endpoint and was designed primarily for host-to-switch connectivity.

Table C-1341 Field Descriptions for the Port Channel Properties Pane

Field	Description
Port Channel Table	
Create	Opens the Create Port Channel ID dialog box, which allows you create a new port channel. Each ML100X-8 card supports up to four Fast Ethernet Channels (FECs). A maximum of four Fast Ethernet ports can bundle into one FEC and provide bandwidth scalability up to 400-Mb/s full-duplex Fast Ethernet for the ML100X-8 card. See 7.10.19.1 Creating a Port Channel, page 7-319. **Note** The Create button is dimmed if four port channels have already been created.
Modify	Opens the Modify Port Channel ID dialog box, which allows you to modify an existing port channel. See 7.10.19.2 Modifying a Port Channel, page 7-320.
Delete	Deletes the selected port channel. **Note** You cannot delete an aggregate link that contains active members. You must first disaggregate all of the associated members from the port channel, then delete the empty port channel.
Channel ID	Displays the port channel ID, which identifies the port channel interface. Prime Optical generates the ID automatically; the range is from 1 to 64.
Admin State	Displays the status of the port channel interface (Up or Down).
MTU	Displays the maximum transmission unit (MTU) size, which is the largest acceptable packet size configured for the port channel interface. The range is from 64 to 9000 bytes; the default is 1500 bytes.
Hold Queue In	Displays the size of the memory packets input queue. The range is from 0 to 4096 bytes.

Table C-1341 Field Descriptions for the Port Channel Properties Pane (continued)

Field	Description
Hold Queue Out	Displays the size of the memory packets output queue. The range is from 0 to 4096 bytes.
Port Channel Members Table	
Add	Opens the Add Port Channel Member on Port Channel ID dialog box, which allows you to add members to a port channel. See 7.10.19.4 Creating a Port Channel Member, page 7-321.
Modify	Opens the Modify Port Channel Member on Port Channel ID dialog box, which allows you to modify an existing port channel member. See 7.10.19.5 Modifying a Port Channel Member, page 7-322.
Remove	Removes the selected member from the port channel.
Port No.	Displays the port number, which identifies the port channel member.
LACP Priority	Displays the number that Link Aggregation Control Protocol (LACP) uses with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating. The range is from 1 to 65535.
LACP Mode	Defines the LACP packets exchange mode between different ports: • Transparent—LACP is not enabled. • Active—Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets. • Passive—Places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP negotiation. In this mode, the port channel group attaches the interface to the bundle.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.23 Slot Properties—ML-MR-10

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH card slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Multilayer 2 (ML2) card (also known as ML-MR-10) is a Layer 2 switch that processes up to 10 Gb/s. With its 10 Ethernet ports, the card is integrated into the ONS 15454 SONET and ONS 15454 SDH platforms.

An ONS 15454 SONET with a 10-gigabit cross-connect card (XC10G) can host the ML2 card in any traffic card slot, but an ONS 15454 SONET with a cross-connect card (XC) or cross-connect virtual tributary card (XCVT) can only host the ML2 card in the four traffic slots. An ONS 15454 SDH can host the ML2 card in any traffic card slot with any cross-connect card.

You can provision VCAT, CCAT, or LCAS circuits on 10 POS ports on the ML-MR-10 card. POS ports are used for aggregation and serve as the source or destination for Ethernet circuits. Prime Optical supports FE payload on RAD SFPs.

VCAT circuits on POS ports can have the following circuit sizes:

- VT1.5-*n*v, where *n* is 1 to 64
- STS-1-*n*v, where *n* is 1 to 192
- STS-3c-*n*v, where *n* is 1 to 64

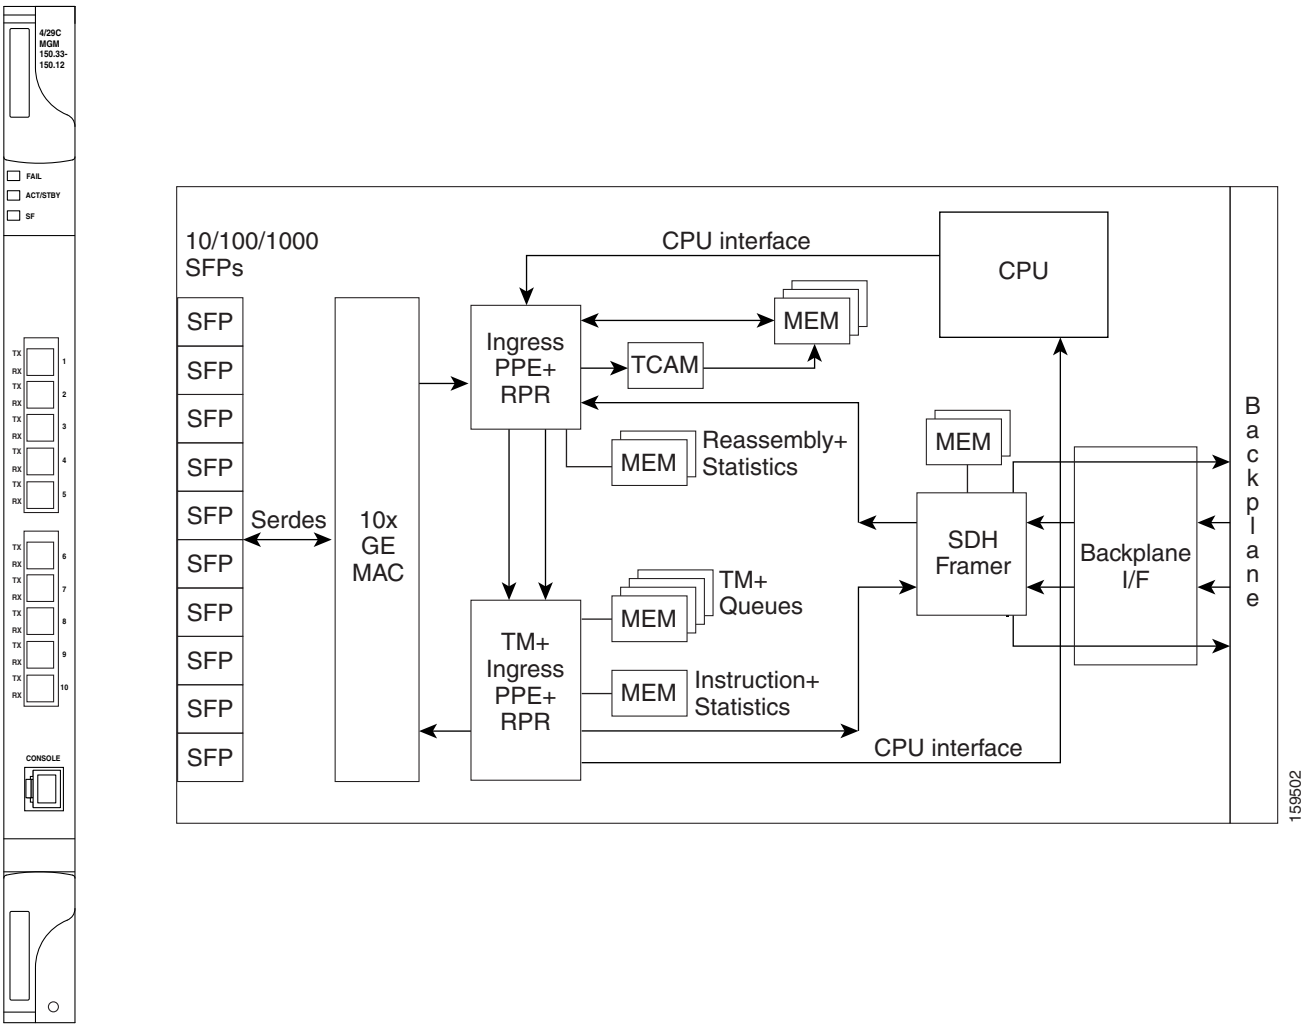
CCAT circuits on POS ports can have the following circuit sizes:

- STS-1, STS-3, STS-6, STS-9, STS-12, STS-24, STS-48, and STS-192

The SDH equivalents of these circuit sizes are also supported.

The following figure shows the card faceplate and block diagram.

Figure C-76 ML-MR-10 Faceplate and Block Diagram



For the ML-MR-10 (ML2) module, the slot properties pane displays the following properties: Module View, Identification, Line, Thresholds, Alarm Behavior, J1 Path Trace, GBIC Inventory, and Info. The properties shown depend on the NE configuration.

C.4.23.1 Module View

The Module View displays a graphic of the ML-MR-10 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.23.2 Identification

The Identification Properties pane allows you to view and update ML-MR-10 card identification information.

Table C-1342 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Card Mode	Specify the mode setting for the internal STS/VC allocation method on the card. Values are: • Exposed—Implies automatic internal selection of time slot index numbers by the node. • Manual—Implies user-selected index numbers.
Equipment State	Displays the state of the card that is installed in the slot.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.23.3 Line

The Line Properties pane allows you to view and update line performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.23.3.1 Ether Line Properties Tab, page C-954

- C.4.23.3.2 POS Port Tab, page C-954
- C.4.23.3.3 RPR Span Tab, page C-955

C.4.23.3.1 Ether Line Properties Tab

The Ether Line tab allows you to view and change the Ethernet line settings on the ML-MR-10 card.

Table C-1343 Field Descriptions for the Ether Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the port.
Administration State	Shows the administrative state of the port: In Service (IS), Out of Service–Maintenance (OOS MT), Out of Service–Disabled (OOS DSBLD), or In Service–Auto In Service Soak (IS AINS).
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Displays the automatic in-service soak, which is the amount of time left before the traffic/termination transitions to the IS_NR state.
AINS Soak Count Down	Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Link State	Displays the physical port state. Values are Up or Down.
Operating Speed	Displays the operating speed for the Ethernet ports. Values are Auto, 10 Mb/s, 100 Mb/s, or 1000 Mb/s.
Operating Duplex	Displays the actual setting of the port. Values are Auto, Full, or Half.
Flow Control	Displays the negotiated flow control mode. Values are On, Off, or None.

C.4.23.3.2 POS Port Tab

The POS Port tab allows you to view and change the POS port settings on the ML-MR-10 card.

Table C-1344 Field Descriptions for the POS Port Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the port.
Administration State	Shows the administrative state of the port: In Service (IS), Out of Service–Maintenance (OOS MT), Out of Service–Disabled (OOS DSBLD), or In Service–Auto In Service Soak (IS AINS).
AINS Suppress Alarms	Choose ON to suppress alarms for the selected port; choose OFF to switch alarm suppression off for the selected port.
AINS Soak	Displays the automatic in-service soak, which is the amount of time left before the traffic/termination transitions to the IS_NR state.
Link State	Displays the physical port state. Values are Up or Down.
MTU	Displays the maximum transmission unit, which is the largest acceptable packet size configured for that port. The default value is 1500.

C.4.23.3.3 RPR Span Tab

The RPR Span tab allows you to view and change the RPR settings on the ML-MR-10 card.

Table C-1345 Field Descriptions for the RPR Span Tab

Field	Description
Port	Displays the port number.
Port Name	Allows you to add a name for the port.
AINS Soak	Displays the automatic in-service soak, which is the amount of time left before the traffic/termination transitions to the IS_NR state.
Administration State	Shows the administrative state of the port: In Service (IS), Out of Service–Maintenance (OOS MT), Out of Service–Disabled (OOS DSBLD), or In Service–Auto In Service Soak (IS AINS).
Framing Type	Shows the encapsulation type set on the card. Values are: • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices. • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • RPR 802.17—802.17 resilient packet ring, which is IEEE compliant.
Span Interface	Displays the direction of the RPR span, either RPR_EAST or RPR_WEST.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Edge	Displays whether or not a span has a neighboring active node or active connection. Possible values are Yes and No.

C.4.23.4 Thresholds

The Thresholds Properties pane allows you to view and create ML-MR-10 thresholds. The Thresholds Properties pane contains the following tabs:

- C.4.23.4.1 POS Port Tab, page C-955
- C.4.23.4.2 RPR Span Tab, page C-956
- C.4.23.4.3 Ether Ports Tab, page C-956

C.4.23.4.1 POS Port Tab

The POS Port tab allows you to view the thresholds for the POS ports.

Table C-1346 Field Descriptions for the POS Port Tab

Field	Description
Index Number	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.

Table C-1346 Field Descriptions for the POS Port Tab (continued)

Field	Description
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold field. In most cases, a falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the POS ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.23.4.2 RPR Span Tab

The RPR Span tab allows you to view the thresholds for the RPR spans.

Table C-1347 Field Descriptions for the RPR Span Tab

Field	Description
Index Number	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold field. In most cases, a falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the RPR span.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.23.4.3 Ether Ports Tab

The Ether Ports tab allows you to view the thresholds for the Ethernet ports.

Table C-1348 Field Descriptions for the Ether Ports Tab

Field	Description
Index Number	Displays the selected interface number.
Slot	Displays the selected card.

Table C-1348 Field Descriptions for the Ether Ports Tab (continued)

Field	Description
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold field. In most cases, a falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the Ethernet ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.23.5 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update ML-MR-10 alarm profile information for the RPR span and Ethernet ports.

Table C-1349 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Equipment State	Displays the equipment state.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port	Displays the card port number or RPR span.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.23.6 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-1350 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Circuit Type	Displays the type of circuit.

Table C-1350 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.4.23.7 GBIC Inventory

The GBIC Inventory Properties pane allows you to view GBIC inventory information.

Table C-1351 Field Descriptions for the GBIC Inventory Properties Pane

Field	Description
Port Number	Displays the GBIC card port number.
Equipment Type	Displays the equipment type the slot is provisioned for.
Serial Number	Displays the GBIC serial number that is unique to each GBIC.
CLEI Code	Displays the CLEI code.
Hardware Part Number	Displays the manufacturer's part number.
Hardware Revision Number	Displays the hardware revision number.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Vendor ID	Displays the ID of the vendor.

C.4.23.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the ML-MR-10 card.

Table C-1352 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.24 Slot Properties—MS-ISC-100T

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Fast Ethernet (MS-ISC-100T) Layer 3 switch processes up to 5.7 Mb/s. The card is integrated into the ONS 15454 SONET or ONS 15454 SDH.

For the MS-ISC-100T module, the slot properties pane displays the following properties: Module View, Identification, Ether Ports, Alarm Behavior, and Info. The properties shown depend on the NE configuration.

C.4.24.1 Module View

The Module View displays a graphic of the MS-ISC-100T that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.24.2 Identification

The Identification Properties pane allows you to view and update MS-ISC-100T card identification information.

Table C-1353 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the state of the card that is installed in the slot.

Table C-1353 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Card Mode	Specifies the card mode. The card mode is HDLC (high-level data link control). HDLC does not support VLAN trunking and is standard on most Cisco data devices. This value cannot be changed.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.24.3 Ether Ports

The Ether Ports Properties pane allows you to view and update MS-ISC-100T Ethernet port information.

Table C-1354 Field Descriptions for the Ether Ports Properties Panes

Field	Description
Ether Ports	
Port Number	Displays the configurable identifier for the port.
Port Name	Displays the port name.
State	Displays the configured administration port state, which is active or inactive. Values are UP and DOWN.
Link State	Displays the physical port state. Values are UP and DOWN.
MTU	Displays the maximum transmission unit, which is the largest acceptable packet size configured for that port. The default value is 1500.
Operating Speed	Displays the operating speed for the ports. Values are Auto, 10 Mb/s, and 100 Mb/s.
Operating Duplex	Displays the actual setting of the port. Values are Auto, Full, and Half.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Optics	Displays the SFP physical media type. Values are Unplugged, Plugged In, 1000 SX, and 1000 LX. Pluggables to the ML100X-8 card are not noted in the Equipment Inventory table. Instead, pluggables are indicated in the Optics field. The Optics field displays “Unknown” if there are no pluggables, and “Plugged In” if there is pluggable equipment. The Optics field does not specify the exact equipment.

C.4.24.4 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update MS-ISC-100T alarm profile information for Ethernet ports.

Table C-1355 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Equipment State	Displays the equipment state.
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.

Table C-1355 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.24.5 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the MS-ISC-100T card.

Table C-1356 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.25 Slot Properties—RAN-SVC

The slot properties pane displays information about the ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Radio Access Network Service (RAN-SVC) card performs circuit emulation and optimization on traffic from 3rd Generation Partnership Project (3GPP) RAN nodes and provides IP-based backhaul of the optimized traffic to other peer nodes. The RAN-SVC card, when combined with the DS1/E1-56 and OC-3/STM-1 cards, provides a high-rack-density aggregation function for the Cisco RAN optimization solution. When the RAN-SVC is used with a Cisco MWR-1941-DC-A, it provides transparent RAN aggregation and optimization services.

The optimized traffic is received by the RAN-SVC card from peer cell site routers on VT1.5 circuits via the cross-connect card or from native GE ports on the RAN-SVC card. Optimized traffic can be received on the ONS 15454 node over a variety of rate interfaces higher than VT1.5, such as OC-3 through OC-192. The data is then reconstructed by the RAN-SVC card onto VT1.5 circuits and sent back through the cross-connect card. The reconstructed traffic is externally delivered to the 3GPP RAN nodes over DS-1 and OC-3 interfaces.

The RAN-SVC card is a multiprocessor card. It consists of three traffic-forwarding CPUs and one service CPU, which performs the control plane function for the card. Each traffic forwarding processor is equipped with one front-side 10/100/1000 Gigabit Ethernet (GE) port, one OC-3 ATM port, one OC-3 POS port, two STM-1, and 42 E1 interfaces. The OC-3 ATM port, OC-3 POS port, STM-1, and E1 interfaces are connected to the backplane.The service CPU is equipped with one Gigabit Ethernet, ATM, and POS interface.

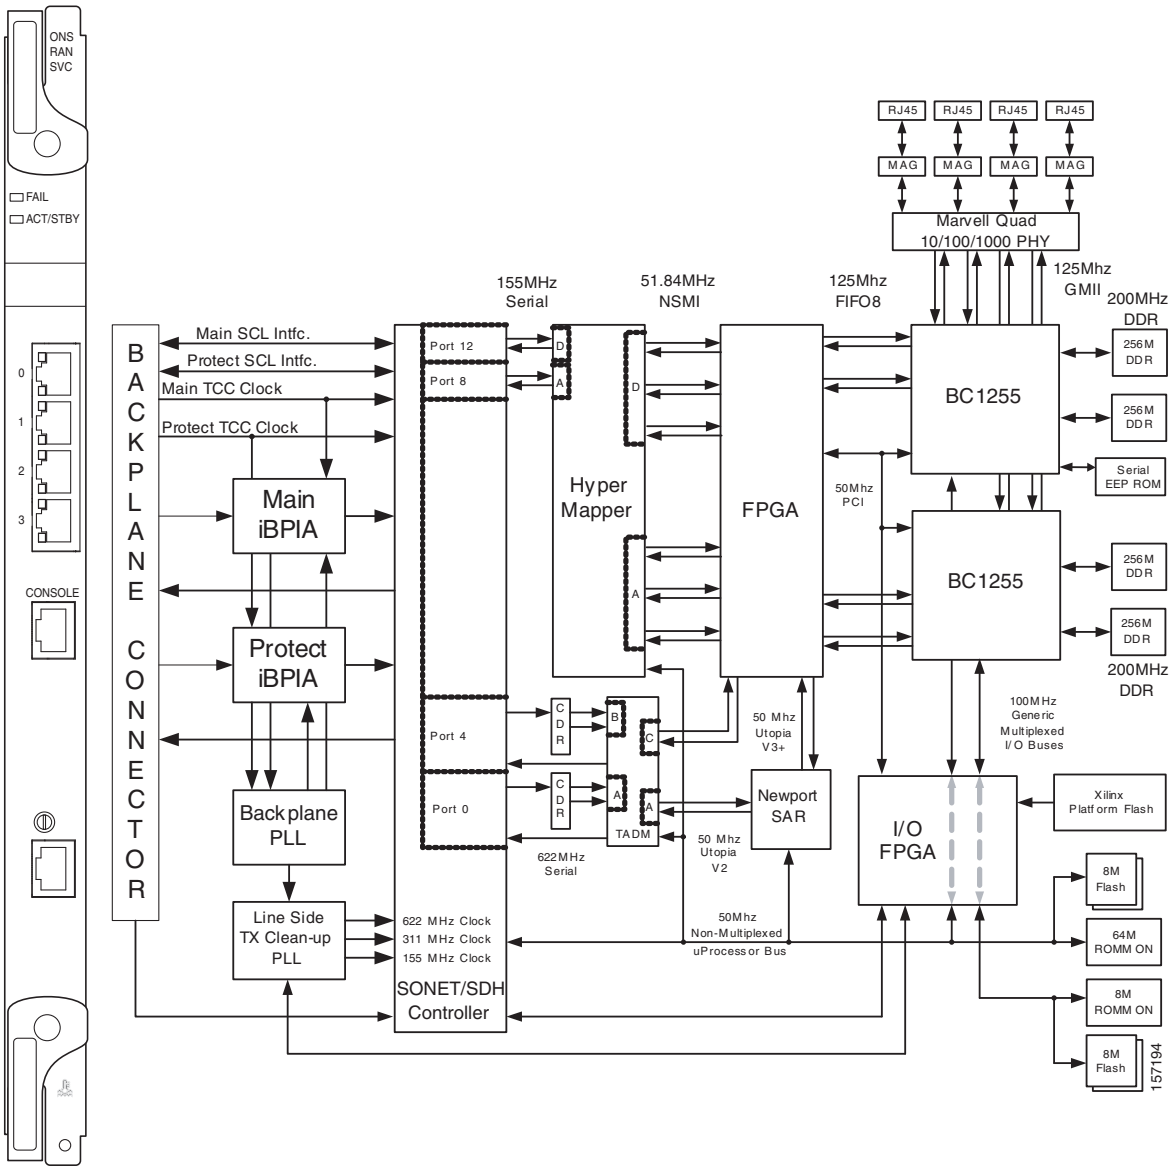
In the ONS 15454, the RAN-SVC card transmits and receives T1 data streams (for GSM applications) and OC-3 data streams (for UMTS applications) via the cross-connect cards. For T1 connections (GSM and/or backhaul), up to 126 T1 interfaces from multiple T1-56 cards can be aggregated by the cross-connect card to form two STS-1 data streams, which are terminated on the RAN-SVC card. For OC-3 interfaces (POS and/or ATM), up to eight OC-3 interfaces from multiple OC-3 cards can be aggregated by the cross-connect cards to form two STS-4 data streams, which are terminated on the RAN-SVC card.

The RAN-SVC card supports 1:N protection. This allows a single RAN-SVC card to protect up to nine working RAN-SVC cards. A RAN-SVC protect card can be installed in any slot and can protect working cards on either side of the shelf.

The RAN-SVC IOS card is present in the ONS 15454 chassis. It combines multiple E1, POS, and ATM streams routed over its GE interfaces for transmission over long-haul access networks. It can be plugged into any ONS 15454 service slot (1-6, 12-17), and is supported on ONS15454 ETSI/SDH and ONS 15454 ANSI/SONET platforms.

The following figure shows the card faceplate and block diagram.

Figure C-77 RAN-SVC Faceplate and Block Diagram



For the RAN-SVC card, the slot properties pane displays the following properties: Module View, Identification, Configuration, Protection, Line, and Info. The properties shown depend on the NE configuration.

.

C.4.25.1 Module View

The Module View displays a graphic of the RAN-SVC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.4.25.2 Identification

The Identification Properties pane allows you to view and update RAN-SVC identification information.

Table C-1357 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the Common Language Equipment Identifier (CLEI) code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.25.3 Configuration

The Configuration Properties pane allows you to upload or download a configuration file for RAN-SVC card.

Table C-1358 Field Descriptions for the Configuration Properties Pane

Field	Description
IOS Config File	
TCC >> File	Click this button to download the file from the TCC card to the host machine. Select Local or Server in the TCC >> File dialog box to designate a location for the file.
File >> TCC	Click this button to upload the file from the host machine to the TCC card. Select Local or Server in the File >> TCC dialog box to designate a location for the file.
Launch CLI	Click this button to launch the command-line interface (CLI).
IOS Access	
Enable Console Port Access	Allows you to enable access to ML cards through console ports. If this field is disabled, you cannot connect to the ML card through the console port.
Enable RADIUS Relay	Allows you to enable access to ML cards through the RADIUS relay server.

C.4.25.4 Protection

The Protection Properties pane allows you to view and update RAN-SVC protection group information.

Table C-1359 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays the list of available protection groups.
Protection Group Details	Displays details about the selected protection group, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

C.4.25.5 Line

The Line Properties pane allows you to view and update line performance monitoring information. The Line Properties pane contains the following tabs:

- C.4.25.5.1 OC3 Tab, page C-965
- C.4.25.5.2 DS1 Tab, page C-966

C.4.25.5.1 OC3 Tab

The OC3 tab allows you to view and change the OC3 line settings on the RAN-SVC card.

Table C-1360 Field Descriptions for the OC3 Tab

Field	Description
Port Number	Displays the card port number.
Port Name	Displays the port name.
Admin State	Displays the administration port state, which is active or inactive. Values are Up and Down.
Link State	Displays the physical port state. Values are Up and Down.

C.4.25.5.2 DS1 Tab

The DS1 tab allows you to view and change the DS1 line settings on the RAN-SVC card.

Table C-1361 Field Descriptions for the DS1 Tab

Field	Description
Port Number	Displays the card port number.
Port Name	Displays the port name.
Admin State	Displays the administration port state, which is active or inactive. Values are Up and Down.
Link State	Displays the physical port state. Values are Up and Down.

C.4.25.6 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the RAN-SVC card.

Table C-1362 Field Descriptions for the Info Properties Pane

Field	Descriptions
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.4.26 Slot Properties—PT_10GE_4

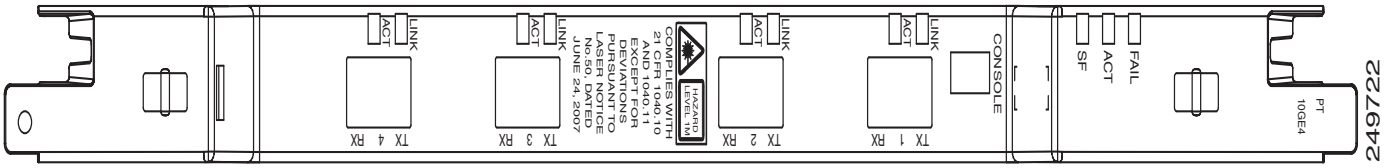
The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The PT_10GE_4 card has four 10GE SFP+ ports. The SFP+ ports on the PT_10GE_4 card serve as normal ports or InterConnect (IC) ports. When PTF_10GE_4 and PT_10GE_4 cards are installed on the shelf, a bidirectional 2 * 16G connection is set up between each PTF_10GE_4 card and PT_10GE_4 card, and between two PTF_10GE_4 cards.

On the CPT 600 shelf, install the PT_10GE_4 cards in slot 2, 3, 6, or 7. There can be up to four PT_10GE_4 cards on the CPT 600 shelf. On the CPT 200 shelf, install the PT_10GE_4 card in slot 2 or 3. There can be a single PT_10GE_4 card on the CPT 200 shelf.

The following figure shows the PT_10GE_4 card faceplate.

Figure C-78 PT_10GE_4 Card Faceplate



For the PT_10GE_4 card, the slot properties pane displays the following properties: Identification. Module View, Alarm Behavior, Ether Ports, Info, Loopback, Optical Thresh, PPM, and RMON Thresholds.

C.4.26.1 Identification

The Identification Properties pane allows you to view and update the PT_10GE_4 identification information.

Table C-1363 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
HW Revision	Displays the hardware version number of the card.
Serial No.	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	The port administration state. It can be: • IS—In Service • OOS, MT—Out of Service, Maintenance
Service State	*Display only.* Sets the service state that indicates the operational state of the channel group. The Service State can be: • IS-NR—In Service–Normal. • OOS-MA, DSBLD—Out of Service and Management, Disabled.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. You can choose an alarm profile for the card from the drop-down list. Values are Default and Inherited. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.26.2 Module View

The Module View displays a graphic of the PT_10GE_4 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.4.26.3 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-1364 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Payload	
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.26.4 Ether Ports

The Ether Ports contains the following tabs:

- C.2.44.4.1 Ports Tab, page C-579
- C.2.44.4.2 Ethernet Tab, page C-580
- C.2.44.4.3 Layer 2 Protocols, page C-581

C.4.26.4.1 Ports Tab

Table C-1365 Field Descriptions for the Ports Tab

Field	Description
Port	Displays the port number.
Port Name	Displays the name of the port.

Table C-1365 Field Descriptions for the Ports Tab (continued)

Field	Description
Admin State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • EW • LW • SW • LRM • ER • LR • SR (short reach, up to 2 km distance) • ZR • IR 2 • LR 2 • DWDM • CWDM40km
Wavelength	Allows you to provision the wavelength frequency.

C.4.26.4.2 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information.

Table C-1366 Field Descriptions for the Ethernet Tab

Field	Description
Port	Displays the port number.
MTU	Displays the maximum transfer unit, which is the largest acceptable packet size configured for that port. The maximum setting is 9000 and the default size is 1500. The MTU value is 0 until the packet-over-SONET (POS) port is used in creating a circuit.

Table C-1366 Field Descriptions for the Ethernet Tab (continued)

Field	Description
Link State	Displays the physical port state. Possible values are Up and Down.
Expected Speed	Displays the expected speed. Possible values are 10 Mbps, 100 Mbps, and Auto. If expected speed is set to Auto, you cannot enable selective autonegotiation.
Expected Duplex	Displays the port's expected duplex setting. Possible values are Full, Half, and Auto. If expected duplex is set to Auto, you cannot enable selective autonegotiation.
Flow Control	Displays the negotiated flow control mode. Possible values are None, Symmetrical, and Asymmetrical.
Interconnect Mode	—
Operating Speed	Displays the actual operating speed.
Operating Duplex	Displays the expected duplex setting of the port.
Operating Flow Control	Displays the value of the flow control.
Carrier Delays (ms)	—

C.4.26.4.3 Layer 2 Protocols

The Layer 2 Protocols tab allows you to view and modify actions for Layer 2 protocols.

Table C-1367 Field Descriptions for the Layer 2 Protocols Tab

Field	Description
Port	Displays the port number.
CDP	Displays the Layer 2 action configured for CDP. To modify the action, click the cell and select the action from the drop-down list.
DOT1X	Displays the Layer 2 action configured for DOT1X. To modify the action, click the cell and select the action from the drop-down list.
DTP	Displays the Layer 2 action configured for DTP. To modify the action, click the cell and select the action from the drop-down list.
LACP	Displays the Layer 2 action configured for LACP. To modify the action, click the cell and select the action from the drop-down list.
PAGP	Displays the Layer 2 action configured for PAGP. To modify the action, click the cell and select the action from the drop-down list.
VTP	Displays the Layer 2 action configured for VTP. To modify the action, click the cell and select the action from the drop-down list.
STP	Displays the Layer 2 action configured for STP. To modify the action, click the cell and select the action from the drop-down list.

C.4.26.5 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-1368 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.4.26.6 Loopback

The Loopback Properties pane allows you to view and update PT_10GE_4 loopback information.

Table C-1369 Field Descriptions for the Loopback Properties Pane

Field	Description
Port	Displays the port number.
Admin State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

C.4.26.7 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.44.7.1 TCA 15 Min Tab, page C-582
- C.2.44.7.2 TCA 1 Day Tab, page C-583
- C.2.44.7.3 Alarm Thresh Tab, page C-583

C.4.26.7.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-1370 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.

Table C-1370 Field Descriptions for the TCA 15 Min Tab (continued)

Field	Description
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.4.26.7.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-1371 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.4.26.7.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-1372 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.4.26.8 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-1373 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
PPM No.	Displays the identifier of the plugin module.

Table C-1373 Field Descriptions for the PPM Properties Pane (continued)

Field	Description
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the port number for the PPM in the Pluggable Port Modules area.
Rate	Displays the port rate for the PPM in the Pluggable Port Modules area.

C.4.26.8.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.4.26.9 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the PT_10GE_4 card.

Table C-1374 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.

Table C-1374 Field Descriptions for the RMON Thresholds Properties Pane (continued)

Field	Description
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the POS ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.4.27 Slot Properties—PTSA_GE

The PTSA_GE panel is a standalone unit and can be connected to the PT System. The PTSA_GE panel enables the number of ports to be scaled on the PT System. The PTSA_GE panel has 4 10GE SFP+ ports and 44 GE SFP ports.

The PTSA_GE panel cannot operate independently. After connecting the PTSA_GE panel to the PTF_10GE_4 card or the PT_10GE_4 card, the PTSA_GE panel is automatically discovered and registered. The discovery operation is performed using the Satellite Discovery Protocol (SDP) and the registration operation is performed using the Satellite Registration Protocol (SRP).

The four SFP+ ports on the PTSA_GE panel can be connected to the SFP+ ports on the PTF_10GE_4 card or the PT_10GE_4 card. The four SFP+ ports on the PTSA_GE panel can be connected to only one card (PTF_10GE_4 or PT_10GE_4) at a time.

PTSA_GE shelf supports ONE-GE and FE for 1 to 44 ports and supports TEN-GE for 45 to 48 ports. By default, the 45 to 48 ports are in IC mode and cannot be changed.

The following figures show the four variations of the PTSA_GE panel faceplate.

Figure C-79 PTSA_GE Panel With AC Power Faceplate

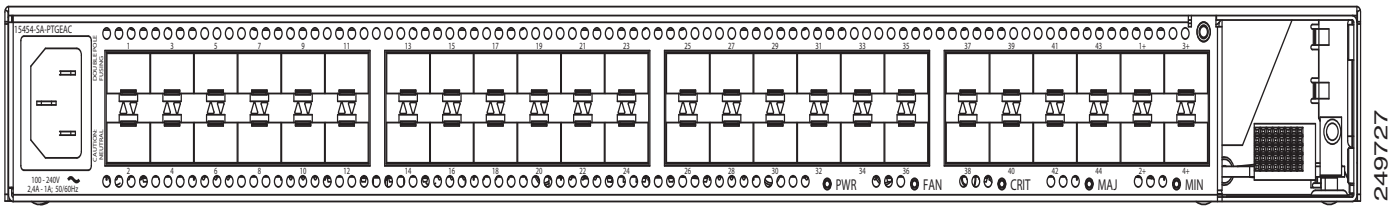


Figure C-80 PTSA_GE Panel With DC ETSI 48 V Faceplate

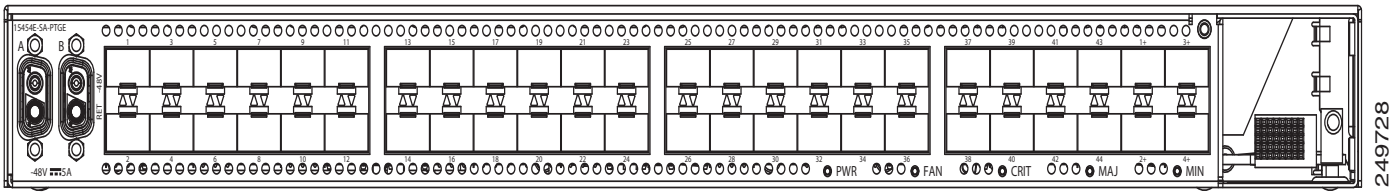

Figure C-81 PTSA_GE Panel With DC ANSI 48 V Faceplate

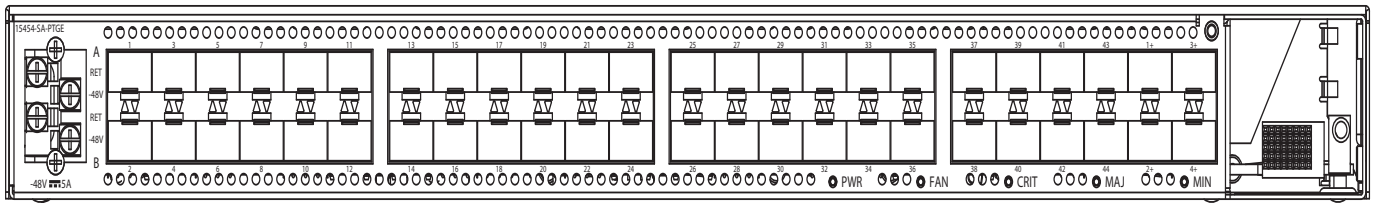

Figure C-82 PTSA_GE Panel With DC ANSI 24 V Faceplate

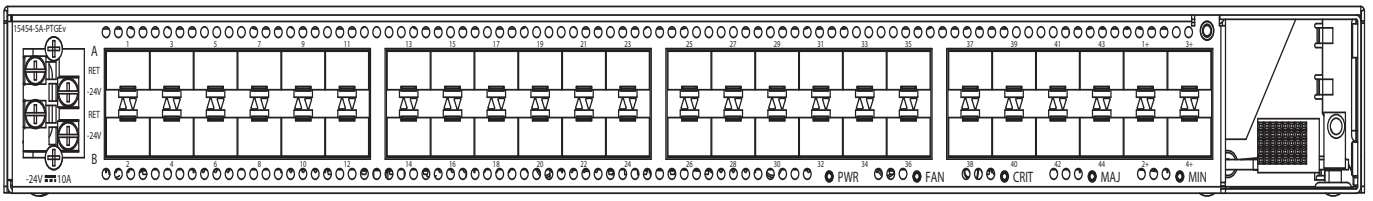


For the PTSA_GE panel, the slot properties pane displays the following properties: Identification, Module View, Alarm Behavior, Ether Ports, Info, Loopback, Optical Thresh, PPM, and RMON Thresholds.

C.4.27.1 Identification

The Identification Properties pane allows you to view and update the PTSA_GE identification information.

Table C-1375 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
HW Revision	Displays the hardware version number of the card.
Serial No.	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	The port administration state. It can be: • IS—In Service • OOS, MT—Out of Service, Maintenance

Table C-1375 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Service State	*Display only.* Sets the service state that indicates the operational state of the channel group. The Service State can be: • IS-NR—In Service–Normal. • OOS-MA, DSBLD—Out of Service and Management, Disabled.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. You can choose an alarm profile for the card from the drop-down list. Values are Default and Inherited. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.4.27.2 Module View

The Module View displays a graphic of the PTSA_GE panel that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.4.27.3 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-1376 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Payload	
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.4.27.4 Ether Ports

The Ether Ports contains the following tabs:

- C.2.44.4.1 Ports Tab, page C-579
- C.2.44.4.2 Ethernet Tab, page C-580
- C.2.44.4.3 Layer 2 Protocols, page C-581

C.4.27.4.1 Ports Tab

Table C-1377 Field Descriptions for the Ports Tab

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Admin State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • EW • LW • SW • LRM • ER • LR • SR (short reach, up to 2 km distance) • ZR • IR 2 • LR 2 • DWDM • CWDM40km
Wavelength	Allows you to provision the wavelength frequency.

C.4.27.4.2 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information.

Table C-1378 Field Descriptions for the Ethernet Tab

Field	Description
Port	Displays the port number.
MTU	Displays the maximum transfer unit, which is the largest acceptable packet size configured for that port. The maximum setting is 9000 and the default size is 1500. The MTU value is 0 until the packet-over-SONET (POS) port is used in creating a circuit.
Link State	Displays the physical port state. Possible values are Up and Down.
Expected Speed	Displays the expected speed. Possible values are 10 Mbps, 100 Mbps, and Auto. If expected speed is set to Auto, you cannot enable selective autonegotiation.
Expected Duplex	Displays the port's expected duplex setting. Possible values are Full, Half, and Auto. If expected duplex is set to Auto, you cannot enable selective autonegotiation.
Flow Control	Displays the negotiated flow control mode. Possible values are None, Symmetrical, and Asymmetrical.
Interconnect Mode	—
Operating Speed	Displays the actual operating speed.
Operating Duplex	Displays the expected duplex setting of the port.
Operating Flow Control	Displays the value of the flow control.
Carrier Delays(ms)	—

C.4.27.4.3 Layer 2 Protocols Tab

The Layer 2 Protocols tab allows you to view and modify actions for Layer 2 protocols.

Table C-1379 Field Descriptions for the Layer 2 Protocols Tab

Field	Description
Port	Displays the port number.
CDP	Displays the Layer 2 action configured for CDP. To modify the action, click the cell and select the action from the drop-down list.
DOT1X	Displays the Layer 2 action configured for DOT1X. To modify the action, click the cell and select the action from the drop-down list.
DTP	Displays the Layer 2 action configured for DTP. To modify the action, click the cell and select the action from the drop-down list.
LACP	Displays the Layer 2 action configured for LACP. To modify the action, click the cell and select the action from the drop-down list.
PAGP	Displays the Layer 2 action configured for PAGP. To modify the action, click the cell and select the action from the drop-down list.
VTP	Displays the Layer 2 action configured for VTP. To modify the action, click the cell and select the action from the drop-down list.
STP	Displays the Layer 2 action configured for STP. To modify the action, click the cell and select the action from the drop-down list.

C.4.27.5 Loopback

The Loopback Properties pane allows you to view and update PTSA_GE loopback information.

Table C-1380 Field Descriptions for the Loopback Properties Pane

Field	Description
Port	Displays the port number and the name of the port.
Admin State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.4.27.6 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.44.7.1 TCA 15 Min Tab, page C-582
- C.2.44.7.2 TCA 1 Day Tab, page C-583
- C.2.44.7.3 Alarm Thresh Tab, page C-583

C.4.27.6.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-1381 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port	Displays the port number and the name of the port.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.

C.4.27.6.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-1382 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port	Displays the port number and the name of the port.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.

C.4.27.6.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-1383 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port	Displays the port number and the name of the port.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.

C.4.27.7 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-1384 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the equipment type that the slot is provisioned for.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	

Table C-1384 Field Descriptions for the PPM Properties Pane (continued)

Field	Description
Port	Displays the identifier of the plugin module and the port number.
Rate	Displays the rate of the port inside the pluggable entity.

C.4.27.7.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.4.27.8 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the PTSA_GE panel.

Table C-1385 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Allows you to create an RMON threshold. Click the **Create** button to create a threshold for the POS ports. **Note** You can select a Channel Group when you create a threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Delete	Select a threshold from the list displayed and click the **Delete** button.

Slot Property Information—FC_MR-4, FMEC, Multirate, and Optical Cards

This appendix provides information on the cards supported in Cisco Prime Optical. This appendix contains the following sections:

- D.1 FC_MR-4 Card, page D-1
- D.2 FMEC Cards, page D-7
- D.3 Multirate Cards, page D-16
- D.4 Optical Cards, page D-84

Note

- In the Prime Optical GUI, display-only fields have a gray background.
- Slot properties are alphabetically displayed under the Overview and Provisioning drawers in the NE Explorer. See "1.5.7 NE Explorer" section on page 1-30 for more information.

D.1 FC_MR-4 Card

This section describes the FC_MR-4 card supported in Prime Optical.

D.1.1 Slot Properties—FC_MR-4

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH card slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Fiber Channel 4-port (FC_MR-4) card is a 1.0625- or 2.125-Gb/s Fiber Channel/Fiber Connectivity (FICON) card that integrates non-SONET or non-SDH framed protocols into a SONET or SDH time-division multiplexing (TDM) platform through virtually concatenated payloads.

The FC_MR-4 card uses pluggable Gigabit Interface Converters (GBICs) to transport non-SONET/SDH-framed, block-coded protocols over SONET/SDH in virtually concatenated or contiguously concatenated payloads. The FC_MR-4 can transport fiber channel over SONET/SDH using fiber-channel client interfaces and allows transport of one of the following at a time:

- Two contiguously concatenated (CCAT) STS-24c/VC4-8c circuits
- One STS-48c/VC4-16c CCAT

- Two virtually concatenated (VCAT) circuits (STC3c-8V/VC4-8v) compliant with ITU-T G.7041 GFP-T and Telcordia GR-253-CORE
- One STS-24c/VC4-8c CCAT and one STS-24c/VC4-8c VCAT

For the FC_MR module, the slot properties pane displays the following tabs: Module View, Identification, Card, Port, Alarm Behavior, RMON Thresholds, J1 Path Trace, GBIC Inventory, and Info.

D.1.1.1 Module View

The Module View Properties pane displays a graphic of the FC_MR that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.1.1.2 Identification

The Identification Properties pane allows you to view and update FC_MR identification information.

Table D-1 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.1.1.3 Card

The Card Properties pane allows you to view and update card information.

Table D-2 Field Descriptions for the Card Properties Pane

Field	Description
Card Mode	Select the card mode. It can be either of the following: • Distance Extension (default) • Line Rate Only
Current Bandwidth Usage	Displays the current bandwidth utilization in terms of STS or VC-4 usage.

D.1.1.4 Port

The Port Properties pane allows you to view and update FC_MR port information. The Properties pane contains the following tabs:

- D.1.1.4.1 General Tab, page D-3
- D.1.1.4.2 Distance Extension Tab, page D-4
- D.1.1.4.3 Enhanced FC/FICON Tab, page D-4

D.1.1.4.1 General Tab

The General tab allows you to view and update general port information.

Table D-3 Field Descriptions for the General Tab

Field	Description
Port Number	Displays the card port number. Values are 1 to 4.
Port Name	Allows you to assign the specified port a name. The name can be up to 32 alphanumeric or special characters and is blank by default.
Admin State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Media Type	Set the media type for each port. Options are: • FICON - 2 Gb/s—Available when Distance Extension card mode is selected or distance extension is enabled on the port. • FICON - 1 Gb/s—Available when Distance Extension card mode is selected or distance extension is enabled on the port. • Fibre Channel - 1 Gb/s—Fiber channel interface. • Fibre Channel - 2 Gb/s—Fiber channel interface. • Undefined—This is the default media type when the card is inserted.
Link Rate	Displays the actual rate of the port.
Max GBIC Rate	Displays the maximum GBIC rate. Cisco supports two GBICs for the FC_MR-4 card (ONS-GX-2FC-SML and ONS-GX-2FC-MMI). If used with another GBIC, “See GBIC vendor” displays.

Table D-3 Field Descriptions for the General Tab (continued)

Field	Description
Enable Link Recovery	Enables or disables link recovery if a local port is inoperable. If enabled, a link reset occurs when there is a loss of transport from a cross-connect switch, a protection switch, or an upgrade.
State	Places the port in service (IS), out of service (OOS), or out of service–maintenance (OOS_MT).

D.1.1.4.2 Distance Extension Tab

The Distance Extension tab allows you to enable the buffer-to-buffer extension between the client and the FC_MR-4 card. This increases the dense wavelength division multiplexing (DWDM) distance without affecting the throughput.

Table D-4 Field Descriptions for the Distance Extension Tab

Field	Description
Port No.	Displays the port number.
Enable Distance Extension	Check to enable end-to-end distances of up to 1600 km for 1 GFC and up to 800 km for 2 GFC. When enabled, all the fields for the port are enabled.
Auto Detect Credits	Check to enable automatic detection of buffer credits for flow control.
Credits Available	Displays the number of credits available. You can set the credits available only if the Auto Detect Credits field is disabled on the port. Values should be in multiples of 2. The minimum value is 2 and the maximum value is 256.
Autoadjust GFP Buffer Threshold	Check to automatically adjust the threshold of the GFP buffer.
GFP Buffers Available	Displays the number of GFP buffers. You can set the GFP buffers as available only if the Autoadjust GFP Buffer Threshold field is disabled. Values should be in multiples of 16. The minimum value is 16 and the maximum value is 1200.

D.1.1.4.3 Enhanced FC/FICON Tab

The Enhanced FC/FICON ISL tab allows you to enable FPGA to drop duplicate frames.

Table D-5 Field Descriptions for the Enhanced FC/FICON Tab

Field	Description
Port No.	Displays the port number.
Ingress Idle Filtering	Enable or disable ingress idle filtering.
Maximum Frame Size	Allows you to select the maximum frame size supported by the FICON/FC. Valid range is from 2148 to 2172.

D.1.1.5 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update FC_MR alarm profile information.

Table D-6 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the FC_MR port number (1 to 4).
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed.
Force to All Ports	Forces the selected alarm profile to all FC_MR ports.

D.1.1.6 RMON Thresholds

The RMON Thresholds Properties pane allows you to create, view, and delete FC_MR-4 thresholds.

Table D-7 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Index Number	A unique value that identifies the different thresholds currently existing on the NE.
Slot	Select a slot for the new FC_MR threshold.
Port	Select a port for the selected slot. If you select All, the threshold will be created on all ports for that slot. This operation may take several minutes to complete.
Variable	Select a variable for the new FC_MR threshold. Available variables will differ based on the type of card selected in the Slot field.
Alarm Type	Select an alarm type for the new FC_MR threshold. Indicate whether the event will be triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Select a sample type for the new FC_MR threshold. Available sample types are relative and absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Enter a sample period for the new FC_MR threshold. The sample period is measured in seconds.
Rising Threshold	Enter a rising threshold for the new FC_MR threshold. The value must be equal to or greater than the falling threshold value.
Falling Threshold	Enter a falling threshold for the new FC_MR threshold. The value must be equal to or less than the rising threshold value.
Create	Click the **Create** button to create an FC_MR threshold.
Delete	Select an FC_MR threshold from the list displayed and click the **Delete** button.

D.1.1.7 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve FC_MR-4 J1 path trace information.

Table D-8 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
STS Number/VC4 Number	Displays the STS or VC4 number.

Table D-8 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Column	Description
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.

D.1.1.8 GBIC Inventory

The GBIC Inventory Properties pane allows you to view GBIC inventory information.

Table D-9 Field Descriptions for the GBIC Inventory Properties Pane

Field	Description
Port Number	Displays the GBIC card port number.
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Hardware Part Number	Displays the manufacturer's part number.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the GBIC serial number that is unique to each GBIC.
CLEI Code	Displays the CLEI code.
Application Filename	The application filename is not supported; therefore, this field displays “unknown.”

D.1.1.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the FC_MR-4 card.

Table D-10 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2 FMEC Cards

This section describes the following FMEC cards supported within Prime Optical:

- D.2.1 Slot Properties—FMEC-DS-1/E1, page D-7
- D.2.2 Slot Properties—FMEC-DS-3/E3, page D-8
- D.2.3 Slot Properties—FMEC-E1, page D-9
- D.2.4 Slot Properties—FMEC-E1-120NP, page D-11
- D.2.5 Slot Properties—FMEC-STM1E 1:1, page D-12
- D.2.6 Slot Properties—MIC-A/P, page D-14
- D.2.7 Slot Properties—MIC-C/T/P, page D-15

D.2.1 Slot Properties—FMEC-DS-1/E1

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH FMEC-DS-1/E1 card provides front-mount electrical connection for 14 ITU-compliant, G.703 E-1 ports. With the FMEC-DS-1/E1 card, each E1-N-14 port operates at 2.048 Mb/s over a 120-ohm, balanced cable through two 37-pin DB connectors.

For the FMEC DS-1/E1 module, the slot properties pane displays the following tabs: Module View and Identification.

D.2.1.1 Module View

The Module View Properties pane displays a graphic of the FMEC DS-1/E1 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.1.2 Identification

The Identification Properties pane allows you to view and update FMEC DS-1/E1 identification information.

Table D-11 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.

Table D-11 Field Descriptions for the Identification Properties Pane

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2.2 Slot Properties—FMEC-DS-3/E3

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH FMEC-DS-3/E3 card provides front-mount electrical connection for 14 ITU-compliant, G.703 E-1 ports. With the FMEC-DS-3/E3 card, each E1-N-14 port operates at 2.048 Mb/s over a 120-ohm, balanced cable through two 37-pin DB connectors.

For the FMEC DS-3/E3 module, the slot properties pane displays the following tabs: Module View, Identification, and Info.

D.2.2.1 Module View

The Module View Properties pane displays a graphic of the FMEC DS-3/E3 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.2.2 Identification

The Identification Properties pane allows you to view and update FMEC DS-3/E3 identification information.

Table D-12 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.

Table D-12 Field Descriptions for the Identification Properties Pane

Field	Description
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.2.2.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the FMEC DS-3/E3 card.

Table D-13 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2.3 Slot Properties—FMEC-E1

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH FMEC-E1 card provides front-mount electrical connection for fourteen ITU-compliant, G.703 E-1 ports. With the FMEC-E1 card, each E1-N-14 port operates at 2.048 Mb/s over a 75-ohm unbalanced coaxial 1.0/2.3 miniature coaxial connector.

For the FMEC-E1 module, the slot properties pane displays the following tabs: Module View, Identification, and Info.

D.2.3.1 Module View

The Module View Properties pane displays a graphic of the FMEC-E1 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.3.2 Identification

The Identification Properties pane allows you to view and update FMEC-E1 identification information.

Table D-14 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.2.3.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the FMEC-E1 card.

Table D-15 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2.4 Slot Properties—FMEC-E1-120NP

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH FMEC-E1-120NP (Unprotected) card provides front-mount electrical connection for 42 ITU-compliant, G.703 E-1 ports. With the FMEC E1-120NP card, each E1-42 port operates at 2.048 Mb/s over a 120-ohm, balanced interface. Twenty-one interfaces are led through one common Molex 96-pin LFH connector.

The ONS 15454 SDH FMEC E1-120PROA (1:3 Protect A) card provides front-mount electrical connection for 42 ITU-compliant, G.703 E-1 ports. With the FMEC E1-120PROA card, each E1-42 port operates at 2.048 Mb/s over a 120-ohm, balanced interface. Twenty-one interfaces are led through one common Molex 96-pin LFH connector.

The ONS 15454 SDH FMEC E1-120PROB (1:3 Protect B) card provides front-mount electrical connection for 42 ITU-compliant, G.703 E-1 ports. With the FMEC E1-120PROB card, each E1-42 port operates at 2.048 Mb/s over a 120-ohm, balanced interface. Twenty-one interfaces are led through one common Molex 96-pin LFH connector.

For the FMEC-E1-120NP module, the slot properties pane displays the following tabs: Module View, Identification, and Info.

D.2.4.1 Module View

The Module View Properties pane displays a graphic of the FMEC-E1-120NP that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.4.2 Identification

The Identification Properties pane allows you to view and update FMEC-E1-120NP identification information.

Table D-16 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table D-16 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.2.4.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the FMEC-E1-120NP card.

Table D-17 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2.5 Slot Properties—FMEC-STM1E 1:1

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 SDH FMEC-STM1E 1:1 card provides front-mount electrical connection for 2 x 12 ITU-compliant, G.703 STM1E ports. With the FMEC-STM1E 1:1 card, each interface of an STM1E-12 card operates at 155.52 Mb/s for STM-1 over a 75-ohm unbalanced coaxial 1.0/2.3 miniature coaxial connector. The FMEC STM1E 1:1 card is required if you want to use the STM1E-12 card in 1:1 protection mode or for connection to two unprotected STM1E-12 cards.

For the FMEC-STM1E card, the slot properties pane displays the following tabs: Module View, Identification, and Info.

D.2.5.1 Module View

The Module View Properties pane displays a graphic of the FMEC-STM1E 1:1 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.5.2 Identification

The Identification Properties pane allows you to view and update the FMEC-STM1E 1:1 card identification information.

Table D-18 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.2.5.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the FMEC-STM1E 1:1 card.

Table D-19 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2.6 Slot Properties—MIC-A/P

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MIC-A/P card provides connection for the BATTERY B input, one of the two possible redundant power supply inputs. It also provides connection for eight alarm outputs (coming from the TCC2 card), sixteen alarm inputs, and four configurable alarm inputs/outputs. Its position is in slot 23 in the center of the ONS 15454 SDH subrack EFCA area.

For the MIC-A/P module, the slot properties pane displays the following tabs: Module View and Identification.

D.2.6.1 Module View

The Module View Properties pane displays a graphic of the MIC-A/P that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.6.2 Identification

The Identification Properties pane allows you to view and update MIC-A/P identification information.

Table D-20 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.2.7 Slot Properties—MIC-C/T/P

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MIC-C/T/P card provides connection for the BATTERY A input, one of the two possible redundant power supply inputs. It also provides connection for system management serial port, system management LAN port, modem port (for future use), and system timing inputs and outputs.

For the MIC-C/T/P module, the slot properties pane displays the following tabs: Module View and Identification.

D.2.7.1 Module View

The Module View Properties pane displays a graphic of the MIC-C/T/P that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.2.7.2 Identification

The Identification Properties pane allows you to view and update MIC-C/T/P identification information.

Table D-21 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.3 Multirate Cards

This section describes the following multirate cards supported within Prime Optical:

- D.3.1 Slot Properties—ASAP_4, page D-16
- D.3.2 Slot Properties—MRC-12, page D-32
- D.3.3 Slot Properties—MRC25G-4, page D-56
- D.3.4 Slot Properties—MRC25G-12, page D-70

D.3.1 Slot Properties—ASAP_4

The slot properties pane displays information about the Cisco ONS 15600 SONET or ONS 15600 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15600 SONET/SDH Any Service Any Port (ASAP_4) card provides up to 16 optical network interface ports, depending on the configuration. When configured for OC-192 XFP, the card provides a maximum of 4 OC-192 optical network interface ports. When the ASAP_4 card is configured with a combination of OC-192 XFP and lower-rate plugins such as OC-48, OC-12, or OC-3, the number of optical network interfaces is factored by 4 for each OC-192. For example, if the ASAP_4 card is configured with 1 OC-192, the card provides a maximum of 13 optical network interfaces (1 for OC-192 and 12 for lower-rate plugins). If the ASAP_4 card is configured with 2 OC-192s, the card provides a maximum of 10 optical network interfaces (2 for OC-192 and 8 for lower-rate plugins). The card can be installed in any I/O module card slot. The card provides 16 optical interfaces on the front panel. When configured for Ethernet, an ASAP port forwards Ethernet frames by encapsulating them in Cisco HDLC or GFP and transports them over SONET/SDH to the far-end GE port, where the unencapsulation is performed.

The OC-192 XFP feature adds the capability to the existing ONS 15600 ASAP card to support 10 GB small form factor pluggable (XFP) optics. This functionality augments the ASAP card with an OC-192 line rate and allows the ASAP card to provide a range of optical service rates that scale from OC-3 to OC-192.

Note The OC-192 XFP cannot be modified once it is configured.

The slot properties pane for the ASAP_4 card displays the following tabs: Module View, Card Identification, Pluggable Provisioning, Line, STS, VC4, Loopback, Protection, Alarm Behavior, J1 Path Trace, Info, Ether Line, Ether Loopback, Ether Alarm Behavior, POS Alarm Behavior, POS Line, Transceiver, Section Trace, and Auto Laser Shutdown. The tabs shown depend on the NE configuration.

D.3.1.1 Module View

The Module View Properties pane displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.3.1.2 Card Identification

The Card Identification Properties pane allows you to view and update identification information.

Table D-22 Field Descriptions for the Card Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The card administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.3.1.3 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities; for example, pluggable port modules (PPMs) and the ports inside these entities.

Table D-23 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable IO Module	
Pluggable Number	Displays the identifier of the plugin module.
Equipment Type	Displays the equipment type that the pluggable slot is provisioned for.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each pluggable I/O module.
CLEI Code	Displays the CLEI code.
Actual Equipment Type	Displays the actual pluggable I/O module that is installed in the pluggable slot.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the pluggable I/O module.
User Code	Allows you to enter an ASCII string to identify the pluggable I/O module. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the pluggable I/O module does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	Displays the port administration state. Values include: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked,automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled,automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled,disabled. • locked,maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled,maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the pluggable I/O module.
Pluggable Port Module	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual pluggable port module that is installed in the pluggable slot.
Equipment State	Displays the equipment state of the pluggable port module.
Admin State	Displays the port administration state. Values include: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked,automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled,automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled,disabled. • locked,maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled,maintenance.

Table D-23 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Optical Ports	
Pluggable Number	Displays the identifier of the plugin module.
Rate	Displays the rate that the port is provisioned for.
Ether Ports	
Pluggable Number	Displays the identifier of the plugin module.
Equipment Type	Displays the equipment type that the Ethernet port is provisioned for.

D.3.1.3.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. The Provision Pluggable dialog box allows you to provision pluggable entities—for example, the PPM and PIM—and to create the ports inside these entities. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

D.3.1.4 Line

The Line Properties pane allows you to view and update optical line performance monitoring information. The Line Properties pane contains the following tabs:

- D.3.1.4.1 Line Config Tab, page D-19
- D.3.1.4.2 Line Thresh 15 Min Tab, page D-21
- D.3.1.4.3 Line Thresh 1 Day Tab, page D-21
- D.3.1.4.4 Physical Thresh 15 Min Tab, page D-22
- D.3.1.4.5 Physical Thresh 1 Day Tab, page D-23
- D.3.1.4.6 Section Thresh 15 Min Tab, page D-23
- D.3.1.4.7 Section Thresh 1 Day Tab, page D-24
- D.3.1.4.8 Alarm Thresh Tab, page D-24

D.3.1.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the ASAP_4 card.

Table D-24 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Port Rate	Displays the rate that the port is provisioned for.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.

Table D-24 Field Descriptions for the Line Config Tab (continued)

Field	Description
EnableSyncMsg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Administration State	The port administration state.
Synchronization Status Message	Allows you to view the incoming synchronization status message.
BLSR Ext. Byte, MS-SPRing Ext. Byte	Select an alternate BLSR or MS-SPRing byte.
Type	Defines the port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

Table D-24 Field Descriptions for the Line Config Tab (continued)

Field	Description
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.

D.3.1.4.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end line thresholds of the ASAP_4 card.

Table D-25 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations–line.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.
PSC	Displays the protection switching count.
PSD	Displays the protection switching duration.
PSC-W	Displays the protection switching count–working.
PSD-W	Displays the protection switching duration–working.
PSC-S	Displays the protection switching count–span.
PSD-S	Displays the protection switching duration–span.
PSC-R	Displays the protection switching count–ring.
PSD-R	Displays the protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations–line.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

D.3.1.4.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day near- and far-end line thresholds of the ASAP_4 card.

Table D-26 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations–line.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.
PSC	Displays the protection switching count–line.
PSD	Displays the protection switching duration–line.
PSC-W	Displays the protection switching count–working.
PSD-W	Displays the protection switching duration–working.
PSC-S	Displays the protection switching count–span.
PSD-S	Displays the protection switching duration–span.
PSC-R	Displays the protection switching count–ring.
PSD-R	Displays the protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations–line.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

D.3.1.4.4 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change the 15-minute near-end physical thresholds of the ASAP_4 card.

Table D-27 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.

Table D-27 Field Descriptions for the Physical Thresh 15 Min Tab (continued)

Field	Description
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.1.4.5 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change the 1-day near-end physical thresholds of the ASAP_4 card.

Table D-28 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.1.4.6 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute near-end section thresholds of the ASAP_4 card.

Table D-29 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations–section.
ES-S	Displays the errored seconds–section.
SES-S	Displays the severely errored seconds–section.
SEFS-S	Displays the severely errored framing seconds–section.

D.3.1.4.7 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day near-end section thresholds of the ASAP_4 card.

Table D-30 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations–section.
ES-S	Displays the errored seconds–section.
SES-S	Displays the severely errored seconds–section.
SEFS-S	Displays the severely errored framing seconds–section.

D.3.1.4.8 Alarm Thresh Tab

The Alarm Thresh tab allows you to select the thresholds for the alarms.

Table D-31 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port No.	Port number.
LBC-HIGH	Maximum laser bias current.
LBC-LOW	Minimum laser bias current.
OPT-HIGH	Maximum optical power transmitted.
OPT-LOW	Minimum optical power transmitted.
OPR-HIGH	Maximum optical power received.
OPR-LOW	Minimum optical power received.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.1.5 STS

The STS Properties pane allows you to view and update ASAP_4 STS information. The STS Properties pane contains the following tabs:

- D.3.1.5.1 STS Config Tab, page D-24
- D.3.1.5.2 Path Thresh 15 Min Tab, page D-25
- D.3.1.5.3 Path Thresh 1 Day Tab, page D-25
- D.3.1.5.4 Customer Info Tab, page D-26

D.3.1.5.1 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the ASAP_4 card.

Table D-32 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

D.3.1.5.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the ASAP_4 card.

Table D-33 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
Far End	
STS No	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
FC-P	Displays failure count–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.

D.3.1.5.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the ASAP_4 card.

Table D-34 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.

Table D-34 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
Far End	
STS No	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
FC-P	Displays failure count–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.

D.3.1.5.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-35 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.3.1.6 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table D-36 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

Table D-36 Field Descriptions for the Loopback Properties Pane

Field	Description
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.3.1.7 Protection

The Protection Properties pane allows you to view and update ASAP_4 protection group information.

Table D-37 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.3.1.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table D-38 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.3.1.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table D-39 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.

Table D-39 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

D.3.1.10 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the ASAP_4 card.

Table D-40 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

D.3.1.11 Ether Line

The Ether Line Properties pane allows you to configure Ether line information.

Table D-41 Field Descriptions for the Ether Line Properties Pane

Field	Description
Port Number	The port number.
Port Name	Allows you to enter a port name.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.
Flow Control	Displays the negotiated flow control mode. Values are None, Symmetrical, and Asymmetrical.
Negotiation Status	Displays the result of the most-recent auto-negotiation. The type of flow control that was negotiated will be displayed.
Auto Negotiation	Allows you to enable the card to match the speed and duplex mode of a partner node.
Max Frame	Sets the maximum frame size.
Flow Control Low	Sets the low flow control buffer level.
Flow Control High	Sets the high flow control buffer level.

Table D-41 Field Descriptions for the Ether Line Properties Pane

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.
AINS Soak (H:M)	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down (H:M)	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.

D.3.1.12 Ether Loopback

The Ether Loopback Properties pane allows loopback to be configured in the Ethernet port. The Ether Loopback Properties pane contains the following tabs:

- D.3.1.12.1 Ether Loopback Port Tab, page D-30
- D.3.1.12.2 SONET STS (Ether) Tab, page D-30

D.3.1.12.1 Ether Loopback Port Tab

The Ether Loopback Port tab allows you to configure Ethernet loopback port information.

Table D-42 Field Descriptions for the Ether Loopback Port Tab

Field	Description
Port Number	The port number.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.3.1.12.2 SONET STS (Ether) Tab

The SONET STS (Ether) tab allows you to configure loopback on cross-connects.

Table D-43 Field Descriptions for the SONET STS (Ether) Tab

Field	Description
STS	Displays the STS number.
XC Loopback	Displays the cross-connect loopback status.

D.3.1.13 Alarm Behavior Property

The Alarm Behavior Properties pane contains the following tabs:

- D.3.1.13.1 Ether Alarm Behavior Tab, page D-30
- D.3.1.13.2 POS Alarm Behavior Tab, page D-31

D.3.1.13.1 Ether Alarm Behavior Tab

The Ether Alarm Behavior tab allows you to view and update Ether alarm profile information.

Table D-44 Field Descriptions for the Ether Alarm Behavior Tab

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.

Table D-44 Field Descriptions for the Ether Alarm Behavior Tab (continued)

Field	Description
Suppress Alarms	When checked, all alarms are suppressed for the port.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.3.1.13.2 POS Alarm Behavior Tab

The POS Alarm Behavior tab allows you to view and update POS alarm profile information.

Table D-45 Field Descriptions for the POS Alarm Behavior Tab

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.3.1.14 POS Line

The POS Line Properties pane allows you to view and update alarm profile information.

Table D-46 Field Descriptions for the POS Line Properties Pane

Field	Description
Port Number	Displays the card port number.
Port Name	Allows you to enter a port name.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Encap CRC	Sets the cyclic redundancy check (CRC) to verify the integrity of the transmitted data.
Framing Type	Allows you to select the line framing type.
Link State	Displays the physical port state. Values are Up and Down.
MTU	Maximum transmission unit. The largest acceptable packet size configured for that port. The default value is 1500.

D.3.1.15 Transceiver

The Transceiver Properties pane allows you to view and update ASAP_4 transceiver information.

Table D-47 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	PIM number, PPM number, or port number.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.3.1.16 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the ASAP_4 card.

Table D-48 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.3.2 Slot Properties—MRC-12

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MRC-12 multirate card (MRC) provides up to 12 OC-3/STM-1 ports, 12 OC-12/STM-4 ports, or 4 OC-48/STM-16 ports using small form factor pluggables (SFPs), in any combination of line rates. All ports are Telcordia GR-253 compliant. The SFP optics can use SR, IR, LR, coarse wavelength division multiplexing (CWDM), and DWDM SFPs to support unrepeated spans.

The ports operate at up to 2488.32 Mb/s over a single-mode fiber. The MRC-12 card has 12 physical connector adapters with 2 fibers per connector adapter (Tx and Rx). The card supports VT payloads, STS-1 payloads, and concatenated payloads at STS-3c, STS-6c, STS-9c, STS-12c, STS-18c, STS-24c, STS-36c, or STS-48c signal levels. It is fully interoperable with the ONS 15454 G-Series Ethernet cards.

The card supports 1+1 unidirectional and bidirectional facility protection. It also supports 1+1 protection in 4-fiber BLSR applications for the ONS 15454 SONET and in 4-fiber MS-SPRing applications for the ONS 15454 SDH, where both span switching and ring switching might occur. You can provision this card as part of a BLSR, UPSR, or 1+1 linear configuration for the ONS 15454 SONET or an MS-SPRing, SNCP, or linear configuration for the ONS 15454 SDH.

Note Longer distances are possible in an amplified system using dispersion compensation.

Note MRC-12 cards can only protect another MRC-12 card if the card is in the same speed slot (drop or trunk slot) and if both ports have matching line rates. For example, port 1 of the MRC-12 card 1 will protect port 1 of the MRC-12 card 2 only if both ports are provisioned with the same rate (for example, OC-12/STM-4). If the ports are provisioned with different rates, you cannot set a 1+1 protection.

You can install MRC-12 cards in slots 1 to 6 and slots 12 to 17 with an XCVT, XC10G, XC-VXL-2.5G, XC-VXL-10G, or XC-VXC-10G card.

Note The MRC-12 card supports an errorless software-initiated cross-connect card switch when used in a shelf equipped with XC-VXL-2.5G, XC-VXL-10G, or XC-VXC-10G cards.

The maximum bandwidth of the MRC-12 card is determined by the cross-connect card, as shown in the following table.

Table D-49 Maximum Bandwidth by Shelf Slot for the MRC-12 in Different Cross-Connect Configurations

XC Card Type	Maximum Bandwidth in the Drop Slot[1] (Slots 1 to 4 and Slots 14 to 17)	Maximum Bandwidth in the Trunk Slot[2] (Slots 5, 6, 12, or 13)
XCVT	OC-12	OC-48
XC10G/XC-VXC-10G	OC-48	OC-192
XC-VXL-2.5G	STM-16	STM-16
XC-VXC-10G/XC-VXL-10G	STM-16	STM-64

1. Drop slots are low-speed slots.
2. Trunk slots are high-speed slots.

The twelve ports of the MRC-12 card are divided into four groups, with each group having a master port as shown in the following table.

Table D-50 Port Grouping

Group	Ports Included	Master Port
1	1	1
2	2, 3, 4	4
3	5, 6, 7, 8	7
4	9, 10, 11, 12	10

Following are the general port rate configuration rules:

- The maximum bandwidth for each port is OC-48.
- Port 1 can occupy all possible backplane bandwidth but cannot exceed OC-48.
- Each port group can have a maximum of 25% backplane bandwidth, except for group 1.
- Only a master port can occupy all possible bandwidth assigned to the group.

Based on the cross-connect card and slot limitations shown in Table D-49, the following rules apply for various synchronous transport signal (STS) available bandwidths:

- STS-12
  - Port 1 is the only port that is usable as an OC-12/STM-4. If port 1 is used as an OC-12/STM-4, all other ports are disabled.
  - Ports 1, 4, 7, and 10 are the only ports usable as OC-3/STM-1. If any of these ports is used as an OC-3/STM-1, Ports 2, 3, 5, 6, 8, 9, 11, and 12 are disabled.
- STS-48
  - Port 1 is the only port usable as an OC-48/STM-16. If port 1 is used as an OC-48/STM-16, all other ports are disabled.
  - Ports 1, 4, 7, and 10 are the only ports usable as OC-12/STM-4.
  - If port 4 is used as an OC-12/STM-4, Ports 2 and 3 are disabled.
  - If port 7 is used as an OC-12/STM-4, Ports 5, 6, and 8 are disabled.
  - If port 10 is used as an OC-12/STM-4, Ports 9, 11, and 12 are disabled.
  - Any port can be used as an OC-3/STM-1 as long as all of the above rules are followed.
- STS-192
  - Ports 1, 4, 7, and 10 are the only ports usable as OC-48/STM-16.
  - If port 4 is used as an OC-48/STM-16, Ports 2 and 3 are disabled.
  - If port 7 is used as an OC-48/STM-16, Ports 5, 6, and 8 are disabled.
  - If port 10 is used as an OC-48/STM-16, Ports 9, 11, and 12 are disabled.
  - If port 4 is used as an OC-12/STM-4, Ports 2 and 3 can be used as an OC-12/STM-4 or OC-3/STM-1.
  - If port 7 is used as an OC-12/STM-4, Ports 5, 6, and 8 can be used as an OC-12/STM-4 or OC-3/STM-1.
  - If Port 10 is as used as an OC-12/STM-4, Ports 9, 11, and 12 can be used as an OC-12/STM-4 or OC-3/STM-1.
  - If port 4 is used as an OC-3/STM-1, Ports 2 and 3 can be used as an OC-12/STM-4 or OC-3/STM-1.
  - If port 7 is used as an OC-3/STM-1, Ports 5, 6, and 8 can be used as an OC-12/STM-4 or OC-3/STM-1.
  - If port 10 is used as an OC-3/STM-1, Ports 9, 11, and 12 can be used as an OC-12/STM-4 or OC-3/STM-1.
  - Any port can be used as an OC-12/STM-4 or OC-3/STM-1, as long as all of the above rules are followed.

For the MRC-12 card, the slot properties pane displays the following tabs: Module View, Identification, Pluggable Provisioning, Line, STS, VC-4 (available only on the ONS 15454 SDH), Loopback, Protection, Alarm Behavior, Transceiver, Auto Laser Shutdown, Section Trace, J1 Path Trace, and Info. The tabs shown depend on the NE configuration.

D.3.2.1 Module View

The Module View Properties pane displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the card is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.3.2.2 Identification

The Identification Properties pane allows you to view and update MRC-12 card identification information.

Table D-51 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.3.2.3 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities; for example, pluggable port module (PPM) and the ports inside these entities.

Table D-52 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual pluggable I/O module that is installed in the pluggable slot.
Equipment State	Displays the equipment state of the card.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Pluggable Ports	
Pluggable Number	Displays the identifier of the plugin module.
Rate	Displays the rate of the port inside the pluggable entity.

D.3.2.3.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. The Provision Pluggable dialog box allows you to provision pluggable entities—for example, the PPM and PIM—and to create the ports inside these entities. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

D.3.2.3.2 Create Port Dialog Box

Use the Create Port dialog box to configure the port rate for a particular pluggable port module (PPM). In the Port Rate field, use the drop-down list to select the new port rate and click **OK**.

D.3.2.4 Line (ONS 15454 SONET)

The Line Properties pane allows you to view and update optical line performance monitoring information. The Line Properties pane contains the following tabs:

- D.3.2.4.1 Line Config Tab, page D-37
- D.3.2.4.2 Line Thresh 15 Min Tab, page D-38
- D.3.2.4.3 Line Thresh 1 Day Tab, page D-39
- D.3.2.4.4 Physical Thresh 15 Min Tab, page D-40
- D.3.2.4.5 Physical Thresh 1 Day Tab, page D-40
- D.3.2.4.6 Section Thresh 15 Min Tab, page D-41

- D.3.2.4.7 Section Thresh 1 Day Tab, page D-41
- D.3.2.4.8 Alarm Thresholds Tab, page D-42

D.3.2.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the MRC-12 card.

Table D-53 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Port Rate	Sets the rate of the new port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Provide Sync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
BLSR Ext. Byte	Select an alternate BLSR byte.
Type	Defines the port.
AINS Soak (H:M)	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down (H:M)	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4

Table D-53 Field Descriptions for the Line Config Tab (continued)

Field	Description
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default) - 3 (OC3, per port) • 0 (default) - 12 (OC-12)
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

D.3.2.4.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end line thresholds of the MRC-12 card.

Table D-54 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.
PSC	Protection switching count–line.
PSD	Protection switching duration–line.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Protection switching duration–span.
PSC-R	Protection switching count–ring.
PSD-R	Protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

D.3.2.4.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day near- and far-end line thresholds of the MRC-12 card.

Table D-55 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

Table D-55 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
PSC	Protection switching count–line.
PSD	Protection switching duration–line.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Protection switching duration–span.
PSC-R	Protection switching count–ring.
PSD-R	Protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

D.3.2.4.4 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change the 15-minute near-end physical thresholds of the MRC-12 card.

Table D-56 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.2.4.5 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change the 1-day near-end physical thresholds of the MRC-12 card.

Table D-57 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.2.4.6 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute near-end section thresholds of the MRC-12 card.

Table D-58 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations–section.
ES-S	Displays the errored seconds–section.
SES-S	Displays the severely errored seconds–section.
SEFS-S	Displays the severely errored framing seconds–section.

D.3.2.4.7 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day near-end section thresholds of the MRC-12 card.

Table D-59 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations–section.
ES-S	Displays the errored seconds–section.
SES-S	Displays the severely errored seconds–section.
SEFS-S	Displays the severely errored framing seconds–section.

D.3.2.4.8 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select the thresholds for the alarms.

Table D-60 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Port No.	Port number.
LBC-HIGH	Maximum laser bias current.
LBC-LOW	Minimum laser bias current.
OPT-HIGH	Maximum optical power transmitted.
OPT-LOW	Minimum optical power transmitted.
OPR-HIGH	Maximum optical power received.
OPR-LOW	Minimum optical power received.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.2.5 Line (ONS 15454 SDH)

The Line Properties pane allows you to view and update optical line performance monitoring information. The Line Properties pane contains the following tabs:

- D.3.2.5.1 Line Config Tab, page D-42
- D.3.2.5.2 MS Thresh 15 Min Tab, page D-44
- D.3.2.5.3 MS Thresh 1 Day Tab, page D-45
- D.3.2.5.4 Physical Thresh 15 Min Tab, page D-46
- D.3.2.5.5 Physical Thresh 1 Day Tab, page D-46
- D.3.2.5.6 RS Thresh 15 Min, page D-47
- D.3.2.5.7 RS Thresh 1 Day Tab, page D-47
- D.3.2.5.8 Alarm Thresholds Tab, page D-48

D.3.2.5.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the MRC-12 card.

Table D-61 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.

Table D-61 Field Descriptions for the Line Config Tab (continued)

Field	Description
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Port Rate	Sets the rate of the new port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Provide Sync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
Type	Defines the port.
AINS Soak (H:M)	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down (H:M)	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
PJ VC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.

Table D-61 Field Descriptions for the Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

D.3.2.5.2 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end line thresholds of the MRC-12 card.

Table D-62 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.

Table D-62 Field Descriptions for the MS Thresh 15 Min Tab (continued)

Field	Description
EB-MS	Displays the errored block–multiplex section.
BBE-MS	Displays the background block errors–multiplex section.
ES-MS	Displays the errored seconds–multiplex section.
SES-MS	Displays the severely errored seconds–multiplex section.
UAS-MS	Displays the unavailable seconds–multiplex section.
PSC	Displays the protection switching count.
PSD	Displays the protection switching duration.
PSC-W	Displays the protection switching count–working.
PSD-W	Displays the protection switching duration–working.
PSC-S	Displays the protection switching count–span.
PSD-S	Displays the protection switching duration–span.
PSC-R	Displays the protection switching count–ring.
PSD-R	Displays the protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
EB-MS	Displays the errored block–multiplex section.
BBE-MS	Displays the background block errors–multiplex section.
ES-MS	Displays the errored seconds–multiplex section.
SES-MS	Displays the severely errored seconds–multiplex section.
UAS-MS	Displays the unavailable seconds–multiplex section.

D.3.2.5.3 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day near- and far-end line thresholds of the MRC-12 card.

Table D-63 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
EB-MS	Displays the errored block–multiplex section.
BBE-MS	Displays the background block errors–multiplex section.
ES-MS	Displays the errored seconds–multiplex section.
SES-MS	Displays the severely errored seconds–multiplex section.
UAS-MS	Displays the unavailable seconds–multiplex section.
PSC	Displays the protection switching count.
PSD	Displays the protection switching duration.

Table D-63 Field Descriptions for the MS Thresh 1 Day Tab (continued)

Field	Description
PSC-W	Displays the protection switching count–working.
PSD-W	Displays the protection switching duration–working.
PSC-S	Displays the protection switching count–span.
PSD-S	Displays the protection switching duration–span.
PSC-R	Displays the protection switching count–ring.
PSD-R	Displays the protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
EB-MS	Displays the errored block–multiplex section.
BBE-MS	Displays the background block errors–multiplex section.
ES-MS	Displays the errored seconds–multiplex section.
SES-MS	Displays the severely errored seconds–multiplex section.
UAS-MS	Displays the unavailable seconds–multiplex section.

D.3.2.5.4 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change the 15-minute near-end physical thresholds of the MRC-12 card.

Table D-64 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.2.5.5 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change the 1-day near-end physical thresholds of the MRC-12 card.

Table D-65 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.2.5.6 RS Thresh 15 Min

The RS Thresh 15 Min tab allows you to view and change the 15-minute near-end section thresholds of the MRC-12 card.

Table D-66 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
EB-RS	Displays the errored block–regenerator section.
BBE-RS	Displays the background block errors–regenerator section.
ES-RS	Displays the errored seconds–regenerator section.
SES-RS	Displays the severely errored seconds–regenerator section.
UAS-RS	Displays the unavailable seconds–regenerator section.
OFS-RS	Displays the out of framing seconds–regenerator section.

D.3.2.5.7 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day near-end section thresholds of the MRC-12 card.

Table D-67 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
EB-RS	Displays the errored block–regenerator section.
BBE-RS	Displays the background block errors–regenerator section.

Table D-67 Field Descriptions for the RS Thresh 1 Day Tab (continued)

Field	Description
ES-RS	Displays the errored seconds–regenerator section.
SES-RS	Displays the severely errored seconds–regenerator section.
UAS-RS	Displays the unavailable seconds–regenerator section.
OFS-RS	Displays the out of framing seconds–regenerator section.

D.3.2.5.8 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select the thresholds for the alarms.

Table D-68 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Port No.	Port number.
LBC-HIGH	Maximum laser bias current.
LBC-LOW	Minimum laser bias current.
OPT-HIGH	Maximum optical power transmitted.
OPT-LOW	Minimum optical power transmitted.
OPR-HIGH	Maximum optical power received.
OPR-LOW	Minimum optical power received.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.2.6 STS (ONS 15454 SONET)

The STS Properties pane allows you to view and update MRC-12 STS information. The STS Properties pane contains the following tabs:

- D.3.2.6.1 STS Config Tab, page D-48
- D.3.2.6.2 Path Thresh 15 Min Tab, page D-49
- D.3.2.6.3 Path Thresh 1 Day Tab, page D-49
- D.3.2.6.4 Customer Info Tab, page D-50

D.3.2.6.1 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the MRC-12 card.

Table D-69 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

D.3.2.6.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the MRC-12 card.

Table D-70 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
PJCS-Pdet	Displays positive pointer justification count, STS path detected.
PJCS-Pgen	Displays positive pointer justification count, STS path generated.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS No.	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.

D.3.2.6.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the MRC-12 card.

Table D-71 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.

Table D-71 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
PJCS-Pdet	Displays positive pointer justification count, STS path detected.
PJCS-Pgen	Displays positive pointer justification count, STS path generated.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS No.	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.

D.3.2.6.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-72 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.3.2.7 VC-4 (ONS 15454 SDH)

The VC-4 Properties pane allows you to view and update MRC-12 VC-4 information. The VC-4 Properties pane contains the following tabs:

- D.3.2.7.1 VC-4 Config Tab, page D-51
- D.3.2.7.2 SDH Path Thresh 15 Min Tab, page D-51
- D.3.2.7.3 SDH Path Thresh 1 Day Tab, page D-52
- D.3.2.7.4 Customer Info Tab, page D-53

D.3.2.7.1 VC-4 Config Tab

The VC-4 Config tab allows you to view and change the VC-4 settings of the MRC-12 card.

Table D-73 Field Descriptions for the VC-4 Config Tab

Field	Description
VC Number	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.

D.3.2.7.2 SDH Path Thresh 15 Min Tab

The SDH Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the MRC-12 card.

Table D-74 Field Descriptions for the SDH Path Thresh 15 Min Tab

Field	Description
Near End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.
PPJC-Pdet	Positive pointer justification count, path detected (PPJC-Pdet) is a count of the positive pointer justifications detected on a particular path on an incoming SDH signal.
NPJC-Pdet	Negative pointer justification count, path detected (NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SDH signal.
PPJC-Pgen	Positive pointer justification count, path generated (PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path.
NPJC-Pgen	Negative pointer justification count, path generated (MS-NPJC-Pgen) is a count of the negative pointer justifications generated for a particular path.
PJCS-Pdet	Number of higher-order path pointer justification count seconds detected on a particular path.
PJCS-Pgen	Number of higher-order path pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.

Table D-74 Field Descriptions for the SDH Path Thresh 15 Min Tab (continued)

Field	Description
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.

D.3.2.7.3 SDH Path Thresh 1 Day Tab

The SDH Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the MRC-12 card.

Table D-75 Field Descriptions for the SDH Path Thresh 1 Day Tab

Field	Description
Near End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.
PPJC-Pdet	Positive pointer justification count, path detected (PPJC-Pdet) is a count of the positive pointer justifications detected on a particular path on an incoming SDH signal.
NPJC-Pdet	Negative pointer justification count, path detected (NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SDH signal.
PPJC-Pgen	Positive pointer justification count, path generated (PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path.
NPJC-Pgen	Negative pointer justification count, path generated (MS-NPJC-Pgen) is a count of the negative pointer justifications generated for a particular path.
PJCS-Pdet	Number of higher-order path pointer justification count seconds detected on a particular path.
PJCS-Pgen	Number of higher-order path pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.

D.3.2.7.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-76 Field Descriptions for the Customer Info Tab

Field	Description
VC No.	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.3.2.8 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table D-77 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

D.3.2.9 Protection

The Protection Properties pane allows you to view and update MRC-12 protection group information.

Table D-78 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.3.2.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table D-79 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.3.2.11 Transceiver

The Transceiver Properties pane allows you to view and update MRC-12 transceiver information.

Table D-80 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	PIM number, PPM number, or port number.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.3.2.12 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update MRC-12 ALS parameters.

Table D-81 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.3.2.13 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the MRC-12 card.

Table D-82 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

D.3.2.14 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table D-83 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS | VC-4 Number	Displays the STS or VC-4 number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

D.3.2.15 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the MRC-12 card.

Table D-84 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.3.3 Slot Properties—MRC25G-4

The slot properties pane displays information about the Cisco ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MRC-2.5G-4 multirate card provides up to four OC-3/STM-1 ports, four OC-12/STM-4 ports, or one OC-48/STM-16 port using small form factor pluggables (SFPs), in various combinations of line rates. All ports are Telcordia GR-253 compliant. The SFP optics can use SR, IR, LR, coarse wavelength division multiplexing (CWDM), and DWDM SFPs to support unrepeated spans.

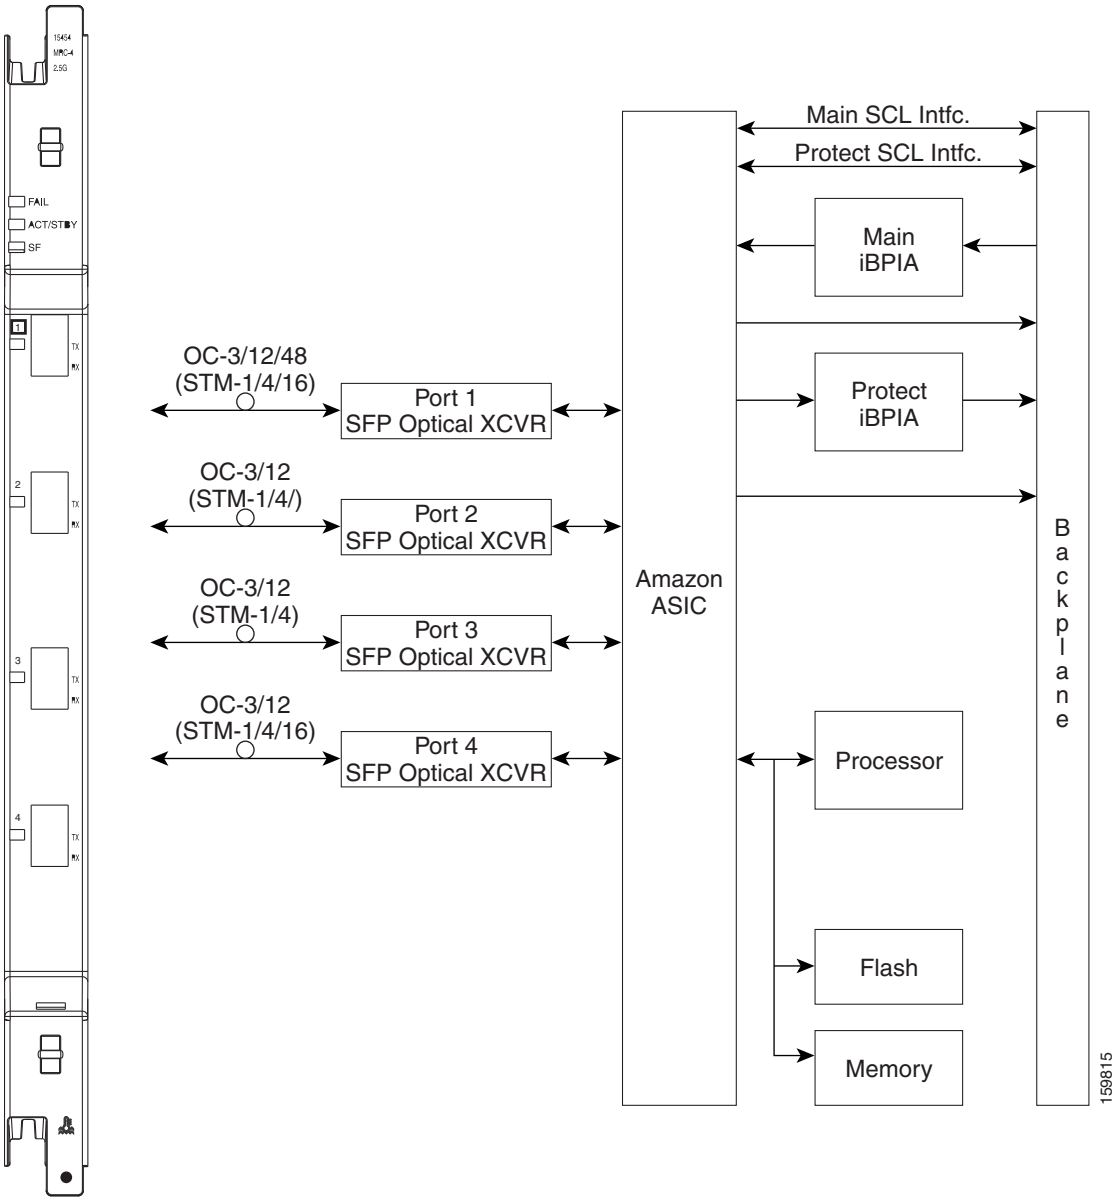
The ports operate at up to 2488.320 Mb/s over a single-mode fiber. The MRC-2.5G-4 card has four physical connector adapters with two fibers per connector adapter (Tx and Rx). The card supports VT payloads, STS-1 payloads, and concatenated payloads at STS-3c, STS-6c, STS-9c, STS-12c, STS-18c, STS-24c, STS-36c, or STS-48c signal levels. It is fully interoperable with the ONS 15454 G-Series Ethernet cards.

The MRC-2.5G-4 port contains a transmit and receive connector (labeled) on the card faceplate. The card supports 1+1 unidirectional and bidirectional facility protection. It also supports 1+1 protection in four-fiber BLSR applications where both span switching and ring switching might occur. You can provision this card as part of an BLSR, UPSR, or 1+1 linear configuration.

Note Longer distances are possible in an amplified system using dispersion compensation.

The following figure shows the MRC-2.5G-4 faceplate and block diagram.

Figure D-1 MRC-2.5G-4 Module



For the MRC25G-4 card, the slot properties pane displays the following tabs: Module View, Identification, Pluggable Provisioning, Line, STS, Loopback, Protection, Alarm Behavior, Transceiver, Auto Laser Shutdown, Section Trace, J1 Path Trace, and Info. The tabs shown depend on the NE configuration.

D.3.3.1 Module View

The Module View Properties pane displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.3.3.2 Identification

The Identification Properties pane allows you to view and update MRC25G-4 card identification information.

Table D-85 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.3.3.3 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities; for example, pluggable port module (PPM) and the ports inside these entities.

Table D-86 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual pluggable I/O module that is installed in the pluggable slot.
Equipment State	Displays the equipment state of the card.

Table D-86 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Pluggable Ports	
Pluggable Number	Displays the identifier of the plugin module.
Rate	Displays the rate of the port inside the pluggable entity.

D.3.3.3.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. The Provision Pluggable dialog box allows you to provision pluggable entities—for example, the PPM and PIM—and to create the ports inside these entities. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

D.3.3.3.2 Create Port Dialog Box

Use the Create Port dialog box to configure the port rate for a particular pluggable port module (PPM). In the Port Rate field, use the drop-down list to select the new port rate and click **OK**.

D.3.3.4 Line

The Line Properties pane allows you to view and update optical line performance monitoring information. The Line Properties pane contains the following tabs:

- D.3.3.4.1 Line Config Tab, page D-59
- D.3.3.4.2 Line Thresh 15 Min Tab, page D-61
- D.3.3.4.3 Line Thresh 1 Day Tab, page D-62
- D.3.3.4.4 Physical Thresh 15 Min Tab, page D-63
- D.3.3.4.5 Physical Thresh 1 Day Tab, page D-63
- D.3.3.4.6 Section Thresh 15 Min Tab, page D-64
- D.3.3.4.7 Section Thresh 1 Day Tab, page D-64
- D.3.3.4.8 Alarm Thresholds Tab, page D-65

D.3.3.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the MRC25G-4 card.

Table D-87 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Port Rate	Sets the rate of the new port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Provide Sync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
BLSR Ext. Byte	Select an alternate BLSR byte.
Type	Defines the port.
AINS Soak (H:M)	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down (H:M)	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default) - 3 (OC3, per port) • 0 (default) - 12 (OC-12)

Table D-87 Field Descriptions for the Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

D.3.3.4.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end line thresholds of the MRC25G-4 card.

Table D-88 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.

Table D-88 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.
PSC	Protection switching count–line.
PSD	Protection switching duration–line.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Protection switching duration–span.
PSC-R	Protection switching count–ring.
PSD-R	Protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

D.3.3.4.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day near- and far-end line thresholds of the MRC25G-4 card.

Table D-89 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.
PSC	Protection switching count–line.
PSD	Protection switching duration–line.

Table D-89 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Protection switching duration–span.
PSC-R	Protection switching count–ring.
PSD-R	Protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds–line.
SES-L	Displays the severely errored seconds–line.
CV-L	Displays the coding violations–line.
UAS-L	Displays the unavailable seconds–line.
FC-L	Displays the failure count–line.

D.3.3.4.4 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change the 15-minute near-end physical thresholds of the MRC25G-4 card.

Table D-90 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.3.4.5 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change the 1-day near-end physical thresholds of the MRC25G-4 card.

Table D-91 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.3.4.6 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute near-end section thresholds of the MRC25G-4 card.

Table D-92 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations–section.
ES-S	Displays the errored seconds–section.
SES-S	Displays the severely errored seconds–section.
SEFS-S	Displays the severely errored framing seconds–section.

D.3.3.4.7 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day near-end section thresholds of the MRC25G-4 card.

Table D-93 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations–section.
ES-S	Displays the errored seconds–section.
SES-S	Displays the severely errored seconds–section.
SEFS-S	Displays the severely errored framing seconds–section.

D.3.3.4.8 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select the thresholds for the alarms.

Table D-94 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Port No.	Port number.
LBC-HIGH	Maximum laser bias current.
LBC-LOW	Minimum laser bias current.
OPT-HIGH	Maximum optical power transmitted.
OPT-LOW	Minimum optical power transmitted.
OPR-HIGH	Maximum optical power received.
OPR-LOW	Minimum optical power received.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.3.5 STS (ONS 15454 SONET)

The STS Properties pane allows you to view and update MRC25G-4 STS information. The STS Properties pane contains the following tabs:

- D.3.3.5.1 STS Config Tab, page D-65
- D.3.3.5.2 Path Thresh 15 Min Tab, page D-65
- D.3.3.5.3 Path Thresh 1 Day Tab, page D-66
- D.3.3.5.4 Customer Info Tab, page D-67

D.3.3.5.1 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the MRC25G-4 card.

Table D-95 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

D.3.3.5.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the MRC25G-4 card.

Table D-96 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
PJCS-Pdet	Displays positive pointer justification count, STS path detected.
PJCS-Pgen	Displays positive pointer justification count, STS path generated.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS No.	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.

D.3.3.5.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the MRC25G-4 card.

Table D-97 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.

Table D-97 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
PJCS-Pdet	Displays positive pointer justification count, STS path detected.
PJCS-Pgen	Displays positive pointer justification count, STS path generated.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS No.	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.

D.3.3.5.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-98 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.3.3.6 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table D-99 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

D.3.3.7 Protection

The Protection Properties pane allows you to view and update MRC25G-4 protection group information.

Table D-100 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.3.3.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table D-101 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.3.3.9 Transceiver

The Transceiver Properties pane allows you to view and update MRC25G-4 transceiver information.

Table D-102 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	PIM number, PPM number, or port number.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.3.3.10 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update MRC25G-4 ALS parameters.

Table D-103 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.3.3.11 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the MRC25G-4 card.

Table D-104 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

D.3.3.12 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table D-105 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS | VC-4 Number	Displays the STS or VC-4 number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

D.3.3.13 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the MRC25G-4 card.

Table D-106 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.3.4 Slot Properties—MRC25G-12

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MRC-2.5G-12 multirate card provides up to 12 OC-3/STM-1 ports, 4 OC-12/STM-4 ports, or 1 OC-48/STM-16 port using small form factor pluggables (SFPs), with total card bandwidth not exceeding OC-48/STM-16. Mixed OC-3 and OC-12 configurations are supported. OC-12/STM-4 SFPs can be installed only in ports 1, 4, 7, and 10, and an OC-48/STM-16 SFP can be installed only in port 1. All ports are Telcordia GR-253 compliant. The SFP optics can use SR, IR, LR, coarse wavelength division multiplexing (CWDM), and DWDM SFPs to support unrepeated spans.

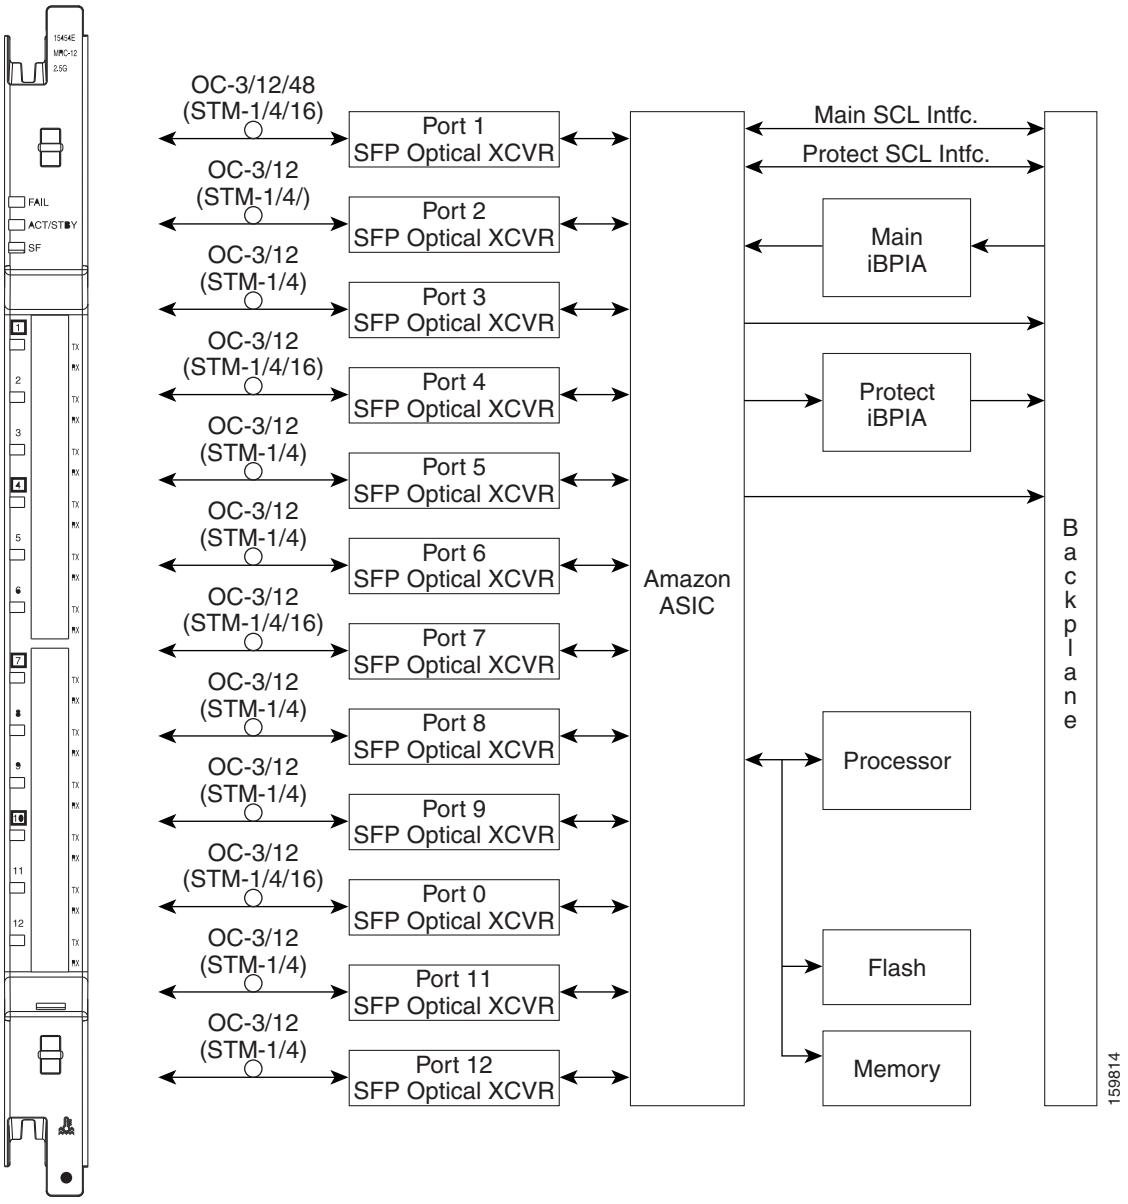
The ports operate at up to 2488.320 Mb/s over a single-mode fiber. The MRC-2.5G-12 card has 12 physical connector adapters with 2 fibers per connector adapter (Tx and Rx). The card supports VT payloads,VC4 payloads, and concatenated payloads at VC4-1c, VC4-2c, VC4-3c, VC4-4c, VC4-8c, VC4-12c, or VC4-16c signal levels. It is fully interoperable with the ONS 15454 SDH G-series Ethernet cards.

Each port contains a transmit and receive connector (labeled) on the card faceplate. The card supports unidirectional and bidirectional facility protection. It also supports both span and ring switching in MS-SPRing protection scheme. You can provision this card as part of an MS-SPRing, SNCP, or linear configuration.

Note Longer distances are possible in an amplified system using dispersion compensation.

The following figure shows the MRC-2.5G-12 faceplate and block diagram.

Figure D-2 MRC-2.5G-12 Module



For the MRC25G-12 card, the slot properties pane displays the following tabs: Module View, Identification, Pluggable Provisioning, Line, VC-4 (available only on the ONS 15454 SDH), Loopback, Protection, Alarm Behavior, Transceiver, Auto Laser Shutdown, Section Trace, J1 Path Trace, and Info. The tabs shown depend on the NE configuration.

D.3.4.1 Module View

The Module View Properties pane displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.3.4.2 Identification

The Identification Properties pane allows you to view and update MRC25G-12 card identification information.

Table D-107 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.3.4.3 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities; for example, pluggable port module (PPM) and the ports inside these entities.

Table D-108 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual pluggable I/O module that is installed in the pluggable slot.
Equipment State	Displays the equipment state of the card.
Admin State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Pluggable Ports	
Pluggable Number	Displays the identifier of the plugin module.
Rate	Displays the rate of the port inside the pluggable entity.

D.3.4.3.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. The Provision Pluggable dialog box allows you to provision pluggable entities—for example, the PPM and PIM—and to create the ports inside these entities. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

D.3.4.3.2 Create Port Dialog Box

Use the Create Port dialog box to configure the port rate for a particular pluggable port module (PPM). In the Port Rate field, use the drop-down list to select the new port rate and click **OK**.

D.3.4.4 Line

The Line Properties pane allows you to view and update optical line performance monitoring information. The Line Properties pane contains the following tabs:

- D.3.4.4.1 Line Config Tab, page D-74
- D.3.4.4.2 MS Thresh 15 Min Tab, page D-75
- D.3.4.4.3 MS Thresh 1 Day Tab, page D-76
- D.3.4.4.4 Physical Thresh 15 Min Tab, page D-77
- D.3.4.4.5 Physical Thresh 1 Day Tab, page D-77
- D.3.4.4.6 RS Thresh 15 Min Tab, page D-78

- D.3.4.4.7 RS Thresh 1 Day Tab, page D-78
- D.3.4.4.8 Alarm Thresholds Tab, page D-79

D.3.4.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the MRC25G-12 card.

Table D-109 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Port Rate	Sets the rate of the new port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Provide Sync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
BLSR Ext. Byte	Select an alternate BLSR byte.
Type	Defines the port.
AINS Soak (H:M)	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down (H:M)	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4

Table D-109 Field Descriptions for the Line Config Tab (continued)

Field	Description
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default) - 3 (OC3, per port) • 0 (default) - 12 (OC-12)
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

D.3.4.4.2 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end line thresholds of the MRC25G-12 card.

Table D-110 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
EB-MS	Displays the errored block–multiplex section.
BBE-MS	Displays the background block errors–multiplex section.
ES-MS	Displays the errored seconds–multiplex section.
SES-MS	Displays the severely errored seconds–multiplex section.
UAS-MS	Displays the unavailable seconds–multiplex section.
PSC	Displays the protection switching count.
PSD	Displays the protection switching duration.
PSC-W	Displays the protection switching count–working.
PSD-W	Displays the protection switching duration–working.
PSC-S	Displays the protection switching count–span.
PSD-S	Displays the protection switching duration–span.
PSC-R	Displays the protection switching count–ring.
PSD-R	Displays the protection switching duration–ring.
Far End	
Port Number	Displays the optical port number.
EB-MS	Displays the errored block–multiplex section.
BBE-MS	Displays the background block errors–multiplex section.
ES-MS	Displays the errored seconds–multiplex section.
SES-MS	Displays the severely errored seconds–multiplex section.
UAS-MS	Displays the unavailable seconds–multiplex section.

D.3.4.4.3 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day near- and far-end line thresholds of the MRC25G-12 card.

Table D-111 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number
EB-MS	Displays the errored block–multiplex section
BBE-MS	Displays the background block errors–multiplex section
ES-MS	Displays the errored seconds–multiplex section
SES-MS	Displays the severely errored seconds–multiplex section
UAS-MS	Displays the unavailable seconds–multiplex section

Table D-111 Field Descriptions for the MS Thresh 1 Day Tab (continued)

Field	Description
PSC	Displays the protection switching count
PSD	Displays the protection switching duration
PSC-W	Displays the protection switching count–working
PSD-W	Displays the protection switching duration–working
PSC-S	Displays the protection switching count–span
PSD-S	Displays the protection switching duration–span
PSC-R	Displays the protection switching count–ring
PSD-R	Displays the protection switching duration–ring
Far End	
Port Number	Displays the optical port number
EB-MS	Displays the errored block–multiplex section
BBE-MS	Displays the background block errors–multiplex section
ES-MS	Displays the errored seconds–multiplex section
SES-MS	Displays the severely errored seconds–multiplex section
UAS-MS	Displays the unavailable seconds–multiplex section

D.3.4.4.4 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change the 15-minute near-end physical thresholds of the MRC25G-12 card.

Table D-112 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.4.4.5 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change the 1-day near-end physical thresholds of the MRC25G-12 card.

Table D-113 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.4.4.6 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute near-end section thresholds of the MRC25G-12 card.

Table D-114 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number
EB-RS	Displays the errored block–regenerator section
BBE-RS	Displays the background block errors–regenerator section
ES-RS	Displays the errored seconds–regenerator section
SES-RS	Displays the severely errored seconds–regenerator section
UAS-RS	Displays the unavailable seconds–regenerator section
OFS-RS	Displays the out of framing seconds–regenerator section

D.3.4.4.7 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day near-end section thresholds of the MRC25G-12 card.

Table D-115 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number
EB-RS	Displays the errored block–regenerator section
BBE-RS	Displays the background block errors–regenerator section

Table D-115 Field Descriptions for the RS Thresh 1 Day Tab (continued)

Field	Description
ES-RS	Displays the errored seconds–regenerator section
SES-RS	Displays the severely errored seconds–regenerator section
UAS-RS	Displays the unavailable seconds–regenerator section
OFS-RS	Displays the out of framing seconds–regenerator section

D.3.4.4.8 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select the thresholds for the alarms.

Table D-116 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Port No.	Port number.
LBC-HIGH	Maximum laser bias current.
LBC-LOW	Minimum laser bias current.
OPT-HIGH	Maximum optical power transmitted.
OPT-LOW	Minimum optical power transmitted.
OPR-HIGH	Maximum optical power received.
OPR-LOW	Minimum optical power received.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.3.4.5 VC-4

The VC-4 Properties pane allows you to view and update MRC25G-12 VC-4 information. The VC-4 Properties pane contains the following tabs:

- D.3.4.5.1 VC-4 Config Tab, page D-79
- D.3.4.5.2 SDH Path Thresh 15 Min Tab, page D-80
- D.3.4.5.3 SDH Path Thresh 1 Day Tab, page D-80
- D.3.4.5.4 Customer Info Tab, page D-81

D.3.4.5.1 VC-4 Config Tab

The VC-4 Config tab allows you to view and change the VC-4 settings of the MRC25G-12 card.

Table D-117 Field Descriptions for the VC-4 Config Tab

Field	Description
VC Number	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.

D.3.4.5.2 SDH Path Thresh 15 Min Tab

The SDH Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the MRC25G-12 card.

Table D-118 Field Descriptions for the SDH Path Thresh 15 Min Tab

Field	Description
Near End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.
PPJC-Pdet	Positive pointer justification count, path detected (PPJC-Pdet) is a count of the positive pointer justifications detected on a particular path on an incoming SDH signal.
NPJC-Pdet	Negative pointer justification count, path detected (NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SDH signal.
PPJC-Pgen	Positive pointer justification count, path generated (PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path.
NPJC-Pgen	Negative pointer justification count, path generated (MS-NPJC-Pgen) is a count of the negative pointer justifications generated for a particular path.
PJCS-Pdet	Number of higher-order path pointer justification count seconds detected on a particular path.
PJCS-Pgen	Number of higher-order path pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.

D.3.4.5.3 SDH Path Thresh 1 Day Tab

The SDH Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the MRC25G-12 card.

Table D-119 Field Descriptions for the SDH Path Thresh 1 Day Tab

Field	Description
Near End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.
PPJC-Pdet	Positive pointer justification count, path detected (PPJC-Pdet) is a count of the positive pointer justifications detected on a particular path on an incoming SDH signal.
NPJC-Pdet	Negative pointer justification count, path detected (NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SDH signal.
PPJC-Pgen	Positive pointer justification count, path generated (PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path.
NPJC-Pgen	Negative pointer justification count, path generated (MS-NPJC-Pgen) is a count of the negative pointer justifications generated for a particular path.
PJCS-Pdet	Number of higher-order path pointer justification count seconds detected on a particular path.
PJCS-Pgen	Number of higher-order path pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
VC Number	Displays the VC-4 port number.
EB-HP	Errored block–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-HP	Unavailable seconds–higher-order path.
BBE-HP	Background block errors–higher-order path.

D.3.4.5.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-120 Field Descriptions for the Customer Info Tab

Field	Description
VC No.	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.3.4.6 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table D-121 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

D.3.4.7 Protection

The Protection Properties pane allows you to view and update MRC25G-12 protection group information.

Table D-122 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.3.4.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table D-123 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.

Table D-123 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.3.4.9 Transceiver

The Transceiver Properties pane allows you to view and update MRC25G-12 transceiver information.

Table D-124 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	PIM number, PPM number, or port number.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.3.4.10 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update MRC25G-12 ALS parameters.

Table D-125 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.3.4.11 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the MRC25G-12 card.

Table D-126 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.

Table D-126 Field Descriptions for the Section Trace Properties Pane

Field	Description
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

D.3.4.12 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table D-127 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS	VC-4 Number	Displays the STS or VC-4 number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

D.3.4.13 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the MRC25G-12 card.

Table D-128 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4 Optical Cards

This section describes the following optical cards supported within Prime Optical:

- D.4.1 Slot Properties—OC12 IR/STM4 SH 1310, page D-85
- D.4.2 Slot Properties—OC12-4 IR/STM4 SH 1310, page D-91

- D.4.3 Slot Properties—OC192 LR/STM64 LH 1550, page D-98
- D.4.4 Slot Properties—OC192/STM64 XFR-Based, page D-105
- D.4.5 Slot Properties—OC3 IR 4 1310, page D-121
- D.4.6 Slot Properties—OC3 IR/STM1 SH 1310-8, page D-127
- D.4.7 Slot Properties—OC48, page D-134
- D.4.8 Slot Properties—OC48 IR 1310, page D-141
- D.4.9 Slot Properties—OC48 LR 1550, page D-148
- D.4.10 Slot Properties—S1.1-2-LC (ONS 15305 CTC), page D-155
- D.4.11 Slot Properties—S1.1-8-LC (ONS 15305 CTC), page D-157
- D.4.12 Slot Properties—S16.1-1-LC (ONS 15305 CTC), page D-159
- D.4.13 Slot Properties—STM-1, page D-161
- D.4.14 Slot Properties—STM-1 S1.1-2-LC/E1-21 (ONS 15305 CTC), page D-166
- D.4.15 Slot Properties—STM-1E-12, page D-168
- D.4.16 Slot Properties—STM-16 (ONS 15454 SDH), page D-174
- D.4.17 Slot Properties—STM-16 (ONS 15600 SDH), page D-179
- D.4.18 Slot Properties—STM-4 IR/STM4 SH 1310, page D-186
- D.4.19 Slot Properties—STM-4 L4.2-2-LC (ONS 15305 CTC), page D-191
- D.4.20 Slot Properties—STM-16 L16.2-1-LC (ONS 15305 CTC), page D-193
- D.4.21 Slot Properties—STM-64 LH 1550 (ONS 15454 SDH), page D-196
- D.4.22 Slot Properties—STM-64 LR/LH 4 (ONS 15600 SDH), page D-201
- D.4.23 Slot Properties—STM-64_4_DWDM (ONS 15600 SDH), page D-208
- D.4.24 Slot Properties—OC192_4_DWDM (ONS 15600 SONET), page D-217

D.4.1 Slot Properties—OC12 IR/STM4 SH 1310

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 Optical Connector (OC12 IR/STM4 SH 1310) card provides one intermediate or short range SONET/SDH OC-12 port compliant with the International Telecommunication Union (ITU) G.707, ITU-T G.957, and Telcordia GR-253-CORE. The port operates at 622.08 Mb/s over a single-mode fiber span. The card supports VT and nonconcatenated or concatenated payloads at STS-1, STS-3c, STS-6c, or STS-12c signal levels.

For the OC12 IR/STM4 SH 1310 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, and Info.

D.4.1.1 Module View

The Module View Properties pane displays a graphic of the OC12 IR/STM4 SH 1310 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The

Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.1.2 Identification

The Identification Properties pane allows you to view and update OC12 IR/STM4 SH 1310 identification information.

Table D-129 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.1.3 Line

The Line Properties pane allows you to view and update OC12 IR/STM4 SH 1310 line performance monitoring information.

Table D-130 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.

Table D-130 Field Descriptions for the Line Properties Pane

Field	Description
Port Name	Allows you to enter the name of the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC-3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Line Threshold 15 Minutes	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count.

Table D-130 Field Descriptions for the Line Properties Pane

Field	Description
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Line Threshold 1 Day	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Section Threshold 15 Minutes	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Section Threshold 1 Day	

Table D-130 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.

D.4.1.4 STS

The STS Properties pane allows you to view and update OC12 IR/STM4 SH 1310 synchronous transport signal (STS) information.

Table D-131 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.

Table D-131 Field Descriptions for the STS Properties Pane

Field	Description
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.1.5 Loopback

The Loopback Properties pane allows you to view and update OC12 IR/STM4 SH 1310 loopback information.

Table D-132 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.1.6 Protection

The Protection Properties pane allows you to view and update OC12 IR/STM4 SH 1310 protection group information.

Table D-133 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.1.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC12 IR/STM4 SH 1310 alarm profile information.

Table D-134 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.1.8 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC12 IR/STM4 SH 1310 module.

Table D-135 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.2 Slot Properties—OC12-4 IR/STM4 SH 1310

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Optical Connector (OC12-4 IR/STM4 SH 1310) card provides one intermediate or short range SONET/SDH OC-12 port compliant with the International Telecommunication Union's G.707, G.957, and Telcordia's GR-253. The port operates at 622.08 Mb/s over a single-mode fiber span. The card supports VT and nonconcatenated or concatenated payloads at STS-1, STS-3c, STS-6c, or STS-12c signal levels.

For the OC12-4 IR/STM4 SH 1310 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, J1 Path Trace, and Info.

D.4.2.1 Module View

The Module View Properties pane displays a graphic of the OC12-4 IR/STM4 SH 1310 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms also display when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.2.2 Identification

The Identification Properties pane is where you view and update OC12-4 IR/STM4 SH 1310 identification information.

Table D-136 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number. This number is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number. This number is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.2.3 Line

The Line Properties pane is where you view and update OC12-4 IR/STM4 SH 1310 optical line performance monitoring information.

Table D-137 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Displays the port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default) - 3 (OC3, per port) • 0 (default) - 12 (OC-12) • 0 (default) - 48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	The port administration state. Choosing an administrative state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Admin states include: • IS—In Service. The port service state changes to IS_NR. • OOS,DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT admin state must be initiated. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4

Table D-137 Field Descriptions for the Line Properties Pane

Field	Description
Send <<FF> DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Line Threshold 15 Minutes > Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.

ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Protection switching duration–span.
Line Threshold 1 Day > Far End	
Port Number	The optical port number.

Table D-137 Field Descriptions for the Line Properties Pane

Field	Description
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Section Threshold 15 Minutes	
Port Number	Displays the optical port number.
CV-S	Coding violations.
ES-S	Errored seconds.
SES-S	Severely errored seconds.
SEFS-S	Severely errored framing seconds.
Section Threshold 1 Day	
Port Number	Displays the optical port number.
CV-S	Coding violations.
ES-S	Errored seconds.
SES-S	Severely errored seconds.
SEFS-S	Severely errored framing seconds.

D.4.2.4 STS

The STS Properties pane allows you to view and update OC12-4 IR/STM4 SH 1310 STS information.

Table D-138 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.

Table D-138 Field Descriptions for the STS Properties Pane

Field	Description
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.2.5 Loopback

The Loopback Properties pane allows you to view and update OC12-4 IR/STM4 SH 1310 loopback information.

Table D-139 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).

Table D-139 Field Descriptions for the Loopback Properties Pane

Field	Description
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.2.6 Protection

The Protection Properties pane allows you to view and update OC12-4 IR/STM4 SH 1310 protection group information.

Table D-140 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.2.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC12-4 IR/STM4 SH 1310 alarm profile information.

Table D-141 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.2.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update OC12-4 IR/STM4 SH 1310 J1 Path Trace information.

Note This property is not available on ONS 15327 OC12-4 IR/STM4 SH 1310 cards.

Table D-142 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.2.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC12-4 IR/STM4 SH 1310 module.

Table D-143 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.3 Slot Properties—OC192 LR/STM64 LH 1550

The slot properties pane displays information about the Cisco ONS 15454 SONET, ONS 15454 SDH, or ONS 15600 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC192 LR/STM64 LH 1550 card provides one long-range SONET/SDH OC-192 port compliant with the International Telecommunication Union (ITU-T) G.707, ITU-T G.957, Telcordia GR-1377-CORE, and Telcordia GR-253-CORE. The card port operates at 9.96 Gb/s over unamplified distances up to 80 km when using fiber such as C-SMF or dispersion compensated fiber limited by loss and/or dispersion. The card supports VT and nonconcatenated or concatenated payloads.

For the OC192 LR/STM64 LH 1550 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, and J1 Path Trace.

D.4.3.1 Module View

The Module View Properties pane displays a graphic of the OC192 LR/STM64 LH 1550 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.3.2 Identification

The Identification Properties pane allows you to view and update OC192 LR/STM64 LH 1550 identification information.

Table D-144 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.3.3 Line

The Line Properties pane allows you to view and update OC192 LR/STM64 LH 1550 optical line performance monitoring information.

Table D-145 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC-3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Line Threshold 15 Minutes	

Table D-145 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	The optical port number.
ES-L	Errored seconds–line.

Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.

D.4.3.4 STS

The STS Properties pane allows you to view and update OC192 LR/STM64 LH 1550 STS information.

Table D-146 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.

Table D-146 Field Descriptions for the STS Properties Pane

Field	Description
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.3.5 Loopback

The Loopback Properties pane allows you to view and update OC192 LR/STM64 LH 1550 loopback information.

Table D-147 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

D.4.3.6 Protection

The Protection Properties pane allows you to view and update OC192 LR/STM64 LH 1550 protection group information.

Table D-148 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.3.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC192 LR/STM64 LH 1550 alarm profile information.

Table D-149 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.3.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update OC192 LR/STM64 LH 1550 ALS parameters.

Table D-150 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.3.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update OC192 LR/STM64 LH 1550 J1 path trace information.

Table D-151 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.

Table D-151 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.4 Slot Properties—OC192/STM64 XFR-Based

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC-192/STM64 XFR-based card is an OC-192/STM-64 card based on XFP optics for use in ONS 15454 SONET or ONS 15454 SDH shelves. It is a one-base OC-192/STM-64 board that can be used with SR, IR, or LR XFP optics modules.

For the OC192/STM64 XFR-based module, the slot properties pane displays the following tabs: Module View, Identification, Pluggable Provisioning, Line, VC-4, STS, Loopback, Protection, Alarm Behavior, Transceiver, Auto Laser Shutdown, Section Trace, J1 Path Trace, and Info.

D.4.4.1 Module View

The Module View Properties pane displays a graphic of the OC192/STM64 XFR-based card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.4.2 Identification

The Identification Properties pane allows you to view and update OC192/STM64 XFR-based card identification information.

Table D-152 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.4.3 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities—for example, the pluggable port module (PPM) and the ports inside these entities.

Table D-153 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Pluggable Number	Displays the identifier of the plugin module and the port number.
Rate	Displays the rate of the port inside the pluggable entity.

D.4.4.3.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. The Provision Pluggable dialog box allows you to provision pluggable entities—for example, the PPM and PIM—and to create the ports inside these entities.

D.4.4.4 Line (ONS 15454 SONET)

The Line Properties pane allows you to view and update OC192/STM64 XFR-based card optical line performance monitoring information.

Table D-154 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
BLSR Ext. Byte	Select an alternate BLSR byte. Choices are Z2, E2, or F1.
Type	Defines the port as SONET or SDH.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.

Table D-154 Field Descriptions for the Line Properties Pane

Field	Description
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distances options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.
Line Thresh 15 Minutes	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.

Table D-154 Field Descriptions for the Line Properties Pane

Field	Description
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.

CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Physical Thresh 15 Minutes	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.
Physical Thresh 1 Day	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

Section Thresh 1 Day	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.

Table D-154 Field Descriptions for the Line Properties Pane

Field	Description
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Alarm Thresholds	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current.
LBC-LOW	Minimum laser bias current.
OPT-HIGH	Maximum optical power transmitted.
OPT-LOW	Minimum optical power transmitted.
OPR-HIGH	Maximum optical power received.
OPR-LOW	Minimum optical power received.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.4.4.5 Line (ONS 15454 SDH)

The Line Properties pane allows you to view and update OC192/STM64 XFR-based card optical line performance monitoring information.

Table D-155 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Port Rate	Sets the rate of the new port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
Type	Defines the port as SONET or SDH.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.

Table D-155 Field Descriptions for the Line Properties Pane

Field	Description
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
PJ VC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.

Table D-155 Field Descriptions for the Line Properties Pane

Field	Description
Reach	Allows you to provision the reach value. You can choose to automatically provision the PPM reach value on the hardware (Auto Provision) or one of the following reach distances: **Note** The reach distances that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.4.8 Loopback

The Loopback Properties pane allows you to view and update OC192/STM64 XFR-based card loopback information.

Table D-158 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

D.4.4.9 Protection

The Protection Properties pane allows you to view and update OC192/STM64 XFR-based card protection group information.

Table D-159 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.4.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC192/STM64 XFR-based card alarm profile information.

Table D-160 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.4.11 Transceiver

The Transceiver Properties pane allows you to view and update OC192/STM64 XFR-based card transceiver information.

Table D-161 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	The port number.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.4.4.12 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update OC192/STM64 XFR-based card ALS parameters.

Table D-162 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.4.13 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the OC192/STM64 XFR-based card.

Table D-163 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

D.4.4.14 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update OC192/STM64 XFR-based card J1 path trace information.

Table D-164 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

Table D-164 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.4.15 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC192/STM64 XFR-based card.

Table D-165 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.5 Slot Properties—OC3 IR 4 1310

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Optical Connector (OC3 IR 4/STM1 SH 1310) card provides four intermediate or short range SONET/SDH OC-3 ports compliant with the International Telecommunication Union (ITU-T) G.707, ITU-T G.957, and Telcordia GR-253-CORE. Each port operates at 155.52 Mb/s over a single-mode fiber span. The card supports VT and nonconcatenated or concatenated payloads at the STS-1 or STS-3c signal levels.

For the OC3 IR 4/STM1 SH 1310 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, J1 Path Trace, and Info.

D.4.5.1 Module View

The Module View Properties pane displays a graphic of the OC3 IR 4/STM1 SH 1310 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.5.2 Identification

The Identification Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 identification information.

Table D-166 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.5.3 Line

The Line Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 optical line performance monitoring information.

Table D-167 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.

Table D-167 Field Descriptions for the Line Properties Pane

Field	Description
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
Line Thresh 15 Minutes	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count—Near-end only.
PSD	Protection switching duration—Near-end only.

Table D-167 Field Descriptions for the Line Properties Pane

Field	Description
Line Thresh 1 Day	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count—Near-end only.
PSD	Protection switching duration—Near-end only.
Section Thresh 15 Minutes	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Section Thresh 1 Day	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.

D.4.5.4 STS

The STS Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 STS information.

Table D-168 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Thresh 15 Min	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.

Table D-168 Field Descriptions for the STS Properties Pane

Field	Description
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Thresh 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.5.5 Loopback

The Loopback Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 loopback information.

Table D-169 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.5.6 Protection

The Protection Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 protection group information.

Table D-170 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.5.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 alarm profile information.

Table D-171 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.5.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update OC3 IR 4/STM1 SH 1310 J1 path trace information.

Note This property is not available on ONS 15327 OC3 IR 4/STM1 SH 1310 cards.

Table D-172 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.5.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC3 IR 4/STM1 SH 1310 module.

Table D-173 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.6 Slot Properties—OC3 IR/STM1 SH 1310-8

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC3 IR/STM1 SH 1310-8 card provides eight intermediate or short range SONET/SDH OC-3 ports compliant with ITU-T G.707, ITU-T G.957, and Telcordia GR-253-CORE. Each port operates at 155.52 Mb/s over a single-mode fiber span. The card supports VT and nonconcatenated or concatenated payloads at the STS-1 or STS-3c signal levels.

For the OC3 IR/STM1 SH 1310-8 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, J1 Path Trace, and Info.

D.4.6.1 Module View

The Module View Properties pane displays a graphic of the OC3 IR/STM1 SH 1310-8 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.6.2 Identification

The Identification Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 identification information.

Table D-174 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.6.3 Line

The Line Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 optical line performance monitoring information.

Table D-175 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
ALS Mode	Allows you to select the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4

Table D-175 Field Descriptions for the Line Properties Pane

Field	Description
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
Line Thresh 15 Minutes	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count—Near-end only.
PSD	Protection switching duration—Near-end only.
Line Thresh 1 Day	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count—Near-end only.
PSD	Protection switching duration—Near-end only.
Section Thresh 15 Minutes	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Section Thresh 1 Day	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.

D.4.6.4 STS

The STS Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 STS information.

Table D-176 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Thresh 15 Min	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Thresh 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.

Table D-176 Field Descriptions for the STS Properties Pane

Field	Description
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.6.5 Loopback

The Loopback Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 loopback information.

Table D-177 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.6.6 Protection

The Protection Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 protection group information.

Table D-178 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.6.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 alarm profile information.

Table D-179 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.

Table D-179 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.6.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 ALS parameters.

Table D-180 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.6.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update OC3 IR/STM1 SH 1310-8 J1 path trace information.

Table D-181 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Table D-181 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.6.10 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC3 IR/STM1 SH 1310-8 module.

Table D-182 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.7 Slot Properties—OC48

The slot properties pane displays information about the Cisco ONS 15600 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

For the OC48 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Transceiver, Protection, Alarm Behavior, and J1 Path Trace.

D.4.7.1 Module View

The Module View Properties pane displays a graphic of the OC48 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).
Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.7.2 Identification

The Identification Properties pane allows you to view and update OC48 identification information.

Table D-183 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.7.3 Line

The Line Properties pane allows you to view and update OC48 optical line performance monitoring information.

Table D-184 Field Descriptions for the Line Properties Pane

Subfield	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.

Table D-184 Field Descriptions for the Line Properties Pane

Subfield	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Synchronization Status Message	Allows you to view the incoming synchronization status message. Values are: • PRS (Primary reference source Stratum 1) • STU (Sync traceability unknown) • ST2 (Stratum 2) • ST3 (Stratum 3) • ST3E (Stratum 3E) • SMC (SONET minimum clock) • ST4 (Stratum 4) • TNC (Transit node clock) • DUS (Do not use for timing synchronization) • RES (Reserved; quality level set by user)
BLSR Ext. Byte	Select an alternate BLSR byte. Choices are Z2, E2, or F1.
Type	Defines the port as SONET or SDH.
Section Thresh 15 Minutes	
Port Number	The optical port number.
CV-S	Coding violations–section.

ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Physical Thresh 15 Minutes	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.

Table D-184 Field Descriptions for the Line Properties Pane

Subfield	Description
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.
Physical Thresh 1 Day	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.4.7.4 STS

The STS Properties pane allows you to view and update OC48 STS information.

Table D-185 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, intermediate path protection monitoring (IPPM), and XC loopback status.	
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.

Table D-185 Field Descriptions for the STS Properties Pane

Field	Description
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
Customer Info	
VC Number	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.7.5 Loopback

The Loopback Properties pane allows you to view and update OC48 loopback information.

Table D-186 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current state of the port.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

D.4.7.6 Transceiver

The Transceiver Properties pane allows you to view and update OC48 transceiver information.

Table D-187 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	The port number.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.4.7.7 Protection

The Protection Properties pane allows you to view and update OC48 protection group information.

Table D-188 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.7.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC48 alarm profile information.

Table D-189 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the OC48 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.7.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view the OC48 J1 path trace information.

Table D-190 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.8 Slot Properties—OC48 IR 1310

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15454 Optical Connector (OC48 IR 1310) card provides one intermediate-range, Telcordia GR-253-CORE compliant SONET OC-48 port per card. Each port operates at 2.49 Gb/s over a single-mode fiber span. The card supports VT, nonconcatenated, or concatenated payloads at STS-1, STS-3c, STS-6c, STS-12c, or STS-48c signal levels.

For the OC48 IR 1310 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, and J1 Path Trace.

Note The OC48 any slot (AS) card supports J1 path trace, but the OC48 card does not.

D.4.8.1 Module View

The Module View Properties pane displays a graphic of the OC48 IR 1310 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.8.2 Identification

The Identification Properties pane allows you to view and update OC48 IR 1310 identification information.

Table D-191 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table D-191 Field Descriptions for the Identification Properties Pane

Field	Description
Administration State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.8.3 Line

The Line Properties pane allows you to view and update OC48 IR 1310 optical line performance monitoring information.

Table D-192 Field Descriptions for the Line Properties Pane

Subfield	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.

Table D-192 Field Descriptions for the Line Properties Pane

Subfield	Description
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
BLSR Ext. Byte	Select an alternate BLSR byte. Choices are Z2, E2, or F1.
Line Threshold 15 Minutes	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.

Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Section Threshold 1 Day	
Port Number	The optical port number.

Table D-192 Field Descriptions for the Line Properties Pane

Subfield	Description
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.

D.4.8.4 STS

The STS Properties pane allows you to view and update OC48 IR 1310 STS information.

Table D-193 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.

Table D-193 Field Descriptions for the STS Properties Pane

Field	Description
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.8.5 Loopback

The Loopback Properties pane allows you to view and update OC48 IR 1310 loopback information.

Table D-194 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

D.4.8.6 Protection

The Protection Properties pane allows you to view and update OC48 IR 1310 protection group information.

Table D-195 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.8.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC48 IR 1310 alarm profile information.

Table D-196 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.8.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update OC48 IR 1310 ALS parameters.

Table D-197 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.8.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update OC48 IR 1310 J1 path trace information.

Note

- This property is not available on ONS 15327 OC48 IR 1310 cards.
- The OC48_AS card supports J1 path trace, but the OC48 card does not.

Table D-198 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.

Table D-198 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.9 Slot Properties—OC48 LR 1550

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC48 LR 1550 card provides one long-range, SONET OC-48 port per card, compliant with Telcordia GR-253-CORE. Each port operates at 2.49 Gb/s over a single-mode fiber span. The card supports VT, nonconcatenated or concatenated payloads at STS-1, STS-3c, STS-6c, STS-12c, or STS-48c signal levels.

For the OC48 LR 1550 module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, and Info.

Note The OC48 any slot (AS) card supports J1 path trace, but the OC48 card does not.

D.4.9.1 Module View

The Module View Properties pane displays a graphic of the OC48 LR 1550 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.9.2 Identification

The Identification Properties pane allows you to view and update OC48 LR 1550 identification information.

Table D-199 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.9.3 Line

The Line Properties pane allows you to view and update OC48 LR 1550 line performance monitoring information.

Table D-200 Field Descriptions for the Line Properties Pane

Subfield	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
ProvidesSync	When checked, the card is provisioned as an NE timing reference.

Table D-200 Field Descriptions for the Line Properties Pane

Subfield	Description
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
BLSR Ext. Byte	Select an alternate BLSR byte. Choices are Z2, E2, or F1.
ALS Mode	Allows you to select the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Admin SSM	If the node does not receive an SSM signal, it defaults to STU (synchronization traceability unknown). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a special do not use (DUS) (0xff) message on the S1 byte.
Line Threshold 15 Minutes	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count—Near-end only.
PSD	Protection switching duration—Near-end only.
PSC-W	Protection switching count—working.
PSD-W	Protection switching duration—working.
PSC-S	Protection switching count—span.
PSD-S	Protection switching duration—span.

Table D-200 Field Descriptions for the Line Properties Pane

Subfield	Description
PSC-R	Protection switching count—ring.
PSD-R	Protection switching duration—ring.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.

PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Protection switching duration–span.
PSC-R	Protection switching count–ring.
PSD-R	Protection switching duration–ring.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Section Threshold 15 Minutes	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.

Table D-200 Field Descriptions for the Line Properties Pane

Subfield	Description
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Section Threshold 1 Day	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.

D.4.9.4 STS

The STS Properties pane allows you to view and update OC48 LR 1550 STS information.

Table D-201 Field Descriptions for the STS Properties Pane

Field	Description
STS Config	
Displays the STS number, the intermediate path protection monitoring (IPPM) status, and XC loopback status.	
Path Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Path Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations–path.
ES-P	Errored seconds–path.
SES-P	Severely errored seconds–path.

Table D-201 Field Descriptions for the STS Properties Pane

Field	Description
UAS-P	Unavailable seconds–path.
FC-P	Failure count–path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.9.5 Loopback

The Loopback Properties pane allows you to view and update OC48 LR 1550 loopback information.

Table D-202 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.9.6 Protection

The Protection Properties pane allows you to view and update OC48 LR 1550 protection group information.

Table D-203 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.9.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC48 LR 1550 alarm profile information.

Table D-204 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.9.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update OC48 LR 1550 ALS parameters.

Table D-205 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the ALS mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.9.9 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC48 LR 1550 module.

Table D-206 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

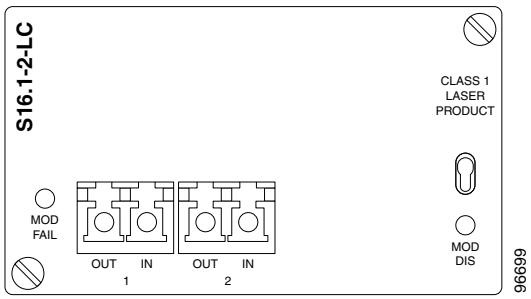
D.4.10 Slot Properties—S1.1-2-LC (ONS 15305 CTC)

The slot properties pane displays information about the Cisco ONS 15305 CTC slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The two optical STM-1 interfaces use a dual-fiber interface, an LC-style connector, one fiber in each direction, 1310 nm wavelength, and single-mode fiber of type 10/125 nm. The optical interfaces are compatible with ITU-T 957 for S-1.1.

The interface is an optical STM-1 short-haul interface, according to clause 5 ITU-T G.957. The definitions of optical parameters and reference points S and R refer to ITU-T G.957. Reference point S is the transmit direction; reference point R is the receive direction of the fiber. The following figure shows the module diagram.

Figure D-3 S1.1-2-LC Module



For the S1.1-2-LC module, the slot properties pane displays the following tabs: Module View, Identification, STM Line, VC-4 Config, and Loopback. The tabs shown depend on the NE configuration.

D.4.10.1 Module View

The Module View Properties pane displays a graphic of the S1.1-2-LC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.4.10.2 Identification

The Identification Properties pane allows you to view and update S1.1-2-LC identification information.

Table D-207 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Displays the alarm profile for the port.

D.4.10.3 STM Line

The STM Line Properties pane allows you to view and update S1.1-2-LC optical line performance monitoring information.

Table D-208 Field Descriptions for the STM Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Shows the administrative state of the port: In Service (IS), or Out of Service (OOS).

D.4.10.4 VC-4 Config

The VC-4 Config Properties pane allows you to view and update S1.1-2-LC VC-4 information.

Table D-209 Field Descriptions for the VC-4 Config Properties Pane

Field	Description
VC Number	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.

D.4.10.5 Loopback

The Loopback Properties pane allows you to view and update STM-1 loopback information.

Table D-210 Field Descriptions for the Loopback Properties Pane

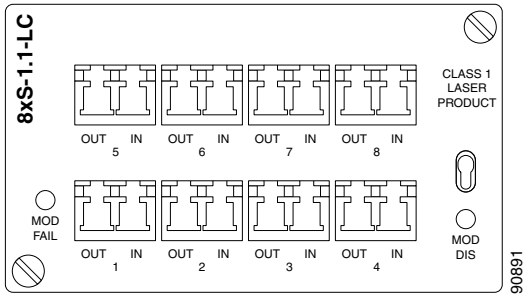
Field	Description
Port Number	Displays the port number.
Admin State	Shows the administrative state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.11 Slot Properties—S1.1-8-LC (ONS 15305 CTC)

The module contains eight optical STM-1 interfaces that meets the S-1.1 specification in ITU-T G.957. The physical connector is an LC connector. The module also contains eight mapper circuits and an IP switch, allowing concentration of IP traffic mapped into a VC-12 container. Because the mapper circuits are connected to the matrix, the mapper circuits are global resources and the traffic to be terminated may come from other modules in the system. The following figure shows the module diagram.

Figure D-4 Optical S-1.1 Module, S1.1-8-LC



For the S1.1-8-LC module, the slot properties pane displays the following tabs: Module View, Identification, STM Line, and WAN Line. The tabs shown depend on the NE configuration.

D.4.11.1 Module View

The Module View Properties pane displays a graphic of the S1.1-8-LC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.4.11.2 Identification

The Identification Properties pane allows you to view and update S1.1-8-LC identification information.

Table D-211 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Card Mode	Select the card mode.
Alarm Profile	Displays the alarm profile for the port.

D.4.11.3 STM Line

The STM Line Properties pane allows you to view and update S1.1-8-LC optical line performance monitoring information.

Table D-212 Field Descriptions for the STM Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Shows the administrative state of the port: In Service (IS), or Out of Service (OOS).

D.4.11.4 WAN Line

The WAN Line Properties pane allows you to view and configure wide-area network (WAN) line information.

Table D-213 Field Descriptions for the WAN Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Link State	Displays the physical port state. Values are Up, Down, or Not Present.

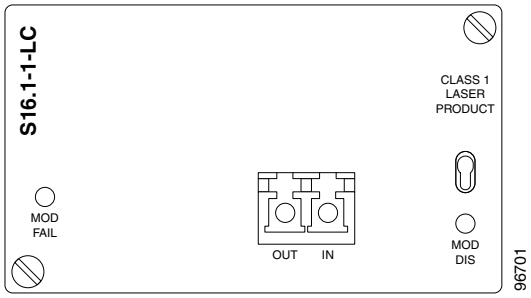
Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.12 Slot Properties—S16.1-1-LC (ONS 15305 CTC)

The S16.1-1-LC module contains one optical STM-16 interfaces that meets the S-16.1 specification in ITU-T G.957. The physical connector is an LC connector. The module only supports TDM traffic.

The slot properties pane displays information about the Cisco ONS 15305 CTC slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties. The following figure shows the module diagram.

Figure D-5 Single Optical S-16.1 Module, S16.1-1-LC



For the S16.1-1-LC module, the slot properties pane displays the following tabs: Module View, Identification, STM Line, VC-4 Config, and Loopback.

D.4.12.1 Module View

The Module View Properties pane displays a graphic of the S16.1-1-LC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.12.2 Identification

The Identification Properties pane allows you to view and update S16.1-1-LC identification information.

Table D-214 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Displays the alarm profile for the port.

D.4.12.3 STM Line

The STM Line Properties pane allows you to view and update S16.1-1-LC optical line performance monitoring information.

Table D-215 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Shows the administrative state of the port: In Service (IS), or Out of Service (OOS).

D.4.12.4 VC-4 Config

The VC-4 Config Properties pane allows you to view and update S16.1-1-LC information.

Table D-216 Field Descriptions for the VC-4 Config Properties Pane

Field	Description
VC Number	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.

D.4.12.5 Loopback

The Loopback Properties pane allows you to view and update S16.1-1-LC loopback information.

Table D-217 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.13 Slot Properties—STM-1

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The STM-1 IR 4/STM1 SH 1310 (STM1_4 and STM1_8) card provides four or eight intermediate or short range, ITU-T G.707-, ITU-T G.957-compliant, SDH STM-1 ports. Each port operates at 155.52 Mb/s over a single-mode fiber span. The card supports concatenated or nonconcatenated payloads at the STM-1 signal level on a per-VC-4 basis.

For the STM-1 module, the slot properties pane displays the following tabs: Module View, Identification, Line, VC-4, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, and J1 Path Trace. The tabs shown depend on the NE configuration.

D.4.13.1 Module View

The Module View Properties pane displays a graphic of the STM-1 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.4.13.2 Identification

The Identification Properties pane allows you to view and update STM-1 identification information.

Table D-218 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.13.3 Line

The Line Properties pane allows you to view and update STM-1 optical line performance monitoring information.

Table D-219 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port.
PJVC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.

Table D-219 Field Descriptions for the Line Properties Pane

Field	Description
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
RS Threshold 15 Minutes	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
RS Threshold 1 Day	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
MS Threshold 15 Minutes	
Port Number	The port number.
EB-MS	Errored block.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.

Table D-219 Field Descriptions for the Line Properties Pane

Field	Description
PSD	Protection switching duration.
MS Threshold 1 Day	
Port Number	The port number.
EB-MS	Errored block.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.

D.4.13.4 VC-4

The VC-4 Properties pane allows you to view and update STM-1 VC-4 information.

Table D-220 Field Descriptions for the VC-4 Properties Pane

Field	Description
VC-4	
Displays the VC-4 number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status. The XC Loopback field only appears on ONS 15454 SDH Release 4.0.	
Threshold 15 Minutes	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Threshold 1 Day	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.

Table D-220 Field Descriptions for the VC-4 Properties Pane

Field	Description
UAS-P	Unavailable seconds–higher-order path.
Customer Info	
VC Number	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.13.5 Loopback

The Loopback Properties pane allows you to view and update STM-1 loopback information.

Table D-221 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

D.4.13.6 Protection

The Protection Properties pane allows you to view and update STM-1 protection group information.

Table D-222 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.13.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-1 alarm profile information.

Table D-223 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.13.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update ALS parameters.

Table D-224 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.13.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table D-225 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

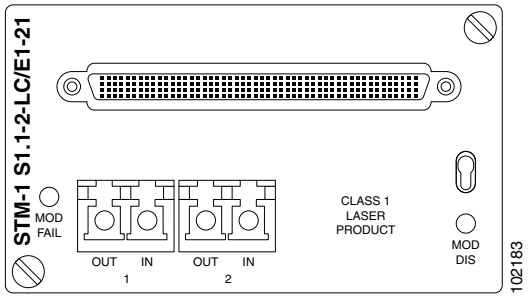
D.4.14 Slot Properties—STM-1 S1.1-2-LC/E1-21 (ONS 15305 CTC)

The slot properties pane displays information about the Cisco ONS 15305 CTC slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The module contains two optical STM-1 short-haul interfaces and 21 E1 interfaces. The main functions of the module are O/E- E/O conversion and SDH multi/demultiplexing with VC-12, VC-3 and VC-4 granularity of the STM-1 traffic and VC-12 mapping/demapping demultiplexing of the E1 traffic. The module supports both transparent E1 data transmission according to ITU-T Rec. G.703 as well as the NT

functionality of ISDN PRA according to ETSI 300 233. One high-density LFH type connector is used to interface the 21 E1s, and a dual-fiber LC connector (one fiber in each direction) is used on the two STM1 interfaces. The following figure shows the module diagram.

Figure D-6 STM-1 S1.1-2-LC/E1-21 Module



For the S1.1-2-LC/E1-21 module, the slot properties pane displays the following tabs: Module View, Identification, STM Line, and E1 Line. The tabs shown depend on the NE configuration.

D.4.14.1 Module View

The Module View Properties pane displays a graphic of the S1.1-2-LC/E1-21 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.4.14.2 Identification

The Identification Properties pane allows you to view and update S1.1-2-LC/E1-21 identification information.

Table D-226 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.

Table D-226 Field Descriptions for the Identification Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	When checked, all alarms are suppressed for the port.

D.4.14.3 STM Line

The STM Line Properties pane allows you to view and update S1.1-2-LC/E1-21 optical line performance monitoring information.

Table D-227 Field Descriptions for the STM Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Shows the administrative state of the port: In Service (IS), or Out of Service (OOS).

D.4.14.4 E1 Line

The E1 Line Properties pane allows you to view and update S1.1-2-LC/E1-21 optical line performance monitoring information.

Table D-228 Field Descriptions for the E1 Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1 transmission coding type.
Admin State	Shows the administrative state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).

D.4.15 Slot Properties—STM-1E-12

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The twelve-port ONS 15454 SDH STM-1E-12 card provides twelve ITU-compliant, G.703 STM-1 ports per card. For release 5.0 NEs and earlier, ports 9 to 12 can be switched to E-4 instead of STM-1. Each interface operates at 155.52 Mb/s for STM-1 or 139.264 Mb/s for E-4 over a 75-ohm coaxial cable (with the FMEC STM1E NP card, the FMEC STM1E 1:1 card, or the FMEC STM1E 1:3 card). In E-4 mode, framed or unframed signal operation is possible. The STM1E-12 card operates as a working or protect card in 1:1 and in 1:3 protection schemes.

Note For release 6.0 NEs, E-4 provisioning is not supported; all ports 1 to 12 are STM-1.

For the STM-1E-12 module, the slot properties pane displays the following tabs: Module View, Identification, Line, VC-4, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

D.4.15.1 Module View

The Module View Properties pane displays a graphic of the STM1E-12 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.15.2 Identification

The Identification Properties pane allows you to view and update STM-1E-12 identification information.

Table D-229 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.15.3 Line

The Line Properties pane allows you to view and update STM-1E-12 line performance monitoring information.

Table D-230 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port.
PJVC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
Port	
Port Number	Displays the port number. **Note** The Port property and fields apply only to release 5.0 and earlier NEs. This functionality does not apply to release 6.0 NEs.
Interface	Displays the SDH interface. **Note** The Port property and fields apply only to release 5.0 and earlier NEs. This functionality does not apply to release 6.0 NEs.
RS Threshold 15 Minutes	
Port Number	The port number.
ES-RS	Errored seconds–regenerator section.
SEFS-RS	Severely errored framing seconds–regenerator section.
EB-RS	Errored blocks–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
BBE-RS (FE)	Background block errors–regenerator section.

Table D-230 Field Descriptions for the Line Properties Pane

Field	Description
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
RS Threshold 1 Day	
Port Number	The port number.
ES-RS	Errored seconds–regenerator section.
SEFS-RS	Severely errored framing seconds–regenerator section.
EB-RS	Errored blocks–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
BBE-RS (FE)	Background block errors–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
MS Threshold 15 Minutes	
Port Number	The port number.
EB-MS (FE)	Errored blocks.
BBE-MS	Background block errors.
ES-MS (FE)	Errored seconds.
SES-MS (FE)	Severely errored seconds.
UAS-MS (FE)	Unavailable seconds.
MS Threshold 1 Day	
Port Number	The port number.
EB-MS (FE)	Errored blocks.
BBE-MS	Background block errors.
ES-MS (FE)	Errored seconds.
SES-MS (FE)	Severely errored seconds.
UAS-MS (FE)	Unavailable seconds.

D.4.15.4 VC-4

The VC-4 Properties pane allows you to view and update STM-1E-12 VC-4 information.

Table D-231 Field Descriptions for the VC-4 Properties Pane

Field	Description
VC-4	
Displays the VC-4 number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status.	
Threshold 15 Minutes	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.

Table D-231 Field Descriptions for the VC-4 Properties Pane

Field	Description
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Threshold 1 Day	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Customer Info	
VC Number	The VC number.
Customer ID	Displays the customer ID.
Service ID	Displays the service ID.
J1 Path Trace Table	
Displays the circuit J1 path trace information. Select a path trace and click **Modify** to open the J1 Path Trace window.	
Port Number	The port number.
STS Number	The STS number.
Expected String	The current expected string.
Received String	The current received string.
Mode	The path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatched	Indicates whether there is a mismatch in the C2 byte received.

D.4.15.5 Loopback

The Loopback Properties pane allows you to view and update STM-1E-12 loopback information.

Table D-232 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

D.4.15.6 Protection

The Protection Properties pane allows you to view and update STM-1E-12 protection group information.

Table D-233 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.15.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-1E-12 alarm profile information.

Table D-234 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.15.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-1E-12 J1 path trace information.

Table D-235 Slot Properties for the J1 Path Trace

Field	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.16 Slot Properties—STM-16 (ONS 15454 SDH)

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC48 IR/STM16 SH AS 1310 card provides one intermediate-range, ITU-T G.707, ITU-T G.957-compliant, SDH STM-16 port per card. The interface operates at 2.488 Gb/s over a single-mode fiber span. The card supports concatenated or nonconcatenated payloads at STM-1, STM-4, or STM-16 signal levels on a per-VC-4 basis.

For the STM-16 module, the slot properties pane displays the following tabs: Module View, Identification, Line, VC-4, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, and J1 Path Trace.

D.4.16.1 Module View

The Module View Properties pane displays a graphic of the STM-16 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.16.2 Identification

The Identification Properties pane allows you to view and update STM-16 identification information.

Table D-236 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table D-236 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.16.3 Line

The Line Properties pane allows you to view and update STM-16 line performance monitoring information.

Table D-237 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port.
PJVC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
RS Threshold 15 Minutes	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.

Table D-237 Field Descriptions for the Line Properties Pane

Field	Description
OFS-RS	Out of framing seconds–regenerator section.
RS Threshold 1 Day	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
MS Threshold 15 Minutes	
Port Number	The port number.
EB-MS	Errored block.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.
MS Threshold 1 Day	
Port Number	The port number.
EB-MS	Errored block.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.

D.4.16.4 VC-4

The VC-4 Properties pane allows you to view and update STM-16 VC-4 information.

Table D-238 Field Descriptions for the VC-4 Properties Pane

Field	Description
VC-4	
Displays the VC-4 number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status.	
Threshold 15 Minutes	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Threshold 1 Day	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Customer Info	
VC Number	The VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.16.5 Loopback

The Loopback Properties pane allows you to view and update STM-16 loopback information.

Table D-239 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

D.4.16.6 Protection

The Protection Properties pane allows you to view and update STM-16 protection group information.

Table D-240 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.16.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-16 alarm profile information.

Table D-241 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.16.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update ALS parameters.

Table D-242 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.16.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-16 J1 path trace information.

Table D-243 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.17 Slot Properties—STM-16 (ONS 15600 SDH)

The slot properties pane displays information about the Cisco ONS 15600 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The STM-16 card provides 16 long-haul STM-16 ITU-T G.957 L-16.2 compliant signals. The ports operate at the ITU-T G.707 compliant 2488.32 Mb/s rate over a single-mode fiber span. The card has four physical connector adapters with eight fibers per connector adapter. The card VC4 payloads and concatenated payloads at VC4, VC4-4c, VC4-8c, or VC4-16c signal levels.

For the STM-16 module, the slot properties pane displays the following tabs: Module View, Identification, Line, VC4, Loopback, Transceiver, Protection, Alarm Behavior, J1 Path Trace, and Section Trace.

D.4.17.1 Module View

The Module View Properties pane displays a graphic of the STM16 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.17.2 Identification

The Identification Properties pane allows you to view and update STM-16 identification information.

Table D-244 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.17.3 Line

The Line Properties pane allows you to view and update STM-16 line performance monitoring information.

Table D-245 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Synchronization Status Message	SDH protocol that communicates information about the quality of the timing source.

Table D-245 Field Descriptions for the Line Properties Pane

Field	Description
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
Type	Defines the port.
MS Thresh 15 Min (Near End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
MS Thresh 15 Min (Far End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
MS Thresh 1 Day (Near End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
MS Thresh 15 Min (Far End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.

Table D-245 Field Descriptions for the Line Properties Pane

Field	Description
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
RS Thresh 15 Min (Near End)	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
RS Thresh 1 Day (Near End)	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
Physical Thresh 15 Min	
Port Number	Port number.
LBC-HIGH	High laser bias current threshold.
LBC-LOW	Low laser bias current threshold.
OPT-HIGH	High optical power transmitted threshold.
OPT-LOW	Low optical power transmitted threshold.
OPR-HIGH	High optical power received threshold.
OPR-LOW	Low optical power received threshold.
SET-OPR	Sets the optical power received (OPR).
Physical Thresh 1 Day	
Port Number	Port number.
LBC-HIGH	High laser bias current threshold.
LBC-LOW	Low laser bias current threshold.
OPT-HIGH	High optical power transmitted threshold.
OPT-LOW	Low optical power transmitted threshold.
OPR-HIGH	High optical power received threshold.
OPR-LOW	Low optical power received threshold.
SET-OPR	Sets the OPR.

D.4.17.4 VC4

The VC4 Properties pane allows you to view and update STM-16 VC4 information.

Table D-246 Field Descriptions for the VC4 Properties Pane

Field	Description
VC4 Config	
VC Number	Displays the VC number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.
Path Thresh 15 Min (Near End)	
VC Number	Displays the VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
PPJC-Pdet	Positive pointer justification count-VC4 path detected.
NPJC-Pdet	Negative pointer justification count-VC4 path detected.
PPJC-Pgen	Positive pointer justification count-VC4 path generated.
NPJC-Pgen	Negative pointer justification count-VC4 path generated.
Path Thresh 15 Min (Far End)	
VC Number	Displays the VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Path Thresh 1 Day (Near End)	
VC Number	Displays the VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
PPJC-Pdet	Positive pointer justification count-VC4 path detected.
NPJC-Pdet	Negative pointer justification count-VC4 path detected.
PPJC-Pgen	Positive pointer justification count-VC4 path generated.
NPJC-Pgen	Negative pointer justification count-VC4 path generated.
Path Thresh 1 Day (Far End)	
VC Number	Displays the VC number.

Table D-246 Field Descriptions for the VC4 Properties Pane

Field	Description
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Customer Info	
VC Number	Displays the VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.17.5 Loopback

The Loopback Properties pane allows you to view and update STM-16 loopback information.

Table D-247 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Shows the administrative state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.17.6 Transceiver

The Transceiver Properties pane allows you to view and update STM-16 transceiver information.

Table D-248 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No	Port number 1–14.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.4.17.7 Protection

The Protection Properties pane allows you to view and update STM-16 protection group information.

Table D-249 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.17.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-16 alarm profile information.

Table D-250 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.17.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-16 J1 path trace information.

Table D-251 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.17.10 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the STM-16 card.

Table D-252 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.18 Slot Properties—STM-4 IR/STM4 SH 1310

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The STM-4 IR/STM4 SH 1310 (STM4_1 and STM4_4) card provides one or four intermediate or short range, ITU-T G.707, ITU-T G.957-compliant, SDH STM-4 ports per card. The interface operates at 622.08 Mb/s over a single-mode fiber span. The card supports concatenated or nonconcatenated payloads on a per-VC-4 basis.

For the STM-4 IR/STM4 SH 1310 card, the slot properties pane displays the following tabs: Module View, Identification, Line, VC-4, Loopback, Protection, Alarm Behavior, and J1 Path Trace.

D.4.18.1 Module View

The Module View Properties pane displays a graphic of the STM-4 IR/STM4 SH 1310 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.4.18.2 Identification

The Identification Properties pane allows you to view and update STM-4 IR/STM4 SH 1310 identification information.

Table D-253 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.18.3 Line

The Line Properties pane allows you to view and update STM-4 IR/STM4 SH 1310 line performance monitoring information.

Table D-254 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port.
PJVC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table D-254 Field Descriptions for the Line Properties Pane

Field	Description
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
RS Threshold 15 Minutes	
Port Number	The port number.
EB-RS	Errored blocks–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
RS Threshold 1 Day	
Port Number	The port number.
EB-RS	Errored blocks–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
MS Threshold 15 Minutes	
Port Number	The port number.
EB-MS	Errored blocks.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.
PSC-W	Protection switching count—working.
PSD-W	Protection switching duration—working.
MS Threshold 1 Day	

Table D-254 Field Descriptions for the Line Properties Pane

Field	Description
Port Number	The port number.
EB-MS	Errored blocks.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.
PSC-W	Protection switching count—working.
PSD-W	Protection switching duration—working.

D.4.18.4 VC-4

The VC-4 Properties pane allows you to view and update STM-4 IR/STM4 SH 1310 VC-4 information.

Table D-255 Field Descriptions for the VC-4 Properties Pane

Field	Description
VC-4	
Displays the VC-4 number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status.	
Threshold 15 Minutes	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Threshold 1 Day	
VC Number	The VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.

Table D-255 Field Descriptions for the VC-4 Properties Pane

Field	Description
Customer Info	
VC Number	The VC number.
Customer ID	Displays the customer ID.
Service ID	Displays the service ID.

D.4.18.5 Loopback

The Loopback Properties pane allows you to view and update STM-4 IR/STM4 SH 1310 loopback information.

Table D-256 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

D.4.18.6 Protection

The Protection Properties pane allows you to view and update STM-4 IR/STM4 SH 1310 protection group information.

Table D-257 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.18.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-4 IR/STM4 SH 1310 alarm profile information.

Table D-258 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Parent Profile	Choose a global alarm profile for the card from the drop-down list.
Port Number	Displays the STM-4 port number.
Alarm Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.18.8 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-4 IR/STM4 SH 1310 J1 path trace information.

Table D-259 Field Descriptions for the J1 Path Trace Properties Pane

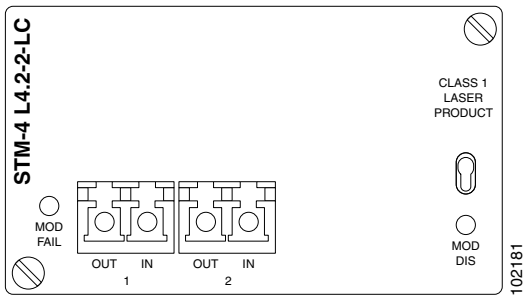
Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.19 Slot Properties—STM-4 L4.2-2-LC (ONS 15305 CTC)

The STM-4 L4.2-2-LC card is a dual-port STM-4 module for long-haul transmission at 1550 nm optical wavelengths. The main functions of the module are O/E-E/O conversion and SDH multi/demultiplexing with VC-12, VC-3, and VC-4 granularity. The following figure shows the module diagram.

Figure D-7 STM-4 L4.2-2-LC Module



For the L4.2-2-LC module, the slot properties pane displays the following tabs: Module View, Identification, STM Line, VC-4 Config, and Loopback. The tabs shown depend on the NE configuration.

D.4.19.1 Module View

The Module View Properties pane displays a graphic of the L4.2-2-LC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

D.4.19.2 Identification

The Identification Properties pane allows you to view and update L4.2-2-LC identification information.

Table D-260 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Displays the alarm profile for the port.

D.4.19.3 STM Line

The STM Line Properties pane allows you to view and update L4.2-2-LC optical line performance monitoring information.

Table D-261 Field Descriptions for the STM Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.

Table D-261 Field Descriptions for the STM Line Properties Pane

Field	Description
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Shows the administrative state of the port: In Service (IS) or Out of Service (OOS).

D.4.19.4 VC-4 Config

The VC-4 Config Properties pane allows you to view and update L4.2-2-LC VC-4 information.

Table D-262 Field Descriptions for the VC-4 Config Properties Pane

Field	Description
VC Number	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.

D.4.19.5 Loopback

The Loopback Properties pane allows you to view and update L4.2-2-LC loopback information.

Table D-263 Field Descriptions for the Loopback Properties Pane

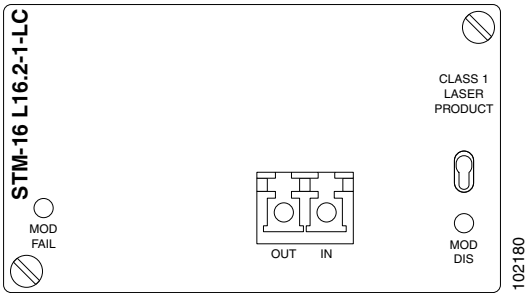
Field	Description
Port Number	Displays the port number.
Admin State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.20 Slot Properties—STM-16 L16.2-1-LC (ONS 15305 CTC)

The STM-16 L16.2-1-LC card is an STM-16 long-haul module for transmission at 1550 nm optical wavelengths. The main functions of the module are O/E- E/O conversion and SDH multi/demultiplexing with VC-12, VC-3, and VC-4 granularity. The following figure shows the module diagram.

Figure D-8 STM-16 L16.2-1-LC Module



For the L16.2-1-LC module, the slot properties pane displays the following tabs: Module View, Identification, STM Line, VC-4 Config, and Loopback. The tabs shown depend on the NE configuration.

D.4.20.1 Module View

The Module View Properties pane displays a graphic of the L16.2-1-LC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

D.4.20.2 Identification

The Identification Properties pane allows you to view and update L16.2-1-LC identification information.

Table D-264 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Displays the alarm profile for the port.

D.4.20.3 STM Line

The STM Line Properties pane allows you to view and update L16.2-1-LC optical line performance monitoring information.

Table D-265 Field Descriptions for the STM Line Properties Pane

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Shows the administrative state of the port: In Service (IS) or Out of Service (OOS).

D.4.20.4 VC-4 Config

The VC-4 Config Properties pane allows you to view and update L16.2-1-LC VC-4 configuration information.

Table D-266 Field Descriptions for the VC-4 Config Properties Pane

Field	Description
VC Number	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Indicates cross-connect loopback.

D.4.20.5 Loopback

The Loopback Properties pane allows you to view and update L16.2-1-LC loopback information.

Table D-267 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.21 Slot Properties—STM-64 LH 1550 (ONS 15454 SDH)

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The STM-64 LH 1550 card provides one long-range SONET/SDH STM64 port compliant with the International Telecommunication Union (ITU-T) G.707, ITU-T G.957, Telcordia GR-1377-CORE, and Telcordia GR-253-CORE. The card port operates at 9.96 Gb/s over unamplified distances up to 80 km when using fiber such as C-SMF or dispersion compensated fiber limited by loss and/or dispersion. The card supports VT and nonconcatenated or concatenated payloads.

For the STM-64 LH 1550 module, the slot properties pane displays the following tabs: Module View, Identification, Line, VC-4, Loopback, Protection, Alarm Behavior, Auto Laser Shutdown, and J1 Path Trace.

D.4.21.1 Module View

The Module View Properties pane displays a graphic of the STM-64 LH 1550 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

D.4.21.2 Identification

The Identification Properties pane allows you to view and update STM-64 LH 1550 identification information.

Table D-268 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.21.3 Line

The Line Properties pane allows you to view and update STM-64 LH 1550 line performance monitoring information.

Table D-269 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port.
PJVC-4 Mon#	Sets the VC that will be used for pointer justification. If set to 0, no VC is monitored. Only one VC can be monitored on each STM port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
RS Threshold 15 Minutes	
Port Number	The port number.
EB-RS	Errored blocks–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
RS Threshold 1 Day	
Port Number	The port number.
EB-RS	Errored blocks–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.

Table D-269 Field Descriptions for the Line Properties Pane

Field	Description
SES-RS	Severely errored seconds–regenerator section.
UAS-RS	Unavailable seconds–regenerator section.
OFS-RS	Out of framing seconds–regenerator section.
MS Threshold 15 Minutes	
Port Number	The port number.
EB-MS	Errored blocks.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.
MS Threshold 1 Day	
Port Number	The port number.
EB-MS	Errored blocks.
BBE-MS	Background block errors.
ES-MS	Errored seconds.
SES-MS	Severely errored seconds.
UAS-MS	Unavailable seconds.
PPJC-PDET	Positive pointer justification count, path detected.
NPJC-PDET	Negative pointer justification count, path detected.
PPJC-PGEN	Positive pointer justification count, path generated.
NPJC-PGEN	Negative pointer justification count, path generated.
PSC	Protection switching counts.
PSD	Protection switching duration.

D.4.21.4 VC-4

The VC-4 Properties pane allows you to view and update STM-64 LH 1550 VC-4 information.

Table D-270 Field Descriptions for the VC-4 Properties Pane

Field	Description
VC-4	
Displays the VC-4 number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status. The XC Loopback field only appears on the ONS 15454 SDH R4.0.	
Path Threshold 15 Minutes	
VC Number	The VC number.
EB-HP	Errored blocks–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Path Threshold 1 Day	
VC Number	The VC number.
EB-HP	Errored blocks–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.

D.4.21.5 Loopback

The Loopback Properties pane allows you to view and update STM-64 LH 1550 loopback information.

Table D-271 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
State	Displays the current loopback state.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

D.4.21.6 Protection

The Protection Properties pane allows you to view and update STM-64 LH 1550 protection group information.

Table D-272 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.21.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-64 LH 1550 alarm profile information.

Table D-273 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.21.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update STM-64 LH 1550 ALS parameters.

Table D-274 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shutdown or Not Shutdown.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shutdown.

D.4.21.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-64 LH 1550 J1 path trace information.

Table D-275 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.22 Slot Properties—STM-64 LR/LH 4 (ONS 15600 SDH)

The slot properties pane displays information about the Cisco ONS 15600 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The STM-64 LR/LH 4 port 1550 card provides 4 long-haul STM-64 ITU-T G.9691 L-64.2c compliant signals. The ports operate at the ITU-T G.707 compliant 9953.28 Mb/s rate over a single-mode fiber span. The card has four physical connector adapters with 2 fibers per connector adapter. The card VC4 payloads and concatenated payloads at VC4, VC4-4c, VC4-8c, VC4-16c, or VC-64c signal levels.

For the STM-64 LR/LH 4 module, the slot properties pane displays the following tabs: Module View, Identification, Line, VC4, Loopback, Transceiver, Protection, Alarm Behavior, J1 Path Trace, and Section Trace.

D.4.22.1 Module View

The Module View Properties pane displays a graphic of the STM-64 LR/LH 4 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.22.2 Identification

The Identification Properties pane allows you to view and update STM-64 LR/LH 4 identification information.

Table D-276 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.22.3 Line

The Line Properties pane allows you to view and update STM-64 LR/LH 4 line performance monitoring information.

Table D-277 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.

Table D-277 Field Descriptions for the Line Properties Pane

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Synchronization Status Message	SDH protocol that communicates information about the quality of the timing source.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
Type	Defines the port.
MS Thresh 15 Min (Near End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
MS Thresh 15 Min (Far End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
MS Thresh 1 Day (Near End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
MS Thresh 15 Min (Far End)	
Port Number	The port number.

Table D-277 Field Descriptions for the Line Properties Pane

Field	Description
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
RS Thresh 15 Min (Near End)	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
RS Thresh 1 Day (Near End)	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
Physical Thresh 15 Min	
Port Number	Port number.
LBC-HIGH	High laser bias current threshold.
LBC-LOW	Low laser bias current threshold.
OPT-HIGH	High optical power transmitted threshold.
OPT-LOW	Low optical power transmitted threshold.
OPR-HIGH	High optical power received threshold.
OPR-LOW	Low optical power received threshold.
SET-OPR	Sets the optical power received (OPR).
Physical Thresh 1 Day	
Port Number	Port number.
LBC-HIGH	High laser bias current threshold.
LBC-LOW	Low laser bias current threshold.
OPT-HIGH	High optical power transmitted threshold.
OPT-LOW	Low optical power transmitted threshold.
OPR-HIGH	High optical power received threshold.
OPR-LOW	Low optical power received threshold.
SET-OPR	Sets the OPR.

D.4.22.4 VC4

The VC4 Properties pane allows you to view and update STM-64 LR/LH 4 VC4 information.

Table D-278 Field Descriptions for the VC4 Properties Pane

Field	Description
VC4 Config	
Displays the VC number, the intermediate path protection monitoring (IPPM) status, and the XC loopback status.	
Path Thresh 15 Min (Near End)	
VC Number	Displays the VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
PPJC-Pdet	Positive pointer justification count-VC4 path detected.
NPJC-Pdet	Negative pointer justification count-VC4 path detected.
PPJC-Pgen	Positive pointer justification count-VC4 path generated.
NPJC-Pgen	Negative pointer justification count-VC4 path generated.
Path Thresh 15 Min (Far End)	
VC Number	Displays the VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Path Thresh 1 Day (Near End)	
VC Number	Displays the VC number.
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
PPJC-Pdet	Positive pointer justification count-VC4 path detected.
NPJC-Pdet	Negative pointer justification count-VC4 path detected.
PPJC-Pgen	Positive pointer justification count-VC4 path generated.
NPJC-Pgen	Negative pointer justification count-VC4 path generated.
Path Thresh 1 Day (Far End)	
VC Number	Displays the VC number.

Table D-278 Field Descriptions for the VC4 Properties Pane

Field	Description
EB-HP	Errored block–higher-order path.
BBE-HP	Background block errors–higher-order path.
ES-HP	Errored seconds–higher-order path.
SES-HP	Severely errored seconds–higher-order path.
UAS-P	Unavailable seconds–higher-order path.
Customer Info	
VC Number	Displays the VC number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.22.5 Loopback

The Loopback Properties pane allows you to view and update STM-64 LR/LH 4 loopback information.

Table D-279 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Shows the administrative state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Payload, or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.22.6 Transceiver

The Transceiver Properties pane allows you to view and update STM-64 LR/LH 4 transceiver information.

Table D-280 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	Port No. Port number 1–14.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.4.22.7 Protection

The Protection Properties pane allows you to view and update STM-64 LR/LH 4 protection group information.

Table D-281 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.22.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-64 LR/LH 4 alarm profile information.

Table D-282 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.22.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-64 LR/LH 4 J1 path trace information.

Table D-283 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.

Table D-283 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.22.10 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the STM-64 LR/LH 4 card.

Table D-284 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.23 Slot Properties—STM-64_4_DWDM (ONS 15600 SDH)

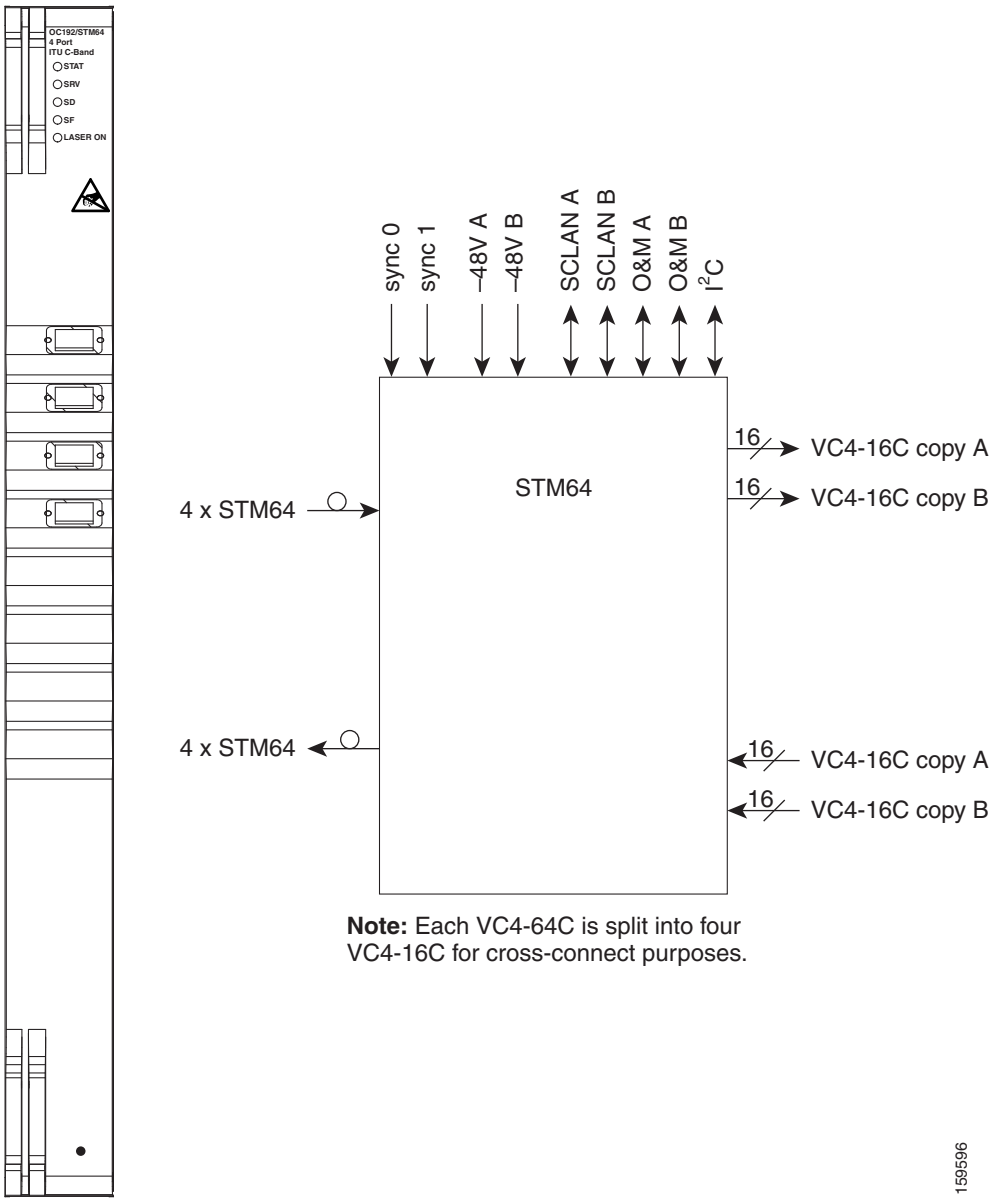
The slot properties pane displays information about the Cisco ONS 15600 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC192/STM64 4 Port ITU C-Band card provides four Telcordia GR-253-CORE compliant, SDH STM-64 ports per card. The ports operate at 9953.28 Mb/s over single-mode fiber. The OC192/STM64 4 Port ITU C-Band card has four physical connector adapters with two fibers per connector adapter. The card supports VC3 payloads and concatenated payloads at VC4, VC4-4c, VC4-8c, VC4-16c, or VC4-64c signal levels.

The OC192/STM64 4 Port ITU C-Band card features a tunable 1550-nm C-band laser on the trunk port. The laser is tunable across 82 wavelengths on the ITU grid with 50-GHz spacing between wavelengths.

The following figure shows the card faceplate and block diagram.

Figure D-9 STM-64_4_DWDM Module



For the STM-64_4_DWDM module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Transceiver, Protection, Alarm Behavior, J1 Path Trace, Info, and Section Trace.

D.4.23.1 Module View

The Module View Properties pane displays a graphic of the STM-64_4_DWDM that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress

Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.23.2 Identification

The Identification Properties pane allows you to view and update STM-64_4_DWDM identification information.

Table D-285 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.23.3 Line

The Line Properties pane allows you to view and update STM-64_4_DWDM line performance monitoring information.

Table D-286 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.

Table D-286 Field Descriptions for the Line Properties Pane

Field	Description
Send DoNotUse	When checked, sends a DNS (do not use) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Synchronization Status Message	SDH protocol that communicates information about the quality of the timing source.
MS-SPRing Ext. Byte	Select an alternate MS-SPRing byte.
Type	Defines the port.
MS Thresh 15 Min (Near End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
MS Thresh 15 Min (Far End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
MS Thresh 1 Day (Near End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count–working.

Table D-286 Field Descriptions for the Line Properties Pane

Field	Description
PSD-W	Protection switching duration–working.
MS Thresh 15 Min (Far End)	
Port Number	The port number.
EB-MS	Errored block–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
RS Thresh 15 Min (Near End)	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
RS Thresh 1 Day (Near End)	
Port Number	The port number.
EB-RS	Errored block–regenerator section.
BBE-RS	Background block errors–regenerator section.
ES-RS	Errored seconds–regenerator section.
SES-RS	Severely errored seconds–regenerator section.
Physical Thresh 15 Min	
Port Number	Port number.
LBC-HIGH	High laser bias current threshold.
LBC-LOW	Low laser bias current threshold.
OPT-HIGH	High optical power transmitted threshold.
OPT-LOW	Low optical power transmitted threshold.
OPR-HIGH	High optical power received threshold.
OPR-LOW	Low optical power received threshold.
SET-OPR	Sets the optical power received (OPR).
Physical Thresh 1 Day	
Port Number	Port number.
LBC-HIGH	High laser bias current threshold.
LBC-LOW	Low laser bias current threshold.
OPT-HIGH	High optical power transmitted threshold.
OPT-LOW	Low optical power transmitted threshold.
OPR-HIGH	High optical power received threshold.

Table D-286 Field Descriptions for the Line Properties Pane

Field	Description
OPR-LOW	Low optical power received threshold.
SET-OPR	Sets the OPR.

D.4.23.4 STS

The STS Properties pane allows you to view and update STM-64_4_DWDM STS information. The STS Properties pane contains the following tabs:

- D.4.23.4.1 STS Config Tab, page D-213
- D.4.23.4.2 Path Thresh 15 Min Tab, page D-213
- D.4.23.4.3 Path Thresh 1 Day Tab, page D-214
- D.4.23.4.4 Customer Info Tab, page D-214

D.4.23.4.1 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the STM-64_4_DWDM card.

Table D-287 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

D.4.23.4.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the STM-64_4_DWDM card.

Table D-288 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.

Table D-288 Field Descriptions for the Path Thresh 15 Min Tab (continued)

Field	Description
Far End	
STS No	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
FC-P	Displays failure count–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.

D.4.23.4.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the STM-64_4_DWDM card.

Table D-289 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
Far End	
STS No	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
FC-P	Displays failure count–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.

D.4.23.4.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-290 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.23.5 Loopback

The Loopback Properties pane allows you to view and update STM-64_4_DWDM loopback information.

Table D-291 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Shows the administrative state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Payload, or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.23.6 Transceiver

The Transceiver Properties pane allows you to view and update STM-64_4_DWDM transceiver information.

Table D-292 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	Port No. Port number 1–14.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.4.23.7 Protection

The Protection Properties pane allows you to view and update STM-64_4_DWDM protection group information.

Table D-293 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.23.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update STM-64_4_DWDM alarm profile information.

Table D-294 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.23.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve STM-64_4_DWDM path trace information.

Table D-295 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
VC Number	Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Mem Num	Displays the virtual concatenation (VCAT) member number.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.23.10 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the STM-64_4_DWDM module.

Table D-296 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

D.4.23.11 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the STM-64_4_DWDM card.

Table D-297 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

D.4.24 Slot Properties—OC192_4_DWDM (ONS 15600 SONET)

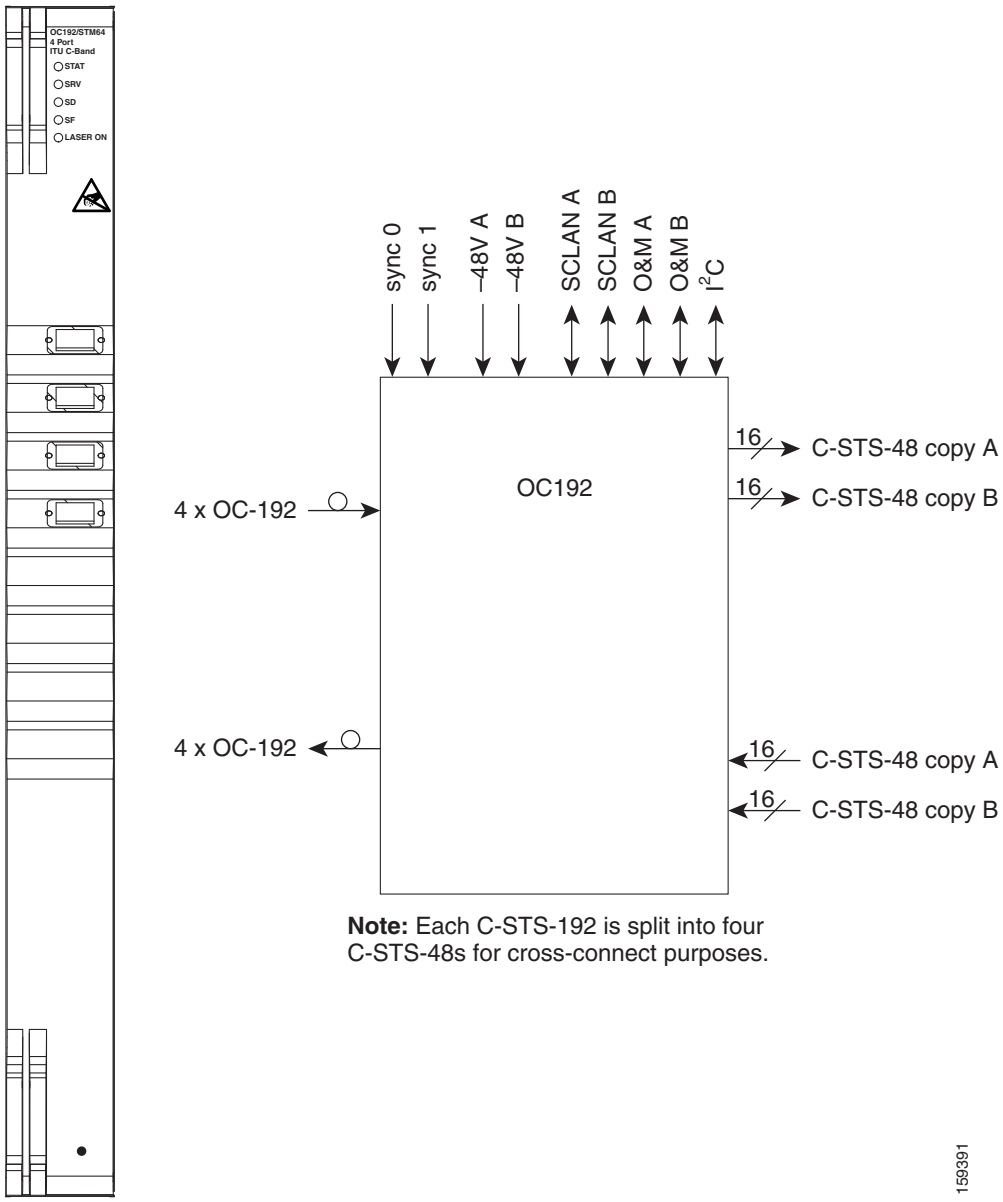
The slot properties pane displays information about the Cisco ONS 15600 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The OC192/STM64 4 Port ITU C-Band card provides four Telcordia GR-253-CORE compliant, SONET OC-192 ports per card. The ports operate at 9953.28 Mb/s over single-mode fiber. The OC192/STM64 4 Port ITU C-Band card has four physical connector adapters with two fibers per connector adapter. The card supports STS-1 payloads and concatenated payloads at STS-3c, STS-12c, STS-24c, STS-48c, or STS-192c signal levels.

The OC192/STM64 4 Port ITU C-Band card features a tunable 1550-nm C-band laser on the trunk port. The laser is tunable across 82 wavelengths on the ITU grid with 50-GHz spacing between wavelengths.

The following figure shows the card faceplate and block diagram.

Figure D-10 OC192_4_DWDM Module



For the OC192_4_DWDM module, the slot properties pane displays the following tabs: Module View, Identification, Line, STS, Loopback, Transceiver, Protection, Alarm Behavior, J1 Path Trace, Info, and Section Trace.

D.4.24.1 Module View

The Module View Properties pane displays a graphic of the OC192_4_DWDM that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress

Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

D.4.24.2 Identification

The Identification Properties pane allows you to view and update OC192_4_DWDM identification information.

Table D-298 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the card part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the card serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Card State	
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

D.4.24.3 Line

The Line Properties pane allows you to view and update OC192_4_DWDM line performance monitoring information.

Table D-299 Field Descriptions for the Line Properties Pane

Subfield	Description
Line Config	
Port Number	Displays the optical port number.
Port Name	Allows you to enter the name of the optical port.

Table D-299 Field Descriptions for the Line Properties Pane

Subfield	Description
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Synchronization Status Message	Allows you to view the incoming synchronization status message. Values are: • PRS (Primary reference source Stratum 1) • STU (Sync traceability unknown) • ST2 (Stratum 2) • ST3 (Stratum 3) • ST3E (Stratum 3E) • SMC (SONET minimum clock) • ST4 (Stratum 4) • TNC (Transit node clock) • DUS (Do not use for timing synchronization) • RES (Reserved; quality level set by user)
BLSR Ext. Byte	Select an alternate BLSR byte. Choices are Z2, E2, or F1.
AINS Soak (H:M)	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Type	Defines the port as SONET or SDH.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths (82 channels), depending on the type of card, and the band selected. Refer to the *Other Information* field in the Equipment Inventory table (11.3.1 Viewing an Equipment Inventory Table, page 11-11) for details of wavelengths supported.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.
Section Thresh 15 Minutes	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.

Table D-299 Field Descriptions for the Line Properties Pane

Subfield	Description
SEFS-S	Severely errored framing seconds–section.
Section Thresh 1 Day	
Port Number	The optical port number.
CV-S	Coding violations–section.
ES-S	Errored seconds–section.
SES-S	Severely errored seconds–section.
SEFS-S	Severely errored framing seconds–section.
Line Thresh 15 Minutes	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count.
PSD	Protection switching duration.
PSC-W	Protection switching count—working.
PSD-W	Protection switching duration—working.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Line Thresh 1 Day	
Near End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
PSC	Protection switching count.
PSD	Protection switching duration.

Table D-299 Field Descriptions for the Line Properties Pane

Subfield	Description
PSC-W	Protection switching count–working.
PSD-W	Protection switching duration–working.
PSC-S	Protection switching count–span.
PSD-S	Displays the protection switching duration–span.
PSC-R	Protection switching count–ring.
PSD-R	Displays the protection switching duration–ring.
Far End	
Port Number	The optical port number.
ES-L	Errored seconds–line.
SES-L	Severely errored seconds–line.
CV-L	Coding violations–line.
UAS-L	Unavailable seconds–line.
FC-L	Failure count–line.
Physical Thresh 15 Minutes	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.
Physical Thresh 1 Day	
Port No.	Port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.
Alarm Threshold	
Port No.	Port number.

Table D-299 Field Descriptions for the Line Properties Pane

Subfield	Description
LBC-HIGH	Maximum laser bias current. The default is (15 min): 150 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 50 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the receiver power decreases, then the OPR percentage decreases to reflect the loss in receiver power. For example, if the receiver power decreases 3 dBm, the OPR decreases 50 percent.

D.4.24.4 STS

The STS Properties pane allows you to view and update OC192_4_DWDM STS information. The STS Properties pane contains the following tabs:

- D.4.24.4.1 STS Config Tab, page D-223
- D.4.24.4.2 Path Thresh 15 Min Tab, page D-223
- D.4.24.4.3 Path Thresh 1 Day Tab, page D-224
- D.4.24.4.4 Customer Info Tab, page D-225

D.4.24.4.1 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the OC192_4_DWDM card.

Table D-300 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

D.4.24.4.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path thresholds of the OC192_4_DWDM card.

Table D-301 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.

Table D-301 Field Descriptions for the Path Thresh 15 Min Tab (continued)

Field	Description
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
Far End	
STS No	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
FC-P	Displays failure count–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.

D.4.24.4.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path thresholds of the OC192_4_DWDM card.

Table D-302 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.
FC-P	Displays failure count–path information.
PPJC-Pdet	Displays positive pointer justification count, STS path detected.
NPJC-Pdet	Displays negative pointer justification count, STS path detected.
PPJC-Pgen	Displays positive pointer justification count, STS path generated.
NPJC-Pgen	Displays negative pointer justification count, STS path generated.
Far End	
STS No	Displays the synchronous transport signal number information.
CV-P	Displays coding violations–path information.
ES-P	Displays errored seconds–path information.
FC-P	Displays failure count–path information.

Table D-302 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
SES-P	Displays severely errored seconds–path information.
UAS-P	Displays unavailable seconds–path information.

D.4.24.4.4 Customer Info Tab

The Customer Info tab allows you to view the customer information.

Table D-303 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

D.4.24.5 Loopback

The Loopback Properties pane allows you to view and update OC192_4_DWDM loopback information.

Table D-304 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Admin State	Shows the administrative state of the port: In Service (IS), Out of Service–Disabled (OOS, DSBLD), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (None). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

D.4.24.6 Transceiver

The Transceiver Properties pane allows you to view and update OC192_4_DWDM transceiver information.

Table D-305 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	Port No. Port number 1–14.
Non-normalized LBC (mA)	The actual operating value of laser bias current (in mA) for the specified card port.
Non-normalized OPT (dBm)	The actual operating value of optical power transmitted (in dBm) for the specified card port.
Non-normalized OPR (dBm)	The actual operating value of optical power received (in dBm) for the specified card port.

D.4.24.7 Protection

The Protection Properties pane allows you to view and update OC192_4_DWDM protection group information.

Table D-306 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

D.4.24.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update OC192_4_DWDM alarm profile information.

Table D-307 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

D.4.24.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve OC192_4_DWDM path trace information.

Table D-308 Field Descriptions for the J1 Path Trace Properties Pane

Column	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

D.4.24.10 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the OC192_4_DWDM card.

Table D-309 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

D.4.24.11 Section Trace

The Section Trace Properties pane allows you to change the section trace settings for the OC192_4_DWDM card.

Table D-310 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

Performance Data

This appendix describes the performance management (PM) tables that are available in Cisco Prime Optical. This appendix includes the following sections:

- E.1 ONS 15305-Specific PM Tables, page E-1
- E.2 PM Tables for CTC-Based NEs, page E-9
- E.3 ONS 15530 and ONS 15540 PM Tables, page E-205

Note PM data collection is not available for the ONS 15216.

E.1 ONS 15305-Specific PM Tables

This section describes the PM tables that are specific to ONS 15305 NEs.

E.1.1 Overview of Supported PM Parameters

ONS 15305 PM parameters are available on any of the following cards:

- S1.1-2-LC
- S1.1-8-LC
- S4.1-2-LC
- S4.1-4-LC
- S16.1-1-LC
- GE-1-LC
- GE-2-LC
- E100-8
- E3T3-6
- E1-8
- E1-21
- E1-63

- L4.2-2-LC
- L16.2-1LC
- S1.1-2-LC/E1-21
- 2xGE+MAP
- 8xFE+MAP

E.1.1.1 Edge SDH

Table E-1 to Table E-7 list all the ONS 15305 Edge SDH PM parameters with the corresponding description and a list of cards supported.

Table E-1 Regenerator Section PM Parameters—Near End

Parameter	Description	ONS 15305 Cards Supported
RS-SES	Regenerator section—severely errored seconds (near end)	S1.1-2-LC, S1.1-8-LC, S4.1-2-LC, S4.1-4-LC, S16.1-1-LC, L4.2-2-LC, L16.2-1LC, S1.1-2-LC/E1-21
RS-BBE	Regenerator section—background block errors (near end)	
RS-ES	Regenerator section—errored seconds (near end)	
RS-UAS	Regenerator section—unavailable seconds (near end)	

Table E-2 Multiplex Section PM Parameters—Near End

Parameter	Description	ONS 15305 Cards Supported
MS-BBE	Multiplex section—background block errors (near end)	S1.1-2-LC, S1.1-8-LC, S4.1-2-LC, S4.1-4-LC, S16.1-1-LC, L4.2-2-LC, L16.2-1LC, S1.1-2-LC/E1-21
MS-ES	Multiplex section—errored seconds (near end)	
MS-SES	Multiplex section—severely errored seconds (near end)	
MS-UAS	Multiplex section—unavailable seconds (near end)	

Table E-3 Multiplex Section PM Parameters—Far End

Parameter	Description	ONS 15305 Cards Supported
MS-BBE	Multiplex section—background block errors (far end)	S1.1-2-LC, S1.1-8-LC, S4.1-2-LC, S4.1-4-LC, S16.1-1-LC, L4.2-2-LC, L16.2-1LC, S1.1-2-LC/E1-21
MS-ES	Multiplex section—errored seconds (far end)	
MS-SES	Multiplex section—severely errored seconds (far end)	
MS-UAS	Multiplex section—unavailable seconds (far end)	

Table E-4 Higher-Order Virtual Container PM Parameters—Near End

Parameter	Description	ONS 15305 Cards Supported
HP-BBE	High-order path—background block errors (near end)	S1.1-2-LC,S1.1-8-LC, S4.1-2-LC, S4.1-4-LC, S16.1-1-LC, L4.2-2-LC, L16.2-1LC, S1.1-2-LC/E1-21
HP-ES	High-order path—errored seconds (near end)	
HP-SES	High-order path—severely errored seconds (near end)	
HP-UAS	High-order path—unavailable seconds (near end)	

Table E-5 Higher-Order Virtual Container PM Parameters—Far End

Parameter	Description	ONS 15305 Cards Supported
HP-BBE	High-order path—background block errors (far end)	S1.1-2-LC,S1.1-8-LC, S4.1-2-LC, S4.1-4-LC, S16.1-1-LC, L4.2-2-LC, L16.2-1LC, S1.1-2-LC/E1-21
HP-ES	High-order path—errored seconds (far end)	
HP-SES	High-order path—severely errored seconds (far end)	
HP-UAS	High-order path—unavailable seconds (far end)	

Table E-6 Lower-Order Virtual Container PM Parameters—Near End

Parameter	Description	ONS 15305 Cards Supported
LP-BBE	Low-order path—background block errors (near end)	S1.1-8-LC, E3T3-6(3), E1-8(1), E1-21(1), E1-63(1), S1.1-2-LC/E1-21(1)
LP-ES	Low-order path—errored seconds (near end)	
LP-SES	Low-order path—severely errored seconds (near end)	
LP-UAS	Low-order path—unavailable seconds (near end)	

Table E-7 Lower-Order Virtual Container PM Parameters—Far End

Parameter	Description	ONS 15305 Cards Supported
LP-BBE	Low-order path—background block errors (far end)	S1.1-8-LC, E3T3-6(3), E1-8(1), E1-21(1), E1-63(1), S1.1-2-LC/E1-21(1)
LP-ES	Low-order path—errored seconds (far end)	
LP-SES	Low-order path—severely errored seconds (far end)	
LP-UAS	Low-order path—unavailable seconds (far end)	

E.1.1.2 Edge Statistics

The following table lists all the ONS 15305 PM parameters with the corresponding description and a list of cards supported.

Table E-8 Statistics PM Parameters—DCC/WAN/LAN

Parameter	Description	ONS 15305 Cards Supported
RxUnicPkt	Number of inbound subnetwork/unicast packets.	S1.1-2-LC, S1.1-8-LC, S4.1-2-LC, S4.1-4-LC, S16.1-1-LC, L4.2-2-LC, L16.2-1LC, S1.1-2-LC/E1-21, GE-1-LC(2), GE-2-LC(2), E100-8(2), 2xGE+MAP(2), 8xFE+MAP(2)
RxDiscards	Number of inbound discarded packets.	
RxErr	Number of erroneous inbound packets.	
RxBytes	Number of received bytes.	
TxBytes	Number of transmitted bytes.	
RxNotUnicPkt	Number of inbound not unicast packets.	
IfInUnknownProtos	Number of discarded packets because of unknown protocol.	
TxUnicPkt	Number of requested subnetwork/unicast packets.	
TxNotUnicPkt	Number of requested not unicast packets.	
TxDiscards	Number of discarded packets—free buffer space.	
TxErr	Number of erroneous outbound packets.	
RxMultPkt	Number of inbound multicast packets.	
RxBroadPkt	Number of inbound broadcast packets.	
TxMultPkt	Number of outbound multicast packets.	
TxBroadPkt	Number of outbound broadcast packets.	

E.1.2 Edge Statistics DCC PM Table

The Edge Statistics DCC PM table shows 15-minute and 1-day data communications channel (DCC) edge statistics performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge Statistics DCC PM table.

Table E-9 Field Descriptions for the Edge Statistics DCC PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.

Table E-9 Field Descriptions for the Edge Statistics DCC PM Table (continued)

Field	Description
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.
Rx Unic Pkt	Number of inbound subnetwork/unicast packets.
Rx Discards	Number of inbound discarded packets.
Rx Err	Number of inbound errored packets.
Rx Bytes	Number of received bytes.
Tx Bytes	Number of bytes transmitted since the last counter reset.
Rx Not Unic Pkt	Number of inbound not unicast packets.
Rx Unknown	Number of discarded packets due to unknown protocol.
Tx Unic Pkt	Number of requested subnetwork/unicast packets.
Tx Not Unic Pkt	Number of requested not unicast packets.
Tx Discards	Number of discarded packets with free buffer space.
Tx Err	Number of outbound errored packets.
Rx Mult Pkt	Number of inbound multicast packets.
Rx Broad Pkt	Number of inbound broadcast packets.
Tx Mult Pkt	Number of multicast frames transmitted error free.
Tx Broad Pkt	Total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sublayer, including those that were discarded or not sent.
NE ID	Name of the selected NE.

E.1.3 Edge Statistics LAN PM Table

The Edge Statistics LAN PM table shows 15-minute and 1-day LAN edge statistics performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge Statistics LAN PM table.

Table E-10 Field Descriptions for the Edge Statistics LAN PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.

Table E-10 Field Descriptions for the Edge Statistics LAN PM Table (continued)

Field	Description
Rx Unic Pkt	Number of inbound subnetwork/unicast packets.
Rx Discards	Number of inbound discarded packets.
Rx Err	Number of inbound errored packets.
Rx Bytes	Number of received bytes.
Tx Bytes	Number of bytes transmitted since the last counter reset.
Rx Not Unic Pkt	Number of inbound not unicast packets.
Rx Unknown	Number of discarded packets due to unknown protocol.
Tx Unic Pkt	Number of requested subnetwork/unicast packets.
Tx Not Unic Pkt	Number of requested not unicast packets.
Tx Discards	Number of discarded packets with free buffer space.
Tx Err	Number of outbound errored packets.
Rx Mult Pkt	Number of inbound multicast packets.
Rx Broad Pkt	Number of inbound broadcast packets.
Tx Mult Pkt	Number of multicast frames transmitted error free.
Tx Broad Pkt	Total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sublayer, including those that were discarded or not sent.
NE ID	Name of the selected NE.

E.1.4 Edge Statistics WAN PM Table

The Edge Statistics WAN PM table shows 15-minute and 1-day WAN edge statistics performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge Statistics WAN PM table.

Table E-11 Field Descriptions for the Edge Statistics WAN PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.
Rx Unic Pkt	Number of inbound subnetwork/unicast packets.
Rx Discards	Number of inbound discarded packets.
Rx Err	Number of inbound errored packets.

Table E-11 Field Descriptions for the Edge Statistics WAN PM Table (continued)

Field	Description
Rx Bytes	Number of received bytes.
Tx Bytes	Number of bytes transmitted since the last counter reset.
Rx Not Unic Pkt	Number of inbound not unicast packets.
Rx Unknown	Number of discarded packets due to unknown protocol.
Tx Unic Pkt	Number of requested subnetwork/unicast packets.
Tx Not Unic Pkt	Number of requested not unicast packets.
Tx Discards	Number of discarded packets with free buffer space.
Tx Err	Number of outbound errored packets.
Rx Mult Pkt	Number of inbound multicast packets.
Rx Broad Pkt	Number of inbound broadcast packets.
Tx Mult Pkt	Number of multicast frames transmitted error free.
Tx Broad Pkt	Total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sublayer, including those that were discarded or not sent.
NE ID	Name of the selected NE.

E.1.5 Edge SDH High Order VC PM Table

The Edge SDH High Order VC PM table shows near- and far-end 15-minute and 1-day SDH high-order Virtual Container (VC) performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge SDH High Order VC PM table.

Table E-12 Field Descriptions for the Edge SDH High Order VC PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.
HP BBE	High path section background block errors.
HP ES	High path section errored seconds.
HP SES	High path section severely errored seconds.
HP UAS	High path section unavailable seconds.
NE ID	Name of the selected NE.

E.1.6 Edge SDH Low Order VC PM Table

The Edge SDH Low Order VC PM table shows near- and far-end 15-minute and 1-day SDH low-order VC performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge SDH Low Order VC PM table.

Table E-13 Field Descriptions for the Edge SDH Low Order VC PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.
LP BBE	Low path background block errors.
LP ES	Low path errored seconds.
LP SES	Low path severely errored seconds.
LP UAS	Low path unavailable seconds.
NE ID	Name of the selected NE.

E.1.7 Edge SDH Multiplex Section PM Table

The Edge SDH Multiplex Section PM table shows near- and far-end 15-minute and 1-day SDH multiplex section performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge SDH Multiplex Section PM table.

Table E-14 Field Descriptions for the Edge SDH Multiplex Section PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.
MS BBE	Multiplex section background block errors.

Table E-14 Field Descriptions for the Edge SDH Multiplex Section PM Table (continued)

Field	Description
MS ES	Multiplex section errored seconds.
MS SES	Multiplex section severely errored seconds.
MS UAS	Multiplex section unavailable seconds.
NE ID	Name of the selected NE.

E.1.8 Edge SDH Regenerator Section PM Table

The Edge SDH Regenerator Section PM table shows 15-minute and 1-day SDH regenerator section performance data for the ONS 15305. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Edge SDH Regenerator Section PM table.

Table E-15 Field Descriptions for the Edge SDH Regenerator Section PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Module Name	Module for which PM data is displayed.
Physical Location	Slot and port number for which PM data is displayed.
Interface	Interface name of the selected NE.
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.
RS BBE	Regenerator section background block errors.
RS ES	Regenerator section errored seconds.
RS SES	Regenerator section severely errored seconds.
RS UAS	Regenerator section unavailable seconds.
NE ID	Name of the selected NE.

E.2 PM Tables for CTC-Based NEs

This section describes the PM tables that are specific to the CTC-based NEs: ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MS SDH, ONS 15327, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, and ONS 15600 SDH.

Note Performance management for the CTC-based ONS 15305 R3.0 is similar to the performance management for the non-CTC-based ONS 15305. See E.1 ONS 15305-Specific PM Tables, page E-1.

For CTC-based NEs, each 15-minute or 1-day PM table has a corresponding real-time PM table that allows you to examine the current value of a PM parameter in granularities finer than 15 minutes or 1 day. Not all of the fields in the historical PM tables are shown in the real-time PM tables. The first fields in real-time PM tables are NE ID, Module Name, Physical Location, Interface, Time Stamp, and Validity; the remaining fields are the actual real-time attributes being polled. The Validity column indicates whether the data in the entry is valid: "true" indicates that the entry is valid; "false" indicates that the entry is invalid.

The following conventions apply to PM tables for CTC-based NEs:

- Invalidity in the historical PM table is shown with the corresponding table cell rendered gray and marked with an asterisk (*).

  Note Real-time PM tables do not support invalidity coloring.

- Threshold crossing alerts (TCAs) for a specific statistic in a particular row in the historical PM table are indicated with a purple rendering for the corresponding cell.

  Note Real-time PM tables do not support TCAs.

- Fields that are not applicable for a particular module in a given PM table are indicated by displaying *N/A* (not applicable) in the corresponding table cell.
- 1-day PM data is collected at 00:00 hours Greenwich Mean Time (GMT) (time on the Prime Optical server host).
- For release 4.0 and later NEs, PM data collected for cards that are preprovisioned and not physically present on a slot are indicated by the symbol *ENEQ* displayed for the corresponding table cell.

Note For an RTPM query for remote NEs, select the slot number and port number required for a PM query (do not select slot *All* and port *All*).

Note The PM parameters that Prime Optical supports for CTC-based NEs are also supported by Prime Optical GateWay/CORBA.

E.2.1 8B10B PM Table—ONS 15454 SONET, ONS 15454 SDH

The 8B10B PM table shows performance data for ONS 15454 SONET and ONS 15454 SDH DWDM cards that support Fibre Channel (FC) or Gigabit Ethernet payloads. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the 8B10B PM table.

Table E-16 Field Descriptions for the 8B10B PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Data Payload	The payload provisioned on the client port of the card.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Valid Packets	Number of received packets that contain nonerrored data code groups that have start and end delimiters. This parameter applies to the FC and Gigabit Ethernet payload configured on the TXPP_MR_2.5G and TXP_MR_2.5G cards.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Invalid Packets	Number of received packets that contain errored data code groups that have start and end delimiters. This parameter applies to the FC and Gigabit Ethernet payload configured on the TXPP_MR_2.5G and TXP_MR_2.5G cards.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Code Group Violations	Number of received code groups that do not contain a start or end delimiter. This parameter applies to the FC and Gigabit Ethernet payload configured on the TXPP_MR_2.5G and TXP_MR_2.5G cards.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Idle Ordered Sets	Number of received packets containing idle ordered sets. This parameter applies to the FC and Gigabit Ethernet payload configured on the TXPP_MR_2.5G and TXP_MR_2.5G cards.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME

Table E-16 Field Descriptions for the 8B10B PM Table (continued)

Field	Description	Cards Supported
Non-idle Ordered Sets	Number of received packets containing nonidle ordered sets. This parameter applies to the FC and Gigabit Ethernet payload configured on the TXPP_MR_2.5G and TXP_MR_2.5G cards.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Data Code Groups	Number of received data code groups that do not contain ordered sets. This parameter applies to the FC and Gigabit Ethernet payload configured on the TXPP_MR_2.5G and TXP_MR_2.5G cards.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Stats Encoding DispErrors	Number of encoding disparity errors received at the port.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Data Ordered Sets	Number of received packets containing data ordered sets.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
rxTotalPackets	Total number of packets received.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
ifInErrors	Total number of errors received.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Invalid Ordered Sets	Number of invalid ordered sets received at this port.	• ONS 15454 SONET: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME • ONS 15454 SDH: TXP_MR_2.5G, TXPP_MR_2.5G, MXP_MR_10DME
Invalid Ordered Sets Disp Errors Sum	Sum of invalid ordered sets of encoding disparity errors received at this port.	• ONS 15454 SONET: MXP_MR_10DME • ONS 15454 SDH: MXP_MR_10DME
rx8b10bWords	Number of code violations/running disparity errors in the 8b/10b encoded characters received.	• ONS 15454 SONET: AR_MXP, AR_XP, AR_XPE • ONS 15454 SDH: AR_MXP, AR_XP, AR_XPE
tx8b10bWords	Number of code violations/running disparity errors in the 8b/10b encoded characters transmitted.	• ONS 15454 SONET: AR_MXP, AR_XP, AR_XPE • ONS 15454 SDH: AR_MXP, AR_XP, AR_XPE
NE ID	Name of the selected NE.	—

E.2.2 ESCON PM Table—ONS 15454 SONET, ONS 15454 SDH

The ESCON PM table shows performance data for ONS 15454 SONET and ONS 15454 SDH DWDM cards that support ESCON payload. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the ESCON PM table.

Table E-17 Field Descriptions for the ESCON PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Stats Last Cleared Time	When the statistics were last reset.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
ifInOctets	Number of bytes received since the last counter reset.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
rxTotalPkts	Number of packets received since the last counter reset.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
ifInErrors	Total number of received errors.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
ifOutOctets	Number of bytes transmitted since the last counter reset.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP

Table E-17 Field Descriptions for the ESCON PM Table (continued)

Field	Description	Cards Supported
txTotalPkts	Number of packets transmitted since the last counter reset.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
mediaIndStatsRxFrameBadCRC	Number of received data frames with payload CRC errors when HDLC framing is used.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
mediaIndStatsRxLcvErrors	Number of L1 line code violations received for constant bit rate protocols that equate to invalid 8b10b ordered sets.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
mediaIndStatsTxLcvErrors	Number of L1 line code violations transmitted for constant bit rate protocols that equate to invalid 8b10b ordered sets.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
Rx Utilization (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
Tx Utilization (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	ONS 15454 SONET and ONS 15454 SDH: 2.5G_DM, 2.5G_DMP
NE ID	Name of the selected NE.	—

E.2.3 CoS PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The CoS PM table shows Class of Service (CoS) performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH ML-series cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the CoS PM table.

Table E-18 Field Descriptions for the CoS PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Interface Name	Name of the interface.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000
Interface Direction	Input or output direction of the interface.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000
Class of Service Level	CoS level. The level ranges from 0 to 7.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000

Table E-18 Field Descriptions for the CoS PM Table (continued)

Field	Description	Cards Supported
Post Policy Packets	Packet count after executing QoS policies.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000
Post Policy Bytes	Octet count after executing QoS policies.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000
Drop Packets	Dropped packet count as the result of all QoS features that can produce drops.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000
Drop Bytes	Dropped octet count as the result of all QoS features that can produce drops.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000 • ONS 15454 SDH: ML100T, ML1000
NE ID	Name of the selected NE.	—

E.2.4 DS1 PM Table (Far End)

The DS1 PM table shows far-end DS-1 performance data. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the DS1 PM table.

Table E-19 Field Descriptions for the DS1 PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-P (Rx)	Coding violations–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
ES-P (Rx)	Errored seconds–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12

Table E-19 Field Descriptions for the DS1 PM Table (Far End) (continued)

Field	Description	Cards Supported
ESA-P (Rx)	Errored seconds type A–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
ESB-P (Rx)	Errored seconds type B–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
SES-P (Rx)	Severely errored seconds–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
SEFS-P (Rx)	Severely errored frame seconds–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
CSS-P (Rx)	Controlled slip seconds–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12

Table E-19 Field Descriptions for the DS1 PM Table (Far End) (continued)

Field	Description	Cards Supported
UAS-P (Rx)	Unavailable seconds–path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
FC-P (Rx)	Failure count–path.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS1_E1_56
ES-L (Rx)	Errored seconds–line.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
ESR-P	Received path errored seconds ratio is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	—
SESR-P	Received path severely errored seconds ratio is the ratio of SES to total seconds in available time during a fixed measurement interval.	—
ESNE-NP	Network performance errored seconds during a fixed measurement interval for near end.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS1_E1_56, DS3XM_12
SESNE-NP	Network performance severely errored seconds during a fixed measurement interval for near end.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS1_E1_56, DS3XM_12
UASNE-NP	Network performance unavailable seconds during a fixed measurement interval for near end.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS1_E1_56, DS3XM_12

SESFE-NP	Network performance severely errored seconds during a fixed measurement interval for far end.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS1_E1_56, DS3XM_12
UASFE-NP	Network performance unavailable seconds during a fixed measurement interval for far end.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS1_E1_56, DS3XM_12
NE ID	Name of the selected NE.	—

E.2.5 DS1 PM Table

The DS1 PM table contains PM information at the line layer. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the DS1 PM table.

Table E-20 Field Descriptions for the DS1 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—

Table E-20 Field Descriptions for the DS1 PM Table (continued)

Field	Description	Cards Supported
Time Stamp	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-L	CV-L indicates the number of coding violations occurring on the line. This parameter is a count of BPVs and EXZs occurring over the accumulation period.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
ES-L	ES-L is a count of the seconds containing one or more anomalies (BPV + EXZ) and/or defects (loss of signal) on the line.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
SES-L	SES-L is a count of the seconds containing more than a particular quantity of anomalies (BPV + EXZ > 1544) and/or defects on the line.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
LOSS-L	LOSS-L is a count of one-second intervals containing one or more LOS defects.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
CV-P (Rx)	Received path coding violation (Rx CV-P) means that a coding violation occurred on the received end of the path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56

Table E-20 Field Descriptions for the DS1 PM Table (continued)

Field	Description	Cards Supported
ES-P (Rx)	Received path errored seconds (Rx ES-P) is a count of the seconds containing one or more anomalies and/or defects for paths on the received end of the signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
SES-P (Rx)	Received path severely errored seconds (Rx SES-P) is a count of the seconds containing more than a particular quantity of anomalies and/or defects for paths on the received end of the signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
SAS-P (Rx)	Received path severely errored seconds frame/alarm indication signal (Rx SAS-P) is a count of one-second intervals containing one or more SEFs or one or more AIS defects on the received end of the signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
UAS-P (Rx)	Received path unavailable seconds (Rx UAS-P) is a count of one-second intervals when the DS-1 path is unavailable on the received end of the signal. The DS-1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. Once unavailable, the DS-1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from unavailable time.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
AISS-P (Rx)	Received path alarm indication signal seconds (Rx AISS-P) means an alarm indication signal occurred on the received end of the path. This parameter is a count of seconds containing one or more AIS defects.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12

Table E-20 Field Descriptions for the DS1 PM Table (continued)

Field	Description	Cards Supported
FC-P (Rx)	Failure count–near-end path.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
CV-P (Tx)	Transmitted path coding violation (Tx CV-P) means that a coding violation occurred on the transmitted end of the path. For DS-1 ESF paths, this parameter is a count of detected CRC-6 errors.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
ES-P (Tx)	Transmitted path errored seconds (Tx ES-P) is a count of the seconds containing one or more anomalies and/or defects for paths on the transmitted end of the signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
SES-P (Tx)	Transmitted path severely errored seconds (Tx SES-P) is a count of the seconds containing more than a particular quantity of anomalies and/or defects for paths on the transmitted end of the signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
SAS-P (Tx)	Transmitted path severely errored seconds frame/alarm indication signal (Tx SAS-P) is a count of one-second intervals containing one or more severely errored framing seconds (SEFS) or one or more AIS defects on the transmitted end of the signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
UAS-P (Tx)	Transmitted path unavailable seconds (Tx UAS-P) is a count of one-second intervals when the DS-1 path is unavailable on the transmitted end of the signal. The DS-1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. Once unavailable, the DS-1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from unavailable time.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56

Table E-20 Field Descriptions for the DS1 PM Table (continued)

Field	Description	Cards Supported
AISS-P (Tx)	Transmitted path alarm indication signal seconds (Tx AISS-P) means that an alarm indication signal occurred on the transmitted end of the path. This parameter is a count of seconds containing one or more AIS defects.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56
FC-P (Tx)	Failure count–near-end path.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM_12
NE ID	Name of the selected NE.	—

E.2.6 DS3 PM Table

The DS3 PM table contains PM information at the DS-3 layer. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the DS3 PM table.

Table E-21 Field Descriptions for the DS3 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—

Table E-21 Field Descriptions for the DS3 PM Table (continued)

Field	Description	Cards Supported
Time Stamp	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-L	Number of coding violations (CVs) occurring on the line. This parameter is a count of BPVs and EXZs occurring over the accumulation period.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15327: XTC • ONS 15454 SONET: DS-3, DS3E, DS3_EC1_48, DS3I, DS3N, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
ES-L	Number of seconds containing one or more anomalies (BPVs + EXZs) and/or defects (loss of signal [LOS]) on the line.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15327: XTC • ONS 15454 SONET: DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
SES-L	Number of seconds containing more than a particular quantity of anomalies (BPV + EXZ > 1544) and/or defects on the line.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15327: XTC • ONS 15454 SONET: DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN

Table E-21 Field Descriptions for the DS3 PM Table (continued)

Field	Description	Cards Supported
LOSS-L	Number of one-second intervals containing one or more LOS defects.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15327: XTC • ONS 15454 SONET: DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
AISSP-PBIT	Number of alarm indication signal seconds (AISS) encountered by a DS-3 interface in the parity bit (PBIT) of the interface in the interval. The PBIT is the bit position at the beginning of the third and fourth subframes, which contains parity information. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
CVP-PBIT	Number of coding violations encountered by a DS-3 interface in the PBIT of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
ESP-PBIT	Number of errored seconds encountered by a DS-3 interface in the PBIT of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN

Table E-21 Field Descriptions for the DS3 PM Table (continued)

Field	Description	Cards Supported
SESP-PBIT	Number of severely errored seconds (SES) encountered by a DS-3 interface in the PBIT of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
SASP-PBIT	Number of severely alarmed seconds (SAS) encountered by a DS-3 interface in the PBIT of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
UASP-PBIT	Number of unavailable seconds (UAS) encountered by a DS-3 interface in the PBIT of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
CVP (C-bit)	Number of coding violations encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN

Table E-21 Field Descriptions for the DS3 PM Table (continued)

Field	Description	Cards Supported
ESP (C-bit)	Number of errored seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
SESP (C-bit)	Number of SESs encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
SASP (C-bit)	Number of severely alarmed seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3_EC1_48
UASP (C-bit)	Number of unavailable seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
NE ID	Name of the selected NE.	—

E.2.7 DS3 and DS3I PM Table (Far End)—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The DS3 and DS3I PM table shows far-end performance data for the DS-3 and DS3I cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the DS3 and DS3I PM table.

Table E-22 Field Descriptions for the DS3 and DS3I PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Coding Violations – Path (C-Bit)	Number of coding violations encountered by a DS-3 interface in the C-bit of the interface in the interval. The C-bit is a bit format used to increase far-end performance monitoring. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN

Table E-22 Field Descriptions for the DS3 and DS3I PM Table (Far End) (continued)

Field	Description	Cards Supported
Errored Seconds – Path (C-Bit)	Number of errored seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
Severely Alarmed Seconds – Path (C-Bit)	Number of severely alarmed seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
Severely Errored Seconds – Path (C-Bit)	Number of severely errored seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
Unavailable Seconds – Path (C-Bit)	Number of unavailable seconds encountered by a DS-3 interface in the C-bit of the interface in the interval. This is a path variable.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS3E, DS3_EC1_48, DS3I, DS3IN, DS3NE, DS3XM, DS3XM_12 • ONS 15454 SDH: DS3I, DS3IN
NE ID	Name of the selected NE.	—

E.2.8 E1 PM Table—ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The E1 PM table shows performance data for the following cards:

- ONS 15310 MA SDH: E1_21_E3_DS3_3 and E1_63_E3_DS3_3
- ONS 15454 SONET: DS1_E1_56
- ONS 15454 SDH: E1

You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the E1 PM table.

Table E-23 Field Descriptions for the E1 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-L	CV-L indicates the number of coding violations occurring on the line. This parameter is a count of BPVs and EXZs occurring over the accumulation period.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-23 Field Descriptions for the E1 PM Table (continued)

Field	Description	Cards Supported
ES-L	ES-L is a count of the seconds containing one or more anomalies (BPV + EXZ) and/or defects (loss of signal) on the line.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
SES-L	SES-L is a count of the seconds containing more than a particular quantity of anomalies (BPV + EXZ > 1544) and/or defects on the line.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
LOSS-L	LOSS-L is a count of one-second intervals containing one or more LOS defects.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
EB-P (Rx)	Received path errored block (EB-P) is a count of the number of bits in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
ES-P (Rx)	Received path errored seconds (ES-P) is a count of the seconds containing one or more anomalies and/or defects for paths on the received end of the signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
SES-P (Rx)	Received path severely errored seconds (SES-P) is a count of the seconds containing more than a particular quantity of anomalies and/or defects for paths on the received end of the signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-23 Field Descriptions for the E1 PM Table (continued)

Field	Description	Cards Supported
BBE-P (Rx)	Received path background block errors (BBE-P) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
UAS-P (Rx)	Received path unavailable seconds (UAS-P) is a count of one-second intervals when the DS-1 path is unavailable on the received end of the signal. The DS-1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. Once unavailable, the DS-1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from unavailable time.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
ESR-P (Rx)	Received path errored second ratio (ESR-P) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
SESR-P (Rx)	Received path severely errored seconds ratio (SESR-P) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
BBER-P (Rx)	Received path background block error ratio (BBER-P) is a ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
AISS-P (Rx)	Received path AISS-P is a count of seconds containing one or more AIS defects.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-23 Field Descriptions for the E1 PM Table (continued)

Field	Description	Cards Supported
EB-P (Tx)	Transmitted path errored block (EB-P) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
ES-P (Tx)	Transmitted path errored seconds (ES-P) is a count of the seconds containing one or more anomalies and/or defects for paths on the transmitted end of the signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
SES-P (Tx)	Transmitted path severely errored seconds (SES-P) is a count of the seconds containing more than a particular quantity of anomalies and/or defects for paths on the transmitted end of the signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
BBE-P (Tx)	Transmitted path background block error (BBE-P) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
UAS-P (Tx)	Transmitted path unavailable seconds (UAS-P) is a count of one-second intervals when the DS-1 path is unavailable on the transmitted end of the signal. The DS-1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. Once unavailable, the DS-1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from unavailable time.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
ESR-P (Tx)	Transmitted path errored second ratio (ESR-P) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-23 Field Descriptions for the E1 PM Table (continued)

Field	Description	Cards Supported
SESR-P (Tx)	Transmitted path severely errored second ratio (SESR-P) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
BBER-P (Tx)	Transmitted path background block error ratio (BBER-P) is a ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
AISS-P (Tx)	Transmitted path AISS-P is a count of seconds containing one or more AIS defects.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
NE ID	Name of the selected NE.	—

E.2.9 E1 PM Table (Far End)—ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The E1 PM table shows far-end performance data for the following cards:

- ONS 15310 MA SDH: E1_21_E3_DS3_3 and E1_63_E3_DS3_3
- ONS 15454 SONET: DS1_E1_56
- ONS 15454 SDH: E1, E1N, and E1_42 cards.

You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the E1 PM table.

Table E-24 Field Descriptions for the E1 PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
RXP-EB	Received path errored blocks (RXP-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
RXP-ES	Received path errored seconds (RXP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
RXPS-ES	Received path severely errored seconds (RXP-SES) is a one-second period containing 30 percent or more errored blocks or at least one defect; SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-24 Field Descriptions for the E1 PM Table (Far End) (continued)

Field	Description	Cards Supported
RXP-BBE	Received path background block errors (RXP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
RXP-UAS	Received path unavailable seconds (RXP-UAS) is a count of one-second intervals when the E1 path is unavailable on the signal received end. The E1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. After it has become unavailable, the E1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from the unavailable time.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
RXP-ESR	Received path errored second ratio (RXP-ESR) is the ratio of SESs to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
RXP-SESR	Received path severely errored second ratio (RXP-SESR) is the ratio of SESs to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
RXP-BBER	Received path background block error ratio (RXP-BBER) is a ratio of BBEs to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
TXP-EB	Transmitted path errored blocks (TXP-EB) is a count of bits that are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-24 Field Descriptions for the E1 PM Table (Far End) (continued)

Field	Description	Cards Supported
TXP-ES	Transmitted path errored seconds (TXP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
TXP-SES	Transmitted path severely errored seconds (TXP-SES) is a one-second period containing 30 percent or more errored blocks or at least one defect; SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
TXP-BBE	Transmitted path background block errors (TXP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
TXP-UAS	Transmitted path unavailable seconds (TXP-UAS) is a count of one-second intervals when the E1 path is unavailable on the signal transmitted. The E1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. After it has become unavailable, the E1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from the unavailable time.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
TXP-ESR	Transmitted path errored second ratio (TXP-ESR) is the ratio of SESs to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
TXP-SESR	Transmitted path severely errored second ratio (TXP-SESR) is the ratio of SESs to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42

Table E-24 Field Descriptions for the E1 PM Table (Far End) (continued)

Field	Description	Cards Supported
TXP-BBER	Transmitted path background block error ratio (TXP-BBER) is a ratio of BBEs to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SONET: DS1_E1_56 • ONS 15454 SDH: E1N, E1, E1_42
NE ID	Name of the selected NE.	—

E.2.10 E3 PM Table—ONS 15310 MA SDH, ONS 15454 SDH

The E3 PM table shows performance data for the ONS 15310 MA SDH E1_21_E3_DS3_3 and E1_63_E3_DS3_3 cards and the ONS 15454 SDH E3 card. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the E3 PM table.

Table E-25 Field Descriptions for the E3 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-25 Field Descriptions for the E3 PM Table (continued)

Field	Description	Cards Supported
CV-L	CV-L indicates the number of coding violations occurring on the line. This parameter is a count of BPVs and EXZs occurring over the accumulation period.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
ES-L	ES-L is a count of the seconds containing one or more anomalies (BPV + EXZ) and/or defects (loss of signal) on the line.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
SES-L	SES-L is a count of the seconds containing more than a particular quantity of anomalies (BPV + EXZ > 1544) and/or defects on the line.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
LOSS-L	LOSS-L is a count of one-second intervals containing one or more LOS defects.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
P-ES	Received path errored seconds (Rx ES-P) is a count of the seconds containing one or more anomalies and/or defects for paths on the received end of the signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
P-SES	Received path severely errored seconds (Rx SES-P) is a count of the seconds containing more than a particular quantity of anomalies and/or defects for paths on the received end of the signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
P-UAS	Received path unavailable seconds (Rx UAS-P) is a count of one-second intervals when the DS-1 path is unavailable on the received end of the signal. The DS-1 path is unavailable when ten consecutive SESs occur. The ten SESs are included in unavailable time. Once unavailable, the DS-1 path becomes available when ten consecutive seconds occur with no SESs. The ten seconds with no SESs are excluded from unavailable time.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
P-ESR	Received path errored second ratio (RX P-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
P-SESR	Received path severely errored second ratio (RX P-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E3
NE ID	Name of the selected NE.	—

E.2.11 CE-Series Ethernet PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The CE-Series Ethernet PM table shows performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH CE-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the CE-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	• ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifInUCastPkts	Number of unicast packets received.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifInMulticastPkts	Number of multicast packets received.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifInBroadcastPkts	Number of broadcast packets received.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifInErrors	Total number of received errors.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifOutUCastPkts	Number of unicast packets transmitted.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifOutMulticastPkts	Number of multicast packets transmitted.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifOutBroadcastPkts	Number of broadcast packets transmitted.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
dot3StatsAlignmentErrors	Number of received packets with alignment errors (incomplete frames).	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
dot3StatsFCSErrors	Number of packets with an FCS error. FCS errors indicate frame corruption during transmission.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
dot3StatsSingleCollisionFrames	Number of successfully transmitted frames that had exactly one collision.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
dot3StatsFrameTooLong	Number of received frames that were larger than the maximum size permitted.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsUndersizePkts	Number of packets below the minimum packet size received.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsFragments	Total number of frames received that are less than 64 bytes in length and have a CRC error.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsPkts64Octets	Number of packets received with a length less than or equal to 64 octets.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsPkts65to127Octets	Number of packets received with a length from 65 to 127 octets.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsPkts128to255Octets	Number of packets received with a length from 128 to 255 octets.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsPkts256to511Octets	Number of packets received with a length from 256 to 511 octets.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsBroadcastPkts	Total number of good broadcast packets received.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsMulticastPkts	Total number of good multicast (nonbroadcast) packets received.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsOversizePkts	Total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsJabbers	Total number of frames received that exceed the maximum 1548 bytes and contain CRC errors.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsCollisions	Best estimate of the total number of collisions on the Ethernet segment.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsCollisionFrames	Best estimate of the total number of collision frames on the Ethernet segment.	• ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-MR-10

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsCRCAlignErrors	Total number of packets received that had a length (excluding framing bits, but including FCS octets) from 64 to 1518 octets, inclusive, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
etherStatsDropEvents	Total number of events in which packets were dropped by the probe due to lack of resources. The value indicates the number of times this condition has been detected.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10
txTotalPkts	Number of packets transmitted since the last counter reset.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
rxTotalPkts	Number of packets received since the last counter reset.	• ONS 15310 CL: CE-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15310 CL: CE-100T-8 • ONS 15454 SONET: CE-1000-4, CE-100T-8
ifOutErrors	Total number of transmitted errors.	—
txPauseFrames	Number of transmitted pause frames.	—
rxPauseFrames	Number of received pause frames.	—

Table E-26 Field Descriptions for the CE-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
rxPktsDroppedInternalCongestion	Number of received packets dropped due to overflow in G1000-4 frame buffer.	—
txPktsDroppedInternalCongestion	Number of transmitted queue drops due to drops in the G1000-4 frame buffer.	—
rxControlFrames	Number of MAC control frames passed by the MAC sublayer to the MAC control sublayer.	—
mediaIndStatsRxFramesTruncated	Total number of frames received that are less than 5 bytes. This value is a part of HDLC and GFP port statistics.	—
mediaIndStatsRxFramesTooLong	Number of received frames that exceed the maximum transmission unit (MTU). This value is part of HDLC and generic framing procedure (GFP) port statistics.	—
mediaIndStatsRxFramesBadCRC	Number of received data frames with payload CRC errors when HDLC framing is used.	—
mediaIndStatsTxFramesBadCRC	Number of transmitted data frames with payload CRC errors when HDLC framing is used.	—
mediaIndStatsRxShortPkts	Number of packets below the minimum packet size received.	—
txEtherUtilizationStats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	—
rxEtherUtilizationStats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	—
NE ID	Name of the selected NE.	—

E.2.12 E-Series Ethernet PM Table—ONS 15327, ONS 15454 SONET, ONS 15454 SDH

The E-Series Ethernet PM table shows performance data for the ONS 15327, ONS 15454 SONET, and ONS 15454 SDH E-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the E-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-27 Field Descriptions for the E-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
ifInUCastPkts	Number of unicast packets received.	• ONS 15327: ETH100 • ONS 15454 SDH: ETH100, ETH1000
ifInErrors	Total number of received errors.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
ifOutUCastPkts	Number of unicast packets transmitted.	• ONS 15327: ETH100 • ONS 15454 SDH: ETH100, ETH1000
dot3StatsAlignmentErrors	Number of received packets with alignment errors (incomplete frames).	• ONS 15327: ETH100 • ONS 15454 SDH: ETH100, ETH1000

Table E-27 Field Descriptions for the E-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
dot3StatsFCSErrors	Number of packets with an FCS error. FCS errors indicate frame corruption during transmission.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
dot3StatsSingleCollisionFrames	Number of successfully transmitted frames that had exactly one collision.	• ONS 15327: ETH100 • ONS 15454 SDH: ETH100, ETH1000
dot3StatsMultipleCollisionFrames	Number of successfully transmitted frames that had multiple collisions.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100 • ONS 15454 SDH: ETH100
dot3StatsDeferredTransmissions	Number of packets deferred.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100 • ONS 15454 SDH: ETH100
dot3StatsLateCollisions	Number of times that a collision was detected later than 64 octets into the transmission (also added into the collision count).	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100 • ONS 15454 SDH: ETH100
dot3StatsExcessiveCollisions	Number of consecutive collisions.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100 • ONS 15454 SDH: ETH100
dot3StatsFrameTooLong	Number of received frames that were larger than the maximum size permitted.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsUndersizePkts	Number of packets below the minimum packet size received.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsFragments	Total number of frames received that are less than 64 bytes in length and have a CRC error.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsPkts64Octets	Number of packets received with a length less than or equal to 64 octets.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsPkts65to127Octets	Number of packets received with a length from 65 to 127 octets.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsPkts128to255Octets	Number of packets received with a length from 128 to 255 octets.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000

Table E-27 Field Descriptions for the E-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsPkts256to511Octets	Number of packets received with a length from 256 to 511 octets.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsOversizePkts	Total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsJabbers	Total number of frames received that exceed the maximum 1548 bytes and contain CRC errors.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsCollisions	Best estimate of the total number of collisions on the Ethernet segment.	• ONS 15327: ETH100 • ONS 15454 SDH: ETH100
etherStatsCollisionFrames	Best estimate of the total number of frame collisions on the segment.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherStatsCRCAlignErrors	Total number of packets received that had a length (excluding framing bits, but including FCS octets) from 64 to 1518 octets, inclusive, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100
rxTotalPkts	Number of packets received since the last counter reset.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
txTotalPkts	Number of packets transmitted since the last counter reset. **Note** This column is no longer supported for R 4.y and later NEs. For those NEs, this column displays *N/A*.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000

Table E-27 Field Descriptions for the E-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
txCollision	Number of transmitted collisions since the last counter reset. **Note** This column is no longer supported for NE R4.7 and later. For NE R4.7 and later this column displays *N/A*.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
rxEtherUtilizationStats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
txEtherUtilizationStats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15327: ETH100 • ONS 15454 SONET: ETH100, ETH1000 • ONS 15454 SDH: ETH100, ETH1000
etherUtilizationStats (%)	Average Ethernet utilization statistics (release 3.4 and earlier).	• ONS 15454 SONET R3.3 and R3.4: ETH100, ETH1000
NE ID	Name of the selected NE.	—

E.2.13 G-Series Ethernet PM Table—ONS 15327, ONS 15454 SONET, ONS 15454 SDH

The G-Series Ethernet PM table shows performance data for the ONS 15327, ONS 15454 SONET, and ONS 15454 SDH G-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the G-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-28 Field Descriptions for the G-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	—
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifInUcastPkts	Number of unicast packets received.	• ONS 15327: G1000_2 • ONS 15454 SONET: GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifInMulticastPkts	Number of multicast packets received.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifInBroadcastPkts	Number of broadcast packets received.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP

Table E-28 Field Descriptions for the G-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInErrors	Total number of received errors.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifOutUcastPkts	Number of unicast packets transmitted.	• ONS 15327: G1000_2 • ONS 15454 SONET: GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifOutMulticastPkts	Number of multicast packets transmitted.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifOutBroadcastPkts	Number of broadcast packets transmitted.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
dot3StatsAlignmentErrors	Number of received packets with alignment errors (incomplete frames).	• ONS 15327: G1000_2 • ONS 15454 SONET: GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
dot3StatsFCSErrors	Number of packets with an FCS error. FCS errors indicate frame corruption during transmission.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP

Table E-28 Field Descriptions for the G-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
dot3StatsFrameTooLong	Number of received frames that were larger than the maximum size permitted.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
dot3StatsCarrierSenseErrors	Number of transmission errors on a particular interface that are not otherwise counted.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
dot3StatsSQETestErrors	Number of times that the SQE test error message is generated by the PLS sublayer for a particular interface.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
etherStatsUndersizePkts	Number of packets below the minimum packet size received.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, ONS 15454 SDH: GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsFragments	Total number of frames received that are less than 64 bytes in length and have a CRC error.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsPkts64Octets	Number of packets received with a length less than or equal to 64 octets.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsPkts65to127Octets	Number of packets received with a length from 65 to 127 octets.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsPkts128to255Octets	Number of packets received with a length from 128 to 255 octets.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP

Table E-28 Field Descriptions for the G-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsPkts256to511Octets	Number of packets received with a length from 256 to 511 octets.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsOversizePkts	Total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsJabbers	Total number of frames received that exceed the maximum 1548 bytes and contain CRC errors.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
etherStatsCRCAlignErrors	Total number of packets received that had a length (excluding framing bits, but including FCS octets) from 64 to 1518 octets, inclusive, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: G1000_4, GE_XP, 10GE_XP
rxPauseFrames	Number of received pause frames.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4

Table E-28 Field Descriptions for the G-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
txPauseFrames	Number of transmitted pause frames.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
rxPktsDroppedInternalCongestion	Number of received packets dropped due to overflow in G1000-4 frame buffer.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
txPktsDroppedInternalCongestion	Number of transmitted queue drops due to drops in the G1000-4 frame buffer.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
rxTotalPkts	Number of packets received since the last counter reset.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: GE_XP, 10GE_XP
txTotalPkts	Number of packets transmitted since the last counter reset.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4, GE_XP, 10GE_XP • ONS 15454 SDH: GE_XP, 10GE_XP
rxGiants	Number of packets received that are greater than 1530 bytes in length.	—
hdlcPktDrops	Total number of packets that are dropped when the card is in HDLC mode and traffic is oversubscribed.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
etherStatsBroadCastPkts	Total number of good broadcast packets received.	• ONS 15454 SONET: GE_XP, 10GE_XP • ONS 15454 SDH: GE_XP, 10GE_XP
etherStatsMultiCastPkts	Total number of good multicast (nonbroadcast) packets received.	• ONS 15454 SONET: GE_XP, 10GE_XP • ONS 15454 SDH: GE_XP, 10GE_XP
rxEtherUtilizationStats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4
txEtherUtilizationStats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15327: G1000_2 • ONS 15454 SONET: G1000_4 • ONS 15454 SDH: G1000_4

Table E-28 Field Descriptions for the G-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherUtilizationStats (%)	Average Ethernet utilization statistics (release 3.4 and earlier).	• ONS 15454 SONET R3.3 and R3.4: G-series cards
NE ID	Name of the selected NE.	—

E.2.14 ML-Series Ethernet PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The ML-Series Ethernet PM table shows performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH ML-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the ML-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
Time Last Cleared	When the statistics were last reset.	• ONS 15454 SONET: ML-MR-10 • ONS 15454 SDH: ML-MR-10
ifInErrors	Total number of received errors.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifInUCastPkts	Number of unicast packets received.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInMulticastPkts	Number of multicast packets received.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifInBroadcastPkts	Number of broadcast packets received.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
Port Drop Counts	Number of received frames dropped at the port level.	• ONS 15310 CL: ML-100T-8 • ONS 15454 SONET: ML1000

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
Rx Runts	Total number of frames received that are less than 64 bytes in length and have a CRC error.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
Rx Giants	Number of packets received that are greater than 1530 bytes in length.	• ONS 15454 SONET: ML1000
Tx Giants	Number of packets transmitted that are greater than 1548 bytes in length.	• ONS 15454 SONET: ML1000
Tx Collisions	Number of collisions transmitted.	• ONS 15454 SONET: ML1000
Rx Total Errors	Total number of received errors.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
RxGMACDropCounts	Number of received frames dropped by MAC module.	• ONS 15454 SONET: ML1000
RxThresholdOversizes	Number of received packets with a length longer than 1518 octets.	• ONS 15454 SONET: ML1000
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifOutUCastPkts	Number of unicast packets transmitted.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifOutMulticastPkts	Number of multicast packets transmitted.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifOutBroadcastPkts	Number of broadcast packets transmitted.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15310 CL: ML-100T-8 • ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
dot3StatsAlignmentErrors	Number of received packets with alignment errors (incomplete frames).	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
dot3StatsFCSErrors	Number of packets with an FCS error. FCS errors indicate frame corruption during transmission.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
dot3StatsSingleCollisionFrames	Number of successfully transmitted frames that had exactly one collision.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
dot3StatsFrameTooLong	Number of received frames that were larger than the maximum size permitted.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsUndersizePkts	Number of packets below the minimum packet size received.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsPkts64Octets	Number of packets received with a length less than or equal to 64 octets.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsPkts65to127Octets	Number of packets received with a length from 65 to 127 octets.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsPkts128to255Octets	Number of packets received with a length from 128 to 255 octets.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsPkts256to511Octets	Number of packets received with a length from 256 to 511 octets.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000
etherStatsPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsBroadcastPkts	Total number of good broadcast packets received.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsMulticastPkts	Total number of good multicast (nonbroadcast) packets received.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsFragments	Total number of frames received that are less than 64 bytes in length and have a CRC error.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsOversizePkts	Total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsJabbers	Total number of octets of data (including bad packets) received on the network.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsCollisions	Best estimate of the total number of collisions on the Ethernet segment.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsCollisionFrames	Best estimate of the total number of frame collisions on the segment.	• ONS 15310 CL: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
etherStatsCRCAlignErrors	Total number of packets received that had a length (excluding framing bits, but including FCS octets) from 64 to 1518 octets, inclusive, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsDropEvents	Total number of events in which packets were dropped by the probe due to lack of resources. The value indicates the number of times this condition has been detected.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML-MR-10 • ONS 15454 SDH: ML-MR-10
txTotalPkts	Number of packets transmitted since the last counter reset.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
rxTotalPkts	Number of packets received since the last counter reset.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH: ML100T, ML1000, ML-MR-10
mediaIndStatsRxFramesBad CRC	Number of received data frames with payload CRC errors when HDLC framing is used.	• ONS 15310 CL: ML-100T-8 • ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000
mediaIndStatsRxFramesToo Long	Number of received frames that exceed the maximum transmission unit (MTU). This value is part of HDLC and generic framing procedure (GFP) port statistics.	• ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
mediaIndStatsOversizeDropped	Number of received packets larger than the ML-series remote monitoring (RMON) threshold.	• ONS 15310 CL: ML-100T-8 • ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000
txPauseFrames	Number of transmitted pause frames.	• ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000
rxPauseFrames	Number of received pause frames.	• ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000
txEtherUtilizationStats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000
rxEtherUtilizationStats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15454 SONET: ML100T, ML1000 • ONS 15454 SDH: ML100T, ML1000
dot3adAggPortStatsLACPDUsRx	Number of valid LAC PDUs received on this aggregation port.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8
dot3adAggPortStatsMarkerPDUsRx	Number of valid marker PDUs received on this aggregation port.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
dot3adAggPortStatsMarkerResponsePDUsRx	Number of valid marker response PDUs received on this aggregation port.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8
dot3adAggPortStatsUnknownRx	Number of frames received that either carry the slow protocols Ethernet type value (43B.4), but contain an unknown PDU, or are addressed to the slow protocols group MAC address (43B.3), but do not carry the slow protocols Ethernet type.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8
dot3adAggPortStatsIllegalRx	Number of frames received that carry the slow protocols Ethernet type value (43B.4), but contain a badly formed PDU or an illegal value of protocol subtype (43B.4).	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8
dot3adAggPortStatsLACPDUsTx	Number of LAC PDUs transmitted on this aggregation port.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8

Table E-29 Field Descriptions for the ML-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
dot3adAggPortStatsMarkerPDUsTx	Number of marker PDUs transmitted on this aggregation port.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8
dot3adAggPortStatsMarkerResponsePDUsTx	Number of marker response PDUs transmitted on this aggregation port.	• ONS 15310 CL: ML-100T-8 • ONS 15310 MA SONET: ML-100T-8 • ONS 15310 MA SDH: ML-100T-8 • ONS 15454 SONET: ML1000, ML100T, ML100X-8 • ONS 15454 SDH: ML1000, ML100T, ML100X-8
NE ID	Name of the selected NE.	—

E.2.15 ASAP-Series Ethernet PM Table—ONS 15600 SONET, ONS 15600 SDH

The ASAP-Series Ethernet PM table shows performance data for the ONS 15600 SONET and ONS 15600 SDH ASAP-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the ASAP-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-30 Field Descriptions for the ASAP-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ifInOctets	Number of bytes received since the last counter reset.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifInUcastPkts	Number of unicast packets received.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifInMulticastPkts	Number of multicast packets received.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifInBroadcastPkts	Number of broadcast packets received.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsOversizePkts	Total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
dot3StatsFCSErrors	Number of packets with an FCS error. FCS errors indicate frame corruption during transmission.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsUndersizePkts	Number of packets below the minimum packet size received.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4

Table E-30 Field Descriptions for the ASAP-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsJabbers	Total number of octets of data (including bad packets) received on the network.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
dot3StatsAlignmentErrors	Number of received packets with alignment errors (incomplete frames).	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifOutOctets	Number of bytes transmitted since the last counter reset.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifOutUcastPkts	Number of unicast packets transmitted.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifOutMulticastPkts	Number of multicast packets transmitted.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifOutBroadcastPkts	Number of broadcast packets transmitted.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsDropEvents	Total number of events in which packets were dropped by the probe due to lack of resources. The value indicates the number of times this condition has been detected.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts	Number of packets received with a length from 1024 to 1518 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4

Table E-30 Field Descriptions for the ASAP-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsBroadcastPkts	Total number of good broadcast packets received.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsMulticastPkts	Total number of good multicast (nonbroadcast) packets received.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsFragments	Total number of frames received that are less than 64 bytes in length and have a CRC error.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts64Octets	Number of packets received with a length less than or equal to 64 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts65to127Octets	Number of packets received with a length from 65 to 127 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts128to255Octets	Number of packets received with a length from 128 to 255 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts256to511Octets	Number of packets received with a length from 256 to 511 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
etherStatsPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4

Table E-30 Field Descriptions for the ASAP-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInErrors	Total number of received errors.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
ifOutErrors	Total number of transmitted errors.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
dot3StatsInternalMacTxErrors	A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmission error.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
dot3StatsFrameTooLong	Number of received frames that were larger than the maximum size permitted.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
dot3StatsInternalMacRxErrors	A count of frames for which reception on a particular interface fails due to an internal MAC sublayer received error.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
dot3StatsSymbolErrors	Number of times there was an invalid data symbol when a valid carrier was present on a particular interface.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
rxPauseFrames	Number of received pause frames.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
txPauseFrames	Number of transmitted pause frames.	ONS 15600 SONET: ASAP_4 ONS 15600 SDH: ASAP_4
Tx Utilization (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	ONS 15600 SONET: ASAP_4
Rx Utilization (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	ONS 15600 SONET: ASAP_4
NE ID	Name of the selected NE.	—

E.2.16 DWDM-Series Ethernet PM Table—ONS 15454 SONET, ONS 15454 SDH

The DWDM-Series Ethernet PM table shows performance data for the ONS 15454 SONET and ONS 15454 SDH DWDM-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the DWDM-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	—
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInMulticastPkts	Number of multicast packets received.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifInBroadcastPkts	Number of broadcast packets received.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifInErrors	Total number of received errors.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifOutMulticastPkts	Number of multicast packets transmitted.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10G
ifOutBroadcastPkts	Number of broadcast packets transmitted.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10G
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
dot3StatsFCSErrors	Number of packets with an FCS error. FCS errors indicate frame corruption during transmission.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
dot3StatsFrameTooLong	Number of received frames that were larger than the maximum size permitted.	• ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP
etherStatsUndersizePkts	Number of packets below the minimum packet size received.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsFragments	Total number of frames received that are less than 64 bytes in length and have a CRC error.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsPkts64Octets	Number of packets received with a length less than or equal to 64 octets.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsPkts65to127Octets	Number of packets received with a length from 65 to 127 octets.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsPkts128to255Octets	Number of packets received with a length from 128 to 255 octets.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsPkts256to511Octets	Number of packets received with a length from 256 to 511 octets.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsBroadcastPkts	Total number of good broadcast packets received.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsMulticastPkts	Total number of good multicast (nonbroadcast) packets received.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsOversizePkts	Total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsJabbers	Total number of frames received that exceed the maximum 1548 bytes and contain CRC errors.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
etherStatsCRCAlignErrors	Total number of packets received that had a length (excluding framing bits, but including FCS octets) from 64 to 1518 octets, inclusive, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP
etherStatsPkts1519tomaxOctets	Total number of packets (including bad packets) received that were 1591 octets in length (excluding framing bits, but including FCS octets).	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
mediaIndStatsTXShortPkts	Number of transmitted frames containing less than the minimum permitted frame size as programmed with the transmit MAC Min Frame Length Configuration Register.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
rxPauseFrames	Number of received pause frames.	• ONS 15454 SONET: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
rxTotalPkts	Number of packets received since the last counter reset.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
txTotalPkts	Number of packets transmitted since the last counter reset.	• ONS 15454 SONET: 10GE_XP, 2.5G_DM, 2.5G_DMP, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE • ONS 15454 SDH: 10GE_XP, 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE
mediaIndStatsRxFramesTruncated	Total number of frames received that are less than 5 bytes. This value is a part of HDLC and GFP port statistics.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
mediaIndStatsRxFramesTooLong	Number of received frames that exceed the MTU. This value is part of HDLC and GFP port statistics.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G,
mediaIndStatsRxFramesBadCRC	Number of received data frames with payload CRC errors when HDLC framing is used.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE
mediaIndStatsTxLcvErrorSG	Number of transmitted line code violations at the PCS layer for GE/FC payload.	• ONS 15454 SONET: AR_XP, AR_XPE • ONS 15454 SDH: AR_XP, AR_XPE
mediaIndStatsLxLcvErrorSG	Number of received line code violations at the PCS layer for GE/FC payload.	• ONS 15454 SONET: AR_XP, AR_XPE • ONS 15454 SDH: AR_XP, AR_XPE
mediaIndStatsTxFramesBadCRC	Number of transmitted data frames with payload CRC errors when HDLC framing is used.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G, AR_XP, AR_XPE

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
rxControlFrames	Number of MAC control frames passed by the MAC sublayer to the MAC control sublayer.	• ONS 15454 SONET: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
rxUnknownOpcodeFrames	Number of MAC control frames received that contain an opcode that is not supported by the device.	• ONS 15454 SONET: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifInErrorBytePkts	Number of received bytes with errors.	• ONS 15454 SDH: ADM_10G
ifInFramingErrorPkts	Number of received framing error counters.	• ONS 15454 SONET: MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: ADM_10G, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifInJunkInterPkts	Number of received interpacket junk counters.	• ONS 15454 SONET: MXP_MR_10DME, TXP_MR_10G • ONS 15454 SDH: ADM_10G, MXP_MR_10DME, TXP_MR_10G
etherStatsPkts	Number of packets received.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP
Dot3StatsControlInUnknown OpCodes	Number of MAC control frames received on the interface that contain an opcode that is not supported by the device.	• ONS 15454 SONET: 10GE_XP, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G • ONS 15454 SDH: 10GE_XP, GE_XP, MXP_MR_10DME, TXP_MR_10E, TXP_MR_10G
ifOutUCastPtks	Number of unicast packets transmitted.	• ONS 15454 SONET: ADM_10G MXP_MR_10DME, TXP_MR_10E • ONS 15454 SDH: ADM_10G, MXP_MR_10DME, TXP_MR_10E
Dot3StatsInPauseFrames	Number of received pause frames.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
Dot3StatsOutPauseFrames	Number of transmitted pause frames.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
Dot3StatsLcvErrors	A count of transmitted frames that are an integral number of octets in length and do not pass the FCS check.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
dot3StatsLayer1Errors	Number of Layer 1 errors as defined within the following conditions: • During Packet Reception—Layer 1 errors are counted only one time per packet. The error is indicated as a direct result of a line side protocol violation in which RX_DV is asserted. This is an uncommon event that could the reason why a device loses synchronization. • During Interpacket Reception—The Layer 1 error is indicated as a direct result of a line side protocol violation in which RX_DV is deasserted. This is an uncommon event. The Layer 1 error is also asserted on detection of a False Carrier indication and an errored byte (interpacket) signal encoding. When the error is asserted during interpacket reception, it is statistically asserted only in the vector.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
EtherStatsPkts1519to1522Octets	Number of packets received with a length from 1519 to 1522 octets.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP
ifInUCastPkts	Number of unicast packets received.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E
ifOutErrors	Total number of transmitted errors.	• ONS 15454 SONET: 10GE_XP, ADM_10G, GE_XP • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP
dot3StatsAlignmentErrors	Number of received packets with alignment errors (incomplete frames).	• ONS 15454 SONET: 10GE_XP, GE_XP, MXP_MR_10DME, TXP_MR_10E • ONS 15454 SDH: 10GE_XP, ADM_10G, GE_XP, MXP_MR_10DME, TXP_MR_10E
ifHCInOctets	Number of bytes received since the last counter reset—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifHCInUcastPkts	Number of unicast packets received—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
ifHCInMulticastPkts	Number of multicast packets received—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
ifHCInBroadcastPkts	Number of broadcast packets received—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
ifHCOutOctets	Number of bytes transmitted since the last counter reset—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
ifHCOutMulticastPkts	Number of multicast packets transmitted—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
ifHCOutBroadcastPkts	Number of broadcast packets transmitted—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityPkts	Number of packets received—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityOctets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets)—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityPkts64Octets	Number of packets received with a length less than or equal to 64 octets—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityPkts65to127Octets	Number of packets received with a length from 65 to 127 octets—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityPkts128to255Octets	Number of packets received with a length from 128 to 255 octets—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityPkts256to511Octets	Number of packets received with a length from 256 to 511 octets—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
etherStatsHighCapacityPkts512to1023Octets	Number of packets received with a length from 512 to 1023 octets—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
etherStatsHighCapacityPkts1024to1518Octets	Number of packets received with a length from 1024 to 1518 octets—high capacity.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisRxReports	Total Internet Group Management Protocol (IGMP) membership reports received at an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisRxLeaves	Total IGMP leave messages received at an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisTxReports	Total IGMP membership reports transmitted through an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisTxLeaves	Total IGMP leave messages transmitted through an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisTxGeneralQueries	Total IGMP general queries transmitted through an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisTxGroupSpecificQueries	Total IGMP group-specific queries transmitted through an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisRxGeneralQueries	Total IGMP general queries received at an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisRxGroupSpecificQueries	Total IGMP group-specific queries received at an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisRxValidPackets	Total valid IGMP packets received at an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
cisRxInvalidPackets	Total invalid IGMP packets received at an interface.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
crepHflRxPdus	Number of hardware flood layer PDUs received on the port.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
crepHflTxPdus	Number of hardware flood layer PDUs transmitted on the port.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP

Table E-31 Field Descriptions for the DWDM-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
crepLslRxPdus	Number of link status layer PDUs received on the port.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
crepLslTxPdus	Number of link status layer PDUs transmitted on the port.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
dot3adAggPortStatsLACPDUsRx	Number of valid LACPDUs received on this Aggregation Port.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
dot3adAggPortStatsLACPDUsTx	Number of LACPDUs transmitted on this Aggregation Port.	• ONS 15454 SONET: 10GE_XP, GE_XP • ONS 15454 SDH: 10GE_XP, GE_XP
rxEtherUtilizationStats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E
txEtherUtilizationStats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME, TXP_MR_10E
NE ID	Name of the selected NE.	—

E.2.17 CPT-Series Ethernet PM Table—ONS 15454 SONET, ONS 15454 SDH

The CPT-Series Ethernet PM table shows performance data for the ONS 15454 SONET and ONS 15454 SDH CPT-series Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the CPT-Series Ethernet PM table.

Note Real-time PM data is not available for Ethernet cards on NE releases earlier than release 5.0.

Table E-32 Field Descriptions for the CPT-Series Ethernet PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
rxTotalPackets	Total number of packets received.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifInUCastPkts	Number of unicast packets received.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifInMulticastPkts	Number of multicast packets received.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4

Table E-32 Field Descriptions for the CPT-Series Ethernet PM Table (continued)

Field	Description	Cards Supported
ifInErrors	Total number of received errors.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
txTotalPkts	Number of packets transmitted since the last counter reset.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifOutUCastPkts	Number of unicast packets transmitted.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifOutMulticastPkts	Number of multicast packets transmitted.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
ifOutErrors	Total number of transmitted errors.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
rxEtherUtilizationStats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
txEtherUtilizationStats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15454 SONET: PTSA_GE, PTF_10GE_4, PT_10GE_4 • ONS 15454 SDH: PTSA_GE, PTF_10GE_4, PT_10GE_4
NE ID	Name of the selected NE.	—

E.2.18 GFP PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, ONS 15454 SDH, and ONS 15600 SDH

The GFP PM table provides monitoring capability to allow operators to identify performance degradation in the generic framing procedure (GFP) multiplexing and framing. GFP describes a framing and encapsulation format for transporting L2/L3 data over SONET, SDH, or OTN transport networks.

You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the GFP PM table.

Table E-33 Field Descriptions for the GFP PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
GfpStatsRxSBitErrors	Number of GFP single-bit errors in the CHEC.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, ML-MR-10, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML-MR-10, MXP_MR_10DME • ONS 15600 SDH: ASAP_4

Table E-33 Field Descriptions for the GFP PM Table (continued)

Field	Description	Cards Supported
GfpStatsRxMBitErrors	Number of GFP multibit errors in the CHEC.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, ML-MR-10, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML-MR-10, MXP_MR_10DME • ONS 15600 SDH: ASAP_4
GfpStatsRxTypeInvalid	Number of GFP invalid UPI fields in the type field.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, ML-MR-10, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML-MR-10, MXP_MR_10DME • ONS 15600 SDH: ASAP_4
GfpStatsRxCRCErrors	Number of superblock CRC errors in the transparent GFP frame.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, ML-MR-10, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML-MR-10, MXP_MR_10DME • ONS 15600 SDH: ASAP_4

Table E-33 Field Descriptions for the GFP PM Table (continued)

Field	Description	Cards Supported
GfpStatsRxCIDInvalid	Number of received frames with an invalid channel ID (CID).	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, ML-MR-10, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML-MR-10, MXP_MR_10DME
GfpStatsCSFRaised	Number of GFP client signal fail frames.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, ML-MR-10, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML-MR-10, MXP_MR_10DME
GfpStatsRxFrame	Number of received data frames.	ONS 15600 SDH: ASAP_4
GfpStatsTxFrame	Number of transmitted data frames.	ONS 15600 SDH: ASAP_4
GfpStatsRxOctets	Number of received data octets.	ONS 15600 SDH: ASAP_4
GfpStatsTxOctets	Number of transmitted data octets.	ONS 15600 SDH: ASAP_4
GfpStatsLFDRaised	Number of GFP LFD frames.	—
GfpStatsRoundTripLatency	Round-trip delay (in milliseconds [ms]) for the end-to-end FC transport.	—
GfpStatsRxSBlkCRCErrors	Number of super block CRC errors detected in the received GFP-T frames.	—
GfpStatsRxDistanceExtBuffers	Number of received buffer credits for GFP-T (valid only if distance extension is enabled).	—
GfpStatsTxDistanceExtBuffers	Number of transmitted buffer credits for GFP-T (valid only if distance extension is enabled).	—
gfpStatscHecRxMBitErrors	Number of received GFP frames with single bit errors in the core header (these errors are uncorrectable).	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
gfpStatstHecRxMBitErrors	Number of received GFP frames with single bit errors in the tHec (these errors are uncorrectable).	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
NE ID	Name of the selected NE.	—

E.2.19 LEX PM Table—ONS 15454 SONET, ONS 15454 SDH

The LEX PM table provides monitoring of performance parameters related to HDLC particular framing (LEX) on optical interfaces. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Note LEX monitors performance parameters only on ADM-10G cards.

The following table describes the fields in the LEX PM table.

Table E-34 Field Descriptions for the LEX PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Rx Total Packets	Number of bytes received since the last counter reset.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
ifInErrors	Total number of received errors.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
Tx Total Packets	Number of packets transmitted since the last counter reset.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G

Table E-34 Field Descriptions for the LEX PM Table

Field	Description	Cards Supported
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
mediaIndStatsRxFramesBadCRC	Number of received data frames with payload CRC errors when HDLC framing is used.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
hdlcInOctets	Number of bytes received (from the SONET/SDH path) prior to the bytes undergoing HLDC decapsulation by the policy engine.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
hdlcRxAborts	Number of received packets aborted on input.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
hdlcOutOctets	Number of bytes transmitted (to the SONET/SDH path) after the bytes undergoing HLDC encapsulation by the policy engine.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G
IfInPayloadCrcErrors	Number of payload CRC errors received since the last counter reset.	• ONS 15454 SONET: ADM-10G • ONS 15454 SDH: ADM-10G

E.2.20 High Order PM Table (Far End)—ONS 15310 MA SDH, ONS 15454 SDH

The SDH High Order PM table shows far-end performance data for the far-end ONS 15310 MA SDH and ONS 15454 SDH high-order sections. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the High Order PM table.

Table E-35 Field Descriptions for the High Order PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
HP-EB	High-order path errored block. HP-EB indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-BBE	High-order path background block errors. HP-BBE is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-ES	High-order path errored seconds. HP-ES is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E

Table E-35 Field Descriptions for the High Order PM Table (Far End) (continued)

Field	Description	Cards Supported
HP-SES	High-order path severely errored seconds. HP-SES is a one-second period containing 30 percent or more errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-UAS	High-order path unavailable seconds. HP-UAS is a count of the seconds when the VC path was unavailable. A high-order path becomes unavailable when ten consecutive seconds occur that qualify as HP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as HP-SESs.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-ESR	High-order path errored seconds ratio. HP-ESR is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-SESR	High-order path severely errored seconds ratio. HP-SESR is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-BBER	High-order path background block error ratio. HP-BBER is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E

Table E-35 Field Descriptions for the High Order PM Table (Far End) (continued)

Field	Description	Cards Supported
HP-FC	High-order path failure count. HP-FC is a count of the number of failed events.	• ONS 15310 MA SDH: CTX, E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: MRC_4, MRC_12_2.5G
NE ID	Name of the selected NE.	—

E.2.21 High Order PM Table (Far End)—ONS 15600 SDH

The High Order PM table shows far-end performance data for the ONS 15600 SDH high-order section. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the High Order PM table.

Table E-36 Field Descriptions for the High Order PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
HP-EB	High-order path errored blocks (HP-EB) indicates that bits are in error within a block.	ASAP_4, STM16_16, STM64_4
HP-ES	High-order path errored seconds (HP-ES) is a one-second period with one or more errored blocks or at least one defect.	ASAP_4, STM16_16, STM64_4

Table E-36 Field Descriptions for the High Order PM Table (Far End) (continued)

Field	Description	Cards Supported
HP-SES	High-order path severely errored seconds (HP-SES) is a one-second period containing more than 30 percent errored blocks or at least one defect. SES is a subset of ES.	ASAP_4, STM16_16, STM64_4
HP-UAS	High-order path unavailable seconds (HP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as HP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as HP-SESs.	ASAP_4, STM16_16, STM64_4
HP-FC	High-order path failure count (HP-FC) is a count of the number of failed events.	ASAP_4, STM16_16, STM64_4
HP-BBE	High-order path background block errors (HP-BBE) is an errored block not occurring as part of a severely errored second (SES).	ASAP_4, STM16_16, STM64_4
HP-ESR	High-order path errored seconds ratio (HP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	ASAP_4, STM16_16, STM64_4
HP-SESR	High-order path severely errored seconds ratio (HP-SESR) is the ratio of SESs to total seconds in available time during a fixed measurement interval.	ASAP_4, STM16_16, STM64_4
HP-BBER	High-order path background block error ratio (HP-BBER) is the ratio of background block errors (BBEs) to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	ASAP_4, STM16_16, STM64_4
NE ID	Name of the selected NE.	—

E.2.22 High Order PM Table—ONS 15310 MA SDH, ONS 15454 SDH

The High Order PM table shows performance data for the ONS 15310 MA SDH and ONS 15454 SDH physical sections. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the High Order PM table.

Table E-37 Field Descriptions for the High Order PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
HP-EB	High-order path errored blocks (HP-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-ES	High-order path errored seconds (HP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-SES	High-order path severely errored seconds (HP-SES) is a one-second period containing greater than 30% errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E

Table E-37 Field Descriptions for the High Order PM Table (continued)

Field	Description	Cards Supported
HP-UAS	High-order path unavailable seconds (HP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as HP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as HP-SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-FC	Number of failed events.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: MRC_4, MRC_12_2.5G
HP-BBE	High-order path background block errors (HP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-ESR	High-order path errored seconds ratio (HP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E

Table E-37 Field Descriptions for the High Order PM Table (continued)

Field	Description	Cards Supported
HP-SESR	High-order path severely errored seconds ratio (HP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-BBER	High-order path background block error ratio (HP-BBER) is the ratio of background block errors (BBEs) to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, DS3I, DS3IN, E1N, E1, E1_42, E3, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
Positive Pointer Justification Count Path Detected	Positive pointer justification count, path detected is a count of the positive pointer justifications detected on a particular path on an incoming SDH signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-NPJC-Pdet	HP-NPJC-Pdet multiplex section, negative pointer justification count, path detected (MS-NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SDH signal.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E

Table E-37 Field Descriptions for the High Order PM Table (continued)

Field	Description	Cards Supported
HP-PPJC-Pgen	HP-PPJC-Pgen multiplex section, positive pointer justification count, path generated (MS-PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-NPJC-Pgen	HP-NPJC-Pgen multiplex section, negative pointer justification count, path generated (MS-NPJC-Pgen) is a count of the negative pointer justifications generated for a particular path.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-PJ-DIFF	Sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
HP-PJCS-Pdet	Number of high-order path pointer justification count seconds detected on a particular path.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E

Table E-37 Field Descriptions for the High Order PM Table (continued)

Field	Description	Cards Supported
HP-PJCS-Pgen	Number of high-order path pointer justification count seconds generated for a particular path.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC192_XFP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E
NE ID	Name of the selected NE.	—

E.2.23 High Order PM Table—ONS 15600 SDH

The High Order PM table shows performance data for the ONS 15600 SDH physical section. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the High Order PM table.

Table E-38 Field Descriptions for the High Order PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp *(time zone)*	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-38 Field Descriptions for the High Order PM Table (continued)

Field	Description	Cards Supported
HP-EB	High-order path errored blocks (HP-EB) indicates that one or more bits are in error within a block.	ASAP_4, STM16_16, STM64_4
HP-ES	High-order path errored seconds (HP-ES) is a one-second period with one or more errored blocks or at least one defect.	ASAP_4, STM16_16, STM64_4
HP-SES	High-order path severely errored seconds (HP-SES) is a one-second period containing greater than 30% errored blocks or at least one defect. SES is a subset of ES.	ASAP_4, STM16_16, STM64_4
HP-UAS	High-order path unavailable seconds (HP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as HP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as HP-SESs.	ASAP_4, STM16_16, STM64_4
HP-FC	High-order path failure count (HP-FC) is a count of the number of failed events.	ASAP_4, STM16_16, STM64_4
HP-BBE	High-order path background block errors (HP-BBE) is an errored block not occurring as part of an SES.	ASAP_4, STM16_16, STM64_4
HP-ESR	High-order path errored seconds ratio (HP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	ASAP_4, STM16_16, STM64_4
HP-SESR	High-order path severely errored seconds ratio (HP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	ASAP_4, STM16_16, STM64_4
HP-BBER	High-order path background block error ratio (HP-BBER) is the ratio of BBEs to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	ASAP_4, STM64_4, STM16_16
HP-PPJC-Pdet	HP-PPJC-Pdet multiplex section, positive pointer justification count, path detected (MS-PPJC-Pdet) is a count of the positive pointer justifications detected on a particular path on an incoming SDH signal.	STM64_4, STM16_16
HP-NPJC-Pdet	HP-NPJC-Pdet multiplex section, negative pointer justification count, path detected (MS-NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SDH signal.	STM64_4, STM16_16
HP-PPJC-Pgen	HP-PPJC-Pgen multiplex section, positive pointer justification count, path generated (MS-PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path.	STM64_4, STM16_16
HP-NPJC-Pgen	HP-NPJC-Pgen multiplex section, negative pointer justification count, path generated (MS-NPJC-Pgen) is a count of the negative pointer justifications generated for a particular path.	STM64_4, STM16_16
NE ID	Name of the selected NE.	—

E.2.24 IP SLA PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, and ONS 15454 SDH

The IP SLA PM table allows you to monitor service-level agreements (SLAs) for IP networks. Service levels are measured by downtime, bandwidth, latency, jitter, packet loss, and so on. These measurements are controllable and do not depend on network traffic.

You can display IP SLA performance data in real time. When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Note

- You can launch the IP SLA PM table only from the IP SLA table, not from the Domain Explorer or the NE Explorer.
- Performance monitoring is disabled for the IP SLA echo operation. If you select an echo row in the IP SLA PM table, the Performance menu is disabled.

The following table describes the fields in the IP SLA PM table.

Table E-39 Field Descriptions for the IP SLA PM Table

Field	Description	Cards Supported
Alias NE ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
NE ID	Name of the selected NE.	—
Validity	Whether the data in the entry is valid.	—
rttMonJitterStatsCompletions	Number of jitter operations that have completed successfully.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsOverThresholds	Number of jitter operations that violate the threshold.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsNumOfRTT	Number of successful round trips.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsRTTSum	Sum of the round-trip values, in milliseconds (ms).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsRTTSum2Low	Sum of the squares of the low round-trip values, in ms.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsRTTSum2High	Sum of the squares of the high round-trip values, in ms.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsRTTMin	Minimum number of round-trip times (RTTs) that were measured successfully.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsRTTMax	Maximum number of RTTs that were measured successfully.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsMinOfPositivesSD	Minimum positive jitter values from the source to the destination, in ms. Positive jitter values indicate delays in receiving time from one packet to another.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsMaxOfPositivesSD	Maximum positive jitter values from the source to the destination, in ms. Positive jitter values indicate delays in receiving time from one packet to another.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsNumOfPositivesSD	Number of jitter values from the source to the destination that are positive (that is, network latency increases for two consecutive test packets).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsSumOfPositivesSD	Sum of the positive values, in ms.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2PositivesSDLow	Sum of the squares of the low positive values.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2PositivesSDHigh	Sum of the squares of the high positive values.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsMinOfNegativesSD	Minimum negative jitter values from the source to the destination. The absolute value is given.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsMaxOfNegativesSD	Maximum negative jitter values from the source to the destination. The absolute value is given.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsNumOfNegativesSD	Number of jitter values from the source to the destination that are negative (that is, network latency decreases for two consecutive test packets).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSumOfNegativesSD	Sum of the negative values.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2NegativesSDLow	Sum of the squares of the negative low values.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2NegativesSDHigh	Sum of the squares of the negative high values.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsMinOfPositivesDS	Minimum of all positive jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsMaxOfPositivesDS	Maximum of all positive jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsNumOfPositivesDS	Sum of numbers of all positive jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSumOfPositivesDS	Sum of RTTs of all positive jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2PositivesDSLow	Sum of squares of RTTs of all positive jitter values from packets sent from the destination to the source (low-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2PositivesDSHigh	Sum of the squares of RTTs of all positive jitter values from packets sent from the destination to the source (high-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsMinOfNegativesDS	Minimum of all negative jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsMaxOfNegativesDS	Maximum of all negative jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsNumOfNegativesDS	Sum of numbers of all negative jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSumOfNegativesDS	Sum of RTTs of all negative jitter values from packets sent from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsSum2NegativesDSLow	Sum of the squares of RTTs of all negative jitter values from packets sent from the destination to the source (low-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsSum2 NegativesDSHigh	Sum of the squares of RTTs of all negative jitter values from packets sent from the destination to the source (high-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsPacke tLossSD	Number of packets lost from the source to the destination.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsPacke tLossDS	Number of packets lost from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsPacke tOutOfSequence	Number of packets that were returned out of order.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsPacke tMIA	Number of packets lost where the direction (source-to-destination or destination-to-source) cannot be determined.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsPacketLateArrival	Number of packets that arrived after the timeout.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsError	Number of times an operation could not be started due to other internal failures.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsBusies	Number of times the operation could not be started because the previously scheduled run was not finished.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWSumSD	Sum of one-way times from the source to the destination.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWSum2SDLow	Sum of the squares of one-way times from the source to the destination (low-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsOWSum2SDHigh	Sum of the squares of one-way times from the source to the destination (high-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWMinSD	Minimum of all one-way times from the source to the destination.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWMaxSD	Maximum of all one-way times from the source to the destination.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWSumDS	Sum of one-way times from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWSum2DSLow	Sum of the squares of one-way times from the destination to the source (low-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

Table E-39 Field Descriptions for the IP SLA PM Table (continued)

Field	Description	Cards Supported
rttMonJitterStatsOWSum2DSHigh	Sum of the squares of one-way times from the destination to the source (high-order 32 bits).	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWMinDS	Minimum of all one-way times from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWMaxDS	Maximum of all one-way times from the destination to the source.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsNumOfOW	Number of one-way times that were measured successfully.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10
rttMonJitterStatsOWMinSDNew	Minimum of all one-way times from the source to the destination. Replaces deprecated rttMonJitterStatsOWMinSD.	• ONS 15310 CL—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15310 MA SONET—ML-100T-8 • ONS 15310 MA SDH—ML-100T-8 • ONS 15454 SONET—ML100T, ML100X-8, ML1000, ML-MR-10 • ONS 15454 SDH—ML100T, ML100X-8, ML1000, ML-MR-10

E.2.25 Low Order VC11 PM Table—ONS 15454 SDH

The Low Order VC11 PM table shows performance data for the ONS 15454 SDH low-order VC11. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Low Order VC11 PM table.

Table E-40 Field Descriptions for the Low Order VC11 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
VC11-LP-EB	Low-order path errored block (LP-EB) indicates that one or more bits are in error within a block.	—
VC11-LP-BBE	Low-order path background block error (LP-BBE) is an errored block not occurring as part of an SES.	—
VC11-LP-ES	Low-order path errored seconds (LP-ES) is a one-second period with one or more errored blocks or at least one defect.	—
VC11-LP-SES	Low-order path severely errored seconds (LP-SES) is a one-second period containing greater than 30% errored blocks or at least one defect. SES is a subset of ES.	—
VC11-LP-UAS	Low-order path unavailable seconds (LP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as LP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as LP-SESs.	—

Table E-40 Field Descriptions for the Low Order VC11 PM Table (continued)

Field	Description	Cards Supported
VC11-LP-ESR	Low-order path errored second ratio (LP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	—
VC11-LP-SESR	Low-order path severely errored second ratio (LP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	—
VC11-LP-BBER	Low-order path background block error ratio (LP-BBER) is the ratio of BBEs to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	—
NE ID	Name of the selected NE.	—

E.2.26 Low Order VC12 PM Table—ONS 15310 MA SDH, ONS 15454 SDH

The Low Order VC12 PM table shows performance data for the ONS 15310 MA SDH and ONS 15454 SDH low-order VC12. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Low Order VC12 PM table.

Table E-41 Field Descriptions for the Low Order VC12 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-41 Field Descriptions for the Low Order VC12 PM Table (continued)

Field	Description	Cards Supported
VC12-LP-EB	Low-order path errored block (LP-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-BBE	Low-order path background block error (LP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-ES	Low-order path errored seconds (LP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-SES	Low-order path severely errored seconds (LP-SES) is a one-second period containing greater than 30% errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-UAS	Low-order path unavailable seconds (LP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as LP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as LP-SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-ESR	Low-order path errored second ratio (LP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-SESR	Low-order path severely errored second ratio (LP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42

Table E-41 Field Descriptions for the Low Order VC12 PM Table (continued)

Field	Description	Cards Supported
VC12-LP-BBER	Low-order path background block error ratio (LP-BBER) is the ratio of BBEs to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
NE ID	Name of the selected NE.	—

E.2.27 Low Order VC11 Section PM Table (Far End)—ONS 15454 SDH

The Low Order VC11 Section PM table shows far-end performance data for the ONS 15454 SDH low-order VC11 section far end. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Low Order VC11 Section PM table.

Table E-42 Field Descriptions for the Low Order VC11 Section PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
VC11-LP-EB	Low-order errored block (LP-EB) indicates that one or more one or more bits are in error within a block.	—

Table E-42 Field Descriptions for the Low Order VC11 Section PM Table (Far End) (continued)

Field	Description	Cards Supported
VC11-LP-BBE	Low-order background block errors (LP-BBE) is an errored block not occurring as part of an SES.	—
VC11-LP-ES	Low-order errored seconds (LP-ES) is a one-second period with one or more errored blocks or at least one defect.	—
VC11-LP-SES	Low-order severely errored seconds (LP-SES) is a one-second period containing greater than or equal to 30 percent errored blocks or at least one defect. SES is a subset of ES.	—
VC11-LP-UAS	Low-order unavailable seconds (LP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as LP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as LP-SESs.	—
VC11-LP-ESR	Low-order errored second ratio (LP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	—
VC11-LP-SESR	Low-order severely errored second ratio (LP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	—
VC11-LP-BBER	Low-order background block error ratio (LP-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	—
NE ID	Name of the selected NE.	—

E.2.28 Low Order VC12 Section PM Table (Far End)—ONS 15310 MA SDH, ONS 15454 SDH

The Low Order VC12 Section PM table shows far-end performance data for the ONS 15310 MA SDH and ONS 15454 SDH low-order VC12 section far end. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Low Order VC12 Section PM table.

Table E-43 Field Descriptions for the Low Order VC12 Section PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
VC12-LP-EB	Low-order errored block (LP-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-BBE	Low-order background block errors (LP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-ES	Low-order errored seconds (LP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-SES	Low-order severely errored seconds (LP-SES) is a one-second period containing greater than or equal to 30 percent errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-UAS	Low-order unavailable seconds (LP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as LP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as LP-SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-ESR	Low-order errored second ratio (LP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42

Table E-43 Field Descriptions for the Low Order VC12 Section PM Table (Far End) (continued)

Field	Description	Cards Supported
VC12-LP-SESR	Low-order severely errored second ratio (LP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
VC12-LP-BBER	Low-order background block error ratio (LP-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: E1, E1N, E1_42
NE ID	Name of the selected NE.	—

E.2.29 Low Order VC3 PM Table—ONS 15310 MA SDH, ONS 15454 SDH

The Low Order VC3 PM table shows performance data for the ONS 15310 MA SDH and ONS 15454 SDH low-order VC3. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Low Order VC3 PM table.

Table E-44 Field Descriptions for the Low Order VC3 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—

Table E-44 Field Descriptions for the Low Order VC3 PM Table (continued)

Field	Description	Cards Supported
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
VC3-LP-EB	Low-order path errored block (LP-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-BBE	Low-order path background block error (LP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-ES	Low-order path errored seconds (LP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-SES	Low-order path severely errored seconds (LP-SES) is a one-second period containing greater than 30% errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-UAS	Low-order path unavailable seconds (LP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as LP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as LP-SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-ESR	Low-order path errored second ratio (LP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-SESR	Low-order path severely errored second ratio (LP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-BBER	Low-order path background block error ratio (LP-BBER) is the ratio of BBEs to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
NE ID	Name of the selected NE.	—

E.2.30 Low Order VC3 Section PM Table (Far End)—ONS 15310 MA SDH and ONS 15454 SDH

The Low Order VC3 Section PM table shows far-end performance data for the far-end ONS 15310 MA SDH and ONS 15454 SDH low-order VC3 sections. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Low Order VC3 Section PM table.

Table E-45 Field Descriptions for the Low Order VC3 Section PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Interface	Interface name of the selected NE.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
VC3-LP-EB	Low-order section errored block (LP-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-BBE	Low-order section background block errors (LP-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3

Table E-45 Field Descriptions for the Low Order VC3 Section PM Table (Far End) (continued)

Field	Description	Cards Supported
VC3-LP-ES	Low-order section errored seconds (LP-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-SES	Low-order section severely errored seconds (LP-SES) is a one-second period containing greater than or equal to 30 percent errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-UAS	Low-order section unavailable seconds (LP-UAS) is a count of the seconds when the VC path was unavailable. A low-order path becomes unavailable when ten consecutive seconds occur that qualify as LP-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as LP-SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-ESR	Low-order section errored second ratio (LP-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-SESR	Low-order section severely errored seconds ratio (LP-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
VC3-LP-BBER	Low-order section background block error ratio (LP-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: E1_21_E3_DS3_3, E1_63_E3_DS3_3 • ONS 15454 SDH: DS3I, DS3IN, E3
NE ID	Name of the selected NE.	—

E.2.31 Multiplex Section PM Table (Far End)—ONS 15310 MA SDH, ONS 15454 SDH

The Multiplex Section PM table shows far-end performance data for the ONS 15310 MA SDH and ONS 15454 SDH multiplex sections (far-end). You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.

- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Multiplex Section PM table.

Table E-46 Field Descriptions for the Multiplex Section PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
MS-EB	Multiplex section errored block (MS-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-ES	Multiplex section errored seconds (MS-E) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G

Table E-46 Field Descriptions for the Multiplex Section PM Table (Far End) (continued)

Field	Description	Cards Supported
MS-SES	Multiplex section severely errored seconds (MS-SES) is a one-second period that contains 30 percent or more errored blocks or at least one defect. SES is a subset of ES. For more information, see ITU-T G.829 Section 5.1.3.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-UAS	Multiplex section unavailable seconds (MS-UAS) is a count of the seconds when the section was unavailable. A section becomes unavailable when ten consecutive seconds occur that qualify as MS-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as MS-SESs. When the condition is entered, MS-SESs decrement and then count toward MS-UAS.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MRC_4, ADM_10G, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-FC	Multiplex section failure count (MS-FC) is a count of the number of failed events.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: ADM_10G
MS-BBE	Multiplex section background block errors (MS-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-ESR	Multiplex section errored seconds ratio (MS-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G

Table E-46 Field Descriptions for the Multiplex Section PM Table (Far End) (continued)

Field	Description	Cards Supported
MS-SESR	Multiplex section severely errored seconds ratio (MS-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-BBER	Multiplex section background block errored ratio (MS-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
NE ID	Name of the selected NE.	—

E.2.32 Multiplex Section PM Table (Far End)—ONS 15600 SDH

The Multiplex Section PM table shows far-end performance data for the ONS 15600 SDH multiplex section far end. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Multiplex Section PM table.

Table E-47 Field Descriptions for the Multiplex Section PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
MS-EB	Multiplex section errored block (MS-EB) indicates that one or more bits are in error within a block.	ASAP_4, STM16_16, STM64_4
MS-ES	Multiplex section errored seconds (MS-ES) is a one-second period with one or more errored blocks or at least one defect.	ASAP_4, STM16_16, STM64_4
MS-SES	Multiplex section severely errored seconds (MS-SES) is a one-second period that contains 30 percent or more errored blocks or at least one defect. SES is a subset of ES. For more information, see ITU-T G.829 Section 5.1.3.	ASAP_4, STM16_16, STM64_4
MS-UAS	Multiplex section unavailable seconds (MS-UAS) is a count of the seconds when the section was unavailable. A section becomes unavailable when ten consecutive seconds occur that qualify as MS-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as MS-SESs. When the condition is entered, MS-SESs decrement and then count toward MS-UAS.	ASAP_4, STM16_16, STM64_4
MS-FC	Multiplex section failure count (MS-FC) is a count of the number of failed events.	ASAP_4, STM16_16, STM64_4
MS-BBE	Multiplex section background block errors (MS-BBE) is an errored block not occurring as part of an SES.	ASAP_4, STM16_16, STM64_4
MS-ESR	Multiplex section errored seconds ratio (MS-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	—
MS-SESR	Multiplex section severely errored seconds ratio (MS-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	—
MS-BBER	Multiplex section background block errored ratio (MS-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	—
NE ID	Name of the selected NE.	—

E.2.33 Multiplex Section PM Table (Near End)—ONS 15310 MA SDH, ONS 15454 SDH

The Multiplex Section PM table shows performance data for the ONS 15310 MA SDH and ONS 15454 SDH multiplex sections. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Multiplex Section PM table.

Table E-48 Field Descriptions for the Multiplex Section PM Table (Near End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
MS-EB	Multiplex section errored blocks (MS-EB) indicates that bits are in error within a block.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G

Table E-48 Field Descriptions for the Multiplex Section PM Table (Near End) (continued)

Field	Description	Cards Supported
MS-ES	Multiplex section errored seconds (MS-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-SES	Multiplex section severely errored seconds (MS-SES) is a one-second period that contains 30 percent or more errored blocks or at least one defect. SES is a subset of ES. For more information, see ITU-T G.829 Section 5.1.3.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-UAS	Multiplex section unavailable seconds (MS-UAS) is a count of the seconds when the section was unavailable. A section becomes unavailable when ten consecutive seconds occur that qualify as MS-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as MS-SESs. When the condition is entered, MS-SESs decrement and then count toward MS-UAS.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-FC	Multiplex section failure count (MS-FC) is a count of the number of failed events.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP

Table E-48 Field Descriptions for the Multiplex Section PM Table (Near End) (continued)

Field	Description	Cards Supported
MS-BBE	Multiplex section background block errors (MS-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-PSC	In a 1 + 1 protection scheme for a working card, protection switching count (PSC) is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM applies to revertive and nonrevertive, line-level protection switching. **Note** MS-SPRing is not supported on the STM-1 card; therefore, the PSD-W, PSD-S, and PSD-R PMs do not increment. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM1, STM1_8, STM4, STM4_4, STM16, STM64
MS-PSD	Protection switching duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, PSD is a count of the seconds that the line was used to carry service. The PSD PM applies to revertive and nonrevertive, line-level protection switching. **Note** MS-SPRing is not supported on the STM-1 card; therefore, the PSD-W, PSD-S, and PSD-R PMs do not increment. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM1, STM1_8, STM4, STM4_4, STM16, STM64
MS-PSC-W	For a working line in a 2-fiber MS-SPRing, protection switching count–working (PSC-W) is a count of the number of times traffic switches away from the working capacity in the failed line and back to the working capacity after the failure is cleared. PSC-W increments on the failed working line and PSC increments on the active protect line. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM4, STM4_4, STM16, STM64

Table E-48 Field Descriptions for the Multiplex Section PM Table (Near End) (continued)

Field	Description	Cards Supported
MS-PSD-W	For a working line in a 2-fiber MS-SPRing, protection switching duration–working (PSD-W) is a count of the number of seconds that service was carried on the protection line. PSD-W increments on the failed working line and PSD increments on the active protect line. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM4, STM4_4, STM16, STM64
MS-PSC-S	In a 4-fiber MS-SPRing, protection switching count–span (PSC-S) is a count of the number of times service switches from a working line to a protection line plus the number of times it switches back to the working line. A count is only incremented if span switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM4, STM4_4, STM16, STM64
MS-PSD-S	In a 4-fiber MS-SPRing, protection switching duration–span (PSD-S) is a count of the seconds that the protection line was used to carry service. A count is only incremented if span switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM4, STM4_4, STM16, STM64
MS-PSC-R	In a 4-fiber MS-SPRing, protection switching count–ring (PSC-R) is a count of the number of times service switches from a working line to a protection line plus the number of times it switches back to a working line. A count is only incremented if ring switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM4, STM4_4, STM16, STM64
MS-PSD-R	In a 4-fiber MS-SPRing, protection switching duration–ring (PSD-R) is a count of the seconds that the protection line was used to carry service. A count is only incremented if ring switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, STM4, STM4_4, STM16, STM64
MS-ESR	Multiplex section errored seconds ratio (MS-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, STM1E_12, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G

Table E-48 Field Descriptions for the Multiplex Section PM Table (Near End) (continued)

Field	Description	Cards Supported
MS-SESR	Multiplex section severely errored seconds ratio (MS-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, STM1E_12, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
MS-BBER	Multiplex section background block error ratio (MS-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, STM1E_12, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
NE ID	Name of the selected NE.	—

E.2.34 Multiplex Section PM Table—ONS 15600 SDH

The Multiplex Section PM table shows performance data for the ONS 15600 SDH multiplex section. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Multiplex Section PM table.

Table E-49 Field Descriptions for the Multiplex Section PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—

Table E-49 Field Descriptions for the Multiplex Section PM Table (continued)

Field	Description	Cards Supported
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
MS-EB	Multiplex section errored blocks (MS-EB) indicates that one or more bits are in error within a block.	ASAP_4, STM16_16, STM64_4
MS-ES	Multiplex section errored seconds (MS-ES) is a one-second period with one or more errored blocks or at least one defect.	ASAP_4, STM16_16, STM64_4
MS-SES	Multiplex section severely errored seconds (MS-SES) is a one-second period that contains 30 percent or more errored blocks or at least one defect. SES is a subset of ES. For more information, see ITU-T G.829 Section 5.1.3.	ASAP_4, STM16_16, STM64_4
MS-UAS	Multiplex section unavailable seconds (MS-UAS) is a count of the seconds when the section was unavailable. A section becomes unavailable when ten consecutive seconds occur that qualify as MS-SESs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as MS-SESs. When the condition is entered, MS-SESs decrement and then count toward MS-UAS.	ASAP_4, STM16_16, STM64_4
MS-FC	Multiplex section failure count (MS-FC) is a count of the number of failed events.	ASAP_4, STM16_16, STM64_4
MS-BBE	Multiplex section background block errors (MS-BBE) is an errored block not occurring as part of an SES.	ASAP_4, STM16_16, STM64_4
MS-PSC	In a 1 + 1 protection scheme for a working card, PSC is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM applies to revertive and nonrevertive, line-level protection switching. **Note** MS-SPRing is not supported on the STM-1 card; therefore, the PSD-W, PSD-S, and PSD-R PMs do not increment.	ASAP_4, STM16_16, STM64_4
MS-PSD	PSD applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, PSD is a count of the seconds that the line was used to carry service. The PSD PM applies to revertive and nonrevertive, line-level protection switching. **Note** MS-SPRing is not supported on the STM-1 card; therefore, the PSD-W, PSD-S, and PSD-R PMs do not increment.	ASAP_4, STM16_16, STM64_4

Table E-49 Field Descriptions for the Multiplex Section PM Table (continued)

Field	Description	Cards Supported
MS-PSC-W	For a working line in a 2-fiber MS-SPRing, protection switching count–working (PSC-W) is a count of the number of times traffic switches away from the working capacity in the failed line and back to the working capacity after the failure is cleared. PSC-W increments on the failed working line and PSC increments on the active protect line.	ASAP_4, STM16_16, STM64_4
MS-PSD-W	For a working line in a 2-fiber MS-SPRing, protection switching duration–working (PSD-W) is a count of the number of seconds that service was carried on the protection line. PSD-W increments on the failed working line and PSD increments on the active protect line.	ASAP_4, STM16_16, STM64_4
MS-PSC-S	In a 4-fiber MS-SPRing, protection switching count–span (PSC-S) is a count of the number of times service switches from a working line to a protection line plus the number of times it switches back to the working line. A count is only incremented if span switching is used.	ASAP_4, STM16_16, STM64_4
MS-PSD-S	In a 4-fiber MS-SPRing, protection switching duration–span (PSD-S) is a count of the seconds that the protection line was used to carry service. A count is only incremented if span switching is used.	ASAP_4, STM16_16, STM64_4
MS-PSC-R	In a 4-fiber MS-SPRing, protection switching count–ring (PSC-R) is a count of the number of times service switches from a working line to a protection line plus the number of times it switches back to a working line. A count is only incremented if ring switching is used.	ASAP_4, STM16_16, STM64_4
MS-PSD-R	In a 4-fiber MS-SPRing, protection switching duration–ring (PSD-R) is a count of the seconds that the protection line was used to carry service. A count is only incremented if ring switching is used.	ASAP_4, STM16_16, STM64_4
MS-ESR	Multiplex section errored seconds ratio (MS-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	—
MS-SESR	Multiplex section severely errored seconds ratio (MS-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	—
MS-BBER	Multiplex section background block error ratio (MS-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	—
NE ID	Name of the selected NE.	—

E.2.35 Optical Physical PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, and ONS 15600 SDH

The Optical Physical PM table shows physical-layer performance data. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.

- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Optical Service Channel (OSC) power—New optical power parameters are monitored for optical cards. Six new PM parameters are added to all the optical interfaces of all the supported cards for ONS 15454 SONET and ONS 15454 SDH. Using Prime Optical, you can monitor six new parameters for optical power: three each for received and transmitted power.

You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Optical Physical PM table.

Table E-50 Field Descriptions for the Optical Physical PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Card-level interface.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Laser Bias Current	Laser bias current, which is interpreted as a percentage value from 0 to 100. **Note** Laser bias current is not supported (N/A) for the TXP_MR_2.5G and TXPP_MR_2.5G cards.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500 • ONS 15310 MA SDH: CTX_2500 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OC3_8/STM1_8, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OC3_8/STM1_8, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP • ONS 15600 SONET: ASAP_4, OC48_16, OC192_4 • ONS 15600 SDH: ASAP_4, STM16_16, STM64_4

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Optical Power Transmitted	Optical power transmitted, which is interpreted as a percentage value from 0 to 100. **Note** Optical power transmitted is not supported (N/A) for the TXP_MR_2.5G and TXPP_MR_2.5G cards.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500 • ONS 15310 MA SDH: CTX_2500 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OC3_8/STM1_8, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OC3_8/STM1_8, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP • ONS 15454 M2/M6: RAMAN_CTP, RAMAN_COP • ONS 15600 SONET: ASAP_4, OC48_16, OC192_4 • ONS 15600 SDH: ASAP_4, STM16_16, STM64_4
Optical Power Received	Optical power received, which is interpreted as a percentage value from 0 to 100. **Note** Optical power received is not supported (N/A) for the TXP_MR_2.5G and TXPP_MR_2.5G cards.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500 • ONS 15310 MA SDH: CTX_2500 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OC3_8/STM1_8, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP • ONS 15454 SDH: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OC3_8/STM1_8, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP • ONS 15454 M2/M6: RAMAN_CTP • ONS 15600 SONET: ASAP_4, OC48_16, OC192_4 • ONS 15600 SDH: ASAP_4, STM16_16, STM64_4
Minimum Laser Bias	Minimum laser bias, which is interpreted as a percentage value from 0 to 100.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Average Laser Bias	Average laser bias, which is interpreted as a percentage value from 0 to 100.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C
Maximum Laser Bias	Maximum laser bias, which is interpreted as a percentage value from 0 to 100.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Minimum Transmitted Power	Minimum transmitted power level in increments of one-tenths of decibels referenced to 1 milliwatt (dBm). The range is from –40.0 to 30.0 dBm for the following cards: TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, MXP_2.5G_10E, and MXP_2.5G_10G. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm. **Note** Transmitted power is not supported for trunk ports.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 M2/M6: RAMAN_CTP, RAMAN_COP

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Average Transmitted Power	Average transmitted power level in increments of one-tenths of dBm. The range is from –40.0 to 30.0 dBm for the following cards: TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, MXP_2.5G_10E, and MXP_2.5G_10G. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm. **Note** Transmitted power is not supported for trunk ports.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, 32MUX_O, 32DMX, 32DMX_L, 32DMX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 M2/M6: RAMAN_CTP, RAMAN_COP

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Maximum Transmitted Power	Maximum transmitted power level in increments of one-tenths of dBm. The range is from –40.0 to 30.0 dBm for the following cards: TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, MXP_2.5G_10E, and MXP_2.5G_10G. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm. **Note** Transmitted power is not supported for trunk ports.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OSC_CSM, OPT_PRE_L, OSCM, OTU2_XP, PSM, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 M2/M6: RAMAN_CTP, RAMAN_COP

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Minimum Received Power	Minimum received power level in increments of one-tenths of dBm. The range is from –40.0 to 30.0 dBm for the following cards: TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, MXP_2.5G_10E, and MXP_2.5G_10G. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 M2/M6: RAMAN_CTP

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Average Received Power	Average received power level in increments of one-tenths of dBm. The range is from –40.0 to 30.0 dBm for the following cards: TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, MXP_2.5G_10E, and MXP_2.5G_10G. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 M2/M6: RAMAN_CTP

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Maximum Received Power	Maximum received power level in increments of one-tenths of dBm. The range is from –40.0 to 30.0 dBm for the following cards: TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, 2.5G_DM, 2.5G_DMP, MXP_2.5G_10E, and MXP_2.5G_10G. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, 32DMX, 32DMX_L, 32DMX_O, 32MUX_O, 32WSS, 32WSS_L, 40DMX_C, 40MUX_C, 40WSS_C, 40WXC_C, 80WXC_C, 4MD, AD_1B, AD_1C, AD_2C, AD_4B, AD_4C, ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C, OPT_BST, OPT_BST_E, OPT_BST_L, OPT_PRE, OPT_PRE_L, OSC_CSM, OSCM, OTU2_XP, PSM, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4, PT_10GE_4, 40G-MXP-C • ONS 15454 M2/M6: RAMAN_CTP
Minimum Passthrough Power	Displays the minimum passthrough power value.	• ONS 15454 SONET: 32WSS, 32WSS_L, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C • ONS 15454 SDH: 32WSS, 32WSS_L, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C
Average Passthrough Power	Displays the average passthrough power value.	• ONS 15454 SONET: 32WSS, 32WSS_L, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C • ONS 15454 SDH: 32WSS, 32WSS_L, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C
Maximum Passthrough Power	Displays the maximum passthrough power value.	• ONS 15454 SONET: 32WSS, 32WSS_L, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C • ONS 15454 SDH: 32WSS, 32WSS_L, OPT_AMP_17_C, OPT_AMP_C, OPT_RAMP_C

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Minimum Transmitted OSC Power	Minimum transmitted OSC power in increments of one-tenths of dBm. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2 • ONS 15454 SDH: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2
Average Transmitted OSC Power	Average transmitted OSC power level in increments of one-tenths of dBm. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2 • ONS 15454 SDH: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2
Maximum Transmitted OSC Power	Maximum transmitted OSC power level in increments of one-tenths of dBm. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2 • ONS 15454 SDH: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2
Minimum Received OSC Power	Minimum received OSC power level in increments of one-tenths of dBm. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2 • ONS 15454 SDH: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2
Average Received OSC Power	Average received OSC power level in increments of one-tenths of dBm. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2 • ONS 15454 SDH: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2
Maximum Received OSC Power	Maximum received OSC power level in increments of one-tenths of dBm. For the other supported DWDM cards, the range is from –50.0 to 30.0 dBm.	• ONS 15454 SONET: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2 • ONS 15454 SDH: OPT_AMP_17_C, OPT_AMP_C, OPT_AMP_L, OPT_BST, OPT_BST_E, OPT_BST_L, OSCM, OSC_CSM, SMR_1, SMR_2

Table E-50 Field Descriptions for the Optical Physical PM Table (continued)

Field	Description	Cards Supported
Minimum PMD	Minimum polarization-mode dispersion (PMD) value, in picoseconds (ps).	• ONS 15454 SONET: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C • ONS 15454 SDH: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C
Average PMD	Average PMD value, in ps.	• ONS 15454 SONET: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C • ONS 15454 SDH: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C
Maximum PMD	Maximum PMD value, in ps.	• ONS 15454 SONET: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C • ONS 15454 SDH: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C
Minimum OSNR	Minimum optical signal-to-noise ratio (OSNR), in dBm.	• ONS 15454 SONET: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C • ONS 15454 SDH: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C
Average OSNR	Average OSNR, in dBm.	• ONS 15454 SONET: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C • ONS 15454 SDH: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C
Maximum OSNR	Maximum OSNR, in dBm.	• ONS 15454 SONET: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C • ONS 15454 SDH: 40E-MXP-C, 40E-TXP-C, 40G-MXP-C
RX Second Order PMD Estimation (SOPMD)	Second Order PMD, in ps^2.	• ONS 15454 SONET: 100G_LC_C • ONS 15454 SDH:100G_LC_C
Polarization Change Rate Estimation (PCR)	Polarization Change Rate, in 10*rad/s.	• ONS 15454 SONET: 100G_LC_C • ONS 15454 SDH:100G_LC_C
RX Polarization Dependent Loss Estimation (PDL)	Polarization Dependent Loss, in dBm.	• ONS 15454 SONET:100G_LC_C • ONS 15454 SDH:100G_LC_C
NE ID	Name of the selected NE.	—

E.2.36 OTN FEC PM Table—ONS 15454 SONET, ONS 15454 SDH

The OTN FEC PM table shows OTN forward error correction (FEC) performance data for trunk ports on the ONS 15454 SONET and ONS 15454 SDH. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the OTN FEC PM table.

Table E-51 Field Descriptions for the OTN FEC PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Bit Errors Corrected	Number of bit errors corrected.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-51 Field Descriptions for the OTN FEC PM Table (continued)

Field	Description	Cards Supported
Uncorrectable Words	Ratio of uncorrected codewords to codewords transmitted. A codeword is a block of *N* symbols that carry *K* information symbols and *R* redundant symbols (N = K+R).	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
NE ID	Name of the selected NE.	—

E.2.37 OTN Path PM Table (Far End)—ONS 15454 SONET, ONS 15454 SDH

The OTN Path PM table shows OTN path performance data for trunk ports on the ONS 15454 SONET and ONS 15454 SDH. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the OTN Path PM table.

Table E-52 Field Descriptions for the OTN Path PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—

Table E-52 Field Descriptions for the OTN Path PM Table (Far End) (continued)

Field	Description	Cards Supported
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ES-P	Errored seconds–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SES-P	Severely errored seconds–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
UAS-P	Unavailable seconds–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-52 Field Descriptions for the OTN Path PM Table (Far End) (continued)

Field	Description	Cards Supported
BBE-P	Background block errors–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
FC-P	Failure count–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
ESR-P	Errored seconds ratio–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SESR-P	Severely errored seconds ratio–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-52 Field Descriptions for the OTN Path PM Table (Far End) (continued)

Field	Description	Cards Supported
BBER-P	Background block errors ratio–path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
NE ID	Name of the selected NE.	—

E.2.38 OTN Path PM Table (Near End)—ONS 15454 SONET, ONS 15454 SDH

The OTN Path PM table shows near-end OTN path performance data for trunk ports on the ONS 15454 SONET and ONS 15454 SDH. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the OTN Path PM table.

Table E-53 Field Descriptions for the OTN Path PM Table (Near End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—

Table E-53 Field Descriptions for the OTN Path PM Table (Near End) (continued)

Field	Description	Cards Supported
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ES-P	Displays the errored seconds-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SES-P	Displays the severely errored seconds-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
UAS-P	Displays the unavailable seconds-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
BBE-P	Displays the background block errors-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-53 Field Descriptions for the OTN Path PM Table (Near End) (continued)

Field	Description	Cards Supported
FC-P	Displays the failure count-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
ESR-P	Displays the errored seconds ratio-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SESR-P	Displays the severely errored seconds ratio-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
BBER-P	Displays the background block errors ratio-path.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
NE ID	Name of the selected NE.	—

E.2.39 OTN Section PM Table (Far End)—ONS 15454 SONET, ONS 15454 SDH

The OTN Section PM table shows OTN section performance data for trunk ports on the ONS 15454 SONET and ONS 15454 SDH. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.

- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the OTN Section PM table.

Table E-54 Field Descriptions for the OTN Section PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ES-S	Errored seconds–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SES-S	Severely errored seconds–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-54 Field Descriptions for the OTN Section PM Table (Far End) (continued)

Field	Description	Cards Supported
UAS-S	Unavailable seconds–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
BBE-S	Background block errors–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
FC-S	Failure count–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
ESR-S	Errored seconds ratio–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-54 Field Descriptions for the OTN Section PM Table (Far End) (continued)

Field	Description	Cards Supported
SESR-S	Severely errored seconds ratio–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
BBER-S	Background block error ratio–section.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
NE ID	Name of the selected NE.	—

E.2.40 OTN Section PM Table (Near End)—ONS 15454 SONET, ONS 15454 SDH

The OTN Section PM table shows near-end OTN section performance data for trunk ports on the ONS 15454 SONET and ONS 15454 SDH. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the OTN Section PM table.

Table E-55 Field Descriptions for the OTN Section PM Table (Near End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
ES-S	Section Errored Seconds (ES-S) indicates the errored seconds recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SES-S	Section Severely Errored Seconds (SES-S) indicates the severely errored seconds recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
UAS-S	Section unavailable seconds (UAS-S) indicates the unavailable seconds recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-55 Field Descriptions for the OTN Section PM Table (Near End) (continued)

Field	Description	Cards Supported
BBE-S	Section Background Block Errors (BBE-S) indicates the number of background block errors recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
FC-S	Section Failure Counts (FC-S) indicates the failure counts recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
ESR-S	Section Errored Seconds Ratio (ESR-S) indicates the errored seconds ratio recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
SESR-S	Section Severely Errored Seconds Ratio (SESR-S) indicates the severely errored seconds ratio recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4

Table E-55 Field Descriptions for the OTN Section PM Table (Near End) (continued)

Field	Description	Cards Supported
BBER-S	Section Background Block Errors Ratio (BBER-S) indicates the background block errors ratio recorded in the OTN section during the PM time interval.	• ONS 15454 SONET: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G, PTF_10GE_4 • ONS 15454 SDH: ADM_10G, GE_XP, 10GE_XP, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G, PTF_10GE_4
NE ID	Name of the selected NE.	—

E.2.41 POS PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15454 SONET, ONS 15310 MA SDH, ONS 15454 SDH, ONS 15600 SONET, ONS 15600 SDH

The POS PM table shows POS performance data for Ethernet cards. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the POS PM table.

Note Real-time PM data is not available for POS cards on NE releases earlier than release 5.0.

Table E-56 Field Descriptions for the POS PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—

Table E-56 Field Descriptions for the POS PM Table (continued)

Field	Description	Cards Supported
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	—
Rx Pre HDLC Bytes	Number of bytes received prior to the bytes undergoing HDCL encapsulation by the policy engine.	—
Rx Post HDLC Bytes	Number of bytes received after the bytes undergoing HDLC encapsulation by the policy engine.	—
Rx Total Packets	Number of bytes received since the last counter reset.	• ONS 15310 CL: CE-100T-8, ML-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10, ML100T, ML100X-8, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
Rx Normal Packets	Number of packets between the minimum and maximum packet size received.	—
Rx Shorts	Number of packets below the minimum packet size received.	—
Rx Runts	Total number of frames received that are less than 64 bytes in length and have a CRC error.	—
Rx Longs	Counter for the number of received frames that exceed the maximum valid packet length of 1518 bytes.	—

Table E-56 Field Descriptions for the POS PM Table (continued)

Field	Description	Cards Supported
ifInErrors	Total number of received errors.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-MR-10
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-MR-10
Rx Crc Errors	Number of received CRC errors.	—
Rx Input Drop Packets	Number of received packets dropped on input.	—
Rx Input Abort Packets	Number of received packets aborted on input.	• ONS 15600 SONET: ASAP_4
Tx Pre HDLC Bytes	Number of bytes transmitted prior to the bytes undergoing HDLC encapsulation by the policy engine.	—
Tx Post HDLC Bytes	Number of bytes transmitted after the bytes undergoing HDLC encapsulation by the policy engine.	—
Tx Total Packets	Number of packets transmitted since the last counter reset.	• ONS 15310 CL: CE-100T-8, ML-100T-8 • ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-100T-8, CE-MR-10, ML100T, ML100X-8, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
Port Drop Counts	Number of received frames dropped at the port level.	—

Table E-56 Field Descriptions for the POS PM Table (continued)

Field	Description	Cards Supported
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100X-8, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, MXP_MR_10DME
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100T, ML100X-8, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, ML100T, ML1000, MXP_MR_10DME
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15310 MA SONET: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15310 MA SDH: CE-100T-8, CE-MR-6, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-MR-10, ML100T, ML100X-8, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-MR-10, ML100T, ML1000, MXP_MR_10DME
etherStatsDropEvents	Total number of events in which packets were dropped by the probe due to lack of resources. The value indicates the number of times this condition has been detected.	• ONS 15310 CL: CE-100T-8, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-100T-8, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME
rxPktsDroppedInternalCongestion	Number of received packets dropped due to overflow in G1000-4 frame buffer.	• ONS 15310 CL: CE-100T-8, ML-100T-8 • ONS 15454 SONET: CE-1000-4, CE-100T-8, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4

Table E-56 Field Descriptions for the POS PM Table (continued)

Field	Description	Cards Supported
mediaIndStatsRxFramesTruncated	Total number of frames received that are less than 5 bytes. This value is a part of HDLC and GFP port statistics.	• ONS 15454 SONET: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
mediaIndStatsRxFramesTooLong	Number of received frames that exceed the MTU. This value is part of HDLC and GFP port statistics.	• ONS 15454 SONET: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
mediaIndStatsRxFramesBadCRC	Number of received data frames with payload CRC errors when HDLC framing is used.	• ONS 15454 SONET: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
mediaIndStatsRxShortPkts	Number of packets below the minimum packet size received.	• ONS 15454 SONET:CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
hdlcInOctets	Number of bytes received (from the SONET/SDH path) prior to the bytes undergoing HLDC decapsulation by the policy engine.	• ONS 15454 SONET:CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
hdlcRxAborts	Number of received packets aborted on input.	• ONS 15454 SONET: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, CE-100T-8, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4

Table E-56 Field Descriptions for the POS PM Table (continued)

Field	Description	Cards Supported
hdlcOutOctets	Number of bytes transmitted (to the SONET/SDH path) after the bytes undergoing HLDC encapsulation by the policy engine.	• ONS 15454 SONET: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, ML100T, ML1000, MXP_MR_10DME • ONS 15600 SONET: ASAP_4 • ONS 15600 SDH: ASAP_4
IfInPayloadCrcErrors	Number of payload CRC errors received since the last counter reset.	• ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, MXP_MR_10DME
IfOutPayloadCrcErrors	Number of payload CRC errors transmitted since the last counter reset.	• ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, MXP_MR_10DME
IfOutOversizePackets	Number of oversize packets transmitted since the last counted reset.	• ONS 15454 SONET: CE-MR-10 • ONS 15454 SDH: CE-1000-4, CE-100T-8, CE-MR-10, MXP_MR_10DME
hdlcPktDrops	Total number of packets that are dropped when the card is in HDLC mode and traffic is oversubscribed.	• ONS 15454 SONET: CE-1000-4, MXP_MR_10DME • ONS 15454 SDH: CE-1000-4, MXP_MR_10DME
Rx Utilization Stats (%)	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15600 SONET: ASAP_4
Tx Utilization Stats (%)	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	• ONS 15600 SONET: ASAP_4
NE ID	Name of the selected NE.	—

E.2.42 Regenerator Section PM Table—ONS 15310 MA SDH, ONS 15454 SDH

The Regenerator Section PM table shows performance data for the ONS 15310 MA SDH and ONS 15454 SDH regenerator section. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Regenerator Section PM table.

Table E-57 Field Descriptions for the Regenerator Section PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
RS-EB	Regenerator Section Errored Block (RS-EB) indicates that one or more bits are in error within a block.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
RS-ES	Regenerator Section Errored Second (RS-ES) is a one-second period with one or more errored blocks or at least one defect.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G

Table E-57 Field Descriptions for the Regenerator Section PM Table (continued)

Field	Description	Cards Supported
RS-SES	Regenerator Section Severely Errored Second (RS-SES) is a one-second period that contains 30 percent or more errored blocks or at least one defect. SES is a subset of ES.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
RS-BBE	Regenerator Section Background Block Error (RS-BBE) is an errored block not occurring as part of an SES.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1, STM1_8, STM1E_12, STM4, STM4_4, STM16, STM64, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
RS-UAS	Regenerator Section Unavailable Second (RS-UAS) is a count of the seconds when the regenerator section was unavailable. A section becomes unavailable when ten consecutive seconds occur that qualify as RS-UASs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as RS-UASs.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MRC_4, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC192_XFP, OSC_CSM, OTU2_XP, STM1E_12, TXP_MR_10G, TXP_MR_10E, TXP_MR_2.5G, TXPP_MR_2.5G
RS-ESR	Regenerator Section Errored Second Ratio (RS-ESR) is the ratio of errored seconds to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, STM1E_12, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G

Table E-57 Field Descriptions for the Regenerator Section PM Table (continued)

Field	Description	Cards Supported
RS-SESR	Regenerator Section Severely Errored Second Ratio (RS-SESR) is the ratio of SES to total seconds in available time during a fixed measurement interval.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, STM1E_12, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
RS-BBER	Regenerator Section Background Block Error Ratio (RS-BBER) is the ratio of BBE to total blocks in available time during a fixed measurement interval. The count of total blocks excludes all blocks during SESs.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, ADM_10G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OTU2_XP, STM1E_12, TXP_MR_10E, TXP_MR_10G, TXP_MR_2.5G, TXPP_MR_2.5G
RS-OFS	Regenerator Section Out of Frame Seconds (RS-OSF) is the count of seconds when the Regenerator Section was out of frame.	• ONS 15310 MA SDH: CTX-2500 • ONS 15454 SDH: MRC_4, MRC_12_2.5G, MXP_MR_10DME, OC192_XFP, OTU2_XP
NE ID	Name of the selected NE.	—

E.2.43 Regenerator Section PM Table—ONS 15600 SDH

The Regenerator Section PM table shows performance data for the ONS 15600 SDH regenerator section. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the Regenerator Section PM table.

Table E-58 Field Descriptions for the Regenerator Section PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
RS-EB	Regenerator Section Errored Block (RS-EB) indicates that one or more bits are in error within a block.	ASAP_4, STM16_16, STM64_4
RS-ES	Regenerator Section Errored Second (RS-ES) is a one-second period with one or more errored blocks or at least one defect.	ASAP_4, STM16_16, STM64_4
RS-SES	Regenerator Section Severely Errored Second (RS-SES) is a one-second period that contains 30 percent or more errored blocks or at least one defect. SES is a subset of ES.	ASAP_4, STM16_16, STM64_4
RS-BBE	Regenerator Section Background Block Error (RS-BBE) is an errored block not occurring as part of an SES.	ASAP_4, STM16_16, STM64_4
RS-UAS	Regenerator Section Unavailable Second (RS-UAS) is a count of the seconds when the regenerator section was unavailable. A section becomes unavailable when ten consecutive seconds occur that qualify as RS-UASs, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as RS-UASs.	—
RS-OFS	Regenerator Section Out of Frame Seconds (RS-OSF) is the count of seconds when the regenerator section was out of frame.	ASAP_4, STM16_16, STM64_4
NE ID	Name of the selected NE.	—

E.2.44 RPR 802.17 PM Table—ONS 15454 SONET, ONS 15454 SDH

The RPR 802.17 PM table shows performance data for the ONS 15454 SONET and ONS 15454 SDH ML-series cards in Resilient Packet Ring (RPR) mode (IEEE 802.17). You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the RPR 802.17 PM table. The fields shown depend on the RPR type selection.

Table E-59 Field Descriptions for the RPR 802.17 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp *(time zone)*	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	—
rprSpanStatsInUcastClassA Frames	Number of received (PHY to MAC) class A unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassA Octets	Number of received (PHY to MAC) class A unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassB CirFrames	Number of received (PHY to MAC) class B CIR unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassB CirOctets	Number of received (PHY to MAC) class B CIR unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassB EirFrames	Number of received (PHY to MAC) class B EIR unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassB EirOctets	Number of received (PHY to MAC) class B EIR unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassC Frames	Number of received (PHY to MAC) class C unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInUcastClassC Octets	Number of received (PHY to MAC) class C unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10

Table E-59 Field Descriptions for the RPR 802.17 PM Table (continued)

Field	Description	Cards Supported
rprSpanStatsInMcastClassA Frames	Number of received (PHY to MAC) class A multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassA Octets	Number of received (PHY to MAC) class A multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassB CirFrames	Number of received (PHY to MAC) class B CIR multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassB CirOctets	Number of received (PHY to MAC) class B CIR multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassB EirFrames	Number of received (PHY to MAC) class B EIR multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassB EirOctets	Number of received (PHY to MAC) class B EIR multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassC Frames	Number of received (PHY to MAC) class C multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInMcastClassC Octets	Number of received (PHY to MAC) class C multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInCtrlFrames	Number of received (PHY to MAC) control frames processed by this MAC. This does not include control frames in transit; that is, a multicast control frame received from a ringlet will be counted as In but not Out. This does not include fairness or idle frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInOamEchoFra mes	Number of received (PHY to MAC) OAM echo frames processed by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInOamFlushFr ames	Number of received (PHY to MAC) OAM flush frames processed by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInOamOrgFra mes	Number of received (PHY to MAC) OAM org frames processed by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInTopoAtdFra mes	Number of received (PHY to MAC) topology ATD frames processed by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsInTopoChkSu mFrames	Number of received (PHY to MAC) topology checksum frames processed by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10

Table E-59 Field Descriptions for the RPR 802.17 PM Table (continued)

Field	Description	Cards Supported
rprSpanStatsInTopoTpFrames	Number of received (PHY to MAC) topology TP frames processed by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassAFrames	Number of transmitted (PHY to MAC) class A unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassAOctets	Number of transmitted (PHY to MAC) class A unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassBCirFrames	Number of transmitted (PHY to MAC) class B CIR unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassBCirOctets	Number of transmitted (PHY to MAC) class B CIR unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassBEirFrames	Number of transmitted (PHY to MAC) class B EIR unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassBEirOctets	Number of transmitted (PHY to MAC) class B EIR unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassCFrames	Number of transmitted (PHY to MAC) class C unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutUcastClassCOctets	Number of transmitted (PHY to MAC) class C unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassAFrames	Number of transmitted (PHY to MAC) class A multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassAOctets	Number of transmitted (PHY to MAC) class A multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassBCirFrames	Number of transmitted (PHY to MAC) class B CIR multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassBCirOctets	Number of transmitted (PHY to MAC) class B CIR multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassBEirFrames	Number of transmitted (PHY to MAC) class B EIR multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10

Table E-59 Field Descriptions for the RPR 802.17 PM Table (continued)

Field	Description	Cards Supported
rprSpanStatsOutMcastClassBEirOctets	Number of transmitted (PHY to MAC) class B EIR multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassCFrames	Number of transmitted (PHY to MAC) class C multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutMcastClassCOctets	Number of transmitted (PHY to MAC) class C multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutCtrlFrames	Number of transmitted (PHY to MAC) control frames generated by this MAC. This does not include control frames in transit; that is, a multicast control frame transmitted from a ringlet will be counted as In but not Out. This does not include fairness or idle frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutOamEchoFrames	Number of transmitted (PHY to MAC) OAM echo frames generated by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutOamFlushFrames	Number of transmitted (PHY to MAC) OAM flush frames generated by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutOamOrgFrames	Number of transmitted (PHY to MAC) OAM org frames generated by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutTopoAtdFrames	Number of transmitted (PHY to MAC) topology ATD frames generated by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutTopoChkSumFrames	Number of transmitted (PHY to MAC) topology checksum frames generated by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanStatsOutTopoTpFrames	Number of transmitted (PHY to MAC) topology TP frames generated by this MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassAFrames	Number of MAC-to-client class A unicast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassAOctets	Number of MAC-to-client class A unicast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassBCirFrames	Number of MAC-to-client class B CIR unicast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassBCirOctets	Number of MAC-to-client class B CIR unicast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10

Table E-59 Field Descriptions for the RPR 802.17 PM Table (continued)

Field	Description	Cards Supported
rprClientStatsInUcastClassBEirFrames	Number of MAC-to-client class B EIR unicast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassBEirOctets	Number of MAC-to-client class B EIR unicast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassCFrames	Number of MAC-to-client class C unicast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInUcastClassCOctets	Number of MAC-to-client class C unicast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassAFrames	Number of MAC-to-client class A multicast and broadcast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassAOctets	Number of MAC-to-client class A multicast and broadcast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassBCirFrames	Number of MAC-to-client class B CIR multicast and broadcast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassBCirOctets	Number of MAC-to-client class B CIR multicast and broadcast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassBEirFrames	Number of MAC-to-client class B EIR multicast and broadcast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassBEirOctets	Number of MAC-to-client class B EIR multicast and broadcast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassCFrames	Number of MAC-to-client class C multicast and broadcast frames in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInMcastClassCOctets	Number of MAC-to-client class C multicast and broadcast octets in the current interval.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsInBcastFrames	Number of MAC-to-client broadcast frames. This value is used only when deriving the multicast and broadcast packet counters for the interface MIB.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassAFrames	Number of client-to-MAC class A unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10

Table E-59 Field Descriptions for the RPR 802.17 PM Table (continued)

Field	Description	Cards Supported
rprClientStatsOutUcastClassAOctets	Number of client-to-MAC class A unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassBCirFrames	Number of client-to-MAC class B CIR unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassBCirOctets	Number of client-to-MAC class B CIR unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassBEirFrames	Number of client-to-MAC class B EIR unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassBEirOctets	Number of client-to-MAC class B EIR unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassCFrames	Number of client-to-MAC class C unicast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutUcastClassCOctets	Number of client-to-MAC class C unicast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassAFrames	Number of client-to-MAC class A multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassAOctets	Number of client-to-MAC class A multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassBCirFrames	Number of client-to-MAC class B CIR multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassBCirOctets	Number of client-to-MAC class B CIR multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassBEirFrames	Number of client-to-MAC class B EIR multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassBEirOctets	Number of client-to-MAC class B EIR multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutMcastClassCFrames	Number of client-to-MAC class C multicast and broadcast frames.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10

Table E-59 Field Descriptions for the RPR 802.17 PM Table (continued)

Field	Description	Cards Supported
rprClientStatsOutMcastClassCOctets	Number of client-to-MAC class C multicast and broadcast octets.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprClientStatsOutBcastFrames	Number of client-to-MAC broadcast frames. This value is used only when deriving the multicast and broadcast packet counters for the interface MIB.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsTtlExpFrames	Number of received (PHY to MAC) frames that were dropped due to zero Time To Live (TTL).	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsTooLongFrames	Number of received (PHY to MAC) frames that exceed the maximum permitted frame size.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsTooShortFrames	Number of received (PHY to MAC) frames shorter than the minimum permitted frame size.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsBadHecFrames	Number of received (PHY to MAC) frames with HEC errors.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsBadFcsFrames	Number of received (PHY to MAC) data and control frames where the FCS value did not match the expected FCS value.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsSelfSrcUcastFrames	Number of received (PHY to MAC) unicast frames that were transmitted by the station itself; that is, the source MAC is equal to the interface MAC.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsPmdAbortFrames	Number of received (PHY to MAC) frames that were aborted by the PMD.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsBadAddrFrames	Number of received (PHY to MAC) frames with invalid SA values.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsBadParityFrames	Number of received (PHY to MAC) frames where the parity value does not match the expected parity value.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsContainedFrames	Number of received (PHY to MAC) frames that were removed due to context containment.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprSpanErrorStatsScffErrors	Number of received (PHY to MAC) errored SCFFs with bad parity, bad FCS, or both.	ONS 15454 SONET and SDH: ML100T, ML100X-8, ML1000, ML-MR-10
rprErrorOversizeFrames	On the ML-MR-10 card, due to the limitation of the current field programmable gate array (FPGA), the frames coming from a gigabit port to an RPR port are sent to an ASIC driver, which discards the packets.	ONS 15454 SONET and SDH: ML-MR-10
NE ID	Name of the selected NE.	—

E.2.45 FC PM Table—ONS 15454 SONET, ONS 15454 SDH

The FC PM table shows performance data for the ONS 15454 SONET and ONS 15454 SDH. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the FC PM table.

Table E-60 Field Descriptions for the FC PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	—
Rx Frames	Number of FC frames received without errors.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME
ifInOctets	Number of bytes received since the last counter reset.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME

Table E-60 Field Descriptions for the FC PM Table (continued)

Field	Description	Cards Supported
Tx Frames	Number of transmitted FC frames.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, MXP_MR_10DME
ifOutOctets	Number of bytes transmitted since the last counter reset.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME
8b10bInvalidOrderedSets	Number of 8b10b code violations.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
8b10bStatsEncodingDispErrors	Number of 8b10b disparity violations on the FC line side.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
fcStatsLinkRecoveries	Number of link recoveries.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME
mediaIndStatsRxFramesBadCRC	Number of received data frames with payload CRC errors when HDLC framing is used.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME
mediaIndStatsTxFramesBadCRC	Number of transmitted data frames with payload CRC errors when HDLC framing is used.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME
mediaIndStatsRxFramesTruncated	Total number of frames received that are less than 5 bytes. This value is a part of HDLC and GFP port statistics.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, FCMR, MXP_MR_10DME

Table E-60 Field Descriptions for the FC PM Table (continued)

Field	Description	Cards Supported
mediaIndStatsRxFramesTooLong	Number of received frames that exceed the MTU. This value is part of HDLC and GFP port statistics.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E, MXP_MR_10DME • ONS 15454 SDH: 2.5G_DM, FCMR, TXP_MR_10E, MXP_MR_10DME
mediaIndStatsRxLcvErrors	Number of L1 line code violations received for lower rate FC, which equate to invalid 8b10b ordered sets.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
mediaIndStatsTxLcvErrors	Number of L1 line code violations transmitted for lower rate FC, which equate to invalid 8b10b ordered sets.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
gfpStatsRxSBitErrors	Number of GFP single-bit errors in the CHEC.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
gfpStatsRxMBitErrors	Number of GFP multibit errors in the CHEC.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
gfpStatsRxTypeInvalid	Number of GFP invalid UPI fields in the type field.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
gfpStatsRxCRCErrors	Number of superblock CRC errors in the transparent GFP frame.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
ifInDiscards	Number of inbound packets that were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
ifOutDiscards	Number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
fcIngressRxDistanceExtBuffers	Number of buffers that are available to receive FC data from GFP frames.	—
fcEgressTxDistanceExtBuffers	Number of buffers that are available on the far end to receive FC data over GFP frames.	—
fcStatsRxCredits	Number of current received buffer-to-buffer credits. (Valid only if distance extension is enabled.)	—

Table E-60 Field Descriptions for the FC PM Table (continued)

Field	Description	Cards Supported
fcStatsTxCredits	Number of current transmitted buffer-to-buffer credits. (Valid only if distance extension is enabled.)	—
fcStatsZeroTxCredits	Number of transmitted attempts that failed because of unavailable credits.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
gfpStatsCSFRaised	Number of GFP client signal fail frames.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
gfpStatsRoundTripLatency	Round-trip delay (in milliseconds [ms]) for the end-to-end FC transport.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
ifInErrors	Total number of received errors.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
txTotalPkts	Number of packets transmitted since the last counter reset.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
rxTotalPkts	Number of packets received since the last counter reset.	• ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E • ONS 15454 SDH: 2.5G_DM, 2.5G_DMP, FCMR, TXP_MR_10E
Rx Utilization	Received utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	—
Tx Utilization	Transmitted utilization, which is a percentage of utilization of the Ethernet segment on a scale of 0 to 100 percent.	—
FibreStatsRxRecvrReady	Number of current received receiver-ready buffer-to-buffer credits.	• ONS 15454 SONET: MXP_MR_10DME • ONS 15454 SDH: MXP_MR_10DME
FibreStatsTxRecvrReady	Number of current transmitted receiver-ready buffer-to-buffer credits.	• ONS 15454 SONET: MXP_MR_10DME • ONS 15454 SDH: MXP_MR_10DME
NE ID	Name of the selected NE.	—

E.2.46 ISC PM Table—ONS 15454 SONET, ONS 15454 SDH

The ISC PM table shows performance data for the ONS 15454 SONET and ONS 15454 SDH. You can display 15-minute or 1-day increments.

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.4 Managing Real-Time PM Data, page 10-26.

The following table describes the fields in the ISC PM table.

Table E-61 Field Descriptions for the ISC PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Time Last Cleared	When the statistics were last reset.	• ONS 15454 SONET: MXP_MR_10DME • ONS 15454 SDH: MXP_MR_10DME
rxTotalPkts	Number of packets received since the last counter reset.	
ifInOctets	Number of bytes received since the last counter reset.	
txTotalPkts	Number of packets transmitted since the last counter reset.	
ifOutOctets	Number of bytes transmitted since the last counter reset.	
mediaIndStatsRxLcvErrors	Number of L1 line code violations received for constant bit rate protocols, which equate to invalid 8b10b ordered sets.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
mediaIndStatsTxLcvErrors	Number of L1 line code violations transmitted for constant bit rate protocols, which equate to invalid 8b10b ordered sets.	• ONS 15454 SONET: AR_MXP, AR_XP • ONS 15454 SDH: AR_MXP, AR_XP
NE ID	Name of the selected NE.	—

E.2.47 SONET Line PM Table (Far End)—ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, ONS 15600 SONET

The SONET Line PM table shows far-end performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, and ONS 15600 SONET line. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET Line PM table.

Table E-62 Field Descriptions for the SONET Line PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-L	Coding violations–line (CV-L) is a count of bit interleaved parity (BIP) errors detected at the line layer (that is, using the B2 bytes in the incoming SONET signal). Up to 8 x N BIP errors can be detected per STS-N frame; each error increments the current CV-L second register.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-62 Field Descriptions for the SONET Line PM Table (Far End) (continued)

Field	Description	Cards Supported
ES-L	Errored seconds–line (ES-L) is a count of the seconds when at least one line-layer BIP error was detected or a line alarm indication signal (AIS-L) defect was present.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
SES-L	Severely errored seconds–line (SES-L) is a count of the seconds when K (see GR-253 for values) or more line-layer BIP errors were detected or an AIS-L defect was present.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
UAS-L	Unavailable seconds–line (UAS-L) is a count of the seconds when the line is unavailable. A line becomes unavailable when ten consecutive seconds occur that qualify as SES-Ls, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as SES-Ls.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-62 Field Descriptions for the SONET Line PM Table (Far End) (continued)

Field	Description	Cards Supported
FC-L	Failure count–line (FC-L) is a count of the number of near-end line failure events. A failure event begins when an AIS-L failure or a lower-layer traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
NE ID	Name of the selected NE.	—

E.2.48 SONET Line PM Table (Near End)—ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, ONS 15600 SONET

The SONET Line PM table shows near-end performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, and ONS 15600 SONET line. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET Line PM table.

Table E-63 Field Descriptions for the SONET Line PM Table (Near End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—

Table E-63 Field Descriptions for the SONET Line PM Table (Near End) (continued)

Field	Description	Cards Supported
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-L	CV-L lists a count of bit interleaved parity (BIP) errors detected at the line-layer (using the B2 bytes in the incoming SONET signal). Up to 8 x N BIP errors can be detected per STS-N frame, with each error incrementing the current CV-L second register.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
ES-L	ES-L lists a count of the seconds when at least one line-layer BIP error was detected or a line alarm indication signal (AIS-L) defect was present.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-63 Field Descriptions for the SONET Line PM Table (Near End) (continued)

Field	Description	Cards Supported
SES-L	SES-L lists a count of the seconds when K (see GR-253-CORE for values) or more line-layer BIP errors were detected or an AIS-L defect was present.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
UAS-L	Unavailable seconds–line (UAS-L) lists a count of the seconds when the line is unavailable. A line becomes unavailable when ten consecutive seconds occur that qualify as SES-Ls, and continues to be unavailable until ten consecutive seconds occur that do not qualify as SES-Ls.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
FC-L	Failure count–line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-63 Field Descriptions for the SONET Line PM Table (Near End) (continued)

Field	Description	Cards Supported
PSC	In a 1 + 1 protection scheme for a working card, PSC is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM is only applicable if revertive line-level protection switching is used. PSC is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PSD	PSD applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, it is a count of the seconds that the line was used to carry service. The PSD PM is only applicable if revertive line-level protection switching is used. PSD is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC3, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PSC-W	For a working line in a 2-fiber BLSR, protection switching count–working (PSC-W) is a count of the number of times traffic switches away from the working capacity in the failed line and back to the working capacity after the failure is cleared. PSC-W increments on the failed working line and PSC increments on the active protect line. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15327: OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PSD-W	For a working line in a 2-fiber BLSR, protection switching duration–working (PSD-W) is a count of the number of seconds that service was carried on the protection line. PSD-W increments on the failed working line and PSD increments on the active protect line. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15327: OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-63 Field Descriptions for the SONET Line PM Table (Near End) (continued)

Field	Description	Cards Supported
PSC-S	In a four-fiber BLSR, protection switching count–span (PSC-S) is a count of the number of times service switches from a working line to a protection line plus the number of times it switches back to the working line. A count is only incremented if span switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15327: OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PSD-S	In a four-fiber BLSR, protection switching duration–span (PSD-S) is a count of the seconds that the protection line was used to carry service. A count is only incremented if span switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15327: OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PSC-R	In a 4-fiber BLSR, protection switching count–ring (PSC-R) is a count of the number of times service switches from a working line to a protection line plus the number of times it switches back to a working line. A count is only incremented if ring switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15327: OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PSD-R	In a 4-fiber BLSR, protection switching duration–ring (PSD-R) is a count of the seconds that the protection line was used to carry service. A count is only incremented if ring switching is used. **Note** This parameter is not supported for transponder or muxponder cards.	• ONS 15327: OC12, OC48 • ONS 15454 SONET: MRC_4, MRC_12, MRC_12_2.5G, MXP_MR_10DME, OC12, OC12_4, OC48, OC192, OC192_XFP • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
NE ID	Name of the selected NE.	—

E.2.49 SONET Section PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, ONS 15600 SONET

The SONET Section PM table shows performance data at the section layer. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET Section PM table.

Table E-64 Field Descriptions for the SONET Section PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Coding Violations–Section	Number of BIP errors detected at the section-layer (using the B1 byte in the incoming SONET signal). Up to eight section BIP errors can be detected per STS-N frame, with each error incrementing the current CV-S second register.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-64 Field Descriptions for the SONET Section PM Table (continued)

Field	Description	Cards Supported
Errored Seconds–Section	Number of seconds when at least one section-layer BIP error was detected or an SEF or LOS defect was present.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
Severely Errored Seconds–Section	Number of seconds when K (see GR-253-CORE for value) or more section-layer BIP errors were detected or an SEF or LOS defect was present.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
Severely Errored Framing Seconds–Section	Number of seconds when an SEF defect was present. A SEF defect is expected to be present during most seconds when a LOS or LOF defect is present. However, there can be situations when that is not the case, and the SEFS-S parameter is only incremented based on the presence of the SEF defect.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, ADM_10G, DS3_EC1_48, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, MXP_2.5G_10G, MXP_MR_10DME, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OSC_CSM, OTU2_XP, TXP_MR_2.5G, TXPP_MR_2.5G, TXP_MR_10E, TXP_MR_10G • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
NE ID	Name of the selected NE.	—

E.2.50 SONET STS Path PM Table (Far End)—ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, ONS 15600

The SONET STS Path PM table shows far-end performance data for the ONS 15310 CL, ONS 15310 MA, ONS 15327, ONS 15454 SONET, and ONS 15600 SONET STS path. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET STS Path PM table.

Table E-65 Field Descriptions for the SONET STS Path PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-65 Field Descriptions for the SONET STS Path PM Table (Far End) (continued)

Field	Description	Cards Supported
CV-P	STS path coding violations (STS CV-P) is a count of BIP errors detected at the STS path layer (that is, using the B3 byte). Up to eight BIP errors can be detected per frame; each error increments the current CV-P second register.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS1_E1_56, DS3N, DS3NE, DS3XM, DS3XM_12, FCMR, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OTU2_XP, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
ES-P	STS path errored seconds (STS ES-P) is a count of the seconds when at least one STS path BIP error was detected. A path alarm indication signal (AIS-P) defect (or a lower-layer, traffic-related, near-end defect) or a path loss of pointer (LOP-P) defect can also cause an STS ES-P.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, FCMR, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OTU2_XP, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
SES-P	STS path severely errored seconds (STS SES-P) is a count of the seconds when K (2400) or more STS path BIP errors were detected. An AIS-P defect (or a lower-layer, traffic-related, near-end defect) or an LOP-P defect can also cause an STS SES-P.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, FCMR, EC1, EC1N, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OTU2_XP, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-65 Field Descriptions for the SONET STS Path PM Table (Far End) (continued)

Field	Description	Cards Supported
UAS-P	STS path unavailable seconds (STS UAS-P) is a count of the seconds when the STS path was unavailable. An STS path becomes unavailable when ten consecutive seconds occur that qualify as SES-Ps, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as SES-Ps.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OTU2_XP, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
FC-P	STS path failure counts (STS FC-P) is a count of the number of near-end STS path failure events. A failure event begins when an AIS-P failure, an LOP-P failure, a UNEQ-P failure, or a path trace identifier mismatch (TIM-P) failure is declared, or if the STS PTE that is monitoring the path supports ERDI-P for that path. The failure event ends when these failures are cleared.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, MXP_2.5G_10E, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, OTU2_XP, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
NE ID	Name of the selected NE.	—

E.2.51 SONET STS Path PM Table—ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, ONS 15600 SONET

The SONET STS Path PM table shows performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET, and ONS 15600 SONET STS path. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET STS Path PM table.

Table E-66 Field Descriptions for the SONET STS Path PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-P	STS path coding violations (STS CV-P) is a count of BIP errors detected at the STS path layer (that is, using the B3 byte). Up to eight BIP errors can be detected per frame; each error increments the current CV-P second register.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-66 Field Descriptions for the SONET STS Path PM Table (continued)

Field	Description	Cards Supported
ES-P	STS path errored seconds (STS ES-P) is a count of the seconds when at least one STS path BIP error was detected. A path alarm indication signal (AIS-P) defect (or a lower-layer, traffic-related, near-end defect) or a path loss of pointer (LOP-P) defect can also cause an STS ES-P.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
SES-P	STS path severely errored seconds (STS SES-P) is a count of the seconds when K (2400) or more STS path BIP errors were detected. An AIS-P defect (or a lower-layer, traffic-related, near-end defect) or an LOP-P defect can also cause an STS SES-P.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
UAS-P	STS path unavailable seconds (STS UAS-P) is a count of the seconds when the STS path was unavailable. An STS path becomes unavailable when ten consecutive seconds occur that qualify as SES-Ps, and it continues to be unavailable until ten consecutive seconds occur that do not qualify as SES-Ps.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-66 Field Descriptions for the SONET STS Path PM Table (continued)

Field	Description	Cards Supported
FC-P	STS path failure counts (STS FC-P) is a count of the number of near-end STS path failure events. A failure event begins when an AIS-P failure, an LOP-P failure, a UNEQ-P failure, or a path trace identifier mismatch (TIM-P) failure is declared, or if the STS PTE that is monitoring the path supports ERDI-P for that path. The failure event ends when these failures are cleared.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, XTC • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS-1, DS1N, DS1_E1_56, DS-3, DS3E, DS3_EC1_48, DS3I, DS3IN, DS3N, DS3NE, DS3XM, DS3XM_12, EC1, EC1N, FCMR, MRC_4, MRC_12, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PPJC-PDET	Positive pointer justification count, STS path detected (PPJC-Pdet) is a count of the positive pointer justifications detected on a particular path on an incoming SONET signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48, • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, MRC_4, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
NPJC-PDET	Negative pointer justification count, STS path detected (NPJC-Pdet) is a count of the negative pointer justifications detected on a particular path on an incoming SONET signal.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, MRC_4, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PPJC-PGEN	Positive pointer justification count, STS path generated (PPJC-Pgen) is a count of the positive pointer justifications generated for a particular path to reconcile the frequency of the SPE with the local clock.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, MRC_4, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16

Table E-66 Field Descriptions for the SONET STS Path PM Table (continued)

Field	Description	Cards Supported
NPJC-PGEN	Negative pointer justification count, STS path generated (PPJC-Pgen) is a count of the negative pointer justifications generated for a particular path to reconcile the frequency of the SPE with the local clock.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, MRC_4, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E • ONS 15600 SONET: ASAP_4, OC192_4, OC48_16
PJ-DIFF	Sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, MRC_4, MRC_12_2.5G, OC3, OC3_8, OC12, OC12_4, OC48, OC192, OC192_XFP, MXP_2.5G_10E, TXP_MR_10E
PJCS-Pdet	Number of pointer justification count seconds detected on a particular path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: MRC_4, MRC_12_2.5G, OC192_XFP
PJCS-Pgen	Number of pointer justification count seconds generated for a particular path.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15454 SONET: MRC_4, MRC_12_2.5G, OC192_XFP
PJP-SEC	Number of positive pointer justification seconds.	• ONS 15310 CL: CTX • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, OC3, OC3_8, OC12, OC12_4, OC48, OC192, MXP_2.5G_10E, TXP_MR_10E

Table E-66 Field Descriptions for the SONET STS Path PM Table (continued)

Field	Description	Cards Supported
PJN-SEC	Number of negative pointer justification seconds.	• ONS 15310 CL: CTX • ONS 15327: OC3, OC12, OC48 • ONS 15454 SONET: 2.5G_DM, 2.5G_DMP, CE-100T-8, DS3_EC1_48, EC1, EC1N, FCMR, OC3, OC3_8, OC12, OC12_4, OC48, OC192, MXP_2.5G_10E, TXP_MR_10E
NE ID	Name of the selected NE.	—

E.2.52 SONET VT1.5 PM Table

The SONET VT1.5 PM table contains PM information at the virtual tributary (VT1.5) layer. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET VT1.5 PM table.

Table E-67 Field Descriptions for the SONET VT1.5 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-67 Field Descriptions for the SONET VT1.5 PM Table (continued)

Field	Description	Cards Supported
CV-V	Code violations VT layer (CV-V) is a count of the BIP errors detected at the VT path layer. Up to two BIP errors can be detected per VT Super Frame, with each error incrementing the current CV-V second register.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
ES-V	Errored seconds VT layer (ES-V) is a count of the seconds when at least one VT Path BIP error was detected. An AIS-V defect (a lower-layer, traffic-related, near-end defect) or a LOP-V defect can also cause an ES-V.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
SES-V	Severely errored seconds VT layer (SES-V) is a count of seconds when K (600) or more VT Path BIP errors were detected. SES-V can also be caused by an AIS-V defect (a lower-layer, traffic-related, near-end defect) or a LOP-V defect.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
UAS-V	Unavailable second VT layer (UAS-V) is a count of the seconds when the VT path was unavailable. A VT path becomes unavailable when ten consecutive seconds occur that qualify as SES-Vs, and continues to be unavailable until ten consecutive seconds occur that do not qualify as SES-Vs.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
NE ID	Name of the selected NE.	—

E.2.53 SONET VT2 PM Table

The SONET VT2 PM table contains PM information at the virtual tributary (VT2) layer. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET VT2 PM table.

Table E-68 Field Descriptions for the SONET VT2 PM Table

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-V	Code violations VT layer (CV-V) is a count of the BIP errors detected at the VT path layer. Up to two BIP errors can be detected per VT Super Frame, with each error incrementing the current CV-V second register.	• ONS 15454 SONET: DS1_E1_56
ES-V	Errored seconds VT layer (ES-V) is a count of the seconds when at least one VT Path BIP error was detected. An AIS-V defect (a lower-layer, traffic-related, near-end defect) or a LOP-V defect can also cause an ES-V.	• ONS 15454 SONET: DS1_E1_56
SES-V	Severely errored seconds VT layer (SES-V) is a count of seconds when K (600) or more VT Path BIP errors were detected. SES-V can also be caused by an AIS-V defect (a lower-layer, traffic-related, near-end defect) or a LOP-V defect.	• ONS 15454 SONET: DS1_E1_56
UAS-V	Unavailable second VT layer (UAS-V) is a count of the seconds when the VT path was unavailable. A VT path becomes unavailable when ten consecutive seconds occur that qualify as SES-Vs, and continues to be unavailable until ten consecutive seconds occur that do not qualify as SES-Vs.	• ONS 15454 SONET: DS1_E1_56
NE ID	Name of the selected NE.	—

E.2.54 SONET VT PM Table (Far End)—ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, ONS 15454 SONET

The SONET VT PM table shows far-end performance data for the ONS 15310 CL, ONS 15310 MA SONET, ONS 15327, and ONS 15454 SONET VT. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET VT PM table.

Table E-69 Field Descriptions for the SONET VT PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-V	Coding violations–VT.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12

Table E-69 Field Descriptions for the SONET VT PM Table (Far End) (continued)

Field	Description	Cards Supported
ES-V	Errored seconds–VT.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS3XM, DS1_E1_56, DS3XM_12
SES-V	Severely errored seconds–VT.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
UAS-V	Unavailable seconds–VT.	• ONS 15310 CL: CTX • ONS 15310 MA SONET: CTX_2500, DS1_28_DS3_EC1_3, DS1_84_DS3_EC1_3 • ONS 15327: XTC • ONS 15454 SONET: DS-1, DS1N, DS1_E1_56, DS3XM, DS3XM_12
NE ID	Name of the selected NE.	—

E.2.55 SONET VT2 PM Table (Far End)—ONS 15454 SONET

The SONET VT2 PM table shows far-end performance data for the ONS 15454 SONET VT2. You can display performance data for 15-minute, 1-day, or real-time increments:

- 15-minute—Data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- 1-day—Data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.
- Real-time—When a real-time PM session is running, it polls the NE for *x* number of attributes every 10 to 900 seconds. This feature allows you to examine the current value of a PM parameter in granularities finer than the standard 15-minute or 1-day interval. For more information, see 10.4.4 Managing Real-Time PM Data, page 10-26.

Performance monitoring can be done either on selected modules, or on specific locations in the NE. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

The following table describes the fields in the SONET VT2 PM table.

Table E-70 Field Descriptions for the SONET VT2 PM Table (Far End)

Field	Description	Cards Supported
Alias ID	Alias name of the selected NE.	—
Module Name	Module for which PM data is displayed.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
CV-V	Coding violations–VT.	• ONS 15454 SONET: DS1_E1_56

SES-V	Severely errored seconds–VT.	• ONS 15454 SONET: DS1_E1_56
UAS-V	Unavailable seconds–VT.	• ONS 15454 SONET: DS1_E1_56
NE ID	Name of the selected NE.	—

E.3 ONS 15530 and ONS 15540 PM Tables

This section describes the PM tables that are specific to ONS 15530 and ONS 15540 NEs.

E.3.1 Overview of Supported PM Parameters

The following ONS 15530 and ONS 15540 PM parameters are available on any of the interfaces listed in the following table. Table E-72 to Table E-77 list all the ONS 15530 and ONS 15540 PM parameters with the corresponding description and a list of interfaces supported.

Table E-71 ONS 155xx Optical Interfaces

ONS 15530	ONS 15540
cevPortTransparent	cevPortTransparent
cevPortWave	cevPortWave
cevPortWaveEthPhy	cevPortWaveEthPhy
cevPort10GigEthPhy	cevport10GigEthBhy
cevPortWavePatch	cevPortWavePatch

Table E-71 ONS 155xx Optical Interfaces (continued)

ONS 15530	ONS 15540
cevPortEsconPhy	cevportWaveOSC
cevPortGEFCPhy	
cevPortVOAIn	
cevPortVOAFilterIn	
cevPortWaveOSC	
cevPortWaveSonetPhy	
cevPort2GFCPhy	

Table E-72 Section PM Parameters—Near End

Parameter	Description	Interfaces Supported
Alias ID	Alias name of the selected NE.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."	—
CV-S	Coding violations—section.	cevPortTransparent[1], cevPortWave[1], cevPortWaveSonetPhy[1]
ES-S	Errored seconds—section.	
SES-S	Severely errored seconds—section.	
SEFS-S	Severely errored framing seconds—section.	
Module Name	Module for which PM data is displayed.	—
NE ID	Name of the selected NE.	—

1. Available on ONS 15530 and ONS 15540 NEs

Table E-73 Line PM Parameters

Parameter	Description	Interfaces Supported
Alias ID	Alias name of the selected NE.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."	—
Rx CVRD	Represents the counter associated with the number of code violations and running disparity errors encountered in the received direction.	cevPortTransparent[1], cevPortWave[1], cevPortWaveEthPhy[1], cevPort10GigEthPhy[1], cevPortEsconPhy, cevPortGEFCPhy
RX CRC	Represents the counter associated with CRC errors. It has a valid value only for interfaces that provide CRC error monitoring.	cevPortWaveEthPhy[2], cevPort10GigEthPhy[2], cevPortEsconPhy[2], cevPortGEFCPhy[2]
TxEncapFarEndPacketErrors	Represents the counter associated with ESCON ingress error indications from the far end of an Ethernet network, where an ESCON stream.	cevPortEsconPhy[2]
Module Name	Module for which PM data is displayed.	—
NE ID	Name of the selected NE.	—

1. Available on ONS 15530 and ONS 15540 NEs.
2. Available on ONS 15530.

Table E-74 CDL PM Parameters

Parameter	Description	Interfaces Supported
Alias ID	Alias name of the selected NE.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—

Table E-74 CDL PM Parameters (continued)

Parameter	Description	Interfaces Supported
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."	—
Rx Header CRC Error	Number of CDL frames received with CDL header CRC errors.	cevPortWaveEthPhy[1], cevPort10GigEthPhy[1], cevPortWaveOSC[1]
Rx Invalid FlowID	Number of CDL flow identifier lookup errors in the received direction.	cevPortWaveEthPhy[2], cevPort10GigEthPhy[2]
Rx Non CDL Packets	Number of packets received without a CDL header on this interface. This counter is incremented only when CDL is enabled on this interface.	cevPortWaveEthPhy[1], cevPort10GigEthPhy[1]
Net Ethernet CRC	Number of Ethernet packets with CRC errors.	cevPortGEFCPhy
Module Name	Module for which PM data is displayed.	—
NE ID	Name of the selected NE.	—

1. Available on ONS 15530 and ONS 15540 NEs.
2. Available on ONS 15530.

Table E-75 Physical PM Parameters

Parameter	Description	Interfaces Supported
Alias ID	Alias name of the selected NE.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."	—
Mean Optical Power	Mean optical power, received direction.	cevPortWavePatch[1]
Optical Power (Max)	Maximum optical power, received direction.	
Optical Power (Min)	Minimum optical power, received direction.	

Table E-75 Physical PM Parameters (continued)

Parameter	Description	Interfaces Supported
Optical Power (Max)	Maximum optical power, received direction, post adjustment.	cevPortVOAIn[2], cevPortVOAFilterIn[2]
Optical Power (Min)	Minimum optical power, received direction, post adjustment.	
Optical Power (Mean)	Mean optical power, received direction, post adjustment.	
Ambient Temp (Max)	Maximum ambient temperature, received direction, post adjustment.	
Ambient Temp (Min)	Minimum ambient temperature, received direction, post adjustment.	
Ambient Temp (Mean)	Mean ambient temperature, received direction, post adjustment.	
Available Seconds	Number of seconds for which the performance data was accounted for in the interval.	cevPortWavePatch[1], cevPortVOAIn[2], cevPortVOAFilterIn[2]
Module Name	Module for which PM data is displayed.	—
NE ID	Name of the selected NE.	—

1. Available on ONS 15530 and ONS 15540 NEs.
2. Available on ONS 15530.

Table E-76 ONS 15530 Fiber Channel Port Errors PM Parameters

Parameter	Description	Interfaces Supported
Alias ID	Alias name of the selected NE.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."	—
Rx Link Resets	Number of link resets (LR primitives) that are received.	cevPortGEFCPhy, cevPort2GFCPhy
Tx Link Resets	Number of link resets (LR primitives) that are transmitted.	
Link Resets	Number of times the reset link protocol was initiated on this port.	
Rx Offline Sequences	Number of offline primitive OLS received on this port.	
Tx Offline Sequences	Number of offline primitive OLS transmitted by this port.	
Loss of Synchs	Number of instances of synchronization loss detected at this port. This count is part of FC-PH's link error status block (LESB).	

Table E-76 ONS 15530 Fiber Channel Port Errors PM Parameters (continued)

Parameter	Description	Interfaces Supported
Loss of Signals	Number of instances of signal loss detected at this port. This count is part of FC-PH's LESB.	cevPortGEFCPhy
Link Failures	Number of link failures. This count is part of FC-PH's LESB.	
Prim Seq Protocol Errors	Number of primitive sequence protocol errors detected at this port. This count is part of FC-PH's LESB.	
Invalid Tx Words	Number of invalid transmission words received at this port. This count is part of FC-PH's LESB.	
Invalid CRCs	Number of frames received with invalid CRC. This count is part of FC-PH's LESB.	
Invalid Ordered Sets	Number of invalid ordered sets received at this port.	
FrameTooLong	Number of frames received at this port where the frame length was greater than what was agreed to in FLOG/PLOGI.	
Truncated Frames	Number of frames received at this port where the frame length was less than the minimum indicated by the frame header, which is normally 24 bytes.	
Address Errors	Number of frames received with unknown addressing.	
Delimiter Errors	Number of invalid frame delimiters received at this port.	
Encoding Disparity Errors	Number of encoding disparity errors received at this port.	
Other Errors	Number of errors that were detected on this port but were not counted by another error counter in this row.	
Module Name	Module for which PM data is displayed.	—
NE ID	Name of the selected NE.	—

Table E-77 ONS 15530 RMON Ethernet History PM Parameters

Parameter	Description	Interfaces Supported
Alias ID	Alias name of the selected NE.	—
Physical Location	Slot and port number for which PM data is displayed.	—
Interface	Interface name of the selected NE.	—
Time Stamp (*time zone*)	When the data was collected. You can select GMT, Local, or User-Defined time for the Time Stamp display. Use the User Preferences dialog box to make your time zone selection.	—
Maintenance	Whether the NE was under maintenance when the performance data was collected.	—
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."	—

Table E-77 ONS 15530 RMON Ethernet History PM Parameters (continued)

Parameter	Description	Interfaces Supported
Octets	Total number of octets of data (including the bad packets) received in the network. This also includes FCS octets but excludes framing bits.	cevPortGEFCPhy
Packets	Number of packets (including bad packets) received during the sampling interval.	
CRCAlignErrors	Number of packets received during the sampling interval that had a length of 64 to 1518 octets but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).	
Undersize Packets	Number of packets received during the sampling interval that were are less than 64 octets long excluding framing bits but including FCS octets.	
Oversize Packets	Number of packets received during the sampling interval that were longer than 1518 octets excluding framing bits but including FCS octets.	
Module Name	Module for which PM data is displayed.	—
NE ID	Name of the selected NE.	—

E.3.2 CDL PM Table—ONS 15530 and ONS 15540

The Converged Data Link (CDL) PM table provides OAM&P in Ethernet packet-based optical networks without a SONET/SDH layer.

You can display performance data for 15-minute or 1-day increments:

- For the 15-minute table, data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- For the 1-day table, data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

When the NE is rebooted, all performance data is cleared on the NE and the first new entry for each interface becomes the new baseline entry. (Baseline entries are always marked invalid.) You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Entries for performance parameters with associated threshold alarms (traps) are flagged in red. Orange represents a major performance problem, yellow represents a minor problem, and blue represents a warning.

Note Display of performance data is affected by settings in the Control Panel.

The following table describes the fields in the CDL PM table.

Table E-78 Field Descriptions for the CDL PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Physical Location	Physical location of the NE: slot, subslot, and port.
Interface	Whether the interface is transparent or trunk side.
Time Stamp	Time when the performance statistics were collected.
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."
Maintenance	Whether the NE was under maintenance when the performance data was collected.
RX HEC	Number of CDL frames received with CDL Header CRC errors.
RX Non CDL	Number of packets received without a CDL header on this interface.
RX Invalid Flow ID	Number of CDL Flow Identifier lookup errors in the received direction.
Net Ethernet CRC *(ONS 15530 only)*	Number of net Ethernet CRC errors.
Module Name	Name of the module.
NE ID	Name of the selected NE.

E.3.3 Ethernet History PM Table—ONS 15530

The Ethernet History PM table shows Ethernet history performance data for ONS 15530 interfaces.

You can display performance data for 15-minute or 1-day increments:

- For the 15-minute table, data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- For the 1-day table, data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

When the NE is rebooted, all performance data is cleared on the NE and the first new entry for each interface becomes the new baseline entry. (Baseline entries are always marked invalid.) You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Entries for performance parameters with associated threshold alarms (traps) are flagged in red. Orange represents a major performance problem, yellow represents a minor problem, and blue represents a warning.

Note Display of performance data is affected by settings in the Control Panel.

The following table describes the fields in the Ethernet History PM table.

Table E-79 Field Descriptions for the Ethernet History PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Physical Location	Physical location of the NE: slot, subslot, and port.
Interface	Name of the interface on which the performance data was collected.
Time Stamp	Time when the performance statistics were collected.
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."
Maintenance	Whether the NE was under maintenance when the performance data was collected.
Octets	Total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).
Packets	Number of packets (including bad packets) received during this sampling interval.
CRC Alignment Errors	Number of packets received during this sampling interval that had a length (excluding framing bits but including FCS octets) from 64 to 1518 octets, inclusive, but had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error).
Under Size Packets	Number of packets received during this sampling interval that were less than 64 octets long (excluding framing bits but including FCS octets) and were otherwise well formed.
Over Size Packets	Number of packets received during this sampling interval that were longer than 1518 octets (excluding framing bits but including FCS octets) but were otherwise well formed.
Module Name	Name of the selected NE module.
NE ID	Name of the selected NE.

E.3.4 FC Port Error PM Table—ONS 15530

The Fibre Channel (FC) Port Error PM table shows performance data for the ONS 15530.

You can display performance data for 15-minute or 1-day increments:

- For the 15-minute table, data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- For the 1-day table, data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

When the NE is rebooted, all performance data is cleared on the NE and the first new entry for each interface becomes the new baseline entry. (Baseline entries are always marked invalid.) You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Entries for performance parameters with associated threshold alarms (traps) are flagged in red. Orange represents a major performance problem, yellow represents a minor problem, and blue represents a warning.

Note Display of performance data is affected by settings in the Control Panel.

The following table describes the fields in the FC Port Error PM table.

Table E-80 Field Descriptions for the FC Port Error PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Physical Location	Physical location of the NE—slot, subslot, and port.
Interface	Whether the interface is transparent or trunk side.
Time Stamp	Time when the performance statistics were collected.
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."
Maintenance	Whether the NE was under maintenance when the performance data was collected.
Rx Link Resets	Number of link resets (LR primitives) received.
Tx Link Resets	Number of link resets (LR primitive) transmitted.
Link Resets	Number of times the reset link protocol was initiated on the port. This includes the number of Loop Initialization Primitive (LIP) events on an arbitrated loop port.
Rx Offline Sequences	Number of offline primitive OLS received at the port.
Tx Offline Sequences	Number of offline primitive OLS transmitted by the port.
Link Failures	Number of link failures. This count is part of the FC-PH Link Error Status Block (LESB).
Loss of Synchs	Number of instances of synchronization loss detected at the port. This count is part of the FC-PH LESB.
Loss of Signals	Number of instances of signal loss detected at the port. This count is part of the FC-PH LESB.
Primitive Sequence Protocol Errors	Number of primitive sequence protocol errors detected at the port. This count is part of the CFC-PH LESB.
Invalid Tx Words	Number of invalid transmission words received at the port. This count is part of the FC-PH LESB.
Invalid CRCs	Number of frames received with an invalid CRC. This count is part of the FC-PH LESB.
Invalid Ordered Sets	Number of invalid ordered sets received at the port.
Frame Too Longs	Number of frames received at the port where the frame length was greater than what was agreed to in FLOGI/PLOGI. This could be caused by losing the end of frame delimiter.
Truncated Frames	Number of frames received at the port where the frame length was less than the minimum indicated by the frame header (normally 24 bytes, but it could be more if the DFCTL field indicates an optional header should have been present).
Address Errors	Number of frames received with unknown addressing, such as an unknown SID or DID. The SID or DID is not known to the routing algorithm.

Table E-80 Field Descriptions for the FC Port Error PM Table (continued)

Field	Description
Delimiter Errors	Number of invalid frame delimiters received at the port. An example is a frame with a class 2 start and a class 3 at the end.
Encoding Disparity Errors	Number of encoding disparity errors received at the port.
Other Errors	Number of errors that were detected on the port but were not counted by any other error counter in the row.
Module Name	Name of the selected NE module.
NE ID	Name of the selected NE.

E.3.5 Line PM Table—ONS 15530 and ONS 15540

The Line PM table shows physical performance data for ONS 15530 and ONS 15540 client and trunk side interfaces. The data shown is from the following modules:

- The transparent and trunk side interfaces of the transponders
- The Optical Supervisory Channel (OSC) interface on the MUX cards

You can display performance data for 15-minute or 1-day increments:

- For the 15-minute table, data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- For the 1-day table, data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

When the NE is rebooted, all performance data is cleared on the NE and the first new entry for each interface becomes the new baseline entry. (Baseline entries are always marked invalid.) You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Entries for performance parameters with associated threshold alarms (traps) are flagged in red. Orange represents a major performance problem, yellow represents a minor problem, and blue represents a warning.

Note Display of performance data is affected by settings in the Control Panel.

The following table describes the fields in the Line PM table.

Table E-81 Field Descriptions for the Line PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Physical Location	Physical location of the NE–slot, subslot, and port.
Interface	Whether the interface is transparent or trunk side.

Table E-81 Field Descriptions for the Line PM Table (continued)

Field	Description
Time Stamp	Time when the performance statistics were collected.
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."
Maintenance	Whether the NE was under maintenance when the performance data was collected.
RX CVRD	Code violations and running disparity errors encountered in the received direction for both types of interfaces. A threshold is associated with this parameter, and the table cell will be flagged in red when the parameter exceeds the threshold. You can set thresholds by using the command line interface (CLI).
RX CRC	Number of CRC errors. This column has a valid value only for interfaces that provide CRC error monitoring. This column is not applicable to ONS 15540.
Tx Packet Errors	Number of ingress error indications from the far end of an Ethernet network, where an ESCON stream is encapsulated in Ethernet packets. This number is incremented whenever an ESCON packet or control character has 8b/10b code violations or running disparity errors in the ingress direction at the far end of the Ethernet network. This column has a valid value only for ESCON interfaces where Ethernet encapsulation is performed. This column is not applicable to ONS 15540.
Module Name	Name of the selected module.
NE ID	Name of the selected NE.

E.3.6 Physical PM Table—ONS 15530 and ONS 15540

The Physical PM table shows physical performance data for ONS 15530 and ONS 15540 client and trunk side interfaces. The data shown is from the following modules:

- The transparent and trunk side interfaces of the transponders
- The OSC interface on the MUX cards

You can display performance data for 15-minute or 1-day increments:

- For the 15-minute table, data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on). The data shown represents the difference in counter values between successive 15-minute intervals.
- For the 1-day table, data is collected at midnight GMT. The data shown represents the difference between the counter values read at successive midnights.

When the NE is rebooted, all performance data is cleared on the NE and the first new entry for each interface becomes the new baseline entry. (Baseline entries are always marked invalid.) You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

Entries for performance parameters with associated threshold alarms (traps) are flagged in red. Orange represents a major performance problem, yellow represents a minor problem, and blue represents a warning.

Note Display of performance data is affected by settings in the Control Panel.

The following table describes the fields in the Physical PM table.

Table E-82 Field Descriptions for the Physical PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Physical Location	Physical location of the NE: slot, subslot, and port.
Interface	Whether the interface is transparent or trunk side.
Time Stamp	Time when the performance statistics were collected.
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as the baseline entry. The description of the baseline entry is "invalid–not enough time has elapsed."
Maintenance	Whether the NE was under maintenance when the performance data was collected.
Mean Power	Mean laser power in dBm.
Maximum Power	Maximum laser power in dBm.
Minimum Power	Minimum laser power in dBm.
Mean Device Temperature	Mean device temperature in degrees Celsius. **Note** This field applies only to the ONS 15530 NE.
Maximum Device Temperature	Maximum device temperature in degrees Celsius. **Note** This field applies only to the ONS 15530 NE.
Minimum Device Temperature	Minimum device temperature in degrees Celsius. **Note** This field applies only to the ONS 15530 NE.
Direction	Line direction.
Available Seconds	Available seconds.
Module Name	Name of the module.
NE ID	Name of the selected NE.

E.3.7 SONET Section PM Table—ONS 15530 and ONS 15540

The SONET Section PM table shows section layer performance data for ONS 15530 and ONS 15540 SONET interfaces. The data shown is from modules with the protocol configured as SONET or SDH. You can use the Plot tab to plot the data in a graphical view that is stored in the Prime Optical database. See 10.4.6 Using PM Data Graphs, page 10-28.

You can display performance data for 15-minute or 1-day increments:

- For the 15-minute table, data is collected at the quarter-hour (for example, at 10:00, 10:15, and so on).
- For the 1-day table, the values shown are the total of 96 15-minute values, ending at midnight GMT.

Entries for performance parameters with associated threshold alarms (traps) are shown in red. Orange represents a major problem, yellow represents a minor problem, and blue represents a warning.

When the NE is rebooted, all performance data is cleared on the NE and the first new entry for each interface becomes the new baseline entry (baseline entries are always marked invalid).

Note Display of performance data is affected by settings in the Control Panel.

The following table describes the fields in the SONET Section PM table.

Table E-83 Field Descriptions for the SONET Section PM Table

Field	Description
Alias ID	Alias name of the selected NE.
Physical Location	Physical location of the NE–slot, subslot, and port.
Interface	Whether the interface is transparent or wave.
Time Stamp	Time when the performance statistics were collected.
Validity	Whether the data in the entry is valid. **Note** The first entry for each interface and port is always invalid and is used as a baseline entry. The description field of a baseline entry is "invalid–not enough time has elapsed."
Maintenance	Whether the NE was under maintenance when the performance data was collected.
Errored Seconds–Section	Number of errored seconds encountered by the SONET/SDH section in the current interval. An errored second is a one-second period with one or more coding violations at that layer or one or more incoming defects at that layer.
Severely Errored Seconds–Section	Number of severely errored seconds encountered by the SONET/SDH section in the current interval. A severely errored second is a one-second period with *x* or more coding violations at that layer one or more incoming defects at that layer. The value of *x* depends on the line rate and bit error rate.
Severely Errored Framing Seconds–Section	Number of severely errored framing seconds encountered by the SONET/SDH section in the current interval. A severely errored framing second is a a one-second period containing one or more severely errored framing events.
Code Violations–Section	Number of coding violations encountered by the SONET/SDH section in the interval. Coding violations are bit interleaved parity errors that are detected in the incoming signal. A threshold is associated with this parameter, and the table cell will be flagged in red when it exceeds the threshold. You can set thresholds by using the CLI.
Module Name	Name of the selected module.
NE ID	Name of the selected NE.

Error Messages

This appendix describes the Cisco Prime Optical error messages and recommends solutions. It contains the following sections:

- F.1 Prime Optical Client Error and Warning Messages, page F-1
- F.2 Prime Optical Server Error Messages, page F-98
- F.3 Prime Optical Server Audit Messages, page F-148

F.1 Prime Optical Client Error and Warning Messages

Error and warning messages are categorized by message type and are listed in ascending numeric order within each category.

Note Because error and warning messages are grouped in number ranges, they are not listed in exact numeric order.

Error Message `EID-2: The NE Explorer is not supported for this NE type.`

Recommended Action Select a different NE for which NE explorer is supported. Table 1-14 on page 1-32 lists the NEs supported in Prime Optical and describes the NE Explorer for each NE.

Error Message `EID-3: The connection to the JMS server was lost.`

Recommended Action No action is required. The service reconnects automatically to the JMS server.

Error Message `EID-100: Fatal error: Cannot connect to EMS server. Check the configuration and retry.`

Recommended Action Verify IP connectivity from the client to the server. Verify that the Prime Optical application is running. See Appendix G, "Troubleshooting," for additional information.

Error Message `EID-102: Fatal error: This service is currently disabled. If the problem persists, contact your service provider.`

Recommended Action Retry later. If the problem persists, contact your Prime Optical system administrator.

Error Message `EID-103: Fatal error: Connection to the EMS server was lost. The application will be shut down.`

Recommended Action Restart the application after verifying that the Prime Optical server is operational and available from the client LAN.

Error Message `EID-104: CTM internal error: Invalid help URL.`

Recommended Action The Prime Optical client cannot connect to the Prime Optical HTTP server. Contact your Prime Optical system administrator.

Error Message `EID-105: This user is currently logged in. Second connection to the EMS server is not allowed.`

Recommended Action If you know where you are logged in currently, close that session. If you do not know where you are logged in, ask the administrator to end the session. After the session ends, start a new session.

Error Message `EID-106: Fatal error: Cannot initialize database connection. Verify that the EMS database is operational.`

Recommended Action Ask the administrator to check the database configuration. Contact Cisco technical support if you cannot find problems with the database.

Error Message `EID-107: Cannot launch a JVM for help.`

Recommended Action Xterm is missing from the Sun Solaris path. Edit the ems-client.cfg file and provide the correct xterm path.

Otherwise, there might not be enough memory to launch a separate help process. Shut down some applications to free memory.

Error Message `EID-108: The administrator has logged out your session. The CTM client will be closed.`

Recommended Action Try logging into the Prime Optical client again.

Error Message `EID-109: Could not log into the CTM server. Cannot start server.`

Recommended Action Run the **opticalctl status** command to see what Prime Optical server processes are running. Restart the Prime Optical server using the **opticalctl start** command.

Error Message `EID-110: Cannot relogin to CTM standby server(s).`

Recommended Action Prime Optical client cannot connect to the servers listed in the Control Panel > Recovery Properties > Server List. Ping the IP address of the server that you are trying to connect to.

Error Message `EID-111: Your password has expired. You must set a new password. Do you want to continue?`

Recommended Action Enter a new password.

Error Message `EID-112: You are entering a protected Cisco domain. Do you want to continue?`

Recommended Action Click **OK** to continue.

Error Message `EID-113: Invalid password. The password cannot contain the same characters as the user ID, even in a different order.`

Recommended Action Choose a different password, one that does not contain the same characters as your username.

Error Message `EID-114: Invalid password. The new password must differ from the old password by at least` *`n`* `characters.`

Recommended Action Choose a different password, one that differs from your old password by at least the number of configured characters.

Error Message `EID-115: Cannot save Auto Refresh state in the User Preferences database table.`

Recommended Action Check your database. Cannot update Auto Refresh Mode in the USER_PREFERENCES_TABLE.

Error Message `EID-116: Cannot launch a browser. CTM uses the default browser to display the online help. The directory where your Mozilla executable is installed must be in your PATH environment variable. Also, verify that the DISPLAY variable is set correctly.`

Recommended Action Use the following procedure to correct the error:

Step 1 Verify that graphical applications can be launched from the terminal window where you execute the Prime Optical client; for example, type:

```
/usr/openwin/bin/xterm
```

Step 2 Verify that Mozilla is in your PATH. Type:

```
which mozilla
```

If the **which mozilla** command returns "mozilla: command not found," verify that Mozilla is installed and is in your PATH variable.

Step 3 Verify that the browser version is supported.

Step 4 Ensure that the browser is Javascript-enabled.

Step 5 If Steps 1 to 4 do not correct the error, install a new browser.

Error Message `EID-117: Cannot launch a browser. CTM uses the default browser to display the online help. If you want to use a specific browser to launch the CTM online help, verify that it is the default browser for your workstation.`

Recommended Action Use the following procedure to correct the error:

Step 1 Choose **Start > Run** from the Windows taskbar.

Step 2 Enter the following command:

```
cmd / start http://www.cisco.com
```

If a browser does not start, verify that an Internet browser is installed and that it is in the global Windows PATH.

Step 3 Verify that the browser version is supported.

Step 4 Ensure that the browser is Javascript-enabled.

Step 5 If Steps 1 to 4 do not correct the error, install a new browser.

Error Message `EID-118: Your password has been set by the administrator. You must set a new password. Do you want to continue?`

Recommended Action Continue setting a new password.

Error Message `EID-119: Error in retrieving backup categories.`

Recommended Action The restore categories could not be retrieved. Restart the Prime Optical client and retry the operation.

Error Message `EID-120: Erroneous filename or NE selections.`

Recommended Action Select a valid filename or NE.

Error Message `EID-121: Categories in backed up file are empty.`

Recommended Action Choose a category for the backed-up file.

Error Message `EID-122: Cannot continue with Finish. Verify that the backup file is not corrupted and that its contents are valid for the restore operation.`

Recommended Action Verify that the backup file is not corrupted and that its contents are valid.

Error Message `EID-123: The ONS 15216 OADM password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-125: The ONS 155XX username is a mandatory field. Specify a username.`

Recommended Action Enter a username.

Error Message `EID-126: The table view has changed. You must refresh the table before performing this operation.`

Recommended Action Click the **Refresh Data** tool.

Error Message `EID-127: An error occurred while scheduling the SNTP configuration.`

Recommended Action Error occurred while scheduling Simple Network Time Protocol (SNTP). Try performing the task again.

Error Message `EID-128: Maximum number of unlock attempts exceeded. Application will be shut down.`

Recommended Action Contact your system administrator to unlock your user account.

Error Message `EID-129: The current user account has been locked. Please try again later.`

Recommended Action This error occurs during Prime Optical user login authentication when a user account is locked out. Wait for the lockout period to expire; then, log into the Prime Optical client.

Error Message `EID-130: Cannot authenticate user. Please try again.`

Recommended Action Enter your username and password and retry.

Error Message `EID-131: Cannot connect to the specified EMS server. Check IP connectivity and try again.`

Recommended Action Ping the server workstation to see if you have IP connectivity. If there is no connectivity, contact the administrator to verify that connectivity is established.

Error Message `EID-132: User disabled due to a security violation. Contact the administrator to enable the user account.`

Recommended Action Contact the administrator to re-enable the user account.

Error Message `EID-133: Please specify a username.`

Recommended Action Enter the username.

Error Message `EID-134: Please enter or select an IP address.`

Recommended Action Enter the IP address.

Error Message `EID-135: There are no undeleted NEs in the selection context.`

Recommended Action The NEs are no longer available. Relaunch the window.

Error Message `EID-136: There is no finish action defined for the selected model.`

Recommended Action No action was defined to complete the operation on the NE. Select a different NE.

Error Message `EID-137: The selection list contains only the deleted NE.`

Recommended Action Relaunch the window.

Error Message `EID-138: Your password has expired. Please contact your service provider for assistance.`

Recommended Action This error occurs during Prime Optical user login authentication when a user's password has expired and the user is not allowed to change the password. Contact your Prime Optical system administrator for assistance.

Error Message `EID-139: Invalid password. The new password must differ from the previous` *`n`* `passwords used. The password you have entered is a duplicate of the password set on` *`date`*`. Enter another password.`

Recommended Action Enter a different password.

Error Message `EID-140: Select at least one NE or select Export EMS Alarms.`

Recommended Action Select at least one NE or select **Export EMS Alarms**.

Error Message `EID-141: Specify the alarm severity.`

Recommended Action Select at least one alarm severity from the list provided.

Error Message `EID-142: Specify the export destination file.`

Recommended Action Specify the export destination file.

Error Message `EID-143: Cannot write to specified export file.`

Recommended Action Verify that the user has the required permission in the directory where the export file is being created. Verify that there is enough disk space available; then, retry.

Error Message `EID-144: Cannot create directory: directory-name.`

Recommended Action Verify that the user has the required permission in the directory where the export file is being created. Verify that there is enough disk space available; then, retry. Verify that there is no existing directory with the name *directory-name.*

Error Message `EID-145: Illegal record count. Enter a positive integer.`

Recommended Action Enter a positive integer.

Error Message `EID-146: Event Export Manager - Cannot create or append to filename. Check access rights and disk space.`

Recommended Action Check access rights and disk space.

Error Message `EID-147: Event Export Manager - Cannot write to filename. Check access rights and disk space.`

Recommended Action Check access rights and disk space.

Error Message `EID-148: Enter message to be sent.`

Recommended Action No message is specified. Enter the message you want to send.

Error Message `EID-149: Message is too long. Only the first 512 bytes will be sent.`

Recommended Action The maximum message size allowed is 512 bytes. If you entered more than 512 bytes, only the first 512 bytes will be sent.

Error Message `EID-150: Illegal threshold value. Enter a number between 0 and 100.`

Recommended Action Enter a number from 0 to 100.

Error Message `EID-151: Copying of CTC binary to CTM server failed. Ensure that server-install-directory/cms/ on the server is not write protected.`

Recommended Action Write-enable the location *server-install-directory*/cms/ and retry.

Error Message `EID-154: The ML Series Card to NE Connection username is a mandatory field. Specify a username.`

Recommended Action Enter a username for ML card-to-NE connections.

Error Message `EID-155: The CTM Server to NE Connection username is a mandatory field. Specify a username.`

Recommended Action Enter a username for Prime Optical server-to-NE connections.

Error Message `EID-157: The CTM Server to NE Connection username is a mandatory field. Specify a username.`

Recommended Action Enter a username for Prime Optical server-to-NE connections.

Error Message `EID-159: Selected NEs for software download are of different model types.`

Recommended Action Reselect the NEs. All NEs selected for software download must be the same model type.

Error Message `EID-160: Year entered is before the current year. Enter a year greater than or equal to the current year.`

Recommended Action Enter a year that is later than, or the same as, the current year.

Error Message `EID-161: Month entered is before the current month. Enter a month greater than or equal to the current month.`

Recommended Action Enter a month that is later than, or the same as, the current month.

Error Message `EID-162: Date entered is before the current date. Enter a date equal to or greater than the current date.`

Recommended Action Enter a day of the month that is the same as, or later than, the current day of the month. The day should be a valid day for the month and year selected.

Error Message `EID-163: Hour entered is before the current hour. Enter an hour greater than or equal to the current hour.`

Recommended Action Enter an hour that is later than, or the same as, the current hour.

Error Message `EID-164: Minute entered is before the current minute. Enter a minute greater than or equal to the current minute.`

Recommended Action Enter a minute that is later than, or the same as, the current minute.

Error Message `EID-165: Source filename is empty. Enter a valid filename.`

Recommended Action Enter a source filename, which is required for the software download or memory restore operation.

Error Message `EID-166: Source file does not exist. Enter a valid filename.`

Recommended Action The source filename specified for the software download or memory restore operation does not exist. Specify a valid source filename.

Error Message `EID-167: Selected NE list is empty. Select NEs from the Available NEs list.`

Recommended Action Select at least one NE for the memory backup or software download operation.

Note You can run the memory restore operation for only one NE at a time.

Error Message `EID-168: An error occurred while scheduling the software download operation.`

Recommended Action The software download operation could not be scheduled. Restart the Prime Optical client and retry the software download operation.

Error Message `EID-169: An error occurred while scheduling the memory restore operation.`

Recommended Action The memory restore operation could not be scheduled. Restart the Prime Optical client and retry the memory restore operation.

Error Message `EID-170: An error occurred while scheduling the memory backup operation.`

Recommended Action The memory backup operation could not be scheduled. Restart the Prime Optical client and retry the memory backup operation.

Error Message `EID-171: Selected Users list is empty. Select users from the Available Users list.`

Recommended Action Select users from the Available Users list and click **Add** to move them to the Selected Users list.

Error Message `EID-172: There are no NEs available in the local user table. Add local NE users first.`

Recommended Action Add local NE users first.

Error Message `EID-173: An error occurred while sending the message.`

Recommended Action The message could not be delivered. Restart the Prime Optical client, retype the message, and resend.

Error Message `EID-174: Cannot retrieve the list of existing configuration files for the NE.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-175: The maximum number of Cisco ONS 15454 NEs must be less than or equal to 100.`

Recommended Action Specify 100 or fewer ONS 15454 NEs.

Error Message `EID-176: An error occurred while reading the global CTM configuration.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-177: An error occurred while modifying the global CTM configuration. Changes made might not take effect.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-178: An error occurred while modifying the global CTM configuration. Changes made might not be communicated to other CTM clients.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-179: No CTM Server to NE Connection username. Username is a mandatory field. Specify a username.`

Recommended Action Enter a username for Prime Optical server-to-NE connections.

Error Message `EID-180: An error occurred while starting this service. Verify that this service is installed on the CTM server and retry.`

Recommended Action Use the following procedure to verify that the Prime Optical processes are running:

Step 1 Log into the Prime Optical server as the root user and enter the following command:

```
opticalctl status
```

Step 2 Contact Cisco technical support with the results of the **opticalctl status** command.

Error Message `EID-181: An internal state error occurred. Do you want to continue using a default standard configuration?`

Recommended Action Click **Yes** or **No**; then, continue accordingly. Alternatively, reopen the Control Panel window.

Error Message `EID-182: An internal state denied the request to read the configuration. Do you want to continue using a default standard configuration?`

Recommended Action Click **Yes** or **No**; then, continue accordingly. Alternatively, reopen the Control Panel window.

Error Message `EID-183: An I/O error occurred. Do you want to continue using a default standard configuration?`

Recommended Action Click **Yes** or **No**; then, continue accordingly. Alternatively, reopen the Control Panel window.

Error Message `EID-184: An internal protocol error occurred. Do you want to continue using a default standard configuration?`

Recommended Action Click **Yes** or **No**; then, continue accordingly. Alternatively, reopen the Control Panel window.

Error Message `EID-185: An internal error would not allow the current configuration to be opened.`

Recommended Action An incorrect server configuration appears on the Control Panel window. Reopen it and verify that the server parameters are correct.

Error Message `EID-186: The request to open the current configuration file was denied.`

Recommended Action An incorrect server configuration appears on the Control Panel window. Reopen it and verify that the server parameters are correct.

Error Message `EID-187: There was a problem opening the current configuration file.`

Recommended Action An incorrect server configuration appears on the Control Panel window. Reopen it and verify that the server parameters are correct.

Error Message `EID-188: There was an exception opening the current configuration file.`

Recommended Action An incorrect server configuration appears on the Control Panel window. Reopen it and verify that the server parameters are correct.

Error Message `EID-189: There is an input character problem in the current configuration file.`

Recommended Action An incorrect server configuration appears on the Control Panel window. Reopen it and verify that the server parameters are correct.

Error Message `EID-190: There is an error in the server configuration file at line` *`line-number`*.

Recommended Action The server configuration file contains an invalid entry (or is missing a mandatory entry) at the line specified. If the line number specified is one more than the last line in the file, invalid data exists on the last line, or some mandatory field values are missing after the last line.

Error Message `EID-191: An error occurred while writing the changes to the server configuration file. The changes made to the server configuration have been lost.`

Recommended Action Refresh the Control Panel window. Redo the changes and click **Save**.

Error Message `EID-192: Server configuration has been modified by another user since it was last read. Click` **`Refresh Data`** `to refresh this view before any changes can be made to the server configuration file.`

Recommended Action To proceed with the save, click the **Refresh Data** tool, change the selected Control Panel property sheet, and click **Save**.

Error Message `EID-193: This IP address was already added as an {0}.`

Recommended Action Enter a different IP address.

Error Message `EID-194: A maximum of` *`n`* `can be configured. You must remove an existing host if you want to add another host.`

Recommended Action Remove an existing Simple Network Management Protocol (SNMP) host; then, add a new host.

Error Message `EID-196: An error occurred while sending the truncate queue event to the server.`

Recommended Action Error while sending event to the server. Restart client.

Error Message `EID-197: Maximum number of login attempts exceeded. Application will be shut down.`

Recommended Action You logged in incorrectly more than the configured number of times. Restart the application and try logging in with the correct username and password. If your user account is locked, contact your system administrator.

Error Message `EID-198: An error occurred while scheduling the alarm profile management operation.`

Recommended Action Reschedule the job.

Error Message `EID-199: An error occurred while scheduling the disclaimer message management operation.`

Recommended Action Reschedule the job.

Error Message `EID-200: An error occurred while scheduling the NE defaults management operation.`

Recommended Action Reschedule the job.

Error Message `EID-201: An error occurred while scheduling the configure node operation.`

Recommended Action Verify that the node is reachable and in service. Try again.

Error Message `EID-202: The archive log backup directory does not exist. Enter a different directory.`

Recommended Action Specify a valid directory for archive log backups.

Error Message `EID-203: Cannot delete the user from the database. Verify that the user is not logged in.`

Recommended Action Check if the user is logged in. Log out the user; then, delete the user.

Error Message `EID-205: The TL1 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the TL1 password.

Error Message `EID-206: Duplicate server address. Enter a unique address.`

Recommended Action Enter a unique server address.

Error Message `EID-207: A maximum of n servers can be configured. You must remove an existing server to add another server.`

Recommended Action Remove an existing server; then, configure another server.

Error Message `EID-208: Could not cancel selected task(s). Action failed.`

Recommended Action The selected task or job is already running or has already been cancelled. Click the **Refresh Data** tool to see the current status.

Error Message `EID-209: Could not cancel selected job(s). Action failed.`

Recommended Action The selected task or job is already running or has already been cancelled. Click the **Refresh Data** tool to see the current status.

Error Message `EID-210: Could not activate selected task(s). Action failed.`

Recommended Action Activate (Commit) fails when the active software version is newer than the standby software version. Only the reactivate (Revert) operation is allowed in this case.

Reactivate (Revert) fails when the active software version is older than the standby software version. Only the activate (Commit) operation is allowed in this case.

Activate or reactivate might fail because a similar administrative operation (such as backup, restore, download, or commit/revert) occurs on the NE. Wait several minutes and try again.

Error Message `EID-211: Could not reactivate job(s). Action failed.`

Recommended Action Activate (Commit) fails when the active software version is newer than the standby software version. Only the reactivate (Revert) operation is allowed in this case.

Reactivate (Revert) fails when the active software version is older than the standby software version. Only the activate (Commit) operation is allowed in this case.

Activate or reactivate might fail because a similar administrative operation (such as backup, restore, download, or commit/revert) occurs on the NE. Wait several minutes and try again.

Error Message `EID-212: Software image download failed for NE-ID.`

Recommended Action The software image file might be empty or corrupt. Or, the problem might be the communication link between Prime Optical and the NE; the NE might not perform the correct handshake response with the Prime Optical. Retry the software download.

Error Message `EID-213: The CTM Server to NE Connection username is a mandatory field. Specify a username.`

Recommended Action Enter a username for Prime Optical server-to-NE connections.

Error Message `EID-215: There are no reachable or known model NEs.`

Recommended Action The NE you chose is unreachable or the NE model type does not support the operation. Choose a different NE.

Error Message `EID-216: No partitions for NEs.`

Recommended Action Initial discovery might still be in progress. Try again later.

Error Message `EID-217: The selected NEs do not have a partition selected to download the image file.`

Recommended Action The selected NE does not have a partition selected for downloading the image. Select a partition to which the image will be downloaded.

Error Message `EID-218: Some NEs do not have associated partitions to download the image file. Do you want to continue?`

Recommended Action One or more of the selected NEs have no partition selected for downloading the image. Select appropriate Flash partitions for all NEs. If you proceed anyway, those NEs will not be scheduled for image download.

Error Message `EID-219: Some selected NE flash partitions do not have enough space for the image: image-name.`

Recommended Action Clean up the space on the Flash partition before job execution time or the job will fail.

Error Message `EID-220: This operation will append only the new commands to the already running configuration. It will not replace the existing running configuration. Do you want to continue?`

Recommended Action Restoring the configuration file as running configuration will only append to the existing running configuration and will not delete the commands that are now present in the new configuration file. This is not a replacement of the running configuration.

Error Message `EID-221: Add at least one NE and a flash bank to Selected Downloads to download the image file.`

Recommended Action Add at least one NE and a Flash bank to the Selected Downloads list.

Error Message `EID-222: Cannot add the user. The total number of users on this NE has reached 20.`

Recommended Action Delete an existing user before adding a new NE user.

Error Message EID-223: Cannot change password at this time. Passwords are allowed to change once every *n* days. You still have *n* (hh:mm:ss) before you will be allowed to change your password.

Recommended Action Wait the specified length of time before changing the password. Alternatively, ask your system administrator to reduce the number of days required between password changes (in the Control Panel > Security Properties pane > Password Rules tab > Interval between password change field).

Error Message EID-224: The FTP password does not match the confirmation password. Retype the password.

Recommended Action Retype the password.

Error Message EID-225: OSS Client Name is a required field. Specify a unique name for this OSS client and retry.

Recommended Action Enter a unique OSS profile name and retry.

Error Message EID-227: IP Address is a required field. Specify a unique IP address for this OSS client and retry.

Recommended Action Enter a unique IP address and retry.

Error Message EID-228: An OSS client with the same name already exists. Specify a unique OSS client name and retry.

Recommended Action Enter a unique OSS client name and retry.

Error Message EID-230: An OSS IP address with the same name already exists. Specify a unique IP address and retry.

Recommended Action Enter a unique IP address and retry.

Error Message EID-231: An error occurred while reading the database. Restart the CTM client and retry.

Recommended Action Restart the Prime Optical client and retry.

Error Message EID-232: An error occurred while creating a new EFD. Add the EFD again.

Recommended Action A database error occurred during this operation. Add the EFD again.

Error Message EID-233: Cannot delete the user from the database. Make the changes again and retry.

Recommended Action Check if the user is logged in.

Error Message `EID-234: EFD Name is a required field. Specify a unique name for the EFD and retry.`

Recommended Action Enter a unique EFD name and retry.

Error Message `EID-235: The password confirmation does not match the actual password. Please try again.`

Recommended Action Retype the password.

Error Message `EID-236: An error occurred while saving the OSS client properties to the database. Make the changes again and retry.`

Recommended Action Redo the EFD changes; then, retry.

Error Message `EID-237: The Password field is mandatory. Enter the password.`

Recommended Action Enter a password that is at least four characters in length.

Error Message `EID-238: At least one NE must be allowed.`

Recommended Action Add at least one NE to the EFD.

Error Message `EID-239: At least one access element must be allowed.`

Recommended Action Add at least one access element to the EFD.

Error Message `EID-241: An error occurred while logging out a CTM user.`

Recommended Action Retry.

Error Message `EID-242: The OSS client name cannot be <NEW>. Enter a different name.`

Recommended Action Enter an OSS client profile name other than "<NEW>."

Error Message `EID-243: An error occurred while stopping this service.`

Recommended Action Use the following procedure to verify that the Prime Optical processes are running:

Step 1 Log into the Prime Optical server as the root user and enter the following command:

```
opticalctl status
```

Step 2 Contact Cisco technical support with the results of the **opticalctl status** command.

Error Message `EID-244: Cannot retrieve the model or service type for this service.`

Recommended Action Try again.

Error Message `EID-245: The modified OSS client was not found in the database.`

Recommended Action Database user data is missing. Recreate the OSS user.

Error Message `EID-246: An error occurred while sending events to other clients.`

Recommended Action Java Management Object and Configuration Object (JMOCO) notification error. Restart the Prime Optical client.

Error Message `EID-247: Cannot delete a new client.`

Recommended Action An error occurred while deleting the selected OSS client. Select another OSS client with an OSS name length greater than 0 characters.

Error Message `EID-248: The ONS 15216 OADM username is a mandatory field. Specify a username.`

Recommended Action Enter a valid username.

Error Message `EID-249: The critical threshold value must be greater than or equal to the major and minor threshold values. The major threshold value must be greater than or equal to the minor threshold value. Enter valid values.`

Recommended Action Enter threshold values where the critical value is greater than the major value, which is greater than the minor value.

Error Message `EID-250: In the Time Period selection, the start time is greater than the end time.`

Recommended Action Enter a start time that is before the end time.

Error Message `EID-251: The username, password, and IP address cannot be changed for an active user. Log out the user and try again.`

Recommended Action Log out the user; then, change the user's username, password, or IP address.

Error Message `EID-252: An error occurred while saving the OSS client properties to the database. All OSS configuration parameters (except OSS username) can be modified when an active OSS user is logged in. Make the changes again and retry.`

Recommended Action All OSS configuration parameters (except OSS username) can be modified when an active OSS user is logged in. Verify the input parameters and try again.

Error Message `EID-253: The selection list contains only the deleted NE.`

Recommended Action Relaunch the window.

Error Message `EID-253: Database error: The EFD profile name must be unique. Make the changes again and retry.`

Recommended Action Enter a unique EFD profile name.

Error Message `EID-254: The deleted NE has been removed from the selection list.`

Recommended Action One or more NEs has been deleted. Relaunch the window.

Error Message `EID-255: The tag can contain only alphanumeric, underscore (_), and period (.) characters.`

Recommended Action Add a tag that contains only alphanumeric characters, an underscore, or a period.

Error Message `EID-256: This username is being used by another CTM user. Choose a different username.`

Recommended Action Choose a different username.

Error Message `EID-257: The new password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-258: An error occurred while scheduling the NE user management job.`

Recommended Action Error occurred while scheduling the job. Try doing the task again.

Error Message `EID-259: Select a user to modify.`

Recommended Action Select a user.

Error Message `EID-260: Select an NE for the user.`

Recommended Action Select an NE.

Error Message `EID-261: This user is already defined on some or all of the selected NEs.`

Recommended Action Select a different user.

Error Message `EID-262: Select at least one user.`

Recommended Action Select at least one user.

Error Message `EID-263: Change the user attributes.`

Recommended Action Change the user attributes.

Error Message `EID-264: The selected user has been deleted from the NE.`

Recommended Action Select a different user.

Error Message `EID-265: Fatal error occurred while notifying the` *`product-name`* `server of this change. Please restart the server and all the clients.`

Recommended Action Restart the Prime Optical server and clients.

Error Message `EID-266: Old CTM User Password field cannot be empty. Enter the old CTM user password and retry.`

Recommended Action Enter the old user password and retry.

Error Message `EID-267: The CTM password you have entered does not match the CTM user password. Please try again.`

Recommended Action Retype the user password.

Error Message `EID-268: The new password does not match the confirmation password. Please try again.`

Recommended Action Retype the confirmation password.

Error Message `EID-269: Database error: Cannot change the user password.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-270: The ONS 15600 username is a mandatory field. Specify a username.`

Recommended Action Enter a username.

Error Message `EID-271: The ONS 15600 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-272: The new CTC password does not match the confirmation password. Please try again.`

Recommended Action Retype the CTC password confirmation.

Error Message `EID-273: Change password feature has been disabled by the administrator for this user.`

Recommended Action Contact the Prime Optical administrator to enable the change password feature for this user.

Error Message `EID-274: All of the fields are blank. Enter valid entries.`

Recommended Action Enter valid entries.

Error Message `EID-275: The ONS 155XX password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-276: The ONS 1530X username is a mandatory field. Specify a username.`

Recommended Action Enter a username.

Error Message `EID-277: The ONS 1530X password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-278: An error occurred while truncating the historical PM collection queue. Please try again.`

Recommended Action Try the operation again.

Error Message `EID-283: The ONS 15216 EDFA3 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-284: Lockout period must be between 1 and 120.`

Recommended Action Enter a lockout period from 1 to 120.

Error Message `EID-285: Logout period must be between 1 and 1440.`

Recommended Action Enter a logout period from 1 to 1440.

Error Message `EID-286: Enter a valid profile name. Either the profile name is blank, or you selected 'Default' or 'Inherited' as the profile name.`

Recommended Action Enter a valid profile name.

Error Message `EID-287: Error: Cannot retrieve profiles from the selected NE.`

Recommended Action View the Alarm Profile tab on the Cisco Transport Controller (CTC).

Error Message `EID-288: Select the two configuration files to be compared.`

Recommended Action Select two different configuration files for comparison.

Error Message `EID-289: No archived configuration files were found. Schedule a memory backup to archive configuration files.`

Recommended Action Schedule a memory backup to archive configuration files.

Error Message `EID-290: The logout period must be greater than the lockout period. Changes will not take effect.`

Recommended Action Enter a logout period that is greater than the lockout period.

Error Message `EID-291: The SNTP address cannot be empty when Use SNTP Server is selected.`

Recommended Action Enter a valid SNTP address.

Error Message `EID-292: The username cannot be empty when the password is entered. Enter a valid username.`

Recommended Action Enter a valid username.

Error Message `EID-299: The ONS 15216 EDFA2 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-300: Cannot open file filename. Privileges to write data are not available.`

Recommended Action You have read access only; this operation requires read/write access. Log out and login again with a username and password that have read/write access.

Error Message `EID-301: Export data error: Table not instantiated.`

Recommended Action You cannot export data before the table is fully open. Wait until the table opens fully; then, click the **Export** tool.

Error Message `EID-302: Export data: Error occurred while opening file filename to export data.`

Recommended Action The file could not be opened for writing the data. This could be due to insufficient permission in the selected directory. Choose a directory with write permission or change the permission to allow writing data in the selected directory.

Error Message `EID-303: The Resync Time (1530X only) value must be in the range 30 to 2147483647.`

Recommended Action Enter a value from 30 to 2147483647.

Error Message `EID-304: Enter a filename for export.`

Recommended Action Enter a filename for the exported file.

Error Message `EID-305: File filename already exists. Do you want to overwrite it?`

Recommended Action The file that you have provided already exists. Verify that you want to overwrite the file before clicking **OK**.

Error Message `EID-306: Cannot write to filename. Check if you have sufficient disk space and permissions to write. Check if another application is using the file.`

Recommended Action Change the permission on the specified file or choose a different filename. If there is insufficient disk space, delete some files to make space on the disk.

Error Message `EID-307: Filename: Path does not exist or no permission to write. Check that the path to the file exists and you have sufficient permissions to write.`

Recommended Action A directory that is part of the path that you specified to the file does not exist or has no permissions to read or write. Create the directory structure to store the file with read/write permissions; then, specify the path. Or, specify a valid path.

Error Message `308: Directory-name is a directory. Enter a filename.`

Recommended Action Enter a filename instead of a directory name.

Error Message `EID-309: Enter a character for separating fields during export.`

Recommended Action You clicked the **Other** radio button but did not specify a separation character. Specify the character that you want to use as the separation character.

Error Message `EID-310: Graph is not available at this time.`

Recommended Action The graph could not be started because the NE could not be contacted. Verify that the NE is available and retry.

Error Message `EID-311: BER statistics are not available at this time.`

Recommended Action The bit error rate (BER) window could not be opened because the NE could not be contacted. Verify that the NE is available and retry.

Error Message `EID-312: The table will be sorted on the Time Stamp column to show new rows. Press OK to sort. You can cancel and sort the table on the Time Stamp column later to see the new rows.`

Recommended Action If you click **Cancel**, the rows will not be sorted in chronological order. If you click **OK**, the rows will be sorted in chronological order and the latest rows appear on top.

Error Message `EID-313: The password change interval cannot be equal to or greater than the password age interval.`

Recommended Action Enter a password change interval that is less than the password age interval.

Error Message `EID-314: Cannot retrieve NE data from the server.`

Recommended Action Restart the Prime Optical client.

Error Message `EID-315: An error occurred while retrieving data from the database.`

Recommended Action Restart the Prime Optical client and retry. Also, check the available memory on the server workstation.

Error Message `EID-316: An error occurred while setting filter criteria in the database.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-317: An error occurred while adding filter criteria in the database.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-318: An error occurred while retrieving the total number of rows from the database.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-319: An error occurred while sorting data in the database.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-320: An error occurred while attempting read/write to the database.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-321: An error occurred while sending a JMOCO request for alarm changed.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-322: An error occurred while initializing the table.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-323: You cannot delete an EFD profile that is used by an OSS client.`

Recommended Action Verify that the EFD profile you want to delete is not being used by an OSS client.

Error Message `EID-324: Cannot add an EFD profile.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-325: Cannot modify an EFD profile.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-326: An error occurred while deleting the selected EFD profile.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-327: An error occurred while deleting the selected EFD profile.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-328: An error occurred while accessing the database.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-329: An error occurred while loading the Java class from the subdirectory.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-330: Cannot launch the table.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-331: An error occurred. The table will be closed.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-332: An exception occurred while creating metadata for` *`object`*`.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-333: A database timeout occurred. Reduce the scope of the query or increase the timeout.`

Recommended Action Your database query is too broad and the time it needs to collect the corresponding data from the database exceeds the configured timeout. To solve this problem, you can do one of the following:

- Reduce the scope of the query. To do so, close the error message box, open the filter of the table that generated the problem, and select a more restrictive criterion. For example, if the table, by default, opens with a "Last 4 Hours" time frame, change it to "Last one hour."
- (Not Recommended) Increase the database timeout by editing the DB_Query_Timeout_Seconds parameter in the config/ems-client.cfg file. The default timeout is 60 seconds.

Error Message `EID-335: Are you sure you want to delete the selected CTC binary?`

Recommended Action Confirm whether you want to delete the selected CTC binary.

Error Message `EID-336: Are you sure you want to activate the selected CTC binary?`

Recommended Action Confirm whether you want to activate the selected CTC binary.

Error Message `EID-337: You cannot delete the active CTC binary.`

Recommended Action Do not delete the active CTC binary.

Error Message `EID-338: The NE is synchronizing the IOS configuration. Try after some time.`

Recommended Action Wait for the NE to synchronize with the IOS configuration; then, try again.

Error Message `EID-339: An error occurred while comparing the two configuration files.`

Recommended Action Check the configuration files being compared and try again.

Error Message `EID-340: The end ID must be greater than the start ID. Enter an end ID value that is greater than the start ID value.`

Recommended Action Enter an end ID value that is greater than the start ID value; then, click **OK** to filter the data.

Error Message `EID-341: The start and end IDs must be valid values. Enter valid values.`

Recommended Action Enter valid values for starting and ending IDs.

Error Message `EID-342: You cannot delete the selected network partition because it is associated with a subnetwork.`

Recommended Action Do not delete this network partition because it is associated with a subnetwork.

Error Message `EID-343: This network partition is not associated with an NE.`

Recommended Action Restart the Prime Optical client and retry.

Error Message `EID-344: You cannot delete the last network partition.`

Recommended Action At least one network partition must be present. Do not delete this last network partition.

Error Message `EID-345: The exported data contains the separator character. Select another separator or check the check box to enclose text in double quotes, which includes the separator.`

Recommended Action Choose another separator or check the **Enclose text in double quotes** check box.

Error Message `EID-346: The two files selected for comparison are identical.`

Recommended Action Select two different configuration files for comparison.

Error Message `EID-347: The search text was not found.`

Recommended Action Repeat the search with new search criteria.

Error Message `EID-348: Enter a valid username.`

Recommended Action Enter a valid username.

Error Message `EID-350: Database error: Cannot unlock the user.`

Recommended Action Retry the unlock operation.

Error Message `EID-351: No more matches.`

Recommended Action This error occurs when the search finds one or more matches, after which no additional matches are found. No action required.

Error Message `EID-352: Enter a valid username.`

Recommended Action Enter a valid username.

Error Message `EID-354: Invalid password change interval.`

Recommended Action Enter the number of days a user must wait between password changes. The range is from 0 to 99 days; the Cisco default is 20 days. A value of 0 disables this feature.

Error Message `EID-355: The start time cannot be before the end time.`

Recommended Action Enter a start time that is earlier than the end time.

Error Message `EID-356: A maximum of 3 parameters can be plotted on a graph.`

Recommended Action Select no more than three parameters to plot.

Error Message `EID-357: Cannot remove all parameters from all lists.`

Recommended Action Select at least one parameter to plot.

Error Message `EID-358: You cannot compare configuration files between different NE families.`

Recommended Action Select two different configuration files for comparison. The configuration files must be for NEs of the same type.

Error Message `EID-359: Select two NEs.`

Recommended Action Select two NEs.

Error Message `EID-360: Cannot create the protection group. The working and protect cards must not be part of a regeneration group, must have the same payload data type and termination mode, and must have G.709 OTN enabled (for MXP cards only).`

Recommended Action Verify that the working and protect cards are not part of a regeneration group, that both cards have the same payload data type and termination mode, and that G.709 OTN is enabled on both cards.

Error Message `EID-361: The selected network partition ID is no longer present. Select another network partition ID.`

Recommended Action This error occurs while adding an NE. If a selected network partition has been deleted by another user, this error message appears. Select a different network partition or a different subnetwork under a different network partition.

Error Message `EID-362: Searched item not found.`

Recommended Action Repeat the search with new search criteria.

Error Message `EID-363: A database error occurred while trying to delete the selected CTC user profile.`

Recommended Action Contact the system administrator.

Error Message `EID-364: The selected CTC user profile has already been deleted from the database.`

Recommended Action Select a different CTC user profile.

Error Message `EID-365: This operation will result in deleting the selected CTC user profile(s) from the database. However, this delete action performed in CTM will not affect the CTC users already configured on the NEs using these profiles. Press 'OK' to continue or 'Cancel' to cancel the operation.`

Recommended Action Click **OK** to continue or **Cancel** to cancel the operation.

Error Message `EID-366: You cannot create a link from an unmanaged NE to a group containing SONET and SDH NEs. Select a destination group that contains only SONET or only SDH NEs.`

Recommended Action Select a different destination group, one that contains only SONET or SDH NEs.

Error Message `EID-367: The corresponding .dbf file does not exist for the selected .shp file.`

Recommended Action Choose a different file.

Error Message `EID-368: An error occurred while modifying the L2 topology bandwidth. Could not modify bandwidth values.`

Recommended Action A provisioning error occurred while modifying the output quality of service (QoS) policy for the selected topology. Check the Error Log for the reason for the failure.

Error Message `EID-369: The Committed Bandwidth value is invalid. Enter a valid value.`

Recommended Action Enter a value from 1 to 99.

Error Message `EID-370: Failed to enable POS ports.`

Recommended Action Log into the card and enter the **no shutdown** command on all of the packet-over-SONET (POS) ports in the topology. If you encounter problems while opening a Telnet connection to the card, reset the card; then, enter the **no shutdown** command on the POS ports.

Error Message `EID-371: Specified VLAN number is already in use.`

Recommended Action Enter a VLAN number that is not already used.

Error Message `EID-372: Failed to retrieve next VLAN number.`

Recommended Action Enter a new VLAN number and provision using that VLAN number.

Error Message `EID-373: For Layer 2 service creation on an RPR topology, select at least two service drops on two different ML cards.`

Recommended Action Select at least two drops on two different ML-series cards that are in Resilient Packet Ring (RPR) topology.

Error Message `EID-374: For Layer 2 service creation on a point-to-point topology, select at least one service drop per ML card.`

Recommended Action Select at least one drop per ML-series card that is in a point-to-point topology.

Error Message `EID-375: No Ether ports exist for the selected topology.`

Recommended Action All of the front ports are used up. Delete drops or L2 services that are not used to free up some front ports.

Error Message `EID-376: An error occurred while retrieving front ports for the selected topology.`

Recommended Action All of the front ports are used. Delete drops or L2 services that are not used to free up some front ports.

Error Message `EID-377: Failed to provision the Layer 2 service.`

Recommended Action If the topology is not synchronized, close the L2 service wizard and try again after the topology synchronization is complete. If there is an invalid username or password, verify that the username and password configured in the ML-series card are synchronized with the NE username and password. Close the L2 service wizard and try again. Check the command-line interface (CLI) configuration on all ML-series cards in the topology and retry the operation. If the problem persists, contact Cisco technical support.

Error Message `EID-378: No Layer 2 service is selected to show drops. Select a Layer 2 service.`

Recommended Action Select one L2 service.

Error Message `EID-379: Select only one Layer 2 service.`

Recommended Action Select one L2 service.

Error Message `EID-380: Failed to retrieve record from the database.`

Recommended Action Select a row in the VLAN table before selecting the Show Drops button.

Error Message `EID-381: Failed to create the QoS template.`

Recommended Action Verify the error details.

Error Message `EID-382: The CTM server is initializing. Please try again later.`

Recommended Action Wait for the Prime Optical server to finish initializing; then, try logging in again.

Error Message `EID-383: The NEs are not reachable. An error occurred while setting the nodes.`

Recommended Action Try again later. If the problem persists, contact the system administrator.

Error Message `EID-384: Failed to retrieve the links in the protect path.`

Recommended Action Verify that there are links in the protect path and that the nodes are in service.

Error Message `EID-385: Circuits involving ML cards cannot be deleted. Delete the associated topologies.`

Recommended Action Delete the associated topologies.

Error Message `EID-386: Editing the UPSR attributes was not successful. There might be a higher-priority request.`

Recommended Action No action is required.

Error Message `EID-387: Failed to retrieve TUG2s.`

Recommended Action Verify that there are available in-service TUG2s on the selected VC3.

Error Message `EID-388: Failed to retrieve VC12s.`

Recommended Action Verify that there are available in-service VC12s on the selected object.

Error Message `EID-389: J1 path trace is not supported by VT circuits or VT tunnels.`

Recommended Action Launch the J1 path trace window for a different circuit type.

Error Message `EID-390: J1 path trace is not supported on this card.`

Recommended Action Launch the J1 path trace window for a different card.

Error Message `EID-391: Failed to retrieve trace data from the server. Contact the system administrator.`

Recommended Action Try again later. If the problem persists, contact your system administrator.

Error Message `EID-392: This circuit has been deleted from another interface. This window will be closed.`

Recommended Action No action.

Error Message `EID-393: Failed to retrieve LAP spans.`

Recommended Action Contact your system administrator.

Error Message `EID-394: Failed to retrieve LO options.`

Recommended Action Contact your system administrator.

Error Message `EID-395: Failed to set LAP destination.`

Recommended Action Contact your system administrator.

Error Message `EID-396: There are no paths available on this link. Make another selection.`

Recommended Action This link does not have enough bandwidth for the current circuit size. Select another route for the current circuit or delete some circuits going through the selected link. If you need help to do this, contact your system administrator.

Error Message `EID-397: This link cannot be included in the required list. There can be only one incoming and outgoing link for a node. The link source cannot be the destination NE. Check the direction and try again.`

Recommended Action Your selection is invalid. Change the direction and try again.

Error Message `EID-398: This NE is not reachable.`

Recommended Action The NE is not reachable. Check whether the NE is down or has lost connectivity with Prime Optical.

Error Message `EID-399: Error: Grooming node selection.`

Recommended Action Select the grooming node for the aggregation circuit.

Error Message `EID-400: No circuits are selected for deletion. Select one or more circuits for deletion.`

Recommended Action Select one or more circuits for deletion.

Error Message `EID-401: Access violation. Check user privileges.`

Recommended Action Select the grooming node for the aggregation circuit.

Error Message `EID-402: The Hold Off Time value must be between 0 to 10000 with a precision of 100.`

Recommended Action Enter a valid hold off time value.

Error Message `EID-403: There are no NEs selected or the selected NEs are not in service.`

Recommended Action Select an in-service NE.

Error Message `EID-404: Incorrect subnetwork selection. The NEs in the selection context belong to different subnetworks.`

Recommended Action Use the Subnetwork Explorer to change the allocation of NEs to the subnetworks.

Error Message `EID-405: Failed to trace the following VLANs: VLANs`

Recommended Action Contact the system administrator.

Error Message `EID-406: ONS 15454 CM Module error while creating selection context for launching the Circuit VLAN table.`

Recommended Action Contact the system administrator.

Error Message `EID-407: ONS 15454 CM Module error while creating selection context for launching the Circuit VLAN table.`

Recommended Action Contact the system administrator.

Error Message `EID-408: Base circuit and span module error while creating selection context for launching the Circuit Span table.`

Recommended Action Contact the system administrator.

Error Message `EID-409: Base circuit and span module error while creating selection context for launching the Circuit Span table.`

Recommended Action Contact the system administrator.

Error Message `EID-410: Number of concurrent active sessions exceeded for this user profile. Application will be shut down.`

Recommended Action The number of permitted simultaneous logins assigned to the user profile has been exceeded. Additional users with the same profile cannot login until current users log out.

Error Message `EID-411: This session has been logged out. CTM client will be closed.`

Recommended Action The logout timer has logged you out of this session. Log back into Prime Optical client and modify the client inactivity timer settings in Control Panel > Security Properties > Security tab.

Error Message `EID-412: Client application cannot be restarted because the required port is not available.`

Recommended Action Restart Prime Optical client.

Error Message `EID-413: Your account has been disabled due to inactivity. Contact your administrator for details.`

Recommended Action Contact your system administrator to re-enable your user account.

Error Message `EID-414: The Flow Control Low value must be less than the Flow Control High value for all ports on the card.`

Recommended Action Enter a Flow Control Low value that is less than the Flow Control High value.

Error Message `EID-415: No configuration data has been detected for this network element.`

Recommended Action If the NE is available, wait a few minutes; then, reopen the NE Explorer window.

Error Message `EID-420: Error occurred while reading the STM-1 configuration from the database. The data shown may be inconsistent with the network element's actual configuration.`

Recommended Action Wait for a few minutes; then, click the **Refresh Data** tool to refresh the view.

Error Message `EID-421: Error occurred while reading the VC4 configuration from the database. The data shown may be inconsistent with the network element's actual configuration.`

Recommended Action Wait for a few minutes; then, click the **Refresh Data** tool to refresh the view.

Error Message `EID-422: Error occurred while reading the VC3 configuration from the database. The data shown may be inconsistent with the network element's actual configuration.`

Recommended Action Wait for a few minutes; then, click the **Refresh Data** tool to refresh the view.

Error Message `EID-423: Error occurred while reading the VC2 configuration from the database. The data shown may be inconsistent with the network element's actual configuration.`

Recommended Action Wait for a few minutes; then, click the **Refresh Data** tool to refresh the view.

Error Message `EID-424: Error occurred while reading the VC12 configuration from the database. The data shown may be inconsistent with the network element's actual configuration.`

Recommended Action Wait for a few minutes; then, click the **Refresh Data** tool to refresh the view.

Error Message `EID-425: Cannot launch NE Explorer because the CTM server is retrieving data from the NE. Try again in a few minutes.`

Recommended Action The server configuration is incomplete. You must wait until all the data for that NE is retrieved and stored in the database. Wait for a few minutes; then, retry.

Error Message `EID-426: Cannot refresh the configuration. Close and reopen the NE Explorer.`

Recommended Action Close and reopen the NE Explorer window.

Error Message `EID-427: Cannot process the configuration change. Close and reopen the NE Explorer.`

Recommended Action Close and reopen the NE Explorer window.

Error Message `EID-428: Cannot clear the Security Violation/Intrusion alarm on` *`NE-name`*`.`

Recommended Action Use CTC to clear the alarm.

Error Message `EID-429: DCC/GCC/OSC was created successfully, but the Admin State was not set.`

Recommended Action The port could not be set. Go to the property sheet of the related card and try to set the Admin State in the Line Config tab.

Error Message `EID-430: You attempted to set unallowed severities for some alarm conditions. The change was not saved successfully. Severities will be reset to the previous values.`

Recommended Action Specify a valid alarm severity.

Error Message `EID-435: Cannot launch the NE Explorer because data retrieval from the NE has failed. You can force the data retrieval by marking the NE Out Of Service and In Service.`

Recommended Action Mark the NE as Out of Service and then In Service.

Error Message `EID-448: You cannot delete the default or inherited alarm profiles.`

Recommended Action Default and inherited alarm profiles cannot be deleted.

Error Message `EID-449: You cannot change the default or inherited alarm profiles.`

Recommended Action Default and inherited alarm profiles cannot be changed or deleted.

Error Message `EID-450: An alarm profile with the same name already exists. Enter another name.`

Recommended Action The selected name is already in use. Choose a different name.

Error Message `EID-451: Enter a valid SNTP server IP address.`

Recommended Action Enter a valid SNTP server IP address.

Error Message `EID-452: Enter a valid DHCP server IP address.`

Recommended Action Enter a valid Dynamic Host Configuration Protocol (DHCP) server IP address.

Error Message `EID-453: The protection group must have working card(s).`

Recommended Action Select a protection group that contains at least one working card.

Error Message `EID-454: Enter valid values for Protection Group Name, Protection Type, Protect Module, and Working Entities.`

Recommended Action Enter valid values.

Error Message `EID-455: Enter a valid value for Protection Group Name.`

Recommended Action Enter a valid protection group name.

Error Message `EID-456: Enter a valid value for Protect Module.`

Recommended Action Enter a valid protect module value.

Error Message `EID-457: Enter a valid value for Working Entities.`

Recommended Action Enter a valid working entities value.

Error Message `EID-458: Enter a valid value for Protection Type.`

Recommended Action Enter a valid protection type value.

Error Message `EID-459: The protection group name is too long. The maximum length is 32 characters.`

Recommended Action Enter a protection group name that does not exceed 32 characters.

Error Message `EID-460: Enter a valid SNMP trap destination IP address.`

Recommended Action Enter a valid SNMP trap destination IP address.

Error Message `EID-461: Enter a valid SNMP community name.`

Recommended Action Enter a valid SNMP community name.

Error Message `EID-462: 0.0.0.0 is not a valid DHCP server IP address. Enter a valid IP address.`

Recommended Action Enter a valid IP address.

Error Message `EID-463: 0.0.0.0 is not a valid SNTP server IP address. Enter a valid IP address.`

Recommended Action Enter a valid IP address.

Error Message `EID-464: The creation of Ethernet thresholds failed on the following ports: port-number(s).`

Recommended Action Try creating the thresholds again. See 5.3.16 Creating an Ethernet Threshold, page 5-29 for more information.

Error Message `EID-465: The change was not saved successfully. Data will be reset to the previous values.`

Recommended Action Some attributes were not saved successfully. Check documentation to see any conditions that must be set up before setting the attributes.

Error Message `EID-466: One VLAN must be marked as Untagged for each port. The changes for the following port will not be applied to ports: port-number.`

Recommended Action Mark one VLAN as untagged for each port.

Error Message `EID-467: Delete request already submitted for topology: topology-name.`

Recommended Action The selected topology has already been marked for deletion.

Error Message `EID-468: Ports cannot be provisioned in transponder mode when autonegotiation is enabled (unidirectional transponding only).`

Recommended Action Disable autonegotiation to complete this operation.

Error Message `EID-469: Autonegotiation cannot be enabled when ports are provisioned in transponder mode (unidirectional transponding only).`

Recommended Action Disable autonegotiation to complete this operation.

Error Message `EID-470: The creation of FCMR thresholds failed on the following ports: port-numbers.`

Recommended Action Check the parameters used for threshold creation and verify that the rising threshold is greater than the falling threshold. Verify that there are no thresholds defined on the same variable on the same port. Then, try this operation again.

Error Message `EID-471: Enter a valid value for Range OSPF Area ID. The value should be one of the DCC area IDs or the LAN port area ID if OSPF is enabled on the LAN.`

Recommended Action Enter a valid value for Range OSPF Area ID.

Error Message `EID-472: Invalid UDP port. The port number must be 162, 391, or any number between 1024 and 65535. The port number is 161 for NE versions earlier than R4.6.`

Recommended Action Enter a valid User Datagram Protocol (UDP) port number.

Error Message `EID-473: Relays must be provided in order. Enter data for Relay A before using Relay B or Relay C.`

Recommended Action Enter relays in order.

Error Message `EID-474: Relays must be provided in order. Enter data for Relay B before using Relay C.`

Recommended Action Enter relays in order.

Error Message `EID-475: If OSPF is active on the LAN, the DCC area IDs cannot be 0.0.0.0. Change all DCC area IDs to not be 0.0.0.0 before enabling OSPF on the LAN.`

Recommended Action Enter a valid DCC area ID value.

Error Message `EID-476: Ordering error. The absolute value must be ELWBATVG <= LWBATVG < HIBATVG <= EHIBATVG.`

Recommended Action Enter the voltages in the correct order.

Error Message `EID-477: Ordering error. The absolute value must be ELWBATVG < EHIBATVG.`

Recommended Action Enter the voltages in the correct order.

Error Message `EID-478: Enter a valid value for OSPF Area Range Address.`

Recommended Action Enter a valid Open Shortest Path First (OSPF) area range address value. See 5.3.4.3.1 Viewing OSPF Virtual Links, page 5-6 for more information.

Error Message `EID-479: A community name without an associated IP address is not allowed.`

Recommended Action Enter a community name associated with an IP address.

Error Message `EID-480: Enter a valid value for RIP Summary Address.`

Recommended Action Enter a valid Routing Information Protocol (RIP) summary address value.

Error Message `EID-481: Enter a valid value for Neighbor Address.`

Recommended Action Enter a valid neighbor address value.

Error Message `EID-482: Authentication key mismatch. Re-enter:`

Recommended Action Retype the authentication key.

Error Message `EID-483: The Dead Interval value must be greater than the Hello Interval value.`

Recommended Action Enter a dead interval that is greater than the hello interval.

Error Message `EID-484: The RIP metric range is 1 to 15.`

Recommended Action Enter a RIP metric from 1 to 15.

Error Message `EID-485: Invalid subnet mask for static route.`

Recommended Action Enter a valid subnet mask address for the static route.

Error Message `EID-486: Invalid virtual link neighbor address.`

Recommended Action Enter a valid virtual link neighbor address.

Error Message EID-487: Invalid Telnet port. The selected port cannot be used to telnet to the node. Choose any port in the range 0 to 9998, but do not use any of the following ports because they might be in use by the node for other services. Some of these ports are configurable or are not always in use, in which case Telnet would be able to use them, but this might interfere with the operation of the node.
0 (reserved)
20 (FTP-data)

5080
9100
9102
9999
10240-12280 (SOCKS Internal)
57790 (CORBA IIOP)

Recommended Action Enter a valid Telnet port number that is not one of the port numbers listed above.

Error Message EID-488: Change the port state to Out of Service before changing card parameters.

Recommended Action Mark the port as Out of Service.

Error Message EID-489: The ONS 15327 password does not match the confirmation password. Retype the password.

Recommended Action Retype the password.

Error Message EID-492: The ONS 15454 ML-series password does not match the confirmation password. Retype the password.

Recommended Action Retype the password.

Error Message EID-494: The ONS 15454 SDH password does not match the confirmation password. Retype the password.

Recommended Action Retype the password.

Error Message `EID-495: The ONS 15454 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-496: Cannot change Credits Available unless Auto Detect Credits is unchecked. Data will be reset to the previous values.`

Recommended Action Uncheck the **Auto Detect Credits** check box in the Distance Extension tab. Then, retype the new value in the **Credits Available** field.

Error Message `EID-497: Cannot change GFP Buffers Available unless Autoadjust GFP Buffer Threshold is unchecked. Data will be reset to the previous values.`

Recommended Action Uncheck the **Autoadjust GFP Buffer Threshold** check box in the Distance Extension tab. Then, retype the new value in the **GFP Buffers Available** field.

Error Message `EID-498: A network element with this IP address already exists in the database, or this is a secure IP address.`

Recommended Action Enter a unique IP address that is not in use.

Error Message `EID-500: Searched item not found.`

Recommended Action No item in the Domain Explorer topology tree matches the search criteria that you specified. Redefine the search criteria and run a new search.

Error Message `EID-501: Cannot launch a remote console to the selected NE.`

Recommended Action Xterm is missing from the Sun Solaris path. Edit the ems-client.cfg file and provide the correct xterm path.

Or, there is not enough memory to launch a separate Telnet process. Shut down some applications to free up memory.

Error Message `EID-502: Group Name is a mandatory field. Enter a unique group name and retry.`

Recommended Action Enter a unique name for the new group.

Error Message `EID-503: A group with the same name already exists. Specify a unique group name and retry.`

Recommended Action Enter a unique name for the new group.

Error Message `EID-504: A group name cannot be the same as a domain name. A domain with the same name already exists. Specify a unique group name and retry.`

Recommended Action Enter a unique name for the new group.

Error Message `EID-505: Database error: An error occurred while adding the new group to the database.`

Recommended Action A database error occurred while adding the new group. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry adding a new group.

Error Message `EID-506: Error in launching CTC Node View for` *`NE-ID`*.

Recommended Action If the CTC progress screen and login dialog box appear, the CTC username or password is incorrect. If you are trying to launch CTC but CTC is locked, you receive this EID. To correct this error:

Step 1 Choose **Administration > Users**.

Step 2 In the Cisco Prime Optical Users table, choose **Edit > Modify**.

Step 3 Click **Next**. In the CTC User Properties panel, change the CTC username and password to match those configured for the device.

If the CTC progress screen idles for a long time before the login dialog box appears, there might be network connectivity problems to the device.

Step 4 (Optional) From a DOS command window or a Sun Solaris terminal, ping the device. If there is no response, set up the routes so that the device is available; then, restart CTC.

Step 5 (Optional) If CTC does not start, your workstation might have resource constraints. Close some open applications and try again. Close some instances of CTC that are managing other groups of ONS 15454 NEs and try again.

Error Message `EID-507: Error in launching CTC node view for selected NE.`

Recommended Action Please try again later.

Error Message `EID-508: Error in launching CTC node view for 15600 NE.`

Recommended Action Please try again later.

Error Message `EID-509: Error in launching CTC node view for 15600 SDH NE.`

Recommended Action Please try again later.

Error Message `EID-511: NE ID is a mandatory field. Enter a unique NE ID and retry.`

Recommended Action Enter a unique ID for the NE.

Error Message `EID-512: An NE or GNE with the same ID already exists in the database. Enter a unique NE ID and retry.`

Recommended Action Enter a unique ID for the NE.

Error Message `EID-513: An NE with the same IP address already exists. Enter a unique IP address and retry.`

Recommended Action Enter a unique ID for the NE that does not exceed 128 alphanumeric characters.

Error Message `EID-514: IP Address is a mandatory field. Enter a unique IP address and retry.`

Recommended Action Enter a unique IP address for the NE.

Error Message `EID-515: No IP address is selected. Select an IP address and retry.`

Recommended Action Enter a unique IP address and retry.

Error Message `EID-516: Invalid IP address. Enter a valid IP address in four decimal bytes (for example, 196.100.200.300) and retry.`

Recommended Action Enter a unique IP address that uses the specified format.

Error Message `EID-519: The selected NEs do not have a partition selected to download the image file.`

Recommended Action The selected NE does not have a partition selected for downloading the image. Select a partition to which the image will be downloaded.

Error Message `EID-520: Database error: An error occurred while adding the new NE to the database.`

Recommended Action A database error occurred while adding the new NE. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry adding a new NE.

Error Message `EID-522: The IOS FTP username is a mandatory field.`

Recommended Action Specify a username.

Error Message `EID-523: The IOS Config Engine username is a mandatory field. Specify a username.`

Recommended Action Enter the username.

Error Message `EID-524: Database error: Cannot set the In-Service time stamp in the database.`

Recommended Action A database error occurred while storing the NE's in-service time stamp in the database. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-525: Database error: Cannot set the Config Mode in the database.`

Recommended Action A database error occurred while setting the NE type in the database. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-526: Invalid tree node selected. You cannot perform this operation with the current selection. Select a group or domain node and retry.`

Recommended Action Select a group or domain node and retry.

Error Message `EID-527: Error occurred while registering with the CTM event notification subsystem. Exit and restart the application.`

Recommended Action Restart the Prime Optical server and all of the clients. Contact Cisco technical support if the problem persists.

Error Message `EID-528: A fatal error occurred while notifying the` *`server-name`* `server of this change. Restart the server and all the clients.`

Recommended Action Restart the Prime Optical server and all of the clients. Contact Cisco technical support if the problem persists.

Error Message `EID-529: An error occurred while writing data to the database.`

Recommended Action Exit and restart the Prime Optical client.

Error Message `EID-530: An error occurred while reading data from the database.`

Recommended Action Exit and restart the Prime Optical client.

Error Message `EID-531: A domain with the same name already exists. Specify a unique domain name and retry.`

Recommended Action Specify a unique domain name.

Error Message `EID-532: Database error: Cannot modify the domain description.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-533: Database error: Cannot modify the domain name.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-534: Domain Name is a mandatory field. Specify the domain name and retry.`

Recommended Action Enter a name for the domain.

Error Message `EID-535: Group Name is a mandatory field. Specify the group name and retry.`

Recommended Action Enter a name for the group.

Error Message `EID-536: Database error: Cannot modify the group name.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-537: Database error: Cannot modify the group description.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-538: Database error: Cannot modify the group location.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-539: Database error: Cannot modify the NE name.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-540: Database error: Cannot modify the NE IP address.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-541: Database error: Cannot modify the network element NSAP address.`

Recommended Action A database error occurred when you tried to modify the NE Network Service Access Point (NSAP) address. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-542: Database error: Cannot modify the NE state.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-543: Database error: Cannot modify the NE description.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-544: Database error: Cannot modify the NE community string.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-545: Database error: Cannot modify the NE location name.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-546: Database error: Cannot modify the NE GNE ID.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-549: Database error: Cannot set the NE type in the database.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-550: Database error: Cannot set the NE PM collection state in the database.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-551: Database error: Cannot set the model type in the database.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-552: Database error: Cannot set the NE username in the database.`

Recommended Action This error occurs when there is a database exception while setting the username for the NE in the NE Authentication tab. Perform the operation again.

Error Message `EID-553: Database error: Cannot set the NE user password in the database.`

Recommended Action This error occurs when there is a database exception while setting the username for the NE in the NE Authentication tab. Perform the operation again.

Error Message `EID-554: Database error: Cannot create the new user.`

Recommended Action Perform the operation again.

Error Message `EID-555: Username is a mandatory field. Enter a unique username and retry.`

Recommended Action Enter a unique username. See Table 8-3 on page 8-16 for the Prime Optical username restriction.

Error Message `EID-556: Username is a mandatory field. Enter a username and retry.`

Recommended Action Enter a unique username.

Error Message `EID-557: A CTM user with the same name already exists. Enter a unique username and retry.`

Recommended Action Enter a unique username.

Error Message `EID-558: A CTC user with the same name already exists. Enter a unique username and retry.`

Recommended Action Enter a unique username.

Error Message `EID-559: User Password is a mandatory field. Enter a unique user password and retry.`

Recommended Action Enter a unique user password. See Table 8-3 on page 8-16 for the Prime Optical user password restriction.

Error Message `EID-560: Enter a username that contains at least 3 characters.`

Recommended Action Enter a username that contains at least three characters.

Error Message EID-561: The username must start with an alphabetic character (A - Z, a - z). Enter a valid username and retry.

Recommended Action Enter a valid username.

Error Message EID-562: A CTC password cannot be specified without a username. Enter a username and retry.

Recommended Action Enter a valid username.

Error Message EID-563: A user password is mandatory to create a CTM user. Enter a unique user password and retry.

Recommended Action Enter a unique user password.

Error Message EID-564: The Add User wizard has been closed because the user privileges list has changed. Launch the wizard again.

Recommended Action Relaunch the Create User Profile wizard.

Error Message EID-565: User Password is a mandatory field. Enter a unique user password and retry.

Recommended Action Enter a unique password for the user. The user password must contain at least six characters. Of those six characters, at least one must be a nonalphanumeric character (*, -, &, %, and so on).

Error Message EID-566: Database error: Cannot modify user properties.

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message EID-567: The password confirmation does not match the actual password. Try again.

Recommended Action Retype the password.

Error Message EID-568: The domain name cannot be the same as a group name. A group with the same name already exists. Specify a unique domain name and retry.

Recommended Action Specify a unique domain name.

Error Message EID-569: No objects are assigned to the user. Assign at least one object to the user.

Recommended Action Assign an object to the user.

Error Message `EID-570: Database error: Cannot create the new user type.`

Recommended Action This error occurs when a new user profile is being created or if an existing profile is being modified. If it occurs while creating a user profile, delete the newly created user profile and try recreating the user profile. If it occurs while modifying an existing user profile, perform the operation again.

Error Message `EID-571: User Type Name is a mandatory field. Enter a unique name and retry.`

Recommended Action Enter a unique user type name.

Error Message `EID-572: Database error: Cannot modify user properties.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-573: The password confirmation does not match the actual password. Reconfirm the password.`

Recommended Action Reconfirm the password.

Error Message `EID-574: A CTM user type with the same name already exists. Enter a unique name and retry.`

Recommended Action Enter a unique user type name.

Error Message `EID-575: No objects are assigned to the user. Assign at least one object to the user.`

Recommended Action Assign at least one object to the user and retry.

Error Message `EID-576: Enter a user type name that contains at least 6 characters.`

Recommended Action Enter a user type name that contains at least 6 characters.

Error Message `EID-577: Enter a user type name that contains at least 6 characters.`

Recommended Action Enter a user type name that contains at least 6 characters.

Error Message `EID-578: Database error: Cannot delete one or more users.`

Recommended Action Perform the operation again.

Error Message `EID-579: Fatal error: Restart the server-name server and all the clients.`

Recommended Action Restart the Prime Optical server and all of the clients.

Error Message `EID-580: The selected user is currently logged in. The user cannot be deleted until he or she logs out.`

Recommended Action Ask the selected users to log out from all of the clients and retry.

Error Message `EID-581: User(s) with this profile already exist(s). The profile cannot be deleted until you delete the user(s) from the CTM Users table.`

Recommended Action Delete the user(s) from the Cisco Prime Optical Users table.

Error Message `EID-582: This is a default user profile. It cannot be deleted.`

Recommended Action You cannot delete the default user profile. Select a different user profile to delete.

Error Message `EID-583: A GNE or NE with the same name already exists. Specify a unique GNE name and retry.`

Recommended Action Enter a unique gateway network element (GNE) name.

Error Message `EID-584: The to and from IP addresses are from different subnetworks.`

Recommended Action This error occurs during the addition of bulk NEs. When a range of IP addresses is specified in the Add NE wizard, the subnet mask of the From and To IP Address must be the same. Verify that the first three parts of the IP address are the same in order to add a range of NEs.

Error Message `EID-585: The "to" IP Address is lower than the "from" IP Address.`

Recommended Action This error occurs during the addition of bulk NEs. Verify that the To IP Address is greater than the From IP Address.

Error Message `EID-586: The selected GNE ID is no longer present. Select another GNE ID.`

Recommended Action This error occurs while adding an NE. If a selected GNE has been deleted by another user, this error message appears. Select a different GNE.

Error Message `EID-587: Database error: Cannot delete one or more user profiles.`

Recommended Action Database error occurred while checking for uniqueness of the user type name or deleting the user from the USER_TYPE_TABLE. It also occurred while writing rows in the OPERATIONS_PERMISSION_TABLE. Check your database connection.

Error Message `EID-588: The selected subnetwork ID is no longer present. Select another subnetwork ID.`

Recommended Action Select another subnetwork ID.

Error Message `EID-589: The specified IP address has already been included in the list.`

Recommended Action Select another IP address.

Error Message `EID-590: Database error: An error occurred after saving the new privileges in the database.`

Recommended Action Check the database connection. If the problem persists, restart the Prime Optical server.

Error Message `EID-591: User profiles have changed. You must refresh the table before modifying a profile.`

Recommended Action Choose **File > Refresh Data** to refresh the table. Then, modify the user profile.

Error Message `EID-592: A CTC user with the same name is used by the server. Enter another username and retry.`

Recommended Action Enter a unique CTC username.

Error Message `EID-593: A CTC user with the same name already exists. Enter a unique username that will be created on all NEs and retry.`

Recommended Action Enter a unique CTC username.

Error Message `EID-594: A CTC user with the same name already exists on all NEs. Enter a unique username and retry.`

Recommended Action Enter a unique CTC username.

Error Message `EID-595: A CTC user with the same name already exists among users created on all NEs. Enter another username and retry.`

Recommended Action Enter a unique CTC username.

Error Message `EID-596: The password cannot be equal to the Username.`

Recommended Action Enter a unique user password. See Table 8-3 on page 8-16 for the Prime Optical user password restriction.

Error Message `EID-597: The last reference of a group can be deleted only after removing all the network elements it contains. Remove all the network elements this group contains and retry.`

Recommended Action Copy or move all of the NEs in this group to another group; then, retry.

Error Message `EID-598: A database error occurred while deleting the selected group from all references of its parent. The group might not be deleted completely.`

Recommended Action Restart the Prime Optical client. Check if the deleted group still exists under all references of its parents. If it does, select each reference in the Domain Explorer tree and choose **Edit > Delete**.

Error Message `EID-599: The autodisable interval range is 0 to 365 days. Enter a new disable interval and retry.`

Recommended Action Enter an autodisable interval from 0 to 365 days.

Error Message `EID-600: Internal error: Cannot register with the event notification subsystem for events. You might not receive updates from other users.`

Recommended Action Restart the Prime Optical client.

Error Message `EID-603: An error occurred while subscribing to EMS events.`

Recommended Action Restart the Prime Optical client.

Error Message `EID-604: An error occurred while unsubscribing from the Cisco Transport Manager event notification subsystem.`

Recommended Action Restart the Prime Optical client.

Error Message `EID-607: A GNE or NE with the same IP address already exists. Enter a unique IP address and retry.`

Recommended Action Enter a unique IP address.

Error Message `EID-608: You cannot change this user's privilege, because this user is the last one with SysAdmin privilege. To change this user's privilege, you must create another user with SysAdmin privilege.`

Recommended Action Create a second user with SysAdmin privileges. Then, you can change the user privilege of the first SysAdmin user.

Error Message `EID-609: There is not enough space in the backup directory. Do you want to continue?`

Recommended Action This error indicates that there is not enough memory for the database backup. You can click OK to continue, but the backup might not succeed if there is not enough space. To ensure a successful database backup, free up space in the backup directory.

Error Message `EID-610: Error starting database backup. Re-enter the password and try again.`

Recommended Action Re-enter the password and try again.

Error Message `EID-611: Error starting database export.`

Recommended Action In the Domain Explorer window, choose **Administration > Audit Log**. Read the details of the failure in the Audit Log, and correct the problem accordingly.

Error Message `EID-612: Cannot connect to the database. Check whether the database is up and retry.`

Recommended Action If the database is down, restart it. Verify that the workstation where the database is installed is IP-reachable from the client machine. If the database is not reachable, make the appropriate corrections to the network. When the database is up and reachable, start the client.

If the database is up and reachable but the problem persists on Windows, check the following:

- Verify that your path contains *client-installation-directory*/lib by opening a command prompt and entering **set path**.
- Verify that an Oracle client is installed on your PC. The earliest Oracle client version that Prime Optical supports is Oracle 10g. If you installed an earlier Oracle release (such as Oracle version 8), upgrade to a later Oracle release.

Error Message `EID-614: A database error occurred while deleting the selected subnetwork from the database. The subnetwork might not be deleted completely.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-615: An error occurred while changing the subnetwork name.`

Recommended Action Restart the Prime Optical client.

Error Message EID-616: An error occurred while changing the subnetwork title.

Recommended Action Restart the Prime Optical client.

Error Message EID-617: An error occurred while changing the subnetwork description.

Recommended Action Restart the Prime Optical client.

Error Message EID-618: An error occurred while changing the subnetwork type.

Recommended Action Restart the Prime Optical client.

Error Message EID-619: An error occurred while changing the subnetwork topology.

Recommended Action Restart the Prime Optical client.

Error Message EID-621: Community String is a mandatory field. Enter the community string and retry.

Recommended Action Enter the community string.

Error Message EID-622: A fatal error occurred while requesting the topology change.

Recommended Action Restart the Prime Optical server and all of the clients.

Error Message EID-623: An error occurred in response to a topology change. Refresh the view.

Recommended Action Close, then reopen the topology window.

Error Message EID-624: Subnetwork Name is a mandatory field. Enter a unique subnetwork name and retry.

Recommended Action Enter a unique subnetwork name.

Error Message EID-625: A subnetwork with the same name already exists. Specify a unique subnetwork name and retry.

Recommended Action Enter a unique subnetwork name.

Error Message EID-626: Database error: An error occurred while adding the new subnetwork to the database.

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-627: You cannot add this NE model under the selected network partition. Select a different subnetwork or network partition.`

Recommended Action Select a different subnetwork or network partition.

Error Message `EID-628: Cisco Transport Manager initialization failed. Cannot connect to the CTM database.`

Recommended Action The Prime Optical client cannot read a required table from the database. Restart the application and start the Debug Log (choose **File > Debug Options**). If the problem persists, contact Cisco technical support with the Debug Log trace.

Error Message `EID-629: A fatal error occurred while trying to retrieve new assignments from the server. The application will be shut down. Restart the application.`

Recommended Action Restart the Prime Optical server and all of the clients.

Error Message `EID-630: The selected NE was not found in the database. The database might be corrupted.`

Recommended Action Restart the Prime Optical client.

Error Message `EID-631: A user with administrator privileges has changed your password. The application will be closed. Login again with the new password.`

Recommended Action Log in with the revised user password.

Error Message `EID-632: A user with administration privileges has disabled this user. The application will be closed.`

Recommended Action The administrator disabled the selected user's access. Contact the administrator to re-enable user access.

Error Message `EID-633: The administrator has deleted this user. The application will be closed.`

Recommended Action The administrator deleted the selected user. Contact the administrator to create a new user account.

Error Message `EID-634: The IOS Config Engine password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-638: A CTM administrator has modified the CTM domain. As a result, your request to modify the CTM topology is invalid. Try again.`

Recommended Action While you were adding an NE or group to an existing group, another administrator deleted the existing group. Consequently, your request to add an NE or group is now invalid. Reselect the node and retry.

Error Message `EID-640: Search string was not found.`

Recommended Action Repeat the search with new search criteria.

Error Message `EID-641: Cannot create the new subnetwork. Try again.`

Recommended Action Create the new subnetwork again.

Error Message `EID-642: Database error: Cannot paste the requested node.`

Recommended Action Try the paste action again. If the problem persists, contact Cisco technical support.

Error Message `EID-643: Database error: Cannot delete the requested node.`

Recommended Action Delete the node again. If the problem persists, contact Cisco technical support.

Error Message `EID-644: Database error: Cannot undelete the requested node.`

Recommended Action Undelete the node again. If the problem persists, contact Cisco technical support.

Error Message `EID-645: Cannot purge the requested NE. Action failed.`

Recommended Action An NE can be purged only if it is marked Out of Service. If the operational state of the NE is not Out of Service, undelete the NE, mark it Out of Service, and delete it again. Try to purge the NE again.

Error Message `EID-646: Cannot add the new NE. An NE with the same name or IP address still exists in the CTM domain. Contact Cisco TAC for support.`

Recommended Action Contact Cisco technical support.

Error Message `EID-647: Cannot copy because the source and destination are the same.`

Recommended Action Specify a different source and destination.

Error Message `EID-648: Selected subnetwork contains deleted NEs. Delete those NEs from the database before deleting the subnetwork.`

Recommended Action Delete the NEs in the Deleted NEs group; then, delete the subnetwork.

Error Message `EID-649: A duplicate target is not allowed.`

Recommended Action Specify a target that has not been used before.

Error Message `EID-650: Specify a target.`

Recommended Action Specify a target.

Error Message `EID-651: The target cannot contain` *`string`*`.`

Recommended Action Specify a target that does not contain this string.

Error Message `EID-652: The target must contain 4 dot-separated integers.`

Recommended Action Specify a target that contains four dot-separated integers.

Error Message `EID-653: The target is invalid.`

Recommended Action Specify a valid target.

Error Message `EID-654: Retry values must be integers between 0 and 5.`

Recommended Action Specify the retry value as an integer from 0 to 5.

Error Message `EID-655: Timeout values must be integers between 1 and 60.`

Recommended Action Specify the timeout as an integer from 1 to 60.

Error Message `EID-656: Specify a write string.`

Recommended Action Specify a write string.

Error Message `EID-657: An error occurred while retrieving the flash partition files.`

Recommended Action Contact the system administrator.

Error Message `EID-658: Rediscover request has been accepted.`

Recommended Action Your rediscover request was accepted; no action is required.

Error Message `EID-659: Rediscover request failed.`

Recommended Action This error occurs when rediscovery is done manually from the ONS 155xx configuration menu. Perform the operation again.

Error Message `EID-660: This will result in rediscovery of the selected ONS 155xx devices. Do you want to continue?`

Recommended Action Click **OK** to continue with the rediscovery of the selected NEs.

Error Message `EID-661: This will result in rediscovery of all ONS 155xx devices. Do you want to continue?`

Recommended Action Click **OK** to continue with the rediscovery of all ONS 155xx NEs.

Error Message `EID-662: Power level refresh failed.`

Recommended Action Connection to the device might have timed out. Contact your system administrator.

Error Message `EID-663: The circuit ID cannot exceed 64 characters.`

Recommended Action Enter a circuit ID that does not exceed 64 characters.

Error Message `EID-665: Config exception: Cannot change EMS identification.`

Recommended Action Enter an EMS ID that has from 1 to 64 characters and does not contain an apostrophe (‘), a semicolon (;), a colon (:), or a comma (,).

Error Message `EID-667: Network Partition ID is a mandatory field. Enter a unique network partition ID and retry.`

Recommended Action Enter a unique network partition ID.

Error Message `EID-668: A network partition with the same ID already exists. Specify a unique network partition ID and retry.`

Recommended Action Enter a unique network partition ID.

Error Message `EID-669: Cannot create the new network partition. Try again.`

Recommended Action Check the database connection. If the problem persists, restart the Prime Optical server.

Error Message `EID-670: Cannot modify the network partition. Try again.`

Recommended Action Check the database connection. If the problem persists, restart the Prime Optical server.

Error Message `EID-671: An error occurred while changing the network partition.`

Recommended Action This error occurs while changing the name of the network partition. Retry changing the network partition name.

Error Message `EID-672: Invalid browser path.`

Recommended Action Verify that a browser is installed on your system and that the browser path in ems-client.cfg is set correctly.

Error Message `EID-673: Network Partition Description is a mandatory field. Enter a unique network partition description and retry.`

Recommended Action Enter a unique network partition description.

Error Message `EID-675: Cannot export data on {0}.`

Recommended Action A critical malfunction occurred on the property sheet; the data cannot be exported. Contact Cisco technical support.

Error Message `EID-676: Some of the data was not exported correctly. See the file` *`filename`* `for details.`

Recommended Action A malfunction occurred while displaying data in the property sheet. A parameter cannot be exported, but the export operation will continue processing other parameters. Contact Cisco technical support.

Error Message `EID-677: Cannot execute the operation. Another NE configuration report is in progress.`

Recommended Action Wait until the report is finished; then, repeat the operation.

Error Message `EID-678: Error: Cannot export some of the data in the` *`tab-name`* `tab.`

Recommended Action A malfunction occurred while displaying data in the property sheet. A parameter cannot be exported, but the export operation will continue processing other parameters. Contact Cisco technical support.

Error Message `EID-679: Enter a directory for the export.`

Recommended Action Specify the name of the directory to use for the export operation.

Error Message EID-680: {path} is not a directory path. Enter a directory.

Recommended Action Specify the name of the directory to use for the export operation.

Error Message EID-681: The ONS 15305 CTC password does not match the confirmation password. Retype the password.

Recommended Action Retype the password.

Error Message EID-682: The ONS 15305 CTC username is a mandatory field. Specify a username.

Recommended Action Enter a unique username.

Error Message EID-683: Cannot plot all the graphs for the selected row. Select valid parameters for plotting.

Recommended Action Choose another row that contains valid parameters for plotting.

Error Message EID-684: An error occurred while scheduling the export inventory table operation.

Recommended Action This error is a job scheduling error. Check the Job Monitor table to see what type of error is reported.

Error Message EID-689: The CTC User Password field cannot be empty. Enter a unique CTC user password and retry.

Recommended Action Enter a unique CTC user password.

Error Message EID-690: A similar job is currently in progress. Wait for the job to finish; then, try again.

Recommended Action No action is required.

Error Message EID-691: Cannot add the new GNE. A GNE with the same name or IP address still exists in the CTM domain. Contact Cisco TAC for support.

Recommended Action Contact Cisco technical support.

Error Message EID-692: No circuit sizes are assigned to the user. Assign at least one circuit size to the user.

Recommended Action Assign at least one circuit size to the user.

Error Message `EID-693: Cannot purge the requested NE because it is connected to another node with a link.`

Recommended Action This error occurs when you purge an NE that has links to other NEs. Delete all links associated with this NE and retry the purge operation.

Error Message `EID-694: Cannot move the requested NE or subnetwork because there are existing links. Delete the links before changing the partition.`

Recommended Action Delete all of the links before moving the NE or subnetwork to another partition.

Error Message `EID-695: You cannot create a link from an unmanaged NE to a group that contains SONET and SDH NEs.`

Recommended Action The destination group must contain either SONET or SDH NEs.

Error Message `EID-697: A database error occurred while trying to modify the selected CTC user profile.`

Recommended Action Contact the system administrator.

Error Message `EID-698: A database error occurred while trying to add the CTC user profile to the database.`

Recommended Action Contact the system administrator.

Error Message `EID-699: A CTC user profile with the same ID already exists. Select a different user ID and retry.`

Recommended Action Select a different CTC user and retry.

Error Message `EID-700: An error occurred while saving node coordinates to the database. Refresh the view and retry.`

Recommended Action Click the **Refresh Data** tool to refresh the view and recustomize the coordinates.

Error Message `EID-701: An error occurred while saving the node icon to the database. Refresh the view and retry.`

Recommended Action Click the **Refresh Data** tool to refresh the view and recustomize the node icons.

Error Message `EID-703: An error occurred while creating the new link between the selected nodes. Recreate the link.`

Recommended Action Recreate the link.

Error Message `EID-704: Links must be created between two distinct nodes of compatible types on the same network map. Recreate the link.`

Recommended Action Recreate the link between two distinct nodes.

Error Message `EID-705: An error occurred while deleting the selected link(s). Check the communication status of the source and destination nodes.`

Recommended Action Click the **Refresh Data** tool to refresh the view and attempt to delete the link again.

Error Message `EID-706: An error occurred while deleting the selected link(s).`

Recommended Action Retry the link deletion later. If the problem persists, contact Cisco technical support.

Error Message `EID-709: An error occurred while opening the selected image file at the specified file path.`

Recommended Action The selected image file does not exist in the selected file path. Select an image file from the file list in the selected subdirectory.

Error Message `EID-710: An error occurred while loading the node icon image. Retry.`

Recommended Action The image could not be loaded from the file you selected. Check the size of the file and reload the icon image. The size of the map file should not exceed 100 KB.

Error Message `EID-711: An error occurred while loading the default background map image.`

Recommended Action Exit the Prime Optical client and retry. If the error persists, some map images were deleted. Reinstall the Prime Optical client.

Error Message `EID-712: An error occurred while loading the link from the database.`

Recommended Action Restart the Network Map. If the error persists, exit the Prime Optical client and retry.

Error Message `EID-713: An error occurred while opening the node.`

Recommended Action Restart the Network Map. If the error persists, exit the Prime Optical client and retry.

Error Message `EID-714: An error occurred while opening the parent node.`

Recommended Action Restart the Network Map. If the error persists, exit the Prime Optical client and retry.

Error Message `EID-715: An error occurred while loading the background map image file. Retry.`

Recommended Action The image could not be loaded from the file you selected. Check the size of the file and reload the background image. The size of the map file should not exceed 100 KB.

Error Message `EID-716: An error occurred while deleting a node from the map. Refresh the view and retry.`

Recommended Action Click the **Refresh Data** tool to refresh the view.

Error Message `EID-717: An error occurred while saving the map background image file. Refresh the view and retry.`

Recommended Action The image could not be saved to the database. Click the **Refresh Data** tool to refresh the view and recustomize the background image. If the problem persists on a Solaris workstation, check the file permissions for the map background and map icon subdirectories under your installed subdirectory.

Error Message `EID-718: You cannot delete the selected link(s) because they are autodiscovered. Action failed.`

Recommended Action You selected an autodiscovered link that is not in an invalid state, and therefore cannot be deleted. You can delete only manual or invalid links.

Error Message `EID-719: Cannot initiate the Rediscover operation because the NE Service is not active. Activate the NE Service before trying the Rediscover operation.`

Recommended Action In the Control Panel, check the NE Service status and activate the NE Service if it is not active.

Error Message `EID-721: Links must be created between two nodes that are in service and available. Recreate the link.`

Recommended Action Recreate the link.

Error Message `EID-722: Circuits must be created between two nodes that are in service and available. Recreate the circuit.`

Recommended Action Recreate the circuit.

Error Message `EID-723: Links cannot be created between two off-view nodes. Recreate the link.`

Recommended Action Recreate the link.

Error Message `EID-724: An exception occurred while launching the Circuit table.`

Recommended Action An error occurred while launching the Circuit table. Try to relaunch the Circuit table.

Error Message `EID-725: Enter a valid link name that contains 1 to 256 characters.`

Recommended Action Enter a valid link name that contains 1 to 256 characters.

Error Message `EID-726: Enter a valid link description that contains 1 to 256 characters.`

Recommended Action Enter a valid link description that contains 1 to 256 characters.

Error Message `EID-727: Enter a valid link name (1 to 64 characters) and description (1 to 256 characters).`

Recommended Action Enter a valid link name and link description.

Error Message `EID-728: There is no support for this model yet.`

Recommended Action The network element software version is not supported. Contact Cisco technical support for more information.

Error Message `EID-731: Action was not completed or was partially completed.`

Recommended Action A link already exists with the same name. Create a link with a unique name.

Error Message `EID-732: Source and destination nodes cannot be the same. Choose a different destination node.`

Recommended Action Choose a different destination node.

Error Message `EID-733: The node is not available or there are no available physical termination points for the given link size in the specified layer and direction.`

Recommended Action All link termination points have links for the specified link size. Delete existing links and perform the operation again.

Error Message `EID-735: Create link action was not completed or was partially completed for the link. The link name might be in use.`

Recommended Action A link already exists with the same name. Create a link with a unique name.

Error Message `EID-736: Modify link action was not completed or was partially completed for the link: link-ID.`

Recommended Action A link already exists with the same name. Create a link with a unique name.

Error Message `EID-738: Cannot create a link with link name name. Verify that both source and destination NEs are in the same network partition.`

Recommended Action Verify that both the source and destination NEs belong to the same network partition.

Error Message `EID-739: Cannot retrieve possible link sizes or link protection information.`

Recommended Action Cannot retrieve possible link sizes on the node. Check if the node is in service.

Error Message `EID-740: A link has already been created with this PTP. Enter a different PTP value.`

Recommended Action Enter a different physical termination point (PTP) value.

Error Message `EID-741: An error occurred while retrieving PTP information through CORBA for the unmanaged NE.`

Recommended Action CORBA exception occurred. Check if the node is in service. For more information, contact Cisco technical support.

Error Message `EID-742: The link rate or protection type selected is not supported by the unmanaged NE. Choose 'Not Applicable' and recreate the link.`

Recommended Action Select Not Applicable as the link rate or protection type and retry. If the problem persists, contact Cisco technical support.

Error Message `EID-744: There is no common link layer or size currently supported between the selected source and destination NE(s).`

Recommended Action Specify different source and destination NEs that share a common link layer or size.

Error Message `EID-745: Enter a link cost between 1 and 2,147,483,647.`

Recommended Action Enter a link cost within the valid range.

Error Message `EID-746: Enter 5 comma-separated alphanumeric group names.`

Recommended Action Enter up to five comma-separated, alphanumeric, unique group names.

Error Message `EID-747: Group names must be unique.`

Recommended Action Enter unique group names.

Error Message `EID-748: The group name cannot contain more than 32 characters.`

Recommended Action Enter a group name that contains 32 characters or fewer.

Error Message `EID-750: The selected row does not contain valid parameters for plotting.`

Recommended Action Choose another row that contains valid parameters for plotting.

Error Message `EID-751: Error in launching CTC provisioning view (NE Explorer) for` *`NE-ID`*`.`

Recommended Action Use the following procedure to correct this error:

Step 1 Choose **Administration > Users**.

Step 2 In the Cisco Prime Optical Users table, choose **Edit > Modify**.

Step 3 Click **Next**. In the CTC User Properties panel, change the CTC username and password to match those configured for the device.

If the CTC progress screen idles for a long time before the login dialog box appears, there might be network connectivity problems to the device.

Step 4 (Optional) From a DOS command window or a Sun Solaris terminal, ping the device. If there is no response, set up the routes so that the device is available; then, restart CTC.

Step 5 (Optional) If CTC does not start, your workstation might have resource constraints. Close some open applications and try again. Close some instances of CTC that are managing other groups of ONS 15454 NEs and try again.

Error Message `EID-755: The CTM Server to NE Connection username is a mandatory field. Specify a username.`

Recommended Action Enter a username for Prime Optical server-to-NE connections.

Error Message `EID-757: The ONS 15310 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-759: You cannot delete this user, because this user is the last one with SysAdmin privileges. To delete this user, you must first create another SysAdmin user.`

Recommended Action Create a second user with SysAdmin privileges. Then, you can delete the first SysAdmin user.

Error Message `EID-800: Selected NEs are invalid or not reachable. NEs must be in the same network partition and must be reachable.`

Recommended Action This error occurs because all NEs under a group are in service or under maintenance but are not reachable, or because the NEs are reachable but in different network partitions. Verify that the selected NEs are in the same network partition.

Error Message `EID-801: None of the NEs contain ML cards or all ML cards are used for an L2 topology.`

Recommended Action This error occurs if there are no ML cards with both POS ports available for the NEs selected during RPR circuit creation. Verify that all ML-series cards used for topology creation are available.

Error Message `EID-802: An error occurred while creating the service provisioner.`

Recommended Action Wait until the NEs under the selected group are in service; then, try again.

Error Message `EID-803: An error occurred while retrieving card list from server. Selected NE does not have ML cards or all cards are used for L2 topology creation.`

Recommended Action This error occurs if there are no ML-series cards with both POS ports available in the NEs selected during RPR creation. Verify that the selected NEs have ML-series cards and are available for L2 topology creation.

Error Message `EID-804: Failed to delete the topologies.`

Recommended Action Verify that you have user privileges to perform the delete operation. If the L2 Service Resync status is Complete, Partially Completed, In Progress, or Sync Needed, delete all of the VLANs in the topology; then, try the operation again.

Error Message `EID-805: Failed to delete circuit(s).`

Recommended Action This is an informational message. Wait for some time; then, try to delete the circuit(s) again.

Error Message `EID-806: An L2 topology with the same name already exists. Enter a unique L2 topology name.`

Recommended Action Enter a unique topology name.

Error Message `EID-807: The L2 topology name conflicts with an existing topology or circuit. Enter a unique L2 topology name.`

Recommended Action Enter a unique topology name.

Error Message `EID-808: The CoS Commit value is invalid. Enter a valid value in the range 0 to 7.`

Recommended Action Enter a valid value within the range specified.

Error Message `EID-809: Failed to create RPR.`

Recommended Action If RPR creation is partial, create the remaining circuits using CTC or Prime Optical to complete the RPR. If no circuits were created in the RPR, try performing the same operation again. If the error persists, use CTC to create circuits in the RPR; then, report the problem to Cisco technical support.

Error Message `EID-810: An L2 topology with the same name already exists. Change the L2 topology name.`

Recommended Action Enter a unique L2 topology name.

Error Message `EID-811: Enter a valid L2 topology name.`

Recommended Action The L2 topology name that you entered is empty or starts with a blank space. Enter a valid L2 topology name.

Error Message `EID-812: You cannot create an L2 topology between ports on the same card.`

Recommended Action Create a topology between ports on different cards.

Error Message `EID-813: Select at least two NEs.`

Recommended Action Select at least two NEs.

Error Message `EID-814: Select at least two cards.`

Recommended Action Select at least two cards.

Error Message `EID-815: Select at least one card per NE.`

Recommended Action Select at least one card per NE.

Error Message `EID-816: Select an L2 topology to modify.`

Recommended Action Select a topology to modify.

Error Message `EID-817: Select an L2 topology to delete.`

Recommended Action Select a topology to delete.

Error Message `EID-818: Select an L2 topology to view circuits in the topology.`

Recommended Action Select a topology.

Error Message `EID-819: The selected L2 topology is resynchronizing. Wait until the resynchronization is complete.`

Recommended Action Select the topology after the resynchronization is complete.

Error Message `EID-820: Some of the selected L2 topologies are resynchronizing. Wait until the resynchronization is complete. Click Details to see the list of L2 topologies that are resynchronizing.`

Recommended Action Select the topologies after the resynchronization is complete.

Error Message `EID-821: Select a row and click the Create L2 Service button.`

Recommended Action Select a row and click **Create L2 Service**.

Error Message `EID-822: The selected L2 topology is resynchronizing. Wait until the resynchronization is complete.`

Recommended Action Select the topology after the resynchronization is complete.

Error Message `EID-823: Bandwidth mismatch on the existing topologies on the source and destination cards. Cannot set bandwidth values. Change the source or destination for PTP creation.`

Recommended Action The selected source and destination cards are already configured with a PTP L2 topology. The two cards have different bandwidth values. Select a different source or destination and try again.

Error Message `EID-824: The NEs in the L2 topology are not in the user domain.`

Recommended Action Verify that the NEs are in the user domain.

Error Message `EID-825: Failed to update the L2 topology name or description.`

Recommended Action Verify that the Prime Optical server is up and running.

Error Message `EID-826: No ports are available for modification.`

Recommended Action Verify that the selected L2 topology state is Complete and that the L2 Service Resync status is Complete. Close the Modify Ports window and try again.

Error Message `EID-827: Failed to modify the ports.`

Recommended Action Verify that the selected L2 topology state is Complete and that the L2 Service Resync status is Complete. Close the Modify Ports window and try again.

Error Message `EID-828: There are no ML cards in the L2 topology.`

Recommended Action Verify that the selected L2 topology state is Complete and that the L2 Service Resync status is Complete. Close the Modify Ports window and try again.

Error Message `EID-829: Select a segment or select the Automatically Route RPR option.`

Recommended Action Select a segment or select the **Automatically Route RPR** option.

Error Message `EID-830: Manual routing failed.`

Recommended Action This error occurs if manual creation of a PTP or RPR circuit fails. Try performing the same operation again. If error persists, use CTC; then, report the problem.

Error Message `EID-831: Route validation failed for the selected segment.`

Recommended Action This error occurs if manual or automatic creation of an RPR circuit segment fails. Try performing the same operation again. If the error persists, use CTC to create segment; then, report the problem to Cisco technical support.

Error Message `EID-832: Unexpected exception. Failed to provision the segment.`

Recommended Action This error occurs if manual or automatic circuit creation of an RPR circuit segment throws a generic exception. Try performing the same operation again. If the error persists, use CTC to create the segment; then, report the problem to Cisco technical support.

Error Message `EID-833: Invalid source or destination selected for routing.`

Recommended Action Select a valid source or destination.

Error Message `EID-834: An error occurred while retrieving L2 topology segments from the server.`

Recommended Action This error occurs because the server is still initializing. Close the wizard and perform the operation again later.

Error Message `EID-835: Invalid L2 topology segment.`

Recommended Action Select a valid topology segment.

Error Message `EID-836: The segment is already provisioned.`

Recommended Action Select an unprovisioned segment.

Error Message `EID-837: You cannot delete this topology because there are L2 services on this topology. Delete all the L2 services for this topology before deleting it.`

Recommended Action Delete the L2 services on the topology before deleting the topology itself.

Error Message `EID-838: The sum of bandwidth values for SP Management, Committed Rate, AVVID Control, Best Effort, and Multicast Traffic cannot exceed 99%.`

Recommended Action Enter combined bandwidth values that do not exceed 99%.

Error Message `EID-839: The CoS values for both the multicast commands cannot be the same. Change the values and try again.`

Recommended Action Enter unique CoS values for the different multicast bandwidth parameters.

Error Message `EID-840: The SP Management Bandwidth value is invalid. Enter a valid value.`

Recommended Action Enter a value from 1 to 99.

Error Message `EID-841: The Committed CoS value is invalid. Enter a valid value.`

Recommended Action Enter comma-separated values from 0 to 7.

Error Message `EID-842: The Best Effort Bandwidth value is invalid. Enter a valid value.`

Recommended Action Enter a value from 1 to 99.

Error Message `EID-843: Cannot remove this card. You must retain at least two cards from different NEs to form an RPR.`

Recommended Action You cannot delete this card because an RPR must contain at least two cards from different NEs. Select a different card for deletion.

Error Message `EID-844: The AVVID Voice Video Bandwidth value is invalid. Enter a valid value.`

Recommended Action Enter a value from 1 to 99.

Error Message `EID-845: The SP Management CoS value is invalid. Enter a valid value.`

Recommended Action Enter a value from 1 to 99.

Error Message `EID-846: The AVVID Control CoS value is invalid. Enter a valid value.`

Recommended Action Enter comma-separated values from 0 to 7.

Error Message `EID-847: The AVVID Voice Video CoS value is invalid. Enter a valid value.`

Recommended Action Enter comma-separated values from 0 to 7.

Error Message `EID-848: The existing L2 topology on one of the selected ML cards is not synchronized completely. Bandwidth parameters cannot be determined.`

Recommended Action There is a PTP L2 topology on the other POS port of the selected ML card. Wait until the L2 Service Resync status is Complete.

Error Message `EID-849: Failed to shut down POS ports.`

Recommended Action This problem occurs because the Telnet connection to the card failed, or because the card was reset while performing the Add/Remove card operation. Try the operation again. If the problem persists, contact Cisco technical support.

Error Message `EID-850: Failed to create IOS user.`

Recommended Action Verify that the Cisco IOS configuration exists on the card. The default Cisco IOS user must be visible in the IOS Users table before you can perform any Cisco IOS user-related operations. Wait until the default user is visible in the IOS Users table; then, try the operation again.

Error Message `EID-851: Failed to delete IOS user.`

Recommended Action Verify that the Cisco IOS configuration exists on the card. The default Cisco IOS user must be visible in the IOS Users table before you can perform any Cisco IOS user-related operations. Wait until the default user is visible in the IOS Users table; then, try the operation again.

Error Message `EID-852: Failed to delete IOS user.`

Recommended Action Verify that the Cisco IOS configuration exists on the card. The default Cisco IOS user must be visible in the IOS Users table before you can perform any Cisco IOS user-related operations. Wait until the default user is visible in the IOS Users table; then, try the operation again.

Error Message `EID-853: IOS user is not selected.`

Recommended Action Select a Cisco IOS user.

Error Message `EID-854: One or more default IOS users selected. You cannot delete the default IOS user.`

Recommended Action Select a different user for deletion.

Error Message `EID-855: You cannot modify the default IOS user.`

Recommended Action Select a different user for modification.

Error Message `EID-856: No data cards are available to create the IOS user.`

Recommended Action Add data cards to the network before creating Cisco IOS users.

Error Message `EID-857: No IOS cards are selected. Select at least one IOS card from the available IOS cards.`

Recommended Action Select at least one Cisco IOS card.

Error Message `EID-858: The user VLAN ID is already in use.`

Recommended Action Enter a unique user VLAN ID.

Error Message `EID-859: Failed to modify the Layer 2 service.`

Recommended Action If the topology is not synchronized, close the L2 service wizard and try again after the topology synchronization is complete. If there is an invalid username or password, verify that the username and password configured in the ML-series card are synchronized with the NE

username and password. Close the L2 service wizard and try again. Check the command-line interface (CLI) configuration on all ML-series cards in the topology and retry the operation. If the problem persists, contact Cisco technical support.

Error Message `EID-860: Failed to add service drops to the Layer 2 service.`

Recommended Action If the topology is not synchronized, close the L2 service wizard and try again after the topology synchronization is complete. If there is an invalid username or password, verify that the username and password configured in the ML-series card are synchronized with the NE username and password. Close the Add/Delete Drops wizard and try again. Check the CLI configuration on all ML-series cards in the topology and retry the operation.

Error Message `EID-861: Failed to delete service drops on the Layer 2 service.`

Recommended Action If the topology is not synchronized, close the L2 service wizard and try again after the topology synchronization is complete. If there is an invalid username or password, verify that the username and password configured in the ML-series card are synchronized with the NE username and password. Close the Add/Delete Drops wizard and try again. Check the CLI configuration on all ML-series cards in the topology and retry the operation.

Error Message `EID-862: No Layer 2 service is selected to modify service drops. Select a Layer 2 service.`

Recommended Action Select an L2 service.

Error Message `EID-863: Select only one Layer 2 service.`

Recommended Action Select one L2 service.

Error Message `EID-864: Failed to retrieve record from the database.`

Recommended Action Select a row in the VLAN table before clicking the Add or Delete button.

Error Message `EID-865: No Layer 2 service is selected for modification. Select a Layer 2 service.`

Recommended Action Select one L2 service.

Error Message `EID-866: Select only one Layer 2 service.`

Recommended Action Select one L2 service.

Error Message `EID-867: Failed to retrieve record from the database.`

Recommended Action Select a row in the VLAN table before clicking the Modify button.

Error Message `EID-868: No Layer 2 service drop is selected. Select a Layer 2 service drop.`

Recommended Action Select one L2 service drop.

Error Message `EID-869: Select only one Layer 2 service drop.`

Recommended Action Select one L2 service drop.

Error Message `EID-870: Failed to retrieve record from the database.`

Recommended Action Select a row in the VLAN table before selecting the Show Drops button.

Error Message `EID-871: PIR should be greater than or equal to CIR.`

Recommended Action Enter a peak information rate (PIR) value that is greater than or equal to the committed information rate (CIR).

Error Message `EID-872: Max PIR burst should be greater than or equal to max CIR burst.`

Recommended Action Enter a PIR that is greater than or equal to the maximum CIR burst.

Error Message `EID-873: Failed to modify service drops on the Layer 2 service.`

Recommended Action If the topology is not synchronized, close the L2 service wizard and try again after the topology synchronization is complete. If there is an invalid username or password, verify that the username and password configured in the ML-series card are synchronized with the NE username and password. Close the Add/Delete Drops wizard and try again. Check the CLI configuration on all ML-series cards in the topology and retry the operation.

Error Message `EID-874: Failed to modify some drops on the Layer 2 service. Click Details to see the list.`

Recommended Action If the topology is not synchronized, close the L2 service wizard and try again after the topology synchronization is complete. If there is an invalid username or password, verify that the username and password configured in the ML-series card are synchronized with the NE username and password. Close the Add/Delete Drops wizard and try again. Check the CLI configuration on all ML-series cards in the topology and retry the operation.

Error Message `EID-875: Select at least one drop to delete.`

Recommended Action Select at least one drop to delete to complete the delete drop port operation. Otherwise, cancel the delete drop port operation.

Error Message `EID-876: Select at least one new drop to add.`

Recommended Action Select at least one drop to add to complete the add drop port operation. Otherwise, cancel the add drop port operation.

Error Message `EID-877: Enter a valid port VLAN ID for the following drops. Click Details to see the list.`

Recommended Action Enter a valid port VLAN ID from 1 to 2095.

Error Message `EID-878: Failed to reset general Layer 2 service attributes.`

Recommended Action Close the modify L2 service window and try again.

Error Message `EID-879: Failed to reset QoS values for the Layer 2 service.`

Recommended Action Close the modify L2 service window and try again.

Error Message `EID-880: Failed to reset the Enable/Disable values for the drops in the Layer 2 service.`

Recommended Action Close the modify L2 service window and try again.

Error Message `EID-881: There are not enough drops for Layer 2 service creation on the RPR topology.`

Recommended Action All drop ports are used. Delete unused drops on VLANs on the cards belonging to the topology; then, launch the wizard.

Error Message `EID-882: There are not enough drops for Layer 2 service creation on the point-to-point topology.`

Recommended Action All drop ports are used. Delete unused drops on VLANs on the cards belonging to the topology; then, launch the wizard.

Error Message `EID-883: The Layer 2 topology is resynchronizing. Wait until the resynchronization is complete.`

Recommended Action Wait until the topology resynchronization has completed before starting the operation.

Error Message `EID-884: The Layer 2 topology state is incomplete.`

Recommended Action Selected topology is incomplete. Complete the topology by creating missing circuits. Try the operation again after completing the topology.

Error Message `EID-885: There are no ML cards in the topology.`

Recommended Action Add the ML-series cards to the topology and wait until the topology is completed. Wait until the topology resynchronization status becomes complete. If the problem persists, contact Cisco technical support.

Error Message `EID-886: The Layer 2 service creation request timed out. The operation is running in the background.`

Recommended Action No action required.

Error Message `EID-887: Select at least one drop to create the Layer 2 service.`

Recommended Action Select at least one drop to create the L2 service.

Error Message `EID-888: The ONS 15216 EDFA3 password does not match the confirmation password. Retype the password.`

Recommended Action Retype the password.

Error Message `EID-889: Failed to modify the QoS template.`

Recommended Action Verify the error details.

Error Message `EID-890: Failed to delete the QoS template.`

Recommended Action Verify the error details.

Error Message `EID-891: The QoS profile name is invalid.`

Recommended Action Enter a valid QoS profile name.

Error Message `EID-892: Enter a valid value for CoS.`

Recommended Action Enter comma-separated values from 0 to 7.

Error Message `EID-893: Enter a valid value for DSCP.`

Recommended Action Enter comma-separated values from 0 to 63.

Error Message `EID-894: Enter a valid value for IP Precedence.`

Recommended Action Enter comma-separated values from 0 to 7.

Error Message `EID-895: Select at least one traffic match criteria.`

Recommended Action No match criteria are selected. Make at least one selection.

Error Message `EID-896: Failed to clone the QoS profile.`

Recommended Action Verify the error details.

Error Message `EID-897: Mark CoS for violate action.`

Recommended Action The Allow radio button is selected on the Violations tab, but CoS is not marked. Click the **Mark CoS** radio button and specify the CoS value.

Error Message `EID-898: Failed to delete some QoS profiles. Click Details to see the list.`

Recommended Action This is an informational message; no action is required.

Error Message `EID-899: You cannot delete the selected L2 topology because it is in Incomplete/Sync Failed state, which prevents any provisioning. Refer to the Circuit table to see what is preventing this L2 topology from transitioning to Complete state.`

Recommended Action Launch the Circuit table to see what is preventing this L2 topology from transitioning to Complete state. After the topology transitions to Complete, you can delete it.

Error Message `EID-900: You must be the root user to upgrade the client.`

Recommended Action Login as the root user to perform this operation.

Error Message `EID-901: Cannot launch the wizard. The selected source(s) and destination(s) are in different subnetworks, or are incompatible NE models, or are not reachable, or not inter-connected.`

Recommended Action You can only create circuits between reachable NEs that are compatible for circuit creation when NEs are in the same subnetwork, or when NEs are connected (even if they are in different subnetworks of the same network partition). Select NEs that are interconnected directly or indirectly through links known by Prime Optical.

Error Message `EID-902: Failed to set the circuit attributes.`

Recommended Action Prime Optical enforces the uniqueness of the circuit ID. Change the circuit name and retry.

Error Message `EID-903: Circuit Name is a mandatory field. Enter a valid circuit name (1 or more characters or a word other than the keyword 'Unknown') and retry.`

Recommended Action Enter a circuit name.

Error Message `EID-904: Failed to set the circuit end points for circuit creation.`

Recommended Action The server service is not ready. Wait several minutes and try again.

Error Message `EID-905: Source is not fully specified.`

Recommended Action Specify the source NE and connection termination points (CTPs).

Error Message `EID-906: Destination is not fully specified.`

Recommended Action Specify the destination NE and CTPs.

Error Message `EID-907: Slot selection is mandatory. Select the slot and retry.`

Recommended Action Select a slot and retry.

Error Message `EID-908: Port selection is mandatory. Select the port and retry.`

Recommended Action Select a port and retry.

Error Message `EID-909: STS/VT selection is mandatory. Select the STS or VT and retry.`

Recommended Action Select a synchronous transport signal (STS) or Virtual Tributary (VT) and retry.

Error Message `EID-910: Secondary slot selection is mandatory. Select the slot and retry.`

Recommended Action Select a secondary slot and retry.

Error Message `EID-911: Secondary port selection is mandatory. Select the port and retry.`

Recommended Action Select a secondary port and retry.

Error Message `EID-912: Secondary STS/VT selection is mandatory. Select the STS or VT and retry.`

Recommended Action Select a secondary STS or VT and retry.

Error Message `EID-913: Failed to retrieve slots.`

Recommended Action The server service is not ready. Wait several minutes and try again.

Error Message `EID-914: Failed to retrieve ports.`

Recommended Action Verify that there are available in-service ports on the selected slot.

Error Message `EID-915: Failed to retrieve STSs.`

Recommended Action The server service is not ready. Wait several minutes and try again.

Error Message `EID-916: Failed to retrieve VTs.`

Recommended Action Verify that there are available in-service VTs on the selected STS.

Error Message `EID-917: Sources cannot be the same.`

Recommended Action You cannot select the same CTPs for the source and secondary source. Select a different source or secondary source and retry.

Error Message `EID-918: Destinations cannot be the same.`

Recommended Action You cannot select the same CTPs for the destination and secondary destination. Select a different destination or secondary destination and retry.

Error Message `EID-919: Source and destination CTPs cannot be identical.`

Recommended Action You cannot select the same CTPs for the source and destination.

Error Message `EID-920: Failed to retrieve adjacent nodes for the current nodes.`

Recommended Action Verify that there is at least one link between the selected nodes.

Error Message `EID-921: Failed to retrieve links between the current node and the adjacent node.`

Recommended Action Verify that there is at least one link between the selected nodes.

Error Message `EID-922: Failed to retrieve segments for the selected link.`

Recommended Action Verify that CTC contains spans for the selected link.

Error Message `EID-923: VLAN selection is mandatory. Select the VLAN and retry.`

Recommended Action Select a VLAN and retry.

Error Message `EID-924: The VLAN ID must be an integer greater than 1.`

Recommended Action Enter a VLAN ID that is greater than 1.

Error Message `EID-925: Failed to retrieve VLANs.`

Recommended Action The server is not ready. Wait several minutes and try again. If the error persists, restart the server.

Error Message `EID-926: Failed to set VLANs.`

Recommended Action The underlying circuit might have been deleted. Reopen the Circuit wizard and try again.

Error Message `EID-927: Failed to provision circuit manually.`

Recommended Action The selected link does not exist. The link might have been deleted. Reopen the Circuit wizard and create the circuit.

Error Message `EID-928: A span is already added for the selected link.`

Recommended Action A span has been added for the current hop. If you want to add a new span, remove the existing span and add the new one.

Error Message `EID-929: Select a span in the current hop.`

Recommended Action Select a span in the current hop.

Error Message `EID-930: No available` *`object`* `found for the selected link.`

Recommended Action All of the objects are in use for the selected link.

Error Message `EID-931: Failed to provision the circuit.`

Recommended Action The underlying circuit is not in the correct state. The circuit must be in a Creating or Active state. Reopen the Circuit wizard and try again.

Error Message `EID-932: Failed to route the circuit.`

Recommended Action The server is not ready. Wait several minutes; then, reopen the Circuit wizard and try again.

Error Message `EID-933: VLAN creation failed.`

Recommended Action Enter a unique VLAN name and a unique VLAN ID that is greater than 1 and less than the MAX_VLAN_ID value.

Error Message `EID-934: Failed to add drops.`

Recommended Action The underlying circuit might have been deleted. Reopen the Circuit wizard and try again.

Error Message `EID-935: Failed to set the circuit end points for editing.`

Recommended Action Source or destination end points are already in use. Reopen the Circuit wizard and try again.

Error Message `EID-936: Failed to retrieve the connection information.`

Recommended Action Verify that there is at least one link between the selected nodes.

Error Message `EID-937: Failed to retrieve the nodes in the working and protect paths.`

Recommended Action Verify that the nodes are in service in the Domain Explorer.

Error Message `EID-938: Failed to retrieve the links in the working path.`

Recommended Action Verify that there are links in the working path and that the nodes are in service.

Error Message `EID-939: Failed to retrieve trace data from the server.`

Recommended Action Contact the system administrator.

Error Message `EID-940: Invalid circuit attributes. Select a circuit with valid attributes.`

Recommended Action Select a circuit with a valid source and destination and an active state.

Error Message `EID-941: Cannot launch the trace report because the source and destination are the same.`

Recommended Action The trace report shows both the primary and the secondary routes that are taken by the circuit. Because the source and destination are the same, there is no route.

Error Message `EID-942: A delete job is already in progress on the selected circuit(s). Wait until the job completes.`

Recommended Action You cannot delete this circuit because the delete request has been submitted on this circuit already.

Error Message `EID-943: Circuit deletion failed.`

Recommended Action Prime Optical reports this error message if any associated cross-connections from the NEs could not be deleted. Prime Optical places the circuit in an Incomplete state. Try to delete this circuit again or take the appropriate action described by the failure event.

Error Message `EID-944: Delete drop failed.`

Recommended Action Click the **Refresh Data** tool to refresh the list of existing drops. Wait for the circuit to change to the ACTIVE or DROP_PENDING state and try again. Alternatively, the node might be down or initializing. Wait for the node to come up or finish its initialization and try again.

Error Message `EID-945: There are no adjacent nodes for the selected node.`

Recommended Action Verify that there is at least one link from the selected node to the other nodes.

Error Message `EID-946: There are no available links between the selected nodes.`

Recommended Action Verify that there is at least one link between the selected nodes.

Error Message `EID-947: Editing the SNCP attributes was not successful. There might be a higher-priority request.`

Recommended Action Contact your system administrator.

Error Message `EID-948: Change the circuit name and retry.`

Recommended Action Enter a unique circuit name.

Error Message `EID-949: The number of circuits must be greater than or equal to 1. Enter a valid number and retry.`

Recommended Action Enter a value that is greater than or equal to 1.

Error Message `EID-950: Failed to upgrade the selected circuit(s).`

Recommended Action Select another circuit. Only circuits that are in an upgradable state can be upgraded. Wait for the source node to be discovered.

Error Message `EID-951: Cannot upgrade the selected circuit because it is not in an upgradeable state.`

Recommended Action Select another circuit that is in an upgradeable state.

Error Message `EID-952: Failed to delete stitched nodes.`

Recommended Action Circuit is not complete or not in an active state. Wait for each node involved in the circuit to be discovered.

Error Message `EID-953: Failed to add nodes.`

Recommended Action Circuit is not complete or not in an active state. Wait for each node involved in the circuit to be discovered.

Error Message `EID-954: Failed to retrieve the circuit provisioner.`

Recommended Action The server service is not ready. Wait several minutes and try again.

Error Message `EID-955: Failed to retrieve the possible Ethernet nodes.`

Recommended Action Wait for each node involved in the circuit to be discovered.

Error Message `EID-956: Selected nodes are not in the same network partition.`

Recommended Action You cannot add or delete VLANs from the Manage VLAN dialog box if the selected NEs are moved to a different network partition. Relaunch the Manage VLAN dialog box and try again.

Error Message `EID-957: Cannot launch the VLAN table.`

Recommended Action Contact your system administrator.

Error Message `EID-958: Failed to change the circuit name.`

Recommended Action Check if the Prime Optical server is up and running. The Prime Optical server service might not be available for some time. Try again. You should also verify that the circuit name is unique.

Error Message `EID-959: Failed to change the circuit description.`

Recommended Action Check if the Prime Optical server is up and running. Try again when the server is available.

Error Message `EID-960: Failed to change the circuit state.`

Recommended Action Check if the Prime Optical server is up and running. Try again when the server is available.

Error Message `EID-961: A circuit with the same name already exists. Enter a unique circuit name.`

Recommended Action Enter a unique circuit name.

Error Message `EID-962: There are no active NEs available.`

Recommended Action Launch the Circuit table only on NEs available for circuit creation.

Error Message `EID-963: Circuit cannot be traced. Circuit status must be Active or Roll Pending.`

Recommended Action Launch a circuit trace for Discovered, Discovered_TL1, or Roll Pending circuits only.

Error Message `EID-964: The requested search criteria did not return any data.`

Recommended Action Modify the search criteria.

Error Message `EID-965: Inconsistent VLANs detected. Cannot edit circuit attributes.`

Recommended Action Delete the existing circuit and create a new circuit.

Error Message `EID-966: An error occurred while checking VLAN applicability.`

Recommended Action Check the Ethernet card mode and try to create the circuit again.

Error Message `EID-967: Failed to change the customer ID.`

Recommended Action Verify that the Prime Optical server is up and running.

Error Message `EID-968: Failed to change the service ID.`

Recommended Action Verify that the Prime Optical server is up and running.

Error Message `EID-969: The source NE for this circuit is not in the user domain.`

Recommended Action Verify that the source NE is in the user domain.

Error Message `EID-970: VLAN deletion failed.`

Recommended Action To delete the VLAN from the network partition, all NEs in the partition must be reachable. Verify that all NEs in the partition are in service and reachable; then, try deleting the VLAN again.

Error Message `EID-971: When 'Ignore All Circuit Names' is not selected, at least one circuit name must be added to the Selected Names list.`

Recommended Action Add at least one circuit name to the Selected Names list.

Error Message `EID-972: When 'Ignore All Customer IDs' is not selected, at least one customer ID must be added to the Selected Names list.`

Recommended Action Add at least one customer ID to the Selected Names list.

Error Message `EID-973: When 'Ignore All Service IDs' is not selected, at least one service ID must be added to the Selected Names list.`

Recommended Action Add at least one service ID to the Selected Names list.

Error Message `EID-974: VLAN manager was not created.`

Recommended Action Contact your system administrator.

Error Message `EID-975: Cannot remove all objects from` *`location`*`.`

Recommended Action Select at least one VLAN for the circuit.

Error Message `EID-976: There are no NEs selected or the selected NEs are not in service.`

Recommended Action Select valid NEs.

Error Message `EID-977: An error occurred while retrieving the NE data provider.`

Recommended Action Contact your system administrator.

Error Message `EID-978: Failed to trace the following VLANs:` *`VLANs`*`.`

Recommended Action Contact your system administrator.

Error Message `EID-979: An error occurred while creating the selection context for the Trace VLAN table.`

Recommended Action Try the operation again.

Error Message `EID-980: An error occurred while launching the Trace VLAN table.`

Recommended Action Contact your system administrator.

Error Message `EID-981: Failed to change the circuit parameters.`

Recommended Action Contact your system administrator.

Error Message `EID-982: Failed to retrieve the monitor source points.`

Recommended Action Contact your system administrator.

Error Message `EID-983: Cannot create monitor circuits on a port grouping circuit.`

Recommended Action No action.

Error Message `EID-984: An error occurred while retrieving the circuit drop points.`

Recommended Action Contact your system administrator.

Error Message `EID-985: An error occurred while retrieving the circuit drop nodes.`

Recommended Action Contact your system administrator.

Error Message `EID-986: Cannot create drops on the circuit. There are no available drops.`

Recommended Action No action.

Error Message `EID-987: There are no available Ethernet nodes to add.`

Recommended Action No action.

Error Message `EID-988: Cannot create monitor circuits on this termination point.`

Recommended Action No action.

Error Message `EID-989: Access violation. Verify that you have user privileges to perform this operation on this circuit.`

Recommended Action Check your user ID access permissions. If you need help doing this, contact the system administrator.

Error Message `EID-990: Circuit Size is a mandatory field. If the circuit size could not be selected, check the user privileges and verify that the circuit sizes are assigned.`

Recommended Action Verify that your user ID has permissions to create circuits with the sizes available on the selected NEs. If you need help to check your user permissions, contact the system administrator.

Error Message `EID-991: VLAN Name is a mandatory field. Enter a valid VLAN name that contains 1 or more characters and retry.`

Recommended Action Enter a valid VLAN name.

Error Message `EID-992: Failed to modify the MTU size for the SPR interface.`

Recommended Action This is an informational message. Wait for some time; then, try to modify the MTU size.

Error Message `EID-993: Request timed out. The operation is running in the background. Please check after some time for the updated attributes.`

Recommended Action Wait for some time; then, check again to see the updated attributes.

Error Message `EID-993: An error occurred while parsing the XML file. Provide a correct XML file to launch the wizard.`

Recommended Action Specify a valid XML file; then, relaunch the wizard.

Error Message `EID-996: Cannot launch the wizard. You must first specify an XML and log file.`

Recommended Action Specify a valid XML and log file; then, relaunch the wizard.

Error Message `EID-997: Cannot launch the wizard. You must first specify an XML file.`

Recommended Action Specify a valid XML file; then, relaunch the wizard.

Error Message `EID-998: Cannot launch the wizard. You must first specify a log file.`

Recommended Action Specify a valid log file; then, relaunch the wizard.

Error Message `EID-1001: Failed to retrieve circuit service provider object.`

Recommended Action Verify that the Prime Optical server and the database are up and running.

Error Message `EID-1002: Failed to retrieve NE system ID.`

Recommended Action The NEs are not present in the system. Make the NE active and try again.

Error Message `EID-1003: Both old and new MAC addresses are mandatory.`

Recommended Action Enter both values.

Error Message `EID-1004: Failed to retrieve circuit manager object.`

Recommended Action Verify that the Prime Optical server is up and running.

Error Message `EID-1006: An invalid L2 topology with the same name already exists. Do you want to delete the invalid topology? Click Cancel to change the L2 topology name.`

Recommended Action Delete the invalid topology, or click **Cancel** and change the L2 topology name to a unique name.

Error Message `EID-1007: Select an L2 topology to view cards in the topology.`

Recommended Action Select an L2 topology.

Error Message `EID-1008: Failed to modify the PoS ports state.`

Recommended Action Retry the operation.

Error Message `EID-1009: The sum of bandwidth values for SP Management, Committed Rate, AVVID Control and Best Effort cannot exceed 99%.`

Recommended Action Enter combined bandwidth values that do not exceed 99%.

Error Message `EID-1010: An error occurred while applying the base card configuration. Check whether the barebone configuration is present in ML cards.`

Recommended Action Verify that the ML-series card contains a barebone configuration file.

Error Message `EID-1011: Failed to retrieve network manager object.`

Recommended Action Verify that the Prime Optical server is up and running.

Error Message `EID-1012: Failed to retrieve path trace mode.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity.

Error Message `EID-1013: Failed to retrieve transmit text.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity.

Error Message `EID-1014: Failed to retrieve expected text.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity.

Error Message `EID-1015: Failed to retrieve received text.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity. Verify that the provisioned card is present in the slot.

Error Message `EID-1016: Failed to retrieve transmit text.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity.

Error Message `EID-1017: Failed to retrieve expected text.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity.

Error Message `EID-1018: Failed to retrieve path trace mode.`

Recommended Action Verify that the Prime Optical server is up and running. Check the NE connectivity.

Error Message `EID-1019: There are no circuits selected for J1 path trace. Select a circuit.`

Recommended Action Select an active STS (for SONET) or active LOP/HOP/VCT (for SDH).

Error Message `EID-1020: Select only one circuit from the table.`

Recommended Action Select only one active STS (for SONET) or active LOP/HOP/VCT (for SDH).

Error Message `EID-1021: Failed to retrieve the record from the database.`

Recommended Action Verify that Prime Optical server and database is up and running.

Error Message `EID-1022: Circuit is not active.`

Recommended Action Select an active STS (for SONET) or active LOP/HOP/VCT (for SDH).

Error Message `EID-1065: Error creating ring Provisioner: Could get data for the selected ring.`

Recommended Action Check the connectivity for all NEs in the BLSR. Mark the NEs in the ring as Out of Service and In Service.

Error Message `EID-1079: Failed to retrieve endpoints.`

Recommended Action Verify that the NE supports the selected circuit type and size.

Error Message `EID-1115: Failed to delete the selected SVLAN(s).`

Recommended Action Verify that the selected SVLANs are valid circuit entries and have not already been deleted. Then, verify that the SVLAN nodes are reachable and in service. Refresh the SVLAN table and try again.

Error Message `EID-1116: Failed to modify the selected SVLAN.`

Recommended Action Verify that the selected SVLAN is a valid circuit entry and has not been deleted.

Error Message `EID-1117: Failed to delete the SVLAN drop: drop-name.`

Recommended Action Verify that the selected drop has not already been deleted. Verify that the SVLAN circuit state is Discovered. Verify that the SVLAN nodes are reachable and in service. Refresh the SVLAN table and try again.

Error Message `EID-1118: Failed to retrieve SVLAN information.`

Recommended Action Verify that the SVLAN nodes are reachable and in service. Refresh the SVLAN table and try again.

Error Message `EID-1130: Access violation. You do not have the required user privileges to create this circuit.`

Recommended Action You do not have the required permissions to create this type of circuit. This is an informational message; no action is required.

Error Message `EID-1200: An error occurred while setting the values. See the log file for more information.`

Recommended Action Use the log file to identify the error that occurred, and make the necessary changes.

Error Message EID-1201: Failed to modify the port parameters related to the drop ports of the Layer 2 service. Use the "Modify Ports" dialog to change the parameters if necessary.

Recommended Action This is an informational message; no action is required.

Error Message EID-1202: The modify port parameters request timed out. The operation is running in the background.

Recommended Action No action required.

Error Message EID-1203: Failed to modify the port parameters related to the drop port of the Layer 2 service. Use the "Modify Ports" dialog to change the parameters if necessary.

Recommended Action Use the Modify Ports dialog box to change port parameters.

Error Message EDI-1204: Not all drops might be deleted as the request got timed out. The process is however continuing in the background. Please verify the drops deleted after sometime.

Recommended Action Wait for some time; then, check again to verify that all drops have been deleted.

Error Message EID-1205: Request timed out. The operation is running in the background. Please check after sometime for the updated attributes.

Recommended Action Wait for some time; then, check again to see the updated attributes.

Error Message EID-1206: Request timed out. The operations can not be executed completely.

Recommended Action Ensure that the NE is connected and reachable (pingable) and try again after a few minutes.

Error Message EID-1210: You cannot create a server trail link between the selected NEs.

Recommended Action Select a different NE as the source or destination for the server trail.

Error Message EID-1213: The TL1 Tunnel password does not match the confirmation password. Retype the password.

Recommended Action Retype the confirmation password.

Error Message `EID-1214: The alarm profile file is corrupt. Use a new file.`

Recommended Action You cannot upload a corrupt alarm profile management file to the NE. Choose a profile that is not corrupt.

Error Message `EID-1220: Database error: Cannot modify the NE SNMP version.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-1221: Database error: Cannot modify the NE SNMPv3 required user.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-1222: Database error: Cannot modify the NE SNMPv3 trap user.`

Recommended Action A database error occurred during this operation. Verify that the Prime Optical database is up and running properly. Restart the Prime Optical client and retry.

Error Message `EID-1223: The GNE TID cannot be empty. Either uncheck the Enable check box or enter a valid GNE TID.`

Recommended Action Uncheck the Enable check box or enter a valid GNE TID.

Error Message `EID-1234: The PM Clear operation is not supported on ML-series and Ethernet-series cards.`

Recommended Action Choose cards other than ML-series or Ethernet-series cards for the PM Clear operation.

Error Message `EID-1235: The PM Clear operation is not supported on ML-series and Ethernet-series cards but is supported on other cards.`

Recommended Action Choose cards other than ML-series or Ethernet-series cards for the PM Clear operation.

Error Message `EID-1236: The PM Clear operation failed.`

Recommended Action Retry the operation, using cards other than ML-series or Ethernet-series cards.

Error Message `EID-1600: Cannot provision the Layer 2 service.`

Recommended Action The operation is not supported on NE releases earlier than release 5.0. Remove those drops from the VLAN creation.

Error Message `EID-4045: Exception: The alarm profile is incompatible with the selected node.`

Recommended Action Select a different alarm profile, one that is compatible with the selected NE type.

Error Message `EID-5039: The CTM GateWay/CORBA service cannot be started because the notification service listening port is in use. Change the notification service port and restart the service, or try again after some time.`

Recommended Action Change the notification service port to a different port number. Alternatively, wait for some time and then try starting the Prime Optical GateWay/CORBA service.

Error Message `EID-5040: The CTM GateWay/CORBA service cannot be started because the notification service failed to start.`

Recommended Action Wait for a few minutes; then, retry.

Error Message `EID-6055: IOS communication session is null; cannot proceed.`

Recommended Action Wait for a few minutes; then, retry.

Error Message `EID-6059: ML card resync failure.`

Recommended Action Verify that the barebone configuration has been uploaded on the ML-series card. Reset the card. Verify that the SNMP trap destination has been set for the server on the NE.

Error Message `EID-6082: Cannot provision the port because bandwidth is not available.`

Recommended Action This error message is returned when an already provisioned port has consumed the entire available bandwidth for the group. Try provisioning the port in another group.

Error Message `EID-6292: The alarm type name cannot exceed 20 characters.`

Recommended Action Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).

Error Message `EID-6293: The alarm type name cannot be blank. Enter a unique alarm type name.`

Recommended Action Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).

Error Message `EID-6294: The alarm type name contains invalid characters. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).`

Recommended Action Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).

Error Message `EID-6296: You cannot add more than 50 alarm types.`

Recommended Action You have exceeded the maximum number of alarm types. You must delete an existing alarm type before adding a new one.

Error Message `EID-6298: The alarm type name that you entered already exists. Enter a unique alarm type name.`

Recommended Action Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).

Error Message `EID-7033: Select the users to send the message to.`

Recommended Action In the Notify Users dialog box > Message Targets field, select recipients for your message. This list includes the default SuperUser, SysAdmin, NetworkAdmin, Provisioner, and Operator profiles, as well as any custom user profile that has been generated. You can select custom and multiple profiles by using the **Shift** and **Control** keys while clicking the profile, or click the **All CTM Users** radio button to send your message to all users, regardless of user type.

Error Message `Photonic Path Trace is in progress.`

Recommended Action Wait until the current Photonic Path Trace ends.

Error Message `An Inactive or Roll Pending circuit state is preventing Photonic Path Trace from starting. If Inactive, restore to Active. If Roll Pending, commit the roll operation.`

Recommended Action If the status of the circuit is Roll Pending, commit the roll operation. If the circuit is not active, check the service and restore its state to Active.

Error Message `Splitter-protected circuits are not supported.`

There is no workaround. The Photonic Path Trace feature is not supported for splitter-protected circuits.

Error Message `Regenerated circuits are not supported.`

There is no workaround. The Photonic Path Trace feature is not supported for circuits belonging to a regeneration group.

Error Message `The Source NE list is unavailable. Verify that the service on the circuit is active and that the state of all NEs is In Service.`

Recommended Action Check the service and the network elements involved in the circuit. The status of the service must be Active and the state of all the network elements must be In Service.

Error Message `The Destination NE list is unavailable. Verify that the service on the circuit is active and that the state of all NEs is In Service.`

Recommended Action Check the service and the network elements involved in the circuit. The status of the service must be Active and the state of all the network elements must be In Service.

Error Message `The source circuit node is unavailable. Verify that it is not damaged.`

There is no workaround. The circuit could be damaged.

Error Message `The destination circuit node is unavailable. Verify that it is not damaged.`

There is no workaround. The circuit could be damaged.

Error Message `No such entity exists.`

There is no workaround.

Error Message `No such interface.`

There is no workaround.

Error Message `An I/O error occurred.`

There is no workaround.

Error Message `No Photonic Path Trace is available for this circuit. Verify that the circuit is not damaged.`

There is no workaround. The circuit could be damaged.

Error Message `No reverse Photonic Path Trace is available for this circuit. Verify that the circuit is not damaged.`

There is no workaround. The circuit could be damaged.

Error Message `Photonic Path Trace could not be completed from the source to the destination. Restart Photonic Path Trace; if the problem persists, check the NE connections.`

Recommended Action Start Photonic Path Trace again. If the error persists, check the stability of connections with the network elements.

Error Message `Photonic Path Trace could not be completed from the destination to the source. Restart Photonic Path Trace; if the problem persists, check the NE connections.`

Recommended Action Start Photonic Path Trace again. If the error persists, check the stability of connections with the network elements.

F.2 Prime Optical Server Error Messages

Prime Optical server error messages appear in the Error Log and have the following syntax:

Date time: *filename(line-number)*: *module-severity-error-ID*: *error-message*

Example:

```
01/01/05 09:56:01 PM: cliroutines.c(80): CONFIG-DEBUG-1201: Unknown_ETHERNET_PORT 0
```

The following error messages are categorized by severity (critical, major, minor, and debug) and are listed in ascending numeric order within each category.

Note Because error messages are grouped in number ranges, they are not listed in exact numeric order.

The following subsections contain information about the various levels of server error messages:

- F.2.1 Critical Server Error Messages, page F-98
- F.2.2 Major Server Error Messages, page F-107
- F.2.3 Minor Server Error Messages, page F-129
- F.2.4 Debug Server Error Messages, page F-147

F.2.1 Critical Server Error Messages

Error Message `EID-601: Failed to open trap listener socket.`

Recommended Action UDP socket 162 should not be taken by another program. If another program is using UDP socket 162, stop that program. Also, verify that the Prime Optical server is running as root.

Error Message `EID-1023: Failed to retrieve circuit manager.`

Recommended Action Contact the system administrator.

Error Message `EID-1024: Failed to retrieve circuit data. Check circuit status. Contact the system administrator if the problem persists.`

Recommended Action Verify that the circuit has been discovered. Contact the system administrator if the problem persists.

Error Message `EID-1025: Could not get access to one of the circuit nodes. Verify that you have user privileges for all circuit nodes. Contact the administrator if the problem persists.`

Recommended Action Verify that you have user privileges for all the nodes in the circuit. If the problem persists, contact your system administrator.

Error Message `EID-1026: Roll creation request failed.`

Recommended Action Try again. Contact system administrator for more information.

Error Message `EID-1027: Error: Cannot proceed with roll creation.`

Recommended Action Close the wizard and try again.

Error Message `EID-1028: An error occurred while setting the roll to point. Try again.`

Recommended Action Perform the operation again.

Error Message `EID-1029: Roll to point is not fully specified. Choose available points.`

Recommended Action Choose available points.

Error Message `EID-1030: Select the circuit termination point.`

Recommended Action Select the circuit termination point.

Error Message `EID-1031: The selected roll path is invalid.`

Recommended Action Choose a valid circuit termination point as the roll path.

Error Message `EID-1032: Failed to complete the roll.`

Recommended Action Contact your system administrator.

Error Message `EID-1033: Failed to delete the roll.`

Recommended Action Contact your system administrator.

Error Message `EID-1034: Failed to cancel the roll.`

Recommended Action Contact your system administrator.

Error Message `EID-1035: Failed to finish the roll.`

Recommended Action Contact your system administrator.

Error Message `EID-1036: Failed to retrieve VAP spans.`

Recommended Action Contact your system administrator.

Error Message `EID-1037: Failed to retrieve VT options.`

Recommended Action Contact your system administrator.

Error Message `EID-1038: Failed to set low-order options.`

Recommended Action Contact your system administrator.

Error Message `EID-1039: Failed to set VAP destination.`

Recommended Action Contact your system administrator.

Error Message `EID-1040: An error occurred while setting the nodes.`

Recommended Action Contact your system administrator.

Error Message `EID-1041: Invalid span selection.`

Recommended Action Select a different route.

Error Message `EID-1042: Failed to retrieve circuit attributes from the database.`

Recommended Action Try again later. If the problem persists, contact the system administrator.

Error Message `EID-1043: There are no links available for circuit creation.`

Recommended Action Select node groups that have links between them. Circuits cannot be created between nodes that are not connected by links.

Error Message `EID-1044: VT tunnel links cannot be used for STS/VT tunnel circuit types.`

Recommended Action Select other link types from the wizard map and continue.

Error Message `EID-1045: There are no spans available for this link.`

Recommended Action This link does not have enough bandwidth for the current circuit size. Select another route for the current circuit or delete some circuits going through the selected link. If you need help to do this, contact your system administrator.

Error Message `EID-1046: Select an adjacent node first.`

Recommended Action Select an adjacent node.

Error Message `EID-1047: Select a node first.`

Recommended Action Select a node.

Error Message `EID-1048: The link is down. Select another link.`

Recommended Action Select another link.

Error Message `EID-1049: Cannot select this node. Only source nodes and nodes attached to the included spans are selectable.`

Recommended Action In the map view, select a node that is attached to an already included span.

Error Message `EID-1050: This port is already assigned. The east and west ports must be different.`

Recommended Action Choose another port.

Error Message `EID-1051: You cannot create a BLSR with these attributes. This means that all nodes and spans in your network have been excluded. Click the "Excluded nodes" button to see a list of nodes and why they cannot be included in the BLSR you are creating.`

Recommended Action To correct this error:

Step 1 Click **OK** in the warning dialog box. The Working Span Selection dialog box appears with an empty map.

Step 2 Click **Excluded Nodes**. The Excluded Nodes dialog box appears. It lists all the nodes excluded from the ring creation and the reasons for excluding them.

Step 3 Correct the problem and perform the operation again.

Step 4 If the problem persists, contact the system administrator.

Error Message `EID-1052: An error occurred while adding the span.`

Recommended Action Click the **Details** button to view the reason why the span was not added. If reason is "not sufficient," contact your system administrator.

Error Message `EID-1053: An error occurred while removing the span.`

Recommended Action The Details button shows the reason for not removing the span. Review the reasons. If the problem persists, contact Cisco technical support.

Error Message `EID-1054: An error occurred while reversing the span.`

Recommended Action The Details button shows the reason for not reversing the span. Review the reasons. If the problem persists, contact Cisco technical support.

Error Message `EID-1055: An error occurred while setting the protect ports.`

Recommended Action Click the **Details** button to view the reason for the failure. Correct the error and retry or contact your system administrator.

Error Message `EID-1056: An error occurred while retrieving the working spans for map update.`

Recommended Action The ring model might not exist in the server. Close the table; then, relaunch it and try to upgrade again.

Error Message `EID-1057: An error occurred while provisioning.`

Recommended Action Click the **Details** button to view the reason why provisioning failed. Correct the problem and retry. If the problem persists, contact your system administrator.

Error Message `EID-1058: An error occurred while upgrading.`

Recommended Action Click the **Details** button to view the reason why the update failed. Correct the problem and retry. If the problem persists, contact your system administrator.

Error Message `EID-1059: An error occurred while editing.`

Recommended Action Click the **Details** button to view the reason why the edit failed. Correct the problem and retry. If the problem persists, contact your system administrator.

Error Message `EID-1060: An error occurred while deleting.`

Recommended Action Click the **Details** button to view the reason why the deletion failed. For more information, contact Cisco technical support.

Error Message `EID-1061: An error occurred while creating the ring provisioner.`

Recommended Action Mark the NEs in the ring as Out of Service and In Service again.

Error Message `EID-1062: An error occurred while retrieving the protect port details.`

Recommended Action Click the **Details** button to view the reason for failure. For more information, contact Cisco technical support.

Error Message `EID-1063: Cannot have a four-fiber ring on` *`location`*`.`

Recommended Action The current topology does not support 4-fiber rings. Click the **Details** button to view reasons why the 4-fiber ring is not supported. Contact your system administrator.

Error Message `EID-1064: An error occurred while submitting the switch command job to the server.`

Recommended Action Try again later.

Error Message `EID-1065: Cannot set reversion to INCONSISTENT.`

Recommended Action Change the selection.

Error Message `EID-1066: The Start Ring ID value must be less than or equal to the End Ring ID value.`

Recommended Action Enter a start ring ID that is less than or equal to the end ring ID.

Error Message `EID-1067: The Start Ring ID value cannot be empty.'`

Recommended Action Enter a start ring ID.

Error Message `EID-1068: The End Ring ID value cannot be empty.`

Recommended Action Enter an end ring ID.

Error Message `EID-1069: The ring ID cannot be empty.`

Recommended Action Enter a value in the Ring ID field.

Error Message `EID-1070: Member numbers must be unique and must be in the range 1 to 256.`

Recommended Action Enter a unique number from 1 to 256.

Error Message `EID-1071: The member circuit name cannot end with \"ROLL**\" and the name length must be less than 48.`

Recommended Action Enter a name that contains fewer than 48 characters and does not end with \ROLL**\.

Error Message `EID-1072: You must select a span for each member. No span selected for member #.`

Recommended Action Select a span for the member.

Error Message `EID-1074: The time slot is already allocated for another member of this VCAT. Please select a different time slot.`

Recommended Action Change the values you entered in the Time Slot Restriction field, in the Member Preferences table, so the numbers are not identical.

Error Message `EID-1701: Cannot allocate memory for: value.`

Recommended Action The CTMServer.cfg file has been corrupted. Reinstall the Prime Optical server.

Error Message `EID-1704: Error connecting to the database.`

Recommended Action The CTMServer.cfg file has been corrupted. Reinstall the Prime Optical server.

Error Message `EID-1715: Failed to get memory for SNMP packet.`

Recommended Action Restart the Prime Optical server. If the problem persists, add memory to the workstation.

Error Message `EID-1717: Failed to bind SNMP socket.`

Recommended Action There is a conflict for the UDP socket. Stop the conflicting UNIX process or reboot the Prime Optical server.

Error Message `EID-1722: Failed to open SNMP port.`

Recommended Action There is a conflict for the UDP socket. Stop the conflicting UNIX process or reboot the Prime Optical server.

Error Message `EID-1725: Failed to open a disk file filename errno=error-number-from-file /usr/include/sys/errno.h.`

Recommended Action Prime Optical could not open SpoolFile in the CTMSHOME directory. Check for file permissions and verify that the Prime Optical server is running with SuperUser privileges. The file system containing SpoolFile must be installed on a local file system.

Error Message `EID-1726: Line line-number: Syntax error: string.`

Recommended Action This error relates to a process resource or syntax error on a line number. You should tune the resource or correct the syntax error.

Error Message `EID-1734: Service service-name failed to initialize.`

Recommended Action Look for previous error messages from the service that failed to determine the cause and fix for the problem. Verify that the Oracle database is running and that there are enough free resources (memory, sockets, and so on) on the server workstation.

Error Message `EID-1736: Failed to initialize UDP socket pool.`

Recommended Action There were not enough sockets available for the server to start. Check the /etc/system file on the server workstation for the following lines:

```
set rlim_fd_max=XXX
set rlim_fd_cur=YYY
```

The value of *XXX* should be greater than or equal to 4096. The value of *YYY* should be greater than or equal to 2048. Adjust the value; then, restart the server workstation.

Error Message `EID-2002: Bad category value in JMOCO event.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2003: JMOCO event is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2025: Cannot initialize the NE Service. Trying to stop the service.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with the output from the getinfo script.

Error Message `EID-2026: Exception string occurred while initializing the NE Service. Trying to stop the service.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with the output from the getinfo script.

Error Message `EID-3101: init: Exception value occurred while initializing trap service. The snmpTrapDispatcher or snmpTrapHandler could not be started.`

Recommended Action The SNMP Trap Service could not start worker threads. Restart the Prime Optical server.

Error Message `EID-3105: createSnmpTrapHandler: Snmp Exception`

Recommended Action This message might indicate a conflict in binding to the trap listener port. Remove any other UNIX process that is using this port.

Error Message `EID-3106: createSnmpTrapHandler: Exception` *`string`*`.`

Recommended Action Report the exception string to Cisco technical support.

Error Message `EID-3107: createSnmpTrapHandler: run Exception` *`string`*`.`

Recommended Action Report the exception string to Cisco technical support.

Error Message `EID-3110: Exception:` *`string`* `occurred while creating Snmp trap queue.`

Recommended Action This is a fatal error with the Prime Optical initialization. Restart the Prime Optical server.

Error Message `EID-3111: Main exception:` *`string`* `occurred while creating Snmp Trap Service.`

Recommended Action This is a fatal error with the Prime Optical initialization. Restart the Prime Optical server.

Error Message `EID-3112: Run failed deque/publish trap exception: Cannot send a message to the JMS server; - nested throwable: (java.net.SocketException: Broken pipe)`

Recommended Action This error occurs when the SNMP Trap Service fails to publish messages to the JMS bus. The problem is caused by a stale or dead JBOSS (JMS) process. To fix the problem, enter the command **/usr/ucb/ps -auxww | grep -i org.jboss.Main**, which gives you the ID of the JBOSS process. Then, kill the process and restart the SNMP Trap Service. Alternatively, enter the command **opticalctl stop**, then **opticalctl start**.

Error Message `EID-4033: LCI trap forwarder not available for ONS 1530x.`

Recommended Action Restart the NE service for the ONS 15305 NE.

Error Message `EID-4235: Exception: No node exists with NEDB ID` *`string`*`.`

Recommended Action Contact Cisco technical support.

Error Message `EID-4237: Exception: Network Manager creating links from DB rows generated an exception.`

Recommended Action Contact Cisco technical support.

Error Message `EID-6050: Exception. This method is not implemented for this network element.`

Recommended Action Contact Cisco technical support.

Error Message `EID-6051: Exception occurred while retrieving NE information.`

Recommended Action Contact Cisco technical support.

F.2.2 Major Server Error Messages

Error Message `EID-202: Error destroying thread.`

Recommended Action The CTMServer.cfg file has been corrupted. Reinstall the Prime Optical server.

Error Message `EID-203: Invalid thread ID.`

Recommended Action If the Prime Optical server starts, ignore this internal error. If the server does not start, increase the memory or swap space on the server workstation. If the problem persists, contact Cisco technical support.

Error Message `EID-204: The ML Series Card to NE Connection username is a mandatory field. Specify a username.`

Recommended Action Enter a username for ML card-to-NE connections.

Error Message `EID-206: Error scheduling work.`

Recommended Action If the Prime Optical server starts, ignore this internal error. If the server does not start, increase the memory or swap space on the server workstation. If the problem persists, contact Cisco technical support.

Error Message `EID-208: Work queue/work was destroyed.`

Recommended Action If the Prime Optical server starts, ignore this internal error. If the server does not start, increase the memory or swap space on the server workstation. If the problem persists, contact Cisco technical support.

Error Message `EID-209: Worker thread is exiting.`

Recommended Action If you receive this error during normal operation, restart the server. This error is normal during shutdown.

Error Message `EID-212: Error waiting on a semaphore.`

Recommended Action If the Prime Optical server starts, ignore this internal error. If the server does not start, increase the memory or swap space on the server workstation.

Error Message `EID-218: Memory corruption: bad header.`

Recommended Action Restart the Prime Optical server.

Error Message `EID-219: Memory corruption: bad footer.`

Recommended Action Restart the Prime Optical server.

Error Message `EID-226: Error creating socket.`

Recommended Action If the Prime Optical server starts, ignore this internal socket-related error. If the server does not start, check the /etc/system file on the server workstation for the following lines:

```
set rlim_fd_max=XXX
set rlim_fd_cur=YYY
```

The value of *XXX* should be greater than or equal to 4096. The value of *YYY* should be greater than or equal to 2048. The value of rlim_fd_max should be greater than the value of rlim_fd_cur. Adjust the values; then, restart the server workstation.

Error Message `EID-227: Error in socket bind.`

Recommended Action If the Prime Optical server starts, ignore this internal socket-related error. If the server does not start, check the /etc/system file on the server workstation for the following lines:

```
set rlim_fd_max=XXX
set rlim_fd_cur=YYY
```

The value of *XXX* should be greater than or equal to 4096. The value of *YYY* should be greater than or equal to 2048. Adjust the value; then, restart the server workstation.

Error Message `EID-228: Error in socket listen.`

Recommended Action This is an internal error. If the Prime Optical server is not operating normally, restart the server.

Error Message `EID-229: Invalid socket.`

Recommended Action This is an internal error; no action is required.

Error Message `EID-232: Error establishing connection.`

Recommended Action The CTMServer.cfg file has been corrupted. Reinstall the Prime Optical server.

Error Message `EID-237: Timer thread exiting.`

Recommended Action If the timer thread exits, the software and configuration upload/download will not work properly. Restart the server.

Error Message `EID-238: Unable to schedule timer work.`

Recommended Action This is an internal error; no action is required.

Error Message `EID-313: Length of request is more than expected.`

Recommended Action This is an internal protocol error. The Prime Optical client will display the appropriate message.

Error Message `EID-314: CTM server port not specified in configuration file.`

Recommended Action This is an internal protocol error. The Prime Optical client will display the appropriate message.

Error Message `EID-321: Unable to set up database entry for NE #`*`NE-ID`*`.`

Recommended Action This is an internal protocol error. The Prime Optical client will display the appropriate message.

Error Message `EID-325: Error encoding arguments.`

Recommended Action This is an internal protocol error. The Prime Optical client will display the appropriate message.

Error Message `EID-326: Error disabling the user login for` *`username`*`.`

Recommended Action This is an internal protocol error. The Prime Optical client will display the appropriate message.

Error Message `EID-327: Maximum number of client connections exceeded for` *`IP-address`*`:`*`socket-number`*`.`

Recommended Action This is an internal protocol error. The Prime Optical client will display the appropriate message.

Error Message `EID-425: The EMS server may require a restart.`

Recommended Action Restart the server. If the error persists, capture a LAN trace from the Prime Optical server to help debug the problem.

Error Message `EID-606: Active alarm recovery looping for NE ID.`

Recommended Action The Prime Optical server cannot recover the active or standing alarms on the NE because of a loop in the SNMP agent on the NE. Restart the NE.

Error Message `EID-809: Circuit creation failed between endpoints.`

Recommended Action Create circuits using CTC or the Prime Optical Create Circuit wizard.

Error Message `EID-810: RPR got created partially because creation of some member circuit failed.`

Recommended Action Create the member circuits using the L2 topology point-to-point Create Circuit wizard or CTC.

Error Message `EID-819: Selected topology is undergoing Resync. Please wait until the L2 Topology Resync is completed.`

Recommended Action Wait until the topology resynchronization is completed.

Error Message `EID-820: Some of the selected L2 topologies is undergoing Resync. Please wait until the L2 Topology Resync is completed. Please click details to see the list of L2 topologies undergoing resync.`

Recommended Action Wait until all the selected topologies complete the resynchronization or select the topologies that have completed resynchronization and then perform the operation.

Error Message `EID-821: Select a row and then click on Create L2 service button.`

Recommended Action Select a row in the topology table before clicking the Create L2 Service button.

Error Message `EID-1101: Database-error-string.`

Recommended Action The database error string describes the error in detail. If the Prime Optical server fails to come up, check the Oracle username and password. For more information, refer to the Oracle documentation.

Error Message `EID-1301: Error-string.`

Recommended Action This is a generic internal error used for debugging purposes.

Error Message `EID-1302: System error: error-string.`

Recommended Action This is a generic internal error used for debugging purposes.

Error Message `EID-1401: The OSI daemon osiamxd is not present.`

Recommended Action The CTMServer.cfg file has been corrupted. The Open System Interconnection (OSI) daemon osiamxd is missing. Reinstall the Prime Optical server.

Error Message `EID-1721: Failed to connect to a socket.`

Recommended Action The CTMServer.cfg file has been corrupted. Reinstall the Prime Optical server.

Error Message `EID-1723: Invalid write errno = error-number-from-file /usr/include/sys/errno.h, size_to_write = size, wrote number bytes.`

Recommended Action This is an internal socket error. Data to the OSS overflowed, but the error will be corrected automatically.

Error Message `EID-1724: Invalid read errno = error-number-from-file /usr/include/sys/errno.h, size_to_read = size.`

Recommended Action This is an internal socket error. Check network connectivity.

Error Message `EID-1727: Cannot allocate memory.`

Recommended Action Increase the available memory or swap space on the server workstation and restart the application.

Error Message `EID-1728: Cannot find table element.`

Recommended Action This is an internal CLI parser error; no action is required.

Error Message `EID-1729: Entry already present in the table.`

Recommended Action This is an internal CLI parser error; no action is required.

Error Message `EID-1730: Invalid type in cfg_find_or_add.`

Recommended Action This is an internal CLI parser error; no action is required.

Error Message `EID-2008: Exception string occurred while notifying main.`

Recommended Action The internal TCP/IP communication channel has gone down. The Prime Optical server will restart the service automatically.

Error Message `EID-2014: Exception: string.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2015: Null NetElement for NE: NE-ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2016: Null NodeModel for NE: NE-ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2017: Exception: string for NE ID while string.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2018: Null pointer: exception-string for NE: NE-ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2019: Operation failed: exception-string for NE: NE-ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2021: Inventory collection was not completed for NE: NE-ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2027: VlanSetManager is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2028: NetCircuitWatchDog is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2029: TopologyClientImpl is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2030: EventDispatcher received is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2031: CerentCMService is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2032: Exception *string* occurred while reading NE *NE-ID* from the NE_Info_Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2033: Exception *string* occurred while reading GNE *GNE-ID* from the GNE_Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2034: Cannot find matching GNE in the GNE_Table. The database might be inconsistent.

Recommended Action Check the GNE information; then, restart the Prime Optical server.

Error Message EID-2041: Network is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2042: Circuit main thread has been interrupted.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2043: *Exception-string* occurred while initializing the circuit database tables.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2044: *Exception-string* occurred while deleting from Circuit Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2045: *Exception-string* occurred while deleting from Circuit Destination Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2046: *Exception-string* occurred while deleting from Circuit Span Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2047: *Exception-string* occurred while deleting from Circuit VLAN Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2048: *Exception-string* occurred while adding to Circuit Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2049: *Exception-string* occurred while adding to Circuit Destination Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2050: *Exception-string* occurred while adding to Circuit Span Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2051: *Exception-string* occurred while adding to Circuit VLAN Table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2056: *Exception-string* occurred while sending circuit update event.

Recommended Action The internal TCP/IP communication channel has gone down. Restart the Prime Optical server.

Error Message EID-2057: Cannot instantiate Circuit Manager. Network instance is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2058: Cannot instantiate Circuit Manager. VLAN set manager is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2059: Cannot add discovered NE. Hostelem is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2060: Cannot add discovered NE. Error occurred while converting the IP address to a long value.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2061: Cannot add discovered node. NE information for GNE is null.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2062: *Exception-string* occurred while adding discovered NE.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2063: Null database row returned while adding a discovered NE.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2064: Null NE ID returned while adding a discovered NE.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2065: *Exception-string* occurred while getting tree node string for parent.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2066: *Exception-string* occurred while adding discovered NE to the area tree table.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2067: Error occurred while adding discovered NE to the database.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2068: *Exception-string* occurred while initializing discovered NE.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2069: *Exception-string* occurred while updating NE IP address.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2070: *Exception-string* occurred while initializing discovered NE that exists in the database.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2074: Invalid instance in topology update.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2077: Cannot add discovered NE to the database. JMOCO session is null.

Recommended Action The internal TCP/IP communication channel has gone down. The Prime Optical server will restart the service automatically.

Error Message EID-2081: Exception: *string* occurred while retrieving network links from the database.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2082: Exception: *string* occurred while reading snmp-trap-queue-size parameter value from the CTMServer.cfg file.

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-2083: Exception: *value* occurred while reading snmp-trap-drop-size parameter value from the CTMServer.cfg file.

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-2084: Exception: *string* occurred while reading snmp-trap-forwarding-port parameter value from the CTMServer.cfg file.

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-2086: Exception: *value* occurred while reading the ons15454-callback-iiop-listen-port parameter value from the CTMServer.cfg file.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2087: Exception: *value* occurred while configuring the CORBA listener port for callbacks from ONS 15327 or ONS 15454 NEs.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2104: *Exception-string* occurred while adding discovered NE with IP address *IP-address*.

Recommended Action Exception needs to be analyzed. Contact Cisco technical support.

Error Message EID-2105: Adding operation for discovered NE with IP address *IP-address* not completed.

Recommended Action Exception needs to be analyzed. Contact Cisco technical support.

Error Message EID-2200: Software download operation failed on NE ID.

Recommended Action Retry the download operation. The cause of the software download operation failure is unknown.

Error Message `EID-2201: Software download operation failed on NE ID because it is not supported by the running agent version.`

Recommended Action The current TL1 agent version does not support the software download. The user cannot download a new agent software version through Prime Optical. Use the following procedure to correct the error:

Step 1 Open an FTP connection between the TFTP boot server and the NE.

Step 2 Enter the STDBY directory of the NE.

Step 3 From the TFTP server directory containing the catalog.txt file, manually transfer the catalog.txt file and all files listed in the catalog.txt file.

Error Message `EID-2202: Software download operation failed on NE ID because of a Flash read/write problem.`

Recommended Action The agent version transfer from the master Control and Monitoring Processor (CMP) to the slave CMP has failed. Use the following procedure to correct the error:

Step 1 Check the configuration of the master and slave CMPs.

Step 2 Check the status of the network between the master CMP and the slave CMP and verify that the CMP slaves are reachable.

Error Message `EID-2203: Software download operation failed on NE ID because of a problem during transfer from the TFTP server to the Master CMP.`

Recommended Action Transfer from the TFTP boot server to the master CMP has failed. Use the following procedure to correct the error:

Step 1 Verify that the TFTP boot server is running.

Step 2 Verify that the TFTP server address is correct.

Step 3 Check the status of the network between the TFTP server and the master CMP.

Step 4 Verify that the path name that lists where the catalog.txt file is located is correct.

Step 5 Verify that all files listed in the catalog.txt file are present in the same directory that contains the catalog.txt file.

Error Message `EID-2204: Software download operation failed on NE ID because the standby agent version is running.`

Recommended Action The standby agent version is running. A download operation is allowed only when the active agent version is running. There are two options to correct the error:

- Reset the NE to run the active agent version; then, overwrite the standby agent version by using the download operation.
- Swap the active and standby agent versions through the commit operation; then, overwrite the new standby agent version by using the download operation.

Error Message `EID-2205: Software revert operation failed on NE ID.`

Recommended Action The cause of the software revert operation failure is unknown. Retry the revert operation.

Error Message `EID-2206: Software revert operation failed on an NE ID because it is not supported by the running agent version.`

Recommended Action The current TL1 agent version does not support the revert operation. You cannot run the standby agent version through Prime Optical. Use the following procedure to correct the error:

Step 1 Connect to the NE through a Telnet connection.

Step 2 Swap the files contained in the STDBY directory and ACTIVE directory.

Step 3 Reset the NE.

Note The effect of this operation is different from that of a revert operation. In this operation, swapping the files of the STDBY and ACTIVE directories causes each subsequent NE reset operation to execute the software that was previously contained in the STDBY directory, which is now contained in the ACTIVE directory. In the revert operation, the default agent version is not changed.

Error Message `EID-2207: Software revert operation failed on NE ID because the standby agent version is corrupted.`

Recommended Action The standby agent version is corrupted. Use the following procedure to correct the error:

Step 1 Execute a new download operation to replace the current standby agent version with the valid one.

Step 2 Execute the revert operation again; then, verify that the new downloaded version works correctly.

Error Message `EID-2208: Software commit operation failed on NE ID.`

Recommended Action The reason for the failure of the software commit operation is unknown. Retry the commit operation.

Error Message `EID-2209: Software commit operation failed on NE ID because it is not supported by the running agent version.`

Recommended Action The current TL1 Agent version does not support the commit operation. The user cannot make the active agent version the current standby agent version in Prime Optical. Use the following procedure to correct the error:

Step 1 Connect to the NE through a Telnet connection.

Step 2 Swap the files contained in the STDBY directory and ACTIVE directory.

Step 3 Reset the NE.

Error Message `EID-2210: Software commit operation failed on NE ID because the standby agent version is corrupted.`

Recommended Action The standby agent version is corrupted. Use the following procedure to correct the error:

Step 1 Execute a new download operation to replace the current standby agent version with the valid one.

Step 2 Execute a revert operation and verify that the new downloaded version works correctly.

Step 3 Execute the commit operation again.

Error Message `EID-2211: Exception during NE ID reset.`

Recommended Action Reset the NE again.

Error Message `EID-2212: Software download operation failed because of invalid path parameter.`

Recommended Action Verify that the path name (representing the path on the TFTP server where the catalog.txt file is located) has the correct format.

Error Message `EID-2213: NE User Management failed - Limit of ten TL1 user profiles definition has been reached on the NE ID.`

Recommended Action There are already ten TL1 users configured on the NE. Use the following procedure to correct the error:

Step 1 Open the NE User Access Administration table.

Step 2 Delete one TL1 user.

Step 3 Retry the previous failed operation.

Error Message `EID-2214: NE User Management failed - Selected user doesn't exist on NE ID.`

Recommended Action No action.

Error Message `EID-2217: NE User Management failed - Duplicated username for NE ID.`

Recommended Action Retry the operation and verify that the username is not already present in the NE User Access Administration table.

Error Message `EID-2218: NE User Management failed - Super user cannot be modified or deleted on NE ID.`

Recommended Action You tried to delete or modify a SuperUser that had an active connection open. Use the following procedure to correct the error:

Step 1 Open the NE Active Users table and disconnect the SuperUser connection.

Step 2 Retry the operation.

Note You cannot delete a SuperUser.

Error Message `EID-2219: Performance Monitoring Task (date and time) not completed because of Agent busy on NE ID.`

Recommended Action This error occurs when the agent on the NE is busy. Verify that the agent on the NE is not overloaded.

Error Message `EID-2220: Performance Monitoring Task failed TL1 login to NE ID.`

Recommended Action Verify that the login information is correct. If the problem persists, contact Cisco technical support.

Error Message `EID-2221: Performance Monitoring task failed to connect to NE ID.`

Recommended Action Verify that the login information is correct. If the problem persists, contact Cisco technical support.

Error Message `EID-3015: Cannot start collector.`

Recommended Action Open the Control Panel. Expand **Prime Optical** and **PM Service**. Stop and restart the PM service. If the problem persists, contact the Prime Optical administrator.

Error Message `EID-3016: Cannot register for events.`

Recommended Action Open the Control Panel. Expand **Prime Optical** and **PM Service**. Stop and restart the PM service. If the problem persists, contact the Prime Optical administrator.

Error Message `EID-3017: Cannot open tables.`

Recommended Action Open the Control Panel. Expand **Prime Optical** and **PM Service**. Stop and restart the PM service. If the problem persists, contact the Prime Optical administrator.

Error Message `EID-3018: Cannot add new Cisco ONS 15454 value.`

Recommended Action Delete the NE from Prime Optical. Add the NE again; then, enable PM after the NE is reachable. If the problem persists, contact the Prime Optical administrator.

Error Message `EID-3019: Cannot retrieve information for new NE value.`

Recommended Action Delete the NE from Prime Optical. Add the NE again; then, enable PM after the NE is reachable. If the problem persists, contact the Prime Optical administrator.

Error Message `EID-3020: Cannot add new Cisco ONS 15454. Database is null value.`

Recommended Action Open the Control Panel. Expand **Prime Optical** and **PM Service**. Stop and restart the PM service. If the problem persists, contact the Prime Optical administrator.

Error Message `EID-3021: Cannot collect PM information from value. Value Retries failed (HTTP error: string).`

Recommended Action Wait for the next PM cycle. If the problem persists, open the CTMServer.cfg file and change the pm-wait-period value from 10000 to 30000. If the problem still persists, contact the Prime Optical administrator.

Error Message `EID-3022: Exception raised while retrieving InventoryTable from CTC.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3023: Error in getting InventoryTable from CTC. XML received is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3024: Error in parsing ETM XML.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3025: Error in parsing ETM XML.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3026: Exception raised while retrieving time from CTC.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3027: Error in getting time from CTC. XML received is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3028: Error in parsing time XML.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3029: Exception raised while retrieving NE tick rate from CTC.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3030: Error in getting tick rate. XML received is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3031: Error in parsing tick rate XML.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3032: Exception raised while retrieving NE time zone from CTC.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3033: Error in getting time zone. XML received is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3034: Error in parsing time zone XML.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3035: Exception raised while retrieving NE date from CTC.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3036: Error in getting date. XML received is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3037: Error in parsing date XML.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3038: Exception raised while retrieving InventoryTable from CTC.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3039: Error in getting InventoryTable from CTC. XML received is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3104: Exception: value occurred while reading ne-service-thread-pool-size parameter value from the CTMServer.cfg file.`

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-3108: Exception: value occurred while reading snmp-trap-port parameter value from the CTMServer.cfg file.`

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-3109: Exception: value occurred while reading snmp-trap-queue-size parameter value from the CTMServer.cfg file.`

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message. Or, reinstall the Prime Optical server.

Error Message `EID-4001: Exception: string occurred while connecting the CORBA object to the Object Request Broker (ORB).`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4002: Exception: string occurred while creating the ConfigManager Interoperable Object Reference (IOR).`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4003: Error in creating the ConfigManager IOR file.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4004: Exception: string occurred while writing the IOR to the file.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4005: Exception: string occurred while waiting for a CORBA client connection.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4006: Error in creating the SessionManager.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4007: Exception: string occurred while creating the NodeManager for NE-ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-4008: Exception: *string* occurred while connecting the NodeManager for *NE-ID* to ORB.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-4018: Exception: *string* while registering for the internal CTM events with the main server.

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-4020: Exception: *string* while configuring the Internet Inter Orb Protocol (iiop) listen port in CORBA ORB.

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-4023: Exception: *string* while reading the list of logged users using JMOCO.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-4026: Exception: *string* while disconnecting the NodeManager for *NE-ID* to ORB.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-4027: Exception: *string* ConfigManager Init. Failed.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-4233: Failed to get available termination points.

Recommended Action Try again later. If the problem persists, contact Cisco technical support.

Error Message EID-4034: Could not add forwarding from IP *IP-address-1* to IP *IP-address-2*, port *port-number*. Exception: *string*.

Recommended Action Close all Cisco Edge Craft (CEC) sessions that are currently open. Retry opening CEC. If the error persists, restart the NE service for the ONS 15305 NE.

Error Message `EID-4239: Exception: NetworkManager.setPathTrace APIs raised exception.`

Recommended Action Try again later. If the problem persists, contact Cisco technical support.

Error Message `EID-4241: Exception: NetworkManager.getPathTrace APIs raised exception.`

Recommended Action Try again later. If the problem persists, contact Cisco technical support.

Error Message `EID-4242: Exception: Unable to delete manual link. Link ID is` *`string`*.

Recommended Action Review the reason for failure stated in the error message. Try again later. If the problem persists, contact Cisco technical support.

Error Message `EID-4301: 15454/15454SDH/15327/15600 equipment provisioning operation failed for NE` *`string`*. `Reason:` *`NE-ID`*.

Recommended Action View the reason for the failure. Correct the error by retrying the provision operation, or contact your system administrator.

Error Message `EID-4400: Error while constructing outgoing XML to CTC.`

Recommended Action Internal errors. No action is required. If you are having operational problems, contact Cisco technical support with this audit message.

Error Message `EID-4401: Error while parsing incoming XML from CTC.`

Recommended Action Internal errors. No action is required. If you are having operational problems, contact Cisco technical support with this audit message.

Error Message `EID-5000: Exception:` *`string`* `occurred while initializing ServiceManager.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5001: Exception:` *`string`* `occurred while connecting the CORBA object to the ORB.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5002: Exception: string occurred while creating the ServiceManager IOR.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5003: Error in creating the ServiceManager IOR file.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5006: Exception: string occurred while initializing CORBA.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5007: Exception: string occurred while getting POA reference.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5013: Exception: string occurred while notifying main.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5031: Exception: string occurred while launching service process.`

Recommended Action Verify that the server has adequate RAM and swap space as listed in the *Cisco Prime Optical 9.6.3 Installation Guide*. Do not run unapproved software on the server.

Error Message `EID-5041: Exception: string occurred while trying to connect to Service Manager.`

Recommended Action Run the **opticalctl status** command to see what Prime Optical server processes are running. Restart the Prime Optical server using the **opticalctl start** command.

Error Message `EID-5042: Exception: string occurred while trying to disconnect from Service Manager.`

Recommended Action Run the **opticalctl status** command to see what Prime Optical server processes are running. Restart the Prime Optical server using the **opticalctl start** command.

Error Message `EID-6055: ML series card provisioning operation failed for NE: string - slot: NE_ID Reason: string.`

Recommended Action Check the ML-series card setting (Telnet information) and if the problem persists, contact Cisco technical support.

Error Message `EID-7002: Cannot retrieve wavelength values.`

Recommended Action Force a Refresh from NE operation on both ends of the link.

Error Message `EID-7032: Exception: string occurred when rolling back the transaction.`

Recommended Action Clean up the data cards that are involved in the topology and retry the operation.

Error Message `EID-7068: Topology should be in Sync Not Ready state to enable an L2 service on it.`

Recommended Action You cannot enable an L2 service on an L2 topology that is not in Sync Not Ready state. Select a different L2 topology. Alternatively, wait for the current topology state to change to Sync Not Ready; then, enable the L2 service on it.

F.2.3 Minor Server Error Messages

Error Message `EID-411: Invalid return of UDP sockets.`

Recommended Action This is an internal error; no action is required.

Error Message `EID-412: No free UDP sockets in pool.`

Recommended Action This is an internal error. Restart Prime Optical if the application is not communicating with any NEs.

Error Message `EID-413: Invalid SNMP type in packet.`

Recommended Action This is an internal error. Restart Prime Optical if the application is not communicating with any NEs.

Error Message `EID-414: Failed to open SNMP session.`

Recommended Action This is an internal error. Restart Prime Optical if the application is not communicating with any NEs.

Error Message `EID-416: Error in SNMP packet: error-string.`

Recommended Action This is an internal SNMP protocol error; no action is required.

Error Message `EID-417: Mangled SNMP response packet.`

Recommended Action This is an internal SNMP protocol error; no action is required.

Error Message `EID-418: Cannot connect to the server. The session timed out.`

Recommended Action The session timed out because the login to the RADIUS server failed. Try logging in again.

Error Message `EID-423: The EMS failed to recover missed alarms from NE ID.`

Recommended Action Prime Optical could not recover all alarms from the NE. Data might be missing from the Alarm Log due to connectivity problems or corrupt packets. In the Domain Explorer window, choose **Fault > Alarm Browser** to view the current alarms.

Error Message `EID-501: Incorrect parse of PM bulk string header for PM-data-type from NE ID.`

Recommended Action This is an internal parsing error. If the error persists, capture a LAN trace from the Prime Optical server to help debug the problem.

Error Message `EID-502: Unknown type number in PM bulk variable for PM-data-type from NE ID.`

Recommended Action This is an internal parsing error. If the error persists, capture a LAN trace from the Prime Optical server to help debug the problem.

Error Message `EID-503: Incorrect parse of PM bulk string for PM-data-type from NE ID.`

Recommended Action This is an internal parsing error. If the error persists, capture a LAN trace from the Prime Optical server to help debug the problem.

Error Message `EID-603: Incorrect trap recvfrom with errno = value.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-604: Failed to parse SNMP trap definition file filename.`

Recommended Action The traps.lst file in the bin directory where the Prime Optical server was installed is corrupted. Delete the traps.lst file and restart the application.

Error Message `EID-605: Failed to recover alarm sequence #number to #number for NE ID.`

Recommended Action Prime Optical could not recover all alarms from the NE. There might be events missing in the Alarm Log due to connectivity problems or corrupt packets. However, the Alarm Browser will reflect the correct alarm information. In the Domain Explorer window, choose **Fault > Alarm Browser** to view the current alarms.

Error Message `EID-1402: The OSI daemon lockfile value is missing.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1403: The OSI daemon lockfile does not contain the PID.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1404: The ping to the OSI daemon failed.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1405: Failed to start the OPS daemon for logging.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1501: Maximum number of Telnet sessions has been reached.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1502: No more threads available for Telnet sessions.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1707: TL1 request exceeds maximum length: value.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1718: Invalid SNMP recvfrom with errno = value.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1719: Invalid SNMP sendto with errno = value.`

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-1720: SNMP trap received from unknown NE ID.`

Recommended Action SNMP traps are being received from an NE that is not configured on the Prime Optical server. Check the configured IP addresses for all NEs by viewing the configuration files (startup-config). The IP addresses should match the IP address of the interface used in the "snmp-server trap-source IF" CLI in the NE configuration.

Error Message `EID-2001: Bad event JMOCO PDU value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2004: Exception string occurred while notifying listeners.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2005: Bad severity value in JMOCO event.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2006: Event is not an instance of known VWEvents.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2007: Event is not an instance of EMSEvent.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2009: Null object is passed in.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-2010: Invalid object type is passed in.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2011: Null module type for slot *number*.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2012: JDAQ external exception: *string*.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2013: JDAQ internal exception: *string*.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2020: Invalid argument value: *string*, NE: *NE-ID*.

Recommended Action This is an internal processing error. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-2021: Inventory collection was not completed for NE *NE-ID*.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2022: Exception *string* occurred while reading the corba-request-timeout parameter value from the CTMServer.cfg file.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2023: Exception *string* occurred while setting the corba-request-timeout parameter value for the ORB.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2024: Exception *string* occurred while reading the ne-service-thread-pool-size parameter value from the CTMServer.cfg file.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2029: Exception: *string* for NE: *exception-string* while *exception-string*.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2035: GNE next hop IP address *value* does not match the NE IP address *value* for NEDBAccessID *value*. The GNE_Table or NE_INFO_Table information might be inconsistent in the database.

Recommended Action Check the GNE next hop IP addresses; then, restart the Prime Optical server.

Error Message EID-2036: Exception *string* for NE *ID* occurred while polling for the discovered node.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2037: Unsupported model type or null version string for *NE-ID*.

Recommended Action Check the software version of the NE listed in the error message. You might need to upgrade Prime Optical.

Error Message EID-2038: No entry found in the version table for *NE-ID*.

Recommended Action Check the software version of the NE listed in the error message. You might need to upgrade Prime Optical.

Error Message EID-2039: Exception *string* occurred while finding time offset for *NE-ID*.

Recommended Action Check the software version of the NE listed in the error message. You might need to upgrade Prime Optical.

Error Message EID-2040: Cannot find time or time zone information for *NE-ID*.

Recommended Action Check the system time and time zone settings. You might have to adjust the settings.

Error Message EID-2052: Invalid object passed to Circuit Module work.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2053: Exception *string* occurred while adding circuit.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2054: Exception *string* occurred while deleting circuit.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2055: Exception *string* occurred while updating circuit.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2071: Exception *string* occurred while invoking addNetLink.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2072: CORBA exception *string* occurred while retrieving topology information.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2073: Exception *string* occurred while retrieving topology information.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2075: Exception *string* occurred while retrieving NE information.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2076: Null NE information.

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message EID-2082: Exception: *value* occurred while reading snmp-trap-queue-size parameter value from the CTMServer.cfg file.

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-2084: Exception: *value* occurred while reading snmp-trap-forwarding-port parameter value from the CTMServer.cfg file.

Recommended Action Check the CTMServer.cfg file for possible corruption. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-2089: InitialPoll to NE: *string* is failed, maybe username and password are wrong or *string*.

Recommended Action Verify that the NE is up and that the software loaded on the NE is supported. Wait for two or three polling cycles. If the problem persists, mark the NE as Out of Service and then In Service again.

Error Message EID-2090: Connection with NE: *string* is lost because *string*.

Recommended Action This problem can occur if the NE is reset or if the NE is not reachable on the network. Wait for two or three polling cycles. If the problem persists, mark the NE as Out of Service and then In Service again.

Error Message EID-2091: HTTP request failed to get software version from node *string* and reason is *string*.

Recommended Action Obtain the NE software version with a web browser using the URL http://*IP-address-of-NE*/getSwVersion. If the connection times out, the web server on the NE might be down. Contact technical support for the NE.

Error Message EID-2106: ObjId from CSM is not an instance of CsmObjId on NE: *NE-ID*.

Recommended Action This is an internal error; no action is required.

Error Message EID-2107: Invalid attribute value *value* in on NE: *NE-ID*.

Recommended Action There is a mismatch between the retrieved and expected automatic protection switching (APS) attributes; no action is required.

Error Message EID-2108: Put the new protocol map in cache on NE: *NE-ID*.

Recommended Action This is an internal message; no action is required.

Error Message EID-2154: CTC supplemental exception occurred: Creating thread is *string*, CTC node ID is *string*.

Recommended Action This error message is for informational purposes only; no action is required.

Error Message `EID-2156: Failed event/alarm resync for M-series card on slot slot-number.`

Recommended Action Mark the NE as Out of Service and In Service again. If the problem persists, contact Cisco technical support. You can also view alarms and events on the card by launching CTC on the NE.

Error Message `EID-2157: Failed to initialize session with M-series card on slot slot-number.`

Recommended Action Mark the NE as Out of Service and In Service again. If the problem persists, contact Cisco technical support.

Error Message `EID-2158: Successfully initialized session with M-series card on slot slot-number.`

Recommended Action This message is for informational purposes only; no action is required.

Error Message `EID-3001: Cannot start collection for string.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3002: Nothing was found value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3003: Ignoring TCA.`

Recommended Action A threshold crossing alert (TCA) is being ignored. If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3004: Incorrect IP address passed in IPADDR_CHANGED Event value.`

Recommended Action Check the newly changed IP address and modify it if you entered the wrong information.

Error Message `EID-3005: Cannot write DS-1 PM for value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3006: Cannot write DS-3 PM for value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3007: Cannot write SONET PM for value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3008: Cannot write STS PM for value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3009: Cannot write VT PM for value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3010: Cannot collect PM information from string. Data format error. Received data = string.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3011: Cannot read PM information from value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3013: Cannot collect PM information from value. HTTP Error: value.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3014: Cannot collect PM. Writer creation failed.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-3047: PM Comm Session is null for NE-name.`

Recommended Action Verify that the NE has available connections. Check the PM data values with the local craft application.

Error Message `EID-3048: Robust PM collection not supported for NE-name.`

Recommended Action Check the PM data values with the local craft application.

Error Message `EID-3049: Exception during PM collection for NE-name: exception-string.`

Recommended Action Verify that the NE has available connections. Check the PM data values with the local craft application.

Error Message `EID-3050: Cannot write PM data for NE-name: exception-string.`

Recommended Action Verify that the database is operating correctly. Check the PM data values with the local craft application.

Error Message `EID-3051: Cannot write PM data for NE-name, data collected was blank.`

Recommended Action Check the PM data values with the local craft application.

Error Message `EID-3052: Partial replies not valid, PM collection failed for NE-name.`

Recommended Action Check the PM data values with the local craft application.

Error Message `EID-3100: args == null.`

Recommended Action This message is used for system logging only; no action is required.

Error Message `EID-3102: Initialized service:`

Recommended Action This message is used for system logging only and is normal at initialization; no action is required.

Error Message `EID-3103: Stopped service.`

Recommended Action This message is for system logging only and is normal when the system is stopped; no action is required.

Error Message `EID-4009: NEInfo is null.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4010: Invalid input parameter for the operation.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4011: The Configuration resync operation cannot be completed because of the non-working operational state of the network element.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4012: The Configuration resync is already in progress for this network element. Try after some time.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4013: Failed to authenticate the CTM user for performing this operation.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4014: This Interface Data Language (IDL) operation is not supported by the network element.`

Recommended Action Ignore this internal error message.

Error Message `EID-4015: Exception: string while reading configuration resync frequency from the CTMServer.cfg file. Using the default resync frequency.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4016: Exception: string while reading configuration poll frequency from the CTMServer.cfg file. Using the default poll frequency.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4017: Exception: string while reading configuration thread pool size from the CTMServer.cfg file. Using the default poll frequency.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message `EID-4019: Exception: string while reading the iiop-listen-port from the CTMServer.cfg file. Using the default port.`

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-4021: Exception: *string* while reading configuration request queue size from the CTMServer.cfg file. Using the default request queue size.

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-4022: CTM server is busy syncing the configuration information for this network element. Retry after some time.

Recommended Action This error message is used for internal protocols between the Prime Optical client and server. The client will display the appropriate error message.

Error Message EID-4024: Exception: *string* received from the model layer.

Recommended Action This error message is used for internal protocols between the Prime Optical client and server. The client will display the appropriate error message.

Error Message EID-4025: Exception: *string* while sending event about this change to other clients.

Recommended Action Restart the Prime Optical server. If the problem persists, contact Cisco technical support with this error message.

Error Message EID-4035: Could not remove forwarding from IP *IP-address-1* to IP *IP-address-2*, port *port-number*. Exception: *string*.

Recommended Action If the error persists, restart the NE Service for the ONS 15305 NE.

Error Message EID-4201: Failed to auto back up memory for *NE-name*: *value*.

Recommended Action Manually back up the configuration.

Error Message EID-4202: Failed to back up memory for *NE-name*: *value*.

Recommended Action Retry this operation later. If the problem persists, reboot the NE and retry.

Error Message EID-4203: Failed to restore memory for *NE-name*: *value*.

Recommended Action If you specify a source directory that is the same as the default destination for memory restore or software download, you will receive EID-4203 because the source file size becomes zero.

To retrieve the file, navigate to the appropriate path and restore the file *x* from *x*.old.

Error Message `EID-4204: Failed to download software for NE-name: value.`

Recommended Action If you specify a source directory that is the same as the default destination for memory restore or software download, you will receive EID-4204 because the source file size becomes zero.

To retrieve the file, navigate to the appropriate path and restore the file *x* from *x*.old.

Error Message `EID-4205: Failed to {activate | revert} for NE-name: Detailed-error-message.`

Recommended Action Follow the instructions given in the detailed error message.

Error Message `EID-4206: Exception: The node is not managed by the NEService.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4207: Exception: The node is not available.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4208: Exception: Chassis is null for the node.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4209: Exception: No terminations available for the given link size.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4210: Exception: NetworkManager raises exception.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4211: Exception: NetworkManager fails to modify Database Link Table.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4212: Exception: CreateLinkWithName called with null name.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4213: Exception: Failed to add link in database.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4214: Exception: Failed to get link in database.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4215: Exception: Failed to modify link in database.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4216: Exception: No link exists with Link ID string.`

Recommended Action The links have not yet uploaded to the database. Wait several minutes; then, try again. If the problem persists, check the link connectivity.

Error Message `EID-4217: Exception: Failed to get info. for link ID string from NCP.`

Recommended Action The links have not yet uploaded to the network. Wait several minutes; then, try again. If the problem persists, check the link connectivity.

Error Message `EID-4218: Exception: Accessing/Updating Database during processing of Auto. Discovered links failed.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4219: Exception: NetworkManager.getExpectedPathTrace raised exception.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4220: Exception: NetworkManager.getPossibleLinkSizes raises exception.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4223: Exception: Failed to get info. for link ID string from Database.`

Recommended Action The links have not yet uploaded to the database. Wait several minutes; then, try again. If the problem persists, check the link connectivity.

Error Message `EID-4224: Exception: deleteLink() Cannot Delete an Auto. Discovered Link. Link ID is string.`

Explanation If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4225: Exception: getNetLinks() DBException Raised while getting Network Links from DB.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4226: Exception: getNetLinksForNode() DBException Raised while getting Network Links from DB for Node Id.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4227: Exception: getDbLinksBetweenSrcAndDest() DBException Raised while getting Network Links from DB.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4228: Exception: deleteLink() DBException raised while executing deleteRow() for Link ID string.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4229: Exception: deleteLink() Invalid Link ID string.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4232: The termination point string is not available.`

Recommended Action Select a different termination point.

Error Message `EID-4236: Exception: NetworkManager.getPathTrace APIs raised exception. J1 Path Trace is not supported for this card.`

Recommended Action No action is required.

Error Message `EID-4238: Exception: NetworkManager.getPathTrace APIs raised exception. J1 Path Trace is supported only for XTC(DS1).`

Recommended Action No action is required.

Error Message `EID-4500: Exception: Invalid model type for this operation.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4501: Exception: Backup/Restore internal exception.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-4502: Error: string cannot be cancelled since they are waiting in the running list to be executed.`

Recommended Action Wait until the job or task completes, or restart the Prime Optical server.

Error Message `EID-4503: Error: Unable to read database table: string.`

Recommended Action Restart the Prime Optical server and retry.

Error Message `EID-4504: Error: Unable to process NE purge event for NEDBID: string.`

Recommended Action No action is required.

Error Message `EID-4506: Failed to configure node for string: string.`

Recommended Action Review the reason for the error and try again.

Error Message `EID-5011: Cannot register to listen for events.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5012: Exception: string while processing CORBA requests.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5022: Exception: string occurred while trying to get managed NE list.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5023: Exception: string occurred while trying to get service ID.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5024: Exception: string occurred while trying to purge NE.`

Recommended Action If you are having operational problems, contact Cisco technical support with this error message. Otherwise, ignore this error message; no action is required.

Error Message `EID-5025: The CTM Service is currently connected to Service Manager.`

Recommended Action Wait until the AUD-5004 message is displayed; then, click the **Activate** button again.

Error Message `EID-5026: The CTM Service is not connected to Service Manager.`

Recommended Action Wait until the AUD-5003 message is displayed; then, click the **Deactivate** button again.

Error Message `EID-5030: Exception: string occurred while performing DB operations.`

Recommended Action Check the database (DB) configurations. Verify that you can connect to the database and perform a structured query language (SQL) query.

Error Message `EID-6052: Exception: source and destination termination points are not valid. Cannot create Managed-Unmanaged link.`

Recommended Action Review the reason for failure stated in the error message.

Error Message `EID-6053: Link cannot be created due to presence of conflicting links.`

Recommended Action Review the reason for failure stated in the error message.

Error Message `EID-6054: Link not valid between the specified end points in the specified layer.`

Recommended Action Review the reason for failure stated in the error message.

Error Message EID-7000: Source PTP is supporting wavelength *string* while sink PTP is supporting *NE-ID*: The wavelengths don't match.

Recommended Action Select PTPs that support the same wavelength.

Error Message EID-7001: DWDM links can only be created between transponders/muxponders and DWDM cards.

Recommended Action Select PTPs such that an end of the link is on a transponder or muxponder and the other end is on a DWDM card.

Error Message EID-7031: Exception: *string* occurred when registering with VLAN Manager.

Recommended Action Retry the operation with a different VLAN number.

F.2.4 Debug Server Error Messages

Error Message EID-4028: *String* communication state: *NE-ID*; *string* = NESysID, *NE-ID* = NE connection state.

Recommended Action Try to restore the connection to the NE.

Note Detailed actions are NE-dependent.

Error Message EID-4029: *String* operational state: *NE-ID*; *string* = NESysID, *NE-ID* = NE operational state.

Recommended Action Set the NE state to In Service.

Error Message EID-4030: The NE resync operation cannot be completed because of the non-working operational state of the network element.

Recommended Action NE is already in synchronization state. Try again later.

Error Message EID-4031: The NE resync is already in progress for this network element. Try after some time.

Recommended Action NE is already in synchronization state. Try again later.

Error Message EID-4032: Invalid initial poll status.

Recommended Action Initial poll of the NE is in progress. Try again later.

Error Message `Photonic Path Trace is supported on OCHNC and OCHTrail circuits only.`

There is no workaround. Photonic Path Trace is available only for OCHNC and OCHTrail circuits.

F.3 Prime Optical Server Audit Messages

Prime Optical server audit messages appear in the Audit Log and include the following information:

- Date and time
- Module
- Filename
- Line number
- Audit ID
- Audit message text

Note Server audit messages are informational only and do not require any action, unless noted.

Audit Message `AUD-101: CTM user username logged in from location.`

Audit Message `AUD-102: CTM user username logged out from location.`

Audit Message `AUD-105: Job# number succeeded for NE: NE-name.`

Audit Message `AUD-106: Job# number failed for NE: NE-name with the error: error-message.`

Recommended Action The job can fail to start if the NE is unavailable or if the configured SNMP community string does not have write privileges. Verify that the NE is available and that the community string has write privileges.

Audit Message `AUD-107: Failed to recover changed configuration from NE: NE-name. Error: error-message.`

Recommended Action This error might occur if there are network problems or if the Flash device on the NE is busy. The Prime Optical server automatically tries to recover the changed configuration information. No action is required.

Audit Message `AUD-108: Job# number cancelled for NE: NE-name.`

Audit Message `AUD-109: Job# number started for NE: NE-name.`

Audit Message `AUD-110: Job# number failed to start for NE: NE-name.`

Recommended Action The job can fail to start if the NE is unavailable or if the configured SNMP community string does not have write privileges. Verify that the NE is available and that the community string has write privileges.

Audit Message AUD-111: Failed to recover changed configuration from NE: *NE-name*.

Recommended Action This error might occur if there are network problems or if the Flash device on the NE is busy. The Prime Optical server automatically tries to recover the changed configuration information. No action is required.

Audit Message AUD-112: Security violation for CTM user *username* from *IP-address*.

Audit Message AUD-113: CTM user *username-type-of-profile-change*.

Audit Message AUD-114: Topology changed: *type-of-topology-change-from-Domain-Explorer*.

Audit Message AUD-115: State for *NE-ID* changed from *state* to *state*.

Note Examples of possible states are In Service, In Service–Initializing, In-Service Synch Configuration, In Maintenance, Out of Service, Preprovisioned, and Under Maintenance.

Audit Message AUD-116: State for port *number* of *NE-ID* changed from *state* to *state*.

Audit Message AUD-117: GNE for *NE-ID* changed from *old-GNE-name* to *new-GNE-name*.

Audit Message AUD-118: CTM server started.

Audit Message AUD-119: CTM server stopped.

Audit Message AUD-120: The NE configured as *NE-ID* is actually *NE-ID*.

Audit Message AUD-121: Administrative task *number* deleted.

Audit Message AUD-122: The CTM service *service* has been stopped.

Audit Message AUD-123: The CTM service *service* has been started.

Audit Message AUD-124: CTM subnet *subnet*.

Audit Message AUD-125: Alarm acknowledged for NE: *NE-name*, index: *index*.

Audit Message AUD-126: Job# *number* is created for NE: *NE-name*.

Audit Message AUD-127: Time offset (*value* sec) is too big on NE: *NE-name*, will use CTMS time.

Audit Message AUD-128: Alarm acknowledged for NE *name* alarm ID *number*.

Audit Message AUD-129: Service *service-name* is started.

Audit Message AUD-130: Service *service-name* is shut down.

Audit Message AUD-131: NE *name* moved to In Service from *present-state*.

Audit Message AUD-132: NE *name* moved to Out of Service from *present-state*.

Audit Message AUD-133: NE *name* moved to Preprovisioned from *present-state*.

Audit Message AUD-134: NE *name* moved to In Maintenance from *present-state*.

Audit Message AUD-135: NE *name* Port *port-number* state changed to In Service.

Audit Message AUD-136: NE *name* Port *port-number* state changed to Out of Service.

Audit Message AUD-137: NE *name* Port *port-number* state changed to Preprovisioned.

Audit Message AUD-138: NE *name* Port *port-number* state changed to In Maintenance.

Audit Message AUD-139: NE *name* property changed - New Sys ID *value*.

Audit Message AUD-140: NE *name* property changed - New IP address *value*.

Audit Message AUD-141: NE *name* property changed - New NSAP address *value*.

Audit Message AUD-142: NE *name* property changed - New description *value*.

Audit Message AUD-143: NE *name* property changed - New community string *value*.

Audit Message AUD-144: NE *name* property changed - New CLLI code *value*.

Audit Message AUD-145: NE *name* property changed - New NE type *value*.

Audit Message AUD-146: NE *name* property changed - New model index *value*.

Audit Message AUD-147: NE *name* property changed - New subnet ID *value*.

Audit Message AUD-148: NE *name* property changed - New system title *value*.

Audit Message AUD-150: NE *name* property changed - New user label *value*.

Audit Message AUD-151: NE *name* property changed - New vendor name *value*.

Audit Message AUD-152: NE *name* property changed - New version *value*.

Audit Message AUD-153: NE *name* property changed - New GNE *value*.

Audit Message AUD-154: NE *name* property changed - Config Mode *number*.

Audit Message AUD-155: NE *name* property changed - Family Seed Old *value* New *value*.

Audit Message AUD-156: NE *name* property changed - PM collection is *value*.

Audit Message AUD-157: Subnet *value* title changed.

Audit Message AUD-158: Subnet *value* type changed.

Audit Message AUD-159: Subnet *value* topology changed.

Audit Message AUD-160: Subnet *value* GNE changed.

Audit Message AUD-161: Subnet *value* name changed.

Audit Message AUD-162: Subnet *value* user label changed.

Audit Message AUD-163: Topology changed - Group *value* added.

Audit Message AUD-164: Topology changed - Group *value* deleted.

Audit Message AUD-165: Topology changed - NE *NE-ID* added.

Audit Message AUD-166: Topology changed - NE *NE-ID* deleted.

Audit Message AUD-167: Topology changed - GNE *NE-ID* added.

Audit Message AUD-168: Topology changed - GNE *NE-ID* deleted.

Audit Message AUD-169: Topology changed - Subnet *subnetwork-ID* added.

Audit Message AUD-170: Topology changed - Subnet *subnetwork-ID* deleted.

Audit Message AUD-171: Topology changed - Node *NE-ID* added.

Audit Message AUD-172: Topology changed - Node *NE-ID* deleted.

Audit Message AUD-173: Topology changed - Node *NE-ID* modified.

Audit Message AUD-174: CTM user *username* logged in.

Audit Message AUD-175: CTM user *username* logged out.

Audit Message AUD-176: CTM user *username* security violations.

Audit Message AUD-177: CTM user *username* profile changed - User added.

Audit Message AUD-178: CTM user *username* profile changed - User deleted.

Audit Message AUD-179: CTM user *username* profile changed - User modified.

Audit Message AUD-180: CTM user *username* profile changed - Domain name changed.

Audit Message AUD-181: CTM user *username* profile changed - Node assignment changed.

Audit Message AUD-182: CTM user *username* profile changed - Domain description changed.

Audit Message AUD-184: Failed login threshold exceeded for user *username*.

Audit Message AUD-185: Password aged out for user *username*.

Audit Message AUD-186: TransportManager user *username* forced to log out from *IP-address*.

Audit Message AUD-187: TransportManager service *service-name* logged in from *username*.

Audit Message AUD-188: TransportManager service *service-name* logged out from *username*.

Audit Message AUD-189: TransportManager service *service-name* logged out unexpectedly from *username*.

Recommended Action Check the Service Monitor to see whether the server automatically started a new instance of this service. If a new instance does not start within five minutes, start it manually from the Control Panel window.

Audit Message AUD-190: TransportManager service *service-name* failed to contact server for 10 minutes. Stopping the service.

Audit Message AUD-191: CTM Authentication towards NE *value* via TL1 failed. Value: NE name.

Audit Message AUD-192: OSS with Profile Name *value1*, IP Address *value2* is successful. Value1: Profile name. Value2: IP Address.

Audit Message AUD-193: OSS with Profile Name value1, IP Address value2 is failed. Value1: Profile name. Value2: IP Address.

Audit Message AUD-194: OSS with Profile Name value1 is value2. Value1: Profile name. Value2: IP Address.

Audit Message AUD-195: The property value is changed. Value: Property name.

Audit Message AUD-196: NE (*value*) Property changed - Audit Trail Collection is Enabled/Disabled. Value: NE name.

Audit Message AUD-201: (TL1) started.

Audit Message AUD-202: (TL1) began shutdown.

Audit Message AUD-203: (TL1) completed shutdown.

Audit Message AUD-204: Accepted a secure port open request to IP address *IP-address*, port *number*.

Audit Message AUD-205: Accepted a user port open request to IP address *IP-address*, port *number*.

Audit Message AUD-206: User *username* logged in from IP address *IP-address*, port *number*.

Audit Message AUD-207: Rejected a user login from IP address *IP-address*, port *number*.

Audit Message AUD-208: User *username* logged out from IP address *IP-address*, port *number*.

Audit Message AUD-209: NE *ID* reported.

Audit Message AUD-210: Job cancelled.

Audit Message AUD-211: Task cancelled.

Audit Message AUD-212: Task modified.

Audit Message AUD-2000: Transport Manager successfully contacted NE: *name*.

Audit Message AUD-2001: Transport Manager was unable to contact: *name*.

Recommended Action Check network connectivity. Log into the Prime Optical client with SuperUser privileges and choose **Administration > Error Log**. Use the Error Log to debug the problem.

Audit Message AUD-2002: New node discovered and added to the database: Node IP: *IP-address* Node ID: *ID*.

Audit Message AUD-2004: NE model: *SysObjectId* not supported for NE: *IP-address*.

Explanation The NE model is not supported. This occurs when a non-ONS 15540 NE is added as an ONS 15540, or when a non-ONS 15540 NE is automatically discovered through the topology neighbors configured on the device.

Recommended Action Mark the device as Out of Service so that resources are not wasted on collecting information from unsupported NEs.

Audit Message AUD-2005: New system ID: *system-ID* of NE: *IP-address* conflicts with the system ID of an existing NE.

Explanation The new system ID configured on the NE is not unique. An existing NE already has this ID, which was configured on the device side.

Recommended Action On the device side, change the hostname of the misconfigured NE to a unique hostname.

Audit Message AUD-2006: NE's IP address: *IP-address* has been reassigned to a different NE. *Identifiers-of-the-two-NEs*.

Explanation The IP address of an existing NE was assigned to another NE. This can occur if you take an existing NE offline and assign its IP address to another NE.

Recommended Action Delete the offline NE from Prime Optical; then, add the other NE to Prime Optical.

Audit Message AUD-2011: NE Discovery State changed from *state* to *state*.

Audit Message AUD-2013: Time change event has occurred on NE: *NE-name*

Audit Message AUD-2014: Time zone change event has occurred on NE: *NE-name*

Audit Message AUD-2031: A communication error occurred on NE *NE-name*. The database might be out of sync, and resynchronization might be required.

Audit Message AUD-2032: A communication error occurred during the health poll on NE *NE-name*. The database might be out of sync, and resynchronization might be required.

Audit Message AUD-2033: An authentication failure occurred on NE *NE-name*.

Audit Message AUD-2034: A connection failure occurred on NE *NE-name*.

Audit Message AUD-2035: One or more events might be lost, and the database might be out of sync.

Audit Message AUD-2036: A runtime error occurred.

Audit Message AUD-2037: The NE will reboot in several seconds. Closing the connection.

Audit Message AUD-2038: The connection with the NE has been closed.

Audit Message AUD-2039: The database for NE *NE-name* is in sync. Resynchronization is not required.

Audit Message AUD-2040: The database for NE *NE-name* is out sync. Resynchronization is required.

Audit Message AUD-2041: The NE with IP address *IP-address* is already managed by CTM with a different NE ID (*ID*) and IP address (*IP-address*). Delete one of the NEs from the Domain Explorer.

Audit Message AUD-2042: Failed to complete robust fault synchronization on NE *NE-name*.

Audit Message AUD-2200: Active IP set to the primary IP.

Audit Message AUD-2201: Active IP set to the secondary IP.

Audit Message AUD-2202: Software download operation succeeded.

Audit Message AUD-2203: Software revert operation succeeded.

Audit Message AUD-2204: Software commit operation succeeded.

Audit Message AUD-2205: Software download operation failed.

Audit Message AUD-2206: Software download operation failed because it is not supported by the running agent version.

Audit Message AUD-2207: Software download operation failed because of a Flash reading/writing problem.

Audit Message AUD-2208: Software download operation failed because of a problem during transfer from the TFTP server to the master CMP.

Audit Message AUD-2209: Software download operation failed because of the standby agent version running.

Audit Message AUD-2210: Software revert operation failed.

Audit Message AUD-2211: Software revert operation failed because it is not supported by the running agent version.

Audit Message AUD-2212: Software revert operation failed because the current standby agent version is corrupted.

Audit Message AUD-2213: Software commit operation failed.

Audit Message AUD-2214: Software commit operation failed because it is not supported by the running agent version.

Audit Message AUD-2215: Software commit operation failed because the current standby agent version is corrupted.

Audit Message AUD-2216: Software download operation failed because of invalid path parameter.

Audit Message AUD-2217: Transport Manager failed TL1 login to NE ID.

Audit Message AUD-3051: Config state: Collector#: *value* Writer#: *value* DS1 Collection: *value* DS3 Collection: *value* Sonet Collection: *value* Sts Collection: *value* Vt Collection: *value* Store Non Zero Only: *value*.

Audit Message AUD-3052: Ignoring PM collection for *NE-name* for interval *time-stamp*.

Audit Message AUD-3053: Time-out error while obtaining PM data for *NE-name* for interval *time-stamp*.

Audit Message AUD-3054: PM collection failed for *string*. HTTP server too busy. (HTTP error: *string*.)

Audit Message AUD-3055: Processing NE time offset for *string*. Offset value too large *value*. So new offset value is 0.

Audit Message AUD-3056: Processing NE time offset for *string*. New offset value is *value*.

Audit Message AUD-3057: Data format error while obtaining PM data for *string* for interval *string*.

Audit Message AUD-3060: PM Comm Session is null for *NE-name*.

Audit Message AUD-3061: Robust PM collection not supported for *NE-name*.

Audit Message AUD-3062: Exception during PM collection for *NE-name*.

Audit Message AUD-3063: Cannot write PM data for *NE-name*.

Audit Message AUD-3064: Cannot write PM data for *NE-name*, data collected was blank.

Audit Message AUD-3065: Partial replies not valid, PM collection failed for *NE-name*.

Audit Message AUD-4101: Create Link operation succeeded for link *description*.

Recommended Action Informational message. No action is required.

Audit Message AUD-4102: Delete Link operation succeeded for link *description*.

Recommended Action Informational message. No action is required.

Audit Message AUD-4104: Create Link operation failed for link *description*.

Recommended Action Verify that you followed the steps in 3.6.5 Creating Links.

Audit Message AUD-4105: Delete Link operation failed for link *description*.

Recommended Action Verify that you followed the steps in 3.6.5 Creating Links.

Audit Message AUD-4110: Provisioning of {class map | policy map | table map}: {*class-map-name* | *policy-map-name* | *table-map-name*} on *NE-ID* succeeded.

Audit Message AUD-4111: Provisioning of {class map | policy map | table map}: {*class-map-name* | *policy-map-name* | *table-map-name*} on *NE-ID* failed.

Audit Message AUD-4201: Auto Backup Job Status has: {Succeeded | Failed}.

Recommended Action This message informs you of the status of the automatic daily backup for each NE. No action is required.

Audit Message AUD-4205: {Activate | Revert} Command Status has: {Succeeded | Failed}.

Recommended Action If the command status is Failed, check the Error Log for EID-4205 for a detailed explanation of the failure.

Audit Message AUD-4302: Cannot launch the NE Explorer because data retrieval from the NE has failed. You can force the data retrieval by marking the NE Out Of Service and In Service.

Audit Message AUD-5000: During circuit creation.

Recommended Action Informational message during circuit creation. No action is required.

Audit Message AUD-5001: The CTM Service *service-name* is being started.

Recommended Action The service is being launched, but might not have started up completely. Do not perform a Stop operation on this service again until you see the AUD-5003 message.

Audit Message AUD-5002: The CTM Service *service-name* is being stopped.

Recommended Action The service is being stopped, but might not have shut down completely. Do not perform a Start operation on this service again until you see the AUD-5004 message.

Audit Message AUD-5003: The CTM Service *service-name* has connected to Service Manager.

Recommended Action The service has started. You can perform a Stop operation.

Audit Message AUD-5004: The CTM Service *service-name* has disconnected from Service Manager.

Recommended Action The service has shut down. You can perform a Start operation.

Audit Message AUD-5005: The CTM Service *value* has unexpectedly disconnected from Service Manager. Value: Name of service.

Audit Message AUD-5006: The CTM Service *value1* has failed to contact Service Manager for *value2* minutes. Stopping the service. *Value1*: Name of service. *Value2*: Number of minutes.

Audit Message AUD-5011: NE *name* has been added.

Audit Message AUD-5012: NE *name* has been deleted.

Audit Message AUD-5013: NE *name* has been undeleted.

Audit Message AUD-5014: NE *name* purge procedure in progress.

Audit Message AUD-5015: NE *name* has been successfully purged.

Audit Message AUD-5016: NE *name* purge procedure has failed.

Audit Message AUD-5017: NE *name* has been discovered.

Audit Message AUD-5018: NE name has changed its Subnetwork ID from *old-subnet-name* to *new-subnet-name*.

Recommended Action If the automatic grouping of subnetworks option is enabled in Prime Optical, NEs that are part of a subnetwork may change subnetworks if a link connecting them to rest of the subnetwork goes down or if a link that connects the NEs to those of another subnetwork comes up. You can disable the automatic grouping of subnetworks through the Control Panel; see 3.5.6 Automatically Grouping NEs in Subnetworks, page 3-23.

Audit Message AUD-7000: Subnetwork Mode Automatic - Started regrouping of managed NEs in subnetwork.

Recommended Action Informational message. No action is required.

Audit Message AUD-7001: Subnetwork Mode Automatic - Completed regrouping of managed NEs in subnetwork.

Recommended Action Informational message. No action is required.

Audit Message AUD-7500: Starting discovery session *x*.

Audit Message AUD-7501: Starting discovery on NE Service *x* for session *y*.

Audit Message AUD-7502: The discovery request failed for NE Service *x*. This causes a partial failure of the discovery session *y*.

Audit Message AUD-7503: The discovery request for NE Service *x*, session *y* completed successfully.

Audit Message AUD-7504: The discovery request for NE Service *x*, session *y* was cancelled (expired timeout).

Audit Message AUD-7505: Detected an unexpected stop of the NE Service *x*. This causes a partial failure of the discovery session *y*.

Audit Message AUD-7506: The discovery request *x* completed successfully.

Audit Message AUD-7507: The discovery request *x* completed with partial success.

Audit Message AUD-7508: The discovery request *x* was cancelled. The timeout has expired.

Audit Message AUD-11000: Provisioning - Set attribute on module *module-name*. Parameters: *parameter-numbers*, *parameter*.cfg, *parameter* - successful.

Troubleshooting

This appendix offers troubleshooting steps to help solve high-level problems while using Cisco Prime Optical or Cisco Prime Optical GateWay. Refer to the troubleshooting procedures in this appendix before contacting the Cisco Technical Assistance Center (TAC) at http://www.cisco.com/tac.

This appendix includes the following troubleshooting information:

- G.1 Overview, page G-1
- G.2 Prime Optical Troubleshooting Tools, page G-2
- G.3 Installation Problems, page G-3
- G.4 Prime Optical Database Problems, page G-5
- G.5 Server Problems, page G-6
- G.6 Client Connectivity Problems, page G-18
- G.7 Client Operational Problems, page G-20
- G.8 Client Debug Messages, page G-42
- G.9 Prime Optical GateWay/CORBA Problems, page G-43

G.1 Overview

Troubleshooting involves:

1. Identifying the source of the problem—Which devices, links, interfaces, hosts, or applications have the problem?
2. Locating the problem on the network—On what VLAN, subnet, or segment is the problem occurring?
3. Comparing current network performance against an established baseline—Is the performance better or worse?
4. Finding out when the problem started—When did you first see the problem? Is it recurring?
5. Determining the extent of the problem—How widespread is the problem? Is it getting worse?

This appendix assumes that the server is installed under the default /opt/CiscoTransportManagerServer directory and the client is installed under the default /opt/CiscoTransportManagerClient directory (Solaris) or C:\Cisco\TransportManagerClient directory (Windows). If a directory other than the default installation directory is specified, replace the default path with the installed path.

G.2 Prime Optical Troubleshooting Tools

You can use all of the following tools to troubleshoot your system:

- Error and Audit Logs—Most NE communication problems that occur when adding a new NE to the Prime Optical domain can be diagnosed by looking at the Error and Audit Logs. See 8.5.1 Viewing the Audit Log, page 8-73 and 9.6.1 Viewing the Error Log, page 9-32.
- EMS alarms—Using the Dashboard, launch the Alarm Browser window to display only the EMS alarms. See 1.5.1 Dashboard, page 1-9.
- Self Monitor table—Launch the Self Monitor table to view server resource historical data. See 10.3.12 Using the Self Monitor Table, page 10-15.
- Debug options—Use this tool only when recommended by the Cisco TAC. See 9.6.4 Setting Debug Options, page 9-36. In some cases, you may need to run the Prime Optical client in debug mode. To run the Prime Optical client in debug mode, close the existing session and execute one of the following commands:
  - In Windows, enter:

    `\Cisco\TransportManagerClient8_5\ctm-`*`config`*`-debug.exe`

  - In Solaris, enter:

    `/opt/CiscoTransportManagerClient/ctmcdebug-start -`*`config`*

  where *config* is the network size (small, medium, large, or highend).
- Getinfo.sh script—Provides UNIX and Prime Optical configuration information. The following is an example of how to execute the getinfo.sh script:

  ```
  #cd /opt/Cis*r/bin
  #./getinfo.sh
  ```

  The getinfo.sh script generates two files, logtext.tar.Z and techinfo.txt.Z. These files are created under the /opt/CiscoTransportManagerServer directory. If one of these files is not created, run the getinfo.sh script in debug mode to see where the script is failing. The following is an example of how to run the script in debug mode:

  ```
  #cd /opt/Cis*r/bin
  #sh -x ./getinfo.sh
  ```

  If the script fails because of the following error: “Permission denied while running rsh,” it means that the server is not configured to perform the **rsh** command without authentication. Remote users are required to enter a password after issuing the **rsh** command.
- System parameter information—Output of commands such as **prstat** and **top** provides system parameter information that can be used to troubleshoot performance issues.

Caution Avoid changing the system parameters. Changing parameters such as the system timing results in substantial difference in poll and current times, which leads to server crashes.

- Prime Optical server log files—See 9.6.1 Viewing the Error Log, page 9-32 for a list of server logs.

  In general, there are two sets of log files for each Prime Optical service: service log and service error log. The service log is generated when you select trace error level in the Control Panel services. The service error log is generated when Prime Optical detects an exception with minor or higher severity.

The ctmop.log file is used to determine whether the server was stopped by the user or whether it shut down abnormally. If the server shuts down abnormally, check the core_pmon.log file to see if any of the critical services went down. Services that are considered critical are Oracle, SMService, OSAgent, and GateWay/CORBA.

Prime Optical server log files are located in the /opt/CiscoTransportManagerServer/log directory.

In the Process Monitoring tab of the Recovery Properties pane of the Control Panel, if a process is not running and is marked as critical, an alarm is generated and Prime Optical shuts down. The core_pmon.log contains the reason for the shutdown, while ctmop.log contains the opticalctl abort command entry. Oracle, OSAgent, and SMService are mandatory critical processes while Prime Optical GateWay/CORBA is not considered a mandatory critical process.

- Performance parameters—Prime Optical periodically monitors vital performance parameters and raises EMS alarms when they cross a predefined threshold value. See 9.4.4 Setting Up and Viewing Alarm Configuration Parameters, page 9-18 for a list of performance parameters. All performance data that is collected at each poll cycle is listed in the Self Monitor table. You can export the data from the Self Monitor table to a spreadsheet to produce graphics and identify trends.
- UNIX commands:
  - netstat—Shows the state of all sockets, all routing table entries, and all physical and logical interfaces.
  - snoop—Captures and inspects network packets.
  - /usr/platform/sun4u/sbin/prtdiag—Displays system diagnostic information, including the number of CPUs and the RAM.
  - vmstat—Reports virtual memory statistics.

G.3 Installation Problems

When the Prime Optical installation runs in debug mode, useful information is dumped to the console. Complete the following steps to run the Prime Optical server installation in debug mode:

Step 1 Enter the following command in the shell where you launch the installation:

```
setenv LAX_DEBUG true
```

Step 2 Enter the following command to start the Prime Optical server installation:

```
setup.sh -dev
```

G.3.1 Prime Optical Installation Fails Before the Database Is Created

If the Prime Optical installation fails before the database is created, do the following before reinstalling:

- Use the **ps -ef | grep setup** command to verify that the previous installation is not running. The installation script is setup.sh. If the installation process is still running even after you exit InstallAnywhere, terminate the installation with the **kill -9** *pid* command, where *pid* is the process identifier that is returned by the **ps -ef | grep setup** command.

- Verify that the /tmp directory is not full. During the Prime Optical installation, the /tmp directory is used to store a temporary copy of the installation scripts and the JRE used for installation. Use the **df -k** command to check if there is enough space on the other file systems (for example, in the /opt directory).
- Make sure that you follow the installation procedures explicitly. Even minor steps, such as creating the /tftpboot directory, must be completed. If you deviate from the documented installation procedures, you will encounter problems during installation.
- If you are not installing Prime Optical from the CD—for example, you are installing Prime Optical from your hard drive—make sure that all of the required scripts and files are available and have the correct ownership and permissions.

Note It is not recommended that you install Prime Optical from CD files copied to your hard drive.

You can use the /temp/dbinit.log for debugging when a new Prime Optical installation fails.

G.3.2 Prime Optical Installer Hangs or Quits

Check the disk space in the root and user installation directories. Also, check the disk space in the /tmp and /temp directories. If disk space is not a problem, check for available RAM.

G.3.3 Default Group Name Does Not Appear During New Installation

Verify the following when the default group name (root/other) does not appear in the Group Info panel during a new installation, or, if supplied, an “Invalid Groupname” error message appears.

- The /tmp folder is created in the correct directory.
- The installation scripts are executable. If not, use the **chmod a+r*** and **chmod a+x*** commands.

G.3.4 Insufficient RAM when Specifying the Destination Directory

Use the **prtconf** command to check your RAM and validate it against the specifications listed in the *Cisco Prime Optical 9.6.3 Installation Guide*.

G.3.5 SQL Errors

If you encounter SQL errors, check the log or err files in the /temp or /tmp directories and do one of the following:

- Check whether the /opt/Cisco*Server/cfg/CTMServer.cfg file exists.
- Make sure that the database password is correct. Use the password to connect to Oracle.

SQL problems occur when there is no connection to Oracle or there are Oracle command syntax violations in SQL.

G.3.6 Uninstaller Quits While Uninstalling the Prime Optical Server

While uninstalling the Prime Optical server, the uninstallation process might quit with the following error

message: “CTM server is running.” Use the **opticalctl status** command to check whether the Prime Optical server is running. If it is running, use the **opticalctl stop** command to stop the server and relaunch the uninstaller.

G.3.7 Things to Keep in Mind when Installing or Uninstalling Prime Optical

- After the main installation phase in the GUI, wait for several minutes while certain files and scripts are copied to the installation directory. Before proceeding, wait for the message “Please reboot your system.”
- Stop the Prime Optical server before starting the migration process.
- Stop the Prime Optical server before uninstalling it.
- The upgrade network size configuration is allowed only in medium-to-large, medium-to-high end, and large-to-high end configurations.
- The Prime Optical GateWay/CORBA option is disabled during migration. It will be reinstalled if it was previously installed.
- Use the /opt/Cisco*Server/UninstallerData/installvariables.properties file to make sure that all of your specifications during the preinstallation process are correct.
- All installation files are available in the /tmp or /temp directories.

G.4 Prime Optical Database Problems

G.4.1 PM Data, Audit Log Data, and Error Log Data Are Not Collected Correctly—CTM R7.0 and Earlier

Collect the following information:

- Error logs in the /opt/CiscoTransportManagerServer/logs directory
- Prime Optical database size

The following cases indicate that the problem is related to the partitioning of the database tables:

- The size of the Prime Optical database is medium, large, or high end.
- The log files contain ORA-01440 errors.

If the problem is related to the Audit Log or Error Log, collect the output of the following query:

```
select partition_name from user_segments where segment_name='ERROR_LOG_TABLE'
```

If PM data is not collected correctly, collect the output of the following query:

```
select partition_name from user_segments where segment_name=PM-table
```

An example of the last line of the query result is P01012007. This means that the latest partition was added on January 1, 2007. You have to manually add the partitions if the date when you performed the query is not January 1, 2007.

G.4.2 Database Crashes

If the database crashes, obtain a copy of all of the log files from the /oracle/admin/CTM/bdump and /oracle/admin/CTM/udump directories. The .trc file located in the udump directory contains the session status logs. The alert_CTM.log file located in the bdump directory contains the issues related to the different database processes and gives the process description with a time stamp.

G.4.3 Database Troubleshooting Tools

G.4.3.1 Checkdbinfo.sh Script

To debug Oracle performance issues, use the checkdbinfo.sh script located in the /opt/CiscoTransportManagerServer/bin directory. The /oracle/dbcheck.log file contains the output of the script.

G.4.3.2 Toad

Run a procedure using Toad and you can check the values of the procedure variables.

G.4.3.3 Prime Optical Database Functions

The displayphyloc and displayip functions that are defined in the Prime Optical database can be used to view data in a readable format. For example, the following query displays the list of installed nodes and the related IP address in readable format:

```
SELECT nesysid, display(neipaddr) FROM ne_info_table
```

See Chapter 3 of the *Cisco Prime Optical 9.6.3 Database Schema* for more information.

G.4.3.4 Tnsping Utility

For remote databases, performance issues might cause process timeouts. Use the tnsping utility to confirm that process timeouts occur.

G.5 Server Problems

This section describes troubleshooting procedures for Prime Optical server-related problems.

Note Log in as the root user on the Solaris workstation where the Prime Optical server is installed to perform any operations on the Solaris workstation.

G.5.1 Conditions that Affect Prime Optical Server Performance

The "System Requirements" chapter in the *Cisco Prime Optical 9.6.3 Installation Guide* lists server, CPU, CPU speed, disk space, and RAM requirements for different types of Prime Optical installations. These requirements are derived from guidelines based on scalability simulation testing.

Actual Prime Optical server performance varies for each customer and is affected by:

- The total number of NEs actively managed by Prime Optical
- The number of NE-related services (including northbound services) running on the server
- The rate of circuit provisioning and the methods used for provisioning
- The rate of network growth (for example, adding 50 NEs to Prime Optical at once)
- The rate of configuration change updates received from the NEs
- The number of circuits provisioned with no signals that generate threshold crossing alerts (TCAs)
- The number of unacknowledged alarms in the Prime Optical database
- The rate of alarm bursts received from the NEs
- The actual number of circuits provisioned in the Prime Optical database

The following conditions might indicate that your Prime Optical installation is near or at capacity:

- Your daily CPU utilization is consistently above 80%
- You experience loss of connectivity (LOC) to 1% to 5% of nodes at random
- Your RAM usage is 100% or your system swaps frequently
- You receive many configuration updates from the NEs
- Your system experiences high Java garbage collection time

Note The Java garbage collection time is determined by engineering after analyzing your CPU utilization data.

If you are experiencing any of these conditions, contact your account representative, who can engage Cisco's Advanced Services team to audit your Prime Optical server and recommend a higher-capacity server and resources.

G.5.2 Prime Optical Server Does Not Respond

Step 1 Log in as the root user on the Solaris workstation where the Prime Optical server is installed.

Step 2 Enter the following command to view the status of the Prime Optical server processes:

```
opticalctl status
```

If you do not have root user privileges but you belong to the UNIX group that can use sudo functionality to run commands as nonroot, enter the following command:

```
sudo opticalctl status
```

If there is a line containing /CTMServer, the Prime Optical server is running.

If there is no line containing /CTMServer, the Prime Optical server is not running. Proceed to Step 3.

Note You can also check the ctmop.log file in /opt/CiscoTransportManagerServer/log to determine whether the server was stopped by another user or if it stopped abnormally. If it stopped abnormally, proceed to Step 3.

Step 3 Run the **getinfo.sh** Prime Optical server tool and send the data to the Cisco TAC for analysis.

If you do not have root user privileges but you belong to the UNIX group that can use sudo functionality to run commands as nonroot, enter the following command:

```
sudo getinfo.sh
```

Step 4 Start the Prime Optical server by using the opticalctl start script in the /opt/CiscoTransportManagerServer/bin directory.

a. Log in as the root user.

b. Change the directory to /opt/CiscoTransportManagerServer/bin and enter the following command:

```
opticalctl start
```

If you do not have root user privileges but you belong to the UNIX group that can use sudo functionality to run commands as nonroot, enter the following command:

```
sudo opticalctl start
```

If the preceding procedure does not solve the problem, complete the following steps:

Step 1 Verify whether the /opt/CiscoTransportManagerServer/cfg/CTMServer.cfg file is corrupt. The file should contain the db-config-mode = auto parameter in the [database] section. If the entry is missing, the Prime Optical server configuration file is corrupt. Reinstall the Prime Optical server.

Step 2 Verify whether the first entry in the /var/opt/oracle/oratab file looks similar to CTM8_5:/oracle/product/10.2.0:Y. If this entry is missing, the Oracle database might not be installed. The Oracle database is a prerequisite for installing the Prime Optical server.

Step 3 To improve system performance, regenerate the database statistics, either before or after a significant system workload. See 4.2.12 Regenerating Statistics in the Database, page 4-27. Internal Oracle statistics allow Oracle to work efficiently, especially during data query operations. If you experience Prime Optical system performance degradation during normal database activities, the database might be using stale statistics.

G.5.3 Cannot Connect to the Prime Optical Server

Step 1 Ping the server's IP address from the client PC or workstation.

Step 2 If the ping fails, resolve the IP connectivity problem and try again.

Step 3 Telnet to the server and log in as the root user.

Step 4 Enter the following command to verify that Prime Optical is running:

```
opticalctl status
```

If you do not have root user privileges but you belong to the UNIX group that can use sudo functionality to run commands as nonroot, enter the following command:

```
sudo opticalctl status
```

Step 5 The server should have at least the following processes running:

```
root 520 12.0 0.02855219536 Dec_19 14:18 CTM Server
root 489 0.0 0.117384 Dec_19 0:00 CTM Server
root 749 0.6 5.7255104112848 Dec_19 346:27 SnmpTrapService
root 541 0.1 5.8284232115256 Dec_19 15:02 SMService
root 507 0.0 0.2 5512 3496 ? Dec 19 Apache Web Server
```

Step 6 If you see fewer than four processes running, enter the following command to stop the server manually:

```
opticalctl stop
```

Step 7 If you changed the server IP address, verify that the configuration files have been updated.

Step 8 Verify that the Oracle database is accepting connections:

a. Enter the following command to log in as the Oracle user:

```
su - oracle
```

b. Enter the following command to open an SQL*Plus session:

```
omu-u60-3% sqlplus ctmanager/ctm123!
```

Step 9 Reboot the server if you receive another error message and the SQL prompt does not appear. Wait for the server to boot up and try to run the client. The SQL prompt indicates that the Oracle database is running and accepting connections.

Step 10 Enter the following commands to restart Prime Optical manually:

```
SQL> exit
omu-u60-3% exit
omu-u60-3% logout
opticalctl start
```

If you do not have root user privileges but you belong to the UNIX group that can use sudo functionality to run commands as nonroot, enter the following command:

```
sudo opticalctl start
```

Step 11 Wait for 5 minutes and run the client.

G.5.4 How Do I Restart the Prime Optical Server when the Network Contains Many NEs?

If your network contains a high number of NEs, it often takes a long time for all of the NEs to synchronize after a Prime Optical server restart. To avoid this NE synchronization delay, complete the following steps:

Step 1 In the Domain Explorer, choose **Administration > Control Panel**.

Step 2 In the Control Panel window, expand the **NE Service** node and click any NE with a green arrow (which indicates that there are services running).

Step 3 In the Status tab, click the **Deactivate** button to deactivate the NE service. This ensures that when the Prime Optical server is restarted, no service consumes too much CPU and the NE resynchronization goes smoothly.

Step 4 For CTC-based NEs, expand the NE Service node and click **CTC-Based SDH NEs** or **CTC-Based SONET NEs**. In the Status tab, click the **Deactivate** button to deactivate the network service.

Step 5 Expand the **PM Service** node and click any NE with a green arrow. In the Status tab, click the **Deactivate** button to deactivate the PM service.

Step 6 Enter the **opticalctl status** command. The command output should not show any active NE or PM services. The output should look similar to the following sample:

```
Prime Optical Processes for Cisco Prime Optical Server Version: 9.2 Build: 831
-------------------------------------------------------------------------------------
USER   PID    %CPU   %MEM               START         TIME   PROCESS
-------------------------------------------------------------------------------------
root   14023  0.0    0.117360           11:00:13      0:00   CTM Server
root   14101  0.0    0.82607214968      11:00:18      0:01   CTM Server
root   14351  0.2    5.7263488113176    11:01:31      1:05   SnmpTrapService
root   14123  0.0    4.728914494384     11:00:20      0:57   SMService
-------------------------------------------------------------------------------------
```

Step 7 Enter the **opticalctl stop** command.

Step 8 After the **opticalctl stop** command is complete, re-enter the **opticalctl status** command to verify that there are no Prime Optical processes running. The output should look similar to the following sample:

```
Prime Optical Processes for Cisco Prime Optical Server Version: 9.2 Build: 831
-------------------------------------------------------------------------------------
USER   PID    %CPU   %MEM               START         TIME   PROCESS
-------------------------------------------------------------------------------------
-------------------------------------------------------------------------------------
```

Step 9 If any process is still running, identify the process ID and enter the following command to stop it:

kill -9 *process-ID*

Step 10 After all processes have been stopped, enter the **opticalctl start** command at the command prompt. This command starts the Prime Optical server but not the NE or PM services.

Step 11 Activate the NE service instances individually after most of the NEs in a partition have started synchronizing. That is, wait until the NE service instance displays an hourglass icon in the Control Panel tree before you activate the next NE service instance. To do this, expand the **NE Service** node; then, expand the appropriate NE node and in the NE Service Instance properties pane, click the **Start Service Instance** button.

Step 12 For CTC-based NEs, activate the network service instances individually after most of the NEs in a partition have started synchronizing. To do this, expand the **NE Service** node; then, expand the **CTC-Based SDH NEs** or **CTC-Based SONET NEs** node. In the Network Service Instance properties pane, click the **Start Service Instance** button.

Step 13 Activate the PM service instances. To do this, expand the **PM Service** node; then, expand the appropriate NE node and in the PM Service Instance properties pane, click the **Start Service Instance** button.

G.5.5 NE Connection State Is Listed as Unavailable

If the connection state of an NE is listed as Unavailable in the Domain Explorer window, a connectivity or configuration problem exists. Wait 5 to 10 minutes after adding the NE to the Prime Optical domain; then, complete the following steps:

Step 1 To see the NE IP address, select the NE in the Domain Explorer window. The Address tab of the Network Element Properties pane lists the IP address of the selected NE.

Step 2 From the Prime Optical server, enter the following command to verify connectivity between the Prime Optical server and the NE:

```
ping IP-address
```

Step 3 If the ping fails, a physical or configuration problem exists in the data communications network (DCN).

a. If connectivity existed earlier:

- If there were no configuration changes made to any routers in the DCN or to the Prime Optical server, the problem is a physical problem.
- If the configuration was changed, the change might have introduced problems. Verify the changed configuration.

b. If connectivity was never established:

- Verify that there are no problems on the physical level.
- Verify the DCN configuration.

Step 4 If the ping succeeds, verify that the NE software version is listed in the Supported NE table (Administration > Supported NE Table).

Step 5 For ONS 15530 and ONS 15540 NEs, SNMP read and write community strings must be set up correctly on each NE. The running configuration on each NE should contain entries similar to the following example:

```
snmp-server community public RO
snmp-server community private RW
```

The community strings configured on the server should match the strings configured on the NE. For information on configuring community strings in Prime Optical for ONS 1550x NEs, see 3.5.1.4 Prerequisites for Adding ONS 15530 and ONS 15540 NEs, page 3-10.

G.5.6 Launching Tables Results in Database Errors

If the Oracle database or Oracle listener that Prime Optical is using is down, launching tables will generate database errors. To troubleshoot table launching errors:

Step 1 Log in as the Oracle user and enter the following command:

```
sqlplus ctmanager/ctm123!
```

If the login succeeds, an SQL> prompt appears, which indicates that the Oracle database has been installed and the database server is up and running. If the login fails, either the Oracle database has not been installed or the database server is not running.

Step 2 To start the Oracle database, log into the Solaris workstation as the Oracle software user and enter the following command at the shell prompt:

```
dbstart
```

Step 3 Enter the following command at the shell prompt to start the Oracle listener:

```
lsnrctl start
```

If there are still problems with starting the Oracle database or the Oracle listener, refer to the Oracle documentation or contact Oracle support.

G.5.7 SNMP Traps Are Not Forwarded from NEs

SNMP traps might not be forwarded, either because the trap port is already in use, or because the NE is not configured correctly.

G.5.8 Trap Port Is Unavailable

The Prime Optical server requires exclusive access to the SNMP trap port to receive SNMP traps from the NE.

Step 1 Enter the following command to verify that the standard SNMP trap port (port 162) is not in use by another application running on the same Solaris workstation:

```
netstat -a | grep 162
```

If the following line is present, the SNMP trap port is in use by another application:

```
*.162 Idle
```

Step 2 If the trap port is in use by another application, stop the other application.

G.5.9 Problems with ONS 15530 and ONS 15540 Configuration

ONS 15530 and ONS 15540 NEs must be configured correctly to send traps to the server.

Step 1 The running configuration on the NE should contain entries similar to the following example:

```
snmp-server enable traps snmp authentication warmstart
snmp-server enable traps bgp
snmp-server enable traps oscp
snmp-server enable traps config
snmp-server enable traps entity
snmp-server enable traps fru-ctrl
snmp-server enable traps topology throttle-interval 60
snmp-server enable traps optical monitor min-severity not-alarmed
snmp-server enable traps rf
snmp-server enable traps aps
snmp-server enable traps patch
snmp-server enable traps cdl all
```

```
snmp-server enable traps alarms
snmp-server enable traps threshold min-severity degrade

snmp-server host 172.20.126.214 version 2c public snmp bgp oscp
config entity fru-ctrl topology optical rf aps patch cdl alarms threshold
```

In this example, the host 172.20.126.214 receives the specified traps from the NE.

Step 2 You can also run the following commands on the server and device:

a. As the root user, enter the following command on the server:

```
# snoop udp port 162
```

b. On the device, enter the following command to generate a configuration change:

```
wr mem
```

If the device is configured correctly, the **snoop** command reports a configuration change trap.

G.5.10 Performance Monitoring Data Is Not Displayed

Step 1 Use the Domain Explorer > Network Element Properties pane to verify whether PM collection is disabled for the selected NE.

Step 2 Choose **Administration > Control Panel** and expand **PM Service**. Select the NE type to verify whether the service status is Active or Not Active.

Step 3 Choose **Administration > Audit Log** to verify whether PM was ignored for the selected NE.

Step 4 Choose **Administration > Control Panel** and click **PM Service**. Look at the PM Data Storage field. Choose **Optimized** to save only nonzero values in the database. Choosing Optimized requires less space than saving all values, including zero values. If you choose Normal in the PM Data Storage field, the database saves all PM values, including zero values.

Note The Optimized PM data storage feature is available only for CTC-based and ONS 155xx NEs.

Step 5 Choose **Administration > Error Log** to verify whether there are any critical, major, or minor errors against the PM service.

Step 6 Verify that the NE is reachable during the duration that PM data is collected. If the NE is not reachable, there is an entry in the Audit Log table (**Administration > Audit Log**).

G.5.11 CTC-Based NE Is Not Discovered

Step 1 Verify that the NE is up and running.

Step 2 Verify that the NE IP address and default route are configured correctly.

Step 3 To verify that the NE is running the correct version of system software, open a CTC session to the NE and check the NE software version.

Step 4 Verify that the NE that acts as the gateway NE (GNE) (through which this node is discovered) is added to Prime Optical and is available.

Step 5 Open CTC from the GNE and verify that CTC can discover the NE.

G.5.12 CTC-Based NE Is Not Reachable

Step 1 Verify that the NE is up and running.

Step 2 Verify that the NE IP address and default route are correctly configured.

Step 3 Wait for five poll cycles while Prime Optical re-establishes connectivity with the NE.

Step 4 To test IP connectivity to the NE from the Prime Optical server, enter the following command from the Solaris workstation where Prime Optical is running:

```
ping NE-IP-address
```

Step 5 To verify that the NE is running the version of system software supported by Prime Optical, open a CTC session to the NE and check the NE software version.

Step 6 Verify that the username and password that Prime Optical uses to reach the NE exist on the NE.

G.5.13 ONS 1530x Communication Problems

Step 1 Make sure that there are no other ONS 1530x NEs with the same name.

Step 2 Test the IP connectivity from the server to the NE.

Step 3 Telnet to the NE from the Prime Optical server. If you are prompted for a password, the NE is running.

Step 4 Connect to the NE using Cisco Edge Craft to verify that SNMP is enabled.

Note Only users connecting from servers that are listed in the SNMP Community table are allowed to log into the NE.

Step 5 Verify that the NE you are trying to connect to is running a software version supported by Prime Optical.

Step 6 Check whether the product name is one of the following:

- ONS 15305
- AXXEDGE

If the product name does not match any of the recognized names, enter the **change-system-name** command.

Step 7 For ONS 15305 CTC R3.x NEs, note the following possible connectivity issues and limitations:

- The username and password that Prime Optical uses to reach the ONS 15305 CTC must exist on the NE.
- ONS 15305 CTC NEs support up to two simultaneous client connections, as follows. Other configurations are not supported and might cause connectivity problems:

  - One Prime Optical plus one CTC connection
  - Two Prime Optical connections
  - Two CTC connections
- CTC cannot be launched on the same workstation where the Prime Optical server is running and managing ONS 15305 CTC NEs, or connectivity problems might occur.
- ONS 15305 CTC NEs do not support the ONS 15454 SDH proxy server implementation. If ONS 15305 CTC NEs are connected to ONS 15454 SDH NEs through optical links, enabling the proxy server on ONS 15454 NEs (and then the GNE/ENE configuration) causes connectivity problems on the ONS 15305 CTC NEs. Verify that proxy server is not enabled on any ONS 15454 SDH NEs that are optically connected to ONS 15305 CTC NEs.

G.5.14 ONS 15540 or ONS 15530 Is Not Reachable

Step 1 Enter the following command on the server to verify IP connectivity between the server and the NE:

```
ping NE-IP-address
```

Step 2 If the NE is reachable through IP, verify that the correct read community string is configured on the server.

- On the server, choose **Administration > ONS 155XX > ONS 155XX SNMP Settings Table** to view the community strings set in Prime Optical.
- On the NE, enter the following command to view the read community string set on the NE:

  ```
  show run | begin SNMP
  ```

- In the running configuration, the community strings are shown in entries similar to the following:

  ```
  snmp-server community public RO
  snmp-server community private RW
  ```

  In this example, the read string is *public*, and the read/write string is *private*.

Step 3 If IP connectivity and community strings are verified and the device is still unavailable, check the Error Log for any errors reported by ONS 155xx NE Service.

G.5.15 Changing the NE Operational State from the UNIX CLI

This procedure is useful when troubleshooting NE connectivity problems, alarm, or configuration synchronization issues and you do not have access to the Prime Optical client GUI.

Step 1 Use the vwdata.sh script to identify the NE database ID number.

Step 2 Run the UNIX CLI tool and connect to the server. The tool name is ctm and is located in the /opt/CiscoTransportManagerServer/bin directory.

Step 3 Use the command **set nestate** to change the NE operational state.

G.5.16 Circuits Are Not Displayed

If Prime Optical fails to display some circuits, or if the information displayed by CTC and Prime Optical differs, complete the following steps:

Step 1 Wait for 2 minutes while the Prime Optical server synchronizes with the NE. If the Circuit table is not in autorefresh mode, click the **Refresh Data** tool when the tool flashes.

Step 2 Verify that the Circuit table is opened from either the source or destination NE of the circuit to be viewed.

Step 3 Verify that the NEs that are part of the circuit (source, destination, or drop) are available in Prime Optical.

Step 4 Open another CTC session and compare the circuit information in the newly opened CTC session with the circuit information displayed by Prime Optical.

G.5.17 Circuit State for Monitor Circuits Reads "Duplicate ID"

Prime Optical generates a unique number that is appended to the circuit name to make the monitor circuit name unique. On rare occasions, Prime Optical might create two or more monitor circuits with the same name. The circuit state for these circuits reads "Duplicate ID." This is a known issue that has been tracked as DDTS number CSCdz87566.

When the circuit state reads "Duplicate ID," you cannot see the actual circuit state. In this case, you must change the duplicate name to a unique name, so that you can see the correct circuit state. Use the Modify Circuit wizard to enter a unique name for each monitor circuit.

G.5.18 NE Model Type Appears as Unknown

If an in-service NE is added to the Domain Explorer but the model type appears as unknown, the software version of the NE might not be prepopulated in the database. In other words, Prime Optical cannot match the NE with a recognizable version.

Use the NE Software table to add the NE software version string to the Prime Optical database. See 4.3.5 Viewing Software Versions and Restarting the NE with a New Software Image, page 4-37.

G.5.19 Cannot Copy the CTC Binary to the Prime Optical Server

If a CTC binary fails to copy to the Prime Optical server, the *Prime Optical-install-directory*/cms/ directory might be missing or write-protected. If the directory is missing, create a cms directory with write-access permissions. Otherwise, change the permissions of the existing cms directory to allow write access.

G.5.20 Memory Backup, Memory Autobackup, or Memory Restore Fails

Step 1 In the Domain Explorer window, choose **Administration > Job Monitor**. The Job Monitor table shows the status of the operation. If a job failure occurs, the reason is displayed in the Additional Information column.

Step 2 Return to the Domain Explorer window and choose **Administration > Audit Log**. The Audit Log table shows the status of the operation.

Step 3 Return to the Domain Explorer window and choose **Administration > Error Log**. The Error Log table shows information about the backup, memory restore, or download failure.

Note Sometimes, when a node is busy, a memory backup, memory autobackup, or memory restore job request may fail. In such a scenario, Prime Optical automatically creates a new, similar job and resends the request using the job retry functionality. The new job is triggered within the first 10 minutes of failure detection. Prime Optical attempts to resend the request a maximum of five times. You can monitor a rescheduled job in the Job Monitor table.

Step 4 See Appendix F, "Error Messages," for the correct action to take in response to the error.

G.5.21 Software Download, Software Commit, or Software Revert Fails

Step 1 In the Domain Explorer window, choose **Administration > Job Monitor**. The Job Monitor table shows the status of the operation. If a job failure occurs, the reason is displayed in the Additional Information column.

Step 2 Return to the Domain Explorer window and choose **Administration > Audit Log**. The Audit Log table shows the status of the operation.

Step 3 Return to the Domain Explorer window and choose **Administration > Error Log**. The Error Log table shows information about the autobackup, software commit, or revert failure.

Note Sometimes, when a node is busy, a software download, software commit, or software revert job request may fail. In such a scenario, Prime Optical automatically creates a new, similar job and resends the request using the job retry functionality. The new job is triggered within the first 10 minutes of failure detection. Prime Optical attempts to resend the request a maximum of five times. You can monitor a rescheduled job in the Job Monitor table.

Step 4 See Appendix F, "Error Messages," for the correct action to take in response to the error.

G.5.22 The getinfo.sh Script Fails

You might experience a problem where the getinfo.sh script fails with the following error:

```
Error: permission denied while running 'rsh.' Check the environment and make sure the root
is permitted to run .rsh on host IP-address.
```

This problem occurs because the getinfo.sh script does not run unless an entry is made in the /.rhosts file. This problem occurs even on a local server and database configuration. This is a known issue that has been tracked as DDTS number CSCin66495.

The solution is to add the hostname to the /.rhosts file. For example:

```
(omu-e450) #more /.rhosts
omu-e450 +
```

```
(omu-e450) #
```

G.6 Client Connectivity Problems

The Prime Optical client might not be able to connect to the Prime Optical server for various reasons. Complete the following procedures in the order listed until the problem is resolved.

G.6.1 Database Is Not Available

If the Prime Optical client cannot connect to the Prime Optical server, verify that the database is available.

Step 1 Log into the Prime Optical server as the Oracle user.

Step 2 Enter the following command to connect to the database:

```
sqlplus ctmanager/ctm123!
```

Step 3 If the error message "maximum processes exceeded" is received, the maximum number of database connections has been reached. Close several clients or ask the database administrator to increase the maximum number of processes for the database.

G.6.2 Database Timeout Occurs

Step 1 Reduce the scope of the query by selecting a group or an NE and not the entire domain before opening tables such as the Alarm Browser, Alarm Log, Audit Log, and PM tables.

Step 2 Increase the client database query timeout period by editing the ems-client.cfg file in the C:\Cisco\TransportManagerClient\config or /opt/CiscoTransportManagerClient/config directory.

Step 3 Add hardware resources to the Oracle database server.

Step 4 Ping the Oracle database server from the client to verify the response time. Increase the bandwidth if the round-trip response time is inadequate.

G.6.3 Are the Prime Optical Client and the Prime Optical Server Connected?

If the database is available, check connectivity between the client and the server.

Step 1 To see the Prime Optical server IP address, enter the following command on the Solaris workstation where the Prime Optical server is running:

```
ifconfig -a
```

The command output looks similar to the following example:

```
hme0:flags=863<UP,BROADCAST,NOTRAILERS,RUNNING,MULTICAST>mtu 1500
inet 192.168.120.93 netmask ffffff00 broadcast 192.168.120.255
```

The IP address is the address following the *inet* field.

Step 2 To verify that the physical connection between the Prime Optical client and the Prime Optical server does not have problems, enter the following command from the Prime Optical client:

```
ping IP-address
```

where the IP address belongs to the Solaris workstation where the Prime Optical server is running.

Step 3 If the ping command fails, fix the physical connectivity; then, log into the Prime Optical client.

G.6.4 Cannot Log In as Provisioner or Operator

Step 1 Use the default username and password to log into the Prime Optical client:

Username: **SysAdmin**

Password: **Ctm123!**

Step 2 If the SysAdmin login succeeds but the provisioner or operator login fails, verify that the provisioner or operator exists and is not disabled. In the Domain Explorer window, choose **Administration > Users** to view a table of all configured Prime Optical users.

Step 3 If the provisioner or operator is not in the Cisco Prime Optical Users table, the user is not configured. Configure the provisioner or operator; then, log in as that user.

Step 4 If the provisioner or operator is in the Cisco Prime Optical Users table, select the row corresponding to that user and click the **Modify User Properties** tool to bring up the Modify User Properties wizard. Verify that the Login State field is set to Enabled. If the login state is disabled, enable it and log in as the provisioner or operator. The user might have been disabled after attempting to log in with an incorrect password.

Step 5 If the password is not correct, set a new password for the user and log in again.

G.6.5 Cannot Authenticate User Message Appears

If the "Cannot authenticate user" error message is received when logging into the Prime Optical client, the Prime Optical server might be initializing. Wait for 5 minutes while the Prime Optical server finishes initializing; then, try to log in again. Alternatively, check your username and password and enter them again. The username and password are case-sensitive.

G.6.6 Socket Over TL1 Issues

Prime Optical supports NEs that are connected in non-IP networks such as Open System Interconnection (OSI) networks. The Cisco NEs will be connected through non-Cisco gateway NEs (NGNEs) and Prime Optical opens a tunnel to connect to the NGNEs. Do the following in case of connectivity issues in a tunnel setup:

Step 1 Ping the NGNE. The NGNE must be connected to the IP network.

Step 2 Check if the NGNE requires login credentials to connect to the network. If it requires login credentials, its TID is listed in the GNE TID text box in the Domain Explorer NE Properties pane. The username and password of the NGNE are specified in the Domain Explorer NE Properties pane and Control Panel.

Step 3 Check that the NGNE encoding mode that is used to connect to the Cisco NEs is correct.

Step 4 (Optional) If you have a very large network (which can slow down the creation of tunnels), do the following to increase the default timeout value of 20 seconds:

a. In the Control Panel window, expand the **NE Service** and click **CTC-Based SONET NEs** or **CTC-Based SDH NEs** to open the NE Service pane.

b. In the Status tab, enter the new timeout value in the **TL1 Tunnel Connection Timeout** text box.

c. Click **Save**.

G.7 Client Operational Problems

This section describes troubleshooting procedures for Prime Optical client operational problems.

G.7.1 Model Index Is Unknown

If a new NE is added to the Prime Optical domain and marked as In Service, but the model index is unknown, complete the following steps:

Step 1 Verify that the IP address and other parameters are entered correctly.

Step 2 The Prime Optical server might not be able to establish connectivity to the GNE for the NE. Verify that the GNE for the NE is marked as In Service, and that the GNE is correctly populated in the Prime Optical domain.

Step 3 Verify that the GNE is DCC-connected to the NE.

Step 4 The Prime Optical server might not recognize the NE's software version. In the Domain Explorer tree, select the NE and choose **Fault > Test NE Connectivity**. If the NE is available, contact the Cisco TAC and verify that the version of the software on the NE is compatible with the Prime Optical server. Use the Supported NE table to provide the new NE software version that the Prime Optical server will recognize.

Step 5 The Prime Optical server might be configured to attempt communication with new NEs after a certain delay. To change the health poll frequency:

a. In the Domain Explorer window, choose **Administration > Control Panel** and click **NE Service**.

b. In the NE Poller tab, look at the NE Health Poll Interval field. The default is 240 seconds. If the value is too large, there might be a communication delay between Prime Optical and the NEs. Under normal conditions, the Prime Optical server attempts communication with new NEs for no more than twice the number of seconds specified in the NE Health Poll Interval field.

G.7.2 Cannot Delete an NE

If an NE cannot be deleted, verify that you logged in as a SuperUser or NetworkAdmin, and not as a Provisioner or Operator. Provisioners and Operators cannot delete NEs. If you logged in as a Provisioner or Operator, restart the Prime Optical client session and log in as a SuperUser.

G.7.3 CTC Fails to Start

If CTC cannot be started for a CTC-based NE, complete the following steps:

Step 1 If an error occurs while opening the NE Explorer but the CTC progress screen and login dialog boxes appear, the CTC username or password might be incorrect. Do the following:

a. Choose **Administration > Users**.

b. In the Cisco Prime Optical Users table, choose **Edit > View/Modify**. The Modify User Properties wizard opens.

c. Click **Next** to move to the CTC/Craft User Properties pane and change the CTC username and password to match those configured on the device. Click **Finish**.

Step 2 If the CTC progress screen idles for a long time before the login dialog box appears, there might be problems with network connectivity to the device.

a. From a DOS command window or a Solaris workstation, ping the device.

b. If no response is received, set up routes so that the device is available; then, restart CTC. If CTC does not start, the workstation might have resource constraints.

c. Close some open applications and try again.

d. Close some instances of CTC that are managing another group of CTC-based NEs and try again.

Step 3 If the GNE for the selected NE was not found, there might be a mismatch between the GNE specified for the device and the available GNEs. This means that the data in the database is corrupt. Contact the Cisco TAC for assistance.

G.7.4 Added a New Software Version to the Wrong NE

Step 1 In the Domain Explorer window, choose **Administration > Supported NE Table**.

Step 2 In the Supported NE table, select the incorrect entry and choose **Edit > Delete**.

Step 3 Click **OK** in the confirmation dialog box.

Step 4 Select the correct NE row from the Supported NE table.

Step 5 Add the correct software version.

Step 6 In the Domain Explorer > Network Element Properties pane, set the operational state of all NEs that are behaving erroneously to **Out of Service**.

Step 7 Click **Save**.

Step 8 In the Network Element Properties pane, set the operational state of all the NEs back to **In Service**.

Step 9 Click **Save**.

G.7.5 Cannot Delete a Subnetwork

If a subnetwork cannot be deleted from the Subnetwork Explorer, complete the following steps:

Step 1 Verify that the user logged in as a SuperUser—not as a Provisioner or an Operator. Provisioners and Operators cannot delete subnetworks. If the user logged in as a Provisioner or Operator, restart the Prime Optical client session and log in as a SuperUser.

Step 2 Verify that the target subnetwork does not contain NEs. Move all NEs to another subnetwork before deleting the empty target subnetwork.

G.7.6 Cannot Move an NE Between Subnetworks

When automatic grouping of NEs in subnetworks is enabled, you cannot move NEs between subnetworks. To move NEs from one subnetwork to another:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel.**

Step 2 In the Control Panel, click **UI Properties**.

Step 3 Under Subnetwork Grouping, uncheck the **Automatically Group NEs in Subnetworks** check box.

Step 4 Click **Save**.

G.7.7 NEs Change Subnetworks Rapidly

NEs that are part of a subnetwork might change subnetworks rapidly if the status of the link or of all links connecting subnetworks fluctuates rapidly; this can occur if automatic grouping of subnetworks is enabled in Prime Optical. Disabling the automatic grouping of subnetworks might prevent NEs from changing subnetworks when caused by links going up and down. To disable the automatic grouping of subnetworks:

Step 1 In the Domain Explorer window, choose **Administration > Control Panel**.

Step 2 In the Control Panel, click **UI Properties**.

Step 3 Under Subnetwork Grouping, uncheck the **Automatically Group NEs in Subnetworks** check box.

Step 4 Click **Save**.

G.7.8 Cannot Schedule Jobs

The Prime Optical client can schedule the following types of administrative tasks:

- Software download
- Memory backup
- Memory restore

Prime Optical maintains an Error Log and Audit Log to track potential problems. To view the Error Log or Audit Log:

Step 1 In the Domain Explorer window, choose **Administration > Audit Log** or **Error Log**.

Step 2 Look for errors related to software download, memory backup, or memory restore.

G.7.9 Prime Optical Does Not Receive Autonomous Alarms from ONS 1530x NEs

Prime Optical can collect alarms or receive autonomous notifications from an ONS 1530x NE. Alarm collection occurs when the NE is first discovered and does not rely on spontaneous events sent from the NE.

Step 1 Verify that the Prime Optical server is present in the SNMP Community table and that the trap is set to enable. If not, you can connect to the NE, but Prime Optical will not receive traps.

Step 2 If the Prime Optical server and the NEs are in different subnetworks, make sure that there is no firewall filtering SNMP packets between the subnetworks.

Step 3 Verify that Cisco Edge Craft is receiving autonomous alarms.

Step 4 Verify the following:

- SNMP traps reach the Prime Optical server machine.
- The command **snoop udp** and port 162 do not show the incoming traps.
- There are no network problems.

Step 5 Check whether the Prime Optical server is receiving traps.

Step 6 Check whether the ONS 1530x NE service is receiving SNMP traps.

G.7.10 Bandwidth-Intensive Operations Are Blocked

Bottlenecks in the DCN affect bandwidth-intensive operations, such as software download. Tune the timeout and retry values to match DCN performance. Log into the NE and enter the following commands:

- **ip tftp min-timeout**—Sets the minimum wait time, in seconds, before retrying the read/write request.

- **ip tftp max-timeout—**Sets the maximum wait time, in seconds, before retrying the read/write request.
- **ip tftp backoff-delay**—Sets the number of seconds to extend the wait time if the read/write request times out.
- **ip tftp write-retries**—Sets the maximum number of times to retry the TFTP read/write request before declaring a failure.

G.7.11 NE Displays Incorrect Configuration Management Data

Step 1 In the Domain Explorer window, choose **Administration > Service Monitor** and verify that the NE Service is running. If it is not running, start the NE Service.

Step 2 Test NE connectivity:

a. In the Domain Explorer tree, select the NE and choose **Fault > Test NE Connectivity**. The message "*NE-name* (*IP-address*) is available" is generated.

b. If the NE is unavailable, establish connectivity to the NE before retrieving configuration data.

G.7.12 Cannot Customize the Network Map

If an image file is not displayed while changing the Network Map background or while changing a node icon, complete the following steps:

Step 1 Choose another image file. The file might be corrupt.

Step 2 Check the size of the image file. The image file might be larger than 100 KB, which is too big to load. If the file is too big, use a smaller image file.

Step 3 Verify that the image file exists in the \images\mapbkgnds\shapefiles directory or the \images\mapicons directory. If the file is missing, it has been deleted. Reinstall the Prime Optical client.

Note The client is bundled primarily with shape files (*.shp) and only a few map background GIF files.

G.7.13 Prime Optical Client Machine Displays Incorrect Colors

When using a UNIX machine as the Prime Optical client host, the machine's display might show incorrect colors. This problem occurs when UNIX systems use a 256-color palette and the graphics require colors that are not available in the 256-color scheme. Although some UNIX systems can work around the missing colors, there are still some that have problems making adjustments. For these systems, the only solution is to disable any other graphical application (for example, Netscape) that is running and upgrade the system graphics capabilities to a 24-bit color display (for example, upgrade the video card or monitor).

G.7.14 Common Topology Problems

Note After marking NEs as Out of Service, wait until the circuits traversing over these NEs (and not involving any other NE) clear from the Prime Optical Circuit table before marking the NEs as In Service again.

G.7.14.1 Cannot Load the Barebone Configuration on ML Cards

To load a fresh barebone configuration on an ML card, complete the following steps:

Step 1 In the Domain Explorer tree, select the NE that contains an ML card and choose **Configuration > NE Explorer** (or click the **Open NE Explorer** tool).

Step 2 In the NE Explorer tree, select the ML card (or double-click the ML card that is shown in the Shelf View).

Step 3 In the Slot Properties pane, click the **Configuration** tab.

Step 4 Click the **File >> TCC** button, specify the configuration file to load, and click **OK**.

Step 5 Reset the card and wait for it to come up.

Step 6 After the card comes up, enter one of the following commands to telnet to it, depending on the node mode:

- If the node is configured in SSH mode, enter:

  ssh *NE-IP-address* **40***card-slot-number*

- If the node is not configured in SSH mode, enter:

  telnet *NE-IP-address* **20***card-slot-number*

Step 7 Enter the username and password to log into the ML card. The default values are:

- Username: CISCO15
- Password: CTM123+

Step 8 After logging in, enter the following command:

```
wr mem
```

G.7.14.2 Topology Goes into Incomplete State

A topology goes into Incomplete state when one or more Layer 1 circuits related to the topology are missing.

Step 1 Launch the Circuit table and check whether the circuits related to the topology are discovered.

Step 2 If one or more Layer 1 circuits are missing, use the Create Circuit wizard to recreate the circuits. Once the Layer 1 circuits are created and Prime Optical discovers them, the topology goes into Complete state.

Step 3 Check the Circuit table to verify whether the newly created Layer 1 circuits are discovered.

Step 4 If the topology still fails to go into Complete state, the topology discovery logic has failed. Complete the following substeps to restart the discovery process:

a. Mark the NE service related to the NE as Out of Service and then In Service.

b. Mark the NEs related to the topology as Out of Service and then In Service.

Step 5 If the problem persists, contact the Cisco TAC.

G.7.14.3 Topology Goes into L2ServiceNotReady State

A topology goes into L2ServiceNotReady state when there is a mismatch between data in the Prime Optical database and data on the ML-series cards.

Step 1 Launch the Circuit table and check whether all circuits related to the topology are discovered.

Step 2 Launch the Equipment Inventory table and check whether the NE inventory is collected correctly.

Step 3 Complete one of the following options:

- Launch the L2 Topology table and enable the L2 service. The Prime Optical database and ML-series cards synchronize. During the synchronization process, the topology goes into In Progress state, and then into Complete state.
- Do a forced resynchronization of the database by launching the NE Explorer for the NEs in the topology and refreshing the data from the NEs. This restarts the synchronization process. Once the NEs are up, the topology goes into Complete state.

Step 4 If the topology still fails to go into Complete state, try the following options to restart the topology discovery process:

- Telnet to the cards and check whether the configuration parameters are corrupt.
- Mark the NE service related to the NE as Out of Service and then In Service.
- Mark the NEs related to the topology as Out of Service and then In Service.
- Delete the topology, reload the barebone config file on the ML-series cards, and reset the cards. To make sure that the barebone config file is reloaded, telnet to the cards and enter the **write memory** command. Then, recreate the topology.

Step 5 Try one of the following options, depending on when the topology goes into L2ServiceNotReady state:

- If the topology goes into L2ServiceNotReady state immediately after topology creation, choose **Administration > Error Log** and search for the BaseCardConfigWork file. Check the message associated with that file. If the message says “Base Card Config Work Failed,” open the IosTransportModule.log server file and search from the bottom for the “INVALID” parameter. The command that failed is displayed with an INVALID error. Then, launch the CLI and check whether the card is configured correctly.
- If the topology goes into Complete state but then changes to L2ServiceNotReady after several minutes, choose **Administration > Error Log** and search for the BaseCardDetectWork file. If the message associated with that file says “BaseCardDetectWork failed,” check the DataService.log file (or the NE Service log for CTM R7.x or later) in the server and search from the bottom for the “BaseCardDetectWork” parameter. Several lines from the bottom, the file shows the exact reason from the base card detection failure.

Step 6 If the problem persists, contact the Cisco TAC with the relevant logs, as well as a configuration snapshot of the cards used in the topology.

G.7.14.4 Topology Goes into SyncFailed State

A topology can go into SyncFailed state for any of the following reasons:

- A preprovisioned card was used to create the topology. There are two ways to determine whether a card is preprovisioned:
  - Launch the NE Explorer and check whether the card is preprovisioned.
  - Telnet to the card to verify that it is present.
- The barebone configuration file is not present on all of the cards.
- You have not specified the correct Prime Optical-to-ML-series card login details. To verify the login details, launch the Prime Optical Control Panel and click **Security Properties**. Click the appropriate NE tab and verify the username and password for Prime Optical server connections to ML-series cards.
- The database and the ML-series card are not synchronized.

Step 1 Launch the Circuit table and check whether the circuits related to the topology are discovered.

Step 2 Launch the Equipment Inventory table and check whether the NE inventory is collected correctly.

Step 3 Wait for the next synchronization cycle. The database should synchronize and the topology should go into In Progress state. If the topology goes into L2ServiceNotReady state, see G.7.14.3 Topology Goes into L2ServiceNotReady State, page G-26.

Step 4 If the topology still fails to go into Complete state, try the following options:

- Telnet to the cards and check whether the configuration parameters are corrupt.
- Mark the NE service related to the NE as Out of Service and then In Service.
- Mark the NEs related to the topology as Out of Service and then In Service.
- Delete the topology, reload the barebone config file on the ML-series cards, and reset the cards. To make sure that the barebone config file is reloaded, telnet to the cards and enter the **write memory** command. Then, recreate the topology.

Step 5 If the problem persists, contact the Cisco TAC with the relevant logs, as well as a configuration snapshot of the cards used in the topology. Alternatively, telnet to the NEs and enter the **flmDeleteDb** command.

G.7.14.5 Topology Goes into Partially Complete State

A topology goes into Partially Complete state when all of the cards are not synchronized with the Prime Optical database.

This problem also occurs when the data service processes a CARD_CONFIG_DATA_FAILED event for any card in the topology. The topology remains in Partially Complete state until a CARD_CONFIG_DATA_FAILED event is received for the failed card. While the topology is in this state, base card configuration provisioning and detection are performed on other cards in the topology.

Step 1 Launch the Circuit table and check whether all circuits related to the topology are discovered.

Step 2 Launch the Equipment Inventory table and check whether the NE inventory is collected correctly.

Step 3 Wait for the next synchronization cycle. The database should synchronize and the topology should go into Complete state. If the topology goes into L2ServiceNotReady state, see G.7.14.3 Topology Goes into L2ServiceNotReady State, page G-26.

Step 4 If the topology still fails to go into Complete state, try the following options:

- Telnet to the cards and check whether the configuration parameters are corrupt.
- Mark the NE service related to the NE as Out of Service and then In Service.
- Mark the NEs related to the topology as Out of Service and then In Service.
- Launch the NE Explorer for the related NE, click the **Refresh** button, and refresh data from the NE.
- Delete the topology, reload the barebone config file on the cards, and reset the cards. To make sure that the barebone config file is reloaded, telnet to the cards and enter the **write memory** command. Then, recreate the topology.
- Check whether the IOS Users table contains all of the entries for all cards included in a ring.

Step 5 If the problem persists, contact the Cisco TAC with the relevant logs, as well as a configuration snapshot of the cards used in the topology. Alternatively, telnet to the NEs and enter the **flmDeleteDb** command.

G.7.14.6 Prime Optical Cannot Discover the Topology

Step 1 Try the following options to restart the topology discovery process:

- Launch the Circuit table and check whether all circuits related to the topology are discovered.
- Mark the NE service related to the NE as Out of Service and then In Service.
- Mark the NEs related to the topology as Out of Service and then In Service.

Step 2 If the topology is still not discovered, complete the following substeps to enable the trace level in the data service logs:

a. In the Domain Explorer window, choose **Administration > Control Panel**.

b. In the Control Panel window, click **Logging Properties** to open the Logging Properties pane.

c. Click the **General** tab.

d. In the Preferences area, select **Trace** from the Logging Level drop-down list.

e. Click **Save**.

Step 3 On the Prime Optical server, enter the following command to telnet to the local host. The port number depends on the port to which the NE belongs:

```
telnet localhost {9500 | 9501}
```

This starts the data log collection on the server. Check whether the data service logs are populating.

Step 4 Check the data service logs to determine whether or not the circuit addition events are being received correctly. You can do this by searching for the string CIRCUIT_ADDED. If the circuit addition events are not being received correctly, there is a problem with Layer 1 circuit provisioning. If the events are received correctly but the topology is not discovered, the circuit deletion logic failed and you must contact the Cisco TAC with the relevant logs.

G.7.14.7 Prime Optical Cannot Delete the Topology

Step 1 Launch the L2 Topology table and check whether the topology is in Deleting state. If the topology is not in Deleting state, there is a problem with the deletion logic in Prime Optical.

Step 2 Check the state of the related Layer 1 circuits. They should also be in Deleting state. If they are in Deleting state but are not eventually deleted, there is a problem related to Layer 1 circuit provisioning.

Step 3 If not all of the circuits are deleted and they are not in Deleting state, use CTC to delete the circuits.

Step 4 After the circuits are deleted, if the topology is still not deleted, complete the following substeps to enable the data service trace logs and check whether the circuit deletion events are received correctly:

a. In the Domain Explorer window, choose **Administration > Control Panel**.

b. In the Control Panel window, click **Logging Properties** to open the Logging Properties pane.

c. Click the **General** tab.

d. In the Preferences area, select **Trace** from the Logging Level drop-down list.

e. Click **Save**.

Step 5 On the Prime Optical server, telnet to the local host. This starts the data log collection on the server. Check whether the circuit deletion events are being received correctly. If they are not being received, there is a problem with the Layer 1 circuit provisioning. If they are being received, there is a problem with the topology deletion logic in Prime Optical. Delete the topology from the L2 Topology table.

Step 6 Open the ML Cards table for the topology. Check the Additional Info column for the reason for the failure.

Step 7 If the problem persists, contact the Cisco TAC with the relevant logs.

G.7.14.8 How Do I Check Whether All Cards in the Topology Are Synchronized?

Use any of the following options to check whether all cards participating in a topology are synchronized:

- In the Domain Explorer, choose **Administration > CTC-Based NEs > IOS Users Table** and check whether an entry for the user exists on the cards that will be used. If an entry exists, the card is synchronized with Prime Optical.
- Check the ONS1545_NE_Inventory_table for all of the NEs participating in the ring. The entry for the ML card should be present. This is the same as checking the Equipment Inventory table from the Prime Optical client and verifying whether all cards are In Service.

- Verify whether you can launch a CLI session on all of the cards:
  1. Open the NE Explorer for the NE.
  2. Select the card in the tree view.
  3. Click the **Configuration** tab.
  4. Click the **Launch CLI** button.
  5. In the Launch CLI dialog box, enter the username and password.

  If the CLI session does not launch, the card does not have the barebone configuration or there is a communication failure and Prime Optical cannot read the configuration.
- Verify whether all of the cards have synchronized correctly in the eqpt_info_table. Perform the following database query:

  ```
  Select * from eqpt_info_table where objectindex = 221
  ```

  If no rows are found, the card is not synchronized correctly. The card does not have the barebone configuration or there is a communication failure and Prime Optical cannot read the configuration.
- CTM R8.0 and later supports 802.17 RPR, which requires cards to be configured in 802.17 RPR mode. If you include a card in an 802.17 RPR that was used previously as a Cisco RPR, you must reload a fresh barebone configuration, perform a software reset on the card, and then create the topology.

G.7.15 Common VLAN Problems

G.7.15.1 VLAN Is Not Discovered

This problem occurs when the VLAN discovery process fails. Try the following options to restart the VLAN discovery process:

- Telnet to the cards and check whether the VLAN configuration parameters are corrupt.
- Mark the NE service related to the NE as Out of Service and then In Service.
- Mark the NEs related to the topology as Out of Service and then In Service.
- Launch the NE Explorer for the related NE, click the **Refresh** button, and refresh data from the NE.

G.7.15.2 VLAN Is Not Created

If Prime Optical cannot create a VLAN, try the following options:

- If the Prime Optical server is resynchronizing, an error message indicates a VLAN creation failure. Wait for some time before attempting to create the VLAN again.
- If you receive an error message that says you cannot create a bridge group, you might have entered invalid AV pair commands in the CLI. Check the IosTransportModule.log for invalid commands. Enable the Trace error level and check the server logs for exceptions.
- When creating an IP SLA, verify that the associated topology and managed VLAN are synchronized. IP SLA is supported only on NE releases 6.0, 7.0, 7.2, and 8.0. Verify that you are using a supported NE version.

If cards that belong to the topology are not listed in the Manage VLANs dialog box, complete the following steps:

Step 1 Log into the server and enter the following command:

```
cd /opt/CiscoTransportManagerServer/bin
```

Step 2 Run the prune_invalid_l2topo.sh script.

Step 3 Restart the NE service.

G.7.15.3 VLAN Is Not Deleted

If Prime Optical cannot delete a VLAN, try the following options:

- If the Prime Optical server is resynchronizing, an error message indicates a VLAN deletion failure. Wait for some time before attempting to delete the VLAN again.
- Check the IosTransportModule.log for exceptions or invalid commands. Enable the trace error level and check the server logs for exceptions.

G.7.16 PM Data Collection Fails

If PM data collection fails, use a browser to collect PM data directly from the NE. Enter one of the following URLs:

- For real-time PM data:
  - For 15-minute collection, use http://*NE-IP-address*>/pm/15min/1
  - For 1-day collection, use http://*NE-IP-address*>/pm/day/1
- For historical PM data:
  - For 15-minute collection, use http://*NE-IP-address*/pm/15min/*bucket#*
  - For 1-day collection, use http://*NE-IP-address*/pm/day/*bucket#*

  where *bucket#* = (current time - missed historical time) / 900000 + 1

G.7.17 Common L1 Circuit Provisioning Problems

The following levels of information are used to debug circuit problems:

- Prime Optical client level

  The debug level in the Debug Options window is set to Info by default. Set the debug level to Debug so you can save all the log information into a file that can be used to debug problems while launching circuit-related windows or wizards; for example, Circuit Creation wizard, BLSR Creation wizard, Modify Circuit dialog box, Circuit Trace window, and J1 path trace.
- Prime Optical client level with database interaction

  When you perform one of the following operations, the Prime Optical client builds an SQL query and uses the Java Data AcQuisition (JDAQ) system to extract data from the database:

  - Find circuit—After performing this operation, the resulting circuits do not meet the criteria or the circuits that meet the criteria are not displayed.
  - Launching circuit, link, BLSR, and rolls tables—There are issues with the data displayed in the Circuit table, Circuit Span table, Link table, VLAN table, Link Utilization table, Rolls table, and BLSR table.

  Enable the JDAQ data and JDAQ modules in the Debug Options window to resolve issues resulting from performing the above operations; then, verify that all the following are correct:

  - The SQL query that was constructed.
  - The parameter values.
  - The data set that results from the SQL query.

  Logs of the actual data displayed in the tables can be collected by exporting the table data to a text file. Having this data in the form of a text file can be useful when debugging circuit issues.

- Prime Optical client level with Prime Optical server interaction

  Almost all the circuit provisioning features involve interaction with the Prime Optical server. To debug the server-side code, collect the NE service logs from the Prime Optical server. The log files are located at /opt/CiscoTransportManagerServer/log. Identify the NE service for which the issue occurred and set the debug level of the NE Service logs in the Control Panel. If you encounter any of the following, collect the NE service logs from the Prime Optical server:

  - Issues when launching the Circuit Trace window; or, the circuit trace does not display the correct information.
  - Issues related to bridge and roll operations.
  - Issues when creating, modifying, or deleting BLSRs.
  - Issues when launching the J1 path trace; or, the J1 path trace does not display the correct information.
  - Issues when creating, modifying, or deleting circuits.

- Prime Optical level

  Ports are available for debugging. Port number 9410 and higher are allocated for debugging Prime Optical-level circuit information. Each NE service or network service has its own port number starting from port 9410. Unfortunately, there is no way to identify which port number is used by which NE service or network service. So while debugging, start with port 9410 and all managed NEs. If the listed NE is the one you need, continue debugging. Otherwise, try port 9411 and so on.

  The information that is displayed in the port is cached at the Prime Optical server and is useful when resolving issues such as the following:

  - Circuits in Prime Optical and CTC are not synchronized.
  - Deleted circuits are removed from CTC but not from Prime Optical.

  The following commands can be used for debugging:

  - Bye, Exit, Quit—Closes the socket.
  - Help—Prints messages.
  - History [#]—Prints the command history.
  - !<text>—Executes an item in your command history that matches <text>.
  - !!—Executes the last item in your command history.
  - AllmanagedNEs—Prints the details of all managed NEs.

  - Allcircuits—Prints the details for all circuits.
  - Logon *filename*—Logs all the information into a file.
  - Logoff—Stops logging all the information into a file.
  - Debugon—Enables the debug flag.
  - Debugoff—Disables the debug flag.
- NCP level

  Complete the following steps to determine the port number and debug circuit issues in the NCP level:

Step 1 Check the NE service log at /tmp/*Service name*.log and search for "Debug Telnetd: port is *port number*."

Step 2 Note the port number.

Note Each NE service has a different port number.

Step 3 Telnet to the localhost using the debug Telnet port and log in using *CISCO15* as the username for CTM R7.2 and earlier and *otbu+1* for CTM R8.0 and later.

Note Only one user can use the debug port at a time. If the Telnet command fails and the port closes immediately, check for other open sessions. If there is an open sessions that is not used, close the session immediately.

The debug port contains a lot of information regarding the various cached objects in the NCP. Depending on the faulty feature, you have to decide what logs are required. Use the **List** command to list all the objects available on a port. When debugging issues related to circuits, the following objects are useful:

- CircuitEnd
- Circuits
- NetCcatCircuit
- NetCircuit
- NetCircuitEnd
- NetCircuitManager
- NetCircuitNode
- NetCircuitSpan
- NetCircuitSplicer
- NetCircuitWatchDog
- Route and network objects—Used for debugging routing or link issues.
- Topology objects—Used for debugging link-related issues.
- BlsrRingManager—Used for debugging BLSR-related issues.
- Bnrpackage, rollmanager, and roll objects—Used for debugging bridge and roll-related issues.

G.7.17.1 Cannot Route Circuits

Step 1 Make sure that a bandwidth is available for the protected circuit.

Step 2 Enter the following commands to retrieve the dumps before and after the problem occurs:

```
> Net dump
> Topo dump
> Topo topo dump
> Network dump
> Circuits dump
> Splicetree dump
```

Step 3 In the Network Control Protocol (NCP) debug window, enter the following commands:

```
> net set
> nl set
> netlink set
> ncpp set
> preset route
> route set
```

Step 4 Create the circuit and dump all the circuit information into a file.

Step 5 Try manual routing on the circuit that you created and save all information in a file.

G.7.17.2 Circuit Creation Is Successful in CTC but Fails in Prime Optical

Step 1 Enable the debug logs using the remote debugger.

Step 2 In the Prime Optical Control Panel, set the debug level to Debug.

Step 3 Perform the steps listed in G.7.17.1 Cannot Route Circuits, page G-34 and collect the NE service logs.

G.7.17.3 Circuit Table Does Not Display the Correct Information

Step 1 Select the following debug options before opening the Circuit table:

- Circuit Management
- JDAQ
- JDAQ Data

Step 2 Dump all the log information into a file.

Step 3 Open the Circuit table.

Step 4 Export all data from the Circuit table to a file.

Step 5 Identify the remote debug ports of the NEs on which the problem occurs.

Step 6 Log into the debug port and collect the dumps of all managed circuits.

G.7.17.4 Circuits Show Up in Incomplete State, Circuits Are Not Discovered, and Circuit Information in Prime Optical Is Not Consistent with Circuit Information in CTC

Perform the following steps when you create a circuit on a set of NEs and the circuit shows as Incomplete in Prime Optical and in CTC, which is launched from Prime Optical. The circuit shows as Active if CTC is launched from a browser.

Step 1 In the NCP debug port window, enter the following commands:

```
>ncp set
>circuit dump
>splicetree dump
>node nmd hoconnections print
>node nmd loconnections print
>node nmd loedits print
```

Step 2 Telnet to the localhost using the debug Telnet port and log in using *CISCO15* as the username for CTM R7.2 and earlier and *otbu+1* for CTM R8.0 and later.

Step 3 Enter the following commands to create a debug log:

```
> log /tmp/debug.log
> ncpp set
```

Step 4 Create a circuit in Prime Optical and enter the following command to check the circuit name:

```
> circuit dump
```

Step 5 Enter the following command if you created an STS circuit:

```
> node nmd hoconnections print
```

Step 6 Enter the following command if you created a VT circuit:

```
> node nmd loconnections print
```

Note If an NE is moved from one network partition to another, the NCP debug port number changes from one NE service to another.

G.7.17.5 Missing Links

The following commands are useful when resolving a missing link problem:

Note Enter all commands in the NCP debug port window.

- TopologyX dump—Displays all the nodes and links in the topology. It also displays the current topology host. The X variable represents the topology identifier. Do not include the X variable if you want to display all topologies.
- Network dump—Displays all the nodes and links in the network. It also displays the topology to which the nodes and links belong.
- Network dumpwaitQ—Displays the nodes that have been added to the network but do not have valid node ID.

- NettopologyX dump—Displays all the links in the network topology along with the SPT. The SPT determines the nodes and links that a circuit can be routed to or routed through. The X variable represents the network topology identifier. Do not include the X variable if you want to display all the network topologies.
- Netelement_*xxx-xxx-xxx-xxx* dump—Displays the current state of the NE. The *xxx-xxx-xxx-xxx* variable represents the IP address in reverse order. Do not include the *xxx-xxx-xxx-xxx* variable to displays all NEs.
- Nldump—Displays the current state of the each net link.
- TopologyX dumpareas—(*For multiple OSPF areas only.*) Lists all the OSPF areas in the topology and indicates whether the OSPF area is actively monitored by a node.
- TopologyX dumpagents—(*For multiple OSPF areas only.*) Lists all the topology agents or topology hosts and the OSPF areas that they are responsible for.
- TopologyX dumpareatotopoagentmap—(*For multiple OSPF areas only.*) Lists all the topology agents or topology hosts that are responsible for maintaining the topology in an OSPF area.

G.7.17.6 Problems with Manual Links

Sometimes when manual link issues occur in Prime Optical, you have to create the same manual link in CTC before resolving the issue in Prime Optical. These links are called phantom links. Complete the following steps to create a phantom link:

Step 1 Create the phantom link in Prime Optical.

Step 2 Access the CTC Telnet port and run the **network dumpnls** command to dump all the links with termination points listed in hexadecimal form.

Step 3 Convert the hexidecimal numbers to decimal.

Step 4 In CTC, launch the debug window by holding down the Ctrl key and then the **Shift** key and press the **About** key.

Step 5 Enter the following command to create the phantom link between *ipaddress1* and *ipaddress2,* and between the termination points in decimal values:

```
network createPhantom ipadress1 decimal value1 ipadress2 decimal value2
```

G.7.17.7 Debugging Server Trail Links

When debugging server trail link issues, use the same procedure as debugging any other links. Only the size and provision type are different.

If you telnet to an NCP debug port, you can extract server trail link information by using the **network dump** command.

G.7.17.8 Debugging Bridge and Roll-Related Problems

When bridge and roll-related problems occur, Telnet to the NCP debug port and enter the **rolls dump** or **rollmanager set** command.

If there is a mismatch between the bridge and roll information in Prime Optical and CTC, complete the following steps:

Step 1 On the Prime Optical server, telnet to the local host.

Step 2 Log in using CISCO15 or otbu+1 as the username.

Step 3 Enter the following commands:

```
> log /tmp/debug.log
> ncpp set
```

Step 4 Create a new roll in Prime Optical.

Step 5 On the Prime Optical server, enter the following command to check for the new roll:

```
> rolls dump
```

Step 6 Enter the following command to check for the new roll on a circuit:

```
> circuits dump
```

Step 7 Enter the following command if you created an STS circuit roll:

```
> node nmd hoconnections print
```

Step 8 Enter the following command if you created a VT circuit roll:

```
> node nmd loconnections print
```

Step 9 Log off.

Note If NEs are moved from one network partition to another, the NCP debug port number changes from one NE service to another.

If there are any problems while creating a roll or performing any bridge and roll operations, complete the following steps:

Step 1 On the Prime Optical server, telnet to the local host.

Step 2 Log in using CISCO15 or otbu+1 as the username.

Step 3 Enter the following commands:

```
> log /tmp/debug.log
> ncpp set
> rolls set
> rollmanager set
> logoff
```

G.7.18 Common Equipment Provisioning Problems

You can perform equipment provisioning at the following levels:

- G.7.18.1 Node Level, page G-38
- G.7.18.2 Card Level, page G-38

G.7.18.1 Node Level

G.7.18.1.1 Cannot Create DCC Using OSI or OSI and IP (PPP)

If you cannot create a DCC after choosing to use the OSI or OSI and IP (PPP) Layer 3/Layer 2 configuration, go to the **NE Explorer > OSI tab > Routers-Setup** subtab and enable the router on which you want to create the DCC.

G.7.18.1.2 Cannot Modify DCC

If you cannot modify a DCC, check whether the same DCC is created in the SDCC and LDCC.

G.7.18.2 Card Level

The following are guidelines when configuring pluggable port modules (PPMs), loopback, and alarm profiles on the card level.

G.7.18.2.1 PPM Tab

You should provision PPMs before creating pluggable port rates. The following are guidelines when provisioning PPMs on specific cards:

- MRC-12 cards
  - You can provision up to twelve PPMs.
  - If the MRC-12 card is provisioned on slots 1 to 4 or slots 14 to 17, PPM1 is provisioned with only the OC48 rate.
  - If the MRC-12 card is provisioned on slots 5, 6, 12, or 13, you can provision PPM1, PPM4, PPM7, and PPM10 with the OC48 rate.
  - The total available bandwidth of the ports is OC48 when the card is provisioned on slots 1 to 4 or slots 14 to 17.
  - The total available bandwidth of the ports is OC192 when the card is provisioned on slots 5, 6, 12, or 13.
  - The total available bandwidth depends also on the XC card.
- MRC-2.5G-12 cards
  - You can provision up to twelve PPMs.
  - Only PPM1 allows provisioning of the STM16 rate. If PPM1 is provisioned with STM16, the other PPMs are unprovisionable.
  - The total bandwidth of the ports is STM16.
  - PPM1, PPM4, PPM7, and PPM10 only allow provisioning of STM4.
- MRC-2.5G-4 cards
  - You can provision up to four PPMs.
  - Only PPM1 allows provisioning of the OC48 rate. If PPM1 is provisioned with OC48, the other PPMs are unprovisionable.
  - The total bandwidth of the ports is OC48.
- STM64 XFP-based cards
  - You can only provision one PPM.

– The only allowed port rate is STM64.

G.7.18.2.2 Loopback Tab

In the Loopback tab of the NE Explorer, you cannot change the admin state from IS to OOS, DSBLD. You should first change the admin state to OOS, MT or IS, AINS and then OOS, DSBLD.

G.7.18.2.3 Alarm Behavior Tab

You can only create alarm profiles at the node level. The Alarm Behavior tab in the card level of the NE Explorer only allows you to apply existing alarm profiles to the card.

G.7.19 How Do I Collect Solaris Client Thread Dumps?

Step 1 Open a terminal session.

Step 2 Run the client with the ctmc.sh script located in the /opt/CiscoTransportManagerClient directory.

Step 3 Enter the following command to obtain the client Java process ID:

```
ps -aef|grep java
```

Step 4 Enter the following command, where *pid* is the client Java process ID:

```
kill -QUIT pid
```

G.7.20 How Do I Collect Windows Client Thread Dumps?

To collect thread dumps for CTM R5.0.2 and earlier, complete the following steps:

Step 1 Open a DOS window.

Step 2 Run the ctmc.bat file located in the C:\Cisco\TransportManagerClient directory.

Step 3 Generate the thread dump by holding down the **Ctrl** key and pressing the **Pause** (**Break**) key.

Step 4 Copy and paste the output to a text file.

To collect thread dumps for CTM R6.0 and later, complete the following steps:

Step 1 Open a DOS window.

Step 2 Depending on your network size, enter one of the following commands:

```
ctm-small-debug.exe
ctm-medium-debug.exe
ctm-large-debug.exe
ctm-highend-debug.exe
```

Step 3 Generate the thread dump by holding down the **Ctrl** key and pressing the **Pause** (**Break**) key.

Step 4 Copy and paste the output to a text file.

G.7.21 How Do I Collect Server Thread Dumps?

Thread dumps are helpful references when debugging the Prime Optical process. To collect thread dumps:

Step 1 Log into the server workstation as the root user.

Step 2 On the command line, enter the following command:

```
thread_dumper [\Group/Service\]
```

where:

- *Group* is the group name for which to collect thread dumps. It can be:
  - SM
  - SNMPTRAP
  - NE
  - PM
  - GW
- *Service* is the service name for which the thread dump is required. It can be:
  - SMService
  - SNMPTrapService
  - CORBAGWService
  - ONS15216NEService
  - ONS15305NEService
  - ONS15310NEService
  - ONS15327NEService
  - ONS15454NEService
  - ONS15454SDHNEService
  - ONS15530NEService
  - ONS15540NEService
  - ONS15600NEService
  - ONS15600SDHNEService
  - UnmanagedNEService
  - ONS15216PMService
  - ONS15305PMService
  - ONS15310PMService
  - ONS15327PMService
  - ONS15454PMService

- ONS15454SDHPMService
- ONS15530PMService
- ONS15540PMService
- ONS15600PMService
- ONS15600SDHPMService

G.7.22 How Do I Enable or Disable the Automatic Refresh Data Feature?

The automatic Refresh Data feature automatically refreshes all data being displayed by Prime Optical. When automatic refresh is enabled, you receive the following prompt:

```
Refresh Data action suggested. This action will result in closing all windows and might
take some time. Do you want to continue? {Yes | No}
```

In an unstable environment where NEs are synchronizing or changing operational states frequently, you might receive the preceding prompt continuously. To disable the prompt:

Step 1 In the Domain Explorer window, choose **Edit > User Preferences**. The User Preferences dialog box opens.

Step 2 Click the **Miscellaneous** tab.

Step 3 To disable the prompt, uncheck the **Enable Refresh Data Timer** check box. (To enable the prompt, leave the check box checked.)

Step 4 Click **OK**.

G.7.23 How Do I Replace the Alarm Interface Panel?

The Alarm Interface Panel (AIP) provides surge protection for CTC-based NEs. This panel has a nonvolatile memory chip that stores the unique node address known as the MAC address. The MAC address identifies the nodes that support circuits. It allows Prime Optical to determine circuit sources, destinations, and spans.

If an AIP fails, an alarm is generated and the LCD display on the fan-try assemblies of the NEs becomes blank. To perform an in-service replacement of the AIP, you must contact the Cisco TAC.

You can replace the AIP on an in-service system without affecting traffic by using the circuit repair feature. See 7.2.10 Repairing Circuits, page 7-144.

G.8 Client Debug Messages

On Windows, you can start the Prime Optical client with a console window that displays exceptions and client debug messages. You can use these messages to help troubleshoot any client problems.

Step 1 Depending on your network size, enter one of the following commands to start the client with a console window:

```
/bin/ctm-small-debug.exe
/bin/ctm-medium-debug.exe
/bin/ctm-large-debug.exe
/bin/ctm-highend-debug.exe
```

Step 2 When the Prime Optical client exits, the console window closes. If you want to capture and save the messages when the client exits, you must redirect the output to a file. In this case, the console will not be displayed. To save exceptions to a file, open one of the following files that corresponds to your network size:

- /bin/ctm-small-debug.lax
- /bin/ctm-medium-debug.lax
- /bin/ctm-large-debug.lax
- /bin/ctm-highend-debug.lax

Note It is strongly recommended that you save a copy of the original .lax file before modifying it.

Step 3 Using a text editor, open the appropriate .lax file and change the following lines by replacing "console" with a filename:

```
lax.stderr.redirect=console
lax.stdout.redirect=console
```

When specifying filenames, make sure to use escaped backslashes (such as c:\\myfolder\\client.log). For example, to save messages to the C:\myfolder\client.log file, change the lines to read:

```
lax.stderr.redirect=c:\\myfolder\\client.log
lax.stdout.redirect=c:\\myfolder\\client.log
```

Step 4 After modifying the .lax file, enter one of the following commands to launch the Prime Optical client, depending on your network size:

```
/bin/ctm-small-debug.exe
/bin/ctm-medium-debug.exe
/bin/ctm-large-debug.exe
/bin/ctm-highend-debug.exe
```

On Solaris, you can start the Prime Optical client with a console window that displays exceptions and client debug messages. You can use these messages to help troubleshoot any client problems.

Depending on your network size, enter one of the following commands to start the client with a console window:

```
ctmcdebug-start -small
ctmcdebug-start -medium
ctmcdebug-start -large
ctmcdebug-start -highend
```

G.9 Prime Optical GateWay/CORBA Problems

G.9.1 Prime Optical GateWay/CORBA Is Installed After Installing the Prime Optical Server

If the Prime Optical server is installed without the Prime Optical GateWay/CORBA option, and the Prime Optical GateWay/CORBA option is installed later, the Control Panel does not refresh automatically after the Prime Optical GateWay/CORBA installation to show that it has been installed.

This problem occurs because the Prime Optical GateWay/CORBA installation is handled by a script that notifies the database that the component has been installed, but does not notify the Prime Optical server.

To work around this problem, click the **Refresh Data** button in the Control Panel. It might take some time for the Control Panel to show that Prime Optical GateWay/CORBA is installed. You might need to close and reopen the Control Panel to see the change.

G.9.2 Testing Prime Optical GateWay/CORBA

Whenever you encounter Prime Optical GateWay/CORBA problems, complete the following to test Prime Optical GateWay/CORBA:

Step 1 In the Control Panel, make sure that the status of Prime Optical Gate/Way CORBA is Active and that the service action is set to Stop. See 12.2.2.2 Starting or Stopping Prime Optical GateWay/CORBA, page 12-12 and 12.2.2.3 Viewing the Prime Optical GateWay/CORBA Service Pane, page 12-13 for more information.

Step 2 Check that your profile has been created in the Prime Optical Gateway/CORBA Users table. Use that profile and the correct password to connect the OSS client to the Prime Optical server. See 12.2.2.4 Viewing the Prime Optical GateWay/CORBA Users Table, page 12-15 and 12.2.2.5 Adding a Prime Optical GateWay/CORBA User, page 12-16 for more information.

Step 3 If you are still encountering problems after performing steps 1 and 2, log into the server and collect the following logs:

- /tmp/CORBAGWService.log
- /tmo/0.log
- /tmp/jcorbagw/log.bak
- /opt/CiscoTransportManagerServer/log/ CORBAGWService-*.log
- /opt/CiscoTransportManagerServer/openfusion/domains/OpenFusion/localhost/NotificationService/log/NotificationService. log

Step 4 Complete the following steps to change the Prime Optical GateWay/CORBA notification service port to dynamic using the Prime Optical client:

a. In the Domain Explorer window, choose **Administration > Control Panel**.

b. Click **GateWay/CORBA Service** to open the GateWay/CORBA Service pane.

c. In the **Global** tab > **Status** area, click the **Stop** button to stop the service.

d. In the **GateWay/CORBA Configuration** area, set the Notification Service Listening Port Number to zero.

e. Save the changes.

Numbers

20MD-L-E 20-channel Mux/Demux–L band–Even channel

20MD-L-O 20-channel Mux/Demux–L band–Odd channel

24WD-LLR 24-channel Wavelength Demultiplexer–Low Loss–Red band

24WD-R 24-channel Wavelength Demultiplexer–Red band

32WD-IR 32-channel Wavelength Demultiplexer–Infrared band

3R retime, reshape, and regenerate

40MD-C-E 40-channel Mux/Demux–C band–Even channel

40MD-C-O 40-channel Mux/Demux–C band–Odd channel

8MD-C 8-channel Mux/Demux–C band

8WD-B 8-channel Wavelength Demultiplexer–Blue band

CLEI Common Language Equipment Identifier

CLEI codes are used by Telcordia licensees to uniquely identify telecommunications equipment in their networks. A CLEI code is a distinctive identifier for specific telecommunications equipment. The CLEI code conforms to a 10-character alphanumeric structure. These characters define an equipment configuration by specifying basic product type, features, source document, and associated drawings and versions. A CLEI code is unique to a specific piece of equipment and cannot be assigned to any other part. CLEI is a trademark of Telcordia Technologies, Inc.
