Name	Displays the name of the MPLS-TP tunnel.
Description	Displays the description of the MPLS-TP tunnel.
Discovery State	Displays the result of the Prime Optical consistency check. There are two discovery states: • Discovered—The Layer 2 service is marked as Discovered if the Prime Optical consistency check is successful. • Incomplete—The Layer 2 service is marked as Incomplete if the Prime Optical consistency check fails. The MPLS-TP tunnel is not an end-to-end connection.
Tunnel Key	Displays the tunnel key of the MPLS-TP tunnel. Tunnel key is the service identifier and consists of the following details: • Source node ID • Source tunnel number • Destination node ID • Destination tunnel number
Protection	Displays the protection status of the MPLS-TP tunnel: Protected or Unprotected.
Bandwidth Tx (Kbps)	Displays the bandwidth transmitted.
Bandwidth Rx (Kbps)	Displays the bandwidth received.

13.4.3 How Do I View or Modify an MPLS-TP Tunnel?

For descriptions of MPLS-TP and LSP, see the following sections:

- 13.1.2 What Is MPLS-TP?, page 13-3
- 13.1.7 What Is an LSP?, page 13-7

View or modify MPLS-TP tunnels using the Modify TP Tunnel wizard.

Note Some of the fields in the Modify TP Tunnel wizard are not editable.

Note When updated data is available, an information bar appears. Click **Refresh Data** to retrieve updated data.

To view or modify an MPLS-TP tunnel:

Step 1 From the TP Tunnel Service table, select the MPLS-TP tunnel that you want to view or modify. The row you select is highlighted in gray.

Step 2 In the TP Tunnel Service table, choose **Edit > View/Modify** (or click **View/Modify** in the toolbar). The Modify TP Tunnel wizard opens.

Step 3 In the General tab, there are two areas:

a. In the General area, view or modify the following fields:

Note If even one of the NEs forming the MPLS-TP tunnel is not in service or not reachable, you cannot modify the Name and Description fields.

- Name—Displays the name of the MPLS-TP tunnel. To modify the name, delete the previous entry. In the Name field, enter the new name.
- Circuit Status—*Display only.* Displays the circuit status: Discovered or Incomplete.
- State—*Display only.* Displays the operational state: Up or Down.
- Protection—*Display only.* Displays the protection status: Protected or Unprotected.
- Description—Displays the description of the MPLS-TP tunnel. To modify the description, delete the previous entry. In the Description field, enter the new description.
- Monitoring—*Display only.* Displays the monitoring status of the service:

  Monitored—All NEs involved are in service and reachable.

  Not monitored—All the NEs involved are out of service or unreachable.

  Partially monitored—The NEs involved are in a mixed status (some NEs are reachable and others are not).
- Service ID—*Display only.* Displays the service ID.
- Tunnel Key—*Display only.* Displays the tunnel key.
- Tx Bandwidth—*Display only.* Displays the bandwidth transmitted.
- Rx Bandwidth—*Display only.* Displays the bandwidth received.

b. In the Endpoints area, view or modify the following fields:

- Set Admin State on all Endpoints—From the drop-down list, select the admin state to be applied on all endpoints: Up and Down.
- Node—*Display only.* Displays the NE ID.

- Tunnel No.—*Display only.* Displays the tunnel number.
- Admin State—Displays the admin state. Click the cell to enable the drop-down list. From the drop-down list, select the admin state.
- Oper. State—*Display only.* Displays the operational state.
- BFD—Displays the BFD template. Click the cell to enable the drop-down list. From the drop-down list, select the BFD template.

c. (Optional) Click **Reset** to clear the changes made in the General tab.

d. Click **Apply** to apply the changes made in the General tab.

Step 4 In the LSP tab, do any of the following:

- Add LSP—Select an endpoint from the table and click the **Add LSP** button to add an LSP. You can add only two LSPs. See 13.4.6.1 How Do I Add an LSP?, page 13-25.
- Edit LSP—Select an endpoint from the table and click the **Edit LSP** button to modify the LSP. See 13.4.6.2 How Do I Modify an LSP?, page 13-26.
- Trace LSP—Select an endpoint from the table and click the **Trace LSP** button to open the Trace LSP window. See 13.4.6.3 How Do I Trace an LSP?, page 13-27.
- Delete LSP—This Delete LSP button is enabled only if there are two LSPs. Select an endpoint from the table and click the **Delete LSP** button to delete the LSP.

a. In the LSP tab, confirm the following details that are displayed in the table:

- Endpoints
- LSP number
- Service ID
- Direction
- Span number

b. (Optional) Click **Reset** to clear the changes made in the LSP tab.

c. Click **Apply** to apply the changes made in the LSP tab.

Step 5 In the Protection tab, confirm the details and perform actions where allowed:

Note The Protection tab is read-only if the protection status is Unprotected.

- Force lockout of—The working LSP or protect LSP can be locked out. Only one LSP can be locked out at a time. From the Force lockout of drop-down list, select an LSP. The options are Working LSP and Protect LSP.
- In the Protection tab, view or modify the following details:
  - LSP—*Display only.* Displays the LSP number.
  - Role—*Display only.* Displays the role of the LSP: Working or Protect.
  - State—*Display only.* Displays the state of the LSP.
  - Switch State—Displays the switch state of the LSP and nodes. Click the cell to enable the drop-down list. From the drop-down list, select the switch state.

a. (Optional) Click **Reset** to clear the changes made in the Protection tab.

b. Click **Apply** to apply the changes made in the Protection tab.

Step 6 In the Alarm tab, do the following:

- Click the **Sync Alarms** button to synchronize the alarms.
- Click the **Toggle Filter** button to filter the data displayed in the table.

13.4.4 How Do I Delete an MPLS-TP Tunnel?

Note If a topology change is made on the network (for example, if a new CPT node is added to the network using CTC), the state of one or more patchcords changes to invalid state in the Link table. To enable the correct TP tunnel discovery, you must delete all patchcords that change to the invalid state.

To delete an MPLS-TP tunnel:

Step 1 From the TP Tunnel Service table, select the MPLS-TP tunnel that you want to delete. The row you select is highlighted in gray.

Step 2 In the toolbar, click **Delete**.

Step 3 Click **OK** in the confirmation message box.

If one or more NEs forming the MPLS-TP tunnel are not in service or not reachable, the corresponding cross-connections are not deleted and an error message is displayed. However, the cross-connections on the reachable NEs are deleted.

13.4.5 How Do I Trace an MPLS-TP Tunnel?

Note When updated data is available, an information bar appears. Click **Refresh Data** to retrieve updated data.

To view a high-level trace or detailed trace for an MPLS-TP tunnel:

Step 1 From the TP Tunnel Service table, select the MPLS-TP tunnel for which you want to view a high-level trace or detailed trace. The row you select is highlighted in gray.

Step 2 Choose **Configuration > Trace** (or click the **Trace** tool). The TP Tunnel Trace window opens.

Step 3 From the TP Tunnel Trace window, do any of the following:

- Save—Choose **File > Save** to save your settings. Your settings become a custom map that does not affect the default map for the nodes currently displayed in the Network Map. Users who have not saved their custom map will still see the default map for those nodes.

- Save As Default—Choose **File > Save As Default** to save your settings (map background, node icons, and x and y coordinates) as the default settings. Your settings become the default map for the nodes currently displayed in the Network Map, and this default map is seen by users who have not saved their custom map for those nodes. There can be only one default setting per group of nodes in the Network Map.
- Exit—Choose **File > Exit** to close the TP Tunnel Trace window.
- Refresh Data—Choose **View > Refresh Data** (or click the **Refresh Data** tool) to refresh the data displayed in the TP Tunnel Trace window.
- Toggle Trace Level—Choose **View > Toggle Trace Level** (or click the **Switch Between High-Level and Detailed Trace** tool) to switch between high-level trace and detailed trace.
- Zoom In—Choose **Edit > Zoom In** (or click the **Zoom In** tool) to zoom in on an object in the map view. This tool increases the size of all of the graphic objects on the map.
- Zoom Out—Choose **Edit > Zoom Out** (or click the **Zoom Out** tool) to zoom out on the map view. This tool decreases the size of all of the graphic objects on the map.
- Zoom Area—Choose **Edit > Zoom Area** (or click the **Zoom Area** tool) to pan and zoom the view to a different region of the map. Hold down the left mouse button and use the Zoom Area box to highlight an area on the map. When you release the left mouse button, the zoom is applied on the selected area of the map.

Step 4 In high-level trace mode and detailed trace mode, do any of the following from the node:

- Right-click the node and click **Open NE Explorer** to open the NE explorer.
- Right-click the node and click **Open IOS Console** to launch the Cisco IOS CLI window.
- Right-click the node and click **Filter Alarm Table** to enable node-level filtering in the Alarm tab.

Step 5 To enable link-level filtering in the Alarm tab, right-click the link and click **Filter Alarm Table**.

Step 6 In detailed trace mode, do any of the following from the port:

- Right-click the port and click **Open Port** to open the property sheet for the corresponding card.
- Right-click the port and click **Filter Alarm Table** to enable port-level filtering in the Alarm tab.

Step 7 To view or modify an MPLS-TP tunnel, see 13.4.3 How Do I View or Modify an MPLS-TP Tunnel?, page 13-20.

13.4.6 How Do I Launch the Pseudowire Service Table from the TP Tunnel Service Table?

To launch the Pseudowire Service table from the TP Tunnel Service table:

Step 1 From the TP Tunnel Service table, select the TP tunnel.

Step 2 Choose **Configuration > Pseudowire Table** (or click **Open Pseudowire Table** in the toolbar). The Pseudowire Service table opens for the corresponding TP tunnel.

13.4.6.1 How Do I Add an LSP?

For a description of LSP, see 13.1.7 What Is an LSP?, page 13-7.

Add an LSP using the Add LSP wizard.

To add an LSP:

Step 1 In the TP Tunnel Service table, select an MPLS-TP tunnel and choose **Edit > View/Modify** (or click **View/Modify** in the toolbar). The Modify TP Tunnel wizard opens.

Step 2 In the Modify TP Tunnel wizard, go to the LSP tab.

Step 3 Select an endpoint from the table in the LSP tab and click the **Add LSP** button. The Add LSP wizard opens.

Step 4 In the Routing Preferences pane:

a. In the LSP Number area, enter the LSP number in the LSP field. By default, an incremental value is displayed. For example, if the previous LSP number was 245, the new LSP number is will be 246.

b. In the Routing Details area, confirm the details and perform actions where allowed:

Note The Automatic Routing and Use Required Nodes/Spans options are mutually exclusive.

- Check the **Automatic Routing** check box if you want the route to be calculated by the system.
- Check the **Use Required Nodes/Spans** check box if you want to manually select the route. Include or exclude NEs and links from the path.
- Review Labels—*Display only.* By default, this check box is checked.
- Protected Path—The Protected Path check box is disabled because when you add an LSP to an existing TP tunnel, the unprotected TP tunnel is automatically upgraded to a protected TP tunnel.

c. In the Node and Link Diversity Options area, choose one of the following radio buttons if the path is protected and if you want the working LSPs and protect LSPs to be routed using paths that traverse different NEs:

- **Node Diversity Required**—Select if the working LSPs and protect LSPs must be routed on different nodes.
- **Node Diversity Desired**—Select if you prefer the working LSPs and protect LSPs to be routed on different nodes.
- **Link Diversity Only**—Select if you want to route the working LSPs and protect LSPs on different links.

d. Click **Next**.

If you checked the Automatic Routing check box, go to Step 5. If you checked the Use Required Nodes/Spans check box, go to Step 6.

Step 5 In the Review Routing pane, the route calculated by the system is displayed. There are two areas:

a. In the NE Map area, the following details are displayed:

- Blue links are the working LSPs.
- Green link is the existing LSP.
- Red dotted link is the new LSP.

b. In the Routing Constraints area, the following details are displayed:

- Working—Displays the working spans and provides a summary of the links and ports used by the Layer 2 service.
- Protected—Displays the protected spans and provides a summary of the links and ports used by the Layer 2 service.

c. Click **Next**.

Step 6 If you chose to manually route, confirm the details and perform actions where allowed in the Review Routing pane:

a. NE Map—Do any of the following:

- Insert Node/Link—Select the NE or link from the NE map and click the **Insert Node/Link** button. The selected NE or link is added and is displayed in the Required NE/Links section.
- Exclude Node/Link—Select the NE or link from the NE map and click the **Exclude Node/Link** button. The selected NE or link is excluded and is displayed in the Excluded NE/Links section.
- Calculate Routing—The working LSPs and protect LSPs have independent routing constraints. Click **Calculate Routing** to calculate the routing.
- Clear—Click **Clear** to clear the routing constraints.

b. Routing Constraints—Confirm the details:

- LSP Constraints—Displays the LSP constraints.
- LSP Routing Summary—Displays the working spans and provides a summary of the LSPs used by the Layer 2 service.

c. Click **Next**.

Step 7 In the Review Labels pane, review the label settings that are automatically calculated by the system and click **Provision**. A new LSP is created and the details are displayed in a table in the LSP tab.

13.4.6.2 How Do I Modify an LSP?

For a description of LSP, see 13.1.7 What Is an LSP?, page 13-7.

Modify an LSP using the Modify LSP wizard.

Note Some of the fields in the Modify LSP wizard are not editable.

To modify an LSP:

Step 1 In the TP Tunnel Service table, select an MPLS-TP tunnel and choose **Edit > View/Modify** (or click **View/Modify** in the toolbar). The Modify TP Tunnel wizard opens.

Step 2 In the Modify TP Tunnel wizard, go to the LSP tab.

Step 3 Select an endpoint from the table in the LSP tab and click the **Edit LSP** button. The Modify LSP wizard opens.

Step 4 In the LSP tab, view or modify the following:

Note If even one of the NEs forming the LSP is not in service or not reachable, you cannot modify the Local Label and Out Label fields.

- LSP No.—*Display only.* Displays the LSP number.
- Role—*Display only.* Displays the role of the LSP: Working or Protected.
- Monitoring—*Display only.* Displays the monitoring status of the service:
  - Monitored—All NEs involved are in service and reachable.
  - Not monitored—All the NEs involved are out of service or unreachable.
  - Partially monitored—The NEs involved are in a mixed status (some NEs are reachable and others are not).
- In the Labels table, view or modify the following details:
  - Port—*Display only.* Displays the port number.
  - Link No.—*Display only.* Displays the number of the MPLS link used.
  - Local Label—Displays the local label number. Double-click the cell to edit the local label.
  - Out Label—Displays the out label number. Double-click the cell to edit the out label.
  - Path—*Display only.* Displays the path: Forward or Reverse.

a. (Optional) Click **Reset** to clear the changes made in the LSP tab.

b. Click **Apply** to apply the changes made in the LSP tab.

Step 5 In the Alarm tab, do any of the following:

- Click the **Sync Alarms** button to synchronize the alarms.
- Click the **Toggle Filter** button to filter the data displayed in the table.

13.4.6.3 How Do I Trace an LSP?

For a description of LSP, see 13.1.7 What Is an LSP?, page 13-7.

To view a high-level trace or detailed trace of an LSP:

Step 1 In the TP Tunnel Service table, select an MPLS-TP tunnel and choose **Edit > View/Modify** (or click **View/Modify** in the toolbar). The Modify TP Tunnel wizard opens.

Step 2 In the Modify TP Tunnel wizard, go to the LSP tab.

Step 3 From the table, select an endpoint and click the **Trace LSP** button. The Trace LSP window opens.

Step 4 From the Trace LSP window, do any of the following:

- Save—Choose **File > Save** to save your settings. Your settings become a custom map that does not affect the default map for the nodes currently displayed in the Network Map. Users who have not saved their custom map will still see the default map for those nodes.

- Save As Default—Choose **File > Save As Default** to save your settings (map background, node icons, and x and y coordinates) as the default settings. Your settings become the default map for the nodes currently displayed in the Network Map and this default map is seen by users who have not saved their custom map for those nodes. There can be only one default setting per group of nodes in the Network Map.
- Exit—Choose **File > Exit** to close the Trace LSP window.
- Refresh Data—Choose **View > Refresh Data** (or click the **Refresh Data** tool) to refresh the data displayed in the Trace LSP window
- Toggle Trace Level—Choose **View > Toggle Trace Level** (or click the **Switch Between High-Level and Detailed Trace** tool) to switch between high-level trace and detailed trace.
- Zoom In—Choose **Edit > Zoom In** (or click the **Zoom In** tool) to zoom in on an object in the map view. This tool increases the size of all of the graphic objects on the map.
- Zoom Out—Choose **Edit > Zoom Out** (or click the **Zoom Out** tool) to zoom out on the map view. This tool decreases the size of all of the graphic objects on the map.
- Zoom Area—Choose **Edit > Zoom Area** (or click the **Zoom Area** tool) to pan and zoom the view to a different region of the map. Hold down the left mouse button and use the Zoom Area box to highlight an area on the map. When you release the left mouse button, the zoom is applied on the selected area of the map.

Step 5 In high-level trace mode and detailed trace mode, do any of the following from the node:

- Right-click the node and click **Open NE Explorer** to open the NE explorer.
- Right-click the node and click **Open IOS Console** to launch the Cisco IOS CLI window.
- Right-click the node and click **Filter Alarm Table** to enable node-level filtering in the Alarm tab.

Step 6 To enable link-level filtering in the Alarm tab, right-click the link and click **Filter Alarm Table**.

Step 7 In detailed trace mode, do any of the following from the port:

- Right-click the port and click **Open Port** to open the property sheet for the corresponding card.
- Right-click the port and click **Filter Alarm Table** to enable port-level filtering in the Alarm tab.

Step 8 To modify an LSP, see 13.4.6.2 How Do I Modify an LSP?, page 13-26.

13.5 Pseudowires

This section describes the following:

- 13.5.1 How Do I Create a Pseudowire?, page 13-29
- 13.5.2 Understanding the PW Service Table, page 13-34
- 13.5.3 How Do I View or Modify a Pseudowire?, page 13-35
- 13.5.4 How Do I Delete a Pseudowire?, page 13-37
- 13.5.5 How Do I Trace a Pseudowire?, page 13-37

13.5.1 How Do I Create a Pseudowire?

For a description of pseudowire, see 13.1.4 What Is Pseudowire?, page 13-4.

Create a pseudowire using the Create Pseudowire Circuit wizard. The following table describes the launch points and the expected behavior for the Create Pseudowire Circuit wizard.

Table 13-5 Create Pseudowire Circuit Wizard Launch Points and Expected Behavior

Launch Points	Expected Behavior
Source NE node in the Domain Explorer or Subnetwork Explorer	Select the source ONS 15454 NE in the Domain Explorer or Subnetwork Explorer and choose **Configuration > PT System > Provision > Create Pseudowire**. The Create Pseudowire Circuit wizard opens. The source NE is preset to the selected source.
Source and destination NE nodes in the Domain Explorer or Subnetwork Explorer	Select the source ONS 15454 NE in the Domain Explorer or Subnetwork Explorer, right-click the NE, and choose **Create L2 Service > Create Pseudowire**. The pointer changes to a plus (+) symbol; select the destination NE. The destination NE must be in the same network partition as the source. The Create Pseudowire Circuit wizard opens. Source and destination NEs are preset to the selected source and destination. **Note** If you press the **Esc** key while the plus symbol is enabled, the operation is canceled and the plus symbol returns to a pointer.
Source and destination NE nodes in the Network Map	Select **Layer 2** as the layer rate from the drop-down list in the Network Map toolbar. Select the source ONS 15454 NE in the Network Map, right-click the NE, and choose **Create L2 Service > Create Pseudowire**. The pointer displays a line extending from the source NE; select the destination NE. The Create Pseudowire Circuit wizard opens. Source and destination NEs are preset to the selected source and destination NE nodes in the Network Map.

To create a pseudowire:

Step 1 Select a node for which to create a pseudowire and open the Create Pseudowire Circuit wizard. For an explanation of wizard launch points, see Table 13-5 on page 13-29.

Step 2 In the PW Circuit Attribute pane:

a. In the AC Global Attribute area, do the following:

- Enter the pseudowire name in the PW Name field.
- Enter a description for the pseudowire in the PW Description field.

- Select the pseudowire type from the PW Type drop-down list. The options are Ethernet and VLAN. The pseudowire type depends on the configuration of the node.
- Click the **Up** or **Down** radio button to select the pseudowire status.

b. In the Redundancy area, do the following:

- Check the **Enabled** check box to enable pseudowire redundancy, and then follow the subsequent steps. If you do not enable redundancy, go to c.
- Check the **Dual Homed Peer** check box to create a special case of pseudowire protection. If you check the Dual Homed Peer check box, the pseudowire will have an additional endpoint (T-PE3).
- In the Enable Delay field, enter the number of seconds that the backup pseudowire must wait to take over after the primary pseudowire goes down. The range is from 0 to 180 seconds.
- Click the **Delay** radio button. In the Delay field, enter the number of seconds that the primary pseudowire must wait after it becomes active to take over from the backup pseudowire. The range is from 0 to 180 seconds.
- Click the **Never** radio button to specify that the primary pseudowire never takes over from the backup pseudowire.

c. In the Bandwidth area, do the following:

- Enter the bandwidth in the Value field. Bandwidth determines the quality of service for the pseudowire.
- Click the appropriate radio button: Kbps, Mbps, or Gbps.

d. Click **Next**.

Step 3 (For unidirectional tunnels) In the PW Source TP pane, check the **Unmanaged** check box if the destination node is not a CPT node. In the Router ID field, enter the IP address of the unmanaged router.

Step 4 In the AC Endpoint area, identify the attachment circuit (AC) with the exact endpoint of the CPT System:

a. To choose a port to serve as an endpoint for the pseudowire, do the following:

- From the Shelf drop-down list, select the shelf.
- From the Slot drop-down list, select the slot.
- From the Port drop-down list, select the port.

b. To choose a channel group to serve as an endpoint for the pseudowire, do the following:

- Check the **Channel Group** check box.
- From the Channel Group drop-down list, select the channel group to serve as an endpoint.
- Click **Manual Load Balancing** to configure manual load balancing on the ports of the channel group. The Manual Load Balancing dialog box appears.
- In the Primary Load-Balanced Link area, select a port from the Primary drop-down list.
- In the Backup Load-Balanced Link area, select the required ports from the Available Ports list and click the right arrow button to move the ports to the Selected Ports list.
- Click **Apply**.

Step 5 In the AC Attributes area, select the AC type. From the drop-down list, select Port Based or VLAN Based. If you select VLAN Based as the AC type, the Configure EFP and Configure QoS buttons are enabled. You must complete the following steps before proceeding to Step 6:

- Configure EFP—See 13.5.1.1 How Do I Configure an EFP?, page 13-33.
- Configure QoS—See 13.5.1.2 How Do I Configure QoS?, page 13-34.

Step 6 In the PW Attributes area, do the following:

a. From the PW Class drop-down list, select the pseudowire class.

b. In the VC ID field, enter the VC ID used by the pseudowire.

c. Check the **Local Label** check box to specify that the pseudowire segment starting from T-PE1 is static. In the Local Label field, enter an unused static label. Otherwise, the pseudowire segment is dynamic.

If redundancy is not enabled, go to Step 8.

Step 7 In the PW Backup Attributes area, do the following:

a. From the PW Class drop-down list, select the backup pseudowire class.

b. In the VC ID field, enter the VC ID used by the backup pseudowire.

c. Check the **Local Label** check box to specify that the backup pseudowire segment starting from T-PE1 is static. In the Local Label field, enter an unused static label. Otherwise, the backup pseudowire segment is dynamic.

Step 8 Click **Next**.

Step 9 In the PW Destination TP pane:

a. From the Node drop-down list, select the destination node for the pseudowire and complete Step 3 to Step 8, as appropriate.

b. Click **Next**.

Step 10 In the PW Secondary Destination TP pane:

a. From the Node drop-down list, select the secondary destination node for the pseudowire and complete Step 3 to Step 8, as appropriate.

b. Click **Next**.

Step 11 In the PW Circuit Path pane, confirm the following details:

- NE Map—Displays the network topology. The blue link is the TP tunnel link used for routing.
- Spans—Displays the working spans in the Spans tab.

Step 12 In the PW Circuit Path pane, go to the Working S-PEs tab. The S-PE Nodes area is displayed.

Step 13 Click **Add**. The Add Node dialog box opens. Do the following:

a. (For unidirectional tunnels) Check the **Unmanaged** check box. In the Router ID field, enter the IP address of the unmanaged router.

b. (For bidirectional tunnels) From the Node drop-down list, select the node.

c. Click **Apply**. The node is added and is displayed in the SPE Nodes box.

d. (Optional) Select the node and click **Up** to move the selected node to the top of the SPE Nodes box.

e. (Optional) Select the node and click **Down** to move the selected node to the bottom of the SPE Nodes box.

f. (Optional) Select the node and click **Remove** to remove the node.

Step 14 In the Segment: 1 area, do the following:

a. In the Neighbor ID field, enter the neighbor ID.

b. From the PW Class drop-down list, select the PW class.

c. In the VC ID field, enter the VC ID.

d. (For static pseudowire segments) In the Local Label field, enter an unused static label.

e. Click **Advanced Configuration**. The Advanced Configuration dialog box opens. Do the following:

- (For dynamic pseudowire segments) In the MTU field, enter the MTU value.
- (For static pseudowire segments) Check the **Requested** check box and in the VLAN field, enter the VLAN ID.
- (For dynamic pseudowire segments) In the Interface Description field, enter the interface description.
- From the VCCV Flags drop-down list, select the VCCV flag.
- Click **Apply** to save the advanced configuration for Segment: 1.

Step 15 In the Segment: 2 area, do the following:

a. In the Neighbor ID field, enter the neighbor ID.

b. From the PW Class drop-down list, select the PW class.

c. In the VC ID field, enter the VC ID.

d. (For static pseudowire segments) In the Local Label field, enter an unused static label.

e. Click **Advanced Configuration**. The Advanced Configuration dialog box opens. Do the following:

- (For dynamic pseudowire segments) In the MTU field, enter the MTU value.
- (For static pseudowire segments) Check the **Requested** check box. In the VLAN field, enter the VLAN ID.
- (For dynamic pseudowire segments) In the Interface Description field, enter the interface description.
- From the VCCV Flags drop-down list, select the VCCV flag.
- Click **Apply** to save the advanced configuration for Segment: 2.

Step 16 Click **Provision**. A pseudowire service is created and the details are displayed in the PW Service table. If the details are not displayed in the PW Service table, refresh the table.

For more information about the PW Service table, see 13.5.2 Understanding the PW Service Table, page 13-34. For more information about troubleshooting pseudowires, see 13.7.2 Understanding the Pseudowire Cross-Connections Table, page 13-52.

13.5.1.1 How Do I Configure an EFP?

For a description of an EFP, see 13.1.9 What Is an EFP?, page 13-8.

Configure EFP using the EFP Configuration wizard.

To configure EFP:

Step 1 In the Outer VLAN Configuration area, do the following:

a. Select the type of VLAN tagging by clicking the appropriate radio button. The options are Double Tagged, Single Tagged, Untagged, Default, and Any.

b. From the TP ID drop-down list, select the TP ID. The options are dot1q, dot1ad, 0x9100, and 0x9200.

c. In the VLAN Tag field, enter the VLAN tag.

d. The Exact check box is enabled only if you select Single Tagged as the VLAN tagging type. Check the **Exact** check box if the EFP must match the exact VLAN tag.

Step 2 In the Inner VLAN Configuration area, do the following:

a. From the TP ID drop-down list, select the TP ID. The options are dot1q, dot1ad, 0x9100, and 0x9200.

b. In the VLAN Tag field, enter the VLAN tag.

Step 3 In the Rewrite Ingress Operation area, do the following:

a. From the Operation drop-down list, select the rewrite operation. The options are PUSH 1, PUSH 2, POP 1, POP 2, Translate 1-to-1, Translate 1-to-2, and Translate 2-to-1.

b. From the Outer VLAN TP ID drop-down list, select the outer VLAN TP ID. The options are dot1q, dot1ad, 0x9100, and 0x9200.

c. In the Outer VLAN Tag field, enter the outer VLAN tag.

d. From the Inner VLAN TP ID drop-down list, select the inner VLAN TP ID. The options are dot1q, dot1ad, 0x9100, and 0x9200.

e. In the Inner VLAN Tag field, enter the inner VLAN tag.

f. Check the **Symmetric** check box to enable the symmetric rewrite operation.

Step 4 In the Miscellaneous Configuration area, do the following in the Statistics area:

- In Prime Optical 9.6.3, the Ingress check box is checked by default and you cannot modify it.
- Check the **Egress** check box to enable egress statistics collection.

Step 5 Click **Apply** to save the EFP configuration.

13.5.1.2 How Do I Configure QoS?

Configure QoS using the QoS Configuration wizard.

To configure QoS:

Step 1 From the Table Map drop-down list, select the table map.

Step 2 From the Ingress drop-down list, select the ingress policy.

Step 3 From the Egress drop-down list, select the egress policy.

Step 4 Click **Apply** to apply the QoS configuration.

Step 5 (Optional) Click **Close** to the exit the QoS Configuration wizard.

13.5.2 Understanding the PW Service Table

For a description of pseudowire, see 13.1.4 What Is Pseudowire?, page 13-4.

View or modify a pseudowire using the PW Service table. The PW Service table lists the pseudowires created. To launch the table, select an NE or a group and choose **Configuration > PT System > Display > Pseudowire Table**.

The following topics describe what you can do in the PW Service table:

- 13.5.3 How Do I View or Modify a Pseudowire?, page 13-35
- 13.5.4 How Do I Delete a Pseudowire?, page 13-37
- 13.5.5 How Do I Trace a Pseudowire?, page 13-37

The following table describes the fields in the PW Service table.

Table 13-6 Field Descriptions for the PW Service Table

Field	Description
Name	Displays the name of the pseudowire.
Description	Displays the description of the pseudowire.
Discovery State	Displays the result of the Prime Optical consistency check. There are two discovery states: • Discovered—The Layer 2 service is marked as Discovered if the Prime Optical consistency check is successful. • Incomplete—The Layer 2 service is marked as Incomplete if the Prime Optical consistency check fails. The pseudowire is not an end-to-end connection.
Protection	Displays the protection status of the pseudowire: Protected or Unprotected.
Bandwidth (Kbps)	Displays the bandwidth.

13.5.3 How Do I View or Modify a Pseudowire?

For a description of pseudowire, see 13.1.4 What Is Pseudowire?, page 13-4.

View or modify pseudowire using the Modify PW Circuit wizard.

Note Some of the fields in the Modify PW Circuit wizard are not editable.

Note When updated data is available, an information bar appears. Click **Refresh Data** to retrieve updated data.

To view or modify a pseudowire:

Step 1 From the PW Service table, select the pseudowire that you want to view or modify. The row is highlighted in gray.

Step 2 In the PW Service table, choose **Edit > View/Modify** (or click **View/Modify** in the toolbar). The Modify PW Circuit wizard opens.

Step 3 In the General tab, view or modify the following fields:

Note If even one of the NEs forming the pseudowire is not in service or not reachable, you cannot modify the Name and Description fields.

a. Name—Displays the name of the pseudowire. To modify the name:
   - Delete the previous entry.
   - In the Name field, enter the new name.

b. Circuit Status—*Display only.* Displays the circuit status: Discovered or Incomplete.

c. State—*Display only.* Displays the state: Up or Down.

d. Description—Displays the description of the pseudowire. To modify the description:
   - Delete the previous entry.
   - In the Description field, enter the new description.

e. Monitoring—*Display only.* Displays the monitoring status of the service:
   - Monitored—All NEs involved are in service and reachable.
   - Not monitored—All the NEs involved are out of service or unreachable.
   - Partially monitored—The NEs involved are in a mixed status (some NEs are reachable and others are not).

f. Type—*Display only.* Displays the type of the pseudowire: Ethernet or VLAN.

g. Service ID—*Display only.* Displays the service ID.

h. No. of Spans—*Display only.* Displays the number of spans.

i. Redundancy—*Display only.* Displays whether redundancy is enabled or disabled.

j. Bandwidth (Kbps)—*Display only.* Displays the bandwidth.

k. (Optional) Click **Reset** to clear the changes made in the General tab.

l. Click **Apply** to apply the changes made in the General tab.

Step 4 In the T-PE Nodes tab, view or modify the following fields:

a. Set Admin State on all Endpoints—From the drop-down list, select the admin state to be applied on all endpoints: Up and Down.

b. Node—*Display only.* Displays the node ID.

c. Router ID—*Display only.* Displays the router ID.

d. Admin State—Displays the admin state. Click the cell to modify the admin state.

e. Oper. State—*Display only.* Displays the operational state.

f. (Optional) Click **Reset** to clear the changes made in the T-PE Nodes tab.

g. Click **Apply** to apply the changes made in the T-PE Nodes tab.

Step 5 In the AC Attributes tab (which is display only), confirm the following details that are displayed in a table:

- Node ID—Click the right arrow to expand the node ID row. You can view the following details:
  - Outer—Displays the outer VLAN tagging type.
  - Inner—Displays the inner VLAN tagging type.
  - Rewrite Ingress operation—Click the right arrow to expand the rewrite ingress operation row. You can view the Outer (symmetric) and Inner rows.
  - Statistics—Displays whether statistics collection is enabled or disabled.
- TP ID—Displays the TP ID.
- VLAN Tag—Displays the VLAN tag details.

Step 6 In the PW Attributes tab (which is display only), confirm the following details that are displayed in the table:

- Node—Displays the node details.
- Peer ID—Displays the IP address of the peer.
- PW Class—Displays the pseudowire class.
- VC ID—Displays the VC ID.
- Local Label—Displays the local label.
- Remote Label—Displays the remote label.

Step 7 In the QoS tab, view or modify the following fields:

a. Node—*Display only.* Displays the node details.

b. Table Map—Double-click the cell to modify the table map.

c. Ingress Policy—Double-click the cell to modify the ingress policy.

d. Egress Policy—Double-click the cell to modify the egress policy.

e. (Optional) Click **Reset** to clear the changes made in the QoS tab.

f. Click **Apply** to apply the changes made in the QoS tab.

Step 8 In the Alarm tab, do the following:

- Click the **Sync Alarms** button to synchronize the alarms.
- Click the **Toggle Filter** button to filter the data displayed in the table.

13.5.4 How Do I Delete a Pseudowire?

To delete a pseudowire:

Step 1 From the PW Service table, select the pseudowire that you want to delete. The row that you select is highlighted in gray.

Step 2 In the toolbar, click **Delete**.

Step 3 Click **OK** in the confirmation message box.

If one or more NEs forming the pseudowire are not in service or not reachable, the corresponding cross-connections are not deleted and an error message is displayed. However, the cross-connections on the reachable NEs are deleted.

13.5.5 How Do I Trace a Pseudowire?

Note When updated data is available, an information bar appears. Click **Refresh Data** to retrieve updated data.

To view a high-level trace or detailed trace for a pseudowire:

Step 1 From the PW Service table, select the pseudowire for which you want to view a high-level trace or detailed trace. The row you select is highlighted in gray.

Step 2 Choose **Configuration > Trace** (or click the **Trace** tool). The PW Circuit Trace window opens.

Step 3 From the PW Circuit Trace window, do any of the following:

- Save—Choose **File > Save** to save your settings. Your settings become a custom map that does not affect the default map for the nodes currently displayed in the Network Map. Users who have not saved their custom map will still see the default map for those nodes.
- Save As Default—Choose **File > Save As Default** to save your settings (map background, node icons, and x and y coordinates) as the default settings. Your settings become the default map for the nodes currently displayed in the Network Map, and this default map is seen by users who have not saved their custom map for those nodes. There can be only one default setting per group of nodes in the Network Map.
- Exit—Choose **File > Exit** to close the PW Circuit Trace window.
- Refresh Data—Choose **View > Refresh Data** (or click the **Refresh Data** tool) to refresh the data displayed in the PW Circuit Trace window.
- Toggle Trace Level—Choose **View > Toggle Trace Level** (or click the **Switch Between High-Level and Detailed Trace** tool) to switch between high-level trace and detailed trace.
- Zoom In—Choose **Edit > Zoom In** (or click the **Zoom In** tool) to zoom in on an object in the map view. This tool increases the size of all of the graphic objects on the map.

- Zoom Out—Choose **Edit > Zoom Out** (or click the **Zoom Out** tool) to zoom out on the map view. This tool decreases the size of all of the graphic objects on the map.
- Zoom Area—Choose **Edit > Zoom Area** (or click the **Zoom Area** tool) to pan and zoom the view to a different region of the map. Hold down the left mouse button and use the Zoom Area box to highlight an area on the map. When you release the left mouse button, the zoom is applied on the selected area of the map.

Step 4 In high-level trace mode and detailed trace mode, do any of the following from the node:

- Right-click the node and click **Open NE Explorer** to open the NE explorer.
- Right-click the node and click **Open IOS Console** to launch the IOS CLI window.
- Right-click the node and click **Filter Alarm Table** to enable node-level filtering in the Alarm tab.

Step 5 To enable link-level filtering in the Alarm tab, right-click the link and click **Filter Alarm Table**.

Step 6 In detailed trace mode, do any of the following from the port:

- Right-click the port and click **Open Port** to open the property sheet for the corresponding card.
- Right-click the port and click **Filter Alarm Table** to enable port-level filtering in the Alarm tab.

Step 7 To view or modify a pseudowire, see 13.5.3 How Do I View or Modify a Pseudowire?, page 13-35.

13.6 EVCs

This section describes the following:

- 13.6.1 How Do I Create an EVC?, page 13-38
- 13.6.2 Understanding the EVC Service Table, page 13-42
- 13.6.3 How Do I View or Modify an EVC?, page 13-43
- 13.6.4 How Do I Delete an EVC?, page 13-47
- 13.6.5 How Do I Trace an EVC?, page 13-47

13.6.1 How Do I Create an EVC?

For a description of EVC, see 13.1.5 What Is an EVC?, page 13-6.

Create an EVC using the Create EVC Circuit wizard. The following table describes the launch points and the expected behavior for the Create EVC Circuit wizard.

Table 13-7 Create EVC Circuit Wizard Launch Points and Expected Behavior

Launch Points	Expected Behavior
Source NE node in the Domain Explorer or Subnetwork Explorer	Select the source ONS 15454 NE in the Domain Explorer or Subnetwork Explorer and choose **Configuration > PT System > Provision > Create EVC**. The Create EVC Circuit wizard opens. The source NE is preset to the selected source.
Source and destination NE nodes in the Domain Explorer or Subnetwork Explorer	Select the source ONS 15454 NE in the Domain Explorer or Subnetwork Explorer, right-click the NE, and choose **Create L2 Service > Create EVC**. The pointer changes to a plus (+) symbol; select the destination NE. The destination NE must be in the same network partition as the source. The Create EVC Circuit wizard opens. Source and destination NEs are preset to the selected source and destination. **Note** If you press the **Esc** key while the plus symbol is enabled, the operation is canceled and the plus symbol returns to a pointer.
Source and destination NE nodes in the Network Map	Select **Layer 2** as the layer rate from the drop-down list in the Network Map toolbar. Select the source ONS 15454 NE in the Network Map, right-click the NE, and choose **Create L2 Service > Create EVC**. The pointer displays a line extending from the source NE; select the destination NE. The Create EVC Circuit wizard opens. Source and destination NEs are preset to the selected source and destination NE nodes in the Network Map.

To create an EVC:

Step 1 Select a node for which to create an EVC and open the Create EVC Circuit wizard. For an explanation of wizard launch points, see Table 13-7 on page 13-39.

Step 2 In the Info View pane:

a. In the EVC Details area, do the following:

- In the EVC Name field, enter the name of the EVC.
- In the EVC Description field, enter the description of the EVC.
- From the EVC Type drop-down list, select the EVC type: Private Line, Virtual Private Line, Private LAN, or Virtual Private LAN.
- From the State drop-down list, select the EFP state: Up and Down. This EFP state maps to the EFP admin state in the Cisco IOS software.
- Open Ended—Check the **Open Ended** check box to create an open-ended circuit.

b. In the Bandwidth area, do the following:

- In the Bandwidth Tx field, enter the bandwidth to be transmitted and click the appropriate radio button.
- In the Bandwidth Rx field, enter the bandwidth to be received and click the appropriate radio button.

c. Click **Next**.

Step 3 In the Source pane:

a. From the Node drop-down list, select the source node.

b. To choose a port to serve as the source EFP, confirm the details and perform actions where allowed:

- Shelf—Displays the shelf number, which is automatically retrieved from the NE.
- From the Slot drop-down list, select the slot.

- From the Port drop-down list, select the port. The ports populated in the drop-down list depend on the selected slot.

c. Check the **Channel Group** check box to select a channel group to serve as the source EFP.

- From the Channel Group drop-down list, select the channel group to serve as the source EFP.
- Click **Manual Load Balancing** to configure manual load balancing on the ports of the channel group. The Manual Load Balancing dialog box appears.
- In the Primary Load-Balanced Link area, from the Primary drop-down list, select a port.
- In the Backup Load-Balanced Link area, from the Available Ports list, select the required ports. Click the right arrow button to move the ports to the Selected Ports list.
- Click **Apply**.

d. Click **Next**.

Step 4 In the Destination pane:

a. From the Node drop-down list, select the destination node.

b. To choose a port to serve as the destination EFP, confirm the details and perform actions where allowed:

- Shelf—Displays the shelf number, which is automatically retrieved from the NE.
- From the Slot drop-down list, select the slot.
- From the Port drop-down list, select the port. The ports populated in the drop-down list depend on the selected slot.

c. Check the **Channel Group** check box to choose a channel group to serve as the destination EFP, and then do the following:

- From the Channel Group drop-down list, select the channel group to serve as the destination EFP.
- Click **Manual Load Balancing** to configure manual load balancing on the ports of the channel group. The Manual Load Balancing dialog box appears.
- In the Primary Load-Balanced Link area, from the Primary drop-down list, select a port.
- In the Backup Load-Balanced Link area, from the Available Ports list, select the required ports. Click the right arrow button to move the ports to the Selected Ports list.
- Click **Apply**.

d. Click **Next**.

Step 5 In the Routing pane:

Note The Automatic Routing and Use Required Nodes options are mutually exclusive.

- If you want the route to be calculated by the system, check the **Automatic Routing** check box. Go to Step 6.
- If you want to manually select the route. check the **Use Required Nodes/Spans** check box Go to Step 7.

Step 6 The Node Selection pane is display-only and shows the EVC route as a blue link. Click **Next** and go to Step 8.

Step 7 In the Node Selection pane:

a. To specify the nodes to include in (or exclude from) the EVC, modify, as needed, the options in the NE Map:

- Select the node and click the **Include Node/Link** button. The selected node is added and is displayed in the Required NEs/Links section.
- Select the node and click the **Exclude Node/Link** button. The selected node is excluded and is displayed in the Excluded NEs/Links section.
- The nodes have independent routing constraints. Click **Calculate Routing** to calculate the routing.
- Click **Clear** to clear the routing constraints.

b. The Routing Constraints area displays the following details:

- Constraints—The working NEs added using the Include Node/Link option and the working NEs excluded using the Exclude Node/Link option. To delete a node, right-click the node and click **Delete**.
- Spans Summary—A summary of the spans, links, and ports used by the Layer 2 service.

c. Click **Next**.

Step 8 In the Review EFP pane, specify the VLAN configuration for the EFPs:

a. Select an EFP in the EVC path:

- The node is populated in the Node drop-down list.
- The port is populated in the Port drop-down list.

b. In the Outer VLAN Configuration area, do the following:

- Select the type of VLAN tagging by clicking the appropriate radio button: Double Tagged, Single Tagged, Untagged, Default, or Any.
- From the TP ID drop-down list, select the TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
- In the VLAN Tag field, enter the VLAN tag.
- The Exact check box is enabled only if you select the VLAN tagging type as Single Tagged. Check the **Exact** check box if the EFP must match the exact VLAN tag.

c. In the Inner VLAN Configuration area, do the following:

- From the TP ID drop-down list, select the TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
- In the VLAN Tag field, enter the VLAN tag.

d. In the Rewrite Ingress Operation area, do the following:

- From the Operation drop-down list, select the rewrite operation: PUSH 1, PUSH 2, POP 1, POP 2, Translate 1-to-1, Translate 1-to-2, or Translate 2-to-1.
- From the Outer VLAN TP ID drop-down list, select the outer VLAN TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
- In the Outer VLAN Tag field, enter the outer VLAN tag.
- From the Inner VLAN TP ID drop-down list, select the inner VLAN TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
- In the Inner VLAN Tag field, enter the inner VLAN tag.
- Check the **Symmetric** check box to enable the symmetric rewrite operation.

e. In the Miscellaneous Configuration area, do the following:

- (For Multipoint EVCs) In the Split Horizon area, check the **Enable Split Horizon** check box to enable the split horizon for the EFPs.
- In the Statistics area, check the **Ingress** check box to enable ingress statistics collection, or check the **Egress** check box to enable egress statistics collection.

f. Click **Apply** to apply this configuration on the selected EFP.

g. Click **Apply All** to derive the EFP configuration on all the EFPs in the EVC path from the source UNI and network-to-network interface (NNI) EFP configuration.

The source node UNI and NNI EFP configuration that is specified are copied to the destination node UNI and NNI, respectively. The source node NNI configuration is copied to all the other EFPs. If the EVC has only one node, the Apply All button is disabled.

Step 9 Click **Provision**. An EVC is created and the details are displayed in the EVC Service table. If the details are not displayed in the EVC Service table, refresh the table.

For more information about the EVC Service table, see 13.6.2 Understanding the EVC Service Table, page 13-42. For more information about troubleshooting EVCs, see 13.7.3 Understanding the EVC Cross-Connections Table, page 13-54.

13.6.2 Understanding the EVC Service Table

For a description of EVC, see 13.1.5 What Is an EVC?, page 13-6.

View or modify an EVC from the EVC Service table. The EVC Service table lists the EVCs created. To launch the EVC Service table, select an NE or a group and choose **Configuration > PT System > Display > EVC Table**.

The following topics describe what you can do in the EVC Service table:

- 13.6.3 How Do I View or Modify an EVC?, page 13-43
- 13.6.4 How Do I Delete an EVC?, page 13-47
- 13.6.5 How Do I Trace an EVC?, page 13-47

The following table describes the fields in the EVC Service table.

Table 13-8 Field Descriptions for the EVC Service Table

Field	Description
Name	Displays the name of the EVC.
Description	Displays the description of the EVC.
Discovery State	Displays the result of the Prime Optical consistency check. There are two discovery states: • Discovered—The Layer 2 service is marked as Discovered if the Prime Optical consistency check is successful. • Incomplete—The Layer 2 service is marked as Incomplete if the Prime Optical consistency check fails. The EVC is not an end-to-end connection.
Operational State	Displays the operational state of the EVC circuit: Up or Down.

13.6.3 How Do I View or Modify an EVC?

For descriptions of EVC, EFP, bridge domain, IGMP snooping, and MVR, see the following sections:

- 13.1.5 What Is an EVC?, page 13-6
- 13.1.9 What Is an EFP?, page 13-8
- 13.1.10 What Is a Bridge Domain?, page 13-9
- 13.1.11 What Is IGMP Snooping?, page 13-9
- 13.1.12 What Is MVR?, page 13-10

View or modify an EVC using the Modify EVC Circuit wizard.

Note Some of the fields in the Modify EVC Circuit wizard are not editable.

Note When updated data is available, an information bar appears. Click **Refresh Data** to retrieve updated data.

To view or modify an EVC:

Step 1 Select a row in the EVC Service table. The row is highlighted in gray.

Step 2 In the EVC Service table, choose **Edit > View/Modify** (or click **View/Modify** in the toolbar). The Modify EVC Circuit wizard opens.

Step 3 In the General tab (which is display only), confirm the following details:

- Name—Displays the name of the EVC.
- Description—Displays the description of the EVC.
- Monitoring—*Display only.* Displays the monitoring status of the service:
  - Monitored—All NEs involved are in service and reachable.
  - Not monitored—All the NEs involved are out of service or unreachable.
  - Partially monitored—The NEs involved are in a mixed status (some NEs are reachable and others are not).
- Circuit Status—Displays the status of the EVC: Discovered or Incomplete.
- Service ID—Displays the service ID of the EVC.
- EVC Type—Displays the type of the EVC. The EVC type can be:
  - Ethernet Private Line
  - Ethernet Virtual Private Line
  - Ethernet Private LAN
  - Ethernet Virtual Private LAN

Step 4 In the Endpoint EFPs tab, the endpoints are listed in a table. Do any of the following:

a. Add Drop—Click the **Add Drop** button to add a drop. To add a drop, see 13.6.5.1 How Do I Add a Drop?, page 13-48.

b. Delete Drop—To delete a drop, do the following:
   - Select the endpoint from the Endpoints table.
   - Click the **Delete Drop** button.
   - Click **OK** in the confirmation message box. The endpoint is deleted.

c. (Optional) Click **Reset** to clear the changes made in the Endpoints tab.

d. Click **Apply** to apply the changes made in the Endpoints tab.

Step 5 In the EFP Configuration tab, view or modify the EFP configuration settings:

a. Node ID—*Display only.* Click the right arrow to expand the node ID row. You can view the following details:
   - Slot/Port—*Display only.* Displays the slot number and the port number.
   - Outer—*Display only.* Displays the outer VLAN tagging type.
   - Inner—*Display only.* Displays the inner VLAN tagging type.
   - Rewrite Ingress Operation—*Display only.* Displays the rewrite ingress operation status. Click the right arrow to expand the rewrite ingress operation row. You can view the Outer (symmetric) and Inner rows.
   - Statistics—*Display only.* Displays the type of statistics collection (ingress or egress).

b. TP ID—*Display only.* Displays the TP ID.

c. VLAN Tag—*Display only.* Displays the VLAN tag details.

d. Admin State—Displays the admin state. Click the cell to enable the drop-down list. From the drop-down list, select the admin state: Up and Down.

e. MLB—Displays the manual load balancing configuration. Click the cell to enable the drop-down list. From the drop-down list, select the manual load balancing configuration.

f. (Optional) Click **Reset** to clear the changes made in the EFP Configuration tab.

g. Click **Apply** to apply the changes made in the EFP Configuration tab.

Step 6 In the QoS tab, view or modify the QoS settings on individual EFPs and the node:

a. Node—*Display only.* Displays the node ID.

b. Ingress Policy—Displays the ingress policy applied. Click the cell to enable the drop-down list. All the available ingress QoS policies are populated in the drop-down list. From the drop-down list, select the ingress QoS policy that you want to apply.

c. Egress Policy—Displays the egress policy applied. Click the cell to enable the drop-down list. All the available egress QoS policies are populated in the drop-down list. From the drop-down list, select the egress QoS policy that you want to apply.

d. (Optional) Click **Reset** to clear the changes made in the QoS tab.

e. Click **Apply** to apply the changes made in the QoS tab.

Step 7 In the IGMP Snooping tab, view or modify the IGMP snooping settings:

a. In the Bridge Domain Configuration table, view or modify the following:
   - Bridge Domain—*Display only.* Displays the node ID, slot number, and port number.
   - In the IGMP Snooping column, check the check box to enable IGMP snooping on the corresponding bridge domain.

- In the Immediate Leave column, check the check box to enable immediate leave. When you enable IGMP immediate leave, IGMP snooping immediately removes a port when it detects an IGMP version 2 leave message on that port.
- In the Report Suppression column, check the check box to enable report suppression. When you enable report suppression, the bridge domain forwards only one IGMP report for each multicast query.

b. In the EFP Configuration table, do the following:

- Ethernet Flow Port—*Display only.* Displays the node ID, slot number, and port number.
- In the IGMP Static Router Port column, click the cell to enable the drop-down list. The options are True and False. To add a static router to the EFP, from the drop-down list, select True.

c. (Optional) Click **Reset** to clear the changes made in the IGMP Snooping tab.

d. Click **Apply** to apply the changes made in the IGMP Snooping tab.

Step 8 In the MAC Learning tab, view or modify the MAC learning settings:

a. In the Bridge Domain Configuration table, view or modify the following:

- Bridge Domain—*Display only.* Displays the node ID, slot number, and port number.
- In the MAC Learning column, check the check box to enable MAC learning on the corresponding bridge domain.
- In the Limit column, double-click the cell and enter the upper limit on the number of MAC addresses that reside in a bridge domain. The default MAC address limit on a bridge domain is 1000. The maximum MAC address limit on a bridge domain is 128000.

b. To add MAC addresses, do the following in the EFP Configuration table:

- Select a node.
- Click the **Add MAC Addresses** button. The Add Static MAC Addresses dialog box opens.

Note You can add multiple MAC addresses.

- In the MAC Address field, enter the MAC address.
- Click **Add**. The MAC address appears in the text box. To remove the MAC address, select the MAC address from the text box and click **Remove**.
- Click **Apply**. The MAC address is added.

c. To delete MAC addresses, do the following in the EFP Configuration table:

- Select a node.
- Click the **Clear MAC Addresses** button.
- Click **OK** in the confirmation text box. The MAC addresses are deleted.

d. In the EFP Configuration table, view or modify the following:

- Node—*Display only.* Displays the node ID.
- MAC Address—*Display only.* Displays the MAC address. To add MAC addresses, go to b. To delete MAC addresses, go to c.

e. (Optional) Click **Reset** to clear the changes made in the MAC Learning tab.

f. Click **Apply** to apply the changes made in the MAC Learning tab.

Step 9 In the MVR tab, view or modify the MVR settings:

a. In the Bridge Domain Configuration table, view or modify the following:

- Bridge Domain—*Display only.* Displays the node ID, slot number, and port number.
- In the MVR column, check the check box to enable MVR for the corresponding bridge domain.

b. In the EFP Configuration table, view or modify the following:

- Ethernet Flow Point—*Display only.* Displays the node ID, slot number, and port number.
- In the MVR Type column, click the cell to enable the drop-down list. The MVR Type can be None, Source, or Receiver for each EFP.
- In the Source Service ID column, click the cell, and from the drop-down list, select an MVR-enabled service.
- In the Immediate Leave column, check the check box to enable the drop-down list. The options are True and False. When you enable immediate leave, MVR immediately removes a port when it detects a leave message on that port.
- In the VLAN column, double-click the cell and enter the VLAN ID.

c. (Optional) Click **Reset** to clear the changes made in the MVR tab.

d. Click **Apply** to apply the changes made in the MVR tab.

Step 10 In the Alarm tab, do any of the following:

- Click the **Sync Alarms** button to synchronize the alarms.
- Click the **Toggle Filter** button to filter the data displayed in the table.

13.6.4 How Do I Delete an EVC?

To delete an EVC:

Step 1 From the EVC Service table, select the EVC that you want to delete. The row that you select is highlighted in gray.

Step 2 In the toolbar, click **Delete**.

Step 3 Click **OK** in the confirmation message box.

If one or more NEs forming the EVC are not in service or not reachable, the corresponding cross-connections are not deleted and an error message is displayed. However, the cross-connections on the reachable NEs are deleted.

13.6.5 How Do I Trace an EVC?

Note When updated data is available, an information bar appears. Click **Refresh Data** to retrieve updated data.

To view a high-level trace or detailed trace for an EVC:

Step 1 From the EVC Service table, select the EVC for which you want to view a high-level trace or detailed trace. The row that you select is highlighted in gray.

Step 2 Choose **Configuration > Trace** (or click the **Trace** tool). The EVC Circuit Trace window opens.

Step 3 From the EVC Circuit Trace window, do any of the following:

- Save—Choose **File > Save** to save your settings. Your settings become a custom map that does not affect the default map for the nodes currently displayed in the Network Map. Users who have not saved their custom map will still see the default map for those nodes.
- Save As Default—Choose **File > Save As Default** to save your settings (map background, node icons, and x and y coordinates) as the default settings. Your settings become the default map for the nodes currently displayed in the Network Map, and this default map is seen by users who have not saved their custom map for those nodes. There can be only one default setting per group of nodes in the Network Map.
- Exit—Choose **File > Exit** to close the EVC Circuit Trace window.
- Refresh Data—Choose **View > Refresh Data** (or click the **Refresh Data** tool) to refresh the data displayed in the EVC Circuit Trace window.
- Toggle Trace Level—Choose **View > Toggle Trace Level** (or click the **Switch Between High-Level and Detailed Trace** tool) to switch between high-level trace and detailed trace.
- Zoom In—Choose **Edit > Zoom In** (or click the **Zoom In** tool) to zoom in on an object in the map view. This tool increases the size of all of the graphic objects on the map.
- Zoom Out—Choose **Edit > Zoom Out** (or click the **Zoom Out** tool) to zoom out on the map view. This tool decreases the size of all of the graphic objects on the map.

- Zoom Area—Choose **Edit > Zoom Area** (or click the **Zoom Area** tool) to pan and zoom the view to a different region of the map. Hold down the left mouse button and use the Zoom Area box to highlight an area on the map. When you release the left mouse button, the zoom is applied on the selected area of the map.

Step 4 In high-level trace mode and detailed trace mode, do any of the following from the node:

- Right-click the node and click **Open NE Explorer** to open the NE explorer.
- Right-click the node and click **Open IOS Console** to launch the Cisco IOS CLI window.
- Right-click the node and click **Filter Alarm Table** to enable node-level filtering in the Alarm tab.

Step 5 To enable link-level filtering in the Alarm tab, right-click the link and click **Filter Alarm Table**.

Step 6 In detailed trace mode, do any of the following from the port:

- Right-click the port and click **Open Port** to open the property sheet for the corresponding card.
- Right-click the port and click **Filter Alarm Table** to enable port-level filtering in the Alarm tab.

Step 7 To view or modify an EVC, see 13.6.3 How Do I View or Modify an EVC?, page 13-43.

13.6.5.1 How Do I Add a Drop?

Add a drop using the Add Drop wizard.

To add a drop:

Step 1 Complete Step 1 through Step 3 in 13.6.3 How Do I View or Modify an EVC?, page 13-43.

Step 2 Click the **Add Drop** button. The Add Drop wizard launches.

Step 3 In the Destination pane, do the following:

a. From the Node drop-down list, select the destination node.

b. To choose a port to serve as the destination EFP, confirm the details and perform actions where allowed:

- Shelf—Displays the shelf number, which is automatically retrieved from the NE.
- From the Slot drop-down list, select the slot.
- From the Port drop-down list, select the port. The ports populated in the drop-down list depend on the selected slot.

c. Check the **Channel Group** check box to choose a channel group to serve as the destination EFP.

- From the Channel Group drop-down list, select the channel group to serve as the destination EFP.
- Click **Manual Load Balancing** to configure manual load balancing on the ports of the channel group. The Manual Load Balancing dialog box appears.
- In the Primary Load-Balanced Link area, from the Primary drop-down list, select a port.
- In the Backup Load-Balanced Link area, from the Available Ports list, select the required ports. Click the right arrow button to move the ports to the Selected Ports list.
- Click **Apply**.

d. Click **Next**.

Step 4 In the Routing pane, do the following:

Note The Automatic Routing and Use Required Nodes options are mutually exclusive.

- If you want the route to be calculated by the system, check the **Automatic Routing** check box. Go to Step 5.
- If you want to manually select the route, check the **Use Required Nodes/Spans** check box. Include or exclude NEs and links from the path. Go to Step 6.

Step 5 The Node Selection pane is display-only and shows the EVC route as a blue link. Click **Next** and go to Step 7.

Step 6 In the Node Selection pane, do any of the following:

a. To specify the nodes to include in (or exclude from) the EVC, modify, as needed, the options in the NE Map:
   - Select the node and click the **Include Node/Link** button. The selected node is added and is displayed in the Required NEs/Links section.
   - Select the node and click the **Exclude Node/Link** button. The selected node is excluded and is displayed in the Excluded NEs/Links section.
   - The nodes have independent routing constraints. Click **Calculate Routing** to calculate the routing.
   - Click **Clear** to clear the routing constraints.

b. The Routing Constraints area displays the following details:
   - Working—The working NEs added using the Include Node/Link option and the working NEs excluded using the Exclude Node/Link option. To delete a node, right-click the node and click **Delete**.
   - Spans Summary—A summary of the spans, links, and ports used by the Layer 2 service.

c. Click **Next**.

Step 7 In the Review EFP pane, specify the VLAN configuration for the EFPs:

a. Select an EFP in the EVC path:
   - The node is populated in the Node drop-down list.
   - The port is populated in the Port drop-down list.

b. In the Outer VLAN Configuration area, do the following:
   - Select the type of VLAN tagging by clicking the appropriate radio button: Double Tagged, Single Tagged, Untagged, Default, or Any.
   - From the TP ID drop-down list, select the TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
   - In the VLAN Tag field, enter the VLAN tag.
   - The Exact check box is enabled only if you select the VLAN tagging type as Single Tagged. Check the **Exact** check box to match the exact tag.

c. In the Inner VLAN Configuration area, do the following:
   - From the TP ID drop-down list, select the TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
   - In the VLAN Tag field, enter the VLAN tag.

d. In the Rewrite Ingress Operation area, do the following:

- From the Operation drop-down list, select the rewrite operation: PUSH 1, PUSH 2, POP 1, POP 2, Translate 1-to-1, Translate 1-to-2, or Translate 2-to-1.
- From the Outer VLAN TP ID drop-down list, select the outer VLAN TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
- In the Outer VLAN Tag field, enter the outer VLAN tag.
- From the Inner VLAN TP ID drop-down list, select the inner VLAN TP ID: dot1q, dot1ad, 0x9100, or 0x9200.
- In the Inner VLAN Tag field, enter the inner VLAN tag.
- Check the **Symmetric** check box to enable the symmetric rewrite operation.

e. In the Miscellaneous Configuration area, do the following:

- (For Multipoint EVCs) In the Split Horizon area, check the **Enable Split Horizon** check box to enable the split horizon for the EFPs.
- In the Statistics area, check the **Ingress** check box to enable ingress statistics collection or check the **Egress** check box to enable egress statistics collection.

f. Click **Apply** to apply this configuration on the selected EFP.

g. Click **Apply All** to derive the EFP configuration on all the EFPs in the EVC path from the source UNI and network-to-network interface (NNI) EFP configuration.

The source node UNI and NNI EFP configuration that is specified are copied to the destination node UNI and NNI, respectively. The source node NNI configuration is copied to all the other EFPs. If the EVC has only one node, the Apply All button is disabled.

Step 8 Click **Provision**. An endpoint is created and the details are displayed in the Endpoints table in the Endpoint EFPs tab.

13.7 Understanding Advanced Troubleshooting Options

Use the Advanced Troubleshooting options to troubleshoot Layer 2 services. In Prime Optical, the PT System Advanced Troubleshooting options are visible only to SuperUser and NetworkAdmin users.

Choose **Configuration > PT System > Advanced Troubleshooting**. The following options are available:

- TP Tunnel Cross-Connections Table—Allows you to launch the TP Tunnel Cross-Connections table.
- Pseudowire Cross-Connections Table—Allows you to launch the Pseudowire Cross-Connections table.
- EVC Cross-Connections Table—Allows you to launch the EVC Cross-Connections table.
- Refresh L2 Service Data Discovery—Allows you to refresh Layer 2 services.

From the TP Tunnel Cross-Connections table, Pseudowire Cross-Connections table, and EVC Cross-Connections table, you can identify whether the Operational State or Admin State of a particular service is Down. The Discovery State column displays whether the discovery is successful or not. You can perform the following operations from these tables:

- Rediscover
- Refresh

- Delete
- Open the corresponding service table

The following topics describe the Advanced Troubleshooting options:

- 13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table, page 13-51
- 13.7.2 Understanding the Pseudowire Cross-Connections Table, page 13-52
- 13.7.3 Understanding the EVC Cross-Connections Table, page 13-54
- 13.7.4 Understanding the Refresh L2 Service Data Discovery Option, page 13-55

13.7.1 Understanding the MPLS-TP Tunnel Cross-Connections Table

Step 1 Select an NE or a group.

Step 2 Choose **Configuration > PT System > Advanced Troubleshooting > TP Tunnel Cross-Connections Table**. The MPLS-TP Tunnel Cross-Connections table opens.

Step 3 From the MPLS-TP Tunnel Cross-Connections table, do any of the following:

- Delete—To delete an MPLS-TP cross-connection:
  - Select the MPLS-TP cross-connection that you want to delete. The row you select is highlighted in gray.
  - Choose **Edit > Delete**.
  - Click **OK** in the confirmation message box. The MPLS-TP cross-connection is deleted.
- Open TP Tunnel Table—To cross-launch the TP Tunnel Service table:
  - Select the MPLS-TP cross-connection for which you want to cross-launch the TP Tunnel Service table. The row you select is highlighted in gray.
  - Choose **Edit > Open TP Tunnel Table** (or click **Open TP Tunnel Table** in the toolbar). The TP Tunnel Service table for the selected MPLS-TP cross-connection opens.
- Rediscover—To rediscover an MPLS-TP cross-connection:
  - Select the MPLS-TP cross-connection that you want to rediscover. The row you select is highlighted in gray.
  - Choose **Configuration > Rediscover** (or click **Rediscover** in the toolbar).
  - Click **OK** in the confirmation message box. The data for the selected MPLS-TP cross-connection is deleted from the Prime Optical database and then rediscovered from the NE.
- Update—To force polling on an MPLS-TP cross-connection:
  - Select the MPLS-TP cross-connection on which you want to force polling on. The row you select is highlighted in gray.
  - Choose **Configuration > Update** (or click **Update** in the toolbar). Polling is forced on the selected MPLS-TP cross-connection. If there are any changes, the selected MPLS-TP cross-connection is updated.

The following table describes the fields in the MPLS-TP Tunnel Cross-Connections table.

Table 13-9 Field Descriptions for the MPLS-TP Tunnel Cross-Connections Table

Field	Description
Service Name	Displays the name of the MPLS-TP tunnel cross-connection.
Description	Displays the description of the MPLS-TP tunnel cross-connection.
Service ID	Displays the service ID of the MPLS-TP tunnel cross-connection.
Node ID	Displays the node ID of the MPLS-TP tunnel cross-connection.
Discovery State	Displays the discovery state of the MPLS-TP tunnel cross-connection. Values are: • Clean—Discovery is successful and Prime Optical was able to save the data in the database. • Dirty—Prime Optical was unable to save some of the data in the database.
Operational State	Displays the operational state of the MPLS-TP tunnel cross-connection: Up or Down.
Admin State	Displays the admin state of the MPLS-TP tunnel cross-connection: Up or Down.
Cross-Connection Type	Displays the cross-connection type of the MPLS-TP tunnel: Midpoint or Endpoint.

13.7.2 Understanding the Pseudowire Cross-Connections Table

Step 1 Select an NE or a group.

Step 2 Choose **Configuration > PT System > Advanced Troubleshooting > Pseudowire Cross-Connections Table**. The Pseudowire Cross-Connections table opens.

Step 3 From the Pseudowire Cross-Connections table, do any of the following:

- Delete—To delete a pseudowire cross-connection:
  - Select the pseudowire cross-connection that you want to delete. The row you select is highlighted in gray.
  - Choose **Edit > Delete**.
  - Click **OK** in the confirmation message box. The pseudowire cross-connection is deleted.
- Open Pseudowire Table—To cross-launch the PW Service table:
  - Select the pseudowire cross-connection for which you want to cross-launch the PW Service table. The row you select is highlighted in gray.
  - Choose **Edit > Open Pseudowire Table** (or click **Open Pseudowire Table** in the toolbar). The PW Service table for the selected pseudowire cross-connection opens.
- Rediscover—To rediscover a pseudowire cross-connection:
  - Select the pseudowire cross-connection that you want to rediscover. The row you select is highlighted in gray.
  - Choose **Configuration > Rediscover** (or click **Rediscover** in the toolbar).

  - Click **OK** in the confirmation message box. The data for the selected pseudowire cross-connection is deleted from the Prime Optical database and then rediscovered from the NE.
- Update—To force polling on a pseudowire cross-connection:
  - Select the pseudowire cross-connection on which you want to force polling on. The row you select is highlighted in gray.
  - Choose **Configuration > Update** (or click **Update** in the toolbar). Polling is forced on the selected pseudowire cross-connection. If there are any changes, the selected pseudowire cross-connection is updated.

The following table describes the fields in the Pseudowire Cross-Connections table.

Table 13-10 Field Descriptions for the Pseudowire Cross-Connections Table

Field	Description
Service Name	Displays the name of the pseudowire cross-connection.
Description	Displays the description of the pseudowire cross-connection.
Service ID	Displays the service ID of the pseudowire cross-connection.
Node ID	Displays the node ID of the pseudowire cross-connection.
Discovery State	Displays the discovery state of the pseudowire cross-connection. Values are: • Clean—Discovery is successful and Prime Optical was able to save the data in the database. • Dirty—Prime Optical was unable to save some of the data in the database.
Operational State	Displays the operational state of the pseudowire cross-connection: Up or Down.
Admin State	Displays the admin state of the pseudowire cross-connection: Up or Down.
Cross-Connection Type	Displays the cross-connection type of the pseudowire: PW Midpoint or PW Endpoint.

13.7.3 Understanding the EVC Cross-Connections Table

Step 1 Select an NE or a group.

Step 2 Choose **Configuration > PT System > Advanced Troubleshooting > EVC Cross-Connections Table**. The EVC Cross-Connections table opens.

Step 3 From the EVC Cross-Connections table, do any of the following:

- Delete—To delete an EVC cross-connection:
  - Select the EVC cross-connection that you want to delete. The row you select is highlighted in gray.
  - Choose **Edit > Delete**.
  - Click **OK** in the confirmation message box. The EVC cross-connection is deleted.
- Open EVC Table—To cross-launch the EVC Service table:
  - Select the EVC cross-connection for which you want to cross-launch the EVC Service table. The row you select is highlighted in gray.
  - Choose **Edit > Open EVC Table** (or click **Open EVC Table** in the toolbar). The EVC Service table for the selected EVC cross-connection opens.
- Rediscover—To rediscover an EVC cross-connection:
  - Select the EVC cross-connection that you want to rediscover. The row you select is highlighted in gray.
  - Choose **Configuration > Rediscover** (or click **Rediscover** in the toolbar).
  - Click **OK** in the confirmation message box. The data for the selected EVC cross-connection is deleted from the Prime Optical database and then rediscovered from the NE.
- Update—To force polling on an EVC cross-connection:
  - Select the EVC cross-connection on which you want to force polling on. The row you select is highlighted in gray.
  - Choose **Configuration > Update** (or click **Update** in the toolbar). Polling is forced on the selected EVC cross-connection. If there are any changes, the selected EVC cross-connection is updated.

The following table describes the fields in the EVC Cross-Connections table.

Table 13-11 Field Descriptions for the EVC Cross-Connections Table

Field	Description
Service Name	Displays the name of the EVC cross-connection.
Description	Displays the description of the EVC cross-connection.
Service ID	Displays the service ID of the EVC cross-connection.
Node ID	Displays the node ID of the EVC cross-connection.

Table 13-11 Field Descriptions for the EVC Cross-Connections Table (continued)

Field	Description
Discovery State	Displays the discovery state of the EVC cross-connection. Values are: • Clean—Discovery is successful and Prime Optical was able to save the data in the database. • Dirty—Prime Optical was unable to save some of the data in the database.
Operational State	Displays the operational state of the EVC cross-connection: Up or Down.
Admin State	Displays the admin state of the EVC cross-connection: Up or Down.
Service Type	Displays the service type of the EVC cross-connection.

13.7.4 Understanding the Refresh L2 Service Data Discovery Option

To refresh all the Layer 2 services, choose **Configuration > PT System > Advanced Troubleshooting > Refresh L2 Service Data Discovery**.

The Refresh L2 Service Data Discovery option allows you retrieve the current data from the Prime Optical database. After you click Refresh L2 Service Data Discovery, the following tables are updated with the current data from the Prime Optical database:

- TP Tunnel Service Table
- PW Service Table
- EVC Service Table
- TP Tunnel Cross-Connections Table
- Pseudowire Cross-Connections Table
- EVC Cross-Connections Table

13.8 CPT System QoS

This section describes the following:

- 13.8.1 How Do I Create and Manage QoS Objects?, page 13-55
- 13.8.2 How Do I Provision QoS Objects in the CPT System?, page 13-66

13.8.1 How Do I Create and Manage QoS Objects?

For a description of the CPT System QoS, see 13.1.6 What Is CPT System QoS?, page 13-7.

The PT System QoS Editor allows you to create and manage QoS objects in the Prime Optical database. To launch the PT System QoS Editor, choose **Configuration > PT System > Provision > QoS Editor**.

The following table lists the tabs and the function of each option in the PT System QoS Editor.

Table 13-12 PT System QoS Editor Tabs and Options

Tab	Options	Function
Class Maps—See 13.8.1.1 How Do I Create and Manage Class Maps?, page 13-57	Add	Allows you to add a class map.
	Remove	Allows you to delete a class map.
	Edit	Allows you to edit a class map.
	Matching Attributes area	Displays the matching attributes and the value for each attribute.
Actions—See 13.8.1.2 How Do I Add and Manage Actions?, page 13-58	Add	Allows you to add an action.
	Remove	Allows you to delete an action.
	Edit	Allows you to edit an action.
	Traffic Marking	Allows you to create and manage traffic markers.
	Ingress Policing	Allows you to configure ingress policing. Policing provides a means to limit the amount of bandwidth that the traffic traveling through a given port or a service instance can use. Policing works by defining an amount of data that the router is willing to receive in kilobytes per second (KB/s). When policing is configured, it limits the flow of data through the router by dropping or marking down the QoS value. When policing is configured, traffic is placed in one of the following categories: • Conform • Exceed • Violate You can decide the action to be applied from the following three categories: • Packets that conform can be configured to be transmitted. • Packets that exceed can be configured to be sent with a decreased priority. • Packets that violate can be configured to be dropped.
	Egress Shaping	Allows you to configure egress shaping. Traffic shaping allows you to control the traffic going out of an interface in order to match its flow to the speed of the remote target interface and to ensure that the traffic conforms to policies contracted for it. You can use shaping to meet downstream requirements, thereby eliminating bottlenecks in topologies with data-rate mismatches. Shaping is the process of delaying packets in queues to make them conform to a specified profile.
Policy Maps—See 13.8.1.3 How Do I Create and Manage Policy Maps?, page 13-62	Add	Allows you to add a policy map.
	Remove	Allows you to delete a policy map.
	Edit	Allows you to edit a policy map.

Table 13-12 PT System QoS Editor Tabs and Options (continued)

Tab	Options	Function
Table Maps—See 13.8.1.4 How Do I Create and Manage Table Maps?, page 13-64	Add	Allows you to add a table map.
	Remove	Allows you to delete a table map.
	Edit	Allows you to edit a table map.
	Attributes area	Displays the attributes and the value for each attribute.

13.8.1.1 How Do I Create and Manage Class Maps?

Create and manage class maps using the PT System QoS Editor. You can perform the following operations:

- Create a class map—13.8.1.1.1 How Do I Create a Class Map?, page 13-57
- Edit a class map—13.8.1.1.2 How Do I Edit a Class Map?, page 13-58
- Delete a class map—13.8.1.1.3 How Do I Delete a Class Map?, page 13-58

13.8.1.1.1 How Do I Create a Class Map?

To create a class map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Class Maps tab.

Step 3 Click the **Add a Class Map** button. The Add Class Map dialog box opens. Do the following:

a. In the Class Map Name field, enter the name of the class map.

b. Select the match criteria by clicking one of the following radio buttons:

- Match All—If you want the criteria to match all rules from c to g.

Note If you select the Match All radio button, the mpls experimental topmost check box is disabled because it is not applicable.

- Match Any—If you want the criteria to match any rule from c to g.

Note You can enter multiple values in the cos, mpls experimental, qos group, vlan, ip dscp, and ip precedence fields. The values that you enter must be separated by a blank space.

c. Check the check box preceding the cos field and enter a value from 0 to 7 in the cos field.

d. Check the check box preceding the mpls experimental topmost field and enter a value from 0 to 7 in the mpls experimental topmost field.

e. Check the check box preceding the qos group field and enter a value from 0 to 9 in the qos group field.

f. Check the check box preceding the vlan field; then, enter a value from 1 to 4094 or ranges of VLANs [1-4094]. You can enter up to 30 values.

g. Check the check box preceding the ip dscp and ip precedence drop-down list:

- From the drop-down list, select ip dscp and enter a value from 0 to 63 in the ip dscp field.
- From the drop-down list, select ip precedence and enter a value from 0 to 7 in the ip precedence field.

Step 4 Click **OK**. The class map is created. The following details appear in a table in the Class Maps tab:

- Class Map—Displays the class map name.
- Match Criteria—Displays the match criteria you selected.
- Matching Attributes:
  - Match Attribute—Displays the attribute.
  - Attribute Value—Displays the value of the attribute.

13.8.1.1.2 How Do I Edit a Class Map?

To edit a class map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Class Maps tab.

Step 3 Select the class map that you want to edit.

Step 4 Click the **Edit a Class Map** button. The Edit Class Map dialog box opens.

Step 5 Edit the class map details, as appropriate.

Step 6 Click **OK**. The updated details appear in the Class Maps tab.

13.8.1.1.3 How Do I Delete a Class Map?

To delete a class map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Class Maps tab.

Step 3 Select the class map that you want to delete.

Step 4 Click the **Remove a Class Map** button.

Step 5 Click **OK** in the confirmation message box. The class map is deleted.

13.8.1.2 How Do I Add and Manage Actions?

Add and manage actions using the PT System QoS Editor. You can perform the following operations:

- Add an action—13.8.1.2.1 How Do I Add an Action?, page 13-59.
- Edit an action—13.8.1.2.2 How Do I Edit an Action?, page 13-62.
- Delete an action—13.8.1.2.3 How Do I Delete an Action?, page 13-62.

13.8.1.2.1 How Do I Add an Action?

To add an action:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Actions tab.

Step 3 Click the **Add an Action** button. The Add Action dialog box opens.

Step 4 In the Action Name field, enter the name of the action. A valid name contains from 1 to 50 characters. Add the following:

- Traffic marker—To create a traffic marker, go to Step 5.
- Ingress policy—To create an ingress policy, go to Step 6.
- Egress shaping policy—To create an egress policy, go to Step 10.

Step 5 Select the Traffic Marking tab and click the **Add a Traffic Marker** button. The Add Traffic Marker dialog box opens. Do the following:

a. From the Attribute drop-down list, select the attribute. See Table 13-13.

b. In the Value field, enter the value for the attribute you selected. See Table 13-13.

Table 13-13 Attribute and Value

Attribute	Value
cos	0 to 7
ip precedence	0 to 7
ip dscp	0 to 63
qos group	0 to 9
discard class	0 to 2

c. Click **OK**. The new traffic marker appears in the Traffic Marking tab.

Step 6 Go to the Ingress Policing tab and do the following:

a. From the Rate drop-down list, select the rate. The options are:

- Single-Rate Dual Color (CIR)
- Single-Rate Dual Color (PIR)
- Single-Rate Three Color
- Dual-Rate Three Color

b. Enter values for any of the following options that remain after you select a rate. (The following options are enabled or disabled depending on the rate you select. For example, if you select Single-Rate Dual Color (CIR) as the rate, the Peak Info Rate and Peak Burst Size options are disabled.)

- In the Committed Info Rate field, enter the value; then, from the drop-down list, select the appropriate bit rate.
- In the Peak Info Rate field, enter the value; then, from the drop-down list, select the appropriate bit rate.

- In the Burst Size field, enter the value; then, from the drop-down list, select the appropriate bit rate.
- In the Peak Burst Size field, enter the value; then, from the drop-down list, select the appropriate bit rate.

Step 7 In the Ingress Policing tab, go to the Conform Actions subtab and click the **Add a Conform Action** button. The Add Conform Action dialog box opens.

a. From the Action drop-down list, select the attribute. See Table 13-14.

b. In the Value field, enter the value for the selected attribute. See Table 13-14.

Table 13-14 Attribute and Value

Attribute	Value
DROP	—
TRANSMIT	If no actions are specified, the default conform action is *transmit*.
set-discard-class-transmit	0 to 2
set-dscp-transmit	0 to 63
set-prec-transmit	0 to 7
set-cos-transmit	0 to 7
set-qos-transmit	0 to 9

c. Click **OK**. The new conform action appears in the Conform Actions subtab. Edit or delete a conform action:

- To edit a conform action, select the row and click the **Edit a Conform Action** button. The Edit Conform Action dialog box opens. Edit the details, as appropriate.
- To delete a conform action, select the row and click the **Remove a Conform Action** button. The conform action is deleted.

Step 8 In the Ingress Policing tab, go to the Exceed Actions subtab and click the **Add an Exceed Action** button. The Add Exceed Action dialog box opens.

a. From the Action drop-down list, select the attribute. See Table 13-15.

b. In the Value field, enter the value for the selected attribute. See Table 13-15.

Table 13-15 Attribute and Value

Attribute	Value
DROP	If no actions are specified, the default exceed action is *drop*.
TRANSMIT	—
set-discard-class-transmit	0 to 2
set-dscp-transmit	0 to 63
set-prec-transmit	0 to 7
set-cos-transmit	0 to 7
set-qos-transmit	0 to 9

c. Click **OK**. The exceed action appears in the Exceed Actions subtab. Add or edit an exceed action:

- To edit an exceed action, select the row and click the **Edit an Exceed Action** button. The Edit Exceed Action dialog box opens. Edit the details, as appropriate.
- To delete an exceed action, select the row and click the **Remove an Exceed Action** button. The exceed action is deleted.

Step 9 In the Ingress Policing tab, go to the Violate Actions subtab and click the **Add a Violate Action** button. The Add Violate Action dialog box opens.

a. From the Action drop-down list, select the attribute. See Table 13-16.

b. In the Value field, enter the value for the selected attribute. See Table 13-16.

Table 13-16 Attribute and Value

Attribute	Value
DROP	If no actions are specified, the default violate action is *drop*.
TRANSMIT	—
set-discard-class-transmit	0 to 2
set-dscp-transmit	0 to 63
set-prec-transmit	0 to 7
set-cos-transmit	0 to 7
set-qos-transmit	0 to 9

c. Click **OK**. The violate action appears in the Violate Actions subtab. Add or edit a violate action:

- To edit a violate action, select the row and click the **Edit a Violate Action** button. The Edit Violate Action dialog box opens. Edit the details, as appropriate.
- To delete a violate action, select the row and click the **Remove a Violate Action** button. The violate action is deleted from the table.

Step 10 Go to the Egress Shaping tab and do the following:

a. Click the **Priority** radio button to enable the Priority field.

Note If you do not want to enter a priority, check the **Blank** check box to disable the Priority option.

- In the Priority field, enter the value. See Table 13-17.
- From the drop-down list, select the unit. See Table 13-17.

Table 13-17 Unit and Value

Unit	Value
kbps	8 to 10000000
%	1 to 100
level	1 to 2

b. Click the **Average Rate** radio button to set the average rate.

- In the Average Rate field, enter the value.
- From the drop-down list, select the unit.

Note The Minimum Bandwidth and Remaining Bandwidth options are enabled only if you select Average Rate. These options are mutually exclusive.

- Click the **Minimum Bandwidth** radio button and enter a value in the Minimum Bandwidth field. From the drop-down list, select the unit.
- Click the **Remaining Bandwidth** radio button and enter a value in the Remaining Bandwidth field. From the drop-down list, select the unit.

Step 11 Click **OK**. The new action appears in the Actions tab.

13.8.1.2.2 How Do I Edit an Action?

To edit an action:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.
Step 2 Go to the Actions tab.
Step 3 Select the action that you want to edit.
Step 4 Click the **Edit an Action** button. The Edit Action dialog box opens.
Step 5 Edit the action details, as appropriate.
Step 6 Click **OK**. The updated details appear in the Actions tab.

13.8.1.2.3 How Do I Delete an Action?

To delete an action:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.
Step 2 Go to the Actions tab.
Step 3 Select the action that you want to delete from the table.
Step 4 Click the **Remove an Action** button.
Step 5 Click **OK** in the confirmation message box. The action is deleted.

13.8.1.3 How Do I Create and Manage Policy Maps?

Create and manage policy maps in the PT System QoS Editor. You can perform the following operations:

- Create a policy map—13.8.1.3.1 How Do I Create a Policy Map?, page 13-63.
- Edit a policy map—13.8.1.3.2 How Do I Edit a Policy Map?, page 13-63.

- Delete a policy map—13.8.1.3.3 How Do I Delete a Policy Map?, page 13-64.

13.8.1.3.1 How Do I Create a Policy Map?

To create a policy map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Policy Maps tab.

Step 3 Click the **Add a Policy Map** button. The Add Policy Map dialog box opens.

Step 4 In the Policy Map Name field, enter the name. A valid name contains from 1 to 50 characters.

Step 5 Click the **Add Policy Map Attributes** button. The Add Policy Map Attributes dialog box opens.

Step 6 Class Map—Enter the name of a class map or click **Browse** to select a class map. The Select a Class Map dialog box opens.

a. To select a class map that you created:
   - Select the class map from the Class Map area. The selected class map name appears in the Selected Class Map field.
   - Click **OK**. The class map is added as an attribute.

b. To select a default class map:
   - Check the check box preceding the Default Class Map drop-down list.
   - From the Default Class Map drop-down list, select the default class map. The selected default class map appears in the Selected Class Map field.
   - Click **OK**. The default class map is added as an attribute.

You can create and manage class maps from the Select a Class Map dialog box. For more information, see 13.8.1.1 How Do I Create and Manage Class Maps?, page 13-57.

Step 7 Action—Enter the name of an action or click **Browse** to browse for an action. The Select an Action dialog box opens.

a. Select an action. The name of the selected action appears in the Selected Action field.

b. Click **OK**. The action is added.

You can create and manage actions from the Select an Action dialog box. For more information, see 13.8.1.2 How Do I Add and Manage Actions?, page 13-58.

Step 8 Child Policy—Enter the name of a child policy or click **Browse** to browse for a child policy map. The Select a Policy Map dialog box opens.

a. Select the child policy map. The name of the child policy map appears in the Selected Policy Map field.

b. Click **OK**. The child policy map is added.

Step 9 Click **OK** in the Add Policy Map Attributes dialog box. The details of the class map, child policy, and action you added appear in the Add Policy Map window.

Step 10 Click **OK** in the Add Policy Map window. The new policy map appears in the Policy Maps tab.

13.8.1.3.2 How Do I Edit a Policy Map?

To edit a policy map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Policy Maps tab.

Step 3 Select the policy map that you want to edit.

Step 4 Click the **Edit a Policy Map** button. The Edit Policy Map dialog box opens.

Step 5 Edit the policy map details, as appropriate.

Step 6 Click **OK**. The updated details appear in the Policy Maps tab.

13.8.1.3.3 How Do I Delete a Policy Map?

To delete a policy map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Policy Maps tab.

Step 3 Select the policy map that you want to delete.

Note If the selected policy map is acting as a child policy in another policy map, you cannot delete it.

Step 4 Click the **Remove a Policy Map** button.

Step 5 Click **OK** in the confirmation message box. The policy map is deleted.

13.8.1.4 How Do I Create and Manage Table Maps?

Create and manage table maps in the PT System QoS Editor. You can perform the following operations:

- Create a table map—13.8.1.4.1 How Do I Create a Table Map?, page 13-65.
- Edit a table map—13.8.1.4.2 How Do I Edit a Table Map?, page 13-66.
- Delete a table map—13.8.1.4.3 How Do I Delete a Table Map?, page 13-66.

13.8.1.4.1 How Do I Create a Table Map?

To create a table map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Table Maps tab.

Step 3 Click the **Add a Table Map** button. The Add Table Map dialog box opens.

Step 4 In the Table Map Name field, enter the table map name.

Note The Default Copy and Default Value options are mutually exclusive.

Step 5 Check the **Default Copy** check box to copy the value of the qos-group set at ingress to the MPLS EXP or VLAN CoS bit. The lower three bits of the qos-group are used as to-value.

Step 6 In the Default Value field, enter the default value. Valid values are from 0 to 999. If there is no combination of qos-group and discard-class provisioned in the table map, set the MPLS EXP bit or the VLAN CoS bit to the value shown in the text box.

Step 7 Click the **Add Table Map Attributes** button in the Add Table Name dialog box to add attributes. The Add Table Map Attributes dialog box opens.

Step 8 In the Add Attributes dialog box, do the following:

a. In the QoS Group field, enter a value from 0 to 999.

b. In the Discard Class field, enter a value from 0 to 999.

c. In the MPLS or CoS field, enter a value from 0 to 999.

d. Click **OK**. The attributes are added and the details are displayed in a table in the Add Table Map dialog box. Edit or delete the attributes:

- To edit the attributes, select the row and click the **Edit Attributes** button. The Edit Attributes dialog box opens. Edit the details, as appropriate.
- To delete an attribute, select the row and click the **Remove Attributes** button. The attribute is deleted from the table.

Step 9 Click **OK** in the Add Table Map dialog box. The table map is created and the following details appear in a table in the Table Maps tab:

- Table Map—Displays the name of the table map.
- Default Copy—Indicates whether default copy is enabled. The value can be True or False.
- Default—Displays the default value.
- Attributes:
  - QoS Group—Displays the QoS group value.
  - Discard Class—Displays the discard class value.
  - MPLS or CoS—Displays the MPLS or CoS value.

13.8.1.4.2 How Do I Edit a Table Map?

To edit a table map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Table Maps tab.

Step 3 Select the table map that you want to edit.

Step 4 Click the **Edit a Table Map** button. The Edit Table Map dialog box opens.

Step 5 Edit the table map details, as appropriate.

Step 6 Click **OK**. The updated details appear in the Table Maps tab.

13.8.1.4.3 How Do I Delete a Table Map?

To delete a table map:

Step 1 Choose **Configuration > PT System > Provision > QoS Editor**. The PT System QoS Editor opens.

Step 2 Go to the Table Maps tab.

Step 3 Select the table map that you want to delete.

Step 4 Click the **Remove a Table Map** button.

Step 5 Click **OK** in the confirmation text box. The table map is deleted.

13.8.2 How Do I Provision QoS Objects in the CPT System?

For a description of the CPT System QoS, see 13.1.6 What Is CPT System QoS?, page 13-7.

Provision QoS objects in the PT System using the Provisioning PT System QoS wizard. To launch the wizard, choose **Configuration > PT System > Provision > QoS Provisioning**.

To provision QoS objects in the PT System:

Step 1 Choose **Configuration > PT System > Provision > QoS Provisioning**. The Provisioning CPT QoS wizard opens.

Step 2 In the Select Class Maps pane, view or modify the following:

a. Available Class Maps—Displays the class maps that you created using the PT System QoS Editor.

- Select the class map that you want to provision. Select multiple class maps by holding down the **Ctrl** key.
- Move the class maps from the Available Class Maps area to the Selected Class Maps area. Use the arrow buttons, as appropriate.

b. Selected Class Maps—Displays the selected class maps.

- Select the class map that you want to deselect and use the arrow buttons, as appropriate.

c. Click **Next**.

Step 3 In the Select Policy Maps pane, view or modify the following:

a. Available Policy Maps—Displays the policy maps that you created using the PT System QoS Editor.
   - Select the policy map that you want to provision. Select multiple policy maps by holding down the **Ctrl** key.
   - Move the policy maps from the Available Policy Maps area to the Selected Policy Maps area. Use the arrow buttons, as appropriate.

b. Selected Policy Maps—Displays the selected policy maps.
   - Select the policy map that you want to deselect and use the arrow buttons, as appropriate.

c. Click **Next**.

Step 4 In the Select Table Maps pane, do the following:

a. Available Table Maps—Displays the table maps that you created using the PT System QoS Editor.
   - Select the table map that you want to provision. Select multiple table maps by holding down the **Ctrl** key.
   - Move the table maps from the Available Table Maps area to the Selected Table Maps area. Use the arrow buttons, as appropriate.

b. Selected Table Maps—Displays the selected table maps.
   - Deselect any of the table maps. Select the table map that you want to deselect and use the arrow buttons, as appropriate.

c. Click **Next**.

Step 5 In the Select CPTs pane, select the node on which to provision the QoS objects and do any of the following:

- Check the Network check box to provision the QoS objects in all the available CPTs in the network.
- Check the NE ID check box to provision the QoS objects in all the available CPTs in the node.
- Check the Shelf check box to provision the QoS objects in all the available CPTs in the shelf.
- Check the Slot check box to provision the QoS objects in that particular slot.

Step 6 Click **Finish**. The QoS Provisioning pane opens and displays the progress:

- Progress Bar—Displays the progress of the provisioning operation.
- Validation Result—The CPT QoS provisioning result is displayed in the Validation Result area of the pane. The result can be one of the following:
  - Success—CPT QoS provisioning succeeded. Proceed to Step 7.
  - In Progress—CPT QoS provisioning is in progress. The Close button is disabled while provisioning is in progress.
  - Partially Failed—CPT QoS provisioning failed on some NEs. The details of the QoS objects and the NEs that failed are displayed in the Provisioning Log area.
  - Failed—CPT QoS provisioning failed. The reason for the failure is displayed in the Provisioning Log area.
- Provisioning Log—Displays the reason for the CPT QoS provisioning failure. Click **Save Log** to save the log in the client file system. You cannot save the log in the Prime Optical server.

Step 7 Click **Close** to exit the Provisioning PT System QoS wizard.

Step 8 Open the NE Explorer of the target NEs and choose **PT System > Provisioning > QoS**. In the QoS property pane, you can view the QoS objects provisioned. For more information, see 13.9.2.7 QoS, page 13-75.

13.9 CPT System

This section describes the following:

- 13.9.1 Understanding CPT Cards, page 13-68
- 13.9.2 Overview of the CPT System Property Sheet, page 13-69
- 13.9.3 Understanding the CPT System Alarms, page 13-87

13.9.1 Understanding CPT Cards

Note CPT System is displayed as “PT System” in the Prime Optical user interface.

The CPT System is supported on the CPT 200 and CPT 600 chassis. The CPT 200 chassis consists of two service slots and has a 160-GB switch capacity. The CPT 600 chassis consists of six service slots and has a 480-GB switch capacity.

The following are the CPT cards:

- PTF_10GE_4—See C.2.44 Slot Properties—PTF_10GE_4, page C-576.
- PT_10GE_4—See C.4.26 Slot Properties—PT_10GE_4, page C-966.

The PTSA_GE panel is a standalone unit and can be connected to the PT System. The PTSA_GE panel enables the number of ports to be scaled on the CPT System. For more information, see C.4.27 Slot Properties—PTSA_GE, page C-974.

PTF_10GE_4 and PT_10GE_4 cards are supported on the CPT 200 and CPT 600 platforms. The CPT System complies with RoHS-6 standards.

The following system configuration is recommended on the CPT 200 shelf:

- Standalone PTF_10GE_4 card
- Standalone TNC, TNCE, TSC, or TSCE card
- One or more PTSA_GE panels

The following system configuration is recommended on the CPT 600 shelf:

- Redundant PTF_10GE_4 cards
- One PT_10GE_4 card
- Redundant TNC, TNCE, TSC, or TSCE cards
- One or more PTSA_GE panels

The CPT System integrates DWDM, OTN, Ethernet, and standards-based MPLS-TP in a single system. The CPT System also integrates with other Cisco platforms such as the ONS 15454, and Carrier Routing System to deliver a combined IP/MPLS and MPLS-TP solution under a single control plane, forwarding mechanism, and NMS. This solution enables you to interoperate with existing IP/MPLS networks.

The CPT System works in the metro edge and access portion of the network, providing an integrated packet and transport solution. The CPT System significantly reduces rack space and power consumption.

The following topics describe the CPT cards:

- C.2.44 Slot Properties—PTF_10GE_4, page C-576
- C.4.26 Slot Properties—PT_10GE_4, page C-966
- C.4.27 Slot Properties—PTSA_GE, page C-974

13.9.2 Overview of the CPT System Property Sheet

For descriptions of the CPT System, CPT cards, and LACP, see the following sections:

- 13.1.3 What Is the CPT System?, page 13-3
- 13.9.1 Understanding CPT Cards, page 13-68
- 13.1.13 What Is LACP?, page 13-11

Note CPT System is displayed as "PT System" in the Prime Optical user interface.

When you choose **Configuration > NE Explorer** for the ONS 15454 SONET or ONS 15454 SDH, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view of the NE's physical shelves and slots. In the tree, click **PT System** to open the PT System property sheet. The properties pane shows information about the PT System.

This section includes:

- 13.9.2.1 Identification, page 13-70
- 13.9.2.2 Channel Groups, page 13-70
- 13.9.2.3 Configuration Mode, page 13-72
- 13.9.2.4 IOS CLI, page 13-72
- 13.9.2.5 MPLS-TP, page 13-73
- 13.9.2.6 Pseudowire Class, page 13-74
- 13.9.2.7 QoS, page 13-75
- 13.9.2.8 Service Alarm, page 13-75
- 13.9.2.9 Timing, page 13-77

When you open the PT System, the default property displayed is the Identification property.

13.9.2.1 Identification

The Identification property displays the list of CPT cards managed by the PT System. The Identification property displays the details in a table. The table has two columns:

- Physical Location—Displays the following details:
  - Shelf number
  - Slot number
  - Fan-Out-Group (FOG) number
- Module Name—Displays the name of the card or panel.

13.9.2.2 Channel Groups

The Channel Groups property property has two tabs:

- Channel Groups—Allows you to perform the following operations:
  - Create channel groups—To create a channel group, see 13.9.2.10 How Do I Create Channel Groups?, page 13-78.
  - Edit channel groups—To edit a channel group, see 13.9.2.11 How Do I Modify Channel Groups?, page 13-82.
  - Delete channel groups—To delete a channel group, select the channel group from the Channel Groups table and click the **Delete a Channel Group** button.
  - Filter—Allows you to filter the data displayed in the Channel Groups table.
  - Configure channel groups to use LACP—To configure channel groups to use LACP, see 13.9.2.10.1 How Do I Configure Channel Group Using LACP?, page 13-79.
  - Configure actions for each Layer 2 protocol—To configure actions for each Layer 2 protocol, see 13.9.2.10.2 How Do I Configure Actions for Each Layer 2 Protocol?, page 13-79.
  - Create load balance configuration—To create a load balance configuration, see 13.9.2.10.3 How Do I Configure Manual Load Balancing?, page 13-80.
  - Edit load balance configuration—To edit a load balance configuration, see 13.9.2.10.4 How Do I Modify Manual Load Balancing Configuration?, page 13-81.
  - Delete load balance configuration—Select the load balance configuration from the Manual Load Balancing table and click the **Delete a Load Balance Configuration** button.
  - Filter—Allows you to filter the data displayed in the Manual Load Balancing table.
- Layer 2 Protocols—Allows you to modify the action for each Layer 2 protocol, see 13.9.2.2.2 Layer 2 Protocols Tab, page 13-71.

13.9.2.2.1 Channel Groups Tab

The Channel Groups tab has two tables:

- Channel Groups Table—See Table 13-18.
- Manual Load Balancing Table—See Table 13-19.

Table 13-18 Field Descriptions for the Channel Groups Table

Field	Description
Channel Group	Displays the channel group ID.
Name	Displays the name of the channel group.
Ports	Displays the port details.
MTU	Displays the MTU value.
Ingress Policy Map	Displays the ingress policy map details.
Ingress Table Map	Displays the ingress table map details.
Ingress Table Map Config	This field is disabled in Prime Optical 9.6.3.
Egress Policy Map	Displays the egress policy map details.

Table 13-19 Field Descriptions for the Manual Load Balancing Table

Field	Description
Primary Port	Displays the primary port details.
Secondary Port	Displays the secondary port details.

13.9.2.2.2 Layer 2 Protocols Tab

The Layer 2 Protocols tab allows you to view and modify actions for Layer 2 protocols. To modify an action, click the cell and select the action from the drop-down list.

Table 13-20 Field Descriptions for the Layer 2 Protocols Tab

Field	Description
Port	Displays the port number.
CDP	Displays the Layer 2 action configured for CDP.
DOT1X	Displays the Layer 2 action configured for DOT1X.
DTP	Displays the Layer 2 action configured for DTP.
LACP	Displays the Layer 2 action configured for LACP.
PAGP	Displays the Layer 2 action configured for PAGP.
VTP	Displays the Layer 2 action configured for VTP.
STP	Displays the Layer 2 action configured for STP.

13.9.2.3 Configuration Mode

The Configuration Mode property is display only. The Operation Mode field in the Configuration Mode property displays the operation mode of the PT System. The operation mode can be IOS Mode or CTC Mode.

If the operation mode is CTC Mode, all the following properties are displayed:

- Channel Groups
- Configuration Mode
- IOS CLI
- Pseudowire Class
- QoS
- Service Alarm

If the operation mode is IOS Mode, only the following two properties are displayed:

- Configuration Mode
- IOS CLI

Note If you switch from CTC Mode to IOS Mode, all the Layer 2 services are deleted automatically.

In IOS Mode, you cannot perform the following operations:

- Create Layer 2 services
- View Layer 2 services
- Modify Layer 2 services
- Trace Layer 2 services
- Troubleshoot Layer 2 services

13.9.2.4 IOS CLI

Monitor Layer 2 service level performance counters using the IOS CLI property. From the PT System IOS CLI Interface area, click **Launch CLI**.

- If you are using a Solaris or Linux operating system, an xterm window runs a Telnet tunnel connection to the active PTF_10GE_4 card IOS console of the PT System.
- If you are using a Windows operating system and if Telnet is installed on the PC running the Prime Optical client, Telnet is directly used to open the tunnel connection.

From the IOS CLI window, you can run the **show interfaces** command. You can also run other Cisco IOS commands on the IOS CLI, but it depends on the security settings and the account active on the PT System.

13.9.2.5 MPLS-TP

The MPLS-TP property allows you to:

- Configure global settings—13.9.2.5.1 Global Settings, page 13-73
- Create, edit, and delete BFD templates—13.9.2.5.2 BFD Template, page 13-73

13.9.2.5.1 Global Settings

The following table describes the fields in the Global Settings tab.

Table 13-21 Field Descriptions for the Global Settings Table

Field	Description
Node ID	Enter the source node ID for all the MPLS-TP tunnels configured on the router.
Global ID	Enter the default global ID used for all the endpoints and midpoints. Enter a value from 0 to 2147483647. The default value is 0.
WTR Timer	Enter the wait-to-restore (WTR) timer. This timer controls the length of time that the system needs to wait before reverting to the original working path following the repair of a fault on the original working path. Enter a value from 0 to 2147483647.
TP Fault OAM area	
Refresh Timer	Enter the maximum time between successive fault OAM messages specified in seconds. Enter a value from 1 to 255. The default value is 20.
MPLS Fast Switch Trigger Range area	
Min	Enter the minimum MPLS fast switchover value.
Max	Enter the maximum MPLS fast switchover value.

13.9.2.5.2 BFD Template

The BFD Template table lists the BFD templates. From the BFD Template tab, you can:

- Create BFD template—To create a BFD template, see 13.9.2.14 How Do I Create a BFD Template?, page 13-85.
- Edit BFD template—To edit a BFD template, see 13.9.2.15 How Do I Edit a BFD Template?, page 13-86.
- Delete BFD template—To delete a BFD template, see 13.9.2.16 How Do I Delete a BFD Template?, page 13-87.

The following table describes the BFD Template table fields.

Table 13-22 Field Descriptions for the BFD Template Property

Field	Description
Name	Displays the name of the BFD template.
Single Hop	Displays whether single hop is enabled or disabled.
Unit	Displays the unit of time: Milliseconds or Microseconds.
Min_Tx Interval	Displays the transmit interval between BFD packets.

Table 13-22 Field Descriptions for the BFD Template Property (continued)

Field	Description
Min_Rx Interval	Displays the receive interval between BFD packets.
Multiplier	Displays the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.

13.9.2.6 Pseudowire Class

The Pseudowire Class property allows you to perform the following operations:

- Create pseudowire class—To create a pseudowire class, see 13.9.2.12 How Do I Create a Pseudowire Class?, page 13-83.
- Edit pseudowire class—To edit a pseudowire class, see 13.9.2.13 How Do I Modify a Pseudowire Class?, page 13-84.
- Delete pseudowire class—Select the pseudowire class from the Pseudowire Class table and click the **Delete a Pseudowire Class** button.

The following table describes the Pseudowire Class table fields.

Table 13-23 Field Descriptions for the Pseudowire Class Table

Field	Description
Name	Displays the name of the pseudowire class.
Encapsulation	Displays the encapsulation type.
Protocol	Displays the protocol details.
Interwork	Displays the type of interworking.
Ctrl Word	Displays whether Ctrl Word is enabled or disabled.
Preferred Path	Displays whether preferred path is enabled or disabled.
Fallback Disable	Displays whether fallback is disabled.
Tunnel Type	Displays the tunnel type.
Tunnel Number	Displays the tunnel number.
Enable Sequencing	Displays whether sequencing is enabled.
Sequencing Mode	Displays the sequencing mode if sequencing is enabled.
Resync Timer	Displays the resync timer.
Static OAM Enable	Displays whether static OAM is enabled.
OAM Class	Displays the OAM class.
BFDoVCCV Enable	Displays whether BFD over VCCV is enabled.
BFD	Displays the BFD template details.
AC Status	Displays whether AC status signaling is enabled or disabled.
Master Redundancy	Displays whether master redundancy is enabled or disabled.

13.9.2.7 QoS

The QoS property has three tabs:

- Class Map—Displays the name of the class maps provisioned using the Provisioning PT System QoS wizard.
- Policy Map—Displays the name of the policy maps provisioned using the Provisioning PT System QoS wizard.
- Table Map—Displays the name of the table maps provisioned using the Provisioning PT System QoS wizard.

13.9.2.8 Service Alarm

Service alarms apply to three different levels:

- Port
- Packet Transport System (PTS)
- Channel group

Service alarms are reported in the Prime Optical alarm browser as a sum of Layer 2 service alarms. From the Service Alarm property, execute a specific query on an NE to find out which service is impacted by these alarms.

Note For the list of service alarms, see Table 13-27 on page 13-91.

For information on the Service Alarm property tabs, see:

- 13.9.2.8.1 How Do I Retrieve Alarms by Service Type?, page 13-75.
- 13.9.2.8.2 How Do I Retrieve Affected Layer 2 Services by Alarm Type?, page 13-76.

13.9.2.8.1 How Do I Retrieve Alarms by Service Type?

The Retrieve Alarms on Service tab allows you to retrieve the Layer 2 alarms by service type.

To retrieve the Layer 2 alarms by service type on the PT System:

Step 1 Click the **Packet Transport System** radio button.

Step 2 From the Service Type drop-down list, select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel).

Step 3 In the Service ID field, enter the service ID.

Step 4 Click **Show**. The Layer 2 alarms by service type on the PT System are displayed in the table.

Step 5 (Optional) Click **Reset** to reset the Service Type drop-down list and the Service ID field.

Step 6 (Optional) Click **Clear Table** to clear the results and run a new query.

To retrieve the Layer 2 alarms by service type on a specific port:

Step 1 Click the **Port** radio button.

Step 2 From the Slot drop-down list, select the slot.

Step 3 From the Port drop-down list, select the port.

Step 4 From the Service Type drop-down list, select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel).

Step 5 In the Service ID field, enter the service ID.

Step 6 Click **Show**. The Layer 2 alarms by service type on the selected port are displayed in the table.

Step 7 (Optional) Click **Reset** to reset the Service Type drop-down list and the Service ID field.

Step 8 (Optional) Click **Clear Table** to clear the results and run a new query.

To retrieve the Layer 2 alarms by service type on a channel group:

Step 1 Click the **Channel Group** radio button.

Step 2 From the Channel Group drop-down list, select the channel group.

Step 3 From the Service Type drop-down list, select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel).

Step 4 In the Service ID field, enter the service ID.

Step 5 Click **Show**. The Layer 2 alarms by service type on the selected channel group are displayed in the table.

Step 6 (Optional) Click **Reset** to reset the Service Type drop-down list and the Service ID field.

Step 7 (Optional) Click **Clear Table** to clear the results and run a new query.

13.9.2.8.2 How Do I Retrieve Affected Layer 2 Services by Alarm Type?

The Retrieve Alarm-Affected Services tab allows you to retrieve the affected Layer 2 services by alarm type.

- To retrieve the affected Layer 2 services by alarm type on the PT System, go to Step 1.
- To retrieve the affected Layer 2 services by alarm type on a specific port, go to Step 2.
- To retrieve the affected Layer 2 services by alarm type on a channel group, go to Step 3.

Step 1 To retrieve the affected Layer 2 services by alarm type on the PT System:

a. Click the **Packet Transport System** radio button.

b. From the Service Type drop-down list, select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel).

c. From the Alarm Type drop-down list, select the alarm type. See Table 13-28 for the list of alarm types.

d. Click **Show**. The affected Layer 2 services by alarm type on the PT System are displayed in the table.

e. (Optional) Click **Reset** to reset the Service Type and Alarm Type drop-down lists.

Step 2 To retrieve the affected Layer 2 services by alarm type on a specific port:

a. Click the **Port** radio button.

b. From the Slot drop-down list, select the slot.

c. From the Port drop-down list, select the port.

d. From the Service Type drop-down list, select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel).

e. From the Alarm Type drop-down list, select the alarm type. See Table 13-28 for the list of alarm types.

f. Click **Show**. The affected Layer 2 services by alarm type on the selected port are displayed in the table.

g. (Optional) Click **Reset** to reset the Service Type and Alarm Type drop-down lists.

Step 3 To retrieve the affected Layer 2 services by alarm type on a channel group:

a. Click the **Channel Group** radio button.

b. From the Channel Group drop-down list, select the channel group.

c. From the Service Type drop-down list, select the service type (Carrier Ethernet, Pseudowire, or MPLS TP tunnel).

d. From the Alarm Type drop-down list, select the alarm type. See Table 13-28 for the list of alarm types.

e. Click **Show**. The affected Layer 2 services by alarm type on the selected channel group are displayed in the table.

f. (Optional) Click **Reset** to reset the Service Type and Alarm Type drop-down lists.

Step 4 (Optional) Click **Service Table** to cross-launch the service table from the Retrieve Alarm-Affected Services tab. For example, if you select Pseudowire as the service type, the Pseudowire Service table opens.

Step 5 (Optional) Click the **Filter** button to filter the affected Layer 2 services displayed in the table. Filter by:

- Service ID
- Name
- Description

Step 6 (Optional) Click **Clear Table** to clear the results and run a new query.

13.9.2.9 Timing

A separate external TDM circuit is required to provide synchronized timing to multiple remote NEs for packet transport networks such as the CPT System. The Synchronous Ethernet (SycnE) feature addresses this requirement by providing effective timing to the remote NEs through a packet network without using an external circuit for timing.

The Timing property allows you to configure SyncE ports.

The following table describes the Timing property table fields.

Table 13-24 Field Descriptions for the Timing Property Table

Field	Description
Card	*Display only.* Displays the card number and slot number.
Port	*Display only.* Displays the port number (n-n) and rate.
ProvidesSync	*Display only.* Selects the port automatically after the port is used as a clock source.
SyncMsgIn	Sets the EnableSync card parameter. Enables synchronization status messages, which allow the node to choose the best timing source.
Admin SSM In	Overrides the synchronization status message (SSM) and the synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU. The options are: • PRS—Primary reference source (Stratum 1) • ST2—Stratum 2 • TNC—Transit node clock • ST3E—Stratum 3E • ST3—Stratum 3 • SMC-SONET minimum clock • ST4—Stratum 4 • DUS—Do not use for timing synchronization • RES—Reserved; quality level set by the user
Send DoNotUse	When checked, sends a DUS message as the QL value.
ESMC Enable	Check the check box on the port where you want to enable SyncE. You can select the clock source among the Ethernet Synchronization Message Channel (ESMC) enabled ports. To select the clock source among the OTN ports, do not check the check box.

13.9.2.10 How Do I Create Channel Groups?

For a description of LACP, see 13.1.13 What Is LACP?, page 13-11.

Create channel groups from the PT System using the Channel Group Creation wizard.

Step 1 Select an ONS 15454 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **Channel Groups**. The Channel Groups page opens.

Step 4 Click the **Create a Channel Group** button. The Channel Group Creation wizard opens.

Step 5 In the Identification area, do the following:

a. In the Name field, enter the name of the channel group.

b. From the ID drop-down list, select an ID for this channel group. Valid values are from 1 to 128.

c. In the MTU field, enter the MTU value.

d. Check the **Fast Switchover** check box to enable fast switchover for this channel group.

Step 6 In the Ports area, do the following:

a. From the Standalone list, choose the ports that will belong to this channel group and click the right arrow button to move the selected ports to the Bundled list.

b. Displays the selected ports. To change the port selection, use the arrow keys, as appropriate.

Step 7 In the LACP area, do the following:

a. Check the **LACP** check box to configure the channel group using LACP (see 13.9.2.10.1 How Do I Configure Channel Group Using LACP?, page 13-79 for information on configuring the channel group using LACP).

b. In the Minimum Bundle field, enter the minimum number of ports that must be active for the channel group to be active. The default value is 1.

c. In the Maximum Bundle field, enter the maximum number of ports to bundle in a channel group. The default value is 8.

Step 8 In the Layer 2 Action area, use the Layer 2 Action Configuration wizard to configure the actions for each Layer 2 protocol (see 13.9.2.10.2 How Do I Configure Actions for Each Layer 2 Protocol?, page 13-79 for information on configuring actions for each Layer 2 protocol).

Step 9 Click **OK**. The channel group details appear in a table in the **Provisioning > Channel Groups** page of the PT System property sheet.

13.9.2.10.1 How Do I Configure Channel Group Using LACP?

For the description of LACP, see 13.1.13 What Is LACP?, page 13-11.

Configure channel groups to use LACP using the LACP Configuration dialog box.

Step 1 Complete Step 1 through Step 6 in 13.9.2.10 How Do I Create Channel Groups?, page 13-78.

Step 2 Check the **LACP** check box. The Configure Port's LACP link becomes active.

Step 3 Click the **Configure Port's LACP** link. The LACP Configuration dialog box opens.

Step 4 Port—*Display only.* The Port column lists all the ports that are added to the channel group.

Step 5 Choose **Active** or **Passive** for each port from the LACP Config drop-down list.

Step 6 Enter the LACP priority in the Priority field for each port. Valid values are from 1 to 32768. The default value is 32768.

Step 7 Click **OK**. The channel group is configured to use LACP.

13.9.2.10.2 How Do I Configure Actions for Each Layer 2 Protocol?

Use the Layer 2 Action Configuration dialog box to configure actions for the following Layer 2 protocols:

- Link Aggregation Control Protocol (LACP)
- Port Aggregation Protocol (PAgP)
- Dynamic Trunking Protocol (DTP)
- IEEE 802.1x
- Cisco Discovery Protocol (CDP)
- VLAN Trunking Protocol (VTP)
- Spanning Tree Protocol (STP)

Note You can also configure actions for each Layer 2 protocol from the Layer 2 Protocols tab in the Channel Groups property.

Step 1 Complete Step 1 through Step 7 in 13.9.2.10 How Do I Create Channel Groups?, page 13-78.

Step 2 In the Layer 2 Action area, click the **Configure Layer 2 Action** link. The Layer 2 Action Configuration dialog box opens.

Step 3 The Protocol column displays the protocols. From the Action drop-down list, select an action: Drop, Forward, and Peer.

For example, if you to want choose Drop as the action for LACP, click the action row corresponding to LACP to enable the drop-down list. From the drop-down list, select Drop.

Step 4 Click **OK**. The selected action is configured for the Layer 2 protocol.

13.9.2.10.3 How Do I Configure Manual Load Balancing?

Configure manual load balancing using the Manual Load Balancing dialog box.

Step 1 Select an ONS 15454 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **Channel Groups**. The Channel Groups page opens.

Step 4 From the Channel Group table, select a channel group. The Manual Load Balancing table is updated with the load balancing details.

Step 5 In the Manual Load Balancing area of the Channel Groups page, click the **Create a Load Balance Configuration** button. The Manual Load Balancing dialog box opens.

Step 6 In the Primary Load-Balanced Link area, from the Primary Port drop-down list, select the port.

Step 7 In the Backup Load-Balanced Link area, do the following:

- Available Ports—Lists the available ports. Select the required ports and click the right arrow button to move the ports to the Selected Ports list.
- Selected Ports—Lists the selected ports. To deselect any of the ports, select the port and click the left arrow button.

Step 8 Click **OK**. Manual load balancing is configured and the details appear in the Manual Load Balancing table.

13.9.2.10.4 How Do I Modify Manual Load Balancing Configuration?

Modify the manual load balancing configuration using the Manual Load Balancing dialog box.

Step 1 Select an ONS 15454 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **Channel Groups**. The Channel Groups page opens.

Step 4 From the Channel Group table, select a channel group.

Step 5 In the Manual Load Balancing table, select the manual load balancing configuration that you want to modify.

Step 6 Click the **Edit a Load Balance Configuration** button. The Manual Load Balancing dialog box opens.

Step 7 *Display only.* In the Primary Load-Balanced Link area, the Primary Port field displays the port number.

Step 8 In the Backup Load-Balanced Link area, modify the following:

- Available Ports—Lists the available ports. Select the required ports and click the right arrow button to move the ports to the Selected Ports list.
- Selected Ports—Lists the selected ports. To deselect any of the ports, select the port and click the left arrow button.

Step 9 Click **OK**. The manual load balancing configuration is modified and the updated details appear in the Manual Load Balancing table.

13.9.2.11 How Do I Modify Channel Groups?

For the description of LACP, see 13.1.13 What Is LACP?, page 13-11.

Modify a channel group from the PT System using the Edit Channel Group wizard.

Note Some of the fields in the Edit Channel Group wizard are not editable.

Step 1 Select an ONS 15454 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **Channel Groups**. The Channel Groups page opens.

Step 4 From the Channel Groups table, select the channel group that you want to edit and click the **Edit a Channel Group** button. The Edit Channel Group wizard opens.

Step 5 In the Identification area, view or modify the following fields:

a. Name—Displays the name of the channel group. To modify the name:
   - Delete the previous entry.
   - In the Name field, enter the new name.

b. ID—*Display only.* Displays the channel group ID.

c. MTU—Displays the MTU value. To modify the MTU value:
   - Delete the previous entry.
   - In the MTU field, enter the new value.

d. Fast Switchover—Displays whether fast switchover is enabled for this channel group.
   - To disable fast switchover, uncheck the **Fast Switchover** check box.
   - To enable fast switchover, check the **Fast Switchover** check box.

Step 6 In the Ports area:

- Standalone—Displays the list of standalone ports. To modify your previous selection, use the arrow keys, as appropriate.
- Bundled—Displays the list of bundled ports. To modify the port selection, use the arrow keys, as appropriate.

Step 7 In the LACP area, modify the following:

Note You can modify the fields in the LACP area only if there are no bundled ports.

a. LACP—Displays whether LACP is configured.
   - To disable LACP, uncheck the **LACP** check box.
   - To enable LACP, check the **LACP** check box and configure the channel group to use LACP (see 13.9.2.10.1 How Do I Configure Channel Group Using LACP?, page 13-79).

b. Minimum Bundle—Displays the minimum bundle value. To modify the value:
   - Delete the previous entry.
   - In the Minimum Bundle field, enter the new value. The default value is 1.

c. Maximum Bundle—Displays the maximum bundle value. To modify the value:
   - Delete the previous entry.
   - In the Maximum Bundle field, enter the new value. The default value is 8.

Step 8 In the Layer 2 Action area, use the Layer 2 Action Configuration wizard to modify the actions for each Layer 2 protocol (see 13.9.2.10.2 How Do I Configure Actions for Each Layer 2 Protocol?, page 13-79).

Step 9 Click **OK**. The updated details appear in the Channel Groups table in the **Provisioning > Channel Groups** page of the PT System property sheet.

13.9.2.12 How Do I Create a Pseudowire Class?

Create a pseudowire class from the PT System using the Create Pseudowire Class wizard.

Step 1 Select an ONS 15454 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **Pseudowire Class**. The Pseudowire Class page opens.

Step 4 Click the **Create a Pseudowire Class** button. The Create Pseudowire Class wizard opens.

Step 5 In the Identification area, perform actions where allowed:

a. In the Name field, enter the name of the pseudowire class.

b. Encapsulation—*Display only.* The encapsulation type for tunneling Layer 2 traffic over a pseudowire is set to MPLS and cannot be changed.

c. Interworking—The Interworking option enables the translation between the different Layer 2 encapsulations. From the Interworking drop-down list, select VLAN or Ethernet.

d. Choose **LDP** or **None** to specify the signaling protocol to be used to manage the pseudowires created from this pseudowire class.

e. Check the **Control Word** check box to enable the control word in a dynamic pseudowire connection.

f. Check the **Master Redundancy** check box to place the pseudowire redundancy group on this node in master mode.

Step 6 In the Preferred Path area, specify the MPLS-TP or MPLS-TE tunnel path that must be used by the pseudowire. Do the following:

a. Check the **Enable** check box to enable the preferred path.

b. Choose **TP** or **TE** as the tunnel type for the preferred path.

c. In the Tunnel ID field, enter the tunnel ID.

d. Check the **Disable Fallback** check box to disable the router from using the default path when the preferred path is unreachable.

Step 7 In the Sequencing area, specify the direction in which the sequencing of packets in a pseudowire must be enabled. Do the following:

a. Check the **Enable** check box to enable sequencing.

b. From the Sequencing drop-down list, select the direction. The options are Transmit, Receive, and Both.
   - Transmit—Updates the sequence number field in the headers of packets sent over the pseudowire according to the data encapsulation method that is used.
   - Receive—Keeps the sequence number field in the headers of packets received over the pseudowire. The packets that are not received in sequence are dropped.
   - Both—Enables both the transmit and receive options.

c. The Resync field is optional and is enabled only if you chose LDP as the protocol in the Identification area. In the Resync field, enter the resync value.

Step 8 In the BFDoVCCV area, enable Bidirectional Forwarding Detection (BFD) over virtual circuit connection verification (VCCV) for a pseudowire class. Do the following:

a. Check the **Enable** check box to enable BFD over VCCV.

b. From the BFD Template drop-down list, choose a BFD template.

c. Check the **AC Status Signalling** check box to enable end-to-end attachment circuit status code notification using BFDoVCCV.

Step 9 In the OAM Status area, do the following:

a. Check the **Enable** check box to enable static OAM.

b. From the OAM Class drop-down list, select a static OAM class.

Step 10 Click **OK**. The pseudowire class is created and appears in the Pseudowire Class table in the **Provisioning > Pseudowire Class** page of the PT System property sheet.

13.9.2.13 How Do I Modify a Pseudowire Class?

Modify a pseudowire class from the PT System using the Edit Pseudowire Class wizard.

Step 1 Select an ONS 15454 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **Pseudowire Class**. The Pseudowire Class page opens.

Step 4 Select the pseudowire class that you want to edit and click the **Edit a Pseudowire Class** button. The Edit Pseudowire Class wizard opens.

Step 5 In the Identification area, do the following:

Note The Name field and the Encapsulation field are not editable.

- From the Interworking drop-down list, select VLAN or Ethernet to enable the translation between the different Layer 2 encapsulations.
- Choose **LDP** or **None** to specify the signaling protocol to be used to manage the pseudowires created from this pseudowire class.
- Check the **Control Word** check box to enable the control word in a dynamic pseudowire connection.

- Check the **Master Redundancy** check box to place the pseudowire redundancy group on this node in master mode.

Step 6 In the Preferred Path area, specify the MPLS-TP or MPLS-TE tunnel path that must be used by the pseudowire. You can make the following modifications:

- Check the **Enable** check box to enable the preferred path.
- Choose **TP** or **TE** as the tunnel type for the preferred path.
- In the Tunnel ID field, enter the tunnel ID.
- Check the **Disable Fallback** check box to disable the router from using the default path when the preferred path is unreachable.

Step 7 In the Sequencing area, specify the direction in which the sequencing of packets in a pseudowire must be enabled. You can make the following modifications:

- Check the **Enable** check box to enable sequencing.
- From the Sequencing drop-down list, select the direction. The options are Transmit, Receive, and Both.
  - Transmit—Updates the sequence number field in the headers of packets sent over the pseudowire according to the data encapsulation method that is used.
  - Receive—Keeps the sequence number field in the headers of packets received over the pseudowire. The packets that are not received in sequence are dropped.
  - Both—Enables both the transmit and receive options.
- The Resync field is optional and is enabled only if you chose LDP as the protocol in the Identification area. In the Resync field, enter the resync value.

Step 8 In the BFDoVCCV area, enable BFD over VCCV for a pseudowire class. You can make the following modifications:

- Check the **Enable** check box to enable BFD over VCCV.
- From the BFD Template drop-down list, choose a BFD template.
- Check the **AC Status Signalling** check box to enable end-to-end attachment circuit status code notification using BFDoVCCV.

Step 9 In the OAM Status area, you can make the following modifications:

- Check the **Enable** check box to enable static OAM.
- From the OAM Class drop-down list, select a static OAM class.

Step 10 Click **OK**. The updated details are displayed in the Pseudowire Class table in the **Provisioning > Pseudowire Class** page of the PT System property sheet.

13.9.2.14 How Do I Create a BFD Template?

To create a BFD template:

Step 1 Select a CPT-200 or CPT-600 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **MPLS-TP**. The MPLS-TP page opens.

Step 4 Go to the BFD Template tab.

Step 5 Click the **Create a BFD Template** button. The Create BFD Template dialog box opens.

Step 6 In the Name field, enter the BFD template name.

Note The Single Hop check box is checked and cannot be changed.

Step 7 In the Multiplier field, enter the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable.

Step 8 In the Tx field, use the arrow buttons and select the transmit interval between BFD packets.

Step 9 In the Rx field, use the arrow buttons and select the receive interval between BFD packets.

Step 10 From the Time Unit drop-down list, select the time unit. The options are Milliseconds or Microseconds.

Step 11 Click **OK**. The BFD template is created.

13.9.2.15 How Do I Edit a BFD Template?

To edit a BFD template:

Step 1 Select a CPT-200 or CPT-600 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **MPLS-TP**. The MPLS-TP page opens.

Step 4 Go to the BFD Template tab.

Step 5 Click the **Edit a BFD Template** button. The Edit BFD Template dialog box opens.

Step 6 View or modify the following fields, as appropriate:

- Name—*Display only.* Displays the BFD template name.
- Single Hop—*Display only.* The Single Hop check box is checked.
- Multiplier—Displays the number of consecutive BFD control packets that must be missed before BFD declares that a peer is unavailable. To modify the value, use the arrow buttons.
- Tx—Displays the transmit interval between BFD packets. To modify the value, use the arrow buttons.
- Rx—Displays the receive interval between BFD packets. To modify the value, use the arrow buttons.
- Time Unit—Displays the time unit. To modify the time unit, select the time unit from the Time Unit drop-down list.

Step 7 Click **OK**. The BFD template is modified.

13.9.2.16 How Do I Delete a BFD Template?

To delete a BFD template:

Step 1 Select a CPT-200 or CPT-600 NE and open the NE Explorer (see 1.5.7 NE Explorer, page 1-30 for information on opening an NE Explorer).

Step 2 In the NE Explorer tree, click **PT System** to open the PT System property sheet.

Step 3 Go to the Provisioning area and select **MPLS-TP**. The MPLS-TP page opens.

Step 4 Go to the BFD Template tab.

Step 5 From the BFD Template table, select the template that to delete.

Step 6 Click the **Delete a BFD Template** button.

Step 7 Click **OK** in the confirmation message box. The BFD template is deleted.

13.9.3 Understanding the CPT System Alarms

In Prime Optical 9.6.3, new alarms have been introduced for the CPT System. This section includes:

- 13.9.3.1 Equipment Alarms, page 13-88
- 13.9.3.2 Satellite Alarms, page 13-88
- 13.9.3.3 Port Alarms, page 13-89
- 13.9.3.4 Service Alarms, page 13-91

13.9.3.1 Equipment Alarms

Table 13-25 describes the equipment alarms.

Table 13-25 Equipment Alarms

Alarm	Description	Logical Object
CUTOVER	The Planned Switch Over alarm is raised when a planned switchover of the PTF_10GE_4 card occurs.	EQPT
RESOURCES_LOW	The Running Low on Resources alarm is raised if the resource memory is very low or if more resources cannot be configured.	EQPT
RESOURCES_OVER	The No More Resources Available alarm is raised if the resource memory is used completely or if configuring of resources is not possible.	EQPT

13.9.3.2 Satellite Alarms

Table 13-26 lists and describes the satellite alarms. The satellite alarms listed in the following table are raised when satellite communication is impacted between PTF_10GE_4, PT_10GE_4, and PTSA_GE.

Table 13-26 Satellite Alarms

Alarm	Description
SAT_DISCOVERY_FAIL	Satellite panel discovery failure.
SAT_ACT_LINK_FAIL	Satellite panel active link failure.
SAT_COMM_FAIL	Satellite panel communication failure.
SAT_IMPROPER_CONFIG	Satellite panel improper configuration.
SAT_FAN_MEA	Satellite panel fan mismatch of equipment and attributes.
SAT_FAN_FAIL	Satellite panel fan failure.
SAT_FAN_DEGRADE	Satellite panel partial fan failure.
SAT_FAN_MFGMEM	Satellite panel fan manufacturing data memory (EEPROM) failure.
SAT_FAN_MISSING	Satellite panel fan unit is missing.
SAT_IHITEMP	Satellite panel industrial high temperature.
SAT_HITEMP	Satellite panel high temperature.
SAT_BAT_FAIL	Satellite panel battery failure.
SAT_BAT_FAIL_A	Satellite panel battery A failure.
SAT_BAT_FAIL_B	Satellite panel battery B failure.

13.9.3.3 Port Alarms

Table 13-27 describes the port alarms.

Table 13-27 Port Alarms

Alarm Name/Condition	PTF_10GE_4 Client	Required on PTF_10GE_4 Trunk Ports	Required on PT_10GE_4 Client	Required on PTSA_GE 1G Port	Required on PTSA_GE Client
MAC_MOVE—MAC address is relearned on a different port in the same bridge domain	Yes	Yes	Yes	Yes	—
SAT_ACTIVE_LINK_FAIL—Satellite panel active link failure	Yes	Yes	Yes	—	—
Legacy Alarms on PTF_10GE_4 and PT_10GE_4					
SYNCLOSS	Yes	Yes	Yes	Yes	Yes
SIGLOSS	Yes	Yes	Yes	Yes	Yes
LOCAL-FAULT	Yes	Yes	Yes	No	Yes
REMOTE-FAULT	Yes	Yes	Yes	No	Yes
SF	No	Yes	No	No	No
SD	No	Yes	No	No	No
FEC-MISM	No	Yes	No	No	No
UNC-WORD	No	Yes	No	No	No
GCC-EOC	No	Yes	No	No	No
HELLO	—	Yes	—	—	—
ISIS-ADJ-FAIL	No	No	No	No	No
PROV-MISMATCH	Yes	Yes	Yes	Yes	Yes
TRAIL-SIGNAL	—	—	—	—	—
LMP-SD	No	No	No	No	No
LMP-SF	No	No	No	No	No
LMP-UNALLOC	No	No	No	No	No
LMP-FAIL	No	No	No	No	No
UNC-WORD	No	Yes	No	No	No
LOF	Yes	Yes	Yes	Yes	Yes
LOS	Yes	Yes	Yes	Yes	Yes
OUT-OF-SYNC	Yes	Yes	Yes	Yes	Yes
OTUK-IAE	No	Yes	No	No	No
OTUK-SD	No	Yes	No	No	No
OTUK-SF	No	Yes	No	No	No
OTUK-TIM	No	Yes	No	No	No
LOM	No	Yes	No	No	No
OTUK-LOF	No	Yes	No	No	No

Table 13-27 Port Alarms (continued)

Alarm Name/Condition	PTF_10GE_4 Client	Required on PTF_10GE_4 Trunk Ports	Required on PT_10GE_4 Client	Required on PTSA_GE 1G Port	Required on PTSA_GE Client
FEC-MISM	No	Yes	No	No	No
OTUK-AIS	No	Yes	No	No	No
ODUK-BDI-PM	—	Yes	—	—	—
OTUK-BDI	—	Yes	—	—	—
ODUK-SD-PM	—	Yes	—	—	—
ODUK-SF-PM	—	Yes	—	—	—
ODUK-TIM-PM	—	Yes	—	—	—
ODUK-AIS-PM	—	Yes	—	—	—
ODUK-LCK-PM	—	Yes	—	—	—
ODUK-OCI-PM	—	Yes	—	—	—
HI-RXPOWER	Yes	Yes	Yes	Yes	Yes
LO-RXPOWER	Yes	Yes	Yes	Yes	Yes
HI-TXPOWER	Yes	Yes	Yes	Yes	Yes

13.9.3.4 Service Alarms

Table 13-28 describes the service alarms.

Table 13-28 Service Alarms

Alarms	Description	Level
PW Alarms		
WKG_PW_CP_DOWN	Working pseudowire control plane down alarm. This alarm is raised on the port if the working pseudowire control plane is down.	Port/PTS_CHANNEL_GROUP
PRT_PW_CP_DOWN	Protect pseudowire control plane down alarm. This alarm is raised on the port if the protect pseudowire control plane is down.	Port/PTS_CHANNEL_GROUP
WKG_PW_CC_DOWN	Working pseudowire continuity check down alarm. This alarm is raised on the port if the working pseudowire continuity check is down.	Port/PTS_CHANNEL_GROUP
PRT_PW_CC_DOWN	Protect pseudowire continuity check down alarm. This alarm is raised on the port if the protect pseudowire continuity check is down.	Port/PTS_CHANNEL_GROUP
PW_ WKSWPR	Pseudowire traffic switched to protection alarm. This alarm is raised on the port when the pseudowire traffic is switched from the working path to the protected path.	Port/PTS_CHANNEL_GROUP

Table 13-28 Service Alarms (continued)

Alarms	Description	Level
WKG_PW_LOC_AC_TX_FLT	Working pseudowire local AC Tx port fault alarm. This alarm is raised when a working pseudowire local AC Tx port fault is detected.	Port/PTS_CHANNEL_GROUP
PRT_PW_LOC_AC_TX_FLT	Protect pseudowire local AC Tx port fault alarm. This alarm is raised when a protect pseudowire local AC Tx port fault is detected.	Port/PTS_CHANNEL_GROUP
WKG_PW_LOC_AC_RX_FLT	Working pseudowire local AC Rx port fault alarm. This alarm is raised when a working pseudowire local AC Rx port fault is detected.	Port/PTS_CHANNEL_GROUP
PRT_PW_LOC_AC_RX_FLT	Protect pseudowire local AC Rx port fault alarm. This alarm is raised when a protect pseudowire local AC Rx port fault is detected.	Port/PTS_CHANNEL_GROUP
WKG_PW_REM_AC_TX_FLT	Working pseudowire remote AC Tx port fault alarm. This alarm is raised when a working pseudowire remote AC Tx port fault is detected.	Port/PTS_CHANNEL_GROUP
PRT_PW_REM_AC_TX_FLT	Protect pseudowire remote AC Tx port fault alarm. This alarm is raised when a protect pseudowire remote AC Tx port fault is detected.	Port/PTS_CHANNEL_GROUP
WKG_PW_REM_AC_RX_FLT	Working pseudowire remote AC Rx port fault alarm. This alarm is raised when a working pseudowire remote AC Rx port fault is detected.	Port/PTS_CHANNEL_GROUP
PRT_PW_REM_AC_RX_FLT	Protect pseudowire remote AC Rx port fault alarm. This alarm is raised when the protect pseudowire remote AC Rx port fault is detected.	Port/PTS_CHANNEL_GROUP
S_PE Alarms		
WKG_LOC_PW_NOT_FWD	Working local pseudowire not forwarding alarm. This alarm is raised when the local working pseudowire is not forwarding traffic.	PTS**
PRT_LOC_PW_NOT_FWD	Protected local pseudowire not forwarding alarm. This alarm is raised when the local protect pseudowire is not forwarding traffic.	PTS**
WKG_REM_PW_NOT_FWD	Working remote pseudowire not forwarding alarm. This alarm is raised when the remote working pseudowire is not forwarding traffic.	PTS**
PRT_REM_PW_NOT_FWD	Protect remote pseudowire not forwarding alarm. This alarm is raised when the remote protect pseudowire is not forwarding the traffic.	PTS**
MPLS_TP Alarms		
TP_TUNNEL_DOWN	MPLS-TP tunnel down alarm. This alarm is raised when the working or protect LSP is down.	PTS**
WKG_LSP_DOWN	Working LSP down alarm. This alarm is raised on the port if the working LSP is down.	Port/PTS_CHANNEL_GROUP
PRT_LSP_DOWN	Protect LSP down alarm. This alarm is raised on the port if the protect LSP is down.	Port/PTS_CHANNEL_GROUP

Table 13-28 Service Alarms (continued)

Alarms	Description	Level
WKG_LSP_AIS	Working LSP alarm indication signal. This alarm is raised when the working LSP receives an LSP alarm indication signal.	Port/PTS_CHANNEL_GROUP
PRT_LSP_AIS	Protect LSP alarm indication signal. This alarm is raised when the protect LSP receives an LSP alarm indication signal.	Port/PTS_CHANNEL_GROUP
WKG_LSP_RDI	Working LSP remote defect indication. This alarm is raised when the working LSP receives an LSP remote defect indication.	Port/PTS_CHANNEL_GROUP
PRT_LSP_RDI	Protect LSP remote defect indication. This alarm is raised when the protect LSP receives an LSP remote defect indication.	Port/PTS_CHANNEL_GROUP
BFD_DOWN	BFD down alarm. This alarm is raised when the BFD is not enabled on the port.	Port/PTS_CHANNEL_GROUP
TP_WKSPWR	TP traffic switched to protection alarm. This alarm is raised when the MPSL-TP traffic switches from working pseudowire to protected pseudowire.	Port/PTS_CHANNEL_GROUP
WKG_TP_LOCKOUT	Working TP lockout alarm. This alarm is raised when the lockout request is set to ON for the working MPLS-TP.	Port/PTS_CHANNEL_GROUP
PRT_TP_LOCKOUT	Protect TP lockout alarm. This alarm is raised when the lockout request is set to ON for the protect MPLS-TP.	Port/PTS_CHANNEL_GROUP
WKG_LSP_LDI	Working LSP link defect indication. This alarm is raised when the working LSP receives an LSP link defect indication.	Port/PTS_CHANNEL_GROUP
PRT_LSP_LDI	Protect LSP link defect indication. This alarm is raised when the protect LSP receives an LSP link defect indication.	Port/PTS_CHANNEL_GROUP
WKG_LSP_LKR	Working LSP lock report alarm. This alarm is raised when an interface is administratively shutdown on a working path in an MPLS-TP tunnel.	Port/PTS_CHANNEL_GROUP
PRT_LSP_LKR	Protect LSP lock report alarm. This alarm is raised when an interface is administratively locked and a lockout request (LKR) is generated on the nearest reachable endpoint.	Port/PTS_CHANNEL_GROUP
EVC Alarms		
EFP_FAIL	EFP failed alarm. This alarm is raised when the EFP fails due to incomplete hardware provisioning or when the interface on which the EFP is present goes down.	Port
MPLS_TE		
TE_TUNNEL_DOWN	TE tunnel down alarm. This alarm is raised when the working and protected MPLS-LSP goes down.	PTS**

Icons and Menus Displayed in Prime Optical

This appendix describes the icons used in Cisco Prime Optical. This appendix contains the following sections:

- A.1 Network Map, Domain Explorer, and Subnetwork Explorer Icons, page A-1
- A.2 Prime Optical Menu Bars, page A-4

A.1 Network Map, Domain Explorer, and Subnetwork Explorer Icons

The following table displays the icons that appear in the Network Map, Domain Explorer, and Subnetwork Explorer. When you open the Network Map from a selected NE in the Domain Explorer or Subnetwork Explorer, the selected NE is preselected on the map.

The icon has white text displayed on a black background. This allows you to distinguish the previously selected NE from the other NEs in the same map.

Table A-1 Icons

Device	Map Icon
Cisco CRS-1	
All ONS 15216 NEs	
ONS 15305	
ONS 15310 CL	

Table A-1 Icons (continued)

Device	Map Icon
ONS 15310 MA SONET	
ONS 15310 MA SDH	
ONS 15327	
All ONS 15454 NEs	
ONS 15530	
ONS 15540	
ONS 15600	
Network partition	
Domain Area	
Group	
Subnetwork	
Not Managed/Other Vendor **Note** The Not Managed/Other Vendor icon is customizable.	

A.1.1 Alarm Icons

The following table shows the icons that correspond to alarm status.

Table A-2 Icon Colors

Alarm Status	Color	Example
Informational	Blue	
Critical	Red	
Major	Orange	
Minor	Yellow	
Warning	Light blue	
Normal	Green	
Unknown	Blue	

A.1.2 Operational State Icons

The following table shows the icons that correspond to operational status.

Table A-3 Icon States

State	Icon
Preprovisioned	
In Service	

Table A-3 Icon States (continued)

State	Icon
Synchronization Configuration	
In Service Initializing	
Maintenance	
Out of Service	

A.1.3 Communication State Icons

The following table shows the icons that correspond to device communication status.

Table A-4 Communication Icon States

State	Color	Icon
Reachable	Green	
Only Reachable	Orange	
Unreachable	Red	
Initialization Failed	Yellow	
Not Applicable	Dark red	

A.2 Prime Optical Menu Bars

The Prime Optical menus are described below. The associated toolbar icons are listed next to their corresponding menu options.

A.2.1 File Menu

The following table describes the tools and options in the File menu.

Table A-5 File Menu Tools Descriptions

Item	Tool	Description
Add Network Element(s)		Opens the Add New Network Element wizard, which allows you to add a new NE or add several new NEs at once.
Add New Network Partition		Opens the Add New Network Partition dialog box, which allows you to add new network partitions to the domain.
Add New Subnetwork		Opens the New Subnetwork dialog box. From here, you can add a new subnetwork, give the subnetwork a name, specify the type and topology, and provide a brief description of the subnetwork.
Close	—	Closes the current window.
Customize View		You can customize the way tables are displayed by selecting the columns to be displayed, and the order in which to display them. Prime Optical allows you to save your customized table view so that the next time you open the table, it is displayed in the same manner in which it was saved. See 1.6.9 Customizing Table Views, page 1-43 for more information.
Dashboard	—	Opens the Cisco Prime Optical Dashboard, which shows the number of NEs in the management domain, and the number of critical, major, minor, warning, or unacknowledged alarms. The dashboard also contains an Alarm Browser tool, which allows you to launch the Alarm Browser window, and an Open Domain Explorer tool, which layers the Domain Explorer window as the top active window.
Debug Options	—	Opens the Debug Options dialog box. Use this dialog box to select parameters for the Debug Log, which contains data that is useful for debugging purposes.
Delete Saved Filter		Deletes a saved filter from the Alarm Log and Audit Log tables.
Domain Explorer	—	Layers the Domain Explorer window as the top active window.
Domain NE Table	—	Opens the Domain NE table for the selected node.
ENE Devices	—	Opens the ENE Devices table for the selected node.
TNE Devices	—	Opens the TNE Devices table for the selected tunnel NE (TNE).
EVC Table		Opens the EVC table from the EVC Cross-Connections table. Select the EVC cross-connection for which you want to cross-launch the EVC Service table, then click this icon.
Exit	—	Exits the program.
Export Data to File		Opens the Export dialog box.
Filter		Opens a filter dialog box, which allows you to filter for information found in the table or window. There are two filter icons displayed in Prime Optical. **Note** Use the percent sign (%) as a wildcard character for filtering on substrings.

Table A-5 File Menu Tools Descriptions (continued)

Item	Tool	Description
Filter Time Period		Allows you to filter using time as a parameter. As the default, Prime Optical displays alarm and event information that occurred during the last four hours. To quickly filter the time period, select the Filter Time Period (4h) tool. You can change the default time period by using the User Preferences dialog box. The icon displayed in the tool bar changes according to the time period selected.
Generate HTML Report		Allows you to generate an HTML report based on the data in the table. You can generate a report for selected rows or for all rows. After you have made your selection, the browser window appears with the HTML report. Use your browser's Print option to print the HTML report.
Launch Bulk NE Wizard	—	Opens the Bulk NE Wizard, which allows you to add multiple NEs simultaneously.
Network Map		Opens the Network Map window for the selected node.
New Group		Opens the New Group dialog box. From here, you can add a new group, give the group a name, specify the group's geographic location, and provide a brief description of the group.
Notify Users	—	Opens the Notify Users dialog box.
Page Back		Moves the table backward by one page if there is more than one page of data.
Page Forward		Moves the table forward by one page if there is more than one page of data.
Parent (also Show Parent Network Map)		If the Network Map is open to a specific NE, clicking Parent or Show Parent Network Map shifts the view back to the main Network Map view.
Perform Protection Switch Operation		Performs protection operations on single and multiple circuits.
Print Graph		Prints the graphical display.
Pseudowire Table		Opens the Pseudowire table from the EVC Cross-Connections table. Select the pseudowire cross-connection for which you want to cross-launch the PW Service table, then click this icon.
Rediscover		Rediscovers the selected MPLS-TP, EVC, or Pseudowire cross-connection.The data for the selected cross-connection is deleted from the Prime Optical database and then rediscovered from the NE.
Refresh Circuit Power Levels	—	(ONS 155xx only) Refreshes the values in the Destination Optical Power column.

Table A-5 File Menu Tools Descriptions (continued)

Item	Tool	Description
Refresh Data		Refreshes all data being displayed by Prime Optical. There are three icons, and both refresh and sync data from either the server or the database. The Refresh Data icon with blue and red arrow (as seen in the Circuit table) flashes when updates are available. This icon has two modes: manual refresh and autorefresh. The other icons (as seen in the VLAN table or CPT System windows) do not notify you that updates are available. You must click the button in order to retrieve updated data. **Note** Clicking Refresh Data in the Domain Explorer window refreshes all data for the entire Prime Optical client. Depending on the number of NEs in your network, you might experience a delay while the data refreshes. **Note** It takes longer to refresh data from the NE than from the server.
Revert to Default	—	Reverts your map customizations (map background, node icons, and *x* and *y* coordinates) to the default map view.
Save		Saves changes made in the current window.
Save as Default	—	Saves your map customizations (map background, node icons, and *x* and *y* coordinates) as the default map view.
Save Custom View	—	Saves your customized table view so that the next time you open the table, it is displayed in the same manner in which it was saved.
Set PM Collection Status		Opens the PM Collection Status dialog box. Use this dialog box to enable or disable PM collection for specific modules and display the results in the PM Module table.
Show Discrepancy Details		Shows detailed information about the selected ONS 155xx discrepancy.
Show Parent Network Map		See Parent.
Subnetwork Explorer	—	Opens the Subnetwork Explorer window.
TP Table		Force polling on an MPLS-TP, EVC, or Pseudowire cross-connection. Select the cross-connection for which you want to force polling on, then click this icon.
Update		Opens the EVC table from the EVC Cross-Connections table. Select the EVC cross-connection for which you want to cross-launch the EVC Service table, then click this icon.

A.2.2 Edit Menu

The following table describes the tools and options in the Edit menu.

Table A-6 Edit Menu Tools Descriptions

Item	Tool	Description
Accept		(ONS 15600 only) Copies the downloaded software onto the standby TSC and activates it.
Activate	—	Activates the selected image and reboots the device.
Activate CTC Binary		Allows you to activate the selected CTC binary. There can be only one active CTC binary at a time. If you select a CTC binary that is already active, the Activate CTC Binary tool becomes unavailable.
Add		Allows you to add an entry to the table. Selecting **Add** opens the Add SNMP Parameters dialog box, in which you can enter a target IP address, the write and read community strings, the number of connection retry attempts, and the timeout (the length of time after which a connection attempt is aborted).
Add CTC Binary		Allows you to specify a CTC JAR file to upload to the Prime Optical server. Clicking the **Add CTC Binary** tool (or choosing **Edit > Add**) opens the Upload CTC Binary File dialog box, where you can enter the CTC JAR filename or click **Browse** to browse for the filename. In addition, you can make the new binary the active binary by checking the **Activate** check box.
Add EFD Profile		Opens the Create Event Forwarding Discriminator Profile wizard.
Add NE User		Opens the Add NE User wizard.
Add Peer Card		Allows addition of another 100G_LC_C peer card to the CFP_TXP card configuration with only one peer card configured.
Add Predefined User		Opens the Add Predefined User wizard.
Add Supported NE		Allows you to add an NE to the Supported NE table and specify its software version.
Affected Circuits		Allows you to view the affected circuits.
APC Results		Opens the APC Results table, which contains automatic power control (APC) data for the nodes and sides that belong to the selected APC domain.
Cancel Job		Allows you to cancel a scheduled job. Cancel is enabled only for jobs with a Queued status.

Table A-6 Edit Menu Tools Descriptions (continued)

Item	Tool	Description
Cancel Task		Allows you to cancel a task.
Change Map Background	—	Opens the Select Map Background dialog box, which allows you to choose a different geographic background for the selected view.
Change Node Icon	—	Opens the Select Node Icon File dialog box, which allows you to select a new icon for the selected node.
Change Password	—	Opens the Change Password dialog box, which allows you to change your Prime Optical or CTC user password.
Circular Layout	—	Arranges the NE on the Network Map in a circular formation.
Close Tunnel		Closes the TL1 tunnel on the selected TNE. A warning message is displayed, alerting you that closing a tunnel will result in loss of connectivity to the selected TNE and all of its ENEs.
Collapse		Collapses the management domain or group to hide all groups or NEs in that management domain or group.
Collapse All Links	—	Collapses all links on the Network Map.
Commit		For the ONS 15327 and ONS 15454, the Commit operation makes the standby software version the active version if it is a later version than the active software. **Note** Commit is not applicable to ONS 155xx or ONS 15600 NEs.
Copy		Copies the selected NE.
Create a New User		Opens the Create New User wizard. When launched from the GateWay/CORBA Client Configuration table, opens the Add GateWay/CORBA User dialog box.
Create a New User Profile		Opens the Create New User Profile wizard.
Create CTC User Profile		Opens the Create CTC User Profile wizard.
Cut		Copies the selected NE. The NE is not removed from its current location until the Paste action is performed.
Declutter Layout	—	Rearranges the icons on the Network Map so that they do not overlap.

Table A-6 Edit Menu Tools Descriptions (continued)

Item	Tool	Description
Delete	—	Deletes the selected instance of the NE or group. If this is the last instance of the NE, the NE is placed in the Deleted NEs group. Only out-of-service or preprovisioned NEs can be placed in the Deleted NEs group. To delete the NE from the database, select the NE in the Deleted NEs group and choose **Edit > Delete**; then, click **OK**. This removes the NE from the client view and deletes all records associated with the NE from the database. If this is the last instance of the group, the group must be empty before you can delete it. **Note** You cannot delete a GNE that has associated subtending NE(s). You can disassociate a subtending NE from the GNE by deleting and purging it or by assigning it to a different GNE. **Note** You cannot delete a TNE that has associated subtending NE(s). You can disassociate a subtending NE from the TNE by deleting and purging it. **Note** You cannot delete an NE that has links to it that are defined in the Link table. Before deleting the NE, you must first delete the links to it.
Delete		Deletes the selected item. There are two delete icons in Prime Optical. The second and third icons are displayed in the CPT System windows.
Delete All	—	Deletes all instances of the selected NE or group. The NE is placed in the Deleted Network Elements group. Only out-of-service or preprovisioned NEs can be placed in the Deleted NEs group. The group must be empty before you can delete it. **Note** You cannot delete a GNE that has associated subtending NE(s). You can disassociate a subtending NE from the GNE by deleting and purging it or by assigning it to a different GNE. **Note** You cannot delete a TNE that has associated subtending NE(s). You can disassociate a subtending NE from the TNE by deleting and purging it. **Note** Delete All does not delete items in a range. Rather, Delete All deletes multiple instances of the same NE or group.
Delete BLSR/MS-SPRing		Deletes the selected BLSR or MS-SPRing.
Delete CTC User Profile		Deletes the selected CTC user profile.
Delete EFD Profile		Deletes the selected event forwarding discriminator profile.

Table A-6 Edit Menu Tools Descriptions (continued)

Item	Tool	Description
Delete Link		Deletes the selected link.
Delete User Profile		Deletes the selected user profile.
Disable APC		Disables the APC on a selected node.
Discover APC Domain		Discovers all APC domains.
Duplicate User Profile		Opens the Create Duplicate Profile window, which allows you to duplicate an existing Prime Optical user profile.
Edit		Opens the Modify wizard window, which allows you to make changes to the selected object. This icon is displayed in the CPT System windows.
Edit BLSR/MS-SPRing		Opens the Edit BLSR/MS-SPRing window, which allows you to modify the ring ID, ring reversion, and span reversion on a ring.
Enable APC		Enables the APC on a selected node.
Enable Drag		Enables drag-and-drop functionality for all nodes in the Network Map window.
Enable Offview		Enables the display of off-view icons in the Network Map window.
Switch Selected BLSR/MS-SPRing		Opens the Switch BLSR/MS-SPRing window, which allows you to set up BLSR/MS-SPRing scheduling data immediately or for an exact time.
Expand		Expands the management domain or group to display all groups or NEs in that management domain or group.
Expand All Links	—	Expands all links on the Network Map.
Modify CTC User Profile		Opens the Modify CTC User Profile wizard.
Modify EFD Profile		Opens the Modify Event Forwarding Discriminator Profile wizard.

Table A-6 Edit Menu Tools Descriptions (continued)

Item	Tool	Description
Modify Link		Opens the Modify Link wizard, which allows you to modify the name or description of the selected link.
Modify NE User		Opens the Modify NE User wizard.
Modify Tunnel		Allows you to modify the settings of the selected TNE.
Modify User Profile Properties		Opens the Modify Prime Optical User Profile Properties wizard.
Modify User Properties		Opens the Modify Prime Optical User Properties wizard. When launched from the GateWay/CORBA Client Configuration table, opens the Modify GateWay/CORBA User dialog box.
NE Active Users		Opens the NE Active Users table.
NE Software Table		Opens the NE Software table.
Open Tunnel		Opens a TL1 tunnel on the selected TNE.
Paste		Pastes the NE into the selected group.
Remove Peer Card		Allows deletion of an existing 100G_LC_C peer card from a CFP_TXP card configuration.
Reset Specific ML Cards		Opens the Reset ML Cards dialog box.
Revert/Switch		For the ONS 15327 and ONS 15454, the Revert/Switch operation causes the active software version to revert to the standby version. **Note** Revert/Switch is not applicable to ONS 155xx or ONS 15600 NEs.
Run APC		Runs the APC function manually.

Table A-6 Edit Menu Tools Descriptions (continued)

Item	Tool	Description
Search		Opens the Search dialog box, which allows you to search the tree by node name, IP address, or description.
Search Next		Searches for the next occurrence of the entry that was searched for using the Search tool.
Spring Layout	—	Arranges the icons on the Network Map in a coiled spring formation.
Squeeze	—	If you select a file that is marked “deleted” and use this command, the file will be physically removed from flash memory.
Table Layout	—	Arranges the icons on the Network Map in rows and columns.
Tag Under Maintenance	—	Allows you to give a port the status of Under Maintenance. Select an in-service port and choose **Edit > Tag Under Maintenance**.
Upgrade BLSR/MS-SPRing		Allows you to upgrade the selected BLSR or MS-SPRing.
Undelete	—	Undeletes the selected object.
Undelete	—	Prime Optical restores the selected NE under the management domain node.
Unlock User		Allows you to unlock a user account.
User Note		Allows you to add a note to the job or equipment.
User Preferences	—	Opens the User Preferences dialog box.
Verify	—	Verifies the checksum of the selected flash file.
Zoom Area		Allows you to pan and zoom the view to a different region of the window. Hold down the left mouse button and use the Zoom Area box to highlight an area on the window. When you release the left mouse button, the zoom is applied on the selected area of the window.
Zoom In		Allows you to zoom in on the window. This tool increases the size of all of the graphic objects in the window.
Zoom Out		Allows you to zoom out on the window. This tool decreases the size of all of the graphic objects in the window.

A.2.3 Fault Menu

The following table describes the tools and options in the Fault menu.

Table A-7 Fault Menu Tools Descriptions

Item	Tool	Description
Acknowledge Alarms		Acknowledge the selected alarm(s). Click again to unacknowledge the selected alarm(s). To enable alarm unacknowledgement, choose **Control Panel > UI Properties**.
Acknowledge All Alarms		Acknowledges all alarms. Click again to unacknowledge all alarms.
Alarm Browser		Opens the Alarm Browser window.
Alarm Log		Opens the Alarm Log window.
Clear Security Violation Alarm	—	Clears any security violation alarms on the selected NE. This option is only available from the NE Explorer window. If this option is not available on the selected NE, the Clears Security Violation Alarms option is grayed out. A message appears if there are no security violation or intrusion alarms on the NE or if the operation has been accepted.
Clear Selected Alarm(s)		Clear selected alarms. A message appears, informing you that only PM failed and PM lost alarms on NEs in your domain will be cleared.
Event Export Manager	—	Opens the Event Export Manager window.
Hide Acknowledged Alarms		Hides all alarms that have been acknowledged.
Hide Cleared Alarms		Hides all alarms that have been cleared.
Locate Alarm/Event		Opens the NE Explorer for the NE where the selected alarm or event is located.
Ping NE	—	Pings the selected NE for IP connectivity.
Reset All Alarms/Events		Clears (resets) all alarms or events from the current view.
Show Alarm Note		Opens the Alarm Note dialog box for the selected alarm.
Show Cleared Alarms		Shows all alarms that have been cleared.

Table A-7 Fault Menu Tools Descriptions (continued)

Item	Tool	Description
Stop Continuous Beep	—	Disables continuous audible notification whenever a new update occurs in the Dashboard window.
Test NE Connectivity	—	For ONS 155xx NEs, tests SNMP connectivity to the selected NE using the community string configured in the Prime Optical client.
Syslog Viewer	—	Opens the Syslog Viewer window.

A.2.4 Performance Menu

The following table describes the options in the Performance menu.

Table A-8 Performance Menu Descriptions

Item	Description
PM Query by Category	Allows you to search for PM data based on the PM category.
PM Query by NE Model	Allows you to search for PM data based on the non-CTC-based NE model.
PM Collection Settings	Allows you to configure PM collection settings by NE type.

A.2.5 Configuration Menu

The following table describes the tools and options in the Configuration menu.

Table A-9 Configuration Menu Tools Descriptions

Icon/Item	Tool	Description
Add or Create Option		Opens the Create wizards for CPT System windows.
Add Drops		Opens the Add L2 Service Drops window.
Add Member		Opens the Add Member wizard, which allows you to add new members to an existing VCAT circuit.
Cancel Roll		Cancels the pending circuit roll.
Complete Roll		Use the Complete Roll button to terminate a manual roll. You can do this when a manual roll is in a ROLL_PENDING state and you have not yet completed the roll or have not canceled its sibling roll.

Table A-9 Configuration Menu Tools Descriptions (continued)

Icon/Item	Tool	Description
Create Circuit		Allows you to create a circuit between NEs in the same group or subnetwork or between NEs in different groups or subnetworks. When you select an NE and choose **Configuration > Circuit Wizard**, the pointer changes to a plus symbol (+), indicating that you are in Create Circuit mode. Click the destination NE to open the Create Circuit wizard, prepopulated with the source and destination nodes.
Create Circuit Roll		Opens the Roll Circuit wizard.
Create L2 Service		Opens the Create L2 Service wizard.
Create L2 Topology		Opens the Create L2 Topology wizard.
Create Link		Allows you to create a link between NEs in the same group or subnetwork or between NEs in different groups or subnetworks. When you select an NE and choose **Configuration > Create Link**, the pointer changes to a plus symbol (+), indicating that you are in Create Link mode. Click the destination NE to open the Create Link wizard, prepopulated with the source and destination nodes. After the link is created, it is viewable in the Network Map window.
Create QoS Profile		Opens the Create QoS Profile dialog box.
CTC-Based SDH NEs	—	Allows you to view and configure various services and features for SDH NEs, including circuits, MS-SPRings, Layer 2 topologies, QoS profiles, alarm profiles, and so on.
CTC-Based SONET NEs	—	Allows you to view and configure various services and features for SONET NEs, including circuits, BLSRs, Layer 2 topologies, QoS profiles, alarm profiles, and so on.
Delete Circuit		Allows you to delete an existing circuit. You can also select and delete multiple circuits.
Delete Drops		Deletes the selected drop. A popup window appears. Click Yes to delete the L2 service or click No to close the window without deleting the L2 service.
Delete L2 Service		Deletes the selected L2 service. A popup window appears. Click Yes to delete the L2 service or click no to close the window without deleting the L2 service.

Table A-9 Configuration Menu Tools Descriptions (continued)

Icon/Item	Tool	Description
Delete L2 Topology		Deletes the selected L2 topology. A popup window appears. Click Yes to delete the L2 topology or click No to close the window without deleting the L2 topology. **Note** You must delete any L2 services on the selected topology before you can delete the selected topology.
Delete Link		Deletes the selected link.
Delete QoS Profile		Deletes the selected QoS profile.
Discover L2 Topologies	—	Initiates a manual discovery of L2 topologies by triggering events for valid L1 circuits in the database.
Duplicate QoS Profile		Opens the Duplicate QoS Profile dialog box.
Edit Circuit		Opens the Edit Circuit window.
Equipment Inventory Table	—	Opens the Equipment Inventory table for the selected NE.
Finish Roll		Use the Finish Roll button to complete the circuit processing of both manual and automatic rolls. It changes the circuit state from ROLL_PENDING to ACTIVE.
J1 Path Trace	—	Opens the J1 Path Trace window.
L2 Service Table		Opens the L2 Service table.
Link Table	—	Opens the Link table.
Manage VLANs	—	Opens the Manage VLANs dialog box, which allows you to create new VLANs or delete existing VLANs from the Prime Optical domain.
Member Circuits		Opens the VCAT Member table.
Merge		Merges different circuits into one or more new circuits.
Modify Drops		Opens the Modify L2 Drops window.
Modify L2 Service		Opens the Modify L2 Service wizard.

Table A-9 Configuration Menu Tools Descriptions (continued)

Icon/Item	Tool	Description
Modify L2 Topology		Opens the Modify L2 Topology wizard.
Modify Link		Opens the Modify Link wizard, which allows you to modify the name or description of the selected link.
Modify a QoS Profile		Opens the Modify QoS Profile wizard.
NE Explorer		Opens the NE Explorer window.
NE Remote Console		Launches the local Telnet application.
ONS 15216	—	Opens the Equipment Inventory table and launches the TL1 interface and the CLI.
ONS 15305	—	Opens the Equipment Inventory table and launches the CLI, Cisco Edge Craft, and CTC for R3.0.
ONS 155XX	—	Opens the Equipment Inventory table, Circuit table, NE Discrepancy table, Discovery Info table; allows you to rediscover some or all NEs; and launches the TL1 interface, the CLI, and the Cisco IOS CLI.
Open Circuit Path Span Table		Opens the Circuit Path Span table.
Open Circuit Path Table		Opens the Circuit Path table for the selected link. Unavailable for some NEs.
Open Circuit Span		Opens the Circuit Span table.
Open Circuit Table		Opens the Circuit table for the selected link. Unavailable for some NEs.
Open Link Utilization Table		Opens the Link Utilization table for the selected link.
Set OTS Link Capacity		Opens the OTS Link Capacity window.
Open Link Utilization Report		Opens the OTS Link Utilization report for the selected links.

Table A-9 Configuration Menu Tools Descriptions (continued)

Icon/Item	Tool	Description
Open Circuit Report		From the OTS Link Utilization report, opens the Circuit report for the selected links.
Refresh Lined Up Circuits		Refreshes any new aligned circuits with the selected circuit.
Restoration Balloon Icon		Displays the most relevant current restoration value.
Roll Circuit		Opens the Roll Circuit wizard, which allows you to transfer ONS 15600 traffic from one facility to another without service interruption.
Show Contained Circuits	—	(ONS 15530 only) Opens a second Circuit table, which shows the circuits contained within the selected circuit.
Show Circuit Note		Allows you to view and add notes to circuits displayed in the Circuit table.
Show Drops		Opens the L2 Service Drop Ports table.
Show QoS Profile		Opens the QoS Classes table.
Start/Stop Template Configuration CLI Recording		Starts and stops recording configuration operations. When you stop recording, the Save Template Configuration dialog box opens, allowing you to save configuration details to a template file.
Trace Circuit		Opens the Circuit Trace window, which traces the connectivity of a circuit by showing in detail the source node, the destination node, and any intermediate nodes in graphical format.
Trace High-Level Circuit		Opens the High-Level Circuit Trace window, which uses high-level span information such as NEs and links to display the circuit trace.
Trace Circuit and Trace High-Level Circuit (GMPLS)		When the cursor is positioned over this icon, the tooltip displays the accepted threshold and optical values as displayed in the circuit table.
VLAN Table	—	Opens the VLAN table.

A.2.6 Administration Menu

The following table describes the tools and options in the Administration menu.

Table A-10 Administration Menu Tools Descriptions

Item	Tool	Description
Add Predefined User		Opens the Add Predefined User wizard.
Add User		Opens the Add User wizard.
Audit Log		Opens the Audit Log window.
Bulk FTP Hosts Creation	—	Opens the Bulk FTP Hosts Creation wizard, which allows you to create FTP hosts in a GNE/ENE firewall environment for multiple NEs simultaneously.
Bulk Software Activation	—	Opens the Bulk Software Activation dialog box, which allows you to schedule a bulk software activation job.
Control Panel	—	Opens the Control Panel window.
CTC-Based NEs	—	Opens the NE User Access Administration table, Audit Trail table, Security Advisory Message Management dialog box, NE Authentication dialog box, or Cisco IOS Users table.
CTC Upgrade Table	—	Opens the CTC Upgrade table.
User Profiles		Opens the Prime Optical User Profiles table.
Users	—	Opens the Prime Optical Users window.
Delete User		Opens a user deletion confirmation window. Click **Yes** to delete the selected user.
Disconnect User		Disconnects the selected user from the Prime Optical application.
Enable/Disable Log		Opens the Enable/Disable Log Activation wizard.
Error Log		Opens the Error Log window.
GateWay/SNMP Users	—	Opens the OSS SNMPv3 Users table, which allows you to add and configure the OSS clients that manage SNMPv3 traps.
GW/CORBA Client Configuration Table	—	Opens the Prime Optical GateWay/CORBA Client Configuration table.
Image Transfer	—	Opens the Image Upload window.

Table A-10 Administration Menu Tools Descriptions (continued)

Item	Tool	Description
Job Monitor	—	Opens the Job Monitor table.
Logged in Users		Opens the Logged In Prime Optical Users table, which lists the Prime Optical users who are currently logged into the Prime Optical application.
Logged in GateWay CORBA Users		Opens the Active GateWay/CORBA Users table, which lists the Prime Optical GateWay/CORBA users who are currently logged into the Prime Optical application.
Log Out GateWay CORBA User		Logs out the selected Prime Optical GateWay/CORBA user from the Prime Optical application.
Log Out User		Logs out the selected user from the Prime Optical application.
Memory Backup	—	Opens the Memory Backup dialog box.
Memory Backup Upload	—	Opens the Backup File dialog box.
Memory Restore	—	Opens the Memory Restore dialog box.
Modify User		Opens the Modify User wizard.
NE Active Users		Opens the NE Active Users table.
NE Software Table	—	Opens the NE Software table.
NE Users Access Activity Log		Opens the NE Users Access Activity Log table.
ONS 15216	—	Opens the NE User Access Administration table and the NE Authentication dialog box.
ONS 155XX	—	Opens the SNMP Settings table, Flash File table, or NE Authentication dialog box.
Retrieve Last Activity Time		Refreshes the Last Activity Time field for the current list of active users, if the activity time has changed. The last activity time is the date and time when the last activity was performed by the active user on the NE.
Self Monitor	—	Opens the Self Monitor table, where you can view information about Prime Optical threshold parameters.
Service Monitor	—	Opens the Service Monitor table.
Show Failed Login Attempts		Opens the Unknown User Login Attempts table.
Show User Note		Allows you to view a user note.

Table A-10 Administration Menu Tools Descriptions (continued)

Item	Tool	Description
SNTP Configuration	—	Opens the SNTP Configuration dialog box.
Software Management	—	The Optical submenu opens the Software Download wizard.
Supported NE Table	—	Opens the Supported NE table.
Unlock		Allows you to unlock a user account.
Update Log		Updates the NE Access Log table.

A.2.7 View Menu

The following table describes the tools and options in the View menu.

Table A-11 View Menu Tools Descriptions

Item	Tool	Description
Clear PM Counters on NE		Clears the real-time PM counters on the NE.
Clear Screen		Clears the current real-time PM data buffer of all values.
Configure Graphing Parameters		Plots gauge parameters that have been stored over time. You can select parameters to plot on the same X-axis and modify the preselected start and end time. For 15-minute PM data, the time period can be plus or minus 125 hours from the selected row time stamp.
Fit in Window		Sizes the graph within the window. When multiple graphs are displayed, select a graph with your mouse pointer; then, click **Fit in Window**.
Launch Real-Time Performance Session		Launches a real-time PM session from the selected row in the PM table. If you select more than one row (or no rows), the toolbar icon is disabled.
Normalize Y Axes		Allows you to normalize axes values in PM graphs and compare data of the same type (for example, receive versus transmit packets).
Plot		Retrieves the available data points (rows) from the Prime Optical database and plots the graph. When the row selection changes on the table, you must click **Plot** again.

Table A-11 View Menu Tools Descriptions (continued)

Item	Tool	Description
Restore Y Axes		Allows you to restore axes values to the previous graph visualization in comparable PM graphs.
Specify Real-Time Polling Interval		By default, the real-time PM session polls the attributes every 10 seconds. Click this toolbar icon to change the real-time polling interval, or to start or stop real-time polling. The polling interval range is from 10 to 900 seconds.
Toggle Graph		Toggles between line and bar graphs.
WDM Topology	—	Allows you to view the complete circuit span between the source and destination NEs.
Zoom In		Reduces the scope of the graph. When multiple graphs are displayed, select a graph with your mouse pointer; then, click **Zoom In**.
Zoom Out		Increases the scope of the graph. When multiple graphs are displayed, select a graph with your mouse pointer; then, click **Zoom Out**.

A.2.8 Window Menu

The following table describes the tools and options in the Window menu.

Table A-12 Window Menu Tools Descriptions

Item	Tool	Description
Arrange Horizontally	—	When multiple Prime Optical windows are open, this option displays the windows side-by-side horizontally.
Arrange Vertically	—	When multiple Prime Optical windows are open, this option displays the windows side-by-side vertically.
Cascade	—	When multiple Prime Optical windows are open, this option positions the active window in the upper left corner, and all other windows are layered on top of the active window in cascading order.
Close All	—	Closes all Prime Optical windows except the Domain Explorer.
Minimize All	—	Minimizes all Prime Optical windows.
Restore All	—	Restores all minimized Prime Optical windows.
Reset to Default Size		Resets the current window to its default size.

A.2.9 Help Menu

The following table describes the tools and options in the Help menu.

Table A-13 Help Menu Tools Descriptions

Item	Tool	Description
Contents and Index	—	Displays the contents and index for the online help.
Current Window		Displays online help for the current window.
About Cisco Prime Optical	—	Opens the About Cisco Prime Optical dialog box, which lists the Prime Optical release you are running, including server and client version.

NE Explorer Information

This appendix provides information on the various NE Explorer windows supported in Cisco Prime Optical. This appendix contains the following sections:

- B.1 ONS 15216 NE Explorer, page B-1
- B.2 ONS 15305, page B-25
- B.3 ONS 15305 CTC NE Explorer, page B-26
- B.4 ONS 15310 CL NE Explorer, page B-32
- B.5 ONS 15310 MA SONET NE Explorer, page B-59
- B.6 ONS 15310 MA SDH NE Explorer, page B-89
- B.7 ONS 15327 NE Explorer, page B-120
- B.8 ONS 15454 MSTP NE Explorer, page B-148
- B.9 ONS 15454 SONET NE Explorer, page B-188
- B.10 ONS 15454 SDH NE Explorer, page B-232
- B.11 ONS 15454-M6 NE Explorer, page B-280
- B.12 ONS 15454-M2 NE Explorer, page B-319
- B.13 ONS 15600 SONET NE Explorer, page B-356
- B.14 ONS 15600 SDH NE Explorer, page B-384
- B.15 CPT 200 NE Explorer, page B-412
- B.16 CPT 600 NE Explorer, page B-441
- B.17 CRS-1/3 NE Explorer, page B-471
- B.18 Unmanaged NE/Other Vendor Node Properties Pane, page B-474

Note In the Prime Optical GUI, display-only fields have a gray background.

B.1 ONS 15216 NE Explorer

The NE Explorer for the ONS 15216 displays information about the selected ONS 15216 NE. ONS 15216 NEs are grouped as active NEs or passive NEs. Passive NEs do not have a management interface, so there is no communication between Prime Optical and passive ONS 15216 NEs. For passive ONS 15216 NEs, the NE Explorer summarizes NE information that has been entered manually through

the Domain Explorer and also allows you to specify the serial number. For active ONS 15216 NEs, the NE Explorer allows you to view the actual values of settings and parameters on the NE and modify configurable parameters.

Table B-1 ONS 15216 NEs

Active ONS 15216 NEs	Passive ONS 15216 NEs
ONS 15216 100-GHz OADM	ONS 15216 EDFA1
ONS 15216 EDFA2	ONS 15216 200-GHz OADM
ONS 15216 EDFA3	ONS 15216 100-GHz DWDM Filters
	ONS 15216 200-GHz DWDM Filters
	ONS 15216 OSC
	ONS 15216 DCU
	ONS 15216 FlexLayer

B.1.1 Active ONS 15216 NEs

The Network Element Properties pane for active ONS 15216 NEs displays information specific to the active ONS 15216 erbium-doped fiber amplifier (EDFA) and optical add/drop multiplexer (OADM) NEs. The properties pane contains the following slot properties:

- B.1.1.1 Status, page B-2
- B.1.1.2 Identification, page B-3
- B.1.1.3 Address, page B-3
- B.1.1.4 NE Authentication, page B-4

The following table lists the different types of active ONS 15216 NEs.

Table B-2 List of Active ONS 15216 NE Types and Descriptions

Active ONS 15216 Types	Description
EDFA	Active EDFA with an IP address.
OADM	Active 100-GHz OADM with an IP address. The OADM can be a 1-, 2-, or 4-channel OADM.

B.1.1.1 Status

The Status Properties pane displays status information for the active NE.

Table B-3 Field Descriptions for the Status Properties Pane

Field	Description
NE ID	Displays the user-defined name of the selected NE.
Description	Displays information that a user has entered (if any) to describe the NE.

Table B-3 Field Descriptions for the Status Properties Pane (continued)

Field	Description
NE Model	Identifies the model of the selected ONS 15216 NE.
Alarm Status	Displays the total number of critical, major, minor, and warning alarms currently existing on the selected NE.
Communication State	Displays the current connectivity state between Prime Optical and the selected NE. Values are Available or Unavailable.
Operational State	Displays the current operational state of the selected NE and allows you to change the state. Values are In Service, Out of Service, and Under Maintenance.

B.1.1.2 Identification

The Identification Properties pane displays NE identification information.

Table B-4 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the user-defined name of the selected NE.
Description	Displays information that user has entered (if any) to describe the NE.
NE Model	Identifies the model of the selected ONS 15216 NE.
NE Type	Displays the ONS 15216 NE type.
Vendor Name	Displays the vendor name. The default vendor name is Cisco Systems.
Software Version	Displays the NE software version.
Version Name	Displays the name of the software version.
Location Name	Displays the geographic location of the selected NE.

B.1.1.3 Address

The Address Properties pane provides address information for the NE. If you change an address, the NE is reset automatically to make the new address selection valid.

Table B-5 Field Descriptions for the Address Properties Pane

Field	Description
NE ID	Displays the user-defined name of the selected NE.
Description	Displays information that a user has entered (if any) to describe the NE.
NE Model	Identifies the model of the selected ONS 15216 NE.
Active IP Address	Displays the IP address of the selected NE.
SNMP Community String	Displays the configured community string name used in Simple Network Management Protocol (SNMP) messages. The community name is used to determine whether a user has access to the device.
GNE ID	Displays the ID for the gateway NE (GNE) on the selected NE ring.

Table B-5 Field Descriptions for the Address Properties Pane (continued)

Field	Description
Subnetwork ID	Displays the name of the subnetwork associated with the selected NE.
Network Partition ID	Displays the name of the network partition associated with the selected NE.

B.1.1.4 NE Authentication

The NE Authentication Properties pane allows you to specify usernames and passwords for Prime Optical server connections to ONS 15216 NEs. Fields shown depend on the type of NE selected.

Table B-6 Field Descriptions for the NE Authentication Properties Pane

Field	Description
NE Connection	
Username	Specify the username that the Prime Optical server uses to connect to ONS 15216 NEs.
Password	Specify the password to use for Prime Optical server-to-NE connections.
Confirm Password	Retype the password to confirm it.

Note Regardless of the actual length of the password, the Password and Confirm Password fields display only a fixed-length string of 15 asterisks (*).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.1.2 Passive ONS 15216 NEs

The Network Element Properties pane for passive ONS 15216 NEs displays information specific to the passive EDFA, the passive OADM, the DCU, the OSC, and the DWDM ONS 15216 NEs. The passive ONS 15216 properties pane contains an Identification.

The following table lists the different types of passive ONS 15216 NEs.

Table B-7 List of Passive ONS 15216 NE Types and Descriptions

Passive ONS 15216 Types	Description
EDFA	Passive EDFA with no IP address or connectivity.
OADM	Passive 200-GHz OADM with no IP address or connectivity. The OADM can be either a 1- or 2-channel OADM.
DCU	Passive DCU with no IP address or connectivity.

Table B-7 List of Passive ONS 15216 NE Types and Descriptions (continued)

Passive ONS 15216 Types	Description
OSC	Passive OSC with no IP address or connectivity.
DWDM	Passive DWDM filter with no IP address or connectivity. The DWDM filter can be a red, 200-GHz, DWDM filter; a blue, 200-GHz, DWDM filter; a red, 100-GHz, DWDM filter; or a blue, 100-GHz, DWDM filter.

B.1.2.1 Identification

The Identification Properties pane displays the NE identification information.

Table B-8 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the user-defined name of the selected NE.
Description	Displays information that a user has entered (if any) to describe the NE.
NE Model	Identifies the model of the selected NE (ONS 15216).
NE Type	Displays the ONS 15216 NE type.
Vendor Name	Displays the vendor name. The default vendor name is Cisco Systems.
Version Name	Displays the name of the software version.
Location Name	Displays the geographic location of the selected NE.
Operational State	Displays the current operational state of the system: In Service, Under Maintenance, or Out of Service.
Subnetwork ID	Displays the name of the subnetwork associated with the selected NE.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.1.3 ONS 15216 Passive DCU NE Explorer

The ONS 15216 Passive DCU NE Explorer displays information about the ONS 15216 Passive DCU NE. It contains Identification, Slot 1, and Slot 2 Properties panes. (See Figure B-1.)

Each slot can accommodate any one of the following modules:

- DCU-100 (100 ps/nm)
- DCU-350 (350 ps/nm)
- DCU-450 (450 ps/nm)
- DCU-550 (550 ps/nm)
- DCU-750 (750 ps/nm)
- DCU-950 (950 ps/nm)

- DCU-1150 (1150 ps/nm)
- DCU-E-200 (200 ps/nm, ELEAF type)
- DCU-E-350 (350 ps/nm, ELEAF type)
- DCU-L-300 (300 ps/nm)
- DCU-L-600 (600 ps/nm)
- DCU-L-700 (700 ps/nm)
- DCU-L-800 (800 ps/nm)
- DCU-L-1000 (1000 ps/nm)
- DCU-L-1100 (1100 ps/nm)
- DCU-DS-L-100 (100 ps/nm)
- DCU-DS-L-200 (200 ps/nm)
- DCU-DS-L-300 (300 ps/nm)
- 15216-FBGDCU-165 (165 ps/nm)
- 15216-FBGDCU-331 (331 ps/nm)
- 15216-FBGDCU-496 (496 ps/nm)
- 15216-FBGDCU-661 (661 ps/nm)
- 15216-FBGDCU-826 (826 ps/nm)
- 15216-FBGDCU-992 (992 ps/nm)
- 15216-FBGDCU-1157 (1157 ps/nm)
- 15216-FBGDCU-1322 (1322 ps/nm)
- 15216-FBGDCU-1653 (1653 ps/nm)
- 15216-FBGDCU-1983 (1983 ps/nm)

B.1.3.1 Identification

The Identification Properties pane displays identification information for the ONS 15216 DCU NE.

Table B-9 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.

Table B-9 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

B.1.3.2 Slot 1 and Slot 2

The Slot 1 and Slot 2 Properties panes display information about the first and second slots. The fields in both Properties panes are identical, except that they pertain to different slots.

Table B-10 Field Descriptions for the Slot 1 and Slot 2 Properties

Field	Description
Module Type	Displays the NE model type. Select one of the following module types: • DCU-100 (100 ps/nm) • DCU-350 (350 ps/nm) • DCU-450 (450 ps/nm) • DCU-550 (550 ps/nm) • DCU-750 (750 ps/nm) • DCU-950 (950 ps/nm) • DCU-1150 (1150 ps/nm) • DCU-E-200 (200 ps/nm, ELEAF type) • DCU-E-350 (350 ps/nm, ELEAF type) • DCU-L-300 (300 ps/nm) • DCU-L-600 (600 ps/nm) • DCU-L-700 (700 ps/nm) • DCU-L-800 (800 ps/nm) • DCU-L-1000 (1000 ps/nm) • DCU-L-1100 (1100 ps/nm) • DCU-DS-L-100 (100 ps/nm) • DCU-DS-L-200 (200 ps/nm) • DCU-DS-L-300 (300 ps/nm)
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.

B.1.4 ONS 15216 DWDM NE Explorer

The NE Explorer for the ONS 15216 DWDM displays information about the passive ONS 15216 DWDM NE. It contains an Identification Properties pane.

The Cisco ONS 15216 48-channel muxponder/demuxponder unit is a new ONS 15216 FlexLayer unit that allows 48 channels of ITU wavelengths to be placed onto a single fiber, and removes 48 channels of ITU wavelengths from a single fiber.

R9.6 supports the ONS 15216 48-channel muxponder/demuxponder odd/even unit:

- 15216-MD-48-ODD=: 48 channels spaced at 100 GHz on the Odd ITU grid
- 15216-MD-48-EVEN=: 48 channels spaced at 100 GHz on the Even ITU grid

B.1.4.1 Identification

The Identification Properties pane displays identification information about the ONS 15216 DWDM NE. See the following table for field descriptions.

Table B-11 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Product Name	Displays the name of the product.
CLEI Code	Displays the Common Language Equipment Identification (CLEI) code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

B.1.5 ONS 15216 FlexLayer NE Explorer

The ONS 15216 FlexLayer NE Explorer displays information about the ONS 15216 FlexLayer NE. It contains the following Properties panes:

- B.1.5.1 Identification
- B.1.3.2 Slot 1 and Slot 2

B.1.5.1 Identification

The Identification Properties pane displays identification information about the ONS 15216 FlexLayer NE.

Table B-12 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

B.1.5.2 Slot 1 Through Slot 4

The Slot Properties panes show module information pertaining to the selected ONS 15216 FlexLayer NE slot. The fields in both Properties panes are identical, except that they pertain to different slots.

Table B-13 Field Descriptions for the Slot 1 through Slot 4 Properties

Field	Description
Module Type	Displays the type of module in the slot.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.

B.1.6 ONS 15216 Passive EDFA NE Explorer

The ONS 15216 Passive EDFA NE Explorer displays information about the ONS 15216 Passive EDFA NE. It contains an Identification Properties pane.

B.1.6.1 Identification

The Identification Properties pane displays identification information for the ONS 15216 Passive EDFA NE.

Table B-14 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

B.1.7 ONS 15216 Active EDFA2 NE Explorer

The ONS 15216 EDFA2 NE Explorer contains the following Properties panes, some of which apply only to a specific NE version:

- B.1.7.1 Identification, page B-10
- B.1.7.2 Address, page B-11
- B.1.7.3 Config/Status, page B-11
- B.1.7.4 Diagnostics, page B-13
- B.1.7.5 Thresholds, page B-13
- B.1.7.6 Alarm Behavior, page B-14
- B.1.7.7 SNMP, page B-15

B.1.7.1 Identification

The Identification Properties pane displays identification information about the ONS 15216 EDFA2 NEs.

Table B-15 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Alias	Displays the alias name of the NE.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.

Table B-15 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Wavelength(s)	Displays the number of wavelengths for the NE. This field is not applicable to the active EDFA NE type.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.
Location	
Latitude	Allows you to set the latitude in the database. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude in the database. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.

B.1.7.2 Address

The Address Properties pane displays information about the NE network address.

Table B-16 Field Descriptions for the Address Properties Pane

Field	Description
IP Address	Displays the IP address of the NE.
Subnet Mask	Displays the subnetwork mask ID of the NE.
Gateway Address	Displays the gateway address of the NE.
SNMP Community String	Displays the SNMP community string of the NE. You can edit this field.
GNE ID	Displays the GNE ID.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

B.1.7.3 Config/Status

The Config/Status Properties pane displays the configuration settings and status of the EDFA2.

Table B-17 Field Descriptions for the Config/Status Properties Pane

Field	Description
Overall	
Overall Gain	Displays the value of the gain set point in dB when the mode is GAINTEMP (gets cerent15216EdfaConstGainOverallGainMeasured). Must be an integer from 13.0 to 22.0.
Measured Gain	Displays the measured overall gain in dB. The range is from 0.0 to 23.0. **Note** If there is no input power, this field reports a negative (invalid) value.
Pre-Attenuation	Displays the gain preattenuation value in dB (gets cerent15216EdfaVariableGainPreAttenuationMeasured). Must be an integer from 0.0 to 11.0.
Input Power	Displays the EDFA2 input power. Must be an integer from –9999.99 to 9999.99.
Output Power	Displays the EDFA2 output power. Must be an integer from –999.99 to 999.99.
DC Power Bus Mode	Displays the power bus mode setting (Simplex or Duplex) and allows you to change the mode.
Auto Laser Shutdown	Allows you to enable (On) or disable (Off) auto laser shutdown for the EDFA2. **Note** The auto laser shutdown feature is available for the ONS 15216 EDFA2 R2.4 and later.
Pump	
Control Mode Setting	Displays the control mode of the laser pumps. Constant gain is achieved by using an automatic control circuit that adjusts pump power when changes in input power are detected. The ONS 15216 EDFA2 operates in Constant Gain Temperature Compensated mode by default, but since there might be applications where other operating modes are required, the ONS 15216 EDFA2 can be set to operate in any one the following pump control modes: • Constant Gain Temperature Compensated mode (ConstGainTempComp; Cisco default). • Constant Output Power mode (ConstOutputPower). **Note** Pump 1 cannot be set to ConstOutputPower mode. • Constant Pump Current mode (ConstCurrent). • Constant Pump Power mode (ConstPower). • Idle—Laser pumps can be shut down using the Idle control mode. **Caution** Use the pump control modes Constant Output Power, Constant Pump Current, and Constant Pump Power with extreme caution. These modes are service affecting and can reduce the lifecycle of the lasers if used in extreme conditions. The factory default setting and the recommended mode of operation is Constant Gain Temperature Compensated mode. It is recommended that you contact the Cisco TAC before changing from this mode of operation.
Actual Control Mode	Displays the actual control mode of the laser pumps.
Constant Pump Current	Displays the laser pump constant pump current in milliamperes (mA). This is the current used when the control mode is changed to constCurrent. When changing Pump 1, Pump 2 is changed automatically when the Apply button is clicked.
Constant Pump Power	Displays the constant pump power in milliwatts (mW). The range is from 0 to 100 mW; the Cisco default is 0. You must set the constant power of pump 1 and pump 2 at the same time.
Constant Output Power	Displays the constant output power in mW. Only Pump2 is writeable. When ConstOutputPower is selected as the control mode, this field is enabled and editable for Pump2 and not for Pump1. The Const Power field is enabled with the Cisco default value (0). The range is from 0.0 to 65.0 mW.

B.1.7.4 Diagnostics

The Diagnostics Properties pane allows you to view NE laser pump attributes.

Table B-18 Field Descriptions for the Diagnostics Properties Pane

Field	Description
Gain Module Temp	Displays the gain module temperature in degrees Celsius. Must be an integer from –99.99 to 99.99.
Gain Module Volt	Displays the gain module voltage in volts. Must be an integer from 0 to 999.
Input Power	Displays the laser input power in dBm. Must be an integer from –9999.99 to 9999.99.
Output Power	Displays the laser output power in dBm. Must be an integer from –999.99 to 999.99.
Gain	Displays the laser gain in dB. Must be an integer from –999.9 to 999.9.
Pump	
Chip Temp	Displays the chip temperature in degrees Celsius. Must be an integer from –999.9 to 999.9.
Chip Temp Set Pt.	Displays the chip temperature set point in degrees Celsius. Must be an integer from 0.0 to 99.9.
TEC Current	Displays the TEC current in mA. Must be an integer from 0 to 99999.
Current	Displays the laser current in mA. Must be an integer from 0 to 999.
Power	Displays the pump power in mW. Must be an integer from 0.0 to 999.99.

B.1.7.5 Thresholds

The Thresholds Properties pane displays the threshold settings of the EDFA2.

Table B-19 Field Descriptions for the Thresholds Properties Pane

Field	Description
Input Power	
Threshold	Displays the input power threshold value in dBm. Must be an integer from –31 to –15.
Hysteresis	Displays the input power hysteresis value in dB. Must be an integer from 0 to 10.
Input Power	Displays the input power threshold value. Must be an integer from –9999.99 to 9999.99.
Output Power	
Alm Deviation	Displays the output power alarm deviation value in dB. Must be an integer from 0 to 10.
Alm Hysteresis	Displays the output power alarm hysteresis value in dB. Must be an integer from 0 to 10.
Output Power Setpt	Displays the output power setpoint threshold value.
Gain	
Min Gain	Displays the minimum gain setting. Must be an integer from –999.99 to 999.99.
Max Gain	Displays the maximum gain setting. Must be an integer from –999.99 to 999.99.
Measured Gain	Displays the value of the gain in dB when the mode is GAINTEMP (gets cerent15216EdfaConstGainOverallGainMeasured). Must be an integer from 0 to 23.
Gain Module Temperature	
Min Temperature	Displays the minimum case temperature in degrees Celsius. Must be an integer from –10 to 10.
Max Temperature	Displays the maximum case temperature in degrees Celsius. Must be an integer from 20 to 70.

Table B-19 Field Descriptions for the Thresholds Properties Pane (continued)

Field	Description
Min Hysteresis	Displays the minimum case temperature hysteresis in degrees Celsius. Must be an integer from 0 to 10.
Max Hysteresis	Displays the maximum case temperature hysteresis in degrees Celsius. Must be an integer from 0 to 10.
Power Bus	
Power Bus Min	Displays the minimum allowable power bus DC voltage. Must be an integer from –70 to –35.
Power Bus Max	Displays the maximum allowable power bus DC voltage. Must be an integer from –70 to –35.
Laser 1 Current	
Out-of-Range	Displays the Laser 1 pump temperature that is out of range.
Current	Displays the current of the Laser 1 pump in mA.
Laser 2 Current	
Out-of-Range	Displays the Laser 2 pump temperature that is out of range.
Current	Displays the current of the Laser 2 pump in mA.
Laser 1 Temperature	
Temp Min	Displays the minimum temperature of Laser 1.
Temp Max	Displays the maximum temperature of Laser 1.
Chip Temp	Displays the Laser 1 chip temperature in degrees Celsius. Must be an integer from –999.99 to 999.99.
Laser 2 Temperature	
Temp Min	Displays the minimum temperature of Laser 2.
Temp Max	Displays the maximum temperature of Laser 2.
Chip Temp	Displays the Laser 2 chip temperature in degrees Celsius. Must be an integer from –999.99 to 999.99.

B.1.7.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to enter, save, view, and update NE fault management attributes.

Table B-20 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Probable Cause	Displays the probable cause of the alarm.
Severity	Displays the alarm severity (Critical, Major, Minor, Informational, or Not Alarmed). **Note** If two minor power bus alarms are generated, the second alarm is escalated to critical in the Alarm Browser window. If the alarm severity is changed to another value, the alarm remains critical due to the power bus escalation feature, which overrides the alarm severity provisioning for power bus alarms.

B.1.7.7 SNMP

The SNMP Properties pane displays the settings for the SNMP Community table, the Trap Destination table, and SNMP views. The SNMP Properties pane contains the following tabs: SNMP Community Table, Trap Destination Table, and SNMP Views.

Table B-21 Field Descriptions for the SNMP Properties Pane

Field	Description
SNMP Community Table	
Community Name	Displays the SNMP community name.
View Index	Displays the view index that specifies which MIBs that the community string can access.
Privileges	Displays the bitmap of access privilege that govern what management operations a particular community can perform. These privileges are expressed as a sum of values, where each value represents a particular operation. The decimal values and their respective SNMP operation are: • 1—Get • 2—GetNext • 4—Response (enabled for all community strings) • 8—Set • 16—SNMPv1-Trap • 32—GetBulk • 64—Inform (enabled for all community strings) • 128—SNMPv2-Trap (enabled for all community strings) For example, 255 is the sum of all decimal values and specifies access to all SNMP operations. This sum is the default private community. 247 is the sum for all SNMP operations with the exception of the Set operation. This sum is the default public community. Use the buttons in the Privileges column to set privilege values. In the Privilege Editor dialog box, check the check boxes that correspond to the privileges that you want to set. After making your selections, click **OK**. Prime Optical computes the bit value automatically.
IP Address	Displays the source IP address.
Subnet Mask	Displays the subnet mask for the source IP address.
Status	Displays the community string status. Values are: • Active • Not in Service • Not Ready • Create and Go • Create and Wait • Destroy
Trap Destination Table	
IP Address	Displays the trap destination IP address.
UDP Port	Displays the trap destination UDP port.
Community Name	Displays the trap destination community string.

Table B-21 Field Descriptions for the SNMP Properties Pane (continued)

Field	Description
Version	Displays the trap version number.
View Index	Displays the trap destination MIB view index.
Status	Displays the community string status. Values are: • Active • Not in Service • Not ready • Create and Go • Create and Wait • Destroy
SNMP Trap Enable check box	If checked, allows you to enable SNMP traps on the NE. **Note** This is a global setting, meaning all users are affected by a change to this setting.
SNMP Views	
View Index	Displays the view index number, which is a unique value for each MIB view.
Subtree	Displays an object identifier that designates a subtree element in the MIB hierarchy.
Mask	Displays a bit mask that identifies objects in the subtree.
Type	Displays a flag that specifies the status of the view. Valid entries are included and excluded.
Status	Indicates the status of the SNMP view entry. If the entry currently exists, the status is active.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.1.8 ONS 15216 Active EDFA3 NE Explorer

The ONS 15216 EDFA3 NE Explorer contains the following Properties panes:

- B.1.8.1 Identification, page B-16
- B.1.8.2 Address, page B-17
- B.1.8.3 Config/Status, page B-18
- B.1.8.4 Diagnostics, page B-19
- B.1.8.5 Thresholds, page B-19
- B.1.8.6 Alarm Behavior, page B-20
- B.1.8.7 SNMP, page B-20

B.1.8.1 Identification

The Identification Properties pane displays identification information for the ONS 15216 EDFA3 NE.

Table B-22 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Wavelength(s)	Displays the number of wavelengths for the NE. This field is not applicable to the active EDFA NE type.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.
NE Date and Time	Displays the date and time configured on the NE.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).

B.1.8.2 Address

The Address Properties pane displays information about the NE network address.

Table B-23 Field Descriptions for the Address Properties Pane

Field	Description
IP Address	Displays the IP address of the NE.
Subnet Mask	Displays the subnetwork mask ID of the NE.
Gateway Address	Displays the gateway address of the NE.
SNMP Community String	Displays the SNMP community string of the NE. You can edit this field.
MAC Address	Displays the ONS 15216 EDFA3 address as it is identified on the IEEE 802 MAC layer.
GNE ID	Displays the GNE ID.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

B.1.8.3 Config/Status

The Config/Status Properties pane displays the configuration settings and status of the EDFA3 and lasers.

Table B-24 Field Descriptions for the Config/Status Properties Pane

Field	Description
Control Mode	
Control Mode	Displays the amplifier control mode. Values are: • Constant Output Power • Constant Gain (Cisco default)
Gain	
Gain	Displays the gain value. Values are integers from 0 to 40 dB.
Gain Setpoint	Displays the gain setpoint. The range is from 5.0 to 38.5 dB; the Cisco default is 21 dB.
Power	
Laser 1 Output Power	Displays the amplifier output power related to laser 1. The range is from –60 to 25 dBm.
Power Setpoint	Displays the amplifier output power setpoint value. The range is from –7 to 17 dBm; the Cisco default is 10 dBm.
Amplifier Input Power	Displays the amplifier input power. The range is from –60 to 25 dBm.
Laser 2 Input Power	Displays the mid-stage access input power value related to laser 2. The range is from –60 to 25 dBm.
Amplifier Output Power	Displays the mid-stage access output power value. The range is from –60 to 25 dBm.
Power Offset	Displays the output power offset. The range is from –20 to 20 dBm; the Cisco default is 0.
Tilt	
Tilt	Displays the tilt value. The range is from –15 to 15 dB.
Tilt Setpoint	Displays the tilt setpoint. The range is from –15 to 15 dB; the Cisco default is 0 dB.
Tilt Offset	Displays the tilt offset. The range is from –20 to 20 dB; the Cisco default is 0 dB.
Laser	
Laser Status	Displays the automatic laser shutdown (ALS) status. Values are: • On—Lasers are on • APR—Lasers are in the automatic power reduction state • Off—Lasers are off
OSRI	Displays the OSRI. Values are: • On—Laser switch is locked on • Off—(Cisco default) There is no lock on the lasers
DC Power Bus Mode	
DC Power Bus Mode	Displays the power bus mode: Simplex or Duplex.

B.1.8.4 Diagnostics

The Diagnostics Properties pane displays diagnostics information for the EDFA3 and lasers.

Table B-25 Field Descriptions for the Diagnostics Properties Pane

Field	Description
DCU Insertion Loss	Displays the insertion loss of the DCU inserted in mid-stage. The range is from 0 to 20 dB.
VOA Value	Displays the variable optical attenuator (VOA) value. The range is from –100 to 100 dB.
Laser Bias	
Laser 1 Bias	Displays the laser 1 bias. The range is from 0 to 150 mA.
Laser 2 Bias	Displays the laser 2 bias. The range is from 0 to 150 mA.
Temperatures	
Case Temperature	Displays the case temperature. The range is from –100 to 150 degrees Celsius.
Fiber Temperature	Displays the fiber temperature. The range is from –100 to 150 degrees Celsius.
Pump 1 Temperature	Displays the pump 1 temperature. The range is from –100 to 150 degrees Celsius.
Pump 2 Temperature	Displays the pump 2 temperature. The range is from –100 to 150 degrees Celsius.
Bus Voltages	
Bus A Voltage	Displays the power bus A voltage. The range is from 0 to 999 V.
Bus B Voltage	Displays the power bus B voltage. The range is from 0 to 999 V.

B.1.8.5 Thresholds

The Thresholds Properties pane displays the threshold settings of the EDFA3.

Table B-26 Field Descriptions for the Thresholds Properties Pane

Field	Description
Gain	
Degrade High	Displays the degrade high threshold associated with the amplifier gain. The range is from 0 to 40 dB.
Degrade Low	Displays the degrade low threshold associated with the amplifier gain. The range is from 0 to 40 dB.
Gain	Displays the gain value. The range is from 0 to 40 dB.
Line 1 Tx Power	
Degrade High	Displays the degrade high threshold associated with the amplifier output power related to the Line 1 Tx port. The range is from 0 to 40 dB.
Degrade Low	Displays the degrade low threshold associated with the amplifier output power related to the Line 1 Tx port. The range is from 0 to 40 dB.
Line 1 Output Power	Displays the amplifier output power related to the Line 1 Tx port. The range is from –60 to 25 dBm.
Fail Low	Displays the fail low threshold associated with the output power value related to the Line 1 Tx port. The range is from –10 to 14 dBm; the Cisco default is –6 dBm.
Line 1 Rx Power	
Amplifier Input Power	Displays the amplifier input power value related to the Line 1 Rx port. The range is from –60 to 25 dBm.

Table B-26 Field Descriptions for the Thresholds Properties Pane (continued)

Field	Description
Fail Low	Displays the fail low threshold associated with the input power value related to the Line 1 Rx port. The range is from –49 to 13 dBm; the Cisco default is 10 dBm.
Line 2 Rx Power	
Laser 2 Input Power	Displays the mid-stage access input power value related to the Line 1 Rx port. The range is from –60 to 25 dBm.
Fail Low	Displays the fail low threshold associated with the mid-stage access input power related to the Line 2 Rx port. The range is from –49 to 15 dBm; the Cisco default is –33 dBm.
Gain Module Temperature	
Temperature Max	Displays the maximum allowable case temperature threshold. The range is from 60 to 100 degrees Celsius; the Cisco default is 65 degrees Celsius.
Temperature Min	Displays the minimum allowable case temperature threshold. The range is from –10 to 30 degrees Celsius; the Cisco default is –5 degrees Celsius.
Case Temperature	Displays the case temperature. The range is from –100 to 150.
Bus Voltage	
Bus Voltage Max	Displays the power bus A and B maximum voltage. The range is from 49 to 70 V; the Cisco default is 57 V.
Bus Voltage Min	Displays the power bus A and B minimum voltage. The range is from 0 to 47 V; the Cisco default is 40 V.
Bus A Voltage	Displays the power bus A voltage. The range is from 0.0 to 999.9 V.
Bus B Voltage	Displays the power bus B voltage. The range is from 0.0 to 999.9 V.

B.1.8.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to enter, save, view, and update NE fault management attributes.

Table B-27 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Probable Cause	Displays the possible causes of the alarm.
Severity	Displays the alarm severity (Critical, Major, Minor, or Not Alarmed) and whether the alarm is service affecting (SA) or nonservice affecting (NSA).

B.1.8.7 SNMP

The SNMP Properties pane displays information about the SNMP Trap Destination table. Click **Add Row** to create a new trap destination; click **Delete Row** to delete an existing trap destination.

Table B-28 Field Descriptions for the SNMP Properties Pane

Field	Description
IP Address	Displays the SNMP IP address.
UDP Port Number	Displays the trap destination UDP port.

Table B-28 Field Descriptions for the SNMP Properties Pane (continued)

Field	Description
Community Name	Displays the trap destination community name.
Version	Displays the SNMP version number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.1.9 ONS 15216 Active OADM NE Explorer

The ONS 15216 OADM NE Explorer displays information about the ONS 15216 100-GHz OADM NE.

The ONS 15216 100-GHz OADM NE Explorer contains the following Properties panes:

- B.1.9.1 Identification
- B.1.9.2 Address, page B-22
- B.1.9.3 DWDM, page B-22
- B.1.9.4 Alarms, page B-23
- B.1.9.5 Thresholds, page B-23

B.1.9.1 Identification

The Identification Properties pane displays identification information for the ONS 15216 100-GHz OADM NE.

Table B-29 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Wavelength(s)	Displays the number of wavelengths for this NE.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the location where the NE is installed.
NE Date and Time	Displays the date and time when the NE was installed.

B.1.9.2 Address

The Address Properties pane displays information about the NE network address.

Table B-30 Field Descriptions for the Address Properties Pane

Field	Description
IP Address	Displays the IP address of the NE.
Subnet Mask	Displays the subnetwork mask ID of the NE. If the field does not apply to the NE, the label is grayed out and the value reads *Not Applicable*.
Gateway Address	Displays the gateway address of the NE. If the field does not apply to the NE, the label is grayed out and the value reads *Not Applicable*.
SNMP Community String	Displays the SNMP community string of the NE. If the field does not apply to the NE, the label is grayed out and the value reads *Not Applicable*.
GNE ID	Displays the GNE ID.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition associated with the selected NE.

B.1.9.3 DWDM

The DWDM Properties pane allows you to view, enter, update, and save the NE DWDM attributes.

Table B-31 Field Descriptions for the DWDM Properties Pane

Field	Description
Channel Number	Displays the channels that can be added or dropped. Values are: • 1-channel—West 1, East 1 • 2-channel—West 1, East 1, West 2, East 2 • 4-channel—West 1, East 1, West 2, East 2, West 3, East 3, West 4, East 4
Mode	Allows you to configure the NE DWDM mode. Values are: • Setpoint (Cisco default)—The add channel power is set to the value of the Default Add Channel Power. Although the Default Add Channel Power can be set in any configuration, the add channel power is only equal to the Default Add Channel Power value in this mode. • Off—To turn off an add channel, set the channel power to a very low value (for example, –35 dBm). No alarm will be triggered. • Disable—When an add/drop channel is not in use, the channel should be configured in DISBABLE mode where no alarms will be triggered.
Default Add Channel Power	Displays the default power of the added channel in dBm. It is available only if you select Setpoint as the mode. Values must be from –29.0 to 3.0 in increments of 0.1.
InsLossAdd	Shows the calculated insertion loss for the add channel.
InsLossDrop	Shows the calculated insertion loss for the drop channel.
InsLossXpress	Shows the calculated insertion loss for the express/through channels.

Table B-31 Field Descriptions for the DWDM Properties Pane (continued)

Field	Description
Calculated Setpoint (CALCSETP)	The CALCSETP feature of the ONS 15216 OADM is a calculated value, and represents the OADMs recommended optical power level setting for a particular add channel. Following this recommendation when selecting the setpoint value for a particular add channel will allow the composite outgoing signal (composed of express channels and newly added channels) to be as flat as possible. The formula used for this calculation is CALCSETP = PWRDROP + ILDROP - ILTHRU.
Passive Cards	Provides information about passive units provisioned in CTC. **Note** Passive units can be provisioned in CTC only.

B.1.9.4 Alarms

The Alarms Properties pane allows you to enter, save, view, and update NE dropped-channel, signal-loss alarm attributes.

Table B-32 Field Descriptions for the Alarms Properties Pane

Field	Description
Channel Number	Displays the channels that can be added or dropped. Values are: • 1-channel—West 1, East 1 • 2-channel—West 1, East 1, West 2, East 2 • 4-channel—West 1, East 1, West 2, East 2, West 3, East 3, West 4, East 4
Drop Channel Signal Loss Alarm	Displays the current condition of the drop channel signal loss alarm. Values are: • On—Enables the loss signal alarm of the drop channel. • Off—Disables the loss signal alarm of the drop channel.

B.1.9.5 Thresholds

The Thresholds Properties pane allows you to enter, save, view, and update NE loss-of-signal and add/drop channel-signal mismatch threshold attributes.

Table B-33 Field Descriptions for the Thresholds Properties Pane

Field	Description
Channel Number	Displays the channels that can be added or dropped. Values are: • 1-channel—West 1, East 1 • 2-channel—West 1, East 1, West 2, East 2 • 4-channel—West 1, East 1, West 2, East 2, West 3, East 3, West 4, East 4
Loss of Signal	Displays the signal loss threshold value. Valid values are –30.0 to 3.5 dBm in increments of 0.1 dBm.
Drop and Add Signal Mismatch	Displays the threshold value for the drop channel signal loss alarm. Valid values are 0.2 to 2.0 dB in increments of 0.1 dB. The Cisco default is 1.0 dB.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.1.10 ONS 15216 Passive OADM NE Explorer

The ONS 15216 Passive OADM NE Explorer displays information about the ONS 15216 passive OADM NE. It contains an Identification Properties pane.

B.1.10.1 Identification

The Identification Properties pane displays identification information for the ONS 15216 passive OADM NE.

Table B-34 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Wavelength(s)	Displays the number of wavelengths for this NE.
Product Name	Displays the name of the product. Displays *15216-MD16-2-BLUE* for the blue version and *15216-MD16-2-RED* for the red version. Displays *Unknown* if the product name is not known. **Note** The information displayed in the Product Name field depends on the wavelength selected.
CLEI Code	Displays the CLEI code. Displays *WMMFD00BRA* for the blue version and *WMMFE00BRA* for the red version. Displays *Unknown* if the CLEI code is not known. **Note** The information displayed in the CLEI Code field depends on the wavelength selected.
Serial Number	Displays the serial number of the NE. You can edit this field.
Location Name	Displays the name of the location where the NE is installed. You can edit this field.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition to which the NE belongs.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.1.11 ONS 15216 OSC Passive NE Explorer

The ONS 15216 Passive OSC NE Explorer displays information about the ONS 15216 passive OSC NE. It contains an Identification Properties pane.

B.1.11.1 Identification

The Identification Properties pane displays the identification information for the ONS 15216 passive OSC NE.

Table B-35 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
NE Type	Displays the type of NE.
NE Version	Displays the software version of the NE.
Wavelength(s)	Displays the number of wavelengths for this NE.
Product Name	Displays the name of the product.
CLEI Code	Displays the CLEI code.
Serial Number	Displays the serial number of the NE. You can edit this field.
Location Name	Displays the name of the location where the NE is installed. You can edit this field.
Subnetwork ID	Displays the ID of the subnetwork to which the NE belongs.
Network Partition ID	Displays the ID of the network partition.

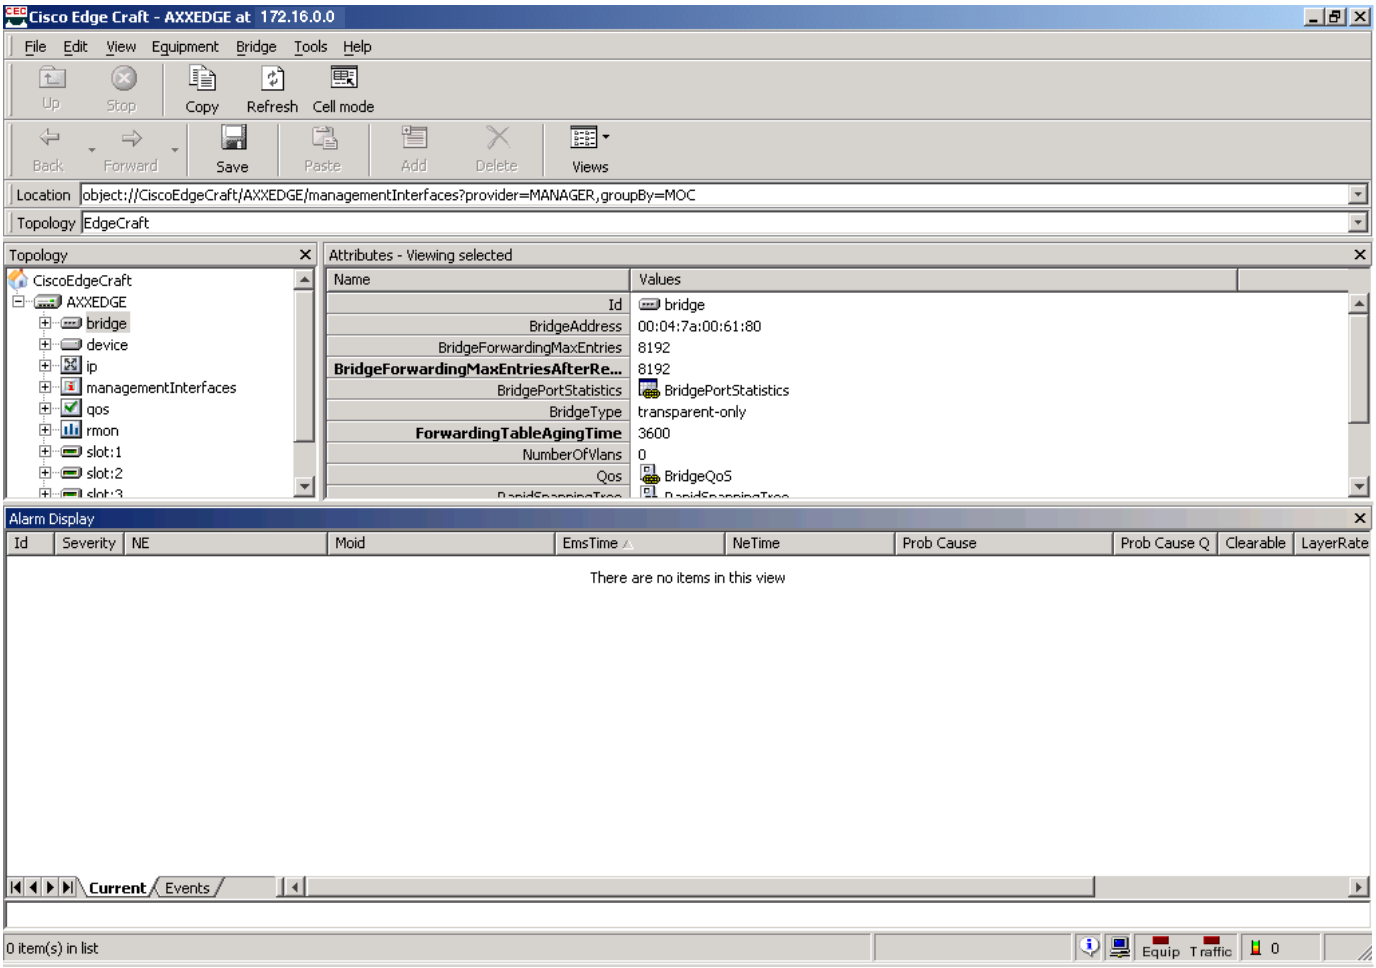
Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.2 ONS 15305

The NE Explorer is not available for the ONS 15305. You can get equivalent functionality by launching Cisco Edge Craft from Prime Optical; choose **Configuration > ONS 15305 > Launch Cisco Edge Craft**.

Note Cisco Edge Craft is not supported on Windows 7 client machine.

Figure B-1 Cisco Edge Craft for the ONS 15305



B.3 ONS 15305 CTC NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15305, the window that Prime Optical displays consists of a tree on the left side and a Properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The Properties pane shows information about the selected entity. See B.3.1 Node Properties Pane—ONS 15305 CTC, page B-27 for more information.

Note If CTC is launched from the web browser for an ONS 15305 node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.3.1 Node Properties Pane—ONS 15305 CTC

The node properties pane displays information about the ONS 15305 CTC slot that is selected in the NE Explorer tree. The properties pane contains the following properties, some of which apply only to a specific NE version:

- B.3.1.1 Shelf View, page B-27
- B.3.1.2 Identification, page B-27
- B.3.1.3 Network, page B-28
- B.3.1.4 Protection, page B-30
- B.3.1.5 DCC, page B-31
- B.3.1.6 Alarm, page B-31

B.3.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15305 CTC that is selected in the NE Explorer tree. Moving the mouse pointer over the graphic of the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset or delete the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.3.1.2 Identification

The Identification Properties pane displays information about the NE.

Table B-36 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
TP Settings	
Use TP Server	If checked, CTC uses a Simple Network Time Protocol (SNTP) server to set the date and time of the node. Using an SNTP server ensures that all ONS 15305 network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use TP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15305 CTC will use these fields for alarm dates and times.

Table B-36 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
TP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.

B.3.1.3 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.3.1.3.1 Address Tab, page B-28
- B.3.1.3.2 Static Routes Tab, page B-28
- B.3.1.3.3 OSPF Tab, page B-29
- B.3.1.3.4 SNMP Tab, page B-29

B.3.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-37 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15305 address as it is identified on the IEEE 802 MAC layer.

B.3.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15305 CTC connectivity and create or delete static routes.

Table B-38 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.

Table B-38 Field Descriptions for the Static Routes Tab (continued)

Field	Description
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15305 CTC and the computer.
Route Type	Displays the type of route (Other, Reject, Local, or Remote).
Protocol	Displays the protocol (OSPF or RIP).

B.3.1.3.3 OSPF Tab

The OSPF tab displays Open Shortest Path First (OSPF) information. OSPF is a link-state Internet routing protocol.

Table B-39 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15305 CTCs as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15305 CTC is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the designated router for a subnet.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.

B.3.1.3.4 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-40 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15305 CTC.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical.

Table B-40 Field Descriptions for the SNMP Tab (continued)

Field	Description
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15305 CTC to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15305 CTC to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15305 CTC to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.3.1.4 Protection

The Protection Properties pane contains the following tabs:

- B.3.1.4.1 Protection Groups Tab, page B-30
- B.3.1.4.2 Operations Tab, page B-31

B.3.1.4.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-41 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], or 1+1 [port]) of the selected protection group.
Protect Module	View the protect module if using 1+1 protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.

Table B-41 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, choose the amount of time following failure condition correction after which the node should switch back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.

B.3.1.4.2 Operations Tab

The Operations tab displays the protection group operation information.

Table B-42 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.3.1.5 DCC

The DCC Properties pane allows you to configure the Data Communication Channel on the regeneration and multiplex sections.

Table B-43 Field Descriptions for the DCC Properties Pane

Field	Description
DccR	
DCC-R Terminations	Displays the DCC termination on the regeneration section configured. The slot and port on which this type of termination is configured are displayed.
Admin State	Allows you to check and set the administrative state of the DCC termination. Values are In Service (IS) or Out of Service (OOS).
DccM	
DCC-M Terminations	Displays the DCC termination on the multiplex section configured. The slot and port on which this type of termination is configured are displayed.
Admin State	Allows you to check and set the administrative state of the DCC termination. Values are IS or OOS.

B.3.1.6 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual nodes. The Alarm Properties pane contains the Alarm Behavior tab.

Note The Alarm Properties pane might contain default alarm profile entries for cards that are not supported by the ONS 15305 CTC. Therefore, you might see some alarms that do not apply to the NE type that you are provisioning.

B.3.1.6.1 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-44 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.4 ONS 15310 CL NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15310 CL, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.4.1 Node Properties Pane—ONS 15310 CL, page B-32 for more information.

Note If CTC is launched from the web browser for an ONS 15310 CL node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.4.1 Node Properties Pane—ONS 15310 CL

The node properties pane displays information about the ONS 15310 CL slot that is selected in the NE Explorer tree. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.4.1.1 Shelf View, page B-33

- B.4.1.2 General, page B-33
- B.4.1.3 Identification, page B-33
- B.4.1.4 Network, page B-34
- B.4.1.5 DCC, page B-41
- B.4.1.6 Timing, page B-43
- B.4.1.7 Protection, page B-46
- B.4.1.8 NE Defaults, page B-48
- B.4.1.9 Security, page B-48
- B.4.1.10 Alarm, page B-52
- B.4.1.11 XC Utilization, page B-53
- B.4.1.12 OSI, page B-54

B.4.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15310 CL that is selected in the NE Explorer tree. Moving the mouse pointer over the graphic of the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset or delete the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.4.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15310 CL NE.

Table B-45 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.4.1.3 Identification

The Identification Properties pane displays information about the ONS 15310 CL NE.

Table B-46 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses a Simple Network Time Protocol (SNTP) server to set the date and time of the node. Using an SNTP server ensures that all ONS 15310 CL network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15310 CL will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
AIS-V Insertion on STS-1 Signal Degrade - Path	
Insert AIS-V on STS-1 SD-P	If checked, the NE inserts an AIS-V signal when it detects an STS-1 signal degrade.
SD-P BER	Select the signal degrade path bit error rate for AIS-V insertion.

B.4.1.4 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.4.1.4.1 Address Tab, page B-35
- B.4.1.4.2 Static Routes Tab, page B-35
- B.4.1.4.3 OSPF Tab, page B-36
- B.4.1.4.4 OSPF Area Range Tab, page B-36
- B.4.1.4.5 OSPF Virtual Links Tab, page B-37
- B.4.1.4.6 SNMP Tab, page B-37

- B.4.1.4.7 Firewall/Proxy Tab, page B-38
- B.4.1.4.8 RIP Routing Table Tab, page B-38
- B.4.1.4.9 RIP Tab, page B-39
- B.4.1.4.10 Routing Table Tab, page B-39
- B.4.1.4.11 Proxy Tunnels Tab, page B-40
- B.4.1.4.12 Firewall Tunnels Tab, page B-40
- B.4.1.4.13 FTP Hosts Tab, page B-41

B.4.1.4.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-47 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15310 CL address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards Dynamic Host Configuration Protocol (DHCP) requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.4.1.4.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15310 CL connectivity and create or delete static routes.

Table B-48 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15310 CL and the computer.

B.4.1.4.3 OSPF Tab

The OSPF tab displays Open Shortest Path First (OSPF) information. OSPF is a link-state Internet routing protocol.

Table B-49 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15310 CL NE as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. The Cisco default metric is 100. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables ONS 15310 CL OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15310 CL NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15310 CL is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the designated router for a subnet.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15310 CL is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.4.1.4.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-50 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15310 CL NE that resides within the OSPF area. For example, if the ONS 15310 CL OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15310 CL NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF range table is advertised.

B.4.1.4.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-51 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay (sec)	Displays the service speed. One second is the Cisco default.
Retransmit Interval (sec)	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval (sec)	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval (sec)	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.4.1.4.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-52 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15310 CL.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15310 CL to proxy SNMP calls.
IP Address	The IP address of the NMS.

Table B-52 Field Descriptions for the SNMP Tab (continued)

Field	Description
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15310 CL to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15310 CL to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15310 CL to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.4.1.4.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-53 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15310 CL serves as a proxy for connections between the Prime Optical server and ONS 15310s that are DCC-connected to the proxy ONS 15310 CL. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the ONS 15310 CL to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the ONS 15310 CL to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.4.1.4.8 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the Routing Information Protocol (RIP) routing table.

Table B-54 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.4.1.4.9 RIP Tab

The RIP tab allows you to view and configure RIP parameters.

Note

- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-55 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.4.1.4.10 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-56 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15310 CL interface used to access the destination. Values are: • cpm0—The ONS 15310 CL Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.4.1.4.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-57 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.4.1.4.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-58 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.4.1.4.13 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-59 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.4.1.5 DCC

The DCC Properties pane allows you to create, delete, and view SONET or SDH DCCs.

Table B-60 Field Descriptions for the DCC Properties Pane

Field	Description
SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.

Table B-60 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination. Click **Create** to create a new LDCC termination; click **Delete** to delete the selected LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.

Table B-60 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination: • IS-NR—In Service–Normal • OOS-AU—Out of Service–Autonomous • OOS-MA—Out of Service–Management • OOS-AUMA—Out of Service–Autonomous and Management In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion • UEQ—Unequipped; there is nothing in the slot • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted • SWDL—Software download in progress • MT—Maintenance, as per the Admin State change • AINS—Automatic in service • DSBLD—Traffic is disabled on the entity • LPBK—Port or connection has a loopback on it
Create button	Allows you to create new terminations on SONET or SDH cards.
Edit button	Allows you to modify existing terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected SDCC or LDCC.

B.4.1.6 Timing

The Timing Properties pane contains the following tabs:

- B.4.1.6.1 General Tab, page B-44
- B.4.1.6.2 Reference List Tab, page B-45

- B.4.1.6.3 Status Tab, page B-46
- B.4.1.6.4 Timing Report Tab, page B-46

B.4.1.6.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-61 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set the node timing mode: • External—The ONS 15310 CL derives its timing from a BITS source wired to the backplane pins. • Line—Timing is derived from an OC-N card (non-DWDM nodes) or OSC card (DWDM nodes) that is optically connected to the timing node. • Mixed—Timing is set to external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the synchronization status message (SSM) set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15310 CL reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Use the Reversion Time field to specify the time in half-minute increments.
Quality of RES	If your timing source supports the reserved S1 byte, you set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS In state to In Service (IS) or Out of Service (OOS). If Timing Mode is set to External or Mixed, set the BITS In State for BITS-1 or BITS-2 to IS (In Service) depending on whether one or both BITS input pin pairs on the backplane are connected to the external timing source. If Timing Mode is set to Line, set the BITS In State to OOS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either Extended Super Frame (ESF), or Super Frame (SF). SSM is not available with Super Frame.

Table B-61 Field Descriptions for the General Tab (continued)

Field	Description
Sync Messaging	If checked, enables the Synchronization Status Message (SSM) for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
BITS OUT Facilities	
Out State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
AIS Threshold	If SSM is disabled or Super Frame is used, set the quality level where a node sends an alarm indication signal (AIS) from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15310 CL. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.4.1.6.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-62 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to the internal clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal. • Timing Mode set to Line—Options are the node's working optical cards and Internal. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 Out is enabled as soon as BITS-1 facilities are placed in service.

B.4.1.6.3 Status Tab

The Status tab provides timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-63 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference. Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference. Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.

B.4.1.6.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.4.1.7 Protection

The Protection Properties pane contains the following tabs:

- B.4.1.7.1 Protection Groups Tab, page B-47
- B.4.1.7.2 Operations Tab, page B-47

B.4.1.7.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-64 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], or 1+1 [port]) of the selected protection group.
Protect Module	View the protect module if using 1+1 protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, choose the amount of time following failure condition correction after which the node should switch back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.

B.4.1.7.2 Operations Tab

The Operations tab displays the protection group operation information.

Table B-65 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

B.4.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15310 CL NE. You can edit NE defaults for the ONS 15310 CL R5.0 and later.

Table B-66 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter. **Note** This field applies to the ONS 15310 CL R6.0 and later.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter. **Note** This field applies to the ONS 15310 CL R6.0 and later.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.4.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15310 CL NE. The Security Properties pane contains the following tabs:

- B.4.1.9.1 Policy Tab, page B-48
- B.4.1.9.2 Password Tab, page B-49
- B.4.1.9.3 Access Tab, page B-50
- B.4.1.9.4 RADIUS Server Tab, page B-51
- B.4.1.9.5 Legal Disclaimer Tab, page B-52

B.4.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-67 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	

Table B-67 Field Descriptions for the Policy Tab (continued)

Field	Description
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.4.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-68 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused. The range is from 1 to 10.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.

Table B-68 Field Descriptions for the Password Tab (continued)

Field	Description
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.4.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-69 Field Descriptions for the Access Tab

Field	Description
LAN Access	
LAN Access	Specify the type of LAN access allowed. Values allowed for the ONS 15310 CL are Front Only or No LAN Access. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access (available for ONS 15310 CL NEs R6.0 and later)	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Shell Access on	Specify shell access on Telnet or SSH.
SSH Port	Indicates the SSH port number that will be used if the SSH radio button is selected.
Telnet Port	This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
Use Standard Telnet Port	If checked, the standard Telnet port is used for Telnet access.
Shell Access (available for ONS 15310 CL NEs R6.0 and later)	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.

Table B-69 Field Descriptions for the Access Tab (continued)

Field	Description
EMS Access (available for ONS 15310 CL NEs R6.0 and later)	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the CTX CORBA (IIOP) listener port and the CTX CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the CTX CORBA (IIOP) listener port is 683. The port number for the CTX CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access (available for ONS 15310 CL NEs R6.0 and later)	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access (available for ONS 15310 CL NEs R6.0 and later)	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.4.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15310 CL R6.0 and later.

Table B-70 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.

Table B-70 Field Descriptions for the RADIUS Server Tab (continued)

Field	Description
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.4.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-71 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.4.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15310 CL nodes. The Alarm Properties pane contains the following tabs:

- B.4.1.10.1 Profile Tab, page B-53
- B.4.1.10.2 Alarm Behavior Tab, page B-53

Note The Alarm Properties pane might contain default alarm profile entries for cards that are not supported by the Cisco ONS 15310. Therefore, you might see some alarms that do not apply to the NE type that you are provisioning.

B.4.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-72 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.4.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-73 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.4.1.11 XC Utilization

The XC Utilization Properties pane allows you to view a summary of the percentage of XTC cross-connect resources used by circuits that traverse or terminate at an ONS 15310 CL.

Table B-74 Field Descriptions for the XC Utilization Properties Pane

Field	Description
STS-1 Matrix	Provides the percentage of the XC cross-connect STS-1 paths resources that are used.
VT1.5 Matrix Ports	Provides the percentage of the XTC cross-connect VT matrix ports that are used. Each port is one STS in size, and each can transport 28 VT1.5s. 24 VT matrix ports are available.
VT1.5 Matrix	Provides the percentage of the VT matrix resources that are used. 672 are available, which is the number of VT matrix ports (24) multiplied by the number of VT1.5s in an STS (28).

B.4.1.12 OSI

Note The OSI Properties pane is supported only for the ONS 15310 CL R6.0 and later.

The OSI Properties pane allows you to provision ONS 15310 CL Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.4.1.12.1 Main Setup Tab, page B-54
- B.4.1.12.2 TARP-Config Tab, page B-54
- B.4.1.12.3 TARP-TDC Tab, page B-56
- B.4.1.12.4 TARP-MAT Tab, page B-56
- B.4.1.12.5 Routers-Setup Tab, page B-57
- B.4.1.12.6 Subnets Tab, page B-57
- B.4.1.12.7 Tunnels Tab, page B-58
- B.4.1.12.8 IS-IS RIB Tab, page B-59
- B.4.1.12.9 ES-IS RIB Tab, page B-59

B.4.1.12.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-75 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15310 CL, End System is the Cisco default.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The ONS 15310 CL performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.4.1.12.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-76 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15310 CL startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.

Table B-76 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.4.1.12.3 TARP-TDC Tab

Table B-77 Field Descriptions for the TARP-TDC Tab

Field	Description
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.

B.4.1.12.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-78 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.

Table B-78 Field Descriptions for the TARP-MAT Tab (continued)

Field	Description
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.4.1.12.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage OSI virtual routers.

Table B-79 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 CL.
System ID	Displays the NSAP system ID of the virtual router. For the primary router (Router 1), $n = 0$.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.4.1.12.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-80 Field Descriptions for the Subnets Tab

Field	Description
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.

Table B-80 Field Descriptions for the Subnets Tab (continued)

Field	Description
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.

B.4.1.12.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-81 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.4.1.12.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-82 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 CL.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.4.1.12.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-83 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 CL.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.5 ONS 15310 MA SONET NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15310 MA SONET, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.5.1 Node Properties Pane—ONS 15310 MA SONET, page B-60 for more information.

Note If CTC is launched from the web browser for an ONS 15310 MA SONET node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.5.1 Node Properties Pane—ONS 15310 MA SONET

The node properties pane displays information about the ONS 15310 MA SONET slot that is selected in the NE Explorer tree. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.5.1.1 Shelf View, page B-60
- B.5.1.2 General, page B-61
- B.5.1.3 Identification, page B-61
- B.5.1.4 Network, page B-62
- B.5.1.5 DCC, page B-69
- B.5.1.6 Timing, page B-72
- B.5.1.7 Protection, page B-75
- B.5.1.8 NE Defaults, page B-76
- B.5.1.9 Security, page B-76
- B.5.1.10 Alarm, page B-81
- B.5.1.11 XC Utilization, page B-81
- B.5.1.12 OSI, page B-82
- B.5.1.13 Alarm Extenders, page B-87
- B.5.1.14 Orderwire, page B-89

B.5.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15310 MA SONET that is selected in the NE Explorer tree. Moving the mouse pointer over the graphic of the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.5.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15310 MA SONET NE.

Table B-84 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.5.1.3 Identification

The Identification Properties pane displays information about the NE.

Table B-85 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses a Simple Network Time Protocol (SNTP) server to set the date and time of the node. Using an SNTP server ensures that all ONS 15310 MA SONET network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15310 MA SONET will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.

Table B-85 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
AIS-V Insertion on STS-1 Signal Degrade - Path	
Insert AIS-V on STS-1 SD-P	If checked, the NE inserts an AIS-V signal when it detects an STS-1 signal degrade.
SD-P BER	Select the signal degrade path bit error rate for AIS-V insertion.

B.5.1.4 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.5.1.4.1 Address Tab, page B-63
- B.5.1.4.2 Static Routes Tab, page B-63
- B.5.1.4.3 OSPF Tab, page B-63
- B.5.1.4.4 OSPF Area Range Tab, page B-64
- B.5.1.4.5 OSPF Virtual Links Tab, page B-65
- B.5.1.4.6 SNMP Tab, page B-65
- B.5.1.4.7 Firewall/Proxy Tab, page B-66
- B.5.1.4.8 RIP Routing Table Tab, page B-66
- B.5.1.4.9 RIP Tab, page B-67
- B.5.1.4.10 Routing Table Tab, page B-67
- B.5.1.4.11 Proxy Tunnels Tab, page B-68
- B.5.1.4.12 Firewall Tunnels Tab, page B-68
- B.5.1.4.13 FTP Hosts Tab, page B-69

B.5.1.4.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-86 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15310 MA SONET address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards Dynamic Host Configuration Protocol (DHCP) requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.5.1.4.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15310 MA SONET connectivity and create or delete static routes.

Table B-87 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15310 MA SONET and the computer.

B.5.1.4.3 OSPF Tab

The OSPF tab displays Open Shortest Path First (OSPF) information. OSPF is a link-state Internet routing protocol.

Table B-88 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.

Table B-88 Field Descriptions for the OSPF Tab (continued)

Field	Description
DCC OSPF Area ID	Displays the number that identifies the ONS 15310 MA SONET as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. The Cisco default metric is 100. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables ONS 15310 MA SONET OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15310 MA SONET NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15310 MA SONET is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the designated router for a subnet.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15310 MA SONET is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.5.1.4.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-89 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15310 MA SONET NEs that reside within the OSPF area. For example, if the ONS 15310 MA SONET OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15310 MA SONET NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.

Table B-89 Field Descriptions for the OSPF Area Range Tab (continued)

Field	Description
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF range table is advertised.

B.5.1.4.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-90 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed, in seconds. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.5.1.4.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-91 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15310 MA SONET.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15310 MA SONET to proxy SNMP calls.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.

Table B-91 Field Descriptions for the SNMP Tab (continued)

Field	Description
Relay A IP Address	The first ONS 15310 MA SONET to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15310 MA SONET to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15310 MA SONET to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.5.1.4.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-92 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15310 MA SONET serves as a proxy for connections between the Prime Optical server and ONS 15310s that are DCC-connected to the proxy ONS 15310 MA SONET. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the ONS 15310 MA SONET to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the ONS 15310 MA SONET to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.5.1.4.8 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the Routing Information Protocol (RIP) routing table.

Table B-93 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.5.1.4.9 RIP Tab

The RIP tab allows you to view and configure RIP parameters.

Note

- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-94 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.5.1.4.10 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-95 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.

Table B-95 Field Descriptions for the Routing Table Tab (continued)

Field	Description
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15310 MA SONET interface used to access the destination. Values are: • cpm0—The ONS 15310 MA SONET Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.5.1.4.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-96 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.5.1.4.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-97 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.5.1.4.13 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-98 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.5.1.5 DCC

The DCC Properties pane allows you to create, delete, and view SONET or SDH DCCs.

Table B-99 Field Descriptions for the DCC Properties Pane

Field	Description
SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.

Table B-99 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination. Click **Create** to create a new LDCC termination; click **Delete** to delete the selected LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.

Table B-99 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
Create button	Allows you to create new terminations on SONET or SDH cards.
Edit button	Allows you to modify existing terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected SDCC or LDCC.

B.5.1.6 Timing

The Timing Properties pane contains the following tabs:

- B.5.1.6.1 General Tab, page B-72
- B.5.1.6.2 Reference List Tab, page B-73
- B.5.1.6.3 Status Tab, page B-74
- B.5.1.6.4 Timing Report Tab, page B-75

B.5.1.6.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-100 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set the node timing mode: • External—The ONS 15310 MA SONET derives its timing from a BITS source wired to the backplane pins. • Line—Timing is derived from an OC-N card (non-DWDM nodes) or OSC card (DWDM nodes) that is optically connected to the timing node. • Mixed—Timing is set to external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the synchronization status message (SSM) set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15310 MA SONET reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Use the Reversion Time field to specify the time in half-minute increments.
Quality of RES	If your timing source supports the reserved S1 byte, you set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.

Table B-100 Field Descriptions for the General Tab (continued)

Field	Description
BITS IN Facilities	
In State	Set the BITS In state to In Service (IS) or Out of Service (OOS). If Timing Mode is set to External or Mixed, set the BITS In State for BITS-1 or BITS-2 to IS (In Service) depending on whether one or both BITS input pin pairs on the backplane are connected to the external timing source. If Timing Mode is set to Line, set the BITS In State to OOS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either Extended Super Frame (ESF), or Super Frame (SF). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
BITS OUT Facilities	
Out State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
AIS Thresh	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15327. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.5.1.6.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-101 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to the internal clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal. • Timing Mode set to Line—Options are the node's working optical cards and Internal. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 Out is enabled as soon as BITS-1 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.5.1.6.3 Status Tab

The Status tab provides timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-102 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference. Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.

Table B-102 Field Descriptions for the Status Tab (continued)

Field	Description
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 Out timing reference.
Operations	Execute a switch on the BITS-1 Out timing reference. Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 Out timing reference.
Operations	Executes a switch on the BITS-2 Out timing reference. Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.

B.5.1.6.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.5.1.7 Protection

The Protection Properties pane contains the following tabs:

- B.5.1.7.1 Protection Groups Tab, page B-75
- B.5.1.7.2 Operations Tab, page B-76

B.5.1.7.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-103 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], or 1+1 [port]) of the selected protection group.
Protect Card	View the protect card if using 1+1 protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.

Table B-103 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.

B.5.1.7.2 Operations Tab

The Operations tab displays the protection group operation information.

Table B-104 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.5.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15310 MA SONET NE.

Table B-105 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.5.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15310 MA SONET NE. The Security Properties pane contains the following tabs:

- B.5.1.9.1 Policy Tab, page B-77
- B.5.1.9.2 Password Tab, page B-77

- B.5.1.9.3 Access Tab, page B-78
- B.5.1.9.4 RADIUS Server Tab, page B-79
- B.5.1.9.5 Legal Disclaimer Tab, page B-80

B.5.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-106 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.5.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-107 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused. The range is from 1 to 10.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.5.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-108 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values allowed for the ONS 15310 MA SONET are Front Only, Backplane Only, Front and Backplane, or No LAN Access. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port A	Check this check box to enable craft port A.
Enable Craft Port B	Check this check box to enable craft port B.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.

Table B-108 Field Descriptions for the Access Tab (continued)

Field	Description
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the TSC CORBA (IIOP) listener port and the TSC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TSC CORBA (IIOP) listener port is 683. The port number for the TSC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.5.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15310 MA SONET.

Table B-109 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.

Table B-109 Field Descriptions for the RADIUS Server Tab (continued)

Field	Description
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.5.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-110 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.5.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15310 MA SONET nodes. The Alarm Properties pane contains the following tabs:

- B.5.1.10.1 Profile Tab, page B-81
- B.5.1.10.2 Alarm Behavior Tab, page B-81

Note The Alarm Properties pane might contain default alarm profile entries for cards that are not supported by the ONS 15310 MA SONET. Therefore, you might see some alarms that do not apply to the NE type that you are provisioning.

B.5.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-111 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.5.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-112 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.5.1.11 XC Utilization

The XC Utilization Properties pane allows you to view a summary of the percentage of XTC cross-connect resources used by circuits that traverse or terminate at an ONS 15310 MA SONET.

Table B-113 Field Descriptions for the XC Utilization Properties Pane

Field	Description
STS-1 Matrix	Provides the percentage of the XC cross-connect STS-1 paths resources that are used.
VT1.5 Matrix Ports	Provides the percentage of the XTC cross-connect VT matrix ports that are used. Each port is one STS in size, and each can transport 28 VT1.5s. 24 VT matrix ports are available.
VT1.5 Matrix	Provides the percentage of the VT matrix resources that are used. 672 are available, which is the number of VT matrix ports (24) multiplied by the number of VT1.5s in an STS (28).

B.5.1.12 OSI

The OSI Properties pane allows you to provision ONS 15310 MA SONET Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.5.1.12.1 Main Setup Tab, page B-82
- B.5.1.12.2 TARP-Config Tab, page B-83
- B.5.1.12.3 TARP-TDC Tab, page B-84
- B.5.1.12.4 TARP-MAT Tab, page B-84
- B.5.1.12.5 Routers-Setup Tab, page B-85
- B.5.1.12.6 Subnets Tab, page B-85
- B.5.1.12.7 Tunnels Tab, page B-86
- B.5.1.12.8 IS-IS RIB Tab, page B-87
- B.5.1.12.9 ES-IS RIB Tab, page B-87

B.5.1.12.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-114 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15310 MA SONET, End System is the Cisco default.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The ONS 15310 MA SONET performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.5.1.12.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-115 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15310 MA SONET startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.

Table B-115 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.5.1.12.3 TARP-TDC Tab

Table B-116 Field Descriptions for the TARP-TDC Tab

Field	Description
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.

B.5.1.12.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-117 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.5.1.12.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage OSI virtual routers.

Table B-118 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 MA SONET.
System ID	Displays the NSAP system ID of the virtual router. For the primary router (Router 1), $n = 0$.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.5.1.12.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-119 Field Descriptions for the Subnets Tab

Field	Description
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.

Table B-119 Field Descriptions for the Subnets Tab (continued)

Field	Description
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.

B.5.1.12.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-120 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.

Table B-120 Field Descriptions for the Tunnels Tab (continued)

Field	Description
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.5.1.12.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-121 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 MA SONET.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.5.1.12.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-122 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 MA SONET.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.5.1.13 Alarm Extenders

The Alarm Extenders Properties pane allows you to view external alarm information and create custom alarm types. The Alarm Extenders Properties pane contains the following tabs:

- B.5.1.13.1 External Alarms Tab, page B-88
- B.5.1.13.2 External Controls Tab, page B-88

- B.5.1.13.3 User-Defined Alarms Tab, page B-88

B.5.1.13.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table B-123 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	Displays a default description for every external alarm that is enabled.
Raised	Indicates whether an alarm has been raised.
Contact Status	Indicates the current status of the contact.

B.5.1.13.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table B-124 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

B.5.1.13.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on the ONS 15310 MA SONET.

Table B-125 Field Descriptions for the User-Defined Alarms Tab

Field	Descriptions
Alarm Types	Lists the user-defined alarm types that have been created on the ONS 15310 MA SONET. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

B.5.1.14 Orderwire

Orderwire allows you to plug a phoneset into a node and communicate with others working at other nodes or other facility equipment. The orderwire is a pulse code modulation (PCM) encoded voice channel that uses E1 or E2 bytes in section/line overhead. The AIC allows simultaneous use of both local (section overhead signal) and express (line overhead channel) orderwire channels on a SONET ring or particular optics facility. Local orderwire also allows communication at regeneration sites when the regenerator is not a Cisco device.

Table B-126 Field Descriptions for the Orderwire Properties Pane

Field	Description
Buzzer	
Buzzer	The Alarm Interface Controller (AIC) supports a call button on the module front panel which, when pressed, causes all AICs on the orderwire subnetwork to ring. The ringer/buzzer resides on the AIC. The AIC also has a ring LED that mimics the AIC ringer. It flashes when any call button is pressed on the orderwire subnetwork. The call button and ringer LED allow a remote craftsperson to get the attention of craftspeople across the network. To enable the audible alert (buzzer) for the orderwire, check the **Buzzer** check box.
2-Wire Level	
RX (dBm)	If needed, adjust the RX dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.
TX (dBm)	If needed, adjust the TX dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.6 ONS 15310 MA SDH NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15310 MA SDH, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.6.1 Node Properties Pane—ONS 15310 MA SDH, page B-90 for more information.

Note If CTC is launched from the web browser for an ONS 15310 MA SDH node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all entity values that you are editing are automatically refreshed. To enable autorefresh, click the Refresh Data button in the NE Explorer.

Caution You will lose all of your changes unless you click the Apply button.

B.6.1 Node Properties Pane—ONS 15310 MA SDH

The node properties pane displays information about the ONS 15310 MA SDH slot that is selected in the NE Explorer tree. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.6.1.1 Shelf View, page B-90
- B.6.1.2 General, page B-91
- B.6.1.3 Identification, page B-91
- B.6.1.4 Network, page B-92
- B.6.1.5 DCC, page B-99
- B.6.1.6 Timing, page B-103
- B.6.1.7 Protection, page B-106
- B.6.1.8 NE Defaults, page B-107
- B.6.1.9 Security, page B-107
- B.6.1.10 Alarm, page B-111
- B.6.1.11 XC Utilization, page B-112
- B.6.1.12 OSI, page B-113
- B.6.1.13 Alarm Extenders, page B-118
- B.6.1.14 Orderwire, page B-120

B.6.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15310 MA SDH that is selected in the NE Explorer tree. Moving the mouse pointer over the graphic of the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.6.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15310 MA SDH NE.

Table B-127 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.6.1.3 Identification

The Identification Properties pane displays information about the NE.

Table B-128 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses a Simple Network Time Protocol (SNTP) server to set the date and time of the node. Using an SNTP server ensures that all ONS 15310 MA SDH network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15310 MA SDH will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).

Table B-128 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
AIS-V Insertion on STS-1 Signal Degrade - Path	
Insert AIS-V on STS-1 SD-P	If checked, the NE inserts an AIS-V signal when it detects an STS-1 signal degrade.
SD-P BER	Select the signal degrade path bit error rate for AIS-V insertion.

B.6.1.4 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.6.1.4.1 Address Tab, page B-92
- B.6.1.4.2 Static Routes Tab, page B-93
- B.6.1.4.3 OSPF Tab, page B-93
- B.6.1.4.4 OSPF Area Range Tab, page B-94
- B.6.1.4.5 OSPF Virtual Links Tab, page B-95
- B.6.1.4.6 SNMP Tab, page B-95
- B.6.1.4.7 Firewall/Proxy Tab, page B-96
- B.6.1.4.8 RIP Routing Table Tab, page B-96
- B.6.1.4.9 RIP Tab, page B-96
- B.6.1.4.10 Routing Table Tab, page B-97
- B.6.1.4.11 Proxy Tunnels Tab, page B-97
- B.6.1.4.12 Firewall Tunnels Tab, page B-98
- B.6.1.4.13 FTP Hosts Tab, page B-98

B.6.1.4.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-129 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.

Table B-129 Field Descriptions for the Address Tab (continued)

Field	Description
MAC Address	Displays the ONS 15310 MA SDH address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards Dynamic Host Configuration Protocol (DHCP) requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.6.1.4.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15310 MA SDH connectivity and create or delete static routes.

Table B-130 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15310 MA SDH and the computer.

B.6.1.4.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-131 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15310 MA SDH as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
RS-DCC Metric	Sets a cost for sending packets across the Regenerator Section Data Communications Channel (RS-DCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.

Table B-131 Field Descriptions for the OSPF Tab (continued)

Field	Description
MS-DCC Metric	Sets a cost for sending packets across the Multiplex Section Data Communications Channel (MS-DCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables ONS 15310 MA SDH OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15310 MA SDH NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15310 MA SDH is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the designated router for a subnet.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15310 MA SDH is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.6.1.4.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-132 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15310 MA SDH NEs that reside within the OSPF area. For example, if the ONS 15310 MA SDH OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15310 MA SDH NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF range table is advertised.

B.6.1.4.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-133 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed, in seconds. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.6.1.4.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-134 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15310 MA SDH.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15310 MA SDH to proxy SNMP calls.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15310 MA SDH to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15310 MA SDH to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15310 MA SDH to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.6.1.4.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-135 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15310 MA SDH serves as a proxy for connections between the Prime Optical server and ONS 15310s that are DCC-connected to the proxy ONS 15310 MA SDH. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the ONS 15310 MA SDH to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the ONS 15310 MA SDH to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.6.1.4.8 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the Routing Information Protocol (RIP) routing table.

Table B-136 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.6.1.4.9 RIP Tab

The RIP tab allows you to view and configure RIP parameters.

Note
- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-137 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.6.1.4.10 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-138 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15310 MA SDH interface used to access the destination. Values are: • cpm0—The ONS 15310 MA SDH Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface. • motfcc0—An Ethernet interface (that is, the RJ-45 jack on the TCC2/TCC2P and the LAN 1 pins on the backplane).

B.6.1.4.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-139 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.6.1.4.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-140 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.6.1.4.13 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-141 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.

Table B-141 Field Descriptions for the FTP Hosts Tab (continued)

Field	Description
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.6.1.5 DCC

The DCC Properties pane allows you to create, delete, and view SONET or SDH DCCs.

Table B-142 Field Descriptions for the DCC Properties Pane

Field	Description
SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-142 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
Service State	Includes an administrative-operational state and secondary state. Administrative-operational states are used to manage service states and use a status attribute to specify the change in service state. The following are valid administrative-operational states: • Unlocked-enabled—The NE is fully operational and performs as provisioned. • Unlocked-disabled—The NE is not operational because of an autonomous event. • Locked-disabled—The NE is not operational because of an autonomous event; it has also been manually removed from service. • Locked-enabled—The NE has been manually removed from service. The following are valid secondary states: • AutomaticInService—Transitioning to the Unlocked-enabled service state is delayed. The transition to Unlocked-enabled state depends on correction of conditions, or on a soak timer. Alarm reporting is suppressed, but traffic is carried. Raised fault conditions, whether or not their alarms are reported, can be retrieved by using the TL1 **RTRV-COND** command. • Disabled—The NE has been manually removed from service and does not provide its provisioned functions. All services are disrupted; the entity is unable to carry traffic. • Failed—The NE has a raised alarm or condition. • Loopback—The NE is in loopback mode. • MismatchOfEquipment—An improper card is installed, a cross-connect card does not support an installed card, or an incompatible backplane is installed. For example, an installed card is not compatible with the card preprovisioning or the slot. This secondary state applies only to cards. • Maintenance—The NE has been manually removed from service for a maintenance activity but still performs its provisioned functions. Alarm reporting is suppressed, but traffic is carried. You can use the TL1 **RTRV-COND** command to retrieve raised fault conditions even if alarms have not been reported. • OutOfGroup—The virtual concatenation (VCAT) member cross-connect is not used to carry VCAT group traffic. This state is used to put a member circuit out of the group and to stop sending traffic. Locked-enabled,outOfGroup applies only to the cross-connects on an end node where VCAT resides. The cross-connects on intermediate nodes are in the Locked-enabled,maintenance service state. • SoftwareDownload—A card is involved in a software download. This secondary state applies only to cards. • Unassigned—A card is not provisioned in the database. This secondary state applies only to cards. • NotInstalled—A card is not physically present (that is, the slot is empty). This secondary state applies only to cards. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination. Click **Create** to create a new LDCC termination; click **Delete** to delete the selected LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.

Table B-142 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-142 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
Service State	Includes an administrative-operational state and secondary state. Administrative-operational states are used to manage service states and use a status attribute to specify the change in service state. The following are valid administrative-operational states: • Unlocked-enabled—The NE is fully operational and performs as provisioned. • Unlocked-disabled—The NE is not operational because of an autonomous event. • Locked-disabled—The NE is not operational because of an autonomous event; it has also been manually removed from service. • Locked-enabled—The NE has been manually removed from service. The following are valid secondary states: • AutomaticInService—Transitioning to the Unlocked-enabled service state is delayed. The transition to Unlocked-enabled state depends on correction of conditions, or on a soak timer. Alarm reporting is suppressed, but traffic is carried. Raised fault conditions, whether or not their alarms are reported, can be retrieved by using the TL1 **RTRV-COND** command. • Disabled—The NE has been manually removed from service and does not provide its provisioned functions. All services are disrupted; the entity is unable to carry traffic. • Failed—The NE has a raised alarm or condition. • Loopback—The NE is in loopback mode. • MismatchOfEquipment—An improper card is installed, a cross-connect card does not support an installed card, or an incompatible backplane is installed. For example, an installed card is not compatible with the card preprovisioning or the slot. This secondary state applies only to cards. • Maintenance—The NE has been manually removed from service for a maintenance activity but still performs its provisioned functions. Alarm reporting is suppressed, but traffic is carried. You can use the TL1 **RTRV-COND** command to retrieve raised fault conditions even if alarms have not been reported. • OutOfGroup—The virtual concatenation (VCAT) member cross-connect is not used to carry VCAT group traffic. This state is used to put a member circuit out of the group and to stop sending traffic. Locked-enabled,outOfGroup applies only to the cross-connects on an end node where VCAT resides. The cross-connects on intermediate nodes are in the Locked-enabled,maintenance service state. • SoftwareDownload—A card is involved in a software download. This secondary state applies only to cards. • Unassigned—A card is not provisioned in the database. This secondary state applies only to cards. • NotInstalled—A card is not physically present (that is, the slot is empty). This secondary state applies only to cards. **Note** If the NE release does not support the Service state, this field shows N/A.
Create button	Allows you to create new terminations on SONET or SDH cards.
Edit button	Allows you to modify existing terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected SDCC or LDCC.

B.6.1.6 Timing

The Timing Properties pane contains the following tabs:

- B.6.1.6.1 General Tab, page B-103
- B.6.1.6.2 Reference List Tab, page B-104
- B.6.1.6.3 Status Tab, page B-105
- B.6.1.6.4 Timing Report Tab, page B-105

B.6.1.6.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-143 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set to External if the ONS 15310 MA SDH derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
Revertive	If checked, the ONS 15310 MA SDH reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
Sa Bit	The Sa Bit field is used to transmit the SSM message. The five available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.
Cable Type	Type of cable. Values are 75 ohm or 120 ohm.
BITS OUT Facilities	

Table B-143 Field Descriptions for the General Tab (continued)

Field	Description
Out State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference. Valid values are: • Unframed • FAS • FAS+CRC • FAS+CAS • FAS+CAS+CRC
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
Sa Bit	The Sa Bit field is used to transmit the SSM message. The five available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.
Cable Type	Type of cable. Values are 75 ohm or 120 ohm.

B.6.1.6.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-144 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.

Table B-144 Field Descriptions for the Reference List Tab (continued)

Field	Description
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.6.1.6.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-145 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.6.1.6.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.6.1.7 Protection

The Protection Properties pane contains the following tabs:

- B.6.1.7.1 Protection Groups Tab, page B-106
- B.6.1.7.2 Operations Tab, page B-106

B.6.1.7.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-146 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], or 1+1 [port]) of the selected protection group.
Protect Card	View the protect card if using 1+1 protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.

B.6.1.7.2 Operations Tab

The Operations tab displays the protection group operation information.

Table B-147 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.6.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15310 MA SDH NE.

Table B-148 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.6.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15310 MA SDH NE. The Security Properties pane contains the following tabs:

- B.6.1.9.1 Policy Tab, page B-107
- B.6.1.9.2 Password Tab, page B-108
- B.6.1.9.3 Access Tab, page B-109
- B.6.1.9.4 RADIUS Server Tab, page B-110
- B.6.1.9.5 Legal Disclaimer Tab, page B-111

B.6.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-149 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.

Table B-149 Field Descriptions for the Policy Tab (continued)

Field	Description
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Session per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.6.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-150 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused. The range is from 1 to 10.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.

Table B-150 Field Descriptions for the Password Tab (continued)

Field	Description
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.6.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-151 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values allowed for the ONS 15310 MA SDH are Front Only, Backplane Only, Front and Backplane, or No LAN Access. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port A	Check this check box to enable craft port A.
Enable Craft Port B	Check this check box to enable craft port B.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.

Table B-151 Field Descriptions for the Access Tab (continued)

Field	Description
CORBA Listener Port	Select the port numbers for the TSC CORBA (IIOP) listener port and the TSC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TSC CORBA (IIOP) listener port is 683. The port number for the TSC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.6.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15310 MA SDH.

Table B-152 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.

Table B-152 Field Descriptions for the RADIUS Server Tab (continued)

Field	Description
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.6.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-153 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.6.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15310 MA SDH nodes. The Alarm Properties pane contains the following tabs:

- B.6.1.10.1 Profile Tab, page B-112
- B.6.1.10.2 Alarm Behavior Tab, page B-112

Note The Alarm Properties pane might contain default alarm profile entries for cards that are not supported by the ONS 15310 MA SDH. Therefore, you might see some alarms that do not apply to the NE type that you are provisioning.

B.6.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-154 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.6.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-155 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.6.1.11 XC Utilization

The XC Utilization Properties pane allows you to view a summary of the percentage of XTC cross-connect resources used by circuits that traverse or terminate at an ONS 15310 MA SDH.

Table B-156 Field Descriptions for the XC Utilization Properties Pane

Field	Description
VC4 Matrix	Provides the percentage of the XTC cross-connect VC-4 path resources that are used.
TUG3 Matrix Ports	Provides the percentage of the XTC cross-connect TUG3 matrix ports that are used.
TUG3 Matrix	Provides the percentage of the TUG3 matrix resources that are used.
VC12 Matrix Ports	Provides the percentage of the XTC cross-connect VC12 matrix ports that are used.
VC12 Matrix	Provides the percentage of the VC12 matrix resources that are used.

B.6.1.12 OSI

The OSI Properties pane allows you to provision ONS 15310 MA SDH OSI parameters. The Properties pane contains the following tabs:

- B.6.1.12.1 Main Setup Tab, page B-113
- B.6.1.12.2 TARP-Config Tab, page B-113
- B.6.1.12.3 TARP-TDC Tab, page B-115
- B.6.1.12.4 TARP-MAT Tab, page B-115
- B.6.1.12.5 Routers-Setup Tab, page B-116
- B.6.1.12.6 Subnets Tab, page B-116
- B.6.1.12.7 Tunnels Tab, page B-117
- B.6.1.12.8 IS-IS RIB Tab, page B-118
- B.6.1.12.9 ES-IS RIB Tab, page B-118

B.6.1.12.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-157 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15310 MA SDH, End System is the Cisco default.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.6.1.12.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-158 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15310 MA SDH startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.

Table B-158 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.6.1.12.3 TARP-TDC Tab

Table B-159 Field Descriptions for the TARP-TDC Tab

Field	Description
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.

B.6.1.12.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-160 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.

Table B-160 Field Descriptions for the TARP-MAT Tab (continued)

Field	Description
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.6.1.12.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage OSI virtual routers.

Table B-161 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 MA SDH.
System ID	Displays the NSAP system ID of the virtual router. For the primary router (Router 1), $n = 0$.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.6.1.12.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-162 Field Descriptions for the Subnets Tab

Field	Description
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.

Table B-162 Field Descriptions for the Subnets Tab (continued)

Field	Description
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.

B.6.1.12.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-163 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.6.1.12.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-164 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 MA SDH.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.6.1.12.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-165 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15310 MA SDH.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.6.1.13 Alarm Extenders

The Alarm Extenders Properties pane allows you to view external alarm information. The Alarm Extenders Properties pane contains the following tabs:

- B.6.1.13.1 External Alarms Tab, page B-118
- B.6.1.13.2 External Controls Tab, page B-119
- B.6.1.13.3 User-Defined Alarms Tab, page B-119

B.6.1.13.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table B-166 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	Displays a default description for every external alarm that is enabled.
Raised	Indicates whether an alarm has been raised.
Contact Status	Indicates the current status of the contact.

B.6.1.13.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table B-167 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

B.6.1.13.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on the ONS 15310 MA SDH.

Table B-168 Field Descriptions for the User-Defined Alarms Tab

Field	Descriptions
Alarm Types	Lists the user-defined alarm types that have been created on the ONS 15310 MA SDH. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.

Table B-168 Field Descriptions for the User-Defined Alarms Tab (continued)

Field	Descriptions
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

B.6.1.14 Orderwire

Orderwire allows you to plug a phoneset into a node and communicate with others working at other nodes or other facility equipment. The orderwire is a pulse code modulation (PCM) encoded voice channel that uses E1 or E2 bytes in section/line overhead. The AIC allows simultaneous use of both local (section overhead signal) and express (line overhead channel) orderwire channels on a SONET ring or particular optics facility. Local orderwire also allows communication at regeneration sites when the regenerator is not a Cisco device.

Table B-169 Field Descriptions for the Orderwire Properties Pane

Field	Description
Buzzer	
Buzzer	The AIC supports a call button on the module front panel which, when pressed, causes all AICs on the orderwire subnetwork to ring. The ringer/buzzer resides on the AIC. The AIC also has a ring LED that mimics the AIC ringer. It flashes when any call button is pressed on the orderwire subnetwork. The call button and ringer LED allow a remote craftsperson to get the attention of craftspeople across the network. To turn on the audible alert (buzzer) for the orderwire, check the **Buzzer** check box.
2-Wire Level	
RX (dBm)	If needed, adjust the RX dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.
TX (dBm)	If needed, adjust the TX dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.7 ONS 15327 NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15327, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.7.1 Node Properties Pane—ONS 15327, page B-121 for more information.

Note If CTC is launched from the web browser for an ONS 15327 node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.7.1 Node Properties Pane—ONS 15327

The node properties pane displays information about the ONS 15327 NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.7.1.1 Shelf View, page B-121
- B.7.1.2 Identification, page B-121
- B.7.1.3 Network, page B-122
- B.7.1.4 DCC, page B-129
- B.7.1.5 Timing, page B-130
- B.7.1.6 Protection, page B-133
- B.7.1.7 Ether Bridge, page B-134
- B.7.1.8 NE Defaults, page B-135
- B.7.1.9 Security, page B-136
- B.7.1.10 Alarm, page B-140
- B.7.1.11 XC Utilization, page B-141
- B.7.1.12 BLSR, page B-141
- B.7.1.13 OSI, page B-142

B.7.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15327 that is selected in the NE Explorer tree. Moving the mouse pointer over the graphic of the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.7.1.2 Identification

The Identification Properties pane displays identification information about the ONS 15327 NE.

Table B-170 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15327 network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15327 will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
AIS-V Insertion on STS-1 Signal Degrade - Path	
Insert AIS-V on STS-1 SD-P	If checked, the NE inserts an AIS-V signal when it detects an STS-1 signal degrade.
SD-P BER	Select the signal degrade path bit error rate for AIS-V insertion.

B.7.1.3 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.7.1.3.1 Address Tab, page B-123
- B.7.1.3.2 Static Routes Tab, page B-123
- B.7.1.3.3 OSPF Tab, page B-123
- B.7.1.3.4 OSPF Area Range Tab, page B-124
- B.7.1.3.5 OSPF Virtual Links Tab, page B-125
- B.7.1.3.6 SNMP Tab, page B-125

- B.7.1.3.7 Firewall/Proxy Tab, page B-126
- B.7.1.3.8 RIP Routing Table Tab, page B-126
- B.7.1.3.9 RIP Tab, page B-127
- B.7.1.3.10 Routing Table Tab, page B-127
- B.7.1.3.11 Proxy Tunnels Tab, page B-128
- B.7.1.3.12 Firewall Tunnels Tab, page B-128

B.7.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-171 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15327 address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards Dynamic Host Configuration Protocol (DHCP) requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.

B.7.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15327 connectivity and create or delete static routes.

Table B-172 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15327 and the computer.

B.7.1.3.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-173 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.

Table B-173 Field Descriptions for the OSPF Tab (continued)

Field	Description
DCC OSPF Area ID	Displays the number that identifies the ONS 15327 as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. The Cisco default DCC metric is 100. This value is normally unchanged.
OSPF Active on LAN	If checked, enables the ONS 15327 OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15327s that connect directly to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15327 is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the designated router for a subnet.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
Authentication Type	Displays Simple Password if the router where the ONS 15327 is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.7.1.3.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-174 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15327s that reside within the OSPF area. For example, if the ONS 15327 OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15327 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF range table is advertised.

B.7.1.3.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-175 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.7.1.3.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-176 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15327.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15327 to proxy SNMP calls.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15327 to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15327 to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.

Table B-176 Field Descriptions for the SNMP Tab (continued)

Field	Description
Relay C IP Address	The third ONS 15327 to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.7.1.3.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-177 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Craft Access Only	If checked, only allows CTC to access the firewall and proxy settings of the NE. Check this item only if the LAN port is used for direct workstation-to-network element connections, and not connected to a LAN. Disabling craft-only access allows the installation of a route to the LAN. Disable this only if the LAN port is actually connected to the LAN. **Note** This field applies only to ONS 15327 releases earlier than R4.6.
Enable Firewall	If checked, blocks packets routed between the local area and DCC networks. This causes a loss of connectivity to DCC-only connected NEs. Prime Optical cannot reestablish the connection unless the proxy is enabled. Additionally, all NEs connected to the LAN must also have their firewall enabled, or connectivity problems will result. **Note** This field applies only to ONS 15327 releases earlier than R4.6.
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15327 serves as a proxy for connections between the Prime Optical server and ONS 15310s that are DCC-connected to the proxy ONS 15327. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the ONS 15327 to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the ONS 15327 to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.7.1.3.8 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the RIP routing table.

Table B-178 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.

Table B-178 Field Descriptions for the RIP Routing Table Tab (continued)

Field	Description
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.7.1.3.9 RIP Tab

The RIP tab allows you to view and configure RIP parameters.

Note

- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-179 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.7.1.3.10 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-180 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.

Table B-180 Field Descriptions for the Routing Table Tab (continued)

Field	Description
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15327 interface used to access the destination. Values are: • cpm0—The ONS 15327 Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.7.1.3.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-181 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.7.1.3.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-182 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.7.1.4 DCC

The DCC Properties pane allows you to create, delete, and view SONET or SDH DCCs.

Table B-183 Field Descriptions for the DCC Properties Pane

Field	Description
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-183 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
Create button	Allows you to create new terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected termination.

B.7.1.5 Timing

The Timing Properties pane contains the following tabs:

- B.7.1.5.1 General Tab, page B-130
- B.7.1.5.2 Reference List Tab, page B-132
- B.7.1.5.3 Status Tab, page B-132
- B.7.1.5.4 Timing Report Tab, page B-133

B.7.1.5.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-184 Field Descriptions for the General Tab

Field	Description
General	
Timing Mode	Set to External if the ONS 15327 derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. **Caution** Mixed timing may cause timing loops. Use this mode with care.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15327 reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
Quality of RES	If your timing source supports the reserved S1 byte, you set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
BITS OUT Facilities	
Out State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.

Table B-184 Field Descriptions for the General Tab (continued)

Field	Description
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15327. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.7.1.5.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-185 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.7.1.5.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.

- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-186 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.7.1.5.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.7.1.6 Protection

The Protection Properties pane contains the following tabs:

- B.7.1.6.1 Protection Groups Tab, page B-133
- B.7.1.6.2 Operations Tab, page B-134

B.7.1.6.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-187 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.

Table B-187 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], or 1+1 [port]) of the selected protection group.
Protect Card	View the protect module if using 1:1 or 1:N protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, choose the amount of time following failure condition correction after which the node should switch back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.

B.7.1.6.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-188 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

B.7.1.7 Ether Bridge

The Ether Bridge Properties pane contains the following tabs:

- B.7.1.7.1 Spanning Tree Config Tab, page B-134
- B.7.1.7.2 Spanning Tree Status, page B-135

B.7.1.7.1 Spanning Tree Config Tab

The Spanning Tree Config tab displays spanning tree configuration information for the ONS 15327.

Table B-189 Field Descriptions for the Spanning Tree Config Tab

Field	Description
Index Number	Unique number that identifies the spanning tree.
Priority	Incoming traffic queue. Priority can be either high or low.
Bridge Max Age	Maximum amount of time that received-protocol information is retained before it is discarded.
Bridge Hello Time	Time interval, in seconds, between the transmission of configuration bridge protocol data units (BPDUs) by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Bridge Forward Delay	Time spent by a port in the listening state and the learning state.

B.7.1.7.2 Spanning Tree Status

The Spanning Tree Status Properties pane displays spanning tree status information for the ONS 15327.

Table B-190 Field Descriptions for the Spanning Tree Status

Field	Description
Index Number	Unique number that identifies the spanning tree.
Bridge ID	ONS 15327 unique identifier that transmits the BPDU; the bridge ID is a combination of the bridge priority and the ONS 15327 MAC address.
Topology Age	Amount of time, in seconds, since the last topology change.
Topology Changes	Number of times the spanning-tree topology has been changed since the node booted up.
Designated Root	Spanning tree's designated root for a particular spanning-tree instance.
Root Cost	Total path cost to the designated root.
Root Port	Port used to reach the root.
Max Age	Maximum amount of time that received-protocol information is retained before it is discarded.
Hello Time	Time interval, in seconds, between the transmission of configuration BPDUs by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Hold Time	Minimum time period, in seconds, that elapses during the transmission of configuration information on a given port.
Forward Delay	Time spent by a port in the listening state and the learning state.

B.7.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15327 NE. You can edit NE defaults for the ONS 15327 R5.0 and later.

Table B-191 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter. **Note** This field applies to the ONS 15327 R6.0 and later.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter. **Note** This field applies to the ONS 15327 R6.0 and later.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.7.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15327 NE. The Security Properties pane contains the following tabs:

- B.7.1.9.1 Policy Tab, page B-136
- B.7.1.9.2 Password Tab, page B-137
- B.7.1.9.3 Access Tab, page B-137
- B.7.1.9.4 RADIUS Server Tab, page B-139
- B.7.1.9.5 Legal Disclaimer Tab, page B-139

B.7.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-192 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.

Table B-192 Field Descriptions for the Policy Tab (continued)

Field	Description
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.7.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-193 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.7.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-194 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only (for ONS 15454 SONET NEs only). **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.

Table B-194 Field Descriptions for the Access Tab (continued)

Field	Description
Restore Timeout	This time period begins if LAN Access is NO and all DCC connections are lost. If the time expires before a DCC is restored, LAN Access is restored so that the node is not isolated. When the DCC comes back, LAN Access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Shell Craft Access (available for ONS 15327 NEs R6.0 and later)	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Shell Access on	Specify shell access on Telnet or SSH.
SSH Port	Indicates the SSH port number that will be used if the SSH radio button is selected.
Telnet Port	This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
Use Standard Telnet Port	If checked, the standard Telnet port is used for Telnet access.
Shell Access (available for ONS 15327 NEs R6.0 and later)	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access (available for ONS 15327 NEs R6.0 and later)	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the XTC CORBA (IIOP) listener port and the XTC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the XTC CORBA (IIOP) listener port is 683. The port number for the XTC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access (available for ONS 15327 NEs R6.0 and later)	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access (available for ONS 15327 NEs R6.0 and later)	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.7.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15327 R6.0 and later.

Table B-195 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.7.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-196 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.7.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15327 nodes. The Alarm Properties pane contains the following tabs:

- B.7.1.10.1 Profile Tab, page B-140
- B.7.1.10.2 Alarm Behavior Tab, page B-141

Note The Alarm Properties pane might contain default alarm profile entries for cards that are not supported by the ONS 15327. Therefore, you might see some alarms that do not apply to the NE type that you are provisioning.

B.7.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-197 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.

Table B-197 Field Descriptions for the Profile Tab (continued)

Field	Description
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.7.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-198 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.7.1.11 XC Utilization

The XC Utilization Properties pane allows you to view a summary of the percentage of XTC cross-connect resources used by circuits that traverse or terminate at an ONS 15327.

Table B-199 Field Descriptions for the XC Utilization Properties Pane

Field	Description
STS-1 Matrix	Provides the percentage of the XC cross-connect STS-1 paths resources that are used.
VT Matrix Ports	Provides the percentage of the XTC cross-connect VT matrix ports that are used. Each port is one STS in size, and each can transport 28 VT1.5s. 24 VT matrix ports are available.
VT Matrix	Provides the percentage of the VT matrix resources that are used. 672 are available, which is the number of VT matrix ports (24) multiplied by the number of VT1.5s in an STS (28).

B.7.1.12 BLSR

The BLSR Properties pane allows you to view BLSR information and create or delete BLSRs.

Table B-200 Field Descriptions for the BLSR Properties Pane

Field	Description
Fiber Type	Indicates whether the fiber type is 2-fiber or 4-fiber.
Rate	Select the BLSR rate.
Ring Name	Assign a six-digit alphanumeric ring name. Nodes in the same BLSR must have the same ring name.

Table B-200 Field Descriptions for the BLSR Properties Pane (continued)

Field	Description
Node ID	Assign a node ID. The node ID identifies the node to the BLSR. Nodes in the same BLSR must have unique node IDs.
Ring Reversion	Set the amount of time that will pass before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in a BLSR ring should have the same ring reversion setting, particularly if *never* (nonrevertive) is selected.
East Line	Assign the east BLSR port.
East Switch	Displays a list of switch commands for the east port.
West Line	Assign the west BLSR port.
West Switch	Displays a list of switch commands for the west port.

B.7.1.13 OSI

The OSI Properties pane allows you to provision ONS 15327 Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.7.1.13.1 Main Setup Tab, page B-142
- B.7.1.13.2 TARP-Config Tab, page B-143
- B.7.1.13.3 TARP-TDC Tab, page B-144
- B.7.1.13.4 TARP-MAT Tab, page B-144
- B.7.1.13.5 Routers-Setup Tab, page B-145
- B.7.1.13.6 Subnets Tab, page B-145
- B.7.1.13.7 Tunnels Tab, page B-146
- B.7.1.13.8 IS-IS RIB Tab, page B-147
- B.7.1.13.9 ES-IS RIB Tab, page B-147

B.7.1.13.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-201 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15327, End System is the default.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The ONS 15327 performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	

Table B-201 Field Descriptions for the Main Setup Tab (continued)

Field	Description
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.7.1.13.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-202 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
MAT 2	Lists the static manual area table entries.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
MAT 1	Lists the static manual area table entries.

Table B-202 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15327 startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.7.1.13.3 TARP-TDC Tab

Table B-203 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Static Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.7.1.13.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-204 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.7.1.13.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage the OSI virtual routers.

Table B-205 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15327.
System ID	Displays the NSAP system ID of the virtual router. For the primary router (Router 1), $n = 0$.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.7.1.13.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-206 Field Descriptions for the Subnets Tab

Field	Description
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Slot/Port	The subnet slot and port.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.

Table B-206 Field Descriptions for the Subnets Tab (continued)

Field	Description
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.7.1.13.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-207 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.

Table B-207 Field Descriptions for the Tunnels Tab (continued)

Field	Description
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.7.1.13.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-208 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15327.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.7.1.13.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-209 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. Only one router is available on the ONS 15327.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.8 ONS 15454 MSTP NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15454 Multiservice Transport Platform (MSTP), the window that Prime Optical displays consists of a tree on the left side and a node properties pane on the right. The tree provides a hierarchical view and alarm status of the multishelf NE's physical racks, shelves, and slots. The properties pane shows information about the selected entity (multishelf NE, rack, shelf, or slot). See B.8.1 Node Properties Pane—ONS 15454 MSTP, page B-148 for more information.

Note Refer to the Cisco ONS 15454 SONET, SDH, and DWDM components' installation documents for precautions, guidelines, and procedures for converting single-shelf NEs to multishelf NEs. Incorrect procedures for converting single-shelf NEs to multishelf NEs can result in nodes not being properly discovered and managed by Prime Optical.

Caution If a shelf is added to a node that is managed by Prime Optical, force a Refresh from NE operation to correctly update the node inventory. Inconsistencies in the node inventory can occur if the operation is not performed. Those inconsistencies are reflected in all Prime Optical user interfaces, including the gateways.

B.8.1 Node Properties Pane—ONS 15454 MSTP

The node properties pane displays information about the ONS 15454 MSTP NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.8.1.1 Node View, page B-148
- B.8.1.2 General, page B-149
- B.8.1.3 Network, page B-150
- B.8.1.4 DCC/GCC/OSC, page B-159
- B.8.1.5 NE Defaults, page B-161
- B.8.1.6 Security, page B-162
- B.8.1.7 Alarm, page B-166
- B.8.1.8 Alarm Conditions, page B-167
- B.8.1.9 DWDM, page B-168
- B.8.1.10 OSI, page B-175

B.8.1.1 Node View

The Node View Properties pane displays a graphic of the ONS 15454 MSTP that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its racks, shelves, slots, or cards displays the current alarms for the highlighted item.

B.8.1.2 General

The General Properties pane displays information about the ONS 15454 MSTP NE. The General Properties pane contains the following tabs:

- B.8.1.2.1 Identification Tab, page B-149
- B.8.1.2.2 Multishelf Config Tab, page B-150

B.8.1.2.1 Identification Tab

The Identification tab displays information about the ONS 15454 MSTP NE.

Table B-210 Field Descriptions for the Identification Tab

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15454 network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15454 will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
AIS-V Insertion on STS-1 Signal Degrade - Path	
Insert AIS-V on STS-1 SD-P	If checked, the NE inserts an AIS-V signal when it detects an STS-1 signal degrade.
SD-P BER	Select the signal degrade path bit error rate for AIS-V insertion.
APC State	

Table B-210 Field Descriptions for the Identification Tab (continued)

Field	Description
Side	Lists all the NEs and their sides that belong to the automatic power control (APC) domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.8.1.2.2 Multishelf Config Tab

The Multishelf Config tab displays information about the ONS 15454 MSTP NE's shelves and racks.

Table B-211 Field Descriptions for the Multishelf Config Tab

Field	Description
Shelf ID	Displays the Shelf ID number.
Rack Number	Select the rack number.
Position in Rack	Select the position number in the rack.

B.8.1.3 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.8.1.3.1 Address Tab, page B-151
- B.8.1.3.2 Static Routes Tab, page B-151
- B.8.1.3.3 OSPF Tab, page B-151
- B.8.1.3.4 OSPF Area Range Tab, page B-152
- B.8.1.3.5 OSPF Virtual Links Tab, page B-153
- B.8.1.3.6 SNMP Tab, page B-154
- B.8.1.3.7 Firewall/Proxy Tab, page B-155
- B.8.1.3.8 Routing Table Tab, page B-155
- B.8.1.3.9 RIP Routing Table Tab, page B-156
- B.8.1.3.10 RIP Tab, page B-156
- B.8.1.3.11 Proxy Tunnels Tab, page B-156
- B.8.1.3.12 Firewall Tunnels Tab, page B-157
- B.8.1.3.13 Secure Config Mode Tab, page B-157
- B.8.1.3.14 FTP Hosts Tab, page B-158

B.8.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-212 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15454 address as it is identified on the IEEE 802 MAC layer.
LCD IP Setting	Allows you to configure the LCD screen. Select from the following values: • Allow Configuration—Enables shelf IP address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.

B.8.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15454 MSTP connectivity and create or delete static routes.

Table B-213 Field Descriptions for the Static Routes Tab

Field	Description
Create	Click the **Create** button to create a new static route. See 5.3.3 Creating Static Routes for CTC-Based NEs, page 5-3.
Delete	Click the **Delete** button to delete an existing static route.
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15454 and the computer.

B.8.1.3.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-214 Field Descriptions for the OSPF Tab

Field	Description
Shelf	Displays the shelf number.
Slot	Displays the slot number.

Table B-214 Field Descriptions for the OSPF Tab (continued)

Field	Description
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15454 as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF Active on LAN	If checked, enables the ONS 15454 OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15454s that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15454 is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
Authentication Type	Displays Simple Password if the router where the ONS 15454 is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.8.1.3.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-215 Field Descriptions for the OSPF Area Range Tab

Field	Description
Create	Click the **Create** button to create a new OSPF area range. See 5.3.4.1 Creating an OSPF Area Range, page 5-5.
Delete	Click the **Delete** button to delete an existing OSPF area range.

Table B-215 Field Descriptions for the OSPF Area Range Tab (continued)

Field	Description
Range Address	Displays the area IP address for the ONS 15454s that reside within the OSPF area. For example, if the ONS 15454 OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15454 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.8.1.3.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create, edit, or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-216 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Create	Click the **Create** button to create a new OSPF virtual link. See 5.3.4.3.2 Creating an OSPF Virtual Link, page 5-6.
Edit	Click the **Edit** button to modify an existing OSPF virtual link. See 5.3.4.3.3 Modifying an OSPF Virtual Link, page 5-7.
Delete	Click the **Delete** button to delete the selected OSPF virtual link.
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.8.1.3.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-217 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15454.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15454 to proxy SNMP calls.
Use Generic MIB	If checked, allows you to transfer traps to a local MIB browser or server.
Create	Click the **Create** button to create a new SNMP trap destination. See 5.3.9.2 Configuring SNMP for CTC-Based NEs, page 5-15.
Delete	Click the **Delete** button to delete the selected SNMP trap destination.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15454 to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15454 to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15454 to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.8.1.3.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-218 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454 serves as a proxy for connections between the Prime Optical server and ONS 15454s that are DCC-connected to the proxy ONS 15454. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Configures the ONS 15454 to proxy as an ENE, meaning the NE supports craft access only, supports firewall, and acts as a proxy. • Gateway Network Element (GNE)—Configures the ONS 15454 to proxy as a GNE, meaning the NE supports firewall and acts as a proxy. • Proxy-only—Configures the ONS 15454 to act as a proxy. If unchecked, the node does not proxy; instead, it acts as a LAN-connected NE (LNE).

B.8.1.3.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-219 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15454 interface used to access the destination. Values are: • cpm0—The ONS 15454 Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.8.1.3.9 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the RIP routing table.

Table B-220 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.8.1.3.10 RIP Tab

The RIP tab allows you to view and configure RIP parameters.

Note

- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-221 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.8.1.3.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-222 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Create	Click the **Create** button to create a new proxy tunnel. See 4.4.4.5 Creating a New Proxy Tunnel, page 4-52.
Delete	Click the **Delete** button to delete the selected proxy tunnel.
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.8.1.3.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-223 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Create	Click the **Create** button to create a new firewall tunnel. See 4.4.4.6 Creating a New Firewall Tunnel, page 4-53.
Delete	Click the **Delete** button to delete an existing firewall tunnel.
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.8.1.3.13 Secure Config Mode Tab

The TCC2P card supports secure config mode. When the secure mode is on, the NE has two IP addresses, one for the backplane and one for the front port. The front port IP address is used by the DCC-connected NEs.

Note When there is no TCC2P card present, the fields in the following table cannot be configured.

The Secure Config Mode tab allows you to configure the secure config mode. The fields shown depend on whether the NE is in secure mode. For example, the backplane Ethernet port values are displayed only when the NE is in secure mode.

Table B-224 Field Descriptions for the Secure Config Mode Tab

Field	Description
TCP/IP Mode	
Normal	When this text is visible, the NE is not in secure mode. There is one IP address shared by TCC and backplane Ethernet ports, with full connectivity between ports.
Secure	When this text is visible, the NE is in secure mode. There are separate IP addresses for TCC and backplane Ethernet ports, with no connectivity between ports.
Mode not locked	When this text is visible, you can change the secure mode.
Mode permanently locked and cannot be unlocked	When this text is visible, the NE is in secure mode, and the secure mode is locked and cannot be changed.
Change Mode	
Change Mode button	Opens the Change Secure Mode dialog box, which allows you to change the mode of the NE from secure to unsecure, and vice versa. This button is enabled only if an active TCC2P card exists on the NE.
Lock	
Lock button	When the NE is in secure mode, the Lock button locks the secure mode on the NE/TCC so that it cannot be changed.

B.8.1.3.14 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-225 Field Descriptions for the FTP Hosts Tab

Field	Description
Create	Click the **Create** button to open the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete	Click the **Delete** button to delete the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.8.1.4 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view SDCCs, LDCCs, Generic Communications Channels (GCCs), Optical Service Channels (OSCs), and DWDM ring IDs.

Table B-226 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
Create	Click the **Create** button to create new terminations on SONET or SDH cards.
Edit	Click the **Edit** button to modify existing terminations on SONET or SDH cards.
Delete	Click the **Delete** button to delete the selected SDCC, LDCC, GCC, OSC, or DWDM ring ID.
RS-DCC/SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-226 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
MS-DCC/LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
GCC	
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.
Foreign	A check mark indicates that the far-end node is a non-ONS node.

Table B-226 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and SNPA address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the GCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Displays the state of the OSC termination.
DWDM Ring ID	
Ring ID	Displays the ring ID.
West Direction	Lists the OSCM or OSC-CSM port that supports the ring in the west direction. The value is N/A if there are no ports in the west direction.
East Direction	Lists the OSCM or OSC-CSM port that supports the ring in the east direction. The value is N/A if there are no ports in the east direction.

B.8.1.5 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15454 MSTP NE.

Table B-227 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter. **Note** This field applies to the ONS 15454 SONET R6.0 and later.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.8.1.6 Security

The Security Properties pane allows you to view and edit security features for the ONS 15454 MSTP NE. The Security Properties pane contains the following tabs:

- B.8.1.6.1 Policy Tab, page B-162
- B.8.1.6.2 Password Tab, page B-163
- B.8.1.6.3 Access Tab, page B-163
- B.8.1.6.4 RADIUS Server Tab, page B-165
- B.8.1.6.5 Legal Disclaimer Tab, page B-166

B.8.1.6.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-228 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.

Table B-228 Field Descriptions for the Policy Tab (continued)

Field	Description
Disable Inactive User	If checked, inactive users are disabled automatically. Specify the duration in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.8.1.6.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-229 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which a user's new password must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.8.1.6.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-230 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only (for ONS 15454 SONET NEs only). **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.

Table B-230 Field Descriptions for the Access Tab (continued)

Field	Description
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Access State	Select one of the following shell access states: • Disable • Non-secure • Secure
SSH Port	Indicates the SSH port number that will be used if the SSH radio button is selected.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
Use Standard Telnet Port	If checked, the standard Telnet port is used for Telnet access.
Enable Shell Password	Indicates whether or not the Shell password is enabled. You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the TCC CORBA (IIOP) listener port and the TCC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TCC CORBA (IIOP) listener port is 683. The port number for the TCC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Pseudo-IOS Access (available for ONS 15454 MSTP R9.2)	
Access State	Pseudo CLI is a command-line interface on the NE that simulates a Cisco IOS connection. Select the pseudo-IOS access state from the drop-down list. You can select Disable, Non-secure, or Secure. If you choose Disable, the port is not configurable, which means that the node does not listen for pseudo-CLI connections. **Note** Pseudo-IOS functionality is available only if the node contains 10GE_XP or GE_XP cards in L2 mode.

Table B-230 Field Descriptions for the Access Tab (continued)

Field	Description
Port	Enter the port number for pseudo-IOS access. If the Access State field is set to Disable, you cannot configure this field.
Other	
PM Clearing Privilege	Select the user privilege that allows clearing PM statistics for the NE.

B.8.1.6.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15454 MSTP.

Table B-231 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.8.1.6.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-232 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.8.1.7 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15454 MSTP nodes. The Alarm Properties pane contains Profile and Alarm Behavior tabs.

B.8.1.7.1 Profile Tab

The Profile tab allows you to view, create, or delete alarm profiles.

Table B-233 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list.
Create button	Click **Create** to create a new alarm profile for the NE.
Delete button	Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.8.1.7.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-234 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot No.	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.8.1.8 Alarm Conditions

The Alarm Conditions Properties pane allows you to view all NE conditions (events with a Not Reported [NR] severity) at the node level. Alarm Conditions Properties pane gives a clear record of changes or events that do not result in alarms.

Note The Alarm Conditions tab is not updated when conditions change; therefore, you must click **Retrieve** to see any changes.

Table B-235 Field Descriptions for the Alarm Conditions Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Retrieve button	Click the **Retrieve** button. The Retrieve button requests the current set of fault conditions from the node, card, or network. Conditions include all fault conditions raised on the node, whether or not they are reported. The time stamp of the condition request is also reported next to the **Retrieve** button.
Perceived Severity	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
Service Affecting	Whether the alarm or event is service affecting (SA). Values are: • True—The alarm is service affecting • False—The alarm is not service affecting

B.8.1.9 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The DWDM Properties pane contains the following tabs:

- B.8.1.9.1 Provisioning Tab, page B-169

- B.8.1.9.2 Connections Tab, page B-170
- B.8.1.9.3 Span Check Tab, page B-171
- B.8.1.9.4 APC Tab, page B-171
- B.8.1.9.5 Node Setup Tab, page B-172
- B.8.1.9.6 Side Tab, page B-172
- B.8.1.9.7 All Facilities Tab, page B-172
- B.8.1.9.8 Passive Cards Tab, page B-173
- B.8.1.9.9 Alien Wavelength Tab, page B-173
- B.8.1.9.10 Fiber Attribute Tab, page B-174

B.8.1.9.1 Provisioning Tab

The Provisioning tab allows you to view and change the optical parameters for the ONS 15454 MSTP. The optical parameters might have already been provisioned manually or by automatic node setup (ANS).

Table B-236 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.

Table B-236 Field Descriptions for the Provisioning Tab (continued)

Field	Description
Origin (*Available in ONS 15454 R8.0 and later*)	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note (*Available in ONS 15454 R8.0 and later*)	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.8.1.9.2 Connections Tab

The Connections tab allows you retrieve internal patchcords and calculate DWDM connections.

Table B-237 Field Descriptions for the Connections Tab

Field	Description
ONS 15454 MSTP R7.2 and Earlier	
Slot-From	The slot from which the DWDM connection originates.
Unit-From	The unit from which the DWDM connection originates.
Port-From	The port from which the DWDM connection originates.
Slot-To	The slot at which the DWDM connection terminates.
Unit-To	The unit at which the DWDM connection terminates.
Port-To	The port at which the DWDM connection terminates.
State	The state of the DWDM connection.
ONS 15454 MSTP R8.0 and Later	

Table B-237 Field Descriptions for the Connections Tab (continued)

Field	Description
From	The unit or port from which the internal patchcord originates.
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.8.1.9.3 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-238 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the Measure Span Loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.

B.8.1.9.4 APC Tab

The APC tab allows you to view the automatic power control (APC) parameters.

Table B-239 Field Descriptions for the APC Tab

Field	Description
Port	Port number.
Last Modification	Date and time the power control setpoint was last modified.
Param	All the APC parameters associated with the port.
Last Check	Date and time the power control setpoint was last verified.

Table B-239 Field Descriptions for the APC Tab (continued)

Field	Description
Side	Lists all the NEs and their sides that belong to the APC domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.8.1.9.5 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs from a selected XML configuration file.

Table B-240 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch ANS Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.8.1.9.6 Side Tab

The Side tab allows you to view, edit, and delete sides defined for an ONS 15454 MSTP NE.

Table B-241 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.8.1.9.7 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the ONS 15454 MSTP NE.

Table B-242 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Retain Selected	Displays only the ports that you selected.
Show All	Retrieves and displays all the optical and DWDM ports for the NE.

B.8.1.9.8 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-243 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.8.1.9.9 Alien Wavelength Tab

The Alien Wavelength tab allows you to view and edit the port and wavelength parameters defined for an ONS 15454 MSTP NE. Click the **Refresh** button to refresh the Alien Wavelength table.

Note Alien Wavelength is applicable to ONS 15454 NEs that support WSON nodes.

Table B-244 Field Descriptions for the Alien Wavelength Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Create button	Allows you to create alien wavelengths for the NE. See 7.12.15 Creating Alien Wavelength for more information.
Edit button	Allows you to modify the existing alien wavelength value. See 7.12.16 Editing Alien Wavelength for more information.
Position	Displays information about the shelf, slot, and port on which the alien wavelength is configured.
Alien Wavelength	Displays the alien wavelength class.
Lambda	Displays the alien wavelength value.
FEC	Displays the FEC mode.

B.8.1.9.10 Fiber Attribute Tab

The Fiber Attribute tab allows you to view the fiber parameters defined for an ONS 15454 MSTP NE.

Note Fiber Attribute is applicable to ONS 15454 NEs that support WSON node.

Table B-245 Field Descriptions for the Fiber Attribute Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Toggle button	Click the **Toggle** button to select the unit of measure.
Optical Side	Displays the name of the optical side to which the fiber is connected.
Fiber Type	Choose the fiber type from the drop-down list.
Fiber Number	Displays the number of the fiber associated to the optical side. Useful when different types of fiber are present on the span.
Fiber Length	Allows you to edit the fiber length.

B.8.1.9.11 WSON Tab

The WSON tab allows you to view and acknowledge the unverified alarms at the circuit level.

Table B-246 Field Descriptions for the WSON Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Acknowledge WSON Alarm button	Click the **Acknowledge WSON Alarm** button to acknowledge a WSON alarm.
Affected Circuits button	Click the **Affected Circuits** button to view the affected circuits. If there are circuits affected by the selected alarm, the new circuit report is displayed. See 7.2.28.2 Working with Circuit Reports for more information. **Note** The Affected Circuits button is enabled only when an alarm condition is selected.

Table B-246 Field Descriptions for the WSON Tab (continued)

Field	Description
ID	Displays the ID of the NE from the Domain Explorer.
PS	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
SA	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE

B.8.1.10 OSI

The OSI Properties pane allows you to provision ONS 15454 MSTP Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.8.1.10.1 Main Setup Tab, page B-176
- B.8.1.10.2 TARP-Config Tab, page B-176
- B.8.1.10.3 TARP-TDC Tab, page B-178
- B.8.1.10.4 TARP-MAT Tab, page B-178

- B.8.1.10.5 Routers-Setup Tab, page B-179
- B.8.1.10.6 Subnets Tab, page B-179
- B.8.1.10.7 Tunnels Tab, page B-180
- B.8.1.10.8 IS-IS RIB Tab, page B-181
- B.8.1.10.9 ES-IS RIB Tab, page B-181

B.8.1.10.1 Main Setup Tab

The Main Setup tab allows you to view and provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-247 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI ES. ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI IS. The ONS 15454 SONET performs all IS functions, including routing data between ISs and ESs, between networks, and between parts of a network. ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15454 SONET, Intermediate System Level 1 is the Cisco default.
Intermediate System Level 1/Level 2	The ONS 15454 SONET performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.8.1.10.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-248 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15454 SONET startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
Timers	
LDB Entry	Sets the TARP loop detection buffer (LDB) timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.

Table B-248 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.8.1.10.3 TARP-TDC Tab

Table B-249 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either of the following: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.8.1.10.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-250 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.

Table B-250 Field Descriptions for the TARP-MAT Tab (continued)

Field	Description
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.8.1.10.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage OSI virtual routers.

Table B-251 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15454 SONET provides three virtual routers, numbered 1 through 3.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 2. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.8.1.10.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-252 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets

Table B-252 Field Descriptions for the Subnets Tab (continued)

Field	Description
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64. For the ONS 15454 LAN subnet, the default DIS priority is 63. This priority should not be changed.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.8.1.10.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-253 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.8.1.10.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-254 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454 SONET provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.8.1.10.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-255 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454 SONET provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.8.2 Rack Properties Pane—ONS 15454 MSTP

The Rack Properties pane displays a graphic of the ONS 15454 MSTP rack that is selected in the NE Explorer tree.

The following table lists the number of shelves and racks supported for Multishelf NEs across Prime Optical releases:

Prime Optical Release	Number of racks and shelves supported
9.6	Up to 50
9.2	Up to 30
9.1	Up to 12
9.0	Up to 12

Prime Optical Release	Number of racks and shelves supported
8.5.x	Up to 12
8.0.x	Up to 8
7.0.x	Up to 8

Moving the mouse pointer over the rack, shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a shelf displays the shelf in the properties pane.

B.8.3 Shelf Properties Pane—ONS 15454 MSTP

The Shelf Properties pane displays information about the shelf that contains the ONS 15454 MSTP cards and modules.

The following table lists the number of shelves and racks supported for Multishelf NEs across Prime Optical releases:

Prime Optical Release	Number of racks and shelves supported
9.6	Up to 50
9.2	Up to 30
9.1	Up to 12
9.0	Up to 12
8.5.x	Up to 12
8.0.x	Up to 8
7.0.x	Up to 8

The shelf properties pane contains the following tabs:

- B.8.3.1 Shelf View, page B-182
- B.8.3.2 General, page B-183
- B.8.3.3 Alarm, page B-183
- B.8.3.4 Protection, page B-184
- B.8.3.5 Timing, page B-185

B.8.3.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15454 MSTP shelf that is selected in the NE Explorer tree. Moving the mouse pointer over the shelves, slots, or cards displays the current state and alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change a card. For unprovisioned slots, the right-click menu allows you to add a card.

B.8.3.2 General

The General Properties pane contains information about voltage thresholds and multishelf configurations for the ONS 15454 MSTP. The General Properties pane contains Power Monitor and Multishelf Config tabs.

B.8.3.2.1 Power Monitor Tab

Table B-256 Field Descriptions for the Power Monitor Tab

Field	Description
ELWBATVG	Allows you to set the monitor value for extreme low battery voltage (ELWBATVG) in volts direct current (VDC).
LWBATVG	Allows you to set the monitor value for low battery voltage (LWBATVG) in VDC.
HIBATVG	Allows you to set the monitor value for high battery voltage (HIBATVG) in VDC.
EHIBATVG	Allows you to set the monitor value for extreme high battery voltage (EHIBATVG) in VDC.
Current Voltage Environment	Shows the current voltage environment.

B.8.3.2.2 Multishelf Config Tab

Table B-257 Field Descriptions for the Multishelf Config Tab

Field	Description
Shelf Role	Specify the configuration for multishelf NEs, where the primary NE is configured to take care of other NEs in the shelf. Select one of the following radio buttons: • Disable Multishelf • Enable as Subtended Shelf • Enable as Node Controller
Shelf ID	Unique number that identifies the shelf. Shelf ID #1 is reserved for the node controller.
LAN Config	Used to specify the LAN configuration that is used for the multishelf NE. A change in this attribute will force an automatic TCC reboot.

B.8.3.3 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15454 MSTP shelves. The Alarm Properties pane contains Profile and Alarm Behavior tabs.

B.8.3.3.1 Profile Tab

The Profile tab allows you to view, create, or delete alarm profiles.

Table B-258 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list.
Create button	Click **Create** to create a new alarm profile for the NE.
Delete button	Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.8.3.3.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-259 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot No.	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.8.3.4 Protection

The Protection Properties pane contains Protection Groups and Operations tabs.

B.8.3.4.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-260 Field Descriptions for the Protection Groups Tab

Field	Descriptions
Protection Groups	
Protection Groups	Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.

Table B-260 Field Descriptions for the Protection Groups Tab (continued)

Field	Descriptions
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], 1+1 [port], or 1+1 Optimized [port]) of the selected protection group.
Protect Module	View the protect module if using 1:1 or 1:N protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, choose the amount of time following failure condition correction after which the node should switch back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.

B.8.3.4.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-261 Field Descriptions for the Operations Tab

Field	Descriptions
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.8.3.5 Timing

The Timing Properties pane contains General, Reference List, Status, and Timing Report tabs.

B.8.3.5.1 General Tab

The General tab displays general timing information.

Table B-262 Field Descriptions for the General Tab

Field	Description
General Timing Area	
Timing Mode	Set to External if the ONS 15454 derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. ⚠ **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15454 reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected. Use the Reversion Time field to specify the time in half-minute increments.
Reversion Time	Specify the reversion time in half-minute increments.
Quality of RES	If your timing source supports the reserved S1 byte, set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities and BITS OUT Facilities	
In State/Out State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS. **Note** BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin. SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15454. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.8.3.5.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-263 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to the internal clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal. • Timing Mode set to Line—Options are the node's working optical cards and Internal. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.8.3.5.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-264 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.

Table B-264 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.8.3.5.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.9 ONS 15454 SONET NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15454 SONET, the window that Prime Optical displays consists of a tree on the left side and a node properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.9.1 Node Properties Pane—ONS 15454 SONET, page B-189 for more information.

Note If CTC is launched from the web browser for an ONS 15454 SONET node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.9.1 Node Properties Pane—ONS 15454 SONET

The node properties pane displays information about the ONS 15454 SONET NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.9.1.1 Shelf View, page B-189
- B.9.1.2 General, page B-189
- B.9.1.3 Network, page B-191
- B.9.1.4 DCC/GCC/OSC, page B-200
- B.9.1.5 Timing, page B-202
- B.9.1.6 Protection, page B-205
- B.9.1.7 Ether Bridge, page B-206
- B.9.1.8 NE Defaults, page B-207
- B.9.1.9 Security, page B-208
- B.9.1.10 Alarm, page B-212
- B.9.1.11 Alarm Conditions, page B-213
- B.9.1.12 XC Utilization, page B-215
- B.9.1.13 BLSR, page B-215
- B.9.1.14 DWDM, page B-216
- B.9.1.15 OSI, page B-226

B.9.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15454 SONET that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change a card. For unprovisioned slots, the right-click menu allows you to add a card.

B.9.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15454 SONET NE.

Table B-265 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.

Table B-265 Field Descriptions for the General Properties Pane (continued)

Field	Description
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15454 network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15454 will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
AIS-V Insertion on STS-1 Signal Degrade - Path	
Insert AIS-V on STS-1 SD-P	If checked, the NE inserts an AIS-V signal when it detects an STS-1 signal degrade.
SD-P BER	Select the signal degrade path bit error rate for AIS-V insertion.
APC State	
Side	Lists all the NEs and their sides that belong to the automatic power control (APC) domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.
Power Monitor Tab	
ELWBATVG	Allows you to set the monitor value for extreme low battery voltage (ELWBATVG) in volts direct current (VDC).
LWBATVG	Allows you to set the monitor value for low battery voltage (LWBATVG) in VDC.
HIBATVG	Allows you to set the monitor value for high battery voltage (HIBATVG) in VDC.
EHIBATVG	Allows you to set the monitor value for extreme high battery voltage (EHIBATVG) in VDC.
Current Voltage Environment	Shows the current voltage environment (48 volts for SONET; 60 volts for SDH).

Table B-265 Field Descriptions for the General Properties Pane (continued)

Field	Description
Multishelf Config Tab	
Shelf Role	Specify the configuration for multishelf NEs, where the primary NE is configured to take care of other NEs in the shelf. Select one of the following radio buttons: • Disable Multishelf • Enable as Subtended Shelf • Enable as Node Controller
Shelf ID	Unique number that identifies the shelf. Shelf ID #1 is reserved for the node controller.
LAN Config	Used to specify the LAN configuration that is used for the multishelf NE. A change in this attribute will force an automatic TCC reboot.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.9.1.3 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

B.9.1.3.1 Address Tab, page B-192
B.9.1.3.2 Static Routes Tab, page B-192
B.9.1.3.3 OSPF Tab, page B-192
B.9.1.3.4 OSPF Area Range Tab, page B-194
B.9.1.3.5 OSPF Virtual Links Tab, page B-194
B.9.1.3.6 SNMP Tab, page B-195
B.9.1.3.7 Firewall/Proxy Tab, page B-195
B.9.1.3.8 Routing Table Tab, page B-196
B.9.1.3.9 RIP Routing Table Tab, page B-196
B.9.1.3.10 RIP Tab, page B-197
B.9.1.3.11 Proxy Tunnels Tab, page B-197
B.9.1.3.12 Firewall Tunnels Tab, page B-198
B.9.1.3.13 Secure Config Mode Tab, page B-198
B.9.1.3.14 FTP Hosts Tab, page B-199

B.9.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-266 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15454 address as it is identified on the IEEE 802 MAC layer.
LCD IP Setting	Allows you to configure the LCD screen. Select from the following values: • Allow Configuration—Enables shelf address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.9.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15454 SONET connectivity and create or delete static routes.

Table B-267 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15454 and the computer.

B.9.1.3.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-268 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15454 as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables the ONS 15454 OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15454s that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15454 is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15454 is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.9.1.3.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-269 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15454s that reside within the OSPF area. For example, if the ONS 15454 OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15454 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.9.1.3.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create, edit, or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-270 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.9.1.3.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-271 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15454 SONET.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15454 SONET to proxy SNMP calls.
Use Generic MIB	If checked, allows you to transfer traps to a local MIB browser or server.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15454 to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15454 to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15454 to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.9.1.3.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-272 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Craft Access Only	If checked, only allows CTC to access the firewall and proxy settings of the NE. Check this item only if the LAN port is used for direct workstation-to-NE connections, and not connected to a LAN. Disabling craft-only access allows the installation of a route to the LAN. Disable this only if the LAN port is actually connected to the LAN. **Note** This field applies only to ONS 15454 SONET releases earlier than R4.6.
Enable Firewall	If checked, blocks packets routed between the local area and DCC networks. This causes a loss of connectivity to DCC-only connected NEs. Prime Optical cannot reestablish the connection unless the proxy is enabled. Additionally, all NEs connected to the LAN must also have their firewall enabled, or connectivity problems will result. **Note** This field applies only to ONS 15454 SONET releases earlier than R4.6.

Table B-272 Field Descriptions for the Firewall/Proxy Tab (continued)

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454 serves as a proxy for connections between the Prime Optical server and ONS 15454s that are DCC-connected to the proxy ONS 15454. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Configures the ONS 15454 to proxy as an ENE, meaning the NE supports craft access only, supports firewall, and acts as a proxy. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Configures the ONS 15454 to proxy as a GNE, meaning the NE supports firewall and acts as a proxy. • Proxy-only—Configures the ONS 15454 to act as a proxy. If unchecked, the node does not proxy; instead, it acts as a LAN-connected NE (LNE).

B.9.1.3.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-273 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15454 SONET interface used to access the destination. Values are: • cpm0—The ONS 15454 Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.9.1.3.9 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the RIP routing table.

Table B-274 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.

Table B-274 Field Descriptions for the RIP Routing Table Tab (continued)

Field	Description
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.9.1.3.10 RIP Tab

The RIP tab allows you to view and configure RIP parameters.

Note

- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-275 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.9.1.3.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-276 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.9.1.3.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-277 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.9.1.3.13 Secure Config Mode Tab

The TCC2P card supports secure config mode. When the secure mode is on, the NE has two IP addresses, one for the backplane and one for the front port. The front port IP address is used by the DCC-connected NEs. The secure config mode feature applies to the ONS 15454 SONET R5.0 and later.

Note When there is no TCC2P card present, the fields in the following table cannot be configured.

The Secure Config Mode tab allows you to configure the secure config mode. The fields shown depend on whether the NE is in secure mode. For example, the Backplane Ethernet Port values are displayed only when the NE is in secure mode.

Table B-278 Field Descriptions for the Secure Config Mode Tab

Field	Description
TCP/IP Mode	
Normal	When this text is visible, the NE is not in secure mode. There is one IP address shared by TCC and backplane Ethernet ports, with full connectivity between ports.

Table B-278 Field Descriptions for the Secure Config Mode Tab (continued)

Field	Description
Secure	When this text is visible, the NE is in secure mode. There are separate IP addresses for TCC and backplane Ethernet ports, with no connectivity between ports.
Mode not locked	When this text is visible, you can change the secure mode.
Mode permanently locked and cannot be unlocked	When this text is visible, the NE is in secure mode, and the secure mode is locked and cannot be changed.
Backplane Ethernet Port	
IP Address	Displays the IP address of the NE.
Secure IP Address	Displays the backplane IP address.
Secure Subnet Mask Length	Displays the mask length of the secure IP address. Use the up or down arrows to change the mask length.
Default Router	Displays the address of the default router for this NE.
Secure MAC Address	Displays the MAC/Ethernet address for the backplane.
Secure LCD IP Setting	Displays the setting value applicable for the secure mode. Select from the following values: • Allow Configuration—Enables shelf address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.
Change Mode	
Change Mode button	Opens the Change Secure Mode dialog box, which allows you to change the mode of the NE from secure to unsecure, and vice versa. This button is enabled only if an active TCC2P card exists on the NE.
Lock	
Lock button	When the NE is in secure mode, the Lock button locks the secure mode on the NE/TCC so that it cannot be changed.

B.9.1.3.14 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-279 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.

Table B-279 Field Descriptions for the FTP Hosts Tab (continued)

Field	Description
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.9.1.4 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view SDCCs, LDCCs, Generic Communications Channels (GCCs), Optical Service Channels (OSCs), and DWDM ring IDs.

Table B-280 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-280 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, FLT, LPBK).
GCC	
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.
Foreign	A check mark indicates that the far-end node is a non-ONS node.

Table B-280 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the GCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, FLT, LPBK).
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Displays the state of the OSC termination.
DWDM Ring ID	
Ring ID	Displays the ring ID.
West Direction	Lists the OSCM or OSC-CSM port that supports the ring in the west direction. The value is N/A if there are no ports in the west direction.
East Direction	Lists the OSCM or OSC-CSM port that supports the ring in the east direction. The value is N/A if there are no ports in the east direction.
Create button	Allows you to create new terminations on SONET or SDH cards.
Edit button	Allows you to modify existing terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected SDCC, LDCC, GCC, OSC, or DWDM ring ID.

B.9.1.5 Timing

The Timing Properties pane contains the following tabs:

- B.9.1.5.1 General Tab, page B-202
- B.9.1.5.2 Reference List Tab, page B-204
- B.9.1.5.3 Status Tab, page B-204
- B.9.1.5.4 Timing Report Tab, page B-205

B.9.1.5.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-281 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set to External if the ONS 15454 derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15454 reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected. Use the Reversion Time field to specify the time in half-minute increments.
Quality of RES	If your timing source supports the reserved S1 byte, set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin. SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
BITS OUT Facilities	
Out State	Set the BITS reference to IS or OOS. For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.

Table B-281 Field Descriptions for the General Tab (continued)

Field	Description
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15454. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.9.1.5.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-282 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to the internal clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal. • Timing Mode set to Line—Options are the node's working optical cards and Internal. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.9.1.5.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.

- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-283 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.9.1.5.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.9.1.6 Protection

The Protection Properties pane contains the following tabs:

- B.9.1.6.1 Protection Groups Tab, page B-205
- B.9.1.6.2 Operations Tab, page B-206

B.9.1.6.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-284 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Protection Groups	Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	View the protection type (1:1 [card], 1:N [card], Y Cable [port], 1+1 [port], or 1+1 Optimized [port]) of the selected protection group.

Table B-284 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Protect Module	View the protect module if using 1:1 or 1:N protection. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the node reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, choose the amount of time following failure condition correction after which the node should switch back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.
Recovery Guard Time	The recovery guard timer prevents rapid switches due to SD or SF failures. After the SD or SF condition is cleared on a facility protected by Optimized 1+1 protection, no switches are performed for the duration of the recovery guard timer.
Verification Guard Time	The verification guard timer specifies the amount of time that a user command has to complete. If a user command cannot be completed within the duration set by the verification guard timer, the command is cleared and an APS_CLEAR event is sent.
Detection Guard Time	The detection guard timer specifies the amount of time after a failure that the system has to complete a switch. After detecting an SD, SF, LOS, LOF, or AISL failure, the detection guard timer is started. If the detection guard timer is set to zero, the system completes a switch within 60 ms for failure events.

B.9.1.6.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-285 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.9.1.7 Ether Bridge

The Ether Bridge Properties pane contains the following tabs:

- B.9.1.7.1 Spanning Tree Config Tab, page B-207
- B.9.1.7.2 Spanning Tree Status Tab, page B-207

B.9.1.7.1 Spanning Tree Config Tab

The Spanning Tree Config tab displays spanning tree configuration information for the ONS 15454.

Table B-286 Field Descriptions for the Spanning Tree Config Tab

Field	Description
Index Number	Unique number that identifies the spanning tree.
Priority	Incoming traffic queue. Priority can be either high or low.
Bridge Max Age	Maximum amount of time that received-protocol information is retained before it is discarded.
Bridge Hello Time	Time interval, in seconds, between the transmission of configuration bridge protocol data units (BPDUs) by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Bridge Forward Delay	Time spent by a port in the listening state and the learning state.

B.9.1.7.2 Spanning Tree Status Tab

The Spanning Tree Status tab displays spanning tree status information for the ONS 15454.

Table B-287 Field Descriptions for the Spanning Tree Status Tab

Field	Description
Index Number	Unique number that identifies the spanning tree.
Bridge ID	ONS 15454 unique identifier that transmits the configuration BPDU; the bridge ID is a combination of the bridge priority and the ONS 15454 MAC address.
Topology Age	Amount of time, in seconds, since the last topology change.
Topology Changes	Number of times the spanning-tree topology has been changed since the node booted up.
Designated Root	Spanning tree's designated root for a particular spanning-tree instance.
Root Cost	Total path cost to the designated root.
Root Port	Port used to reach the root.
Max Age	Maximum amount of time that received-protocol information is retained before it is discarded.
Hello Time	Time interval, in seconds, between the transmission of configuration BPDUs by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Hold Time	Minimum time period, in seconds, that elapses during the transmission of configuration information on a given port.
Forward Delay	Time spent by a port in the listening state and the learning state.

B.9.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15454 SONET NE. You can edit NE defaults for the ONS 15454 SONET R5.0 and later.

Table B-288 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.

Table B-288 Field Descriptions for the NE Defaults Properties Pane (continued)

Field	Description
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter. **Note** This field applies to the ONS 15454 SONET R6.0 and later.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter. **Note** This field applies to the ONS 15454 SONET R6.0 and later.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.9.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15454 SONET NE. The Properties pane contains the following tabs:

- B.9.1.9.1 Policy Tab, page B-208
- B.9.1.9.2 Password Tab, page B-209
- B.9.1.9.3 Access Tab, page B-210
- B.9.1.9.4 RADIUS Server Tab, page B-211
- B.9.1.9.5 Legal Disclaimer Tab, page B-212

B.9.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-289 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.

Table B-289 Field Descriptions for the Policy Tab (continued)

Field	Description
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically. Specify the duration in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.9.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-290 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords. Default value is 45 days. Range is from 20 to 90 days.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire. Default value is 5 days. Range is from 2 to 20 days.

B.9.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-291 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access (available for ONS 15454 SONET NEs R6.0 and later)	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Shell Access on	Specify shell access on Telnet or SSH.
SSH Port	Indicates the SSH port number that will be used if the SSH radio button is selected.
Telnet Port	This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
Use Standard Telnet Port	If checked, the standard Telnet port is used for Telnet access.
Shell Access (available for ONS 15454 SONET NEs R6.0 and later)	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access (available for ONS 15454 SONET NEs R6.0 and later)	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the TCC CORBA (IIOP) listener port and the TCC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TCC CORBA (IIOP) listener port is 683. The port number for the TCC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.

Table B-291 Field Descriptions for the Access Tab (continued)

Field	Description
TL1 Access (available for ONS 15454 SONET NEs R6.0 and later)	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access (available for ONS 15454 SONET NEs R6.0 and later)	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Pseudo-IOS Access (available for ONS 15454 SONET R9.2)	
Access State	Pseudo CLI is a command-line interface on the NE that simulates a Cisco IOS connection. Select the pseudo-IOS access state from the drop-down list. You can select Disable, Non-secure, or Secure. If you choose Disable, the port is not configurable, which means that the node does not listen for pseudo-CLI connections. **Note** Pseudo-IOS functionality is available only if the node contains 10GE_XP or GE_XP cards in L2 mode.
Port	Enter the port number for pseudo-IOS access. If the Access State field is set to Disable, you cannot configure this field.
Other	
PM Clearing Privilege	Select the user privilege that allows clearing PM statistics for the NE.

B.9.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15454 SONET R6.0 and later.

Table B-292 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.

Table B-292 Field Descriptions for the RADIUS Server Tab (continued)

Field	Description
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.9.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-293 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.9.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15454 SONET nodes. The Alarm Properties pane contains Profile and Alarm Behavior tabs.

B.9.1.10.1 Profile Tab

The Profile tab allows you to view, create, or delete alarm profiles.

Table B-294 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.9.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-295 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.9.1.11 Alarm Conditions

The Conditions Properties pane allows you to view all NE conditions (events with a Not Reported [NR] severity) at the node level. Alarm Conditions Properties pane gives a clear record of changes or events that do not result in alarms.

Note The Alarm Conditions tab is not updated when conditions change; therefore, you must click **Retrieve** to see any changes.

Table B-296 Field Descriptions for the Alarm Conditions Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Retrieve button	Click the **Retrieve** button. The Retrieve button requests the current set of fault conditions from the node, card, or network. Conditions include all fault conditions raised on the node, whether or not they are reported. The time stamp of the condition request is also reported next to the **Retrieve** button.
Perceived Severity	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
Service Affecting	Whether the alarm or event is service affecting (SA). Values are: • True—The alarm is service affecting • False—The alarm is not service affecting

B.9.1.12 XC Utilization

The XC Utilization Properties pane allows you to view a summary of the percentage of XTC cross-connect resources used by circuits that traverse or terminate at an ONS 15454 SONET.

Table B-297 Field Descriptions for the XC Utilization Properties Pane

Field	Description
VT Payload Type	Indicates the payload type of the cross-connect card in the NE. This field is not editable unless the NE contains an XCVXC card. If the NE contains an XCVXC card, you can specify the VT payload type as VT1.5, VT2, or mixed mode (a combination of VT1.5 and VT2).
Summary	
STS-1 Matrix	Provides the percentage of the XC cross-connect STS-1 paths resources that are used.
VT2 Matrix Ports	Provides the percentage of the XTC cross-connect VT2 matrix ports that are used, and the total number of ports available.
VT2 Matrix	Provides the percentage of the VT2 matrix resources that are used, and the total number of resources available.
VT1.5 Matrix Ports	Provides the percentage of the XTC cross-connect VT1.5 matrix ports that are used, and the total number of ports available.
VT1.5 Matrix	Provides the percentage of the V1.5 matrix resources that are used, and the total number of resources available.

B.9.1.13 BLSR

The BLSR Properties pane allows you to view BLSR information and create or delete BLSRs.

Table B-298 Field Descriptions for the BLSR Properties Pane

Field	Description
Fiber Type	Indicates whether the fiber type is 2-fiber or 4-fiber.
Rate	Select the BLSR rate.
Ring Name	Assign a six-digit alphanumeric ring name. Nodes in the same BLSR must have the same ring name.
Node ID	Assign a node ID. The node ID identifies the node to the BLSR. Nodes in the same BLSR must have unique node IDs.
Ring Reversion	Set the amount of time that will pass before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in a BLSR ring should have the same ring reversion setting, particularly if *never* (nonrevertive) is selected.
Span Reversion	Set the amount of time to pass before the span reverts to the working path.
East Line	Assign the east BLSR port.
East Switch	Displays a list of switch commands for the east port.
West Line	Assign the west BLSR port.
West Switch	Displays a list of switch commands for the west port.
East Protect	For 4-fiber BLSRs, assign the east BLSR protect port.
West Protect	For 4-fiber BLSRs, assign the west BLSR protect port.

B.9.1.14 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The DWDM Properties pane contains the following tabs:

- B.9.1.14.1 Provisioning Tab, page B-216
- B.9.1.14.2 Connections Tab, page B-218
- B.9.1.14.3 Port Status Tab, page B-218
- B.9.1.14.4 Span Check Tab, page B-219
- B.9.1.14.5 APC Tab, page B-219
- B.9.1.14.6 Side Power Monitoring Tab, page B-220
- B.9.1.14.7 Node Setup Tab, page B-221
- B.9.1.14.8 Side Tab, page B-222
- B.9.1.14.9 All Facilities Tab, page B-222
- B.9.1.14.10 Passive Cards Tab, page B-222
- B.9.1.14.11 Alien Wavelength Tab, page B-223
- B.9.1.14.12 Fiber Attribute Tab, page B-223

B.9.1.14.1 Provisioning Tab

The Provisioning tab allows you to view, export, and import a Cisco MetroPlanner configuration file into the DWDM node to configure the node automatically for ONS 15454 SONET NEs R6.*x* and earlier. It also allows you to provision card and ANS parameters using the Automatic Node Setup wizard for ONS 15454 SONET NEs R7.0 and later. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

Table B-299 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.

Table B-299 Field Descriptions for the Provisioning Tab (continued)

Field	Description
Origin (*Available in ONS 15454 SONET R8.0 and later*)	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note (*Available in ONS 15454 SONET R8.0 and later*)	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.9.1.14.2 Connections Tab

The Connections tab allows you to create or delete DWDM connections or internal patchcords. It also allows you to calculate DWDM connections.

Table B-300 Field Descriptions for the Connections Tab

Field	Description
Create button	Create a DWDM connection or an internal patchcord. See 7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier, page 7-331 or 7.12.4 Creating Internal Patchcords—ONS 15454 SONET and ONS 15454 SDH R8.0 and Later, page 7-332 for more information.
Delete button	Delete a DWDM connection or an internal patchcord. See 7.12.5 Deleting DWDM Connections or Internal Patchcords, page 7-334 for more information.
Calculate Connections button	Verify if the DWDM connection matches the connections on the DWDM design plan. See 7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier, page 7-331 for more information. It also automatically creates an internal patchcord based on the card provisioned on the node. See 7.12.2 Calculating Internal Patchcord Connections—ONS 15454 SONET and ONS 15454 SDH R8.0 and R9.0, page 7-331 for more information.
ONS 15454 SONET R7.2 and Earlier	
Slot-From	The slot from which the DWDM connection originates.
Unit-From	The unit from which the DWDM connection originates.
Port-From	The port from which the DWDM connection originates.
Slot-To	The slot at which the DWDM connection terminates.
Unit-To	The unit at which the DWDM connection terminates.
Port-To	The port at which the DWDM connection terminates.
State	The state of the DWDM connection.
ONS 15454 SONET R8.0 and Later	
From	The unit or port from which the internal patchcord originates.
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.9.1.14.3 Port Status Tab

The Port Status tab allows you to view port status and launch automatic node setup (ANS) for the selected port. Click the **Update** button to view the port status of all newly added cards.

This tab applies only to NE releases earlier than NE release 9.2.

Table B-301 Field Descriptions for the Port Status Tab

Field	Description
Launch ANS button	Launches the ANS function for the selected port. ANS adjusts the variable optical attenuators (VOAs) on the different channel paths to equalize the amplifier per-channel input power.
Slot ID (*available in CTM R7.2 and earlier*)	Lists the ONS node slot where the DWDM card is installed.
Card (*available in CTM R7.2 and earlier*)	Describes the card that is installed in the slot.
Port	Displays the card port.
Link Status	Displays the status of the link. Values are: • Success - Changed—The calculated setpoint was changed. • Success - Unchanged—The calculated setpoint was not changed. • Fail - Out of Range—The calculated setpoint is outside the range for that parameter. • Fail - Port in IS State—The setpoint cannot be applied because the port has an IS-NR service state. • Not Applicable—The setpoint does not apply to the node.
Parameter	The parameter name.

B.9.1.14.4 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-302 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the Measure Span Loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.

B.9.1.14.5 APC Tab

The APC tab allows you to manually run the automatic power control (APC) function, disable and enable APC, and view the date and time the power control setpoint was last checked and modified.

Table B-303 Field Descriptions for the APC Tab

Field	Description
Disable APC button (*available in CTM R7.2 and earlier*)	Disables the automatic power control function. **Caution** Disabling APC should be performed only for specific maintenance actions. When APC is disabled, aging compensation calculations are not performed and circuits cannot be activated.
Run APC button (*available in CTM R7.2 and earlier*)	Runs the automatic power control function manually.
Slot ID (*available in CTM R7.2 and earlier*)	Slot number for power control information and actions.
Card (*available in CTM R7.2 and earlier*)	Card type that is installed in the slot.
Port	Port number.
Last Modification	Date and time the power control setpoint was last modified.
Param (*available in CTM R8.0 and later*)	All the APC parameters associated with the ports.
Last Check	Date and time the power control setpoint was last verified.
Side (*available in CTM R8.0 and later*)	Lists all the NEs and their sides that belong to the APC domain.
APC State (*available in CTM R8.0 and later*)	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.9.1.14.6 Side Power Monitoring Tab

The Side Power Monitoring tab allows you to view bar charts of the input and output spectrum on each optical side of the node.

When you place the mouse over each wavelength in the bar chart, the power level and wavelength type are displayed. This feature is available on nodes that are installed with cards with Optical Channel Monitoring (OCM) capability.

Table B-304 Field Descriptions for the Side Power Monitoring Tab

Field	Descriptions
Bar Chart	Displays power monitoring information. The Side Power Monitoring panel is divided into Optical Side X subtabs, where X is the optical side. The number of subtabs is equal to the number of optical sides in the node. Each subtab displays two bar graphs. The IN bar graph displays the optical spectrum at the input port (LINE-RX) of the side in the direction from the fiber to the node provided the OCM functionality is available on this port else the graph displays the aggregate signal spectral distribution on the first port in the signal flow (indicated in the title of the bar chart) that is downstream of the LINE-RX port where an OCM measurement is available (For example, in node using a booster and SMR card, the measurement is done on the EXP port of the SMR card). The OUT bar graph displays the optical spectrum at the output port (LINE-TX) of the side in the direction from the node to the fiber provided the OCM functionality is available on this port else the graph displays the aggregate signal spectral distribution on the first port (indicated in the title of the bar chart) that is upstream of the LINE-TX port where an OCM measurement is available. **Note** Depending on the side layout, the LINE-TX port (output) and the LINE-RX port (input) of the card facing the fiber cannot measure the optical spectrum in a reliable manner if the OCM functionality is not available on these ports. When you place the mouse over each wavelength in the bar chart, the power level and the wavelength type (local ADD/DROP or EXPRESS) are displayed as a tooltip. • IN graph: The tooltip displays the destination side of each wavelength. The wavelength is either dropped locally or expressed to another side. • OUT graph: The tooltip displays the source side of each wavelength. The wavelength is either added locally or expressed from another side.
Tooltip Data	You can select or deselect the tooltip check boxes and the corresponding information is displayed in the tooltip. The tooltip check boxes control the tooltip information for both charts in this tab. Each Optical Side X subtab has these check boxes to control the chart tooltip for its own subtab. The options are: • Power • Lambda • Side • Channel

B.9.1.14.7 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs from a selected XML configuration file.

Table B-305 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.

Table B-305 Field Descriptions for the Node Setup Tab (continued)

Field	Description
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.9.1.14.8 Side Tab

The Side tab allows you to view, edit, and delete sides defined for an ONS 15454 SONET NE.

Table B-306 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.9.1.14.9 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the ONS 15454 SONET NE.

Table B-307 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number. **Note** Shelf ID is not included in the port number if the node is not a multishelf NE.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Keep Selected button	Displays only the ports that you selected.
Load button	Retrieves and displays all the optical and DWDM ports for the NE.

B.9.1.14.10 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-308 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.9.1.14.11 Alien Wavelength Tab

The Alien Wavelength tab allows you to view and edit the port and wavelength parameters defined for an ONS 15454 SONET NE. Click the **Refresh** button to refresh the Alien Wavelength table.

Note Alien Wavelength is applicable to ONS 15454 NEs that support WSON nodes.

Table B-309 Field Descriptions for the Alien Wavelength Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Create button	Allows you to create alien wavelengths for the NE. See 7.12.15 Creating Alien Wavelength for more information.
Edit button	Allows you to modify the existing alien wavelength value. See 7.12.16 Editing Alien Wavelength for more information.
Position	Displays information about the shelf, slot, and port on which the alien wavelength is configured.
Alien Wavelength	Displays the alien wavelength class.
Lambda	Displays the alien wavelength value.
FEC	Displays the FEC mode.

B.9.1.14.12 Fiber Attribute Tab

The Fiber Attribute tab allows you to view the fiber parameters defined for an ONS 15454 SONET NE.

Note Fiber Attribute is applicable to ONS 15454 NEs that support WSON node.

Table B-310 Field Descriptions for the Fiber Attribute Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Toggle button	Click the **Toggle** button to select the unit of measure.
Optical Side	Displays the name of the optical side to which the fiber is connected.
Fiber Type	Choose the fiber type from the drop-down list.
Fiber Number	Displays the number of the fiber associated to the optical side. Useful when different types of fiber are present on the span.
Fiber Length	Allows you to edit the fiber length.

B.9.1.14.13 WSON Tab

The WSON tab allows you to view and acknowledge the unverified alarms at the circuit level.

Table B-311 Field Descriptions for the WSON Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Acknowledge WSON Alarm button	Click the **Acknowledge WSON Alarm** button to acknowledge a WSON alarm.
Affected Circuits button	Click the **Affected Circuits** button to view the affected circuits. If there are circuits affected by the selected alarm, the new circuit report is displayed. See 7.2.2 Viewing the Circuit Table for more information. **Note** The Affected Circuits button is enabled only when an alarm condition is selected.
ID	Displays the ID of the NE from the Domain Explorer.
PS	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.

Table B-311 Field Descriptions for the WSON Tab (continued)

Field	Description
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
SA	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE

B.9.1.14.14 WSON Tab

The WSON tab allows you to view and acknowledge the unverified alarms at the circuit level.

Table B-312 Field Descriptions for the WSON Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Acknowledge WSON Alarm button	Click the **Acknowledge WSON Alarm** button to acknowledge a WSON alarm.
Affected Circuits button	Click the **Affected Circuits** button to view the affected circuits. If there are circuits affected by the selected alarm, the new circuit report is displayed. See 7.2.28.2 Working with Circuit Reports for more information. **Note** The Affected Circuits button is enabled only when an alarm condition is selected.
ID	Displays the ID of the NE from the Domain Explorer.

Table B-312 Field Descriptions for the WSON Tab (continued)

Field	Description
PS	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
SA	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE

B.9.1.15 OSI

The OSI Properties pane allows you to provision ONS 15454 SONET Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.9.1.15.1 Main Setup Tab, page B-227
- B.9.1.15.2 TARP-Config Tab, page B-227
- B.9.1.15.3 TARP-TDC Tab, page B-229
- B.9.1.15.4 TARP-MAT Tab, page B-229
- B.9.1.15.5 Routers-Setup Tab, page B-230

- B.9.1.15.6 Subnets Tab, page B-230
- B.9.1.15.7 Tunnels Tab, page B-231
- B.9.1.15.8 IS-IS RIB Tab, page B-232
- B.9.1.15.9 ES-IS RIB Tab, page B-232

B.9.1.15.1 Main Setup Tab

The Main Setup tab allows you to view and provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-313 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). The ONS 15454 SONET performs all IS functions including routing data between ISs and ESs, between networks, and between parts of a network. ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15454 SONET, Intermediate System Level 1 is the Cisco default.
Intermediate System Level 1/Level 2	The ONS 15454 SONET performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.9.1.15.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-314 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15454 SONET startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.

Table B-314 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.9.1.15.3 TARP-TDC Tab

Table B-315 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.9.1.15.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-316 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.

Table B-316 Field Descriptions for the TARP-MAT Tab (continued)

Field	Description
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.9.1.15.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage OSI virtual routers.

Table B-317 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15454 SONET provides three virtual routers, numbered 1 through 3.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 2. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.9.1.15.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-318 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets

Table B-318 Field Descriptions for the Subnets Tab (continued)

Field	Description
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64. For the ONS 15454 LAN subnet, the default DIS priority is 63. This priority should not be changed.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.9.1.15.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-319 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.9.1.15.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-320 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454 SONET provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.9.1.15.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-321 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454 SONET provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.10 ONS 15454 SDH NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15454 SDH, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.10.1 Node Properties Pane—ONS 15454 SDH, page B-233 for more information.

Note If CTC is launched from the web browser for an ONS 15454 SDH node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.10.1 Node Properties Pane—ONS 15454 SDH

The node properties pane displays information about the ONS 15454 SDH NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.10.1.1 Shelf View, page B-233
- B.10.1.2 General, page B-234
- B.10.1.3 Network, page B-235
- B.10.1.4 DCC/GCC/OSC, page B-244
- B.10.1.5 Timing, page B-251
- B.10.1.6 Protection, page B-254
- B.10.1.7 Ether Bridge, page B-255
- B.10.1.8 NE Defaults, page B-256
- B.10.1.9 Security, page B-257
- B.10.1.10 Alarm, page B-261
- B.10.1.11 Alarm Conditions, page B-262
- B.10.1.12 XC Utilization, page B-264
- B.10.1.13 MS-SPRing, page B-264
- B.10.1.14 DWDM, page B-265
- B.10.1.15 OSI, page B-274

Note When the NE Explorer is in autorefresh mode, any updates made to an entity or object (port, line, card, protection group, DCC, MS-SPRing, and so on) will refresh all the values of that entity even if you are currently editing the values. You will lose your changes on that entity.

B.10.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15454 SDH that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.10.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15454 SDH NE.

Table B-322 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15454 SDH network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15454 SDH will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
APC State	
Side	Lists all the NEs and their sides that belong to the automatic power control (APC) domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.
Power Monitor Tab	

Table B-322 Field Descriptions for the General Properties Pane (continued)

Field	Description
ELWBATVG	Allows you to set the monitor value for extreme low battery voltage (ELWBATVG) in volts direct current (VDC).
EHIBATVG	Allows you to set the monitor value for extreme high battery voltage (EHIBATVG) in VDC.
Current Voltage Environment	Shows the current voltage environment.
Multishelf Config Tab	
Shelf Role	Specify the configuration for multishelf NEs, where the primary NE is configured to take care of other NEs in the shelf. Select one of the following radio buttons: • Disable Multishelf • Enable as Subtended Shelf • Enable as Node Controller
Shelf ID	Unique number that identifies the shelf. Shelf ID #1 is reserved for the node controller.
LAN Config	Used to specify the LAN configuration that is used for the multishelf NE. A change in this attribute will force an automatic TCC reboot.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.10.1.3 Network

The Network Properties pane displays information about the NE network address. The Properties pane contains the following tabs:

- B.10.1.3.1 Address Tab, page B-236
- B.10.1.3.2 Static Routes Tab, page B-236
- B.10.1.3.3 OSPF Tab, page B-237
- B.10.1.3.4 OSPF Area Range Tab, page B-238
- B.10.1.3.5 OSPF Virtual Links Tab, page B-238
- B.10.1.3.6 SNMP Tab, page B-239
- B.10.1.3.7 Firewall/Proxy Tab, page B-240
- B.10.1.3.8 Routing Table Tab, page B-240
- B.10.1.3.9 RIP Routing Table Tab, page B-240
- B.10.1.3.10 RIP Tab, page B-241
- B.10.1.3.11 Proxy Tunnels Tab, page B-241
- B.10.1.3.12 Firewall Tunnels Tab, page B-242
- B.10.1.3.13 Secure Config Mode Tab, page B-242
- B.10.1.3.14 FTP Hosts Tab, page B-243

B.10.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-323 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15454 SDH address as it is identified on the IEEE 802 MAC layer.
LCD IP Setting	Allows you to configure the LCD screen. Select from the following values: • Allow Configuration—Enables shelf address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.10.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15454 SDH connectivity and create or delete static routes.

Table B-324 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15454 SDH and the computer.

B.10.1.3.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-325 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15454 SDH NE as a unique OSPF area. The OSPF area number can be an integer from 0 to 4294967295, and it can take a form similar to an IP address. The number must be unique to the LAN OSPF area.
RS-DCC Metric	Sets a cost for sending packets across the RS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
MS-DCC Metric	Sets a cost for sending packets across the MS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables the ONS 15454 SDH OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15454 SDH NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15454 SDH is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15454 SDH is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.10.1.3.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-326 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15454 SDH NEs that reside within the OSPF area. For example, if the ONS 15454 SDH OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15454 SDH NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.10.1.3.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-327 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.10.1.3.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-328 Field Descriptions for the SNMP Tab

Field	Description
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15454 SDH.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15454 SDH to proxy SNMP calls.
Use Generic MIB	All enterprise-specific SNMP traps are defined twice in the MIBs, once in CERENT-454-MIB and then again in CERENT-GENERIC-MIB. The ONS 15454 SDH uses SNMP trap definitions from CERENT-454-MIB and does not use the CERENT-GENERIC-MIB. Other ONS nodes use SNMP trap definitions from CERENT-GENERIC-MIB and do not use the CERENT-454-MIB. When you check the Use Generic MIB check box on an ONS 15454 SDH, the node starts using SNMP trap definitions from CERENT-GENERIC-MIB instead of the SNMP trap definitions specified by the CERENT-454-MIB to prepare and send SNMP traps.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15454 SDH to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15454 SDH to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15454 SDH to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.10.1.3.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-329 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454 SDH serves as a proxy for connections between the Prime Optical server and ONS 15454 SDHs that are DCC-connected to the proxy ONS 15454 SDH. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Configures the ONS 15454 SDH to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Configures the ONS 15454 SDH to proxy as a GNE. • Proxy-only—Configures the ONS 15454 SDH to act as a proxy. If unchecked, the node does not proxy; instead, it acts as a LAN-connected NE (LNE).

B.10.1.3.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-330 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15454 SDH interface used to access the destination. Values are: • cpm0—The ONS 15454 SDH Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.10.1.3.9 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the Routing Information Protocol (RIP) routing table.

Table B-331 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.

Table B-331 Field Descriptions for the RIP Routing Table Tab (continued)

Field	Description
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.10.1.3.10 RIP Tab

The RIP tab allows you to view and configure the RIP parameters.

Note

- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-332 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.10.1.3.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-333 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.10.1.3.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-334 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.10.1.3.13 Secure Config Mode Tab

The TCC2P card supports secure config mode. When the secure mode is on, the NE has two IP addresses, one for the backplane and one for the front port. The front port IP address is used by the DCC-connected NEs. The secure config mode feature applies to the ONS 15454 SDH R5.0 and later.

Note When there is no TCC2P card present, the fields in the following table cannot be configured.

The Secure Config Mode tab allows you to configure the secure config mode. The fields shown depend on whether the NE is in secure mode. For example, the Backplane Ethernet Port values are displayed only when the NE is in secure mode.

Table B-335 Field Descriptions for the Secure Config Mode Tab

Field	Description
TCP/IP Mode	
Normal	When this text is visible, the NE is not in secure mode. There is one IP address shared by TCC and backplane Ethernet ports, with full connectivity between ports.

Table B-335 Field Descriptions for the Secure Config Mode Tab (continued)

Field	Description
Secure	When this text is visible, the NE is in secure mode. There are separate IP addresses for TCC and backplane Ethernet ports, with no connectivity between ports.
Mode not locked	When this text is visible, you can change the secure mode.
Mode permanently locked and cannot be unlocked	When this text is visible, the NE is in secure mode, and the secure mode is locked and cannot be changed.
Backplane Ethernet Port	
IP Address	Displays the IP address of the NE.
Secure IP Address	Displays the backplane IP address.
Secure Subnet Mask Length	Displays the mask length of the secure IP address. Use the up or down arrows to change the mask length.
Default Router	Displays the address of the default router for this NE.
Secure MAC Address	Displays the MAC/Ethernet address for the backplane.
Secure LCD IP Setting	Displays the setting value applicable for the secure mode. Select from the following values: • Allow Configuration—Enables shelf address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.
Change Mode	
Change Mode button	Opens the Change Secure Mode dialog box, which allows you to change the mode of the NE from secure to unsecure, and vice versa. This button is enabled only if an active TCC2P card exists on the NE.
Lock	
Lock button	When the NE is in secure mode, the Lock button locks the secure mode on the NE/TCC so that it cannot be changed.

B.10.1.3.14 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-336 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.

Table B-336 Field Descriptions for the FTP Hosts Tab (continued)

Field	Description
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.10.1.4 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view RS-DCCs, MS-DCCs, GCCs, OSCs, and DWDM ring IDs.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
RS-DCC	
SDCC Terminations	Displays the slot, port, and card type of an RS-DCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the RS-DCC is provisioned as OSI only, the following LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the RS-DCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Includes an administrative-operational state and secondary state. Administrative-operational states are used to manage service states and use a status attribute to specify the change in service state. The following are valid administrative-operational states: • Unlocked-enabled—The NE is fully operational and performs as provisioned. • Unlocked-disabled—The NE is not operational because of an autonomous event. • Locked-disabled—The NE is not operational because of an autonomous event; it has also been manually removed from service. • Locked-enabled—The NE has been manually removed from service. The following are valid secondary states: • AutomaticInService—Transitioning to the Unlocked-enabled service state is delayed. The transition to Unlocked-enabled state depends on correction of conditions, or on a soak timer. Alarm reporting is suppressed, but traffic is carried. Raised fault conditions, whether or not their alarms are reported, can be retrieved by using the TL1 **RTRV-COND** command. • Disabled—The NE has been manually removed from service and does not provide its provisioned functions. All services are disrupted; the entity is unable to carry traffic. • Failed—The NE has a raised alarm or condition. • Loopback—The NE is in loopback mode. • MismatchOfEquipment—An improper card is installed, a cross-connect card does not support an installed card, or an incompatible backplane is installed. For example, an installed card is not compatible with the card preprovisioning or the slot. This secondary state applies only to cards. • Maintenance—The NE has been manually removed from service for a maintenance activity but still performs its provisioned functions. Alarm reporting is suppressed, but traffic is carried. You can use the TL1 **RTRV-COND** command to retrieve raised fault conditions even if alarms have not been reported. • OutOfGroup—The virtual concatenation (VCAT) member cross-connect is not used to carry VCAT group traffic. This state is used to put a member circuit out of the group and to stop sending traffic. Locked-enabled,outOfGroup applies only to the cross-connects on an end node where VCAT resides. The cross-connects on intermediate nodes are in the Locked-enabled,maintenance service state. • SoftwareDownload—A card is involved in a software download. This secondary state applies only to cards. • Unassigned—A card is not provisioned in the database. This secondary state applies only to cards. • NotInstalled—A card is not physically present (that is, the slot is empty). This secondary state applies only to cards. **Note** If the NE release does not support the Service state, this field shows N/A.
MS-DCC	
LDCC Terminations	Displays the slot, port, and card type of an MS-DCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the MS-DCCs that are provisioned as OSI only.
OSI SNPA	If the MS-DCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Includes an administrative-operational state and secondary state. Administrative-operational states are used to manage service states and use a status attribute to specify the change in service state. The following are valid administrative-operational states: • Unlocked-enabled—The NE is fully operational and performs as provisioned. • Unlocked-disabled—The NE is not operational because of an autonomous event. • Locked-disabled—The NE is not operational because of an autonomous event; it has also been manually removed from service. • Locked-enabled—The NE has been manually removed from service. The following are valid secondary states: • AutomaticInService—Transitioning to the Unlocked-enabled service state is delayed. The transition to Unlocked-enabled state depends on correction of conditions, or on a soak timer. Alarm reporting is suppressed, but traffic is carried. Raised fault conditions, whether or not their alarms are reported, can be retrieved by using the TL1 **RTRV-COND** command. • Disabled—The NE has been manually removed from service and does not provide its provisioned functions. All services are disrupted; the entity is unable to carry traffic. • Failed—The NE has a raised alarm or condition. • Loopback—The NE is in loopback mode. • MismatchOfEquipment—An improper card is installed, a cross-connect card does not support an installed card, or an incompatible backplane is installed. For example, an installed card is not compatible with the card preprovisioning or the slot. This secondary state applies only to cards. • Maintenance—The NE has been manually removed from service for a maintenance activity but still performs its provisioned functions. Alarm reporting is suppressed, but traffic is carried. You can use the TL1 **RTRV-COND** command to retrieve raised fault conditions even if alarms have not been reported. • OutOfGroup—The virtual concatenation (VCAT) member cross-connect is not used to carry VCAT group traffic. This state is used to put a member circuit out of the group and to stop sending traffic. Locked-enabled,outOfGroup applies only to the cross-connects on an end node where VCAT resides. The cross-connects on intermediate nodes are in the Locked-enabled,maintenance service state. • SoftwareDownload—A card is involved in a software download. This secondary state applies only to cards. • Unassigned—A card is not provisioned in the database. This secondary state applies only to cards. • NotInstalled—A card is not physically present (that is, the slot is empty). This secondary state applies only to cards. **Note** If the NE release does not support the Service state, this field shows N/A.
GCC	
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the GCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Includes an administrative-operational state and secondary state. Administrative-operational states are used to manage service states and use a status attribute to specify the change in service state. The following are valid administrative-operational states: • Unlocked-enabled—The NE is fully operational and performs as provisioned. • Unlocked-disabled—The NE is not operational because of an autonomous event. • Locked-disabled—The NE is not operational because of an autonomous event; it has also been manually removed from service. • Locked-enabled—The NE has been manually removed from service. The following are valid secondary states: • AutomaticInService—Transitioning to the Unlocked-enabled service state is delayed. The transition to Unlocked-enabled state depends on correction of conditions, or on a soak timer. Alarm reporting is suppressed, but traffic is carried. Raised fault conditions, whether or not their alarms are reported, can be retrieved by using the TL1 **RTRV-COND** command. • Disabled—The NE has been manually removed from service and does not provide its provisioned functions. All services are disrupted; the entity is unable to carry traffic. • Failed—The NE has a raised alarm or condition. • Loopback—The NE is in loopback mode. • MismatchOfEquipment—An improper card is installed, a cross-connect card does not support an installed card, or an incompatible backplane is installed. For example, an installed card is not compatible with the card preprovisioning or the slot. This secondary state applies only to cards. • Maintenance—The NE has been manually removed from service for a maintenance activity but still performs its provisioned functions. Alarm reporting is suppressed, but traffic is carried. You can use the TL1 **RTRV-COND** command to retrieve raised fault conditions even if alarms have not been reported. • OutOfGroup—The virtual concatenation (VCAT) member cross-connect is not used to carry VCAT group traffic. This state is used to put a member circuit out of the group and to stop sending traffic. Locked-enabled,outOfGroup applies only to the cross-connects on an end node where VCAT resides. The cross-connects on intermediate nodes are in the Locked-enabled,maintenance service state. • SoftwareDownload—A card is involved in a software download. This secondary state applies only to cards. • Unassigned—A card is not provisioned in the database. This secondary state applies only to cards. • NotInstalled—A card is not physically present (that is, the slot is empty). This secondary state applies only to cards. **Note** If the NE release does not support the Service state, this field shows N/A.
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the OSCs that are provisioned as OSI only.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Includes an administrative-operational state and secondary state. Administrative-operational states are used to manage service states and use a status attribute to specify the change in service state. The following are valid administrative-operational states: • Unlocked-enabled—The NE is fully operational and performs as provisioned. • Unlocked-disabled—The NE is not operational because of an autonomous event. • Locked-disabled—The NE is not operational because of an autonomous event; it has also been manually removed from service. • Locked-enabled—The NE has been manually removed from service. The following are valid secondary states: • AutomaticInService—Transitioning to the Unlocked-enabled service state is delayed. The transition to Unlocked-enabled state depends on correction of conditions, or on a soak timer. Alarm reporting is suppressed, but traffic is carried. Raised fault conditions, whether or not their alarms are reported, can be retrieved by using the TL1 **RTRV-COND** command. • Disabled—The NE has been manually removed from service and does not provide its provisioned functions. All services are disrupted; the entity is unable to carry traffic. • Failed—The NE has a raised alarm or condition. • Loopback—The NE is in loopback mode. • MismatchOfEquipment—An improper card is installed, a cross-connect card does not support an installed card, or an incompatible backplane is installed. For example, an installed card is not compatible with the card preprovisioning or the slot. This secondary state applies only to cards. • Maintenance—The NE has been manually removed from service for a maintenance activity but still performs its provisioned functions. Alarm reporting is suppressed, but traffic is carried. You can use the TL1 **RTRV-COND** command to retrieve raised fault conditions even if alarms have not been reported. • OutOfGroup—The virtual concatenation (VCAT) member cross-connect is not used to carry VCAT group traffic. This state is used to put a member circuit out of the group and to stop sending traffic. Locked-enabled,outOfGroup applies only to the cross-connects on an end node where VCAT resides. The cross-connects on intermediate nodes are in the Locked-enabled,maintenance service state. • SoftwareDownload—A card is involved in a software download. This secondary state applies only to cards. • Unassigned—A card is not provisioned in the database. This secondary state applies only to cards. • NotInstalled—A card is not physically present (that is, the slot is empty). This secondary state applies only to cards. **Note** If the NE release does not support the Service state, this field shows N/A.

Table B-337 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
DWDM Ring ID	
Ring ID	Displays the ring ID.
West Direction	Lists the OSCM or OSC-CSM port that supports the ring in the west direction. The value is N/A if there are no ports in the west direction.
East Direction	Lists the OSCM or OSC-CSM port that supports the ring in the east direction. The value is N/A if there are no ports in the east direction.
Create button	Allows you to create new terminations on SONET, SDH, or transponder cards.
Edit button	Allows you to modify existing terminations on SONET, SDH, or transponder cards.
Delete button	Allows you to delete the selected RS-DCC, MS-DCC, GCC, OSC, or DWDM ring ID.

B.10.1.5 Timing

The Timing Properties pane contains the following tabs:

- B.10.1.5.1 General Tab, page B-251
- B.10.1.5.2 Reference List Tab, page B-253
- B.10.1.5.3 Status Tab, page B-253
- B.10.1.5.4 Timing Report Tab, page B-254

B.10.1.5.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-338 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set to External if the ONS 15454 SDH derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
Revertive	If checked, the ONS 15454 SDH reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.

Table B-338 Field Descriptions for the General Tab (continued)

Field	Description
BITS IN Facilities	
In State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
Sa Bit	The Sa Bit field is used to transmit the SSM message. The five available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.
BITS OUT Facilities	
Out State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
Sa Bit	The Sa Bit field is used to transmit the SSM message. The five available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.

B.10.1.5.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-339 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.10.1.5.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-340 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.

Table B-340 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.10.1.5.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.10.1.6 Protection

The Protection Properties pane contains the following tabs:

- B.10.1.6.1 Protection Groups Tab, page B-254
- B.10.1.6.2 Operations Tab, page B-255

B.10.1.6.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-341 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, 1+1, or Y-cable) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed.
Protect Module	View the protect module if using 1:1, 1:N, or Y-cable protection. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.

Table B-341 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the ONS 15454 SDH reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the ONS 15454 SDH switches back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.

B.10.1.6.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-342 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Switch Commands	Allows you to perform command switching.
Inhibit Switching	Allows you to inhibit command switching.

B.10.1.7 Ether Bridge

The Ether Bridge Properties pane contains the following tabs:

- B.10.1.7.1 Spanning Tree Config Tab, page B-255
- B.10.1.7.2 Spanning Tree Status Tab, page B-256

B.10.1.7.1 Spanning Tree Config Tab

The Spanning Tree Config tab displays spanning-tree configuration information for the ONS 15454 SDH.

Table B-343 Field Descriptions for the Spanning Tree Config Tab

Field	Description
Index Number	Unique number that identifies the spanning tree.
Priority	Incoming traffic queue. Priority can be either high or low.
Bridge Max Age	Maximum amount of time that received-protocol information is retained before it is discarded.

Table B-343 Field Descriptions for the Spanning Tree Config Tab (continued)

Field	Description
Bridge Hello Time	Time interval, in seconds, between the transmission of configuration bridge protocol data units (BPDUs) by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Bridge Forward Delay	Time spent by a port in the listening state and the learning state.

B.10.1.7.2 Spanning Tree Status Tab

The Spanning Tree Status tab displays spanning-tree status information for the ONS 15454 SDH.

Table B-344 Field Descriptions for the Spanning Tree Status Tab

Field	Description
Index Number	Unique number that identifies the spanning tree.
Bridge ID	ONS 15454 SDH unique identifier that transmits the configuration BPDU; the bridge ID is a combination of the bridge priority and the ONS 15454 SDH MAC address.
Topology Age	Amount of time, in seconds, since the last topology change.
Topology Changes	Number of times the spanning-tree topology has been changed since the node booted up.
Designated Root	Spanning tree's designated root for a particular spanning-tree instance.
Root Cost	Total path cost to the designated root.
Root Port	Port used to reach the root.
Max Age	Maximum amount of time that received-protocol information is retained before it is discarded.
Hello Time	Time interval, in seconds, between the transmission of configuration BPDUs by a bridge that is the spanning-tree root or is attempting to become the spanning-tree root.
Hold Time	Minimum time period, in seconds, that elapses during the transmission of configuration information on a given port.
Forward Delay	Time spent by a port in the listening state and the learning state.

B.10.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15454 SDH NE. You can edit NE defaults for the ONS 15454 SDH R5.0 and later.

Table B-345 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.

Table B-345 Field Descriptions for the NE Defaults Properties Pane (continued)

Field	Description
Range	Lists the possible range of values for the default NE parameter. **Note** This field applies to the ONS 15454 SDH R6.0 and later.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter. **Note** This field applies to the ONS 15454 SDH R6.0 and later.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.10.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15454 SDH NE. The Properties pane contains the following tabs:

- B.10.1.9.1 Policy Tab, page B-257
- B.10.1.9.2 Password Tab, page B-258
- B.10.1.9.3 Access Tab, page B-259
- B.10.1.9.4 RADIUS Server Tab, page B-260
- B.10.1.9.5 Legal Disclaimer Tab, page B-261

B.10.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-346 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.

Table B-346 Field Descriptions for the Policy Tab (continued)

Field	Description
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.10.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-347 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.10.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-348 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only (for ONS 15454 SONET NEs only). **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Shell Access on	Specify shell access on Telnet or SSH.
SSH Port	Indicates the SSH port number that will be used if the SSH radio button is selected.
Telnet Port	This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
Use Standard Telnet Port	If checked, the standard Telnet port is used for Telnet access.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the Controller Card CORBA (IIOP) listener port and the Controller Card CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the Controller Card CORBA (IIOP) listener port is 683. The port number for the Controller Card CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	

Table B-348 Field Descriptions for the Access Tab (continued)

Field	Description
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Pseudo-IOS Access	
Access State	Pseudo CLI is a command-line interface on the NE that simulates a Cisco IOS connection. Select the pseudo-IOS access state from the drop-down list. You can select Disable, Non-secure, or Secure. If you choose Disable, the port is not configurable, which means that the node does not listen for pseudo-CLI connections. **Note** Pseudo-IOS functionality is available only if the node contains 10GE_XP or GE_XP cards in L2 mode.
Port	Enter the port number for pseudo-IOS access. If the Access State field is set to Disable, you cannot configure this field.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.10.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for ONS 15454 SDH R6.0 or later.

Table B-349 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.

Table B-349 Field Descriptions for the RADIUS Server Tab (continued)

Field	Description
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.10.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-350 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.10.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15454 SDH nodes. The Properties pane contains the following tabs:

- B.10.1.10.1 Profile Tab, page B-262
- B.10.1.10.2 Alarm Behavior Tab, page B-262

B.10.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-351 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.10.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-352 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.10.1.11 Alarm Conditions

The Conditions Properties pane allows you to view all NE conditions (events with a Not Reported [NR] severity) at the node level. Alarm Conditions Properties pane gives a clear record of changes or events that do not result in alarms.

Note The Alarm Conditions tab is not updated when conditions change; therefore, you must click **Retrieve** to see any changes.

Table B-353 Field Descriptions for the Alarm Conditions Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Retrieve button	Click the **Retrieve** button. The Retrieve button requests the current set of fault conditions from the node, card, or network. Conditions include all fault conditions raised on the node, whether or not they are reported. The time stamp of the condition request is also reported next to the **Retrieve** button.
Perceived Severity	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
Service Affecting	Whether the alarm or event is service affecting (SA). Values are: • True—The alarm is service affecting • False—The alarm is not service affecting

B.10.1.12 XC Utilization

The XC Utilization Properties pane allows you to view a summary of the percentage of XTC cross-connect resources used by circuits that traverse or terminate at an ONS 15454 SDH.

Table B-354 Field Descriptions for the XC Utilization Properties Pane

Field	Description
Low Order Payload Type	Indicates the payload type of the cross-connect card in the NE. This field is not editable unless the NE contains an XCVXC card. If the NE contains an XCVXC card, you can specify the payload type as VC11, VC12, or mixed mode (a combination of VC11 and VC12).
Summary	
VC-4 Matrix	Provides the percentage of the XTC cross-connect VC-4 path resources that are used.
TUG3 Matrix Ports	Provides the percentage of the XTC cross-connect TUG3 matrix ports that are used.
TUG3 Matrix	Provides the percentage of the TUG3 matrix resources that are used.
VC12 Matrix Ports	Provides the percentage of the XTC cross-connect VC12 matrix ports that are used.
VC12 Matrix	Provides the percentage of the VC12 matrix resources that are used.
VC11 Matrix Ports	Provides the percentage of the XTC cross-connect VC11 matrix ports that are used.
VC11 Matrix	Provides the percentage of the VC11 matrix resources that are used.

B.10.1.13 MS-SPRing

The MS-SPRing Properties pane allows you to view MS-SPRing information and create new MS-SPRings. MS-SPRings share the ring bandwidth equally between working and protection traffic. Half of the payload bandwidth is reserved for protection in each direction, making the communication pipe half-full under normal operation. Click **Create** to create a new MS-SPRing; click **Delete** to delete an existing MS-SPRing; click **Ring Map** to open the Ring Map; click **Squelch Table** to open the Squelch table.

Table B-355 Field Descriptions for the MS-SPRing Properties Pane

Field	Description
Fiber Type	Indicates whether the fiber type is 2-fiber or 4-fiber.
Rate	Select the MS-SPRing rate.
Ring Name	Assign a six-digit alphanumeric ring name. Nodes in the same MS-SPRing must have the same ring name.
Node ID	Assign a node ID. The node ID identifies the node to the MS-SPRing. Nodes in the same MS-SPRing must have unique node IDs.
Ring Reversion	Set the amount of time that will pass before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in an MS-SPRing should have the same ring reversion setting, particularly if *never* (nonrevertive) is selected.
Span Reversion	Set the amount of time to pass before the span reverts to the working path.
East Line	Assign the east MS-SPRing port.
East Switch	Displays a list of switch commands for the east port.

Table B-355 Field Descriptions for the MS-SPRing Properties Pane (continued)

Field	Description
West Line	Assign the west MS-SPRing port.
West Switch	Displays a list of switch commands for the west port.
East Protect	For 4-fiber MS-SPRings, assign the east MS-SPRing protect port.
West Protect	For 4-fiber MS-SPRings, assign the west MS-SPRing protect port.

B.10.1.14 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The Properties pane contains the following tabs:

- B.10.1.14.1 Provisioning Tab, page B-265
- B.10.1.14.2 Connections Tab, page B-267
- B.10.1.14.3 Port Status Tab, page B-267
- B.10.1.14.4 Span Check Tab, page B-268
- B.10.1.14.5 APC Tab, page B-268
- B.10.1.14.6 Side Power Monitoring Tab, page B-269
- B.10.1.14.7 Node Setup Tab, page B-270
- B.10.1.14.8 Side Tab, page B-271
- B.10.1.14.9 All Facilities Tab, page B-271
- B.10.1.14.10 Passive Cards Tab, page B-271
- B.10.1.14.11 Alien Wavelength Tab, page B-272
- B.10.1.14.12 Fiber Attribute Tab, page B-272

B.10.1.14.1 Provisioning Tab

The Provisioning tab allows you to view, export, and import a Cisco MetroPlanner configuration file into the DWDM node to configure the node automatically for ONS 15454 SDH NEs R6.*x* and earlier. It also allows you to provision card and ANS parameters using the Automatic Node Setup wizard for ONS 15454 SDH NEs R7.0 and later. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

Table B-356 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.

Table B-356 Field Descriptions for the Provisioning Tab (continued)

Field	Description
Origin (*Available in ONS 15454 SDH R8.0 and later*)	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note (*Available in ONS 15454 SDH R8.0 and later*)	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.10.1.14.2 Connections Tab

The Connections tab allows you to create or delete DWDM connections or internal patchcords. It also allows you to calculate DWDM connections.

Table B-357 Field Descriptions for the Connections Tab

Field	Description
Create button	Create a DWDM connection or an internal patchcord. See 7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier, page 7-331 or 7.12.4 Creating Internal Patchcords—ONS 15454 SONET and ONS 15454 SDH R8.0 and Later, page 7-332 for more information.
Delete button	Delete a DWDM connection or an internal patchcord. See 7.12.5 Deleting DWDM Connections or Internal Patchcords, page 7-334 for more information.
Calculate Connections button	Verify if the DWDM connection matches the connections on the DWDM design plan. See 7.12.1 Calculating DWDM Connections—ONS 15454 SONET and ONS 15454 SDH R7.2 and Earlier, page 7-331 for more information. It also automatically creates an internal patchcord based on the card provisioned on the node. See 7.12.2 Calculating Internal Patchcord Connections—ONS 15454 SONET and ONS 15454 SDH R8.0 and R9.0, page 7-331 for more information.
ONS 15454 SDH R7.2 and Earlier	
Slot-From	The slot from which the DWDM connection originates.
Unit-From	The unit from which the DWDM connection originates.
Port-From	The port from which the DWDM connection originates.
Slot-To	The slot at which the DWDM connection terminates.
Unit-To	The unit at which the DWDM connection terminates.
Port-To	The port at which the DWDM connection terminates.
State	The state of the DWDM connection.
ONS 15454 SDH R8.0 and Later	
From	The unit or port from which the internal patchcord originates.
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.10.1.14.3 Port Status Tab

The Port Status tab allows you to view port status and launch automatic node setup (ANS) for the selected port. Click the **Update** button to view the port status of all newly added cards.

This tab applies only to NE releases earlier than NE release 9.2.

Table B-358 Field Descriptions for the Port Status Tab

Field	Description
Launch ANS button	Launches the ANS function for the selected port. ANS adjusts the variable optical attenuators (VOAs) on the different channel paths to equalize the amplifier per-channel input power.
Slot ID (*available in CTM R7.2 and earlier*)	Lists the ONS node slot where the DWDM card is installed.

Table B-358 Field Descriptions for the Port Status Tab (continued)

Field	Description
Card (*available in CTM R7.2 and earlier*)	Describes the card that is installed in the slot.
Port	Displays the card port.
Link Status	Displays the status of the link. Possible values are: • Success - Changed—The calculated setpoint was changed. • Success - Unchanged—The calculated setpoint was not changed. • Fail - Out of Range—The calculated setpoint is outside the range for that parameter. • Fail - Port in IS State—The setpoint cannot be applied because the port has an IS-NR service state. • Not Applicable—The setpoint does not apply to the node.
Parameter	The parameter name.

B.10.1.14.4 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-359 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the measured span loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.

B.10.1.14.5 APC Tab

The APC tab allows you to manually run the automatic power control (APC) function, disable and enable APC, and view the date and time the power control setpoint was last checked and modified.

Table B-360 Field Descriptions for the APC Tab

Field	Description
Disable APC button (*available in CTM R7.2 and earlier*)	Disables the automatic power control function. **Caution** Disabling APC should be performed only for specific maintenance actions. When APC is disabled, aging compensation calculations are not performed and circuits cannot be activated.
Run APC button (*available in CTM R7.2 and earlier*)	Runs the automatic power control function manually.
Slot ID (*available in CTM R7.2 and earlier*)	The slot number for power control information and actions.
Card (*available in CTM R7.2 and earlier*)	The card type that is installed in the slot.
Port	The port number.
Last Modification	Date and time the power control setpoint was last modified.
Param (*available in CTM R8.0 and later*)	All the parameters associated with the ports.
Last Check	Date and time the power control setpoint was last verified.
Side (*available in CTM R8.0 and later*)	Lists all the NEs and their sides that belong to the APC domain.
APC State (*available in CTM R8.0 and later*)	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.10.1.14.6 Side Power Monitoring Tab

The Side Power Monitoring tab allows you to view bar charts of the input and output spectrum on each optical side of the node.

When you place the mouse over each wavelength in the bar chart, the power level and wavelength type are displayed. This feature is available on nodes that are installed with cards with Optical Channel Monitoring (OCM) capability.

Table B-361 Field Descriptions for the Side Power Monitoring Tab

Field	Descriptions
Bar Chart	Displays power monitoring information. The Side Power Monitoring panel is divided into Optical Side X subtabs, where X is the optical side. The number of subtabs is equal to the number of optical sides in the node. Each subtab displays two bar graphs. The IN bar graph displays the optical spectrum at the input port (LINE-RX) of the side in the direction from the fiber to the node provided the OCM functionality is available on this port else the graph displays the aggregate signal spectral distribution on the first port in the signal flow (indicated in the title of the bar chart) that is downstream of the LINE-RX port where an OCM measurement is available (For example, in node using a booster and SMR card, the measurement is done on the EXP port of the SMR card). The OUT bar graph displays the optical spectrum at the output port (LINE-TX) of the side in the direction from the node to the fiber provided the OCM functionality is available on this port else the graph displays the aggregate signal spectral distribution on the first port (indicated in the title of the bar chart) that is upstream of the LINE-TX port where an OCM measurement is available. **Note** Depending on the side layout, the LINE-TX port (output) and the LINE-RX port (input) of the card facing the fiber cannot measure the optical spectrum in a reliable manner if the OCM functionality is not available on these ports. When you place the mouse over each wavelength in the bar chart, the power level and the wavelength type (local ADD/DROP or EXPRESS) are displayed as a tooltip. • IN graph: The tooltip displays the destination side of each wavelength. The wavelength is either dropped locally or expressed to another side. • OUT graph: The tooltip displays the source side of each wavelength. The wavelength is either added locally or expressed from another side.
Tooltip Data	You can select or deselect the tooltip check boxes and the corresponding information is displayed in the tooltip. The tooltip check boxes control the tooltip information for both charts in this tab. Each Optical Side X subtab has these check boxes to control the chart tooltip for its own subtab. The options are: • Power • Lambda • Side • Channel

B.10.1.14.7 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs.

Table B-362 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.

Table B-362 Field Descriptions for the Node Setup Tab (continued)

Field	Description
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.10.1.14.8 Side Tab

The Side tab allows you to view, edit, and delete sides defined for an ONS 15454 SDH NE.

Table B-363 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.10.1.14.9 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the ONS 15454 SDH NE.

Table B-364 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number. **Note** Shelf ID is not included in the port number if the node is not a multishelf NE.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Retain Selected button	Displays only the ports that you selected.
Show All button	Retrieves and displays all the optical and DWDM ports for the NE.

B.10.1.14.10 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-365 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.10.1.14.11 Alien Wavelength Tab

The Alien Wavelength tab allows you to view and edit the port and wavelength parameters defined for an ONS 15454 SDH NE. Click the **Refresh** button to refresh the Alien Wavelength table.

Note Alien Wavelength is applicable to ONS 15454 NEs that support WSON nodes.

Table B-366 Field Descriptions for the Alien Wavelength Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Create button	Allows you to create alien wavelengths for the NE. See 7.12.15 Creating Alien Wavelength for more information.
Edit button	Allows you to modify the existing alien wavelength value. See 7.12.16 Editing Alien Wavelength for more information.
Position	Displays information about the shelf, slot, and port on which the alien wavelength is configured.
Alien Wavelength	Displays the alien wavelength class.
Lambda	Displays the alien wavelength value.
FEC	Displays the FEC mode.

B.10.1.14.12 Fiber Attribute Tab

The Fiber Attribute tab allows you to view the fiber parameters defined for an ONS 15454 SDH NE.

Note Fiber Attribute is applicable to ONS 15454 NEs that support WSON node.

Table B-367 Field Descriptions for the Fiber Attribute Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Toggle button	Click the **Toggle** button to select the unit of measure.
Optical Side	Displays the name of the optical side to which the fiber is connected
Fiber Type	Choose the fiber type from the drop-down list.
Fiber Number	Displays the number of the fiber associated to the optical side. Useful when different types of fiber are present on the span.
Fiber Length	Allows you to edit the fiber length.

B.10.1.14.13 WSON Tab

The WSON tab allows you to view and acknowledge the unverified alarms at the circuit level.

Table B-368 Field Descriptions for the WSON Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Acknowledge WSON Alarm button	Click the **Acknowledge WSON Alarm** button to acknowledge a WSON alarm.
Affected Circuits button	Click the **Affected Circuits** button to view the affected circuits. If there are circuits affected by the selected alarm, the new circuit report is displayed. See 7.2.28.2 Working with Circuit Reports for more information. **Note** The Affected Circuits button is enabled only when an alarm condition is selected.
ID	Displays the ID of the NE from the Domain Explorer.
PS	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.

Table B-368 Field Descriptions for the WSON Tab (continued)

Field	Description
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
SA	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE

B.10.1.15 OSI

The OSI Properties pane allows you to provision ONS 15454 SDH Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.10.1.15.1 Main Setup Tab, page B-274
- B.10.1.15.2 TARP-Config Tab, page B-275
- B.10.1.15.3 TARP-TDC Tab, page B-276
- B.10.1.15.4 TARP-MAT Tab, page B-277
- B.10.1.15.5 Routers-Setup Tab, page B-277
- B.10.1.15.6 Subnets Tab, page B-278
- B.10.1.15.7 Tunnels Tab, page B-279
- B.10.1.15.8 IS-IS RIB Tab, page B-279
- B.10.1.15.9 ES-IS RIB Tab, page B-279

B.10.1.15.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-369 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15454 SDH, Intermediate System Level 1 is the Cisco default.
Intermediate System Level 1/Level 2	The ONS 15454 SDH performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.10.1.15.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-370 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).

Table B-370 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15454 SDH startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.10.1.15.3 TARP-TDC Tab

Table B-371 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.

Table B-371 Field Descriptions for the TARP-TDC Tab (continued)

Field	Description
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.10.1.15.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-372 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.10.1.15.5 Routers-Setup Tab

Table B-373 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15454 SDH provides three virtual routers, numbered 1 through 3.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 2. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.

Table B-373 Field Descriptions for the Routers-Setup Tab (continued)

Field	Description
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.

B.10.1.15.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-374 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64. For the ONS 15454 LAN subnet, the default DIS priority is 63. This priority should not be changed.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.10.1.15.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-375 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.10.1.15.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-376 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454 SDH provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.10.1.15.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-377 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454 SDH provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.11 ONS 15454-M6 NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15454 MSTP, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.11.1 Node Properties Pane—ONS 15454-M6, page B-281 for more information.

Note Refer to the Cisco ONS 15454 SONET, SDH, and DWDM components' installation documents for precautions, guidelines, and procedures for converting single-shelf NEs to multishelf NEs. Incorrect procedures for converting single-shelf NEs to multishelf NEs can result in nodes not being properly discovered and managed by Prime Optical.

Caution If a shelf is added to a node that is managed by Prime Optical, force a Refresh from NE operation to correctly update the node inventory. Inconsistencies in the node inventory can occur if the operation is not performed. Those inconsistencies are reflected in all Prime Optical user interfaces, including the gateways.

B.11.1 Node Properties Pane—ONS 15454-M6

The node properties pane displays information about the ONS 15454-M6 NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.11.1.1 Shelf View, page B-281
- B.11.1.2 General, page B-281
- B.11.1.3 Network, page B-283
- B.11.1.4 DCC/GCC/OSC, page B-291
- B.11.1.5 Timing, page B-293
- B.11.1.6 Protection, page B-296
- B.11.1.7 NE Defaults, page B-297
- B.11.1.8 Security, page B-298
- B.11.1.9 Alarm, page B-302
- B.11.1.10 Alarm Conditions, page B-303
- B.11.1.11 DWDM, page B-305
- B.11.1.12 OSI, page B-311
- B.11.1.13 ECU Ports Alarms Suppression, page B-317
- B.11.1.14 Alarm Extenders, page B-317

B.11.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15454-M6 that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.11.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15454-M6 NE.

Table B-378 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.

Table B-378 Field Descriptions for the General Properties Pane (continued)

Field	Description
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15454-M6 network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15454-M6 will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
APC State	
Side	Lists all the NEs and their sides that belong to the automatic power control (APC) domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.
Power Monitor Tab	
Voltage Thresholds	
ELWBATVG	Allows you to set the monitor value for extreme low battery voltage (ELWBATVG) in volts direct current (VDC).
LWBATVG	Allows you to set the monitor value for low battery voltage (LWBATVG) in VDC.
HIBATVG	Allows you to set the monitor value for high battery voltage (HIBATVG) in VDC.
EHIBATVG	Allows you to set the monitor value for extreme high battery voltage (EHIBATVG) in VDC.
Current Voltage Environment	Shows the current voltage environment.
Multishelf Config Tab	

Table B-378 Field Descriptions for the General Properties Pane (continued)

Field	Description
Shelf Role	Specify the configuration for multishelf NEs, where the primary NE is configured to take care of other NEs in the shelf. Select one of the following radio buttons: • Disable Multishelf • Enable as Subtended Shelf • Enable as Node Controller
Shelf ID	Unique number that identifies the shelf. Shelf ID #1 is reserved for the node controller.
LAN Config	Used to specify the LAN configuration that is used for the multishelf NE. A change in this attribute forces an automatic TNC/TSC reboot.
Public VLAN ID	*Display only.* Public VLAN ID is used by the node controller to communicate with the external network.
Internal VLAN ID	*Display only.* Internal VLAN ID is used by the node controller to communicate with the subtending shelves.
Voltage/Temperature Tab	
Voltage A, B, and so on	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.
Cooling Profile	Displays the fan cooling profile. Values are: • High • Medium • Low
Reset	Resets all voltage and temperature values.
Help	Opens context-sensitive help.

B.11.1.3 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.11.1.3.1 Address Tab, page B-284
- B.11.1.3.2 Static Routes Tab, page B-284
- B.11.1.3.3 OSPF Tab, page B-285
- B.11.1.3.4 OSPF Area Range Tab, page B-286
- B.11.1.3.5 OSPF Virtual Links Tab, page B-286
- B.11.1.3.6 SNMP Tab, page B-287
- B.11.1.3.7 Firewall/Proxy Tab, page B-287
- B.11.1.3.8 Routing Table Tab, page B-288
- B.11.1.3.9 RIP Routing Table Tab, page B-288
- B.11.1.3.10 RIP Tab, page B-288
- B.11.1.3.11 Proxy Tunnels Tab, page B-289
- B.11.1.3.12 Firewall Tunnels Tab, page B-290

- B.11.1.3.13 Secure Config Mode Tab, page B-290
- B.11.1.3.14 FTP Hosts Tab, page B-290

B.11.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-379 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15454-M6 address as it is identified on the IEEE 802 MAC layer.
LCD IP Setting	Allows you to configure the LCD screen. Select from the following values: • Allow Configuration—Enables shelf address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.11.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15454-M6 connectivity and create or delete static routes.

Table B-380 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15454-M6 and the computer.

B.11.1.3.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-381 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15454-M6 NE as a unique OSPF area. The OSPF area number can be an integer from 0 to 4294967295, and it can take a form similar to an IP address. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables the ONS 15454-M6 OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15454-M6 SDH NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15454-M6 is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15454-M6 is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.11.1.3.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-382 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15454-M6 NEs that reside within the OSPF area. For example, if the ONS 15454-M6 OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15454-M6 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.11.1.3.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-383 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.11.1.3.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-384 Field Descriptions for the SNMP Tab

Field	Description
Use Generic MIB	If checked, allows you to transfer traps to a local MIB browser or server.
Engine ID	Displays the unique SNMP node engine ID.
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15454-M6.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15454-M6 to proxy SNMP calls.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15454-M6 to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.
Relay B IP Address	The second ONS 15454-M6 to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15454-M6 to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.11.1.3.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-385 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454-M6 serves as a proxy for connections between the Prime Optical server and ONS 15454-M6 that are DCC-connected to the proxy ONS 15454-M6. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Configures the ONS 15454-M6 to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Configures the ONS 15454-M6 to proxy as a GNE. • Proxy-only—Configures the ONS 15454-M6 to act as a proxy. If unchecked, the node does not proxy; instead, it acts as a LAN-connected NE (LNE).

B.11.1.3.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-386 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15454-M6 interface used to access the destination. Values are: • cpm0—The ONS 15454-M6 Ethernet interface (that is, the RJ-45 jack on the TNC/TSC and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.11.1.3.9 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the Routing Information Protocol (RIP) routing table.

Table B-387 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.11.1.3.10 RIP Tab

The RIP tab allows you to view and configure the RIP parameters.

Note
- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-388 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.11.1.3.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-389 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.11.1.3.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-390 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.11.1.3.13 Secure Config Mode Tab

The Secure Config Mode tab allows you to configure the secure config mode. The fields shown depend on whether the NE is in secure mode. For example, the Backplane Ethernet Port values are displayed only when the NE is in secure mode.

Table B-391 Field Descriptions for the Secure Config Mode Tab

Field	Description
TCP/IP Mode	
Normal	When this text is visible, the NE is not in secure mode. There is one IP address shared by TNC/TSC and backplane Ethernet ports, with full connectivity between ports.
Secure	When this text is visible, the NE is in secure mode. There are separate IP addresses for TNC/TSC and backplane Ethernet ports, with no connectivity between ports.
Mode not locked	When this text is visible, you can change the secure mode.
Mode permanently locked and cannot be unlocked	When this text is visible, the NE is in secure mode, and the secure mode is locked and cannot be changed.
Change Mode	
Change Mode button	Opens the Change Secure Mode dialog box, which allows you to change the mode of the NE from secure to unsecure, and vice versa. This button is enabled only if an active TNC/TSC card exists on the NE.
Lock	
Lock button	When the NE is in secure mode, the Lock button locks the secure mode on the NE/TNC/TSC so that it cannot be changed.

B.11.1.3.14 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-392 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.11.1.4 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view SDCCs, LDCCs, GCCs, and OSCs.

Table B-393 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-393 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
GCC	
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.

Table B-393 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the GCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Displays the state of the OSC termination.

B.11.1.5 Timing

The Timing Properties pane contains the following tabs:

- B.11.1.5.1 General Tab, page B-293
- B.11.1.5.2 Reference List Tab, page B-295
- B.11.1.5.3 Status Tab, page B-295
- B.11.1.5.4 Timing Report Tab, page B-296

B.11.1.5.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-394 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set to External if the ONS 15454-M6 derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.

Table B-394 Field Descriptions for the General Tab (continued)

Field	Description
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SDH protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SDH Line layer. They enable SDH devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15454-M6 reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Quality of RES	If your timing source supports the reserved S1 byte, set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
BITS OUT Facilities	
Out State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15454-M6. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.11.1.5.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-395 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TNC/TSC. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.11.1.5.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-396 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.

Table B-396 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.11.1.5.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.11.1.6 Protection

The Protection Properties pane contains the following tabs:

- B.11.1.6.1 Protection Groups Tab, page B-296
- B.11.1.6.2 Operations Tab, page B-297

B.11.1.6.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-397 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, 1+1, or Y-cable) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed.
Protect Module	View the protect module if using 1:1, 1:N, or Y-cable protection. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.

Table B-397 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the ONS 15454-M6 reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the ONS 15454-M6 switches back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.
Recovery Guard Time	The recovery guard timer prevents rapid switches due to SD or SF failures. After the SD or SF condition is cleared on a facility protected by Optimized 1+1 protection, no switches are performed for the duration of the recovery guard timer.
Verification Guard Time	The verification guard timer specifies the amount of time that a user command has to complete. If a user command cannot be completed within the duration set by the verification guard timer, the command is cleared and an APS_CLEAR event is sent.
Detection Guard Time	The detection guard timer specifies the amount of time after a failure that the system has to complete a switch. After detecting an SD, SF, LOS, LOF, or AISL failure, the detection guard timer is started. If the detection guard timer is set to zero, the system completes a switch within 60 ms for failure events.

B.11.1.6.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-398 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Switch Commands	Allows you to perform command switching.
Inhibit Switching	Allows you to inhibit command switching.

B.11.1.7 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15454-M6 NE.

Table B-399 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Load Data	Loads the NE default values.
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.

Table B-399 Field Descriptions for the NE Defaults Properties Pane (continued)

Field	Description
Range	Lists the possible range of values for the default NE parameter.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.11.1.8 Security

The Security Properties pane allows you to view and edit security features for the ONS 15454-M6 NE. The Properties pane contains the following tabs:

- B.11.1.8.1 Policy Tab, page B-298
- B.11.1.8.2 Password Tab, page B-299
- B.11.1.8.3 Access Tab, page B-300
- B.11.1.8.4 RADIUS Server Tab, page B-301
- B.11.1.8.5 Legal Disclaimer Tab, page B-302

B.11.1.8.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-400 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.

Table B-400 Field Descriptions for the Policy Tab (continued)

Field	Description
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.11.1.8.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-401 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.11.1.8.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-402 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are EMS Only, No LAN Access, Front Craft and EMS, or Front and Craft.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the Controller Card CORBA (IIOP) listener port and the Controller Card CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the Controller Card CORBA (IIOP) listener port is 683. The port number for the Controller Card CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Pseudo-IOS Access (available for ONS 15454 SDH R9.2)	

Table B-402 Field Descriptions for the Access Tab (continued)

Field	Description
Access State	Pseudo CLI is a command-line interface on the NE that simulates a Cisco IOS connection. Select the pseudo-IOS access state from the drop-down list. You can select Disable, Non-secure, or Secure. If you choose Disable, the port is not configurable, which means that the node does not listen for pseudo-CLI connections. **Note** Pseudo-IOS functionality is available only if the node contains 10GE_XP or GE_XP cards in L2 mode.
Port	Enter the port number for pseudo-IOS access. If the Access State field is set to Disable, you cannot configure this field.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.11.1.8.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15454-M6 NE.

Table B-403 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.11.1.8.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-404 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.11.1.9 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15454-M6 nodes. The Properties pane contains the following tabs:

- B.11.1.9.1 Profile Tab, page B-302
- B.11.1.9.2 Alarm Behavior Tab, page B-303

B.11.1.9.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-405 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.11.1.9.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-406 Field Descriptions for the Alarm Behavior Tab

Field	Description
Node Profile	
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.11.1.10 Alarm Conditions

The Conditions Properties pane allows you to view all NE conditions (events with a Not Reported [NR] severity) at the node level. Alarm Conditions Properties pane gives a clear record of changes or events that do not result in alarms.

Note The Alarm Conditions tab is not updated when conditions change; therefore, you must click **Retrieve** to see any changes.

Table B-407 Field Descriptions for the Alarm Conditions Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Retrieve button	Click the **Retrieve** button. The Retrieve button requests the current set of fault conditions from the node, card, or network. Conditions include all fault conditions raised on the node, whether or not they are reported. The time stamp of the condition request is also reported next to the **Retrieve** button.
Perceived Severity	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
Service Affecting	Whether the alarm or event is service affecting (SA). Values are: • True—The alarm is service affecting • False—The alarm is not service affecting

B.11.1.11 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The Properties pane contains the following tabs:

- B.11.1.11.1 Provisioning Tab, page B-305
- B.11.1.11.2 Connections Tab, page B-306
- B.11.1.11.3 Span Check Tab, page B-306
- B.11.1.11.4 APC Tab, page B-307
- B.11.1.11.5 Node Setup Tab, page B-308
- B.11.1.11.6 Side Tab, page B-308
- B.11.1.11.7 All Facilities Tab, page B-308
- B.11.1.11.8 Passive Cards Tab, page B-309
- B.11.1.11.9 Alien Wavelength Tab, page B-309
- B.11.1.11.10 Fiber Attribute Tab, page B-310

B.11.1.11.1 Provisioning Tab

The Provisioning tab allows you to view and change the optical parameters for the ONS 15454-M6 NE. The optical parameters might have already been provisioned manually or by automatic node setup (ANS).

Table B-408 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.

Table B-408 Field Descriptions for the Provisioning Tab (continued)

Field	Description
Origin (*Available in ONS 15454 SDH R8.0 and later*)	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note (*Available in ONS 15454 SDH R8.0 and later*)	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.11.1.11.2 Connections Tab

The Connections tab allows you to create or delete DWDM connections or internal patchcords. It also allows you to calculate DWDM connections.

Table B-409 Field Descriptions for the Connections Tab

Field	Description
From	The unit or port from which the internal patchcord originates.
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.11.1.11.3 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-410 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the measured span loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.
Measured By	Specifies the channel on which the span check was calculated.

B.11.1.11.4 APC Tab

The APC tab allows you to manually run the automatic power control (APC) function, disable and enable APC, and view the date and time the power control setpoint was last checked and modified.

Table B-411 Field Descriptions for the APC Tab

Field	Description
Disable APC button (*available in CTM R7.2 and earlier*)	Disables the automatic power control function. **Caution** Disabling APC should be performed only for specific maintenance actions. When APC is disabled, aging compensation calculations are not performed and circuits cannot be activated.
Run APC button (*available in CTM R7.2 and earlier*)	Runs the automatic power control function manually.
Slot ID (*available in CTM R7.2 and earlier*)	The slot number for power control information and actions.
Card (*available in CTM R7.2 and earlier*)	The card type that is installed in the slot.
Port	The port number.
Last Modification	Date and time the power control setpoint was last modified.
Param (*available in CTM R8.0 and later*)	All the parameters associated with the ports.
Last Check	Date and time the power control setpoint was last verified.

Table B-411 Field Descriptions for the APC Tab (continued)

Field	Description
Side (*available in CTM R8.0 and later*)	Lists all the NEs and their sides that belong to the APC domain.
APC State (*available in CTM R8.0 and later*)	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.11.1.11.5 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs.

Table B-412 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.11.1.11.6 Side Tab

The Side tab allows you to view, edit, and delete sides defined for an ONS 15454-M6 NE.

Table B-413 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.11.1.11.7 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the ONS 15454-M6 NE.

Table B-414 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number. **Note** Shelf ID is not included in the port number if the node is not a multishelf NE.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Retain Selected button	Displays only the ports that you selected.
Show All button	Retrieves and displays all the optical and DWDM ports for the NE.

B.11.1.11.8 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-415 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.11.1.11.9 Alien Wavelength Tab

The Alien Wavelength tab allows you to view and edit the port and wavelength parameters defined for an ONS 15454-M6 NE. Click the **Refresh** button to refresh the Alien Wavelength table.

Note Alien Wavelength is applicable to ONS 15454 NEs that support WSON nodes.

Table B-416 Field Descriptions for the Alien Wavelength Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Create button	Allows you to create alien wavelengths for the NE. See 7.12.15 Creating Alien Wavelength for more information.
Edit button	Allows you to modify the existing alien wavelength value. See 7.12.16 Editing Alien Wavelength for more information.
Position	Displays information about the shelf, slot, and port on which the alien wavelength is configured.
Alien Wavelength	Displays the alien wavelength class.
Lambda	Displays the alien wavelength value.
FEC	Displays the FEC mode.

B.11.1.11.10 Fiber Attribute Tab

The Fiber Attribute tab allows you to view the fiber parameters defined for an ONS 15454-M6 NE.

Note Fiber Attribute is applicable to ONS 15454 NEs that support WSON node.

Table B-417 Field Descriptions for the Fiber Attribute Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Toggle button	Click the **Toggle** button to select the unit of measure.
Optical Side	Displays the name of the optical side to which the fiber is connected.
Fiber Type	Choose the fiber type from the drop-down list.
Fiber Number	Displays the number of the fiber associated to the optical side. Useful when different types of fiber are present on the span.
Fiber Length	Allows you to edit the fiber length.

B.11.1.11.11 WSON Tab

The WSON tab allows you to view and acknowledge the unverified alarms at the circuit level.

Table B-418 Field Descriptions for the WSON Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Acknowledge WSON Alarm button	Click the **Acknowledge WSON Alarm** button to acknowledge a WSON alarm.
Affected Circuits button	Click the **Affected Circuits** button to view the affected circuits. If there are circuits affected by the selected alarm, the new circuit report is displayed. See 7.2.28.2 Working with Circuit Reports for more information. **Note** The Affected Circuits button is enabled only when an alarm condition is selected.

Table B-418 Field Descriptions for the WSON Tab (continued)

Field	Description
ID	Displays the ID of the NE from the Domain Explorer.
PS	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
SA	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE

B.11.1.12 OSI

The OSI Properties pane allows you to provision ONS 15454-M6 Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.11.1.12.1 Main Setup Tab, page B-312
- B.11.1.12.2 TARP-Config Tab, page B-312
- B.11.1.12.3 TARP-TDC Tab, page B-314
- B.11.1.12.4 TARP-MAT Tab, page B-314

- B.11.1.12.5 Routers-Setup Tab, page B-314
- B.11.1.12.6 Subnets Tab, page B-315
- B.11.1.12.7 Tunnels Tab, page B-316
- B.11.1.12.8 IS-IS RIB Tab, page B-316
- B.11.1.12.9 ES-IS RIB Tab, page B-317

B.11.1.12.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-419 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15454-M6, Intermediate System Level 1 is the Cisco default.
Intermediate System Level 1/Level 2	The ONS 15454-M6 performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.11.1.12.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-420 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.

Table B-420 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15454 SDH startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.11.1.12.3 TARP-TDC Tab

Table B-421 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.11.1.12.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-422 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.11.1.12.5 Routers-Setup Tab

Table B-423 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15454-M6 provides three virtual routers, numbered 1 through 3.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 2. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.

Table B-423 Field Descriptions for the Routers-Setup Tab (continued)

Field	Description
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.11.1.12.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-424 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64. For the ONS 15454 LAN subnet, the default DIS priority is 63. This priority should not be changed.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.

Table B-424 Field Descriptions for the Subnets Tab (continued)

Field	Description
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.11.1.12.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-425 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.11.1.12.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-426 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454-M6 provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.11.1.12.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-427 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454-M6 provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.11.1.13 ECU Ports Alarms Suppression

The External Control Unit (ECU) Ports Alarms Suppression Properties pane allows you to suppress the alarms for the MS_ISC ports of the ECU.

Table B-428 Field Descriptions for the ECU Ports Alarms Suppression Properties Pane

Field	Description
Ports	The port number.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms for the MS_ISC ports of the ECU are suppressed.

B.11.1.14 Alarm Extenders

The Alarm Extenders Properties pane allows you to view external alarm information and create custom alarm types. The Alarm Extenders Properties pane contains the following tabs:

- B.11.1.14.1 Alarm Dry Contacts Mode Tab, page B-318
- B.11.1.14.2 External Alarms Tab, page B-318
- B.11.1.14.3 External Controls Tab, page B-318
- B.11.1.14.4 User Defined Alarms Tab, page B-319

B.11.1.14.1 Alarm Dry Contacts Mode Tab

The Alarm Dry Contacts Mode tab indicates whether the input and output ports are External Alarms or External Controls.

Table B-429 Field Descriptions for the Alarm Dry Contacts Mode Tab

Field	Description
Input/Output	Select External Alarm if you use external alarms only; select External Control if you use both external alarms and external controls. Selecting only External Alarm gives you 14 external alarm ports and no external control ports. If you select External Control, four of the ports are converted to external control ports, leaving you with 10 external alarm ports.
External Controls	Allows you to view and update external controls.
External Alarms	Allows you to view and update external alarm information.

B.11.1.14.2 External Alarms Tab

Table B-430 Field Descriptions for the External Alarms Tab

Field	Description
Input No.	Displays the number assigned to the external alarm. To activate the input number, check the Enabled check box and set the input number.
Enabled	If checked, the Input No. field for the alarm gets activated.
Alarm Type	Sets the type of alarm. Select an alarm type from the drop-down list; more than 50 types of alarms are available.
Severity	Defines the severity of the alarm. The alarm severity level indicates the state of the LEDs. The LEDs are active if the alarm level is set to one of the following: Critical (CR), Major (MJ), or Minor (MN). The LEDs are not active if the alarm level is set to one of the following: Not Alarmed (NA) or Not Reported (NR). However, even if the LEDs are not active, they will continue to send reports to Prime Optical.
Raised When	Indicates the contact condition of the device (Open or Closed), which triggered the alarm.
Virtual Wire	Assigns the alarm to a virtual wire.
Description	Allows you to enter a description for the alarm.

B.11.1.14.3 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table B-431 Field Descriptions for the External Controls Tab

Field	Description
Control No.	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.

B.11.1.14.4 User Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on the ONS 15454-M6 SONET/SDH NE.

Table B-432 Field Descriptions for the User Defined Alarms Tab

Field	Description
Alarm Types	Lists the user-defined alarm types that have been created on the ONS 15454-M6 SONET/SDH. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the Add button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the Delete button to delete an existing alarm type.

B.12 ONS 15454-M2 NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15454 MSTP, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.12.1 Node Properties Pane—ONS 15454-M2, page B-320 for more information.

Note Refer to the Cisco ONS 15454 SONET, SDH, and DWDM components' installation documents for precautions, guidelines, and procedures for converting single-shelf NEs to multishelf NEs. Incorrect procedures for converting single-shelf NEs to multishelf NEs can result in nodes not being properly discovered and managed by Prime Optical.

Caution If a shelf is added to a node that is managed by Prime Optical, force a Refresh from NE operation to correctly update the node inventory. Inconsistencies in the node inventory can occur if the operation is not performed. Those inconsistencies are reflected in all Prime Optical user interfaces, including the gateways.

B.12.1 Node Properties Pane—ONS 15454-M2

The node properties pane displays information about the ONS 15454-M2 MSTP NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.12.1.1 Shelf View, page B-320
- B.12.1.2 General, page B-320
- B.12.1.3 Network, page B-322
- B.12.1.4 DCC/GCC/OSC, page B-330
- B.12.1.5 Timing, page B-332
- B.12.1.6 Protection, page B-335
- B.12.1.7 NE Defaults, page B-336
- B.12.1.8 Security, page B-337
- B.12.1.9 Alarm, page B-341
- B.12.1.10 Alarm Conditions, page B-342
- B.12.1.11 DWDM, page B-343
- B.12.1.12 OSI, page B-350

B.12.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15454-M2 that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change the card. For unprovisioned slots, the right-click menu allows you to add a card.

B.12.1.2 General

The General Properties pane displays identification information and voltage thresholds for the ONS 15454-M2 NE.

Table B-433 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.

Table B-433 Field Descriptions for the General Properties Pane (continued)

Field	Description
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15454-M2 network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15454-M2 will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.
APC State	
Side	Lists all the NEs and their sides that belong to the automatic power control (APC) domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.
Power Monitor Tab	
ELWBATVG	Allows you to set the monitor value for extreme low battery voltage (ELWBATVG) in volts direct current (VDC).
LWBATVG	Allows you to set the monitor value for low battery voltage (LWBATVG) in VDC.
HIBATVG	Allows you to set the monitor value for high battery voltage (HIBATVG) in VDC.
EHIBATVG	Allows you to set the monitor value for extreme high battery voltage (EHIBATVG) in VDC.
Current Voltage Environment	Shows the current voltage environment.
Multishelf Config Tab	
The Multishelf Config Tab for this card is disabled.	
Voltage/Temperature Tab	
Voltage A, B, and so on	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

Table B-433 Field Descriptions for the General Properties Pane (continued)

Field	Description
Reset	Resets all voltage and temperature values.
Help	Opens context-sensitive help.

B.12.1.3 Network

The Network Properties pane displays information about the NE network address. The Network Properties pane contains the following tabs:

- B.12.1.3.1 Address Tab, page B-322
- B.12.1.3.2 Static Routes Tab, page B-323
- B.12.1.3.3 OSPF Tab, page B-323
- B.12.1.3.4 OSPF Area Range Tab, page B-324
- B.12.1.3.5 OSPF Virtual Links Tab, page B-325
- B.12.1.3.6 SNMP Tab, page B-325
- B.12.1.3.7 Firewall/Proxy Tab, page B-326
- B.12.1.3.8 Routing Table Tab, page B-326
- B.12.1.3.9 RIP Routing Table Tab, page B-327
- B.12.1.3.10 RIP Tab, page B-327
- B.12.1.3.11 Proxy Tunnels Tab, page B-328
- B.12.1.3.12 Firewall Tunnels Tab, page B-328
- B.12.1.3.13 Secure Config Mode Tab, page B-329
- B.12.1.3.14 FTP Hosts Tab, page B-329

B.12.1.3.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-434 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15454-M2 address as it is identified on the IEEE 802 MAC layer.
LCD IP Setting	Allows you to configure the LCD screen. Select from the following values: • Allow Configuration—Enables shelf address changing from the LCD. • Display Only—Prevents users from changing the shelf IP address from the LCD screen. • Suppress Display—Makes the LCD screen blank.

Table B-434 Field Descriptions for the Address Tab (continued)

Field	Description
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.12.1.3.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15454-M2 connectivity and create or delete static routes.

Table B-435 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15454-M2 and the computer.

B.12.1.3.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-436 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15454-M2 as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the Section Data Communications Channel (SDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.

Table B-436 Field Descriptions for the OSPF Tab (continued)

Field	Description
OSPF on LAN	
OSPF Active on LAN	If checked, enables the ONS 15454-M2 OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15454-M2 NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15454-M2 is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15454-M2 is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.12.1.3.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-437 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15454-M2 NEs that reside within the OSPF area. For example, if the ONS 15454-M2 OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15454-M2 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.12.1.3.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-438 Field Descriptions for the OSPF Virtual Links

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.12.1.3.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-439 Field Descriptions for the SNMP Tab

Field	Description
Use Generic MIB	If checked, allows you to transfer traps to a local MIB browser or server.
Engine ID	Displays the unique SNMP node engine ID.
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15454-M2.
Allow SNMP Proxy	If checked, allows you to configure the ONS 15454-M2 to proxy SNMP calls.
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Relay A IP Address	The first ONS 15454-M2 to relay traps through. The IP address is appended to the base community string to tell the first NE the IP address and the port to forward the trap to. The second NE recognizes the IP address and strips it from the community string before forwarding the trap.
Relay A Community Name	The community name for the relay A node to use in the trap when forwarding it.

Table B-439 Field Descriptions for the SNMP Tab (continued)

Field	Description
Use Generic MIB	If checked, allows you to transfer traps to a local MIB browser or server.
Engine ID	Displays the unique SNMP node engine ID.
Relay B IP Address	The second ONS 15454-M2 to relay traps through.
Relay B Community Name	The community name for the relay B node to use in the trap when forwarding it.
Relay C IP Address	The third ONS 15454-M2 to relay traps through.
Relay C Community Name	The community name for the relay C node to use in the trap when forwarding it.

B.12.1.3.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-440 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15454-M2 serves as a proxy for connections between the Prime Optical server and ONS 15454-M2 that are DCC-connected to the proxy ONS 15454-M2. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Configures the ONS 15454-M2 to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Configures the ONS 15454-M2 to proxy as a GNE. • Proxy-only—Configures the ONS 15454-M2 to act as a proxy. If unchecked, the node does not proxy; instead, it acts as a LAN-connected NE (LNE).

B.12.1.3.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-441 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.

Table B-441 Field Descriptions for the Routing Table Tab (continued)

Field	Description
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15454-M2 interface used to access the destination. Values are: • cpm0—The ONS 15454-M2 Ethernet interface (that is, the RJ-45 jack on the TNC or TSC and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.12.1.3.9 RIP Routing Table Tab

The RIP Routing Table tab allows you to view the Routing Information Protocol (RIP) routing table.

Table B-442 Field Descriptions for the RIP Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host.
Mask	Displays the subnet mask used to reach the destination network or host.
Gateway	Displays the IP address of the gateway used to reach the destination network or host.
Cost	Displays the hop count metric. The valid range is from 1 to 15.

B.12.1.3.10 RIP Tab

The RIP tab allows you to view and configure the RIP parameters.

Note
- When you enable RIP, you must wait for approximately one minute for the default RIP address summary to become visible.
- When you disable RIP on the NE, all summary address entries in the Summary Address table are deleted.

Table B-443 Field Descriptions for the RIP Tab

Field	Description
RIP Active	Check this check box to enable RIP. Uncheck it to disable RIP. **Note** Checking the RIP Active check box and clicking the **Apply** button does not enable RIP. Instead, you must check the RIP Active check box, click the **Create** button, and use the Create RIP Address Summary dialog box to create a new RIP address. For details, see 5.3.5 Using RIP, page 5-8.
RIP Type	Select RIP version 1.0 or RIP version 2.0.
Metric	Enter the hop count metric. The valid range is from 1 to 15.
Authentication Type	Select the authentication type.
Authentication Key	Enter the authentication key (password) if the authentication type is Simple Password.

Table B-443 Field Descriptions for the RIP Tab (continued)

Field	Description
Confirm Authentication Key	Retype the authentication key to confirm it.
RIP Address Summary	• Summary Address—Displays the summary address. • Mask Length—Displays the subnet mask length. • Cost—Displays the hop count metric. The valid range is from 1 to 15.
Create button	Click **Create** to create a new RIP address. See 5.3.5 Using RIP, page 5-8.
Delete button	Click **Delete** to delete an existing RIP address.

B.12.1.3.11 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-444 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.12.1.3.12 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-445 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.12.1.3.13 Secure Config Mode Tab

The Secure Config Mode tab allows you to configure the secure config mode. The fields shown depend on whether the NE is in secure mode. For example, the Backplane Ethernet Port values are displayed only when the NE is in secure mode.

Table B-446 Field Descriptions for the Secure Config Mode Tab

Field	Description
TCP/IP Mode	
Normal	When this text is visible, the NE is not in secure mode. There is one IP address shared by TNC/TSC and backplane Ethernet ports, with full connectivity between ports.
Secure	When this text is visible, the NE is in secure mode. There are separate IP addresses for TNC/TSC and backplane Ethernet ports, with no connectivity between ports.
Mode not locked	When this text is visible, you can change the secure mode.
Mode permanently locked and cannot be unlocked	When this text is visible, the NE is in secure mode, and the secure mode is locked and cannot be changed.
Change Mode	
Change Mode button	Opens the Change Secure Mode dialog box, which allows you to change the mode of the NE from secure to unsecure, and vice versa. This button is enabled only if an active TNC/TSC card exists on the NE.
Lock	
Lock button	When the NE is in secure mode, the Lock button locks the secure mode on the NE/TNC/TSC so that it cannot be changed.

B.12.1.3.14 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-447 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.12.1.4 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view SDCCs, LDCCs, GCCs, OSCs, and DWDM ring IDs.

Table B-448 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
SDCC	
Create	Click the Create button to create new terminations on SONET or SDH cards.
Edit	Click the Edit button to modify existing terminations on SONET or SDH cards.
Delete	Click the Delete button to delete the selected SDCC, LDCC, GCC, or OSC.
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-448 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
GCC	
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.

Table B-448 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the GCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Displays the state of the OSC termination.

B.12.1.5 Timing

The Timing Properties pane contains the following tabs:

- B.12.1.5.1 General Tab, page B-332
- B.12.1.5.2 Reference List Tab, page B-334
- B.12.1.5.3 Status Tab, page B-334
- B.12.1.5.4 Timing Report Tab, page B-335

B.12.1.5.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-449 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set to External if the ONS 15454-M2 derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node. A third option, Mixed, allows you to set external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.

Table B-449 Field Descriptions for the General Tab (continued)

Field	Description
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SDH protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SDH Line layer. They enable SDH devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15454-M2 reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Quality of RES	If your timing source supports the reserved S1 byte, set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
BITS OUT Facilities	
Out State	Set the BITS reference to Locked or Unlocked. For nodes set to Line timing with no equipment timed through BITS Out, set the state to Locked. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to Unlocked.
Coding	Set to the coding used by your BITS reference, either AMI or HDB3.
Framing	Set to the framing used by your BITS reference.
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15454. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.12.1.5.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-450 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TNC/TSC. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for the equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.12.1.5.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-451 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.

Table B-451 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.12.1.5.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.12.1.6 Protection

The Protection Properties pane contains the following tabs:

- B.12.1.6.1 Protection Groups Tab, page B-335
- B.12.1.6.2 Operations Tab, page B-336

B.12.1.6.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-452 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, 1+1, or Y-cable) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed.
Protect Module	View the protect module if using 1:1, 1:N, or Y-cable protection. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.

Table B-452 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select the 1+1 (port) type.
Revertive	If checked, the ONS 15454-M2 reverts traffic to the working card or port after failure conditions for the amount of time entered in Reversion Time. This option is not available if you select the 1:N (card) type.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the ONS 15454-M2 switches back to the working card or port. Use half-minute increments. This option is available only if you select the 1:1 (card) type.
Recovery Guard Time	The recovery guard timer prevents rapid switches due to SD or SF failures. After the SD or SF condition is cleared on a facility protected by Optimized 1+1 protection, no switches are performed for the duration of the recovery guard timer.
Verification Guard Time	The verification guard timer specifies the amount of time that a user command has to complete. If a user command cannot be completed within the duration set by the verification guard timer, the command is cleared and an APS_CLEAR event is sent.
Detection Guard Time	The detection guard timer specifies the amount of time after a failure that the system has to complete a switch. After detecting an SD, SF, LOS, LOF, or AISL failure, the detection guard timer is started. If the detection guard timer is set to zero, the system completes a switch within 60 ms for failure events.

B.12.1.6.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-453 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands. **Note** For OTU2_XP cards, the card name might be shown as XP_4_10G_LINE_CARD.
Switch Commands	Allows you to perform command switching.
Inhibit Switching	Allows you to inhibit command switching.

B.12.1.7 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15454-M2 NE.

Table B-454 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Load Data	Loads the values for NE defaults.
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.

Table B-454 Field Descriptions for the NE Defaults Properties Pane (continued)

Field	Description
Range	Lists the possible range of values for the default NE parameter.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.12.1.8 Security

The Security Properties pane allows you to view and edit security features for the ONS 15454-M2 NE. The Properties pane contains the following tabs:

- B.12.1.8.1 Policy Tab, page B-337
- B.12.1.8.2 Password Tab, page B-338
- B.12.1.8.3 Access Tab, page B-339
- B.12.1.8.4 RADIUS Server Tab, page B-340
- B.12.1.8.5 Legal Disclaimer Tab, page B-341

B.12.1.8.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-455 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.

Table B-455 Field Descriptions for the Policy Tab (continued)

Field	Description
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.12.1.8.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-456 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.12.1.8.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-457 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are EMS Only, No LAN Access, Front Craft and EMS, or Front and Craft.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Disable IPv4 Access for IPv6	Check this check box to disable IPv4 access for IPv6 ports.
Serial Craft Access	
Enable Craft Port	Check this check box to enable the craft port.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the Controller Card CORBA (IIOP) listener port and the Controller Card CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the Controller Card CORBA (IIOP) listener port is 683. The port number for the Controller Card CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Pseudo-IOS Access (available for ONS 15454 SDH R9.2)	

Table B-457 Field Descriptions for the Access Tab (continued)

Field	Description
Access State	Pseudo CLI is a command-line interface on the NE that simulates a Cisco IOS connection. Select the pseudo-IOS access state from the drop-down list. You can select Disable, Non-secure, or Secure. If you choose Disable, the port is not configurable, which means that the node does not listen for pseudo-CLI connections. **Note** Pseudo-IOS functionality is available only if the node contains 10GE_XP or GE_XP cards in L2 mode.
Port	Enter the port number for pseudo-IOS access. If the Access State field is set to Disable, you cannot configure this field.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.12.1.8.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15454-M2 NE.

Table B-458 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.12.1.8.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-459 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.12.1.9 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15454-M2 SDH nodes. The Properties pane contains the following tabs:

- B.10.1.10.1 Profile Tab, page B-262
- B.10.1.10.2 Alarm Behavior Tab, page B-262

B.12.1.9.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-460 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.12.1.9.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-461 Field Descriptions for the Alarm Behavior Tab

Field	Description
Node Profile	
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.12.1.10 Alarm Conditions

The Conditions Properties pane allows you to view all NE conditions (events with a Not Reported [NR] severity) at the node level. Alarm Conditions Properties pane gives a clear record of changes or events that do not result in alarms.

Note The Alarm Conditions tab is not updated when conditions change; therefore, you must click **Retrieve** to see any changes.

Table B-462 Field Descriptions for the Alarm Conditions Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Retrieve button	Click the **Retrieve** button. The Retrieve button requests the current set of fault conditions from the node, card, or network. Conditions include all fault conditions raised on the node, whether or not they are reported.
Perceived Severity	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
Service Affecting	Whether the alarm or event is service affecting (SA). Values are: • True—The alarm is service affecting • False—The alarm is not service affecting

B.12.1.11 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The Properties pane contains the following tabs:

- B.12.1.11.1 Provisioning Tab, page B-344
- B.12.1.11.2 Connections Tab, page B-345

- B.12.1.11.3 Span Check Tab, page B-345
- B.12.1.11.4 APC Tab, page B-346
- B.12.1.11.5 Node Setup Tab, page B-347
- B.12.1.11.6 Side Tab, page B-347
- B.12.1.11.7 All Facilities Tab, page B-347
- B.12.1.11.8 Passive Cards Tab, page B-348
- B.12.1.11.9 Alien Wavelength Tab, page B-348
- B.12.1.11.10 Fiber Attribute Tab, page B-349

B.12.1.11.1 Provisioning Tab

The Provisioning tab allows you to view and change the optical parameters for the ONS 15454-M2 NE. The optical parameters might have already been provisioned manually or by automatic node setup (ANS).

Table B-463 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.

Table B-463 Field Descriptions for the Provisioning Tab (continued)

Field	Description
Origin (*Available in ONS 15454 SDH R8.0 and later*)	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note (*Available in ONS 15454 SDH R8.0 and later*)	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.12.1.11.2 Connections Tab

The Connections tab allows you to create or delete DWDM connections or internal patchcords. It also allows you to calculate DWDM connections.

Table B-464 Field Descriptions for the Connections Tab

Field	Description
From	The unit or port from which the internal patchcord originates.
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.12.1.11.3 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-465 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the measured span loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.
Measured By	Specifies the channel on which span check was calculated.

B.12.1.11.4 APC Tab

The APC tab allows you to manually run the automatic power control (APC) function, disable and enable APC, and view the date and time the power control setpoint was last checked and modified.

Table B-466 Field Descriptions for the APC Tab

Field	Description
Disable APC button (*available in CTM R7.2 and earlier*)	Disables the automatic power control function. **Caution** Disabling APC should be performed only for specific maintenance actions. When APC is disabled, aging compensation calculations are not performed and circuits cannot be activated.
Run APC button (*available in CTM R7.2 and earlier*)	Runs the automatic power control function manually.
Slot ID (*available in CTM R7.2 and earlier*)	The slot number for power control information and actions.
Card (*available in CTM R7.2 and earlier*)	The card type that is installed in the slot.
Port	The port number.
Last Modification	Date and time the power control setpoint was last modified.
Param (*available in CTM R8.0 and later*)	All the parameters associated with the ports.
Last Check	Date and time the power control setpoint was last verified.

Table B-466 Field Descriptions for the APC Tab (continued)

Field	Description
Side (*available in CTM R8.0 and later*)	Lists all the NEs and their sides that belong to the APC domain.
APC State (*available in CTM R8.0 and later*)	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.12.1.11.5 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs.

Table B-467 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.12.1.11.6 Side Tab

The Side tab allows you to view, edit, and delete sides defined for an ONS 15454-M2 NE.

Table B-468 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.12.1.11.7 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the ONS 15454-M2 NE.

Table B-469 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number. **Note** Shelf ID is not included in the port number if the node is not a multishelf NE.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Retain Selected button	Displays only the ports that you selected.
Show All button	Retrieves and displays all the optical and DWDM ports for the NE.

B.12.1.11.8 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-470 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.12.1.11.9 Alien Wavelength Tab

The Alien Wavelength tab allows you to view and edit the port and wavelength parameters defined for an ONS 15454-M2 NE. Click the **Refresh** button to refresh the Alien Wavelength table.

Note Alien Wavelength is applicable to ONS 15454 NEs that support WSON nodes.

Table B-471 Field Descriptions for the Alien Wavelength Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Create button	Allows you to create alien wavelengths for the NE. See 7.12.15 Creating Alien Wavelength for more information.
Edit button	Allows you to modify the existing alien wavelength value. See 7.12.16 Editing Alien Wavelength for more information.
Position	Displays information about the shelf, slot, and port on which the alien wavelength is configured.
Alien Wavelength	Displays the alien wavelength class.
Lambda	Displays the alien wavelength value.
FEC	Displays the FEC mode.

B.12.1.11.10 Fiber Attribute Tab

The Fiber Attribute tab allows you to view the fiber parameters defined for an ONS 15454-M2 NE.

Note Fiber Attribute is applicable to ONS 15454 NEs that support WSON node.

Table B-472 Field Descriptions for the Fiber Attribute Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Toggle button	Click the **Toggle** button to select the unit of measure.
Optical Side	Displays the name of the optical side to which the fiber is connected.
Fiber Type	Choose the fiber type from the drop-down list.
Fiber Number	Displays the number of the fiber associated to the optical side. Useful when different types of fiber are present on the span.
Fiber Length	Allows you to edit the fiber length.

B.12.1.11.11 WSON Tab

The WSON tab allows you to view and acknowledge the unverified alarms at the circuit level.

Table B-473 Field Descriptions for the WSON Tab

Field	Description
Filter button	Click the **Filter** button to filter the data displayed in the table.
Acknowledge WSON Alarm button	Click the **Acknowledge WSON Alarm** button to acknowledge a WSON alarm.
Affected Circuits button	Click the **Affected Circuits** button to view the affected circuits. If there are circuits affected by the selected alarm, the new circuit report is displayed. See 7.2.28.2 Working with Circuit Reports for more information. **Note** The Affected Circuits button is enabled only when an alarm condition is selected.

Table B-473 Field Descriptions for the WSON Tab (continued)

Field	Description
ID	Displays the ID of the NE from the Domain Explorer.
PS	Perceived severity of the selected alarm (critical, major, minor, or warning). The background color also indicates the severity, where: • Red = Critical • Orange = Major • Yellow = Minor • Blue = Warning • Green = Cleared **Note** For the ONS 15530 and ONS 15540, alarms that are shown in the command-line interface (CLI) as informational are shown in Prime Optical as warnings.
Probable Cause	Probable cause of the selected alarm. Some possible values include: • Not Applicable/Unknown—If no additional information is available • Mismatch of equipment and attributes (MEA) alarm—For misconfigured pluggable port modules (PPMs) • Link Layer Keep-Alive Failure—When the keepalive frame on the POS port is disabled and the port is shut down • Bad Packet Count Exceeds Threshold—When the packets through the front port have CRC errored frames • Auto-Negotiation Remote Failure Indication—When a remote Gigabit Ethernet port is shut down from a local port
Condition	Error message or condition name that is associated with the alarm or event.
Affected Object	Name of the object where the selected alarm occurred.
Module Name	Name of the module where the selected alarm occurred.
Physical Location	Physical location of the equipment where the selected alarm occurred, such as chassis, rack, subrack (shelf), slot, and port numbers.
NE Alarm Time	Date and time when the alarm occurred on the NE.
SA	Whether the alarm or event is service affecting (SA). Values are: • Yes—The alarm is service affecting • No—The alarm is not service affecting • N/A—No information is provided by the NE

B.12.1.12 OSI

The OSI Properties pane allows you to provision ONS 15454-M2 Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.12.1.12.1 Main Setup Tab, page B-351
- B.12.1.12.2 TARP-Config Tab, page B-351
- B.12.1.12.3 TARP-TDC Tab, page B-353
- B.12.1.12.4 TARP-MAT Tab, page B-353

- B.12.1.12.5 Routers-Setup Tab, page B-353
- B.12.1.12.6 Subnets Tab, page B-354
- B.12.1.12.7 Tunnels Tab, page B-355
- B.12.1.12.8 IS-IS RIB Tab, page B-355
- B.12.1.12.9 ES-IS RIB Tab, page B-356

B.12.1.12.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-474 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs. For the ONS 15454-M2, Intermediate System Level 1 is the Cisco default.
Intermediate System Level 1/Level 2	The ONS 15454-M2 performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.12.1.12.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-475 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.

Table B-475 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15454-M2 startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.12.1.12.3 TARP-TDC Tab

Table B-476 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.12.1.12.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-477 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.12.1.12.5 Routers-Setup Tab

Table B-478 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15454-M2 provides three virtual routers, numbered 1 through 3.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 2. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.

Table B-478 Field Descriptions for the Routers-Setup Tab (continued)

Field	Description
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.12.1.12.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-479 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64. For the ONS 15454 LAN subnet, the default DIS priority is 63. This priority should not be changed.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.

Table B-479 Field Descriptions for the Subnets Tab (continued)

Field	Description
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.12.1.12.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-480 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.12.1.12.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-481 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454-M2 provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.12.1.12.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-482 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the OSI router number. The ONS 15454-M2 provides three virtual routers, numbered 1 through 3.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.13 ONS 15600 SONET NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15600 SONET, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.13.1 Node Properties Pane—ONS 15600 SONET, page B-356 for more information.

Note If CTC is launched from the web browser for an ONS 15600 SONET node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.13.1 Node Properties Pane—ONS 15600 SONET

The node properties pane displays information about the ONS 15600 SONET NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.13.1.1 Shelf View, page B-357

- B.13.1.2 General, page B-357
- B.13.1.3 Identification, page B-358
- B.13.1.4 Network, page B-358
- B.13.1.5 DCC, page B-364
- B.13.1.6 Timing, page B-366
- B.13.1.7 Protection, page B-369
- B.13.1.8 NE Defaults, page B-370
- B.13.1.9 Security, page B-371
- B.13.1.10 Alarm, page B-375
- B.13.1.11 Maintenance, page B-376
- B.13.1.12 Alarm Extenders, page B-376
- B.13.1.13 BLSR, page B-378
- B.13.1.14 OSI, page B-378

B.13.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15600 SONET that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change a card. For unprovisioned slots, the right-click menu allows you to add a card.

B.13.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15600 SONET NE.

Table B-483 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.13.1.3 Identification

The Identification Properties pane displays identification information about the ONS 15600 SONET NE.

Table B-484 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15600 SONET network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15600 SONET will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.

B.13.1.4 Network

The Network Properties pane displays information about the NE network address. The Properties pane contains the following tabs:

- B.13.1.4.1 Address Tab, page B-359
- B.13.1.4.2 Static Routes Tab, page B-359
- B.13.1.4.3 OSPF Tab, page B-359
- B.13.1.4.4 OSPF Area Range Tab, page B-360
- B.13.1.4.5 OSPF Virtual Links Tab, page B-361
- B.13.1.4.6 SNMP Tab, page B-361
- B.13.1.4.7 Firewall/Proxy Tab, page B-362

- B.13.1.4.8 Routing Table Tab, page B-362
- B.13.1.4.9 Internal Subnet Tab, page B-363
- B.13.1.4.10 Proxy Tunnels Tab, page B-363
- B.13.1.4.11 Firewall Tunnels Tab, page B-364
- B.13.1.4.12 FTP Hosts Tab, page B-364

B.13.1.4.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-485 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15600 SONET address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.13.1.4.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15600 SONET connectivity and create or delete static routes.

Table B-486 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15600 and the computer.

B.13.1.4.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-487 Field Descriptions for the OSPF Tab

Field	Description
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the ONS 15600s as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
SDCC Metric	Sets a cost for sending packets across the SDCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. The Cisco default DCC metric is 100. This value is normally unchanged.
LDCC Metric	Sets a cost for sending packets across the Line Data Communications Channel (LDCC), which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables ONS 15600 OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15600s that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15600 is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15600 is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.13.1.4.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-488 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15600 SONET NEs that reside within the OSPF area. For example, if the ONS 15600 SONET OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15600 SONET NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.13.1.4.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-489 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.13.1.4.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-490 Field Descriptions for the SNMP Tab

Field	Description
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.

Table B-490 Field Descriptions for the SNMP Tab (continued)

Field	Description
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.
Allow SNMP Set	If checked, allows you to use SNMP management software with the ONS 15600 SONET.

B.13.1.4.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-491 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Enable Proxy Server on Port	If checked, the ONS 15600 SONET serves as a proxy for connections between the Prime Optical server and ONS 15600 SONET NEs that are DCC-connected to the proxy node. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the ONS 15600 SONET to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the ONS 15600 SONET to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy. ⚠ **Caution** Disabling the proxy prevents the NE from relaying packets to DCC-only connected NEs, and can lead to a loss of connectivity.

B.13.1.4.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-492 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host. Destination (0.0.0.0) is the default route entry. All undefined destination network or host entries on this routing table are mapped to the default route entry.
Mask	Displays the subnet mask used to reach the destination network or host. Mask (0.0.0.0) is always 0 for the default route.
Gateway	Displays the IP address of the gateway used to reach the destination network or host. All outbound traffic belonging to this network is sent to this gateway. Gateway (172.20.214.1) is the default gateway address. All outbound traffic that cannot be found in this routing table or is not on the node's local subnet will be sent to this gateway.

Table B-492 Field Descriptions for the Routing Table Tab (continued)

Field	Description
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15600 SONET interface used to access the destination. Values are: • cpm0—The ONS 15600 SONET Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.13.1.4.9 Internal Subnet Tab

The Internal Subnet tab allows you to change the class B subnet address for timing and shelf controller (TSC) cards. TSC cards perform all system-timing functions for each ONS 15600 SONET. To avoid IP address conflicts, you should change the class B subnet address if your internal network uses the same address range as the default subnet addresses.

Table B-493 Field Descriptions for the Internal Subnet Tab

Field	Description
TSC1	Enter the class B subnet address for the first TSC.
TSC2	If two TSCs are installed, enter the class B subnet address for the second TSC.

B.13.1.4.10 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-494 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.13.1.4.11 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-495 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.13.1.4.12 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-496 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.13.1.5 DCC

The DCC Properties pane allows you to create, delete, and view SONET and SDH DCCs.

Table B-497 Field Descriptions for the DCC Properties Pane

Field	Description
SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.

Table B-497 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the SDCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the LDCCs that are provisioned as OSI only.
OSI SNPA	If the LDCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-497 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
Service State	Select the state of the LDCC termination: • IS-NR—In Service–Normal • OOS-AU—Out of Service–Autonomous • OOS-MA—Out of Service–Management • OOS-AUMA—Out of Service–Autonomous and Management In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion • UEQ—Unequipped; there is nothing in the slot • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted • SWDL—Software download in progress • MT—Maintenance, as per the Admin State change • AINS—Automatic in service • DSBLD—Traffic is disabled on the entity • LPBK—Port or connection has a loopback on it
Create button	Allows you to create new terminations on SONET or SDH cards.
Edit button	Allows you to modify existing terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected SDCC or LDCC.

B.13.1.6 Timing

The Timing Properties pane contains the following tabs:

- B.13.1.6.1 General Tab, page B-366
- B.13.1.6.2 Reference List Tab, page B-368
- B.13.1.6.3 Status Tab, page B-368
- B.13.1.6.4 Timing Report Tab, page B-369

B.13.1.6.1 General Tab

The General tab displays general timing information.

Note BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.

Table B-498 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set to External if the ONS 15600 SONET derives its timing from a BITS source wired to the backplane pins; set to Line if timing is derived from an OC-N card that is optically connected to the timing node.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15600 SONET reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
Quality of RES	If your timing source supports the reserved S1 byte, you set the timing quality here. (Most timing sources do not use RES.) Qualities are displayed in descending quality order as ranges. For example, ST3 < RES < ST2 means the timing reference is higher than a Stratum 3 and lower than a Stratum 2.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS IN Facilities	
In State	Set the BITS reference to IS (In Service) or OOS (Out of Service). For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
BITS OUT Facilities	
Out State	Set the BITS reference to IS or OOS. For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
AIS Threshold	If SSM is disabled or Super Frame is used, sets the quality level where a node sends an AIS from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
LBO	If you are timing an external device connected to the BITS Out pins, set the distance between it and the ONS 15600 SONET. Options are 0-133 ft (Cisco default), 134-266 ft, 267-399 ft, 400-533 ft, and 534-655 ft.

B.13.1.6.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-499 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. **Note** For Timing Mode set to External and Timing Mode set to Line, select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1. • Timing Mode set to Mixed—Both BITS and optical cards are available, allowing you to set a mixture of external BITS and optical trunk cards as timing references.
BITS-1 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.
BITS-2 Out References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3) for equipment wired to the BITS Out backplane pins. Normally, BITS Out is used with line nodes, so the options displayed are the working optical cards. BITS-1 and BITS-2 Out are enabled as soon as BITS-1 and BITS-2 facilities are placed in service.

B.13.1.6.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-500 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.

Table B-500 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.13.1.6.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.13.1.7 Protection

The Protection Properties pane contains the following tabs:

- B.13.1.7.1 Protection Groups Tab, page B-369
- B.13.1.7.2 Operations Tab, page B-370

B.13.1.7.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-501 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, or 1+1) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed. 1+1 protection is only used for optical cards.
Protect Module	Choose the protect card if using 1:1 or 1:N protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.

Table B-501 Field Descriptions for the Protection Groups Tab (continued)

Field	Description
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select 1+1 (port) type.
Revertive	If checked, the ONS 15600 SONET reverts traffic to the working card or port after failure conditions are corrected and remain correct for the amount of time entered in Reversion Time.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the ONS 15600 SONET switches back to the working card or port.

B.13.1.7.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-502 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.13.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15600 SONET NE. You can edit NE defaults for the ONS 15600 SONET R5.0 and later.

Table B-503 Field Descriptions for the NE Defaults Properties Pane

Field	Description
Parameter	Lists the default NE parameter.
Value	Shows the default parameter value, and allows you to change the default.
Units	Lists the unit of measure that corresponds to the default NE parameter.
Range	Lists the possible range of values for the default NE parameter. **Note** This field applies to the ONS 15600 SONET R6.0 and later.
Side Effects	Lists any side effects that could occur as a result of changing the default NE parameter. **Note** This field applies to the ONS 15600 SONET R6.0 and later.

You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.13.1.9 Security

The Security Properties pane allows you to view and edit security features for the ONS 15600 SONET NE. The Security Properties pane contains the following tabs:

- B.13.1.9.1 Policy Tab, page B-371
- B.13.1.9.2 Password Tab, page B-372
- B.13.1.9.3 Access Tab, page B-372
- B.13.1.9.4 RADIUS Server Tab, page B-374
- B.13.1.9.5 Legal Disclaimer Tab, page B-375

B.13.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-504 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.13.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-505 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.13.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-506 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only (for ONS 15454 SONET NEs only). **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access (available for ONS 15600 SONET NEs R6.0 and later)	
Enable Craft Port A	Check this check box to enable craft port A.
Enable Craft Port B	Check this check box to enable craft port B.

Table B-506 Field Descriptions for the Access Tab (continued)

Field	Description
Shell Access	
Shell Access on	Specify shell access on Telnet or SSH.
SSH Port	Indicates the SSH port number that will be used if the SSH radio button is selected.
Telnet Port	This is enabled if you selected the Telnet radio button. Enter the Telnet port number.
Use Standard Telnet Port	If checked, the standard Telnet port is used for Telnet access.
Shell Access (available for ONS 15600 SONET NEs R6.0 and later)	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access (available for ONS 15600 SONET NEs R6.0 and later)	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the TCC CORBA (IIOP) listener port and the TCC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TCC CORBA (IIOP) listener port is 683. The port number for the TCC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access (available for ONS 15600 SONET NEs R6.0 and later)	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access (available for ONS 15600 SONET NEs R6.0 and later)	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.13.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15600 SONET R6.0 and later.

Table B-507 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.13.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-508 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.13.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15600 SONET nodes. The Alarm Properties pane contains the following tabs:

- B.13.1.10.1 Profile Tab, page B-375
- B.13.1.10.2 Alarm Behavior Tab, page B-376

B.13.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-509 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.13.1.10.2 Alarm Behavior Tab

The Alarm behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-510 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.13.1.11 Maintenance

The ONS 15600 SONET hardware keeps track of which copies of data (backplane STS), SYNC, O&M, and CLK are currently being used by I/O and CXC cards.

B.13.1.11.1 Preferred Copy Tab

The Preferred Copy tab allows you to change the preferred data source and view the clock and SYNC copy.

Table B-511 Field Descriptions for the Preferred Copy Tab

Field	Description
Data Copy	
Preferred Data	Allows you to select the data copy (CXC) when both CXC cards are present in the system.
Selected Data	Displays the data copy currently being used.
Clock and Sync Copy	
Preferred Clock	Displays the preferred clock and SYNC copy.
Selected Clock	Displays the clock and SYNC copy currently being used.

B.13.1.12 Alarm Extenders

The Alarm Extenders Properties pane allows you to view external alarm information and create custom alarm types. The Alarm Extenders Properties pane contains the following tabs:

- B.13.1.12.1 External Alarms Tab, page B-376
- B.13.1.12.2 External Controls Tab, page B-377
- B.13.1.12.3 User-Defined Alarms Tab, page B-377

B.13.1.12.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table B-512 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	Displays a default description for every external alarm that is enabled.
Raised	Indicates whether an alarm has been raised.
Contact Status	Indicates the current status of the contact.

B.13.1.12.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table B-513 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

B.13.1.12.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on the ONS 15600 SONET.

Table B-514 Field Descriptions for the User-Defined Alarms Tab

Field	Descriptions
Alarm Types	Lists the user-defined alarm types that have been created on the ONS 15600 SONET. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.

Table B-514 Field Descriptions for the User-Defined Alarms Tab (continued)

Field	Descriptions
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

B.13.1.13 BLSR

The BLSR Properties pane allows you to view BLSR information and create or delete BLSRs.

Table B-515 Field Descriptions for the BLSR Properties Pane

Field	Description
Fiber Type	Indicates whether the fiber type is 2-fiber or 4-fiber.
Rate	Select the BLSR rate.
Ring Name	Assign a ring ID (a number from 0 to 9999). Nodes in the same BLSR must have the same ring ID.
Node ID	Assign a node ID. The node ID identifies the node to the BLSR. Nodes in the same BLSR must have unique node IDs.
Ring Reversion	Set the amount of time that will pass before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in a BLSR ring should have the same ring reversion setting, particularly if *never* (nonrevertive) is selected.
Span Reversion	Set the amount of time to pass before the span reverts to the working path.
East Line	Assign the east BLSR port.
East Switch	Displays a list of switch commands for the east port.
West Line	Assign the west BLSR port.
West Switch	Displays a list of switch commands for the west port.
East Protect	Assign the east BLSR protect port.
West Protect	Assign the west BLSR protect port.

B.13.1.14 OSI

The OSI Properties pane allows you to provision ONS 15600 SONET Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.13.1.14.1 Main Setup Tab, page B-379
- B.13.1.14.2 TARP-Config Tab, page B-379
- B.13.1.14.3 TARP-TDC Tab, page B-381
- B.13.1.14.4 TARP-MAT Tab, page B-381
- B.13.1.14.5 Routers-Setup Tab, page B-381
- B.13.1.14.6 Subnets Tab, page B-382
- B.13.1.14.7 Tunnels Tab, page B-383
- B.13.1.14.8 IS-IS RIB Tab, page B-383
- B.13.1.14.9 ES-IS RIB Tab, page B-383

B.13.1.14.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-516 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The ONS 15600 SONET performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected. For the ONS 15600 SONET, Intermediate System Level 1/Level 2 is the default routing mode.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.13.1.14.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-517 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.

Table B-517 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15600 SONET startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.13.1.14.3 TARP-TDC Tab

Table B-518 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.13.1.14.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-519 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.13.1.14.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage the OSI virtual routers.

Table B-520 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15600 SONET provides six virtual routers, numbered 1 through 6.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 6. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.

Table B-520 Field Descriptions for the Routers-Setup Tab (continued)

Field	Description
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.13.1.14.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-521 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.13.1.14.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-522 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.13.1.14.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-523 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15600 SONET provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.13.1.14.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-524 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15600 SONET provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.14 ONS 15600 SDH NE Explorer

When you choose **Configuration > NE Explorer** for the ONS 15600 SDH, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The tree provides a hierarchical view and alarm status of the NE's physical shelves and slots. The properties pane shows information about the selected entity. See B.14.1 Node Properties Pane—ONS 15600 SDH, page B-384 for more information.

Note If CTC is launched from the web browser for an ONS 15600 SDH node, the CTC GUI might look different from when it is launched from Prime Optical. This discrepancy occurs because the latest version of CTC (for NE releases supported by Prime Optical) is packaged with Prime Optical. If launched from a browser, the CTC software is retrieved from the NE itself, which might be a version different from that packaged with Prime Optical.

When an NE Explorer is in autorefresh mode, all values of an entity that is being edited by the user are automatically refreshed. You will lose all of your changes unless you click the Apply button. To enable autorefresh, click the Refresh Data button in the NE Explorer.

B.14.1 Node Properties Pane—ONS 15600 SDH

The node properties pane displays information about the ONS 15600 SDH NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.14.1.1 Shelf View, page B-385
- B.14.1.3 Identification, page B-385
- B.14.1.4 Network, page B-386
- B.14.1.5 DCC, page B-392
- B.14.1.6 Timing, page B-394
- B.14.1.7 Protection, page B-397

- B.14.1.8 NE Defaults, page B-398
- B.14.1.9 Security, page B-398
- B.14.1.10 Alarm, page B-402
- B.14.1.11 Maintenance, page B-403
- B.14.1.12 Alarm Extenders, page B-404
- B.14.1.13 MS-SPRing, page B-405
- B.14.1.14 OSI, page B-405

B.14.1.1 Shelf View

The Shelf View Properties pane displays a graphic of the ONS 15600 SDH that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change a card. For unprovisioned slots, the right-click menu allows you to add a card.

B.14.1.2 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the ONS 15600 SDH NE.

Table B-525 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.14.1.3 Identification

The Identification Properties pane displays identification information about the ONS 15600 SDH NE.

Table B-526 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.

Table B-526 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.
Contact	Displays the name of the node contact person and the phone number.
System Description	Displays a description of the NE.
SNTP Settings	
Use NTP/SNTP Server	If checked, CTC uses an SNTP server to set the date and time of the node. Using an SNTP server ensures that all ONS 15600 SDH network nodes use the same date and time reference. The server synchronizes the node's time after power outages or software upgrades. If you check the **Use NTP/SNTP Server** check box, enter the server's IP address in the next field. If you do not use an SNTP server, complete the Time and Time Zone fields. The ONS 15600 SDH will use these fields for alarm dates and times.
SNTP Server	Displays the SNTP server IP address.
Location	
Latitude	Allows you to set the latitude of the NE. Select **North** or **South** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Longitude	Allows you to set the longitude of the NE. Select **East** or **West** from the drop-down list; then, enter the degrees and minutes (or click the up and down arrows to increase or decrease each by 1 unit).
Date and Time	
Time	Displays the NE date and time.
Time Zone	Displays the time zone where the NE is located.
Use Daylight Savings Time	If checked, Daylight Savings Time is observed.

B.14.1.4 Network

The Network Properties pane displays information about the NE network address. The Properties pane contains the following tabs:

- B.14.1.4.1 Address Tab, page B-387
- B.14.1.4.2 Static Routes Tab, page B-387
- B.14.1.4.3 OSPF Tab, page B-387
- B.14.1.4.4 OSPF Area Range Tab, page B-388
- B.14.1.4.5 OSPF Virtual Links Tab, page B-389
- B.14.1.4.6 SNMP Tab, page B-389
- B.14.1.4.7 Firewall/Proxy Tab, page B-390
- B.14.1.4.8 Routing Table Tab, page B-390
- B.14.1.4.9 Internal Subnet Tab, page B-391
- B.14.1.4.10 Proxy Tunnels Tab, page B-391
- B.14.1.4.11 Firewall Tunnels Tab, page B-392
- B.14.1.4.12 FTP Hosts Tab, page B-392

B.14.1.4.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-527 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.
MAC Address	Displays the ONS 15600 SDH address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.14.1.4.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and ONS 15600 SDH connectivity and create or delete static routes.

Table B-528 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the ONS 15600 SDH and the computer.

B.14.1.4.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-529 Field Descriptions for the OSPF Tab

Field	Description
DCC/GCC OSPF Area ID Table	
Slot	Displays the slot number.
Port	Displays the port number.

Table B-529 Field Descriptions for the OSPF Tab (continued)

Field	Description
DCC OSPF Area ID	Displays the number that identifies the ONS 15600 SDH as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
RS-DCC Metric	Sets a cost for sending packets across the RS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
MS-DCC Metric	Sets a cost for sending packets across the MS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
OSPF on LAN	
OSPF Active on LAN	If checked, enables the ONS 15600 SDH OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on ONS 15600 SDHs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the ONS 15600 SDH is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the ONS 15600 SDH is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.14.1.4.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-530 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the ONS 15600 SDHs that reside within the OSPF area. For example, if the ONS 15600 SDH OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the ONS 15600 SDH NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.14.1.4.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-531 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.14.1.4.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-532 Field Descriptions for the SNMP Tab

Field	Description
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.

Table B-532 Field Descriptions for the SNMP Tab (continued)

Field	Description
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.

B.14.1.4.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-533 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the ONS 15600 SDH serves as a proxy for connections between the Prime Optical server and ONS 15600s that are DCC-connected to the proxy ONS 15600 SDH. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the ONS 15600 SDH to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the ONS 15600 SDH to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.14.1.4.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-534 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host. Destination (0.0.0.0) is the default route entry. All undefined destination network or host entries on this routing table are mapped to the default route entry.
Mask	Displays the subnet mask used to reach the destination network or host. Mask (0.0.0.0) is always 0 for the default route.
Gateway	Displays the IP address of the gateway used to reach the destination network or host. All outbound traffic belonging to this network is sent to this gateway. Gateway (172.20.214.1) is the default gateway address. All outbound traffic that cannot be found in this routing table or is not on the nodes local subnet will be sent to this gateway.

Table B-534 Field Descriptions for the Routing Table Tab (continued)

Field	Description
Usage	Shows the number of times the listed route has been used.
Interface	Shows the ONS 15600 SDH interface used to access the destination. Values are: • cpm0—The ONS 15600 SDH Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.14.1.4.9 Internal Subnet Tab

The Internal Subnet tab allows you to change the class B subnet address for TSC cards. TSC cards perform all system-timing functions for each ONS 15600 SDH. To avoid IP address conflicts, you should change the class B subnet address if your internal network uses the same address range as the default subnet addresses.

Table B-535 Field Descriptions for the Internal Subnet Tab

Field	Description
TSC1	Enter the class B subnet address for the first TSC.
TSC2	If two TSCs are installed, enter the class B subnet address for the second TSC.

B.14.1.4.10 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-536 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.14.1.4.11 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-537 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.14.1.4.12 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-538 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.14.1.5 DCC

The DCC Properties pane allows you to create, delete, and view SONET and SDH DCCs.

Table B-539 Field Descriptions for the DCC Properties Pane

Field	Description
RS-DCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.

Table B-539 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the SDCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
MS-DCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the LDCCs that are provisioned as OSI only.
OSI SNPA	If the LDCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.

Table B-539 Field Descriptions for the DCC Properties Pane (continued)

Field	Description
Service State	Select the state of the MS-DCC termination: • IS-NR—In Service–Normal • OOS-AU—Out of Service–Autonomous • OOS-MA—Out of Service–Management • OOS-AUMA—Out of Service–Autonomous and Management In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion • UEQ—Unequipped; there is nothing in the slot • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted • SWDL—Software download in progress • MT—Maintenance, as per the Admin State change • AINS—Automatic in service • DSBLD—Traffic is disabled on the entity • LPBK—Port or connection has a loopback on it
Create button	Allows you to create new terminations on SONET or SDH cards.
Edit button	Allows you to modify existing terminations on SONET or SDH cards.
Delete button	Allows you to delete the selected RS-DCC or MS-DCC.

B.14.1.6 Timing

The Timing Properties pane contains the following tabs:

- B.14.1.6.1 General Tab, page B-394
- B.14.1.6.2 Reference List Tab, page B-396
- B.14.1.6.3 Status Tab, page B-396
- B.14.1.6.4 Timing Report Tab, page B-397

B.14.1.6.1 General Tab

The General tab displays general timing information.

Table B-540 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set the node timing mode: • External—The ONS 15600 SDH derives its timing from a BITS source wired to the backplane pins. • Line—Timing is derived from an STM-N card that is optically connected to the timing node. • Mixed—Timing is set to external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the ONS 15600 SDH reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS In/Out Facilities	
E1, T1, 2.048 MHz, 64 KHz	Select the speed of the BITS facility.
In/Out State	Set the BITS reference to IS or OOS. For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS. **Note** BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
AIS Threshold	If SSM is disabled or Super Frame is used, set the quality level where a node sends an alarm indication signal (AIS) from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
Cable Type	Type of cable. Values are 75 ohm or 120 ohm.
Sa Bit	The Sa Bit is used to transmit the SSM message. Available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.

B.14.1.6.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-541 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. Select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1.

B.14.1.6.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-542 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.

Table B-542 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.14.1.6.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.14.1.7 Protection

The Protection Properties pane contains the following tabs:

- B.14.1.7.1 Protection Groups Tab, page B-397
- B.14.1.7.2 Operations Tab, page B-398

B.14.1.7.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-543 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, or 1+1) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed. 1+1 protection is only used for optical cards.
Protect Module	Choose the protect card if using 1:1 or 1:N protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select 1+1 (port) type.
Revertive	If checked, the ONS 15600 SDH reverts traffic to the working card or port after failure conditions are corrected and remain correct for the amount of time entered in Reversion Time.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the ONS 15600 SDH switches back to the working card or port.

B.14.1.7.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-544 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.14.1.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the ONS 15600 SDH NE. You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.14.1.9 Security

The Security Properties pane allows you to view and edit the security advisory message for the ONS 15600 SDH NE. The Security Properties pane contains the following tabs:

- B.14.1.9.1 Policy Tab, page B-398
- B.14.1.9.2 Password Tab, page B-399
- B.14.1.9.3 Access Tab, page B-400
- B.14.1.9.4 RADIUS Server Tab, page B-401
- B.14.1.9.5 Legal Disclaimer Tab, page B-402

B.14.1.9.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-545 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	

Table B-545 Field Descriptions for the Policy Tab (continued)

Field	Description
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.14.1.9.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-546 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.

Table B-546 Field Descriptions for the Password Tab (continued)

Field	Description
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.14.1.9.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-547 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port A	Check this check box to enable craft port A.
Enable Craft Port B	Check this check box to enable craft port B.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.

Table B-547 Field Descriptions for the Access Tab (continued)

Field	Description
CORBA Listener Port	Select the port numbers for the TSC CORBA (IIOP) listener port and the TSC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TSC CORBA (IIOP) listener port is 683. The port number for the TSC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.14.1.9.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the ONS 15600 SDH R8.0 and later.

Table B-548 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.

Table B-548 Field Descriptions for the RADIUS Server Tab (continued)

Field	Description
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.14.1.9.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-549 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.14.1.10 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual ONS 15600 SDH nodes. The Alarm Properties pane contains the following tabs:

- B.14.1.10.1 Profile Tab, page B-402
- B.14.1.10.2 Alarm Behavior Tab, page B-403

B.14.1.10.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-550 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.14.1.10.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-551 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.14.1.11 Maintenance

The ONS 15600 SDH hardware keeps track of which copies of data (backplane STS), SYNC, O&M, and CLK are currently being used by I/O and CXC cards.

B.14.1.11.1 Preferred Copy Tab

The Preferred Copy tab allows you to change the preferred data source and view the clock and SYNC copy.

Table B-552 Field Descriptions for the Preferred Copy Tab

Field	Description
Data Copy	
Preferred Data	Allows you to select the data copy (CXC) when both the CXC cards are present in the system.
Selected Data	Displays the data copy currently being used.
Clock and Sync Copy	
Preferred Clock	Displays the preferred clock and SYNC copy.
Selected Clock	Displays the clock and SYNC copy currently being used.

B.14.1.12 Alarm Extenders

The Alarm Extenders Properties pane allows you to view external alarm information and create custom alarm types. The Alarm Extenders Properties pane contains the following tabs:

- B.14.1.12.1 External Alarms Tab, page B-404
- B.14.1.12.2 External Controls Tab, page B-404
- B.14.1.12.3 User-Defined Alarms Tab, page B-405

B.14.1.12.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table B-553 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	Displays a default description for every external alarm that is enabled.
Raised	Indicates whether an alarm has been raised.
Contact Status	Indicates the current status of the contact.

B.14.1.12.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table B-554 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

B.14.1.12.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on the ONS 15600 SDH.

Table B-555 Field Descriptions for the User-Defined Alarms Tab

Field	Descriptions
Alarm Types	Lists the user-defined alarm types that have been created on the ONS 15600 SDH. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

B.14.1.13 MS-SPRing

The MS-SPRing Properties pane allows you to view MS-SPRing information and create new MS-SPRings. MS-SPRings share the ring bandwidth equally between working and protection traffic. Half of the payload bandwidth is reserved for protection in each direction, making the communication pipe half-full under normal operation. Click **Create** to create a new MS-SPRing; click **Delete** to delete an existing MS-SPRing; click **Ring Map** to open the Ring Map; click **Squelch Table** to open the Squelch table.

Table B-556 Field Descriptions for the MS-SPRing Properties Pane

Field	Description
Fiber Type	Indicates whether the fiber type is 2-fiber or 4-fiber.
Rate	Select the MS-SPRing rate.
Ring Name	Assign a ring name. Nodes in the same MS-SPRing must have the same ring name.
Node ID	Assign a node ID. The node ID identifies the node to the MS-SPRing. Nodes in the same MS-SPRing must have unique node IDs.
Ring Reversion	Set the amount of time that will pass before the traffic reverts to the original working path. The Cisco default is 5 minutes. All nodes in an MS-SPRing should have the same ring reversion setting, particularly if *never* (nonrevertive) is selected.
Span Reversion	Set the amount of time to pass before the span reverts to the working path.
East Line	Assign the east MS-SPRing port.
East Switch	Displays a list of switch commands for the east port.
West Line	Assign the west MS-SPRing port.
West Switch	Displays a list of switch commands for the west port.
East Protect	For the 4-fiber MS-SPRing, assign the east MS-SPRing protect port.
West Protect	For the 4-fiber MS-SPRing, assign the west MS-SPRing protect port.

B.14.1.14 OSI

The OSI Properties pane allows you to provision ONS 15600 SDH Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.14.1.14.1 Main Setup Tab, page B-406
- B.14.1.14.2 TARP-Config Tab, page B-406
- B.14.1.14.3 TARP-TDC Tab, page B-408
- B.14.1.14.4 TARP-MAT Tab, page B-408
- B.14.1.14.5 Routers-Setup Tab, page B-409
- B.14.1.14.6 Subnets Tab, page B-409
- B.14.1.14.7 Tunnels Tab, page B-410
- B.14.1.14.8 IS-IS RIB Tab, page B-411
- B.14.1.14.9 ES-IS RIB Tab, page B-411

B.14.1.14.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-557 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The ONS 15600 SDH performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected. For the ONS 15600 SDH, Intermediate System Level 1/Level 2 is the default routing mode.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.14.1.14.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-558 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial ONS 15600 SDH startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.

Table B-558 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.14.1.14.3 TARP-TDC Tab

Table B-559 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.14.1.14.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-560 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.

Table B-560 Field Descriptions for the TARP-MAT Tab (continued)

Field	Description
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.14.1.14.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage the OSI virtual routers.

Table B-561 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15600 SDH provides six virtual routers, numbered 1 through 6.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 6. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.14.1.14.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-562 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets

Table B-562 Field Descriptions for the Subnets Tab (continued)

Field	Description
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.14.1.14.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-563 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.14.1.14.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-564 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15600 SDH provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.14.1.14.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-565 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The ONS 15600 SDH provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.15 CPT 200 NE Explorer

The node properties pane displays information about the CPT 200 NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.15.0.1 Shelf View, page B-412
- B.15.0.2 Alarm, page B-412
- B.15.0.3 DCC/GCC/OSC, page B-413
- B.15.0.4 DWDM, page B-415
- B.15.0.5 General, page B-419
- B.15.0.6 NE Defaults, page B-420
- B.15.0.7 Network, page B-420
- B.15.0.8 OSI, page B-426
- B.15.0.9 Protection, page B-432
- B.15.0.10 Security, page B-433
- B.15.0.11 Timing, page B-437

B.15.0.1 Shelf View

The Shelf View Properties pane displays a graphic of the CPT 200 NE that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change a card. For unprovisioned slots, the right-click menu allows you to add a card.

B.15.0.2 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual CPT 200 NE nodes. The Alarm Properties pane contains the following tabs:

- B.15.0.2.1 Profile Tab, page B-412
- B.15.0.2.2 Alarm Behavior Tab, page B-413

B.15.0.2.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-566 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.15.0.2.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-567 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.15.0.3 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view SDCCs, LDCCs, Generic Communications Channels (GCCs), Optical Service Channels (OSCs), and DWDM ring IDs.

Table B-568 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
Create	Click the **Create** button to create new terminations on SONET or SDH cards.
Edit	Click the **Edit** button to modify existing terminations on SONET or SDH cards.
Delete	Click the **Delete** button to delete the selected SDCC, LDCC, GCC, OSC, or DWDM ring ID.
RS-DCC/SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.

Table B-568 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
MS-DCC/LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
GCC	

Table B-568 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and SNPA address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the GCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Displays the state of the OSC termination.
DWDM Ring ID	
Ring ID	Displays the ring ID.
West Direction	Lists the OSCM or OSC-CSM port that supports the ring in the west direction. The value is N/A if there are no ports in the west direction.
East Direction	Lists the OSCM or OSC-CSM port that supports the ring in the east direction. The value is N/A if there are no ports in the east direction.

B.15.0.4 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The DWDM Properties pane contains the following tabs:

- B.15.0.4.1 Provisioning Tab, page B-416
- B.15.0.4.2 Connections Tab, page B-416
- B.15.0.4.3 Span Check Tab, page B-417
- B.15.0.4.4 APC Tab, page B-417
- B.15.0.4.5 Node Setup Tab, page B-418
- B.15.0.4.6 Side Tab, page B-418
- B.15.0.4.7 All Facilities Tab, page B-418
- B.15.0.4.8 Passive Cards Tab, page B-419

B.15.0.4.1 Provisioning Tab

The Provisioning tab allows you to view and change the optical parameters for the CPT 200 NE. The optical parameters might have already been provisioned manually or by automatic node setup (ANS).

Table B-569 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.
Origin	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.15.0.4.2 Connections Tab

The Connections tab allows you retrieve internal patchcords and calculate DWDM connections.

Table B-570 Field Descriptions for the Connections Tab

Field	Description
Slot-From	The slot from which the DWDM connection originates.
Unit-From	The unit from which the DWDM connection originates.

Table B-570 Field Descriptions for the Connections Tab (continued)

Field	Description
Port-From	The port from which the DWDM connection originates.
Slot-To	The slot at which the DWDM connection terminates.
Unit-To	The unit at which the DWDM connection terminates.
Port-To	The port at which the DWDM connection terminates.
State	The state of the DWDM connection.
From	The unit or port from which the internal patchcord originates.
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.15.0.4.3 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-571 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the Measure Span Loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.

B.15.0.4.4 APC Tab

The APC tab allows you to view the automatic power control (APC) parameters.

Table B-572 Field Descriptions for the APC Tab

Field	Description
Port	Port number.
Last Modification	Date and time the power control setpoint was last modified.
Param	All the APC parameters associated with the port.
Last Check	Date and time the power control setpoint was last verified.

Table B-572 Field Descriptions for the APC Tab (continued)

Field	Description
Side	Lists all the NEs and their sides that belong to the APC domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.15.0.4.5 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs from a selected XML configuration file.

Table B-573 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch ANS Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.15.0.4.6 Side Tab

The Side tab allows you to view, edit, and delete sides defined for a CPT 200 NE.

Table B-574 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.15.0.4.7 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the CPT 200 NE.

Table B-575 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Retain Selected	Displays only the ports that you selected.
Show All	Retrieves and displays all the optical and DWDM ports for the NE.

B.15.0.4.8 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-576 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.15.0.5 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the CPT 200 NE.

Table B-577 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.

Table B-577 Field Descriptions for the General Properties Pane (continued)

Field	Description
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.15.0.6 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the CPT 200 NE. You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.15.0.7 Network

The Network Properties pane displays information about the NE network address. The Properties pane contains the following tabs:

- B.15.0.7.1 Address Tab, page B-420
- B.15.0.7.2 Static Routes Tab, page B-421
- B.15.0.7.3 OSPF Tab, page B-421
- B.15.0.7.4 OSPF Area Range Tab, page B-422
- B.15.0.7.5 OSPF Virtual Links Tab, page B-423
- B.15.0.7.6 SNMP Tab, page B-423
- B.15.0.7.7 Firewall/Proxy Tab, page B-424
- B.15.0.7.8 Routing Table Tab, page B-424
- B.15.0.7.9 Internal Subnet Tab, page B-425
- B.15.0.7.10 Proxy Tunnels Tab, page B-425
- B.15.0.7.11 Firewall Tunnels Tab, page B-425
- B.15.0.7.12 FTP Hosts Tab, page B-426

B.15.0.7.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-578 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.

Table B-578 Field Descriptions for the Address Tab (continued)

Field	Description
MAC Address	Displays the CPT 200 NE address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.15.0.7.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and CPT 200 NE connectivity and create or delete static routes.

Table B-579 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the CPT 200 NE and the computer.

B.15.0.7.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-580 Field Descriptions for the OSPF Tab

Field	Description
DCC/GCC OSPF Area ID Table	
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the CPT 200 NE as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
RS-DCC Metric	Sets a cost for sending packets across the RS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
MS-DCC Metric	Sets a cost for sending packets across the MS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.

Table B-580 Field Descriptions for the OSPF Tab (continued)

Field	Description
OSPF on LAN	
OSPF Active on LAN	If checked, enables the CPT 200 NE OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on CPT 200 NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the CPT 200 NE is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the CPT 200 NE is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.15.0.7.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-581 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the CPT 600 NEs that reside within the OSPF area. For example, if the CPT 600 NE OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the CPT 200 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.15.0.7.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-582 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.15.0.7.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-583 Field Descriptions for the SNMP Tab

Field	Description
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.

B.15.0.7.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-584 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the CPT 200 NE serves as a proxy for connections between the Prime Optical server and CPT 200s that are DCC-connected to the proxy CPT 200 NE. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the CPT 200 NE to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the CPT 200 NE to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.15.0.7.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-585 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host. Destination (0.0.0.0) is the default route entry. All undefined destination network or host entries on this routing table are mapped to the default route entry.
Mask	Displays the subnet mask used to reach the destination network or host. Mask (0.0.0.0) is always 0 for the default route.
Gateway	Displays the IP address of the gateway used to reach the destination network or host. All outbound traffic belonging to this network is sent to this gateway. Gateway (172.20.214.1) is the default gateway address. All outbound traffic that cannot be found in this routing table or is not on the nodes local subnet will be sent to this gateway.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the CPT 200 NE interface used to access the destination. Values are: • cpm0—The CPT 200 NE Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.15.0.7.9 Internal Subnet Tab

The Internal Subnet tab allows you to change the class B subnet address for TSC cards. TSC cards perform all system-timing functions for each CPT 200 NE. To avoid IP address conflicts, you should change the class B subnet address if your internal network uses the same address range as the default subnet addresses.

Table B-586 Field Descriptions for the Internal Subnet Tab

Field	Description
TSC1	Enter the class B subnet address for the first TSC.
TSC2	If two TSCs are installed, enter the class B subnet address for the second TSC.

B.15.0.7.10 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-587 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.15.0.7.11 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-588 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.15.0.7.12 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-589 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.15.0.8 OSI

The OSI Properties pane allows you to provision CPT 200 NE Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.15.0.8.1 Main Setup Tab, page B-426
- B.15.0.8.2 TARP-Config Tab, page B-427
- B.15.0.8.3 TARP-TDC Tab, page B-428
- B.15.0.8.4 TARP-MAT Tab, page B-429
- B.15.0.8.5 Routers-Setup Tab, page B-429
- B.15.0.8.6 Subnets Tab, page B-430
- B.15.0.8.7 Tunnels Tab, page B-430
- B.15.0.8.8 IS-IS RIB Tab, page B-431
- B.15.0.8.9 ES-IS RIB Tab, page B-431

B.15.0.8.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-590 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The CPT 200 NE performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected. For the CPT 200 NE, Intermediate System Level 1/Level 2 is the default routing mode.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.15.0.8.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-591 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.

Table B-591 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial CPT 200 NE startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.15.0.8.3 TARP-TDC Tab

Table B-592 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.

Table B-592 Field Descriptions for the TARP-TDC Tab (continued)

Field	Description
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.15.0.8.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-593 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.15.0.8.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage the OSI virtual routers.

Table B-594 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The CPT 200 NE provides six virtual routers, numbered 1 through 6.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 6. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.15.0.8.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-595 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.15.0.8.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-596 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.

Table B-596 Field Descriptions for the Tunnels Tab (continued)

Field	Description
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.15.0.8.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-597 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The CPT 200 NE provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.15.0.8.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-598 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The CPT 200 NE provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.

Table B-598 Field Descriptions for the ES-IS RIB Tab (continued)

Field	Description
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.15.0.9 Protection

The Protection Properties pane contains the following tabs:

- B.15.0.9.1 Protection Groups Tab, page B-432
- B.15.0.9.2 Operations Tab, page B-433

B.15.0.9.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-599 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, or 1+1) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed. 1+1 protection is only used for optical cards.
Protect Module	Choose the protect card if using 1:1 or 1:N protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select 1+1 (port) type.
Revertive	If checked, the CPT 200 NE reverts traffic to the working card or port after failure conditions are corrected and remain correct for the amount of time entered in Reversion Time.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the CPT 200 NE switches back to the working card or port.

B.15.0.9.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-600 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.15.0.10 Security

The Security Properties pane allows you to view and edit the security advisory message for the CPT 200 NE. The Security Properties pane contains the following tabs:

- B.15.0.10.1 Policy Tab, page B-433
- B.15.0.10.2 Password Tab, page B-434
- B.15.0.10.3 Access Tab, page B-435
- B.15.0.10.4 RADIUS Server Tab, page B-436
- B.15.0.10.5 Legal Disclaimer Tab, page B-437

B.15.0.10.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-601 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	

Table B-601 Field Descriptions for the Policy Tab (continued)

Field	Description
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.15.0.10.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-602 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.15.0.10.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-603 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port A	Check this check box to enable craft port A.
Enable Craft Port B	Check this check box to enable craft port B.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the TSC CORBA (IIOP) listener port and the TSC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TSC CORBA (IIOP) listener port is 683. The port number for the TSC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.

Table B-603 Field Descriptions for the Access Tab (continued)

Field	Description
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.15.0.10.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the CPT 200 NE and later.

Table B-604 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.15.0.10.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-605 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.15.0.11 Timing

The Timing Properties pane contains the following tabs:

- B.15.0.11.1 General Tab, page B-437
- B.15.0.11.2 Reference List Tab, page B-439
- B.15.0.11.3 Status Tab, page B-439
- B.15.0.11.4 Timing Report Tab, page B-440

B.15.0.11.1 General Tab

The General tab displays general timing information.

Table B-606 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set the node timing mode: • External—The CPT 200 NE derives its timing from a BITS source wired to the backplane pins. • Line—Timing is derived from an STM-N card that is optically connected to the timing node. • Mixed—Timing is set to external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the CPT 200 NE reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS In/Out Facilities	
E1, T1, 2.048 MHz, 64 KHz	Select the speed of the BITS facility.
In/Out State	Set the BITS reference to IS or OOS. For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS. **Note** BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
AIS Threshold	If SSM is disabled or Super Frame is used, set the quality level where a node sends an alarm indication signal (AIS) from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
Cable Type	Type of cable. Values are 75 ohm or 120 ohm.
Sa Bit	The Sa Bit is used to transmit the SSM message. Available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.

B.15.0.11.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-607 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. Select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1.

B.15.0.11.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-608 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.

Table B-608 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.15.0.11.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.16 CPT 600 NE Explorer

The node properties pane displays information about the CPT 600 NE. The properties pane contains the following tabs, some of which apply only to a specific NE version:

- B.16.0.1 Shelf View, page B-441
- B.16.0.2 Alarm, page B-441
- B.16.0.3 Alarm Extenders, page B-442
- B.16.0.4 DCC/GCC/OSC, page B-443
- B.16.0.5 DWDM, page B-446
- B.16.0.6 ECU Ports Alarms Suppression, page B-450
- B.16.0.7 General, page B-450
- B.16.0.8 NE Defaults, page B-451
- B.16.0.9 Network, page B-451
- B.16.0.10 OSI, page B-457
- B.16.0.11 Protection, page B-463
- B.16.0.12 Security, page B-464
- B.16.0.13 Timing, page B-468

B.16.0.1 Shelf View

The Shelf View Properties pane displays a graphic of the CPT 600 NE that is selected in the NE Explorer tree. Moving the mouse pointer over the NE, its shelves, slots, or cards displays the current alarms for the highlighted item. Double-clicking a slot or card displays the slot or card in the properties pane. The right-click menu allows you to reset, delete, or change a card. For unprovisioned slots, the right-click menu allows you to add a card.

B.16.0.2 Alarm

The Alarm Properties pane allows you to change default alarm severities by creating unique alarm profiles for individual CPT 600 NE nodes. The Alarm Properties pane contains the following tabs:

- B.14.1.10.1 Profile Tab, page B-402
- B.14.1.10.2 Alarm Behavior Tab, page B-403

B.16.0.2.1 Profile Tab

The Profile tab allows you to select, create, or delete alarm profiles.

Table B-609 Field Descriptions for the Profile Tab

Field	Description
Alarm Profile Name	Choose an alarm profile for the NE from the drop-down list. Click **Create** to create a new alarm profile for the NE. Click **Delete** to delete an alarm profile from the NE.
Condition	Displays the alarm condition.
Severity	Displays the alarm severity.

B.16.0.2.2 Alarm Behavior Tab

The Alarm Behavior tab allows you to change default alarm severities by creating unique alarm profiles.

Table B-610 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Choose a global alarm profile for the NE from the drop-down list.
Suppress Alarms	If checked, all alarms are suppressed.
Slot Number	Displays the location of the module.
Equipment Type	Displays the type of module in the slot.
Profile	Choose an alarm profile for the slot from the drop-down list.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms are suppressed for the port.

B.16.0.3 Alarm Extenders

The Alarm Extenders Properties pane allows you to view external alarm information and create custom alarm types. The Alarm Extenders Properties pane contains the following tabs:

- B.16.0.3.1 External Alarms Tab, page B-442
- B.16.0.3.2 External Controls Tab, page B-442
- B.16.0.3.3 User-Defined Alarms Tab, page B-443

B.16.0.3.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table B-611 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	Displays a default description for every external alarm that is enabled.
Raised	Indicates whether an alarm has been raised.
Contact Status	Indicates the current status of the contact.

B.16.0.3.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table B-612 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

B.16.0.3.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on the CPT 600 NE.

Table B-613 Field Descriptions for the User-Defined Alarms Tab

Field	Descriptions
Alarm Types	Lists the user-defined alarm types that have been created on the CPT 600 NE. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

B.16.0.4 DCC/GCC/OSC

The DCC/GCC/OSC Properties pane allows you to create, delete, and view SDCCs, LDCCs, Generic Communications Channels (GCCs), Optical Service Channels (OSCs), and DWDM ring IDs.

Table B-614 Field Descriptions for the DCC/GCC/OSC Properties Pane

Field	Description
Create	Click the **Create** button to create new terminations on SONET or SDH cards.
Edit	Click the **Edit** button to modify existing terminations on SONET or SDH cards.
Delete	Click the **Delete** button to delete the selected SDCC, LDCC, GCC, OSC, or DWDM ring ID.
RS-DCC/SDCC	
SDCC Terminations	Displays the slot, port, and card type of an SDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.

Table B-614 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
LAPD Config	If the SDCC is provisioned as OSI only, the following SDCC LAP-D parameters are displayed: • AITS/UITS—Indicates the LAP-D acknowledgement type, either Acknowledged Information Transfer Service (AITS) or Unacknowledged Transfer Service (UITS). • Network/User—Indicates the LAP-D frame command/response role, either Network or User. • MTU—Shows the size of the maximum transfer unit (MTU). The range is from 512 to 1500 octets. • T2000—Shows the time between Set Asynchronous Balanced Mode (SABME) frame transmission. The range is from 0.2 to 20 seconds. • T203—Shows the maximum time between LAP-D frame exchanges. The range is from 4 to 120 seconds.
OSI SNPA	If the SDCC is provisioned for OSI, the following subnetwork point-of-attachment (SNPA) information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the termination: • IS-NR—In Service–Normal. • OOS-AU—Out of Service–Autonomous. • OOS-MA—Out of Service–Management. • OOS-AUMA—Out of Service–Autonomous and Management. In addition, a secondary state provides additional information about the status of the entity. Values for secondary state are: • MEA—Mismatch of equipment due to invalid equipment insertion. • UEQ—Unequipped; there is nothing in the slot. • UAS—Unassigned; the entity does not exist, has not been created, or has been deleted. • SWDL—Software download in progress. • MT—Maintenance, as per the Admin State change. • AINS—Automatic in service. • DSBLD—Traffic is disabled on the entity. • LPBK—Port or connection has a loopback on it. • FLT—Fault secondary state. When an entity is faulted, an FLT state is raised. Equipment and ports in FLT state should be cleared as they transition. Transition states are listed in Table 11-11 on page 11-15. See Table 11-11 on page 11-15 for the Service state-Secondary state possible values. **Note** If the NE release does not support the Service state, this field shows N/A.
MS-DCC/LDCC	
LDCC Terminations	Displays the slot, port, and card type of an LDCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
Foreign	A check mark indicates that the far-end node is a non-ONS node.

Table B-614 Field Descriptions for the DCC/GCC/OSC Properties Pane (continued)

Field	Description
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the LDCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
GCC	
GCC Terminations	Displays the slot, port, and card type of a GCC termination.
OSPF Disabled on Link	Check to prevent the advertisement of the OSPF routing table.
GCC Rate	Displays the GCC rate.
Foreign	A check mark indicates that the far-end node is a non-ONS node.
Foreign IP	Displays the foreign node IP address.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only. For GCCs, this column is always N/A.
OSI SNPA	If the GCC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and SNPA address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Select the state of the GCC termination (IS-NR, OOS-AU, OOS-MA, OOS-AUMA) plus the secondary state (MEA, UEQ, UAS, SWDL, MT, AINS, DSBLD, LPBK).
OSC	
OSC Terminations	Displays the slot, port, and card type of an OSC termination.
LAPD Config	Displays the LAP-D parameters for the SDCCs that are provisioned as OSI only.
OSI SNPA	If the OSC is provisioned for OSI, the following SNPA information is displayed: • Router—Indicates the ONS router and NSAP address. • Router State—Indicates whether the router is enabled or disabled.
Service State	Displays the state of the OSC termination.
DWDM Ring ID	
Ring ID	Displays the ring ID.
West Direction	Lists the OSCM or OSC-CSM port that supports the ring in the west direction. The value is N/A if there are no ports in the west direction.
East Direction	Lists the OSCM or OSC-CSM port that supports the ring in the east direction. The value is N/A if there are no ports in the east direction.

B.16.0.5 DWDM

The DWDM Properties pane allows you to manage and provision DWDM connections. The DWDM Properties pane contains the following tabs:

- B.16.0.5.1 Provisioning Tab, page B-446
- B.16.0.5.2 Connections Tab, page B-447
- B.16.0.5.3 Span Check Tab, page B-448
- B.16.0.5.4 APC Tab, page B-448
- B.16.0.5.5 Node Setup Tab, page B-449
- B.16.0.5.6 Side Tab, page B-449
- B.16.0.5.7 All Facilities Tab, page B-449
- B.16.0.5.8 Passive Cards Tab, page B-450

B.16.0.5.1 Provisioning Tab

The Provisioning tab allows you to view and change the optical parameters for the CPT 600 NE. The optical parameters might have already been provisioned manually or by automatic node setup (ANS).

Table B-615 Field Descriptions for the Provisioning Tab

Field	Description
Attribute Name	Displays the Properties pane name that is imported from or exported to the Cisco MetroPlanner configuration file.
Value	Displays the default value of the corresponding Properties pane name imported from or exported to the Cisco MetroPlanner configuration file.

Table B-615 Field Descriptions for the Provisioning Tab (continued)

Field	Description
Origin	Shows how the parameter is set. Possible values are: • Default • Automatic • Provisioned • Imported
Note	Displays error details if ANS fails to set the parameter. Possible errors are: • Error during NE board navigation; value is not calculated • Cannot send the parameter request to far-end node; value is not calculated • No response from far-end node; value is not calculated • Configuration is not supported; value is not calculated • Far-end node configuration is not supported; value is not calculated • OSC far-end launch power is not available; value is not calculated • Far-end launch power is not available; value is not calculated • Span loss value is not available; value is not calculated • Fiber stage insertion loss is not available; value is not calculated • Preamplifier tilt is not available; value is not calculated • Add/drop output power is not available; value is not calculated • NE node launch power is not available; value is not calculated • WXC degree is not available; value is not calculated • Value is out of range • Read-only attribute; value is not calculated

B.16.0.5.2 Connections Tab

The Connections tab allows you retrieve internal patchcords and calculate DWDM connections.

Table B-616 Field Descriptions for the Connections Tab

Field	Description
Slot-From	The slot from which the DWDM connection originates.
Unit-From	The unit from which the DWDM connection originates.
Port-From	The port from which the DWDM connection originates.
Slot-To	The slot at which the DWDM connection terminates.
Unit-To	The unit at which the DWDM connection terminates.
Port-To	The port at which the DWDM connection terminates.
State	The state of the DWDM connection.
From	The unit or port from which the internal patchcord originates.

Table B-616 Field Descriptions for the Connections Tab (continued)

Field	Description
To	The unit or port at which the internal patchcord terminates.
Wavelength	Shows the wavelength value if the internal patchcord is between two channel ports. Otherwise, it shows *N/A*.

B.16.0.5.3 Span Check Tab

The Span Check tab allows you to check the span loss between the selected node and the previous node in the chain. The span check is always in reception.

Note If the Measured Span Loss value crosses the Min or Max Expected Span Loss threshold, a condition is raised.

Table B-617 Field Descriptions for the Span Check Tab

Field	Description
Retrieve Span Loss Values button	Runs the span loss verification function and retrieves values for the Measure Span Loss column.
Side	Specifies the side for which span loss information is displayed (east-to-west or west-to-east).
Min Exp. Span Loss	Specifies the minimum expected span loss (in dBm) for the incoming span. This value is imported from MetroPlanner, but can be modified manually.
Max Exp. Span Loss	Specifies the maximum expected span loss (in dBm) for the incoming span.
Meas. Span Loss	The measured span loss value.
Resolution	The resolution or accuracy of the span loss measurement.

B.16.0.5.4 APC Tab

The APC tab allows you to view the automatic power control (APC) parameters.

Table B-618 Field Descriptions for the APC Tab

Field	Description
Port	Port number.
Last Modification	Date and time the power control setpoint was last modified.
Param	All the APC parameters associated with the port.
Last Check	Date and time the power control setpoint was last verified.
Side	Lists all the NEs and their sides that belong to the APC domain.
APC State	Displays the actual state of the APC. Values are: • Enabled—APC is enabled. • Disabled—APC is disabled. • Force Disabled—APC is disabled by the user. • Not Applicable—APC domain is incomplete.

B.16.0.5.5 Node Setup Tab

The Node Setup tab allows you to automatically preprovision NEs from a selected XML configuration file.

Table B-619 Field Descriptions for the Node Setup Tab

Field	Description
XML Settings	
Select XML File	Click **Browse** to select an XML file (generated by the MetroPlanner application). Prime Optical parses the XML file selected by the operator and checks the accuracy of its content.
Log Settings	
Select Log File	Click **Browse** to select a log file to which the results of the operations you perform will be saved.
Launch ANS Wizard button	Click the **Launch ANS Wizard** button to launch the Automatic Node Setup wizard. See 7.12.11 Configuring Automatic Node Setup, page 7-340 for more information.

B.16.0.5.6 Side Tab

The Side tab allows you to view, edit, and delete sides defined for a CPT 600 NE.

Table B-620 Field Descriptions for the Side Tab

Field	Description
Create button	Allows you to create side objects for the NE.
Modify button	Allows you to modify the side ID of an existing side object.
Delete button	Allows you to delete side objects.
Side	Displays the NE's side ID.
Line In	Displays the index of the receive side of the OTS port.
Line Out	Displays the index of the transmit side of the OTS port.

B.16.0.5.7 All Facilities Tab

The All Facilities tab allows you to view the DWDM and optical ports for the CPT 600 NE.

Table B-621 Field Descriptions for the All Facilities Tab

Field	Description
Port	Displays the card port number, shelf ID, and slot number.
Power	Displays the current power for the port.
State	Displays the administrative state of the port.
Service State	Displays the service state of the port.
Retain Selected	Displays only the ports that you selected.
Show All	Retrieves and displays all the optical and DWDM ports for the NE.

B.16.0.5.8 Passive Cards Tab

The Passive Cards tab allows you to view information about passive units provisioned in CTC.

Note Passive units can be provisioned in CTC only.

Table B-622 Field Descriptions for the Passive Cards Tab

Field	Description
Passive Cards	
ID	Displays the passive card shelf ID.
Equipment Name	Displays the general card type/name.
Location	Displays the location of the passive card.
Description	Displays the passive card description.
Optical Ports	
Port	Displays the port number.
Type	Displays the port type.
MPO	Displays any physical multifiber push connectors.
Wavelength	Displays the port wavelength.

B.16.0.6 ECU Ports Alarms Suppression

The External Control Unit (ECU) Ports Alarms Suppression Properties pane allows you to suppress the alarms for the MS_ISC ports of the ECU.

Table B-623 Field Descriptions for the ECU Ports Alarms Suppression Properties Pane

Field	Description
Ports	The port number.
Suppress Alarms	Indicates whether or not the alarms for a particular card are suppressed. If checked, all alarms for the MS_ISC ports of the ECU are suppressed.

B.16.0.7 General

The General Properties pane displays identification information, voltage thresholds, and multishelf configurations for the CPT 600 NE.

Table B-624 Field Descriptions for the General Properties Pane

Field	Description
Identification Tab	
NE ID	Displays the ID of the NE from the Domain Explorer.
NE Model	Displays the NE model type.
Software Version	Displays the current running version of the system software.

Table B-624 Field Descriptions for the General Properties Pane (continued)

Field	Description
Contact	Displays the name and phone number of the node contact person.
Description	Enter a description of the NE.
System Description	Displays the NE type and the version of the system software.
Voltage/Temperature Tab	
Voltage	Displays the voltage (in millivolts) of the shelf that corresponds to the power supply.
Temperature	Displays the temperature (in degrees Celsius) of the shelf.

B.16.0.8 NE Defaults

The NE Defaults Properties pane displays a list of default thresholds for the CPT 600 NE. You can load different NE defaults using the NE Defaults Management window. See 4.5.9 Restoring NE Defaults, page 4-86.

B.16.0.9 Network

The Network Properties pane displays information about the NE network address. The Properties pane contains the following tabs:

- B.16.0.9.1 Address Tab, page B-451
- B.16.0.9.2 Static Routes Tab, page B-452
- B.16.0.9.3 OSPF Tab, page B-452
- B.16.0.9.4 OSPF Area Range Tab, page B-453
- B.16.0.9.5 OSPF Virtual Links Tab, page B-454
- B.16.0.9.6 SNMP Tab, page B-454
- B.16.0.9.7 Firewall/Proxy Tab, page B-455
- B.16.0.9.8 Routing Table Tab, page B-455
- B.16.0.9.9 Internal Subnet Tab, page B-456
- B.16.0.9.10 Proxy Tunnels Tab, page B-456
- B.16.0.9.11 Firewall Tunnels Tab, page B-456
- B.16.0.9.12 FTP Hosts Tab, page B-457

B.16.0.9.1 Address Tab

The Address tab allows you to view and change information about the NE network address.

Table B-625 Field Descriptions for the Address Tab

Field	Description
IP Address	Displays the IP address of the NE.
Default Router	Displays the IP address of the default router.
Subnet Mask	Displays the subnetwork mask ID of the NE.

Table B-625 Field Descriptions for the Address Tab (continued)

Field	Description
MAC Address	Displays the CPT 600 NE address as it is identified on the IEEE 802 MAC layer.
Forward DHCP Requests	If checked, forwards DHCP requests to the IP address entered in the DHCP Server field. When the Forward DHCP Requests check box is unchecked, the DHCP Server field is display-only.
DHCP Server	Displays the IP address of the DHCP server.
IPv6 Config	
Enable IPv6	If checked, allows you to configure the node to use the IPv6 protocol and to assign an IPv6 address to the node.
IPv6 Address	Enter the IPv6 address of the node.
Default IPv6 Router	Enter the IPv6 default router of the node.
IPv6 Subnet Mask	Enter the IPv6 subnetwork mask length.

B.16.0.9.2 Static Routes Tab

The Static Routes tab allows you to view information about Prime Optical and CPT 600 NE connectivity and create or delete static routes.

Table B-626 Field Descriptions for the Static Routes Tab

Field	Description
Destination IP	Displays the IP address of the computer running Prime Optical.
Subnet Mask	Displays the subnetwork mask.
Next Hop	Displays the IP address of the router port or the node IP address if the Prime Optical computer is connected to the node directly.
Cost	Displays the number of hops between the CPT 600 NE and the computer.

B.16.0.9.3 OSPF Tab

The OSPF tab displays OSPF information. OSPF is a link-state Internet routing protocol.

Table B-627 Field Descriptions for the OSPF Tab

Field	Description
DCC/GCC OSPF Area ID Table	
Slot	Displays the slot number.
Port	Displays the port number.
DCC OSPF Area ID	Displays the number that identifies the CPT 600 NE as a unique OSPF area. The OSPF area number can be from 0.0.0.0 to 255.255.255.255. The number must be unique to the LAN OSPF area.
RS-DCC Metric	Sets a cost for sending packets across the RS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.
MS-DCC Metric	Sets a cost for sending packets across the MS-DCC, which is used by OSPF routers to calculate the shortest path. This value should always be higher than the LAN metric. This value is normally unchanged.

Table B-627 Field Descriptions for the OSPF Tab (continued)

Field	Description
OSPF on LAN	
OSPF Active on LAN	If checked, enables the CPT 600 NE OSPF topology to be advertised to OSPF routers on the LAN. Enable this field on CPT 600 NEs that directly connect to OSPF routers.
LAN Port Area ID	Displays the OSPF area ID for the router port where the CPT 600 NE is connected. (This number is different from the DCC OSPF area ID.)
Router Priority	Displays the value used for this NE in designated router election. The Cisco default value is zero (0). A router that has Router Priority set to 0 is ineligible to become a designated router on the attached network.
Dead Interval	Displays the number of seconds that will pass while an OSPF router's packets are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Transit Delay	Displays the service speed. One second is the Cisco default.
LAN Metric	Displays a cost for sending packets across the LAN. This value should always be lower than the DCC metric. Ten is the Cisco default.
OSPF Authentication	
Authentication Type	Displays Simple Password if the router where the CPT 600 NE is connected uses authentication. Otherwise, it displays No Authentication.
Authentication Key	Displays the OSPF key (password) if authentication is enabled.
Confirm Authentication Key	Retype the authentication key to confirm it.

B.16.0.9.4 OSPF Area Range Tab

The OSPF Area Range tab allows you to view information about OSPF area ranges and create or delete area ranges.

Table B-628 Field Descriptions for the OSPF Area Range Tab

Field	Description
Range Address	Displays the area IP address for the CPT 600 NEs that reside within the OSPF area. For example, if the CPT 600 NE OSPF area includes nodes with IP addresses 10.10.20.100, 10.10.30.150, 10.10.40.200, and 10.10.50.250, the range address would be 10.10.0.0.
Range Area ID	Displays the OSPF area ID for the CPT 600 NEs. This is either the ID in the DCC OSPF Area ID field or the ID in the LAN Port Area ID field.
Mask Length	Displays the subnet mask length.
Mask	Displays the subnet mask IP address.
Advertise	Indicates whether the OSPF routing table is advertised.

B.16.0.9.5 OSPF Virtual Links Tab

The OSPF Virtual Links tab allows you to view information about OSPF virtual links and create or delete virtual links.

Note You cannot create a new virtual link unless OSPF is active on the LAN.

Table B-629 Field Descriptions for the OSPF Virtual Links Tab

Field	Description
Neighbor	Displays the router ID of the Area 0 router.
Transit Delay	Displays the service speed. One second is the Cisco default.
Retransmit Interval	Displays the time that will elapse before a packet is resent. Five seconds is the Cisco default.
Hello Interval	Displays the number of seconds between OSPF hello packet advertisements sent by OSPF routers. Ten seconds is the Cisco default.
Dead Interval	Displays the number of seconds that will pass while the packets of an OSPF router are not visible before its neighbors declare the router down. Forty seconds is the Cisco default.
Authentication Type	Displays the authentication type.
Authentication Key	Displays the authentication key.

B.16.0.9.6 SNMP Tab

The SNMP tab allows you to view SNMP information and create or delete SNMP trap destinations.

Table B-630 Field Descriptions for the SNMP Tab

Field	Description
IP Address	The IP address of the NMS.
Community Name	The SNMP community name. **Note** The SNMP community string cannot be blank in Prime Optical. If a blank community string is required in CTC builds earlier than R4.6, you must set the blank community string in CTC.
UDP Port	The UDP port for SNMP. The Cisco default UDP port is 162.
Trap Version	The trap version, either SNMP version 1 or version 2. See your NMS documentation to determine whether to use SNMP version 1 or version 2.

B.16.0.9.7 Firewall/Proxy Tab

The Firewall/Proxy tab allows you to use an NE as a proxy server or as a firewall.

Table B-631 Field Descriptions for the Firewall/Proxy Tab

Field	Description
Gateway Settings	
Enable Proxy Server on Port	If checked, the CPT 600 NE serves as a proxy for connections between the Prime Optical server and CPT 600s that are DCC-connected to the proxy CPT 600 NE. The Prime Optical server establishes connections to DCC-connected nodes through the proxy node. The Prime Optical server can connect to nodes that it cannot directly reach from the host on which it runs. The proxy server port number (display-only) is shown following the Enable Proxy Server on Port field. The proxy server uses port 1080. If checked, the following radio buttons are enabled: • End Network Element (ENE)—Enables the CPT 600 NE to proxy as an ENE. Note that an alternate expansion for ENE is *external network element*. • Gateway Network Element (GNE)—Enables the CPT 600 NE to proxy as a GNE. • Proxy-only—Enables proxy only. If unchecked, the node does not proxy.

B.16.0.9.8 Routing Table Tab

The Routing Table tab allows you to view the OSPF routing table.

Table B-632 Field Descriptions for the Routing Table Tab

Field	Description
Destination	Displays the IP address of the destination network or host. Destination (0.0.0.0) is the default route entry. All undefined destination network or host entries on this routing table are mapped to the default route entry.
Mask	Displays the subnet mask used to reach the destination network or host. Mask (0.0.0.0) is always 0 for the default route.
Gateway	Displays the IP address of the gateway used to reach the destination network or host. All outbound traffic belonging to this network is sent to this gateway. Gateway (172.20.214.1) is the default gateway address. All outbound traffic that cannot be found in this routing table or is not on the nodes local subnet will be sent to this gateway.
Usage	Shows the number of times the listed route has been used.
Interface	Shows the CPT 600 NE interface used to access the destination. Values are: • cpm0—The CPT 600 NE Ethernet interface (that is, the RJ-45 jack on the TCC+/TCC2 and the LAN 1 pins on the backplane). • pdcc0—An SDCC interface (that is, an OC-N trunk card identified as the SDCC termination). • lo0—A loopback interface.

B.16.0.9.9 Internal Subnet Tab

The Internal Subnet tab allows you to change the class B subnet address for TSC cards. TSC cards perform all system-timing functions for each CPT 600 NE. To avoid IP address conflicts, you should change the class B subnet address if your internal network uses the same address range as the default subnet addresses.

Table B-633 Field Descriptions for the Internal Subnet Tab

Field	Description
TSC1	Enter the class B subnet address for the first TSC.
TSC2	If two TSCs are installed, enter the class B subnet address for the second TSC.

B.16.0.9.10 Proxy Tunnels Tab

The Proxy Tunnels tab allows you to configure source and destination information and create or delete proxy tunnels.

Table B-634 Field Descriptions for the Proxy Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the proxy server.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the proxy server.

B.16.0.9.11 Firewall Tunnels Tab

The Firewall Tunnels tab allows you to configure source and destination information and create and delete firewall tunnels.

Table B-635 Field Descriptions for the Firewall Tunnels Tab

Field	Description
Source Address	Specify the source IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Source Mask	Specify the source subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Address	Specify the destination IP address in the source-destination pair for the tunnel that will be routed through the firewall.
Destination Mask	Specify the destination subnetwork mask in the source-destination pair for the tunnel that will be routed through the firewall.

B.16.0.9.12 FTP Hosts Tab

The FTP Hosts tab allows you to configure database backup or restore and software download to an ENE when the firewall is enabled. You can provision a list of legal FTP hosts for which the firewall opens for all FTP commands. You can configure the FTP hosts to expire after a certain amount of time, after which the FTP relay resumes blocking all FTP access for the ENEs.

Table B-636 Field Descriptions for the FTP Hosts Tab

Field	Description
Create button	Opens the Create New FTP Host dialog box, which allows you to create up to 12 new FTP hosts in a GNE/ENE firewall environment. See 5.3.10.1 Creating an FTP Host, page 5-22. **Note** You cannot create more than 12 FTP hosts.
Delete button	Deletes the selected FTP host.
FTP Host Address	Displays the FTP host IP address.
Prefix Length	Displays the FTP host subnet mask length.
Enable FTP Relay	Indicates whether FTP relay is enabled or disabled. If FTP relay is disabled, the FTP Relay Timer field is dimmed.
FTP Relay Timer	Displays the number of minutes that the FTP relay is configured to run, after which the FTP relay resumes blocking all FTP access for the ENEs.

B.16.0.10 OSI

The OSI Properties pane allows you to provision CPT 600 NE Open System Interconnection (OSI) parameters. The Properties pane contains the following tabs:

- B.16.0.10.1 Main Setup Tab, page B-457
- B.16.0.10.2 TARP-Config Tab, page B-458
- B.16.0.10.3 TARP-TDC Tab, page B-459
- B.16.0.10.4 TARP-MAT Tab, page B-460
- B.16.0.10.5 Routers-Setup Tab, page B-460
- B.16.0.10.6 Subnets Tab, page B-461
- B.16.0.10.7 Tunnels Tab, page B-461
- B.16.0.10.8 IS-IS RIB Tab, page B-462
- B.16.0.10.9 ES-IS RIB Tab, page B-462

B.16.0.10.1 Main Setup Tab

The Main Setup tab allows you to provision the OSI Network Entity Title (NET) address and the OSI routing mode.

Table B-637 Field Descriptions for the Main Setup Tab

Field	Description
Main Network Entity Title	Displays the node NET. The NET is used in OSI networks to identify the node to the end system (ES) or intermediate system (IS).
End System	Provisions the node as an OSI end system (ES). ESs send end system hello (ESH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1	Provisions the node as an OSI intermediate system (IS). ISs send intermediate system hello (ISH) messages regularly to announce their presence to neighboring ISs and ESs.
Intermediate System Level 1/Level 2	The CPT 600 NE performs all IS functions. It communicates with other IS and ES nodes within an OSI area and broadcasts ISHs to IS nodes in other areas to which it is connected. For the CPT 600 NE, Intermediate System Level 1/Level 2 is the default routing mode.
Node Routing Mode	
L1 LSP Buffer Size	Sets the Level 1 Link State Protocol (LSP) data unit buffer size. The Cisco default is 512.
L2 LSP Buffer Size	Sets the Level 2 LSP data unit buffer size. The Cisco default is 512.

B.16.0.10.2 TARP-Config Tab

The TARP-Config tab allows you to provision the TID Address Resolution Protocol (TARP). TARP is used when TL1 TIDs must be translated to an NSAP address. During the TID-to-NSAP translation, the TID is mapped to a NET; then, the NSAP is derived from the NET based on the NSAP selector value.

Table B-638 Field Descriptions for the TARP-Config Tab

Field	Description
TARP PDUs L1 Propagation	If checked (default), TARP Type 1 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 1 area. Type 1 PDUs request a protocol address that matches a target TID within a Level 1 routing area. The propagation does not occur if the NE is the target of the Type 1 PDU and the PDUs are not propagated to the NE from which the PDU was received. **Note** This parameter is not used when the node is set to End System.
TARP PDUs Origination	If checked (default), the node performs all TARP configuration functions, including: • TID-to-NSAP resolution requests • NSAP-to-TID requests • TARP address changes **Note** TARP Echo and NSAP to TID are not supported.
L2 TARP Data Cache	If checked (default), the TIDs and NSAPs are added to the TDC before the node propagates the requests to other NEs. **Note** This parameter is designed for IS Level 1/Level 2 nodes that are connected to other IS Level 1/Level 2 nodes. Enabling the parameter for IS Level 1 nodes is not recommended.
LAN TARP Storm Suppression	If checked (default), enables the TARP storm suppression to prevent redundant TARP PDUs from being propagated across the network.
Type 4 PDU Delay	Sets the amount of time that will pass before the Type 4 PDU is generated. The Cisco default value is 60 seconds; the range is from 0 to 255 seconds.

Table B-638 Field Descriptions for the TARP-Config Tab (continued)

Field	Description
TARP PDUs L2 Propagation	If checked (default), TARP Type 2 PDUs received by the node that are not excluded by the loop detection buffer are propagated to other NEs within the OSI Level 2 area. Type 2 PDUs request a protocol address that matches a target TID within a Level 2 routing area. The propagation occurs if the NE is the target of the Type 2 PDU and the PDUs are not propagated to the NE from which the PDU was received.
L1 TARP Data Cache	If checked, the node maintains a TARP data cache (TDC). The TDC is a database of TID-to-NSAP pairs created from TARP Type 3 PDUs received by the node. TARP Type 3 PDUs are responses to Type 1 and Type 2 PDUs and modified by TARP Type 4 PDUs (TID-to-NSAP updates or corrections).
LDB	If checked, enables the TARP loop detection buffer (LDB). The LDB prevents TARP PDUs from being sent more than once on the same subnet.
Send Type 4 PDU on Startup	If checked, a TARP Type 4 PDU is originated during the initial CPT 600 NE startup. Type 4 PDUs indicate that a TID or NSAP change has occurred at the NE. This option is disabled by default.
Timers	
LDB Entry	Sets the TARP LDB timer. The LDB buffer time is assigned to each LDB entry for which the TARP sequence number is zero. The Cisco default is 5 minutes; the range is from 1 to 10 minutes.
T1 Timer	Sets the amount of time to wait for response to a Type 1 Request PDU. Type 1 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 15 seconds; the range is from 0 to 3600 seconds.
T3 Timer	Sets the amount of time to wait for an address resolution request. The Cisco default is 40 seconds; the range is from 0 to 3600 seconds.
LDB Flush	Sets the frequency period for flushing the LDB. The Cisco default is 5 minutes; the range is from 0 to 1440 minutes.
T2 Timer	Sets the amount of time to wait for a Type 2 Request PDU. TARP Type 2 requests seek a specific NE TID within an OSI Level 1 area. The Cisco default is 25 seconds; the range is from 0 to 3600 seconds.
T4 Timer	Sets the amount of time to wait for an error recovery. The timer begins after the T2 timer expires without successfully finding the NE TID. The Cisco default is 20 seconds; the range is from 0 to 3600 seconds.

B.16.0.10.3 TARP-TDC Tab

Table B-639 Field Descriptions for the TARP-TDC Tab

Field	Description
TID	Target ID that is statistically linked to an NSAP or NET. For ONS nodes, the TID is the node name.
NSAP/NET	The NSAP that is statistically linked to the TID.
Type	Indicates how the TARP data cache entry was created. It can be either: • Dynamic—The entry was created through the TARP propagation process. • Static—The entry was manually created and is a static entry.

Table B-639 Field Descriptions for the TARP-TDC Tab (continued)

Field	Description
Add Static Entry button	Click **Add Static Entry** to statically link a TID to an NSAP or NET.
Delete Selected Entry button	Click **Delete Selected Entry** to delete the selected TID-to-NSAP/NET static entry.
TID to NSAP button	Click **TID to NSAP** to query the network for an NSAP that matches a TID.
Flush Dynamic Entries button	Click **Flush Dynamic Entries** to delete all dynamically generated TDC entries.

B.16.0.10.4 TARP-MAT Tab

The TARP-MAT tab allows you to manually provision a TARP adjacency.

Table B-640 Field Descriptions for the TARP-MAT Tab

Field	Description
Level	Sets the TARP Type Code that will be sent. • Level 1—Indicates that the manual area adjacency is within the same area as the node. The entry generates Type 1 PDUs. • Level 2—Indicates that the manual area adjacency is in an area different from that of the node. The entry generates Type 2 PDUs.
NSAP	The NSAP address of the node at the other end of the TARP manual adjacency.
Add button	Click **Add** to create a TARP manual area adjacency.
Remove button	Click **Remove** to delete the selected TID-to-NSAP/NET static entry.

B.16.0.10.5 Routers-Setup Tab

The Routers-Setup tab allows you to view and manage the OSI virtual routers.

Table B-641 Field Descriptions for the Routers-Setup Tab

Field	Description
Router Number	Displays the virtual router number. The CPT 600 NE provides six virtual routers, numbered 1 through 6.
System ID	Displays the NSAP system ID of the virtual router. The NSAP system identifier is set to the node's first IEEE 802.3 MAC address + *n*, where *n* = 0 through 6. For the primary router (Router 1), *n* = 0.
Status	Indicates the virtual router status. Select Enabled or Disabled from the drop-down list. **Note** Router 1 must be enabled before additional routers can be enabled.
Primary Area Address	Indicates the primary manual area address. For Router 1, this is the main NET for the node; that is, the NSAP without the system ID and selector (set to 00) fields.
Manual Area Address 1	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Manual Area Address 2	Indicates the address of any additional manual areas that are created. **Note** An OSI area allows up to two additional manual areas in addition to the primary manual area.
Edit button	Click **Edit** to modify the address parameters.

B.16.0.10.6 Subnets Tab

The Subnets tab allows you to view and manage OSI subnetwork point-of-attachment parameters. The parameters are initially provisioned when you enable a subnet on an SDCC, LDCC, GCC, OSC, or LAN interface.

Table B-642 Field Descriptions for the Subnets Tab

Field	Description
Slot/Port	The subnet slot and port.
Router Number	The OSI virtual router where the subnet (SDCC, LDCC, GCC, or OSC) is provisioned.
Type	The interface where the subnet is provisioned: SDCC, LDCC, GCC, OSC, or LAN.
Protocol	The data link protocol that is provisioned for the subnet. It can be: • Point to Point Protocol (PPP) • Link Access Protocol on the D channel (LAP-D) • 802.3 for LAN subnets
ISH	The intermediate system hello (ISH) PDU propagation frequency. Intermediate system NEs send ISHs to other ESs and ISs to inform them about the NETs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
ESH	The end system hello (ESH) PDU propagation frequency. End system NEs transmit ESHs to inform other ESs and ISs about the NSAPs they serve. The Cisco default is 10 seconds; the range is from 10 to 1000 seconds.
IIH	The intermediate system-to-intermediate system hello (IIH) PDU propagation frequency. The IS-IS hello PDUs establish and maintain adjacencies between ISs. The Cisco default is 3 seconds; the range is from 1 to 600 seconds.
DIS Priority	The designated intermediate system (DIS) priority. In IS-IS networks, one router is elected as the DIS. For Cisco routers, the DIS priority is 64.
IS-IS Cost	The cost for sending packets on the subnet. This is used by OSPF routers to calculate the shortest path. The Cisco default value is 20.
Enable LAN Subnet button	*Router 1 only.* Enables OSI over the LAN; that is, it activates the IS-IS protocol on the LAN so OSI traffic is enabled on the LAN.
Edit button	Click **Edit** to modify the subnet parameters.
Disable LAN Subnet button	*Router 1 only.* Disables OSI over the LAN if it has been enabled.

B.16.0.10.7 Tunnels Tab

The Tunnels tab allows you to view, create, edit, and delete Generic Routing Encapsulation (GRE) and Cisco tunnels. GRE tunnels encapsulate one network protocol for transfer across another network layer. Within a mixed TCP/IP and OSI network, GRE tunnels tunnel IP traffic over an OSI NE and OSI traffic over an IP NE.

Table B-643 Field Descriptions for the Tunnels Tab

Field	Description
IP Address	Displays the IP address of the GRE destination Prime Optical or CTC computer.
Netmask Address	Displays the IP address subnet mask of the destination Prime Optical or CTC computer.

Table B-643 Field Descriptions for the Tunnels Tab (continued)

Field	Description
NSAP Address	The destination NE NSAP address. The NSAP selector (last two NSAP characters) must be 2f (GRE tunnel) or cc (proprietary Cisco tunnel), depending on which tunnel type you want to create. The Cisco proprietary tunnel is slightly more efficient than the GRE tunnel because it does not add an encapsulation header for each IP packet, while the GRE tunnel adds a small header to the packets. The two tunnel types are incompatible. **Note** Most Cisco routers support the Cisco tunnel, while only a few support both GRE and Cisco IP tunnels.
OSPF Metric	Displays the cost for sending packets across the GRE tunnel. Cost is used by OSPF routers to calculate the shortest path.
Create button	Click **Create** to create a new GRE tunnel route.
Edit button	Click **Edit** to edit an existing GRE tunnel.
Delete button	Click **Delete** to delete an existing GRE tunnel.

B.16.0.10.8 IS-IS RIB Tab

The IS-IS RIB tab allows you to view the intermediate system-to-intermediate system (IS-IS) protocol routing information base (RIB). IS-IS is an OSI link-state hierarchical routing protocol that floods the network with link-state information that enables the NEs to build a complete and consistent picture of a network topology.

Table B-644 Field Descriptions for the IS-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The CPT 600 NE provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.
Destination Address	Displays the Network Service Access Point (NSAP).
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

B.16.0.10.9 ES-IS RIB Tab

The ES-IS RIB tab allows you to view the end system-to-intermediate system (ES-IS) protocol RIB. ES-IS is an OSI protocol that defines how end systems (hosts) and intermediate systems (routers) learn about each other.

Table B-645 Field Descriptions for the ES-IS RIB Tab

Field	Description
Router Number	Displays the virtual router number. The CPT 600 NE provides six virtual routers, numbered 1 through 6.
Subnet Type	Indicates the OSI subnetwork point-of-attachment type used to access the destination address. It includes SDCC, LDCC, GCC, OSC, and LAN.

Table B-645 Field Descriptions for the ES-IS RIB Tab (continued)

Field	Description
Destination Address	Displays the NSAP of the destination ES.
MAC Address	Displays the NE's MAC address for destinations that are accessed by the LAN subnets.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

B.16.0.11 Protection

The Protection Properties pane contains the following tabs:

- B.16.0.11.1 Protection Groups Tab, page B-463
- B.16.0.11.2 Operations Tab, page B-464

B.16.0.11.1 Protection Groups Tab

The Protection Groups tab displays a list of available protection groups and allows you to create, delete, and view protection groups.

Table B-646 Field Descriptions for the Protection Groups Tab

Field	Description
Protection Groups	
Displays a list of available protection groups. Click the **Create** or **Delete** button to create a new protection group or delete an existing one.	
Selected Protection Group	
Name	Modify the name of the selected protection group. The name can have up to 32 alphanumeric characters.
Type	Choose the protection type (1:1, 1:N, or 1+1) from the drop-down list. The protection selected determines the cards that are available to serve as protect and working cards. For example, if you choose 1:N protection, only DS-1N and DS-3N cards are displayed. 1+1 protection is used for optical cards only.
Protect Module	Choose the protect card if using 1:1 or 1:N protection.
Available Entities	Displays a list of available entities. You can toggle between available and working entities.
Working Entities	Displays a list of working entities. You can toggle between working and available entities.
Bidirectional Switching	Click if you want both the transmit and the receive channels to switch if a failure occurs on one. This option is available only if you select 1+1 (port) type.
Revertive	If checked, the CPT 600 NE reverts traffic to the working card or port after failure conditions are corrected and remain correct for the amount of time entered in Reversion Time.
Reversion Time	If Revertive is checked, enter the amount of time following failure condition correction that should elapse before the CPT 600 NE switches back to the working card or port.

B.16.0.11.2 Operations Tab

The Operations tab displays protection group operation information.

Table B-647 Field Descriptions for the Operations Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock out switching, or lock on switching.

B.16.0.12 Security

The Security Properties pane allows you to view and edit the security advisory message for the CPT 600 NE. The Security Properties pane contains the following tabs:

- B.16.0.12.1 Policy Tab, page B-464
- B.16.0.12.2 Password Tab, page B-465
- B.16.0.12.3 Access Tab, page B-466
- B.16.0.12.4 RADIUS Server Tab, page B-467
- B.16.0.12.5 Legal Disclaimer Tab, page B-468

B.16.0.12.1 Policy Tab

The Policy tab allows you to specify user security parameters.

Note If the user is already logged in, any changes to the NE user type settings take effect only when the user next logs in.

Table B-648 Field Descriptions for the Policy Tab

Field	Description
Idle User Timeout	
Each CTC or TL1 user can be idle during his or her login session for a specified amount of time before the CTC window is locked. The lockouts prevent unauthorized users from making changes. Higher-level users have shorter default idle periods and lower-level users have longer or unlimited default idle periods. The user idle period can be modified by a SuperUser. **Note** A user already logged into the node is not affected by a change to the Idle User Timeout policy.	
Retrieve	Set the idle user timeout for a CTC Retrieve user.
Maintenance	Set the idle user timeout for a CTC Maintenance user.
Provisioner	Set the idle user timeout for a CTC Provisioner user.
SuperUser	Set the idle user timeout for a CTC SuperUser user.
User Lockout	

Table B-648 Field Descriptions for the Policy Tab (continued)

Field	Description
Manual Unlock by SuperUser	If checked, the CTC SuperUser user must manually unlock locked out CTC users. If unchecked, locked out CTC users are automatically unlocked after the lockout duration period elapses.
Lockout Duration	Set the lockout duration period for locked out CTC users. This field is enabled only if the Manual Unlock by SuperUser check box is unchecked.
Failed Logins Allowed	Set the number of failed logins before the CTC user is automatically locked out.
Other	
Single Sessions per User	If checked, each CTC user can launch only one session at a time.
Prevent Disabling the SuperUser	If checked, inactive CTC SuperUsers are never disabled.
Disable Inactive User	If checked, inactive users are disabled automatically for the amount of time in the Inactive Duration field.
Inactive Duration	Specify the inactive duration in days. The range is from 1 to 90 days; the Cisco default is 45 days. A value of 0 implies the inactive duration is disabled and invalid.

B.16.0.12.2 Password Tab

The Password tab allows you to specify user password security parameters.

Table B-649 Field Descriptions for the Password Tab

Field	Description
Password Change	
Prevent Reusing Last	Prevents setting a CTC user's current password to one of the most recent passwords. You can set the number of most recent passwords that cannot be reused.
Disable Password Flipping	If checked, users are not allowed to change passwords for the number of days specified in the Can Change Password After field.
Can Change Password After	Enter the number of days that must elapse before the user can change the password.
Force Password Change After Assigned	If checked, during the first successful login, the user is forced to change the password.
Password Difference	Allows SuperUsers to specify the number of characters by which the new password of a user must differ from the old password, while performing a password change. The default value is 1; the range is from 1 to 5 characters.
Password Aging	
Enable Password Aging	Check this check box to enable password aging.
Aging Period	Enter the aging period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the aging period expires, CTC users are forced to change their passwords.
Warning Period	Enter the warning period, in days, for Retrieve, Maintenance, Provisioner, and SuperUser CTC users. After the warning period expires, CTC users are warned that their passwords will soon expire.

B.16.0.12.3 Access Tab

The Access tab allows you to configure LAN and shell access to the NE.

Table B-650 Field Descriptions for the Access Tab

Field	Description
Access	
LAN Access	Specify the type of LAN access allowed. Values are Backplane Only, No LAN Access, Front and Backplane, or Front Only. **Note** After the LAN access to the backplane is set, the Prime Optical client is unusable for 4 to 5 minutes.
Restore Timeout	This time period begins if *No LAN Access* is selected and all DCC connections are lost. If the time expires before a DCC is restored, LAN access is restored so that the node is not isolated. When the DCC comes back, LAN access returns to its specified settings. The range is from 0 (never) to 60 minutes; the Cisco default is 5 minutes.
Serial Craft Access	
Enable Craft Port A	Check this check box to enable craft port A.
Enable Craft Port B	Check this check box to enable craft port B.
Shell Access	
Access State	Select the Shell access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SSH Port	Indicates the SSH port number that will be used.
SFTP Port	Indicates the SFTP port number.
Telnet Port	This is enabled if you selected the Non-secure access state. Enter the Telnet port number that will be used.
Use Standard Telnet Port	Check this check box to indicate that the standard Telnet port will be used.
Enable Shell Password	Indicates whether or not the Shell password is enabled. **Note** You cannot enable the Shell password in Prime Optical. Enabling and providing a Shell password is currently done in CTC.
EMS Access	
Access State	Select the EMS access state from the drop-down list. You can select either Non-secure or Secure.
CORBA Listener Port	Select the port numbers for the TSC CORBA (IIOP) listener port and the TSC CORBA (SSLIOP) listener port. Select one of the following radio buttons: • Default-Fixed—Assigns a default port number. • Standard Constant—The port number for the TSC CORBA (IIOP) listener port is 683. The port number for the TSC CORBA (SSLIOP) listener port is 684. • Other Constant—When selected, enter the port number that will be used.
TL1 Access	
Access State	Select the TL1 access state from the drop-down list. You can select Disable, Non-secure, or Secure.
SNMP Access	
Access State	Select the SNMP access state from the drop-down list. You can select either Disable or Non-secure.

Table B-650 Field Descriptions for the Access Tab (continued)

Field	Description
Other	
PM Clearing Privilege	Select the users privilege that allows clearing PM statistics for the NE.

B.16.0.12.4 RADIUS Server Tab

The RADIUS Server tab allows you to configure, create, modify, and delete RADIUS servers for the CPT 200 NE and later.

Table B-651 Field Descriptions for the RADIUS Server Tab

Field	Description
Enable RADIUS Authentication	Check this check box to enable RADIUS authentication.
Enable RADIUS Accounting	Check this check box to enable RADIUS accounting. This is enabled if the Enable RADIUS Authentication check box is checked.
Enable the Node as the Final Authenticator When no RADIUS Server is Reachable	Select a row from the RADIUS Servers in Order of Authentication table; then, check this check box. This indicates that the RADIUS server that you selected will be the final authenticator when there are no more RADIUS servers that can be reached.
Create button	Click **Create** to create a RADIUS server. See 8.4.2.1.1 Creating a RADIUS Server, page 8-46.
Edit button	Click **Edit** to modify an existing RADIUS server's information. See 8.4.2.1.2 Modifying a RADIUS Server, page 8-47.
Delete button	Click **Delete** to delete an existing RADIUS server. See 8.4.2.1.3 Deleting a RADIUS Server, page 8-47.
Move Up/Move Down buttons	Click **Move Up** or **Move Down** to reorder the list of RADIUS servers in the RADIUS Servers in Order of Authentication table.
RADIUS Servers in Order of Authentication	
IP Address	Displays the IP address of the RADIUS server.
Shared Secret	Displays a text string that serves as a password between a RADIUS client and RADIUS server.
Authentication Port	Displays the authentication port number of the RADIUS server. Default access is through port number 1812.
Accounting Port	Displays the accounting port number of the RADIUS server. Default access is through port number 1813.

B.16.0.12.5 Legal Disclaimer Tab

The Legal Disclaimer tab allows you to edit the NE's advisory message and preview the disclaimer.

Table B-652 Field Descriptions for the Legal Disclaimer Tab

Tab	Description
Advisory Message	The existing message is a default, noncustomer-specific disclaimer. If you want to edit this statement with specifics for your company, you can change the text. You can also use the following HTML commands to format the text: • ****—Begins boldface font • ****—Ends boldface font • ** **—Aligns type in the center of the window • ** **—Ends the center alignment • **<font=*n*, where *n* = point size>**—Changes the font to the new size • ****—Ends the font size command • **<p>**—Creates a line break • **_{**—Begins subscript • **}**—Ends subscript • **^{**—Begins superscript • **}**—Ends superscript • **<u>**—Starts underline • **</u>**—Ends underline
Preview	Allows you to view the advisory message before saving it.

B.16.0.13 Timing

The Timing Properties pane contains the following tabs:

- B.16.0.13.1 General Tab, page B-468
- B.16.0.13.2 Reference List Tab, page B-470
- B.16.0.13.3 Status Tab, page B-470
- B.16.0.13.4 Timing Report Tab, page B-471

B.16.0.13.1 General Tab

The General tab displays general timing information.

Table B-653 Field Descriptions for the General Tab

Field	Description
General Timing	
Timing Mode	Set the node timing mode: • External—The CPT 600 NE derives its timing from a BITS source wired to the backplane pins. • Line—Timing is derived from an STM-N card that is optically connected to the timing node. • Mixed—Timing is set to external and line timing references. **Caution** Mixed timing might cause timing loops. Use this mode with care.
SSM Message Set	Choose the SSM set level supported by your network. SSM is an SONET protocol that communicates information about the quality of the timing source. SSM messages are carried on the S1 byte of the SONET Line layer. They enable SONET devices to automatically select the highest quality timing reference and to avoid timing loops. If a Generation 1 node receives a Generation 2 message, the message is mapped down to the next available Generation 1 node. For example, an ST3E message becomes an ST3.
Revertive	If checked, the CPT 600 NE reverts to a primary reference source after the conditions that caused it to switch to a secondary timing reference are corrected.
Reversion Time	Specify the reversion time in half-minute increments.
BITS-IN-OUT Facility Type	
In Facility Type	Provisions the BITS In facility type.
Out Facility Type	Provisions the BITS Out facility type.
BITS In/Out Facilities	
E1, T1, 2.048 MHz, 64 KHz	Select the speed of the BITS facility.
In/Out State	Set the BITS reference to IS or OOS. For nodes set to Line timing with no equipment timed through BITS Out, set the state to OOS. For nodes using External timing or Line timing with equipment timed through BITS Out, set the state to IS. **Note** BITS IN Facilities and BITS OUT Facilities values apply to both BITS-1 and BITS-2.
Coding	Set to the coding used by your BITS reference, either B8ZS or AMI.
Framing	Set to the framing used by your BITS reference, either ESF or SF (D4). SSM is not available with Super Frame.
Sync Messaging	If checked, enables the SSM for BITS In. (SSM is not available if Framing is set to Super Frame.)
Admin SSM	If the Sync Messaging check box is not checked, you can choose the SSM Generation 2 type from the drop-down list.
AIS Threshold	If SSM is disabled or Super Frame is used, set the quality level where a node sends an alarm indication signal (AIS) from the BITS-1 Out and BITS-2 Out backplane pins. An AIS is raised when the optical source for the BITS reference falls to or below the SSM quality level defined in this field.
Cable Type	Type of cable. Values are 75 ohm or 120 ohm.
Sa Bit	The Sa Bit is used to transmit the SSM message. Available Sa bits are Sa4, Sa5, Sa6, Sa7, and Sa8.

B.16.0.13.2 Reference List Tab

The Reference List tab provides timing reference information.

Table B-654 Field Descriptions for the Reference List Tab

Field	Description
NE References	Allows you to define three timing references (Ref-1, Ref-2, and Ref-3). The node uses Reference 1 unless a failure occurs on that reference, in which case, the node uses Reference 2. If that fails, the node uses Reference 3, which is typically set to Internal Clock. This is the Stratum 3 clock provided on the TCC+. The options displayed depend on the Timing Mode setting: • Timing Mode set to External—Options are BITS-1, BITS-2, and Internal Clock. • Timing Mode set to Line—Options are the node's working optical cards and Internal Clock. Select the cards/ports that are directly or indirectly connected to the node wired to the BITS source; that is, the node's trunk cards. Set Reference 1 to the trunk card that is closest to the BITS source. For example, if Slot 5 is connected to the node wired to the BITS source, select Slot 5 as Reference 1.

B.16.0.13.3 Status Tab

The Status tab displays timing status information.

Note If you change any values in the Status tab and click Apply at the bottom of the screen, the values are not set. Instead, use the following buttons to apply changes:

- Clear—Releases any existing switch request. For example, if you issue a Force Switch and then issue a Clear, the Force Switch request is released.
- Manual Switch—Switches the timing reference from one source to another.
- Force Switch—Switches the timing reference from one source to another. This request has a higher priority than the Manual Switch request.

Table B-655 Field Descriptions for the Status Tab

Field	Description
NE Clock	
NE Reference	Set the NE timing reference to internal, BITS-1, or BITS-2.
Status	Displays the status of the NE clock.
Operations	Execute a switch on the NE timing reference.
BITS-1 Out	
BITS-1 Out	Set the BITS-1 out timing reference.
Status	Displays the status of the BITS-1 out timing reference.
Operations	Execute a switch on the BITS-1 out timing reference.
BITS-2 Out	
BITS-2 Out	Set the BITS-2 out timing reference.

Table B-655 Field Descriptions for the Status Tab (continued)

Field	Description
Status	Displays the status of the BITS-2 out timing reference.
Operations	Execute a switch on the BITS-2 out timing reference.

B.16.0.13.4 Timing Report Tab

The Timing Report tab summarizes the NE's current timing settings.

B.17 CRS-1/3 NE Explorer

When you choose **Configuration > NE Explorer** for the CRS-1/3, the window that Prime Optical displays consists of a tree on the left side and a properties pane on the right. The properties pane shows information about the selected entity. See B.17.1 Node Properties Pane—CRS-1/3 for more information.

B.17.1 Node Properties Pane—CRS-1/3

The node properties pane displays information about the CRS-1/3 NE. The properties pane contains the following tabs:

- B.17.1.1 General, page B-471
- B.17.1.2 OTN, page B-472
- B.17.1.3 PM, page B-472
- B.17.1.4 Proactive Protection Regen, page B-473
- B.17.1.5 Status Tab, page B-474

B.17.1.1 General

The General Properties pane displays admin state, wavelength, and loopback information for the CRS-1/3 NE.

Note Wavelength and Loopback fields are editable only if the Admin State is not IS.

Table B-656 Field Descriptions for the General Properties Pane

Field	Description
Filter	Click the **Filter** button to filter the data displayed in the table.
Refresh	Click the **Refresh Data** button to refresh the table.

Table B-656 Field Descriptions for the General Properties Pane

Field	Description
Admin State	The port administration state. It can be: • IS—In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Wavelength	Displays the number of wavelengths for this NE.
Loopback	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

B.17.1.2 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings.

Table B-657 Field Descriptions for the OTN Tab

Field	Description
Filter	Click the **Filter** button to filter the data displayed in the table.
Refresh	Click the **Refresh Data** button to refresh the table.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
SF BER	Displays the signal fail bit error rate.
SD BER	Displays the signal degrade bit error rate.

B.17.1.3 PM

The PM tab allows you to view the optics in the current interval of a PM parameter. The interval is 15 minutes or 1 day.

Note The parameters displayed depend on the PM type selected.

Click the **Refresh** button to refresh the parameters. You can save the data displayed in the text area to your local disk by clicking the **Export** button.

Table B-658 Field Descriptions for the PM Tab

Field	Description
PM Type	Choose Interval or History to display the performance monitor parameters. 1. If you choose Interval PM type, the Interval PM area is displayed: • Intervals – 15-Minute—Displays a collection of PM data every 15 minutes. – 1 Day—Displays a collection of PM data every 24 hours. • PM Layer—Choose the performance monitor layer. Values are: – FEC – Optics – OTN 2. If you choose History PM type, the History PM area is displayed. Possible values are: – All – 15-Minute – 1 Day – FEC – Optics – OTN

B.17.1.4 Proactive Protection Regen

The Proactive Protection Regen tab allows you to provision proactive protection regen.

Table B-659 Field Description for the Proactive Protection Regen Tab

Field	Description
Filter	Click the **Filter** button to filter the data displayed in the table.
Refresh	Click the **Refresh Data** button to refresh the table.
Trigger Threshold	Sets the maximum BER threshold to trigger proactive protection.

Table B-659 Field Description for the Proactive Protection Regen Tab

Field	Description
Trigger Window (ms)	Sets the duration for which BER is monitored before triggering proactive protection. The trigger window value must be a multiple of: • 10 ms for trigger thresholds between 1E-3 and 6E-6 • 100 ms for trigger threshold between 5E-6 and 1E-7 The trigger window must be less than or equal to 10000 ms.
Revert Threshold	Sets the revert threshold value of BER. **Note** The Revert Threshold settings must be less than the Trigger Threshold values.
Revert Window (ms)	Sets the duration for which BER is monitored for settings that are less than the revert threshold value before which proactive protection provided to the router is removed. The Revert Window value must be at least 2000 ms and a multiple of: • 10ms for a revert threshold of 1E-4 to 6E-7 • 100ms for a revert threshold of 5E-7 to 5E-8 The revert window must be less than or equal to 10000 ms.

B.17.1.5 Status Tab

The status tab allows you to view the current status of the CRS-1/3 NE. The Status tab provides details on loopback, controller state, FEC, OTU, ODU, and alarm.

B.18 Unmanaged NE/Other Vendor Node Properties Pane

The Unmanaged NE/Other Vendor node properties pane displays information about unmanaged NEs or nodes from other vendors. The properties pane contains an Identification Properties pane.

B.18.1 Identification

The Identification Properties pane displays identification information about the unmanaged or other-vendor NE.

Table B-660 Field Descriptions for the Identification Properties Pane

Field	Description
NE ID	Displays the ID of the NE from the Domain Explorer.
Description	Displays the description of the NE from the Domain Explorer.
NE Model	Displays *Unmanaged* as the NE model type.
NE Type	Displays *Not Applicable* as the NE type.
NE Version	Displays the NE version.
Serial Number	Displays the serial number of the NE.
Location Name	Displays the name of the physical location of the NE.
Subnetwork ID	Displays the assigned subnetwork ID of the NE.
Network Partition ID	Displays the network partition ID of the NE.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

Slot Properties Pane Information—Common, DWDM, Electrical, and Ethernet Cards

This appendix provides information on the cards supported in Cisco Prime Optical. This appendix contains the following sections:

- C.1 Common Cards, page C-1
- C.2 DWDM Cards, page C-111
- C.3 Electrical Cards, page C-651
- C.4 Ethernet Cards, page C-832

Note

- In the Prime Optical GUI, display-only fields have a gray background.
- Slot properties are alphabetically displayed under the Overview and Provisioning drawers in the NE Explorer. For more information, see the "1.5.7 NE Explorer" section on page 1-30.

C.1 Common Cards

This section describes the following common cards supported within Prime Optical:

- C.1.1 Slot Properties—AIC, page C-2
- C.1.2 Slot Properties—AIC-I, page C-5
- C.1.3 Slot Properties—CTX-2500, page C-9
- C.1.4 Slot Properties—CTX-CL600, page C-26
- C.1.5 Slot Properties—FILLER, page C-59
- C.1.6 Slot Properties—MIC-28-3-A and MIC-28-3-B, page C-59
- C.1.7 Slot Properties—MMU (ONS 15454 SONET and ONS 15454 SDH), page C-60
- C.1.8 Slot Properties—OSCM (ONS 15454 SONET and ONS 15454 SDH), page C-65
- C.1.9 Slot Properties—SSXC, page C-70
- C.1.10 Slot Properties—TCC+, page C-71
- C.1.11 Slot Properties—TCC-I, page C-72
- C.1.12 Slot Properties—TCC2, page C-73

- C.1.13 Slot Properties—TCC2P, page C-75
- C.1.14 Slot Properties—TCC3, page C-77
- C.1.15 Slot Properties—TNC and TNCE, page C-79
- C.1.16 Slot Properties—TSC and TSCE, page C-90
- C.1.17 Slot Properties—TSC (ONS 15600 SONET and ONS 15600 SDH), page C-92
- C.1.18 Slot Properties—Unprovisioned Slot (ONS 15327 and ONS 15454 SONET), page C-93
- C.1.19 Slot Properties—Unprovisioned Slot (ONS 15454 SDH), page C-94
- C.1.20 Slot Properties—XC, page C-94
- C.1.21 Slot Properties—XC-VXL-10G, page C-95
- C.1.22 Slot Properties—XC10G, page C-96
- C.1.23 Slot Properties—XCVT, page C-98
- C.1.24 Slot Properties—XCVXC, page C-100
- C.1.25 Slot Properties—XTC (ONS 15305), page C-101
- C.1.26 Slot Properties—XTC (ONS 15327), page C-102

C.1.1 Slot Properties—AIC

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The optional Alarm Interface Controller (AIC) card provides customer-defined alarm input/output (I/O) and supports local and express orderwire.

For the AIC module, the slot properties pane displays the following properties: Module View, Identification, Alarm Extenders, Local Orderwire, Express Orderwire, and Info.

C.1.1.1 Module View

The Module View displays a graphic of the AIC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.1.2 Identification

The Identification Properties pane allows you to view and update AIC identification information.

Table C-1 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.

Table C-1 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the Common Language Equipment Identifier (CLEI) code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.1.3 Alarm Extenders

The Alarm Extenders Properties pane allows you view AIC alarm information and create custom alarm types. The Alarm Extenders Properties pane contains the following tabs:

- C.1.1.3.1 External Alarms Tab, page C-3
- C.1.1.3.2 External Controls Tab, page C-4
- C.1.1.3.3 User-Defined Alarms Tab, page C-4

C.1.1.3.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table C-2 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	Displays the alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.

Table C-2 Field Descriptions for the External Alarms Tab (continued)

Field	Description
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	Displays a default description that is provided for every enabled external alarm.
Raised	Indicates if an alarm has been raised.
Contact Status	Indicates the current status of the contact.

C.1.1.3.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table C-3 Field Descriptions for the External Controls Tab

Field	Description
Control Number	Displays the control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	Displays the current state of the control.
Auto State	Displays the auto state of the control.
Contact Setting	Displays the current contact setting.

C.1.1.3.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on AIC cards.

Table C-4 Field Descriptions for the User-Defined Alarms Tab

Field	Description
Alarm Types	Lists the user-defined alarm types that have been created on the AIC card. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

C.1.1.4 Local Orderwire

Local Orderwire allows a craftsperson to plug a phoneset into a node and communicate with craftspeople working at other nodes or other facility equipment. The orderwire is a pulse code modulation (PCM) encoded voice channel that uses E1 or E2 bytes in section/line overhead. The AIC allows simultaneous

use of both local (section overhead signal) and express (line overhead channel) orderwire channels on a SONET ring or particular optics facility. Local orderwire also allows communication at regeneration sites when the regenerator is not a Cisco device.

Table C-5 Field Descriptions for the Local Orderwire Properties Pane

Field	Description
4-Wire Level	If needed, adjust the Tx and Rx dBm (decibels referenced per milliwatt) by moving the slider to the right or left for the four-wire headset that you will use. In general, you should not need to adjust the dBm.
2-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.

C.1.1.5 Express Orderwire

The Express Orderwire Properties pane allows you to configure express orderwire settings.

Table C-6 Field Descriptions for the Express Orderwire Properties Pane

Field	Description
4-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the four-wire headset that you will use. In general, you should not need to adjust the dBm.
2-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.

C.1.1.6 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the AIC card.

Table C-7 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.2 Slot Properties—AIC-I

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The optional Alarm Interface Controller-International (AIC-I) card provides customer-defined (environmental) alarms and controls and supports local and express orderwire. It provides twelve customer-defined input and four customer-defined input/output contacts. The physical connections are through the backplane wire-wrap pin terminals.

For the AIC-I module, the slot properties pane displays the following properties: Module View, Identification, Card, Alarm Extenders, Local Orderwire, Express Orderwire, and Info.

C.1.2.1 Module View

The Module View displays a graphic of the AIC-I that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.2.2 Identification

The Identification Properties pane allows you to view and update AIC-I identification information.

Table C-8 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.2.3 Card

The Card Properties pane allows you to view and update AIC-I card information.

Table C-9 Field Descriptions for the Card Properties Pane

Field	Description
Add Extension	Check this check box if you are using the Alarm Expansion Panel (AEP).
Extended Type	The AEP radio button is automatically selected if you checked the Add Extension check box.
Input/Output	Select External Alarm if you use external alarms only; select External Control if you use both external alarms and external controls. Selecting only External Alarm gives you 16 external alarm ports and no external control ports. If you select External control, four of the ports are converted to external control ports, leaving you with 12 external alarm ports.
Station Number	Enter a four-digit station number. The valid range is from 0 to 9999.

C.1.2.4 Alarm Extenders

The Alarm Extenders Properties pane allows you view AIC-I alarm information. The Alarm Extenders Properties pane contains the following tabs:

- C.1.2.4.1 External Alarms Tab, page C-7
- C.1.2.4.2 External Controls Tab, page C-7
- C.1.2.4.3 User-Defined Alarms Tab, page C-8

C.1.2.4.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table C-10 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	A default description is provided in this line for every external alarm that is enabled.
Raised	Indicates if an alarm has been raised.
Contact Status	Indicates the current status of the contact.

C.1.2.4.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table C-11 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

C.1.2.4.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on AIC-I cards.

Table C-12 Field Descriptions for the User-Defined Alarms Tab

Field	Description
Alarm Types	Lists the user-defined alarm types that have been created on the AIC-I card. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

C.1.2.5 Local Orderwire

Orderwire allows a craftsperson to plug a phoneset into a node and communicate with craftspeople working at other nodes or other facility equipment. The orderwire is a pulse code modulation (PCM) encoded voice channel that uses E1 or E2 bytes in section/line overhead. The AIC-I allows simultaneous use of both local (section overhead signal) and express (line overhead channel) orderwire channels on a SONET ring or particular optics facility. Local orderwire also allows communication at regeneration sites when the regenerator is not a Cisco device.

Table C-13 Field Descriptions for the Local Orderwire Properties Pane

Field	Description
Buzzer	The AIC-I supports selective dual tone multifrequency (DTMF) dialing for telephony connectivity, which causes one AIC-I card or all AIC-I cards on the orderwire subnetwork to ring. The ringer/buzzer resides on the AIC-I. If you want to turn on the audible alert (buzzer) for the orderwire, check the **Buzzer** check box.

Table C-13 Field Descriptions for the Local Orderwire Properties Pane (continued)

Field	Description
4-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the four-wire headset that you will use. In general, you should not need to adjust the dBm.
2-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.

C.1.2.6 Express Orderwire

The Express Orderwire Properties pane allows you to configure express orderwire settings.

Table C-14 Field Descriptions for the Express Orderwire Properties Pane

Field	Description
Buzzer	If you want to turn on the audible alert (buzzer) for the orderwire, check the **Buzzer** check box.
4-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the four-wire headset that you will use. In general, you should not need to adjust the dBm.
2-Wire Level	If needed, adjust the Tx and Rx dBm by moving the slider to the right or left for the two-wire headset that you will use. In general, you should not need to adjust the dBm.

C.1.2.7 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the AIC-I card.

Table C-15 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.3 Slot Properties—CTX-2500

The slot properties pane displays information about the Cisco ONS 15310 MA SONET or ONS 15310 MA SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The CTX-2500 card, for use with the ONS 15310 MA SONET or ONS 15310 MA SDH, is a fully nonblocking cross-connect card that operates in a redundant configuration. It performs system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SONET data communications channel (DCC) termination, system fault detection, and cross-connect

maintenance and management for the ONS 15310 MA SONET and ONS 15310 MA SDH. The card also provides the circuitry for the OC-3/OC-12/OC-48 interfaces, and ensures that the system maintains timing with SMC stability.

The CTX-2500 card provides 576 x 576 STS-1 level cross-connections, 96 x 96 TU-3 level cross-connections, 2688 x 2688 VT1.5s, or 2016 x 2016 VT2s.

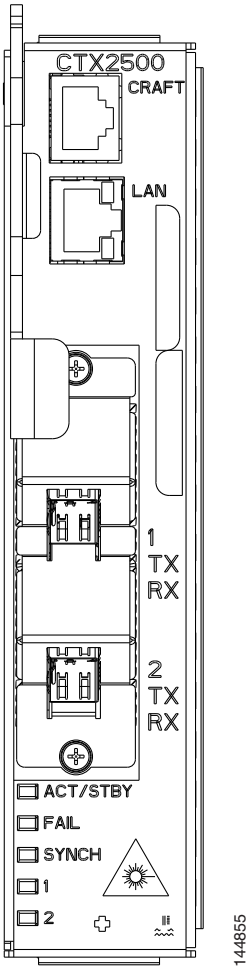
The CTX-2500 card can be installed in slots 3 or 4. Protection switches between the active and standby CTX-2500 are hitless (less than a 50-ms impact to any traffic).

The CTX-2500 supports errorless side switches (switching from one CTX-2500 on one side of the shelf to the other CTX-2500 on the other side of the shelf) when the switch is initiated through software and is caused by a software upgrade.

There are two PPM (small form factor pluggable [SFP]) slots on the CTX-2500 faceplate. Each slot can contain a one-port PPM. Cisco-qualified SFPs can be single-rate (OC-3, OC-12, or OC-48) or multirate (OC-3, OC-12, and OC-48). Single-rate PPMs are autoprovisioned when they are installed, but multirate PPMs must be provisioned. This behavior can be controlled by NE defaults.

The following figure shows the CTX-2500 card faceplate.

Figure C-1 CTX-2500 Faceplate



For the CTX-2500 module, the slot properties pane displays the following properties: Module View, Identification, Pluggable Provisioning, Line, STS, VT, Loopback, Alarm Behavior, Transceiver, Auto Laser Shutdown, Protection, J1 Path Trace, and Section Trace.

C.1.3.1 Module View

The Module View displays a graphic of the CTX-2500 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.3.2 Identification

The Identification Properties pane allows you to view and update CTX-2500 identification information.

Table C-16 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Card State	
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.3.3 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities; for example, the pluggable port module (PPM) and pluggable I/O module (PIM) and the ports inside these entities.

Table C-17 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Equipment State	Displays the equipment state of the card.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Pluggable Number	Displays the identifier of the plugin module and the port number.
Rate	Displays the rate of the port inside the pluggable entity.

C.1.3.3.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision pluggable entities such as the PPM and PIM, and to create the ports inside these entities.

- Table C-18 describes the fields displayed in the Provision Pluggable dialog box when provisioning a PPM.
- Table C-19 applies only to the ONS 15600 SONET/SDH ASAP_4 card and describes the fields displayed in the Provision Pluggable dialog box when provisioning a PIM.
- Table C-20 describes the fields displayed in the Provision Pluggable dialog box when provisioning a PPM.
- Table C-21 describes the fields displayed in the Provision Pluggable dialog box when creating the ports inside the PPM and PIM.

Table C-18 Field Descriptions for the Provision Pluggable Dialog Box—PPM

Field	Description
PPM #	Sets the PPM number.
No. of Ports	Sets the number of ports inside the PPM.
PPM Type	Sets the type of PPM.

Table C-19 Field Descriptions for the Provision Pluggable Dialog Box—PIM (ONS 15600 SONET/SDH ASAP_4 Card)

Field	Description
PIM #	Sets the PIM number.
No. of Ports	Sets the number of ports inside the PIM.
PIM Type	Sets the type of PIM.

Table C-20 Field Descriptions for the Provision Pluggable Dialog Box—PPM (ONS 15454 SONET/SDH MRC-12 Card)

Field	Description
PPM	Select the PPM for which you want to create the port.
PPM Type	Sets the PPM type.

Table C-21 Field Descriptions for the Provision Pluggable Dialog Box

Field	Description
PPM	Select the PPM for which you want to create the port.
Port Number	Sets the port number.
Port Rate	Sets the rate of the new port.

C.1.3.4 Line

The Line Properties pane allows you to view and update line card information. The Line Properties pane displays the following tabs:

- C.1.3.4.1 Line Config Tab, page C-13
- C.1.3.4.2 Line Thresh 15 Min Tab, page C-15
- C.1.3.4.3 Line Thresh 1 Day Tab, page C-16
- C.1.3.4.4 Section Thresh 15 Min Tab, page C-17
- C.1.3.4.5 Section Thresh 1 Day Tab, page C-18
- C.1.3.4.6 Physical Thresh 15 Min Tab, page C-18
- C.1.3.4.7 Physical Thresh 1 Day Tab, page C-18
- C.1.3.4.8 Alarm Thresholds Tab, page C-19

C.1.3.4.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of an optical card.

Table C-22 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Port Rate	Sets the rate of the new port.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.

Table C-22 Field Descriptions for the Line Config Tab (continued)

Field	Description
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
SendDoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Send <FF> DoNotUse	When checked, sends a do not use (DUS) (0xff) message on the S1 byte.
Type	Defines the port as SONET or SDH.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Admin SSM	If the node does not receive an SSM signal, it defaults to synchronization traceability unknown (STU). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC-3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)

Table C-22 Field Descriptions for the Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected.

C.1.3.4.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of an optical card.

Table C-23 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.

Table C-23 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.
PSC	In a 1 + 1 protection scheme for a working card, protection switching count (PSC) is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM is applicable only if revertive line-level protection switching is used. PSC is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
PSD	Protection switching duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, it is a count of the seconds that the line was used to carry service. The PSD PM is applicable only if revertive line-level protection switching is used. PSD is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.

C.1.3.4.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of an optical card.

Table C-24 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

Table C-24 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.
PSC	In a 1 + 1 protection scheme for a working card, protection switching count (PSC) is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM is applicable only if revertive line-level protection switching is used. PSC is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
PSD	Protection switching duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, it is a count of the seconds that the line was used to carry service. The PSD PM is applicable only if revertive line-level protection switching is used. PSD is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.

C.1.3.4.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold settings of an optical card.

Table C-25 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.

Table C-25 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.1.3.4.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold settings of an optical card.

Table C-26 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.1.3.4.6 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change 15-minute physical threshold information on an optical card.

Table C-27 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Port No.	Pluggable entity number and port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 200 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 20 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the received power decreases, then the OPR percentage decreases to reflect the loss in received power. For example, if the received power decreases 3-dBm, the OPR decreases 50 percent.

C.1.3.4.7 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change 1-day physical threshold information on an optical card.

Table C-28 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Port No.	Pluggable entity number and port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 200 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 20 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the received power decreases, then the OPR percentage decreases to reflect the loss in received power. For example, if the received power decreases 3-dBm, the OPR decreases 50 percent.

C.1.3.4.8 Alarm Thresholds Tab

The Alarm Thresholds tab allows you to select thresholds for alarm generation.

Table C-29 Field Descriptions for the Alarm Thresholds Tab

Field	Description
Port Number	The port number.
LBC-High	Maximum laser bias current. The default is (15 min): 200 percent.
LBC-Low	Minimum laser bias current. The default is (15 min): 20 percent.
OPT-High	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-Low	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-High	Maximum optical power received. The default is (15 min): 200 percent.
OPR-Low	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the received power decreases, then the OPR percentage decreases to reflect the loss in received power. For example, if the received power decreases 3-dBm, the OPR decreases 50 percent.

C.1.3.5 STS

The STS Properties pane allows you to view and update synchronous transport signal (STS) information. The STS Properties pane displays the following tabs:

- C.1.3.5.1 STS Config Tab, page C-19
- C.1.3.5.2 Path Thresh 15 Min Tab, page C-20
- C.1.3.5.3 Path Thresh 1 Day Tab, page C-20
- C.1.3.5.4 Customer Info Tab, page C-21

C.1.3.5.1 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the EC1 port.

Table C-30 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

C.1.3.5.2 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change the 15-minute path threshold information for the CTX-2500 card.

Table C-31 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS No.	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.
PPJC-Pdet	Displays positive pointer justification count-VC4 path detected.
NPJC-Pdet	Displays negative pointer justification count-VC4 path detected.
PPJC-Pgen	Displays positive pointer justification count-VC4 path generated.
NPJC-Pgen	Displays negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS No.	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.1.3.5.3 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change the 1-day path threshold information for the CTX-2500 card.

Table C-32 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS No.	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Displays positive pointer justification count-VC4 path detected.
NPJC-Pdet	Displays negative pointer justification count-VC4 path detected.
PPJC-Pgen	Displays positive pointer justification count-VC4 path generated.
NPJC-Pgen	Displays negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS No.	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.1.3.5.4 Customer Info Tab

The Customer Info tab displays customer information.

Table C-33 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.3.6 VT

The VT Properties pane allows you to view and update VT line information. The VT Properties pane displays the following tabs:

- C.1.3.6.1 VT Config Tab, page C-22
- C.1.3.6.2 VT Thresh 15 Min Tab, page C-22
- C.1.3.6.3 VT Thresh 1 Day Tab, page C-22
- C.1.3.6.4 Customer Info Tab, page C-23

C.1.3.6.1 VT Config Tab

The VT Config tab allows you to view and change the VT settings of the card.

Table C-34 Field Descriptions for the VT Config Tab

Field	Description
VT No.	Displays VT number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

C.1.3.6.2 VT Thresh 15 Min Tab

The VT Thresh 15 Min tab displays near- and far-end 15-minute VT threshold information.

Table C-35 Field Descriptions for the VT Thresh 15 Min Tab

Field	Description
VT No.	Displays VT number information.
CV	Displays the coding violations information.
ES	Displays the errored seconds information.
SES	Displays the severely errored seconds information.
UAS	Displays the unavailable seconds information.
FC	Displays the failure count information.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.3.6.3 VT Thresh 1 Day Tab

The VT Thresh 1 Day tab displays near- and far-end 1-day VT threshold information.

Table C-36 Field Descriptions for the VT Thresh 1 Day Tab

Field	Description
VT No.	Displays VT number information.
CV	Displays the coding violations information.
ES	Displays the errored seconds information.
SES	Displays the severely errored seconds information.
UAS	Displays the unavailable seconds information.
FC	Displays the failure count information.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.3.6.4 Customer Info Tab

The Customer Info tab displays customer information.

Table C-37 Field Descriptions for the Customer Info Tab

Field	Description
STS No.	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.3.7 Loopback

The Loopback Properties pane allows you to view and update CTX-2500 loopback information.

Table C-38 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Administration State	Allows you to select the administration state of the port: In Service (IS) or Out of Service (OOS).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.1.3.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profiles assigned to cards on the ONS 15310 MA SONET or ONS 15310 MA SDH node.

Table C-39 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.1.3.9 Transceiver

The Transceiver Properties pane shows OC-N port optical power received (OPR), optical power transmitted (OPT), and laser bias current (LBC) from the line card and stores these values with the PM counts for the 15-minute and 1-day periods. The physical layer performance parameters consist of normalized and non-normalized values of LBC, OPT, and OPR.

Table C-40 Field Descriptions for the Transceiver Properties Pane

Field	Description
Port No.	Displays the port number.
Non-Normalized LBC (mA)	Displays the actual operating value of laser bias current (mA) for the specified card port. This value should be somewhat consistent from port to port and cannot be configured.
Non-Normalized OPT (dBm)	Displays the actual operating value of optical power transmitted (dBm) for the specified card port. This value should be somewhat consistent from port to port and cannot be configured.
Non-Normalized OPR (dBm)	Displays the actual operating value of optical power received (dBm) for the specified card port. This value varies from port to port because of received optical signal power differences.

C.1.3.10 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-41 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.1.3.11 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-42 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.1.3.12 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and retrieve J1 path trace information.

Table C-43 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS/VC Number	Displays the STS or VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.6 Using the Circuit Trace Window to Apply Protection to the Ports in a Splitter-Protection Group, page 7-171 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.1.3.13 Section Trace

The Section Trace Properties pane is used to provision section trace.

Table C-44 Field Descriptions for the Section Trace Properties Pane

Field	Description
Port No.	Displays the port number.
Trace Mode	Displays the trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.4 Slot Properties—CTX-CL600

The slot properties pane displays information about the Cisco ONS 15310 CL slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The CTX-CL600 card is an unpluggable card on the ONS 15310 CL NE. It has a total of 26 ports that are either mounted or pluggable.

For the CTX-CL600 module, the slot properties pane displays the following properties: Module View, Identification, Wideband Ports, Broadband Ports, Pluggable Provisioning, DS-1, DS-3, EC1, Optical, Alarm Extenders, and Info.

C.1.4.1 Module View

The Module View displays a graphic of the CTX-CL600 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.4.2 Identification

The Identification Properties pane allows you to view and update CTX-CL600 identification information.

Table C-45 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.4.3 Wideband Ports

The Wideband Ports Properties pane allows you to view the wideband port information.

Table C-46 Field Descriptions for the Wideband Ports Properties Pane

Field	Description
Port Number	Displays the port number.
Rate	Displays the rate that the slot is provisioned for.

C.1.4.4 Broadband Ports

The Broadband Ports Properties pane allows you to view, create, and delete DS-3 and EC1 broadband ports.

Table C-47 Field Descriptions for the Broadband Ports Properties Pane

Field	Description
Create	Click the **Create** button to launch the Create Port dialog box and create a new broadband port. Use the **Port Number** drop-down list to choose an available port. Use the **Port Rate** drop-down list to specify the port rate (DS-3 or EC1). After making your selections, click **OK**.
Delete	Click the **Delete** button to delete an existing DS-3 or EC1 broadband port.
DS-3	
Port Number	Displays the DS-3 port number.
Rate	Displays the rate that the slot is provisioned for.
EC1	
Port Number	Displays the EC1 port number.
Rate	Displays the rate that the slot is provisioned for.

C.1.4.5 Pluggable Provisioning

The Pluggable Provisioning Properties pane allows you to view and provision pluggable entities; for example, the pluggable port module (PPM) and pluggable I/O module (PIM) and the ports inside these entities.

Table C-48 Field Descriptions for the Pluggable Provisioning Properties Pane

Field	Description
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Pluggable Number	Displays the identifier of the plugin module and the port number.
Rate	Displays the rate of the port inside the pluggable entity.

C.1.4.5.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision pluggable entities such as the PPM and PIM, and to create the ports inside these entities.

- Table C-49 applies only to the ONS 15600 SONET/SDH ASAP_4 card and describes the fields displayed in the Provision Pluggable dialog box when provisioning a PIM.
- Table C-50 applies only to the ONS 15600 SONET/SDH ASAP_4 card and describes the fields displayed in the Provision Pluggable dialog box when creating the ports inside the PPM and PIM.
- Table C-51 describes the fields displayed in the Provision Pluggable dialog box when provisioning a PPM.
- Table C-52 describes the fields displayed in the Provision Pluggable dialog box when creating the ports inside the PPM.
- Table C-53 describes the fields displayed in the Provision Pluggable dialog box when creating the lanes inside the PPM for CFP_LC card.

Table C-49 Field Descriptions for the Provision Pluggable Dialog Box—PIM (ONS 15600 SONET/SDH ASAP_4 Card)

Field	Description
PIM #	Sets the PIM number.
PIM Type	Sets the type of PIM.

Table C-50 Field Descriptions for the Provision Pluggable Dialog Box—PPM (ONS 15600 SONET/SDH ASAP_4 Card)

Field	Description
PIM	Select the PIM for which you want to create the port.
PPM	Select the PPM for which you want to create the port.
Port Rate	Sets the rate of the new port.

Table C-51 Field Descriptions for the Provision Pluggable Dialog Box—PPM (ONS 15454 SONET/SDH MRC-12 Card)

Field	Description
PPM	Select the PPM for which you want to create the port.
PPM Type	Sets the PPM type.

Table C-52 Field Descriptions for the Provision Pluggable Dialog Box

Field	Description
PPM	Select the PPM for which you want to create the port.
Port Rate	Sets the rate of the new port.

Table C-53 Field Descriptions for the Provision Pluggable Dialog Box (ONS 15454 SONET/SDH CFP_LC Card)

Field	Description
Port	Select the PPM for which you want to create the port.
Port Type	Sets the type of the port.
No of Lanes	Number of sublanes that can be created based on the pluggable type. Values are: • 4 (card mode is TXP) • 1 and 4 (card mode is MXP)

C.1.4.6 DS-1

The DS-1 Properties pane allows you to view node near-end and far-end performance on a DS-1 card to detect possible performance problems. The DS-1 Properties pane contains the following tabs:

- C.1.4.6.1 Line Config Tab, page C-29
- C.1.4.6.2 Line Thresh 15 Min Tab, page C-30
- C.1.4.6.3 Line Thresh 1 Day Tab, page C-31
- C.1.4.6.4 Electric Path Thresh 15 Min Tab, page C-31
- C.1.4.6.5 Electric Path Thresh 1 Day Tab, page C-32
- C.1.4.6.6 STS Thresh 15 Min Tab, page C-33
- C.1.4.6.7 STS Thresh 1 Day Tab, page C-33
- C.1.4.6.8 VT Thresh 15 Min Tab, page C-34
- C.1.4.6.9 VT Thresh 1 Day Tab, page C-34
- C.1.4.6.10 Alarm Behavior Tab, page C-35
- C.1.4.6.11 Loopback Tab, page C-35
- C.1.4.6.12 J1 Path Trace Tab, page C-35
- C.1.4.6.13 Customer Info Tab, page C-36

C.1.4.6.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the DS-1 card.

Table C-54 Field Descriptions for the Line Config Tab

Field	Description
Port Name	Allows you to add a name for the optical port.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1 transmission coding type.

Table C-54 Field Descriptions for the Line Config Tab (continued)

Field	Description
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262 • 263–393 • 394–524 • 525–655
Administration State	Displays the status of the line: In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Provide Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Message	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Enable Retiming	When checked, enables retiming. Retiming removes accumulated jitter and wander from synchronous transport network payload signals. Retiming should not be enabled when accumulated jitter and wander is not present.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS-V for DS-1 AIS	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.

C.1.4.6.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the DS-1 card.

Table C-55 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.

Table C-55 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
LOSS-L	Displays the loss of signal seconds line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

C.1.4.6.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the DS-1 card.

Table C-56 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
LOSS-L	Displays the loss of signal seconds line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

C.1.4.6.4 Electric Path Thresh 15 Min Tab

The Electric Path Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute electrical path threshold settings for the DS-1 card.

Table C-57 Field Descriptions for the Electric Path Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	

Table C-57 Field Descriptions for the Electric Path Thresh 15 Min Tab (continued)

Field	Description
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
CSS-P	Displays the controlled slip seconds path information.
SEFS-P	Displays the severely errored framing seconds path information.

C.1.4.6.5 Electric Path Thresh 1 Day Tab

The Electric Path Thresh 1 Day tab allows you to view and change the near- and far-end 1-day electrical path threshold settings for the DS-1 card.

Table C-58 Field Descriptions for the Electric Path Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal–path information.
AISS-P	Displays the alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
Port No.	Displays the port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
ESA-P	Displays the errored seconds type A path information.
ESB-P	Displays the errored seconds type B path information.
CSS-P	Displays the controlled slip seconds path information.
SEFS-P	Displays the severely errored framing seconds path information.

C.1.4.6.6 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute STS information for the DS-1 card.

Table C-59 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.1.4.6.7 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information for the DS-1 card.

Table C-60 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.

Table C-60 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.1.4.6.8 VT Thresh 15 Min Tab

The VT Thresh 15 Min tab displays near- and far-end 15-minute VT threshold information.

Table C-61 Field Descriptions for the VT Thresh 15 Min Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.
Far End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.

C.1.4.6.9 VT Thresh 1 Day Tab

The VT Thresh 1 Day tab displays near- and far-end 1-day VT threshold information.

Table C-62 Field Descriptions for the VT Thresh 1 Day Tab

Field	Description
Near End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.
Far End	
VT Number	Displays VT number information.
CV-V	Displays the coding violations–VT path information.
ES-V	Displays the errored seconds–VT path information.

Table C-62 Field Descriptions for the VT Thresh 1 Day Tab (continued)

Field	Description
SES-V	Displays the severely errored seconds–VT path information.
UAS-V	Displays the unavailable seconds–VT path information.

C.1.4.6.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update DS-1 alarm profile information.

Table C-63 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.1.4.6.11 Loopback Tab

The Loopback tab allows you to view and update DS-1 loopback information.

Table C-64 Field Descriptions for the Loopback Tab

Field	Description
Line Number	Displays the line number.
Administration State	Allows you to configure the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT)
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send Code	Allows you to send loopback commands to the far end.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.1.4.6.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-65 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.1.4.6.13 Customer Info Tab

The Customer Info tab displays customer information.

Table C-66 Field Descriptions for the Customer Info Tab

Field	Description
STS Number, VT Number	Displays the STS or VT number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.4.7 DS-3

The DS-3 Properties pane allows you to view node near-end and far-end performance on a DS-3 card to detect possible performance problems. The DS-3 Properties pane contains the following tabs:

- C.1.4.7.1 Line Config Tab, page C-37
- C.1.4.7.2 Line Thresh 15 Min Tab, page C-37
- C.1.4.7.3 Line Thresh 1 Day Tab, page C-37
- C.1.4.7.4 PBit Thresh 15 Min Tab, page C-38
- C.1.4.7.5 PBit Thresh 1 Day Tab, page C-38
- C.1.4.7.6 CPBit Thresh 15 Min Tab, page C-39
- C.1.4.7.7 CPBit Thresh 1 Day Tab, page C-39
- C.1.4.7.8 STS Thresh 15 Min Tab, page C-40
- C.1.4.7.9 STS Thresh 1 Day Tab, page C-40
- C.1.4.7.10 Alarm Behavior Tab, page C-41
- C.1.4.7.11 Loopback Tab, page C-41
- C.1.4.7.12 J1 Path Trace Tab, page C-41
- C.1.4.7.13 Customer Info Tab, page C-42

C.1.4.7.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the DS-3 card.

Table C-67 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0 - 225 (default) • 226 - 450
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the transmission coding type.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.1.4.7.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the DS-3 card.

Table C-68 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line (near-end only).
ES-L	Displays the errored seconds lines line.
SES-L	Displays the severely errored seconds line (near-end only).
LOSS-L	Displays the loss of signal seconds line (near-end only).

C.1.4.7.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the DS-3 card.

Table C-69 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Port Number	Displays the optical port number.
CV-L	Displays the coding violations line (near-end only).
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line (near-end only).
LOSS-L	Displays the loss of signal seconds line (near-end only).

C.1.4.7.4 PBit Thresh 15 Min Tab

The PBit Thresh 15 Min tab displays near-end 15-minute PBit path threshold information on the DS-3 card.

Table C-70 Field Descriptions for the PBit Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal–path
AISS-P	Alarm indication signal seconds path
UAS-P	Displays the unavailable seconds path information.

C.1.4.7.5 PBit Thresh 1 Day Tab

The PBit Thresh 1 Day tab displays near- and far-end 1-day PBit path threshold information on the DS-3 card.

Table C-71 Field Descriptions for the PBit Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal–path information.
AISS-P	Alarm indication signal seconds path information.
UAS-P	Displays the unavailable seconds path information.

C.1.4.7.6 CPBit Thresh 15 Min Tab

The CPBit Thresh 15 Min tab displays near- and far-end 15-minute CPBit path threshold information on the DS-3 card.

Table C-72 Field Descriptions for the CPBit Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal–path information.
UAS-P	Displays the unavailable seconds path information.

C.1.4.7.7 CPBit Thresh 1 Day Tab

The CPBit Thresh 1 Day tab displays near- and far-end 1-day CPBit path threshold information on the DS-3 card.

Table C-73 Field Descriptions for the CPBit Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
Far End	
Port No.	Displays the optical port number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
SAS-P	Displays the severely errored frame/alarm indication signal path information.
UAS-P	Displays the unavailable seconds path information.

C.1.4.7.8 STS Thresh 15 Min Tab

The STS Thresh 15 Min tab allows you to view and change near- and far-end 15-minute STS information on the card.

Table C-74 Field Descriptions for the STS Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.1.4.7.9 STS Thresh 1 Day Tab

The STS Thresh 1 Day tab allows you to view and change near- and far-end 1-day STS information on the DS-3 card.

Table C-75 Field Descriptions for the STS Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.

Table C-75 Field Descriptions for the STS Thresh 1 Day Tab (continued)

Field	Description
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.

C.1.4.7.10 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and update DS-3 alarm profile information.

Table C-76 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.1.4.7.11 Loopback Tab

The Loopback tab allows you to view and update DS-3 loopback information.

Table C-77 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Inhibit FE Loopback	When selected, inhibits far-end loopback.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.1.4.7.12 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-78 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.1.4.7.13 Customer Info Tab

The Customer Info tab displays customer information.

Table C-79 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.4.8 EC1

The EC1 Properties pane allows you to view node near-end and far-end performance on an EC1 card to detect possible performance problems. The EC1 Properties pane contains the following tabs:

- C.1.4.8.1 Line Config Tab, page C-43
- C.1.4.8.2 Line Thresh 15 Min Tab, page C-43
- C.1.4.8.3 Line Thresh 1 Day Tab, page C-44
- C.1.4.8.4 Section Thresh 15 Min Tab, page C-44
- C.1.4.8.5 Section Thresh 1 Day Tab, page C-45
- C.1.4.8.6 Path Thresh 15 Min Tab, page C-45
- C.1.4.8.7 Path Thresh 1 Day Tab, page C-46
- C.1.4.8.8 STS Config Tab, page C-47
- C.1.4.8.9 Alarm Behavior Tab, page C-47
- C.1.4.8.10 Loopback Tab, page C-48
- C.1.4.8.11 J1 Path Trace Tab, page C-48
- C.1.4.8.12 Customer Info Tab, page C-48

C.1.4.8.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of the EC1 card.

Table C-80 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number for the optical port.
Port Name	Allows you to add a name for the optical port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC-3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
Line Length (feet)	Defines the distance (in feet) from backplane connection to the next termination point. Values are 0 through 225 (default) or 226 through 450.
Rx Equalization	For early EC1 card versions, equalization can be turned off if the line length is short or the environment is extremely cold; Rx Equalization should normally be set to On (checked, default).
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.1.4.8.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of the EC1 card.

Table C-81 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

Table C-81 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.1.4.8.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of the EC1 card.

Table C-82 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line.
FC-L	Displays the failure count line.

C.1.4.8.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold information on the EC1 card.

Table C-83 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.

Table C-83 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.1.4.8.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold information on the EC1 card.

Table C-84 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.1.4.8.6 Path Thresh 15 Min Tab

The Path Thresh 15 Min tab allows you to view and change near- and far-end 15-minute path threshold information on the EC1 card.

Table C-85 Field Descriptions for the Path Thresh 15 Min Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Displays positive pointer justification count-VC4 path detected.
NPJC-Pdet	Displays negative pointer justification count-VC4 path detected.
PPJC-Pgen	Displays positive pointer justification count-VC4 path generated.
NPJC-Pgen	Displays negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.

Table C-85 Field Descriptions for the Path Thresh 15 Min Tab (continued)

Field	Description
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Displays positive pointer justification count-VC4 path detected.
NPJC-Pdet	Displays negative pointer justification count-VC4 path detected.
PPJC-Pgen	Displays positive pointer justification count-VC4 path generated.
NPJC-Pgen	Displays negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.

C.1.4.8.7 Path Thresh 1 Day Tab

The Path Thresh 1 Day tab allows you to view and change near- and far-end 1-day path threshold information on the EC1 card.

Table C-86 Field Descriptions for the Path Thresh 1 Day Tab

Field	Description
Near End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
FC-P	Displays the failure count path information.
PPJC-Pdet	Displays positive pointer justification count-VC4 path detected.
NPJC-Pdet	Displays negative pointer justification count-VC4 path detected.
PPJC-Pgen	Displays positive pointer justification count-VC4 path generated.
NPJC-Pgen	Displays negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.

Table C-86 Field Descriptions for the Path Thresh 1 Day Tab (continued)

Field	Description
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Far End	
STS Number	Displays the synchronous transport signal number.
CV-P	Displays the coding violations path information.
ES-P	Displays the errored seconds path information.
SES-P	Displays the severely errored seconds path information.
UAS-P	Displays the unavailable seconds path information.
PPJC-Pdet	Displays positive pointer justification count-VC4 path detected.
NPJC-Pdet	Displays negative pointer justification count-VC4 path detected.
PPJC-Pgen	Displays positive pointer justification count-VC4 path generated.
NPJC-Pgen	Displays negative pointer justification count-VC4 path generated.
PJCS-Pdet	Indicates the number of pointer justification count seconds (PJCS) detected on a particular path.
PJCS-Pgen	Indicates the number of pointer justification count seconds generated for a particular path.
PJC-Diff	Displays the sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.

C.1.4.8.8 STS Config Tab

The STS Config tab allows you to view and change the STS settings of the EC1 card.

Table C-87 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

C.1.4.8.9 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and change EC1 alarm profile information.

Table C-88 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.

Table C-88 Field Descriptions for the Alarm Behavior Tab (continued)

Field	Description
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.1.4.8.10 Loopback Tab

The Loopback tab allows you to view and change EC1 loopback information.

Table C-89 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.1.4.8.11 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-90 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.1.4.8.12 Customer Info Tab

The Customer Info tab displays customer information.

Table C-91 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.4.9 Optical

The Optical Properties pane allows you to view node near-end and far-end performance on an optical card to detect possible performance problems. The Optical Properties pane contains the following tabs:

- C.1.4.9.1 Line Config Tab, page C-49
- C.1.4.9.2 Line Thresh 15 Min Tab, page C-51
- C.1.4.9.3 Line Thresh 1 Day Tab, page C-52
- C.1.4.9.4 Section Thresh 15 Min Tab, page C-53
- C.1.4.9.5 Section Thresh 1 Day Tab, page C-54
- C.1.4.9.6 Physical Thresh 15 Min Tab, page C-54
- C.1.4.9.7 Physical Thresh 1 Day Tab, page C-54
- C.1.4.9.8 STS Config Tab, page C-55
- C.1.4.9.9 Alarm Behavior Tab, page C-55
- C.1.4.9.10 Loopback Tab, page C-55
- C.1.4.9.11 Auto Laser Shutdown Tab, page C-56
- C.1.4.9.12 Protection Tab, page C-56
- C.1.4.9.13 J1 Path Trace Tab, page C-57
- C.1.4.9.14 Customer Info Tab, page C-57

C.1.4.9.1 Line Config Tab

The Line Config tab allows you to view and change the line settings of an optical card.

Table C-92 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Port Rate	Sets the rate of the new port.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.

Table C-92 Field Descriptions for the Line Config Tab (continued)

Field	Description
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC-3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
Provides Sync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
SendDoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AINS Soak Count Down	Automatic in-service soak countdown. Displays the remaining time of valid input signal in *hh:mm* format, after which the card becomes in service (IS) automatically.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Admin SSM	If the node does not receive an SSM signal, it defaults to synchronization traceability unknown (STU). Admin SSM allows you to override the STU value with one of the following: • PRS—Primary reference source (Stratum 1) • STS2—Stratum 2 • TNC—Transit node clock • STS3E—Stratum 3E • STS3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4
Send <FF> DoNotUse	When checked, sends a do not use (DUS) (0xff) message on the S1 byte.

Table C-92 Field Descriptions for the Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected.

C.1.4.9.2 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the near- and far-end 15-minute threshold settings of an optical card.

Table C-93 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the optical port number.

Table C-93 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.
PSC	In a 1 + 1 protection scheme for a working card, protection switching count (PSC) is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM is applicable only if revertive line-level protection switching is used. PSC is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
PSD	Protection switching duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, it is a count of the seconds that the line was used to carry service. The PSD PM is applicable only if revertive line-level protection switching is used. PSD is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.

C.1.4.9.3 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the near- and far-end 1-day threshold settings of an optical card.

Table C-94 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.

Table C-94 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.
PSC	In a 1 + 1 protection scheme for a working card, protection switching count (PSC) is a count of the number of times service switches from a working card to a protection card plus the number of times service switches back to the working card. For a protection card, PSC is a count of the number of times service switches to a working card from a protection card plus the number of times service switches back to the protection card. The PSC PM is applicable only if revertive line-level protection switching is used. PSC is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
PSD	Protection switching duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, it is a count of the seconds that the line was used to carry service. The PSD PM is applicable only if revertive line-level protection switching is used. PSD is supported in revertive and nonrevertive modes. **Note** This parameter is not supported for transponder or muxponder cards.
Far End	
Port Number	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line (FC-L) lists a count of the number of near-end line failure events. A failure event begins when an AIS-L failure is declared, or when a lower-layer, traffic-related, near-end failure is declared. This failure event ends when the failure is cleared. A failure event that begins in one period and ends in another period is counted only in the period where it begins.

C.1.4.9.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the near-end 15-minute section threshold settings of an optical card.

Table C-95 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.

Table C-95 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.1.4.9.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the near-end 1-day section threshold settings of an optical card.

Table C-96 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.

C.1.4.9.6 Physical Thresh 15 Min Tab

The Physical Thresh 15 Min tab allows you to view and change 15-minute physical threshold information on an optical card.

Table C-97 Field Descriptions for the Physical Thresh 15 Min Tab

Field	Description
Port No.	Pluggable entity number and port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 200 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 20 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the optical power received (OPR) establishes the received power level as 100 percent. If the received power decreases, then the OPR percentage decreases to reflect the loss in received power. For example, if the received power decreases 3-dBm, the OPR decreases 50 percent.

C.1.4.9.7 Physical Thresh 1 Day Tab

The Physical Thresh 1 Day tab allows you to view and change 1-day physical threshold information on an optical card.

Table C-98 Field Descriptions for the Physical Thresh 1 Day Tab

Field	Description
Port No.	Pluggable entity number and port number.
LBC-HIGH	Maximum laser bias current. The default is (15 min): 200 percent.
LBC-LOW	Minimum laser bias current. The default is (15 min): 20 percent.
OPT-HIGH	Maximum optical power transmitted. The default is (15 min): 120 percent.
OPT-LOW	Minimum optical power transmitted. The default is (15 min): 80 percent.
OPR-HIGH	Maximum optical power received. The default is (15 min): 200 percent.
OPR-LOW	Minimum optical power received. The default is (15 min): 50 percent.
Set OPR	Setting the OPR establishes the received power level as 100 percent. If the received power decreases, then the OPR percentage decreases to reflect the loss in received power. For example, if the received power decreases 3-dBm, the OPR decreases 50 percent.

C.1.4.9.8 STS Config Tab

The STS Config tab allows you to view and change the STS settings of an optical card.

Table C-99 Field Descriptions for the STS Config Tab

Field	Description
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable IPPM and uncheck to disable IPPM.
XC Loopback	Displays the cross-connect loopback status.

C.1.4.9.9 Alarm Behavior Tab

The Alarm Behavior tab allows you to view and change optical card alarm profile information.

Table C-100 Field Descriptions for the Alarm Behavior Tab

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.1.4.9.10 Loopback Tab

The Loopback tab allows you to view and change optical card loopback information.

Table C-101 Field Descriptions for the Loopback Tab

Field	Description
Port Number	Displays the port number.
Administration State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Send AIS on Facility Loopback	When selected, sends AIS on the facility loopback.
Send AIS on Terminal Loopback	When selected, sends AIS on the terminal loopback.

C.1.4.9.11 Auto Laser Shutdown Tab

The Auto Laser Shutdown tab allows you to view and update optical card auto laser shutdown (ALS) parameters.

Table C-102 Field Descriptions for the Auto Laser Shutdown Tab

Field	Description
Port Number	Displays the port number.
ASL Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.1.4.9.12 Protection Tab

The Protection tab allows you to view and update protection group information.

Table C-103 Field Descriptions for the Protection Tab

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.

Table C-103 Field Descriptions for the Protection Tab (continued)

Field	Description
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock-out switching, or lock-on switching.

C.1.4.9.13 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and retrieve J1 path trace information.

Table C-104 Field Descriptions for the J1 Path Trace Tab

Field	Description
Port Number	Displays the port number.
STS Number	Displays the synchronous transport signal number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Display	Click the **Display** button to view the circuit trace information. See 7.2.20.7 Viewing a J1 Path Trace from the NE Explorer, page 7-173 for more information.
Retrieve	Click the **Retrieve** button to retrieve J1 path trace information.

C.1.4.9.14 Customer Info Tab

The Customer Info tab displays customer information.

Table C-105 Field Descriptions for the Customer Info Tab

Field	Description
STS Number	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.4.10 Alarm Extenders

The Alarm Extenders Properties pane allows you to view CTX-CL600 alarm information. The Alarm Extenders Properties pane contains the following tabs:

- C.1.4.10.1 External Alarms Tab, page C-58
- C.1.4.10.2 External Controls Tab, page C-58
- C.1.4.10.3 User-Defined Alarms Tab, page C-58

C.1.4.10.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table C-106 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	A default description is provided in this line for every external alarm that is enabled.
Raised	Indicates if an alarm has been raised.
Contact Status	Indicates the current status of the contact.

C.1.4.10.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table C-107 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

C.1.4.10.3 User-Defined Alarms Tab

The User-Defined Alarms tab allows you to view, add, and delete custom alarm types on CTX-CL600 cards.

Table C-108 Field Descriptions for the User-Defined Alarms Tab

Field	Description
Alarm Types	Lists the user-defined alarm types that have been created on the CTX-CL600 card. You can create up to 50 custom environmental alarms, which are reported in the Condition column in the Alarm Log and Alarm Browser windows.
Add	Click the **Add** button to add a new custom alarm type. Enter a unique alarm type name that contains 20 characters or fewer. Only the following characters are valid: 0-9, A-Z, a-z, and hyphen (-).
Delete	Click the **Delete** button to delete an existing alarm type.

C.1.4.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the CTX-CL600 module.

Table C-109 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.5 Slot Properties—FILLER

The slot properties pane displays information about the ONS 15310 CL, ONS 15310 MA SONET, ONS 15310 MA SDH, ONS 15454 SONET, ONS 15454 SDH, ONS 15600 SONET, or ONS 15600 SDH slot that is selected in the NE Explorer tree. For the FILLER module, the slot properties pane displays the Module View.

C.1.5.1 Module View

The Module View displays a graphic of the FILLER card that is installed in the slot. Right-clicking the graphic opens a shortcut menu that you can use to add a card.

C.1.6 Slot Properties—MIC-28-3-A and MIC-28-3-B

The slot properties pane displays information about the Cisco ONS 15327 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MIC-28-3-A and MIC-28-3-B cards are the Mechanical Interface Cards (MICs). The MICs provide the physical connection points for the DS-1 and DS-3 interfaces on the XTC cards, the redundant power inputs, the alarm inputs and outputs, and the BITS timing inputs and outputs.

For the MIC module, the slot properties pane displays Module View and Identification properties.

C.1.6.1 Module View

The Module View displays a graphic of the MIC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.6.2 Identification

The Identification Properties pane allows you to view and update MIC identification information.

Table C-110 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.7 Slot Properties—MMU (ONS 15454 SONET and ONS 15454 SDH)

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

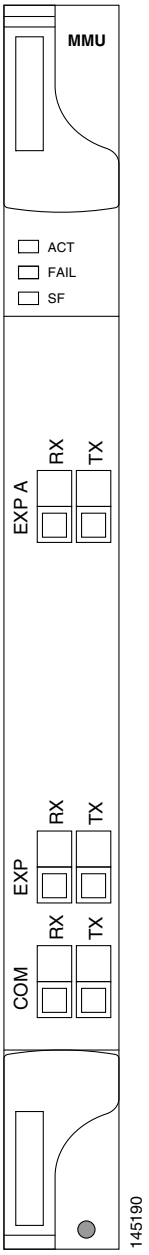
The Multi-Ring/Mesh Upgrade Unit (MMU) supports multiring and mesh upgrades for reconfigurable optical add/drop (ROADM) nodes in both the C-band and the L-band. Mesh/multiring upgrade is the capability to optically bypass a given wavelength from one section of the network or ring to another one without requiring 3R regeneration. In each node, you need to install two MMUs, one on the east side and one on the west side. You can install the MMU card in slots 1 through 6 and 12 through 17.

The MMU has six ports:

- EXP RX port—Receives the optical signal from the ROADM section available on the NE.
- EXP TX port—Sends the optical signal to the ROADM section available on the NE.
- EXP-A RX port—Receives the optical signal from the ROADM section available on other NEs or rings.
- EXP-A TX port—Sends the optical signal to the ROADM section available on other NEs or rings.
- COM TX port—Sends the optical signal to the fiber stage section.
- COM RX port—Receives the optical signal from the fiber stage section.

The following figure shows the card faceplate.

Figure C-2 MMU Faceplate and Ports



For the MMU module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, and Inventory.

C.1.7.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.7.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-111 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.7.3 Optical Line

The Optical Line Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.1.7.3.1 Parameters Tab, page C-63
- C.1.7.3.2 Warning Thresh 15 Min Tab, page C-64
- C.1.7.3.3 Warning Thresh 1 Day Tab, page C-64
- C.1.7.3.4 Alarm Thresh Tab, page C-64

C.1.7.3.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-112 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Displays the port type.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-112 Field Descriptions for the Parameters Tab (continued)

Field	Description
Administration State	Displays the status of the channel. Values are: • IS—In Service; able to carry traffic. • OOS_DSBLD—Out of Service–Disabled. Unable to carry traffic. • IS_AINS—In Service–Auto In Service. Alarm reporting is suppressed, but traffic is carried. • OOS_MT—Out of Service–Maintenance. Alarm reporting is suppressed, but traffic is carried and loopbacks are allowed.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.

C.1.7.3.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert (TCA) generation.

Table C-113 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Displays the port type.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.1.7.3.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-114 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Displays the port type.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.1.7.3.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-115 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Power Failure Low (dBm)	Allows you to set the low power failure settings.

C.1.7.4 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-116 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

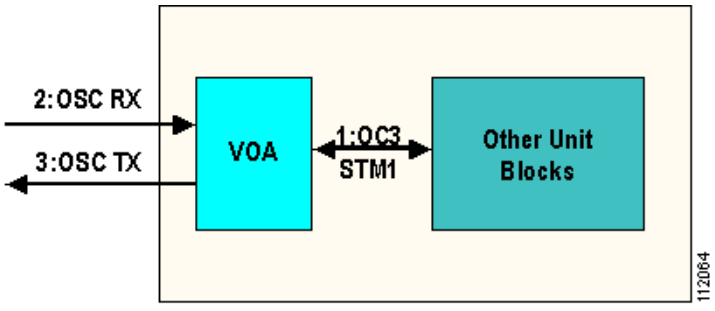
C.1.8 Slot Properties—OSCM (ONS 15454 SONET and ONS 15454 SDH)

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Optical Service Channel Modem (OSCM) module is a single-slot card with a 1510 nm OC-3 optical transceiver interface. The OSCM features a variable optical attenuator (VOA) in the transmit path and a 100BASE-T FE user data channel. The OSCM also distributes the synchronous clock to all NEs on the ring.

The following figure shows the block diagram.

Figure C-3 OSCM Module



For the OSCM module, the slot properties pane displays the following properties: Module View, Identification, Line, Optical Line, Inventory, and Alarm Behavior.

C.1.8.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.8.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-117 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.8.3 Line

The Line Properties pane allows you to view and update line card information.

Table C-118 Field Descriptions for the Line Properties Pane

Field	Description
Line Config	
Port No.	The port number.
Port Name	The port name.
SD BER	The signal degrade bit error rate.
SF BER	The signal fail bit error rate.

Table C-118 Field Descriptions for the Line Properties Pane (continued)

Field	Description
Type	The port type (SONET or SDH).
PJSTSMon#	The STS that will be used for pointer justification. If set to zero, no STS is used.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state.
Line Thresh 15 Minute - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Line Thresh 1 Day - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Section Thresh 15 Min, Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Section Thresh 1 Day, Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.

Table C-118 Field Descriptions for the Line Properties Pane (continued)

Field	Description
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.

C.1.8.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-119 Field Descriptions for the Optical Line Properties Pane

Tab	Description
Parameters	
Port Number	The port number.
Port Name	The port name.
Status	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT).
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Line Direction (*available in CTM R7.2 and earlier*)	The direction of the line (west-to-east or east-to-west).
Type	The port type.
Power	The laser power.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref	The VOA reference power.
VOA Power Calib	The VOA calibration power.
VOA Attenuation Ref	The VOA reference attenuation.
OSC Power	Shows the current optical service channel (OSC) power level per port.
VOA Attenuation Calib	The VOA calibration attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	The lower power threshold.
Power High	The upper power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.

Table C-119 Field Descriptions for the Optical Line Properties Pane (continued)

Tab	Description
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	The lower power threshold.
Power High	The upper power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	The lower power failure threshold.
Power Degrade High	The upper power degrade threshold.
Power Degrade Low	The lower power degrade threshold.
VOA Degrade High	The upper VOA degrade threshold.
VOA Degrade Low	The lower VOA degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Failure High	Allows you to set the high OSC power failure threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.

C.1.8.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-120 Field Descriptions for the Inventory Properties Pane

Field	Description
Serial Number	The serial number that is unique to each card.
IL-REF	The reference insertion loss.
Part Number	The part number that is printed on the top of the card.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.
Vendor ID	The ID of the vendor.
Hardware Version	The hardware version number.

C.1.8.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-121 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.9 Slot Properties—SSXC

The slot properties pane displays information about the Cisco ONS 15600 SONET and ONS 15600 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The SSXC card provides a fully nonblocking 6144 bidirectional STS-1 matrix.

Note In NE releases earlier than release 5.0, the SSXC card is called the CXC card.

For the SSXC, the slot properties pane displays Module View and Identification properties.

C.1.9.1 Module View

The Module View displays a graphic of the SSXC card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.9.2 Identification

The Identification Properties pane allows you to view and update SSXC identification information.

Table C-122 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.10 Slot Properties—TCC+

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Timing Communication and Control+ (TCC+) card performs system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SONET data communications channel (DCC) termination, and system fault detection for the ONS 15327 and ONS 15454. The TCC+ also ensures that the system maintains Telcordia timing requirements.

For the TCC+ module, the slot properties pane displays Module View and Identification properties.

C.1.10.1 Module View

The Module View displays a graphic of the TCC+ that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).

C.1.10.2 Identification

The Identification Properties pane allows you to view and update TCC+ identification information.

Table C-123 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.11 Slot Properties—TCC-I

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Timing Communication and Control-International (TCC-I) Card performs system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SONET data communications channel (DCC) termination, and system fault detection for the ONS 15454 SDH. The TCC-I also ensures that the system maintains Telcordia timing requirements.

For the TCC-I module, the slot properties pane displays Module View and Identification properties.

C.1.11.1 Module View

The Module View displays a graphic of the TCC-I that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.1.11.2 Identification

The Identification Properties pane allows you to view and update TCC-I identification information.

Table C-124 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for; for example, TCC+ or TCC-I.
Actual Equipment Type	Displays the actual card that is installed in the slot; for example, TCC+ or TCC-I.
HW Part No	Displays the part number that is printed on the top of the card.
HW Hardware Revision	Displays the card revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the hardware revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.12 Slot Properties—TCC2

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Advanced Timing, Communications, and Control (TCC2) performs system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SDH section overhead (SOH) data communication channel/generic communication channel (DCC/GCC) termination, and system fault detection for the ONS 15454 SDH. The TCC2 also ensures that the system maintains Stratum 3E (ITU-T G.813) timing requirements. It monitors the supply voltage of the system. The TCC2 card can work with the XC10G, XC-VXL-10G, or XC-VXL-2.5G cross-connect cards. It requires software release 5.0 or later.

For the TCC2 module, the slot properties pane displays the following properties: Module View, Identification, and Info.

C.1.12.1 Module View

The Module View displays a graphic of the TCC2 that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.12.2 Identification

The Identification Properties pane allows you to view and update TCC2 identification information.

Table C-125 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.12.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the TCC2 card.

Table C-126 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.13 Slot Properties—TCC2P

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Advanced Timing, Communications, and Control Plus (TCC2P) card is an enhanced version of the TCC2 card. The primary enhancements are Ethernet security features and 64K composite clock BITS timing.

The TCC2P card performs system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SONET SOH DCC/GCC termination, and system fault detection for the ONS 15454. The TCC2P also ensures that the system maintains Stratum 3 (Telcordia GR-253-CORE) timing requirements. It monitors the supply voltage of the system.

Note The TCC2P card requires software release 5.0 or later.

For the TCC2P module, the slot properties pane displays the following properties: Module View, Identification, and Info.

C.1.13.1 Module View

The Module View displays a graphic of the TCC2P that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.13.2 Identification

The Identification Properties pane allows you to view and update TCC2P identification information.

Table C-127 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.13.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the TCC2P card.

Table C-128 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

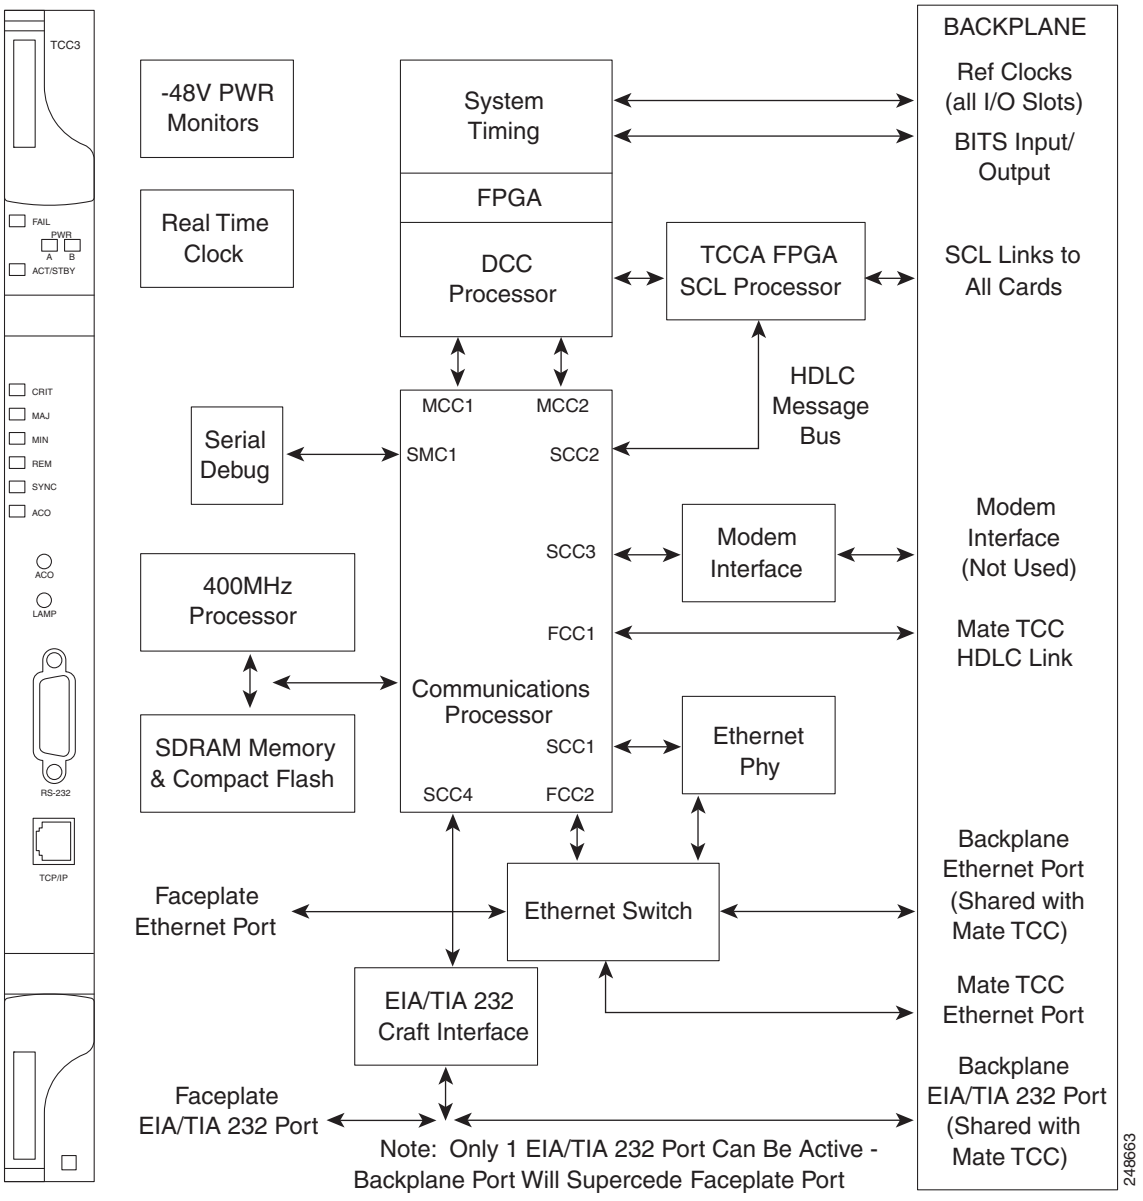
C.1.14 Slot Properties—TCC3

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Timing Communications Control Three (TCC3) card is an enhanced version of the TCC2P card. The primary enhancements include the increase in memory size and compact flash space. The TCC3 card boots up as a TCC2P card in older releases and as a TCC3 card from Release 9.2 onwards. The TCC3 card supports multi-shelf management. The TCC3 card acts as a shelf controller and node controller for the ONS 15454.

The following figure shows the TCC3 faceplate and block diagram.

Figure C-4 TCC3 Faceplate and Block Diagram



For the TCC3 module, the slot properties pane displays the following properties: Module View, Identification, and Info.

C.1.14.1 Module View

The Module View displays a graphic of the TCC3 card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.14.2 Identification

The Identification Properties pane allows you to view and update TCC3 card identification information.

Table C-129 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the Suppress Alarms check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.1.14.3 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the TCC3 card.

Table C-130 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.15 Slot Properties—TNC and TNCE

(Cisco ONS 15454 M2 and ONS 15454 M6 only)

The Transport Node Controller (TNC) and the Transport Node Controller - Enhanced (TNCE) combines the functions of multiple cards such as TCC2P, OSCM, ISC, and AIC-I. The cards support the ONS 15454 M2 and ONS 15454 M6 shelf assemblies. The TNCE card is optimized for Ethernet transport and has support for Synchronous-Ethernet (SyncE) and IEEE1588-2008 Precision Time Protocol to add support for Two-Way Time Transfer (TWTT).

The TNC and TNCE cards are provisioned as master and slave in the ONS 15454 M6 shelf, and as a stand-alone card in the ONS 15454 M2 shelf. The TNC and TNCE card serves as the processor card for the node. The TNC and TNCE cards cannot be inserted in the same shelf.

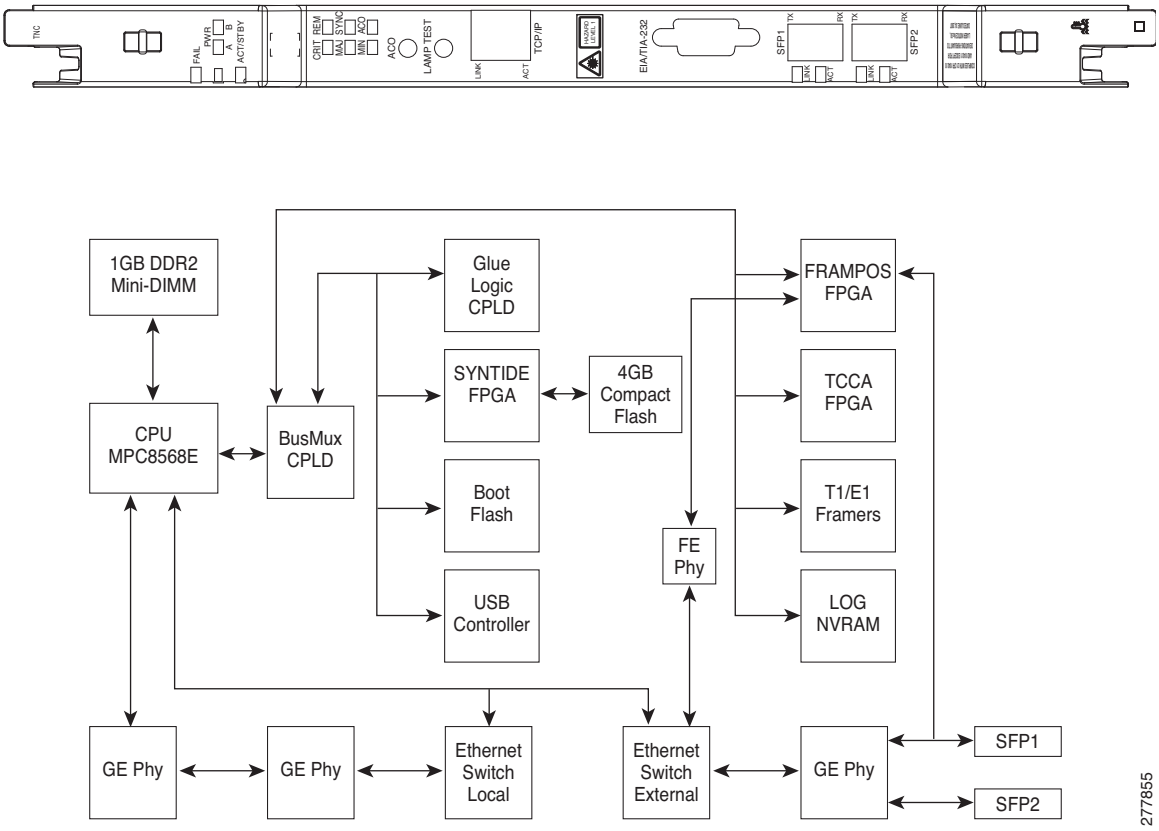
On the ONS 15454 M6 shelf, install redundant TNC and TNCE cards in slots 1 and 8. If the active TNC or TNCE card fails, system traffic switches to the redundant TNC or TNCE card respectively. The card supports line cards from slots 2 to 7.

On the ONS 15454 M2 shelf, install the stand-alone TNC or TNCE card in slot 1. The TNC and TNCE cards support line cards in slots 2 and 3.

The following figure shows the TNC faceplate and block diagram.

Note Both the TNC and TNCE cards are displayed as TNC in the NE Explorer.

Figure C-5 TNC Faceplate and Block Diagram



The slot properties pane displays the following properties: Module View, Identification, PPM, Alarm Behavior, UDC/VOIP, Optical Thresh, Auto Laser Shutdown, Line, and RMON Thresholds.

C.1.15.1 Module View

The Module View displays a graphic of the TNC or TNCE card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s).
Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.15.2 Identification

The Identification Properties pane allows you to view and update TNC or TNCE card identification information.

Table C-131 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.

Table C-131 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the Suppress Alarms check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.1.15.3 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-132 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Administration State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
PPM	

Table C-132 Field Descriptions for the PPM Properties Pane (continued)

Field	Description
Port	Displays the port number for the PPM in the Pluggable Port Modules area.
Rate	Displays the port rate for the PPM in the Pluggable Port Modules area.

C.1.15.4 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update TNC or TNCE card alarm profile information.

Table C-133 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Displays the alarm profile that has been configured for the card. You can choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.1.15.5 UDC/VOIP

You can configure UDC/VoIP on a specific port. The TNC or TNCE card supports the UDC/VoIP configuration only when Optical Supervisory Channel (OSC) is configured on the ports. From the **Service Type** drop-down list, choose UDC or VOIP.

C.1.15.6 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.1.15.6.1 TCA 15 Min Tab, page C-82
- C.1.15.6.2 TCA 1 Day Tab, page C-83
- C.1.15.6.3 Alarm Thresh Tab, page C-83

C.1.15.6.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-134 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
LBC-High	Displays the maximum threshold for the laser bias current.
OPR-High	Displays the maximum threshold for the optical power received.

Table C-134 Field Descriptions for the TCA 15 Min Tab (continued)

Field	Description
OPR-Low	Displays the minimum threshold for the optical power received.
OPT-High	Displays the maximum threshold for the optical power transmitted.
OPT-Low	Displays the minimum threshold for the optical power transmitted.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.6.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-135 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
LBC-High	Displays the maximum threshold for the laser bias current.
OPR-High	Displays the maximum threshold for the optical power received.
OPR-Low	Displays the minimum threshold for the optical power received.
OPT-High	Displays the maximum threshold for the optical power transmitted.
OPT-Low	Displays the minimum threshold for the optical power transmitted.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.6.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-136 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
LBC-High	Displays the maximum threshold for the laser bias current.
OPR-High	Displays the maximum threshold for the optical power received.
OPR-Low	Displays the minimum threshold for the optical power received.
OPT-High	Displays the maximum threshold for the optical power transmitted.
OPT-Low	Displays the minimum threshold for the optical power transmitted.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-137 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
OC3 Line	
Port Number	Displays the port number.
OSRI	Displays the OSRI. Values are: • On—Laser switch is locked on • Off—(Cisco default) There is no lock on the lasers
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.
FE Line	
Port Number	Displays the port number.
OSRI	Displays the OSRI. Values are: • On—Laser switch is locked on • Off—(Cisco default) There is no lock on the lasers
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.
ONE GE Line	
Port Number	Displays the port number.
OSRI	Displays the OSRI. Values are: • On—Laser switch is locked on • Off—(Cisco default) There is no lock on the lasers
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.

Table C-137 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.1.15.8 Line

The Line Properties pane allows you to configure line information. The Properties pane contains the following tabs:

- C.1.15.8.1 Ports Tab, page C-85
- C.1.15.8.2 OC3 Tab, page C-86
- C.1.15.8.3 Line Thresh 15 Min Tab, page C-87
- C.1.15.8.4 Line Thresh 1 Day Tab, page C-88
- C.1.15.8.5 Section Thresh 15 Min Tab, page C-88
- C.1.15.8.6 Section Thresh 1 Day Tab, page C-89

C.1.15.8.1 Ports Tab

The ports tab allows you to provision PPM parameters of a TNC or TNCE card.

Table C-138 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.

Table C-138 Field Descriptions for the Ports Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)

C.1.15.8.2 OC3 Tab

The OC3 tab allows you to view and change the OC3 line settings on the TNC or TNCE card.

Table C-139 Field Descriptions for the OC3 Tab

Field	Description
Port Number	Displays the card port number.
Port Name	Displays the port name.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
PJSTSMon#	Sets the STS that will be used for pointer justification. If set to 0, no STS is monitored. Only one STS can be monitored on each OC-N port. • 0 (default)–3 (OC-3, per port) • 0 (default)–12 (OC-12) • 0 (default)–48 (OC-48)
SendDoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.

C.1.15.8.3 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change 15-minute near- and far-end line thresholds for the TNC or TNCE card.

Table C-140 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.
UAS-L	Displays the unavailable seconds line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.

Table C-140 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
UAS-L	Displays the unavailable seconds line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.8.4 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change 1-day near- and far-end line thresholds for the TNC or TNCE card.

Table C-141 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.
UAS-L	Displays the unavailable seconds line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port Number	Displays the port number.
CV-L	Displays the coding violations line.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
FC-L	Displays the failure count line.
UAS-L	Displays the unavailable seconds line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.8.5 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change 15-minute near-end section thresholds for the TNC or TNCE card.

Table C-142 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.

Table C-142 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.8.6 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change 1-day near-end regenerator section thresholds for the TNC or TNCE card.

Table C-143 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.1.15.9 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for the TNC or TNCE card. These thresholds are applicable to Fast Ethernet and Gigabit Ethernet Pluggable rates.

Table C-144 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Index Number	Displays the optical port number.
Slot	Displays the slot.
Port	Displays the port.
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising and Falling.
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period (sec)	Displays the Ethernet threshold sample period, in seconds.
Rising Thresholds (count)	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresholds (count)	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.

C.1.16 Slot Properties—TSC and TSCE

(Cisco ONS 15454 M2 and ONS 15454 M6 only)

The Transport Shelf Controller (TSC) and Transport Shelf Controller - Enhanced (TSCE) cards combine the functions of multiple cards such as TCC2P, ISC, and AIC-I. The cards support the ONS 15454 M2 and ONS 15454 M6 shelf assemblies. The TSCE is optimized for Ethernet transport and has support for Synchronous-Ethernet (SyncE) and IEEE1588-2008 Precision Time Protocol to add support for Two-Way Time Transfer (TWTT).

The TSC and TSCE cards are provisioned as master and slave in the ONS 15454 M6 shelf, and as a stand-alone card in the ONS 15454 M2 shelf. The TSC and TSCE cards serve as the processor card for the node.

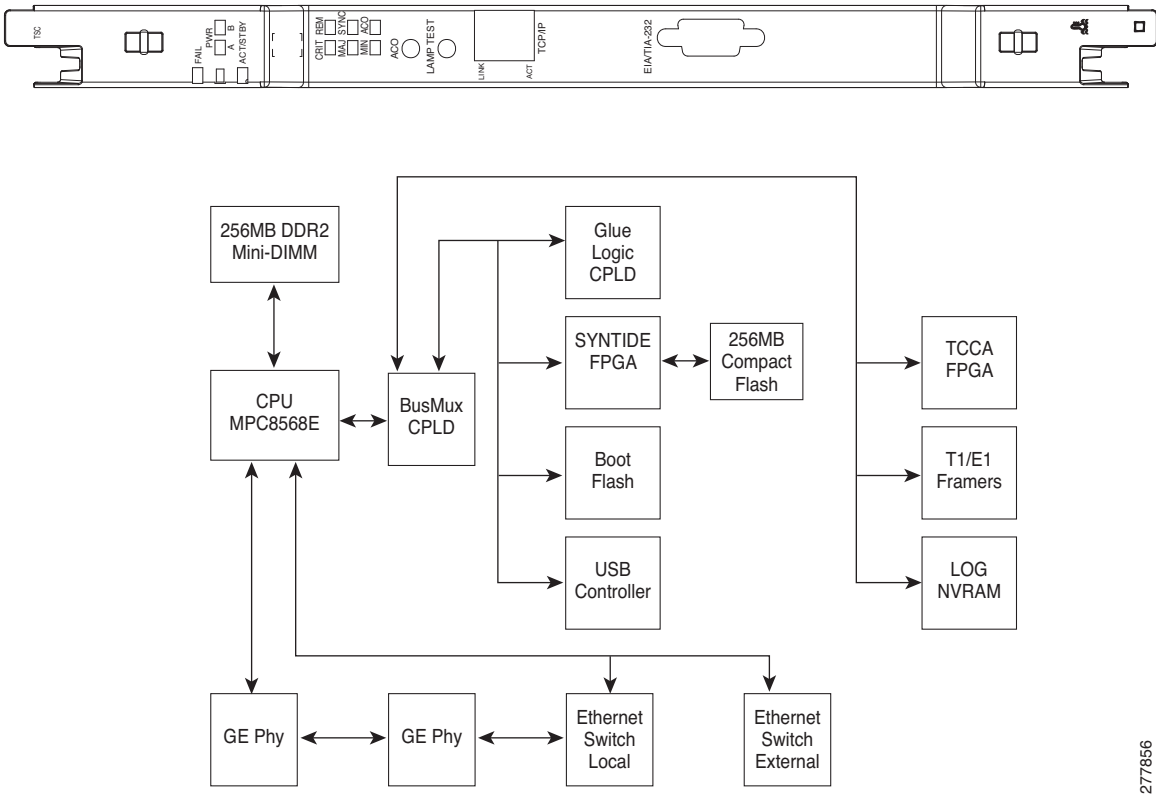
On the ONS 15454 M6 shelf, install redundant TSC or TSCE cards in slots 1 and 8. If the active TSC or TSCE card fails, system traffic switches to the redundant TSC or TSCE card. The TSC or TSCE card supports line cards from slots 2 to 7.

On the ONS 15454 M2 shelf, install the stand-alone TSC or TSCE card in slot 1. The TSC or TSCE card supports line cards in slots 2 and 3.

The following figure shows the TSC faceplate and block diagram.

Note Both the TSC and TSCE cards are displayed as TSC in the NE Explorer.

Figure C-6 TSC Faceplate and Block Diagram



The slot properties pane displays the following properties: Module View and Identification.

C.1.16.1 Module View

The Module View displays a graphic of the TSC or TSCE card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.1.16.2 Identification

The Identification Properties pane allows you to view and update TSC or TSCE card identification information.

Table C-145 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.

Table C-145 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format Administrative_State-Operational_State, Status_Attribute.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the Suppress Alarms check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.1.17 Slot Properties—TSC (ONS 15600 SONET and ONS 15600 SDH)

The slot properties pane displays information about the Cisco ONS 15600 SONET or ONS 15600 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The timing and shelf controller (TSC) card performs all system-timing functions for each ONS 15600. The TSC card monitors the recovered clocks from each traffic card and two building integrated timing supply (BITS) interfaces for frequency accuracy.

For the TSC module, the slot properties pane displays Module View and Identification properties.

C.1.17.1 Module View

The Module View displays a graphic of the TSC card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.17.2 Identification

The Identification Properties pane allows you to view and update TSC identification information.

Table C-146 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.18 Slot Properties—Unprovisioned Slot (ONS 15327 and ONS 15454 SONET)

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET subrack slot that is selected in the NE Explorer tree. Unprovisioned slots are slots that are not polled by the TCC. Unprovisioned slots display a Module View.

C.1.18.1 Module View

The Module View displays a graphic of the ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. For unprovisioned slots, a blank slot graphic is displayed.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.19 Slot Properties—Unprovisioned Slot (ONS 15454 SDH)

The slot properties pane displays information about the Cisco ONS 15454 SDH subrack slot that is selected in the NE Explorer tree. Unprovisioned slots are slots that are not polled by the TCC. Unprovisioned slots display a Module View.

C.1.19.1 Module View

The Module View displays a graphic of the ONS 15454 SDH slot that is selected in the NE Explorer tree. For unprovisioned slots, a blank slot graphic is displayed.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.20 Slot Properties—XC

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15327 or ONS 15454 Cross-Connect (XC) card performs port-to-port time-division multiplexing (TDM), STS switching, and can terminate 288 STSs, or 144 STS cross-connections. Each STS cross-connection uses two STS ports on the XC card STS matrix.

For the XC module, the slot properties pane displays the following properties: Module View, Identification, and Protection.

C.1.20.1 Module View

The Module View displays a graphic of the XC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.1.20.2 Identification

The Identification Properties pane allows you to view and update XC identification information.

Table C-147 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the serial number that is unique to each card.

Table C-147 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.20.3 Protection

The Protection Properties pane allows you to view and update XC protection group information.

Table C-148 Field Descriptions for the Protection Properties Pane

Field	Description
State of Slot *x*	Displays the state of the selected slot and of the companion XC slot.
Switch	Click to switch the selected slot from its current state to the other states.
Lock	Click to lock the selected slot into its current state.
Unlock	Click to unlock the current slot from its current state.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.21 Slot Properties—XC-VXL-10G

The slot properties pane displays information about the Cisco ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The XC-VXL-10G card cross-connects E-1, E-3, DS-3, STM-1, STM-4, STM-16, and STM-64 signal rates. The XC-VXL-10G provides a maximum of 384 x 384 VC-4 nonblocking cross-connections, 384 x 384 VC-3 nonblocking cross-connections, or 2016 x 2016 VC-12 nonblocking cross-connections. It is designed for 10-Gb/s solutions.

For the XC-VXL-10G module, the slot properties pane displays the following properties: Module View, Identification, and Protection.

C.1.21.1 Module View

The Module View displays a graphic of the XC-VXL-10G that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.1.21.2 Identification

The Identification Properties pane allows you to view and update XC-VXL-10G identification information.

Table C-149 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.21.3 Protection

The Protection Properties pane allows you to view and update XC-VXL-10G protection group information.

Table C-150 Field Descriptions for the Protection Properties Pane

Field	Description
State of Slot *x*	Displays the state of the selected slot and of the companion XC-VXL-10G slot.
Switch	Click to switch the selected slot from its current state to the other states.
Lock	Click to lock the selected slot into its current state.
Unlock	Click to unlock the current slot from its current state.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.22 Slot Properties—XC10G

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

ONS 15454 SONET and ONS 15454 SDH cross-connect cards establish connections and perform time division switching (TDS) at the STS-1 level between ONS 15454 traffic cards. The ONS 15454 SONET and ONS 15454 SDH 10 Gigabit Cross-Connect (XC10G) card cross-connects STS-12, STS-48, and

STS-192 signal rates. The XC10G provides a maximum of 1152 STS-1 cross-connections. Any STS-1 on any port can be connected to any other port, which means that the STS cross-connections are nonblocking.

For the XC10G module, the slot properties pane displays the following properties: Module View, Identification, Protection, and Info.

C.1.22.1 Module View

The Module View displays a graphic of the XC10G that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.22.2 Identification

The Identification Properties pane allows you to view and update XC10G identification information.

Table C-151 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.22.3 Protection

The Protection Properties pane allows you to view and update XC10G protection group information.

Table C-152 Field Descriptions for the Protection Properties Pane

Field	Description
State of Slot *x*	Displays the state of the selected slot and of the companion XC10G slot.
Switch	Click to switch the selected slot from its current state to the other states.
Lock	Click to lock the selected slot into its current state.
Unlock	Click to unlock the current slot from its current state.

C.1.22.4 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the XC10G card.

Table C-153 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.23 Slot Properties—XCVT

The slot properties pane displays information about the Cisco ONS 15327 or ONS 15454 SONET slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The ONS 15327 or ONS 15454 Cross-Connect Virtual Tributary (XCVT) performs port-to-port time-division multiplexing (TDM), STS and VT1.5 switching, and can terminate 288 STSs, or 144 STS cross-connections. (Each STS cross-connection uses two STS ports on the cross-connect card STS matrix.)

For the XCVT module, the slot properties pane displays the following properties: Module View, Identification, and Protection.

C.1.23.1 Module View

The Module View displays a graphic of the XCVT that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to add, delete, change, or reset the module.

C.1.23.2 Identification

The Identification Properties pane allows you to view and update XCVT identification information.

Table C-154 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for
Actual Equipment Type	Displays the actual card that is installed in the slot.
Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.23.3 Protection

The Protection Properties pane allows you to view and update XCVT protection group information.

Table C-155 Field Descriptions for the Protection Properties Pane

Field	Description
State of Slot *x*	Displays the state of the selected slot and of the companion XCVT slot.
Switch	Click to switch the selected slot from its current state to the other states.
Lock	Click to lock the selected slot into its current state.
Unlock	Click to unlock the current slot from its current state.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.24 Slot Properties—XCVXC

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

In the SONET system, the XCVXC card cross-connects STS-1 and VT1.5/VT2 layers. It provides full, nonblocking 1152 x 1152 port STS-1 cross-connections or 2688 x 2688 port VT1.5 cross-connections.

In the SDH system, the XCVXC card cross-connects VC-3, VC-4, and VC-12/VC-11 layers. It provides 384 x 384 VC-3/TUG-3 cross-connections, full, nonblocking 384 x 384 VC-4 (and 4-Nc) cross-connections, or 2016 x 2016 VC-12 cross-connections.

Cross-connect and provisioning information is established through the user interface on the TCC2 card.

For the XCVXC card, the slot properties pane displays the following properties: Module View, Identification, Protection, and Info.

C.1.24.1 Module View

The Module View displays a graphic of the XCVXC card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.24.2 Identification

The Identification Properties pane allows you to view and update XCVXC card identification information.

Table C-156 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Select the designation that determines whether an entity is in service or out of service. The administration state is the driver for the service state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-156 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.24.3 Protection

The Protection Properties pane allows you to view and update XCVXC protection group information.

Table C-157 Field Descriptions for the Protection Properties Pane

Field	Description
State of Slot *x*	Displays the state of the selected slot and of the companion XCVXC slot.
Switch	Click to switch the selected slot from its current state to the other states.
Lock	Click to lock the selected slot into its current state.
Unlock	Click to unlock the current slot from its current state.

C.1.24.4 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the XCVXC card.

Table C-158 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.1.25 Slot Properties—XTC (ONS 15305)

The slot properties pane displays information about the CTC-based ONS 15305 that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Integrated Cross-Connect, Timing, and Control (XTC) cards perform system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SONET data communications channel (DCC) termination, system fault detection, and cross-connect maintenance and management for the ONS 15305 CTC. The XTC cards also provide the circuitry for the DS-1 and DS-3 interfaces and ensure that the system maintains Telcordia timing requirements. An XTC card is required to operate the ONS 15305 CTC and can be used in a redundant or nonredundant configuration.

For the ONS 15305 CTC XTC controller, the slot properties pane displays a single Module View.

C.1.25.1 Module View

The Module View displays a graphic of the XTC controller that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.26 Slot Properties—XTC (ONS 15327)

The slot properties pane displays information about the Cisco ONS 15327 slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Integrated Cross-Connect, Timing, and Control (XTC) cards perform system initialization, provisioning, alarm reporting, maintenance, diagnostics, IP address detection/resolution, SONET data communications channel (DCC) termination, system fault detection, and cross-connect maintenance and management for the ONS 15327. The XTC cards also provide the circuitry for the DS-1 and DS-3 interfaces and ensure that the system maintains Telcordia timing requirements. An XTC card is required to operate the ONS 15327 and can be used in a redundant or nonredundant configuration.

For the XTC module, the slot properties pane displays the following properties: Module View, Identification, DS-1, DS-3, STS-1 Path, VT1.5 Path, Alarm Extenders, Protection, and J1 Path Trace.

C.1.26.1 Module View

The Module View displays a graphic of the XTC that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.1.26.2 Identification

The Identification Properties pane allows you to view and update XTC identification information.

Table C-159 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type that the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.

Table C-159 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.1.26.3 DS-1

The DS-1 Properties pane allows you to view and update XTC DS-1 information.

Table C-160 Field Descriptions for the DS-1 Properties Pane

Subfield	Description
Line Config	
Port Number	Displays the port number: • 1 to 14 (XTC-14) • 1 to 28 (XTC-28-3)
Port Name	Allows you to enter the name of the port. You can enter up to 32 alphanumeric or special characters. The port name is blank by default.
Line Type	Defines the line framing type as ESF (Extended Super Frame), D4, or unframed.
Line Coding	Allows you to define the DS-1 transmission coding type. Values are: • AMI—Alternate Mark Inversion (default) • B8ZS—Bipolar 8 Zero Substitution
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are: • 0–131 (default) • 132–262 • 263–393 • 394–524 • 525–655

Table C-160 Field Descriptions for the DS-1 Properties Pane (continued)

Subfield	Description
State	Displays the status of the line. Values are: • IS—In Service • IS_AINS—In Service–Auto In Service Soak • OOS—Out of Service • OOS_MT—Out of Service–Maintenance
AINS Soak	Automatic in-service soak. The amount of valid input signal in *hh.mm*, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
AINS Soak Count Down	Displays the remaining time of valid input signal in *hh.mm*, after which the card becomes in service (IS) automatically. The range is from 0 to 48 hours, in 15-minute increments.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Send AIS-V for DS-1 AIS	When checked, sends an Alarm Indication Signal VT (AIS-V) instead of a DS-1 AIS (from the line side toward the backplane/system side) when a line-side trigger occurs.
Raise AIS for LOF	Sends an AIS when a loss of frame (LOF) occurs.
Line Threshold 15 Minutes	
Port Number	The port number (1 to 14 for XTC-14; 1 to 28 for XTC-28-3).
CV-L	Coding violations line (near-end only).
ES-L	Errored seconds line.
SES-L	Severely errored seconds line (near-end only).
LOSS-L	Loss of signal seconds line (near-end only).
Line Threshold 1 Day	
Port Number	The port number (1 to 14 for XTC-14; 1 to 28 for XTC-28-3).
CV-L	Coding violations line (near-end only).
ES-L	Errored seconds line.
SES-L	Severely errored seconds line (near-end only).
LOSS-L	Loss of signal seconds line (near-end only).
Electric Path Threshold 15 Minutes	
Near End	
Port Number	The port number (1 to 14 for XTC-14; 1 to 28 for XTC-28-3).
CV-P	Coding violations path information.
ES-P	Errored seconds path information.
SES-P	Severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal–path information.
AISS-P	Alarm indication signal seconds path information.
UAS-P	Unavailable seconds path information.
Far End	
Port Number	The port number (1 to 14 for XTC-14; 1 to 28 for XTC-28-3).

Table C-160 Field Descriptions for the DS-1 Properties Pane (continued)

Subfield	Description
CV-P	Coding violations path information.
ES-P	Errored seconds path information.
SES-P	Severely errored seconds path information.
UAS-P	Unavailable seconds path information.
ESA-P	Errored seconds type A path information.
ESB-P	Errored seconds type B path information.
CSS-P	Controlled slip seconds path information.
SEFS-P	Severely errored framing seconds path information.
Electric Path Threshold 1 Day	
Near End	
Port Number	The port number (1 to 14 for XTC-14; 1 to 28 for XTC-28-3).
CV-P	Coding violations path information.
ES-P	Errored seconds path information.
SES-P	Severely errored seconds path information.
SAS-P	Severely errored frame/alarm indication signal path information.
AISS-P	Alarm indication signal seconds path information.
UAS-P	Unavailable seconds path information.
Far End	
Port Number	The port number (1 to 14 for XTC-14; 1 to 28 for XTC-28-3).
CV-P	Coding violations path information.
ES-P	Errored seconds path information.
SES-P	Severely errored seconds path information.
UAS-P	Unavailable seconds path information.
ESA-P	Errored seconds type A path information.
ESB-P	Errored seconds type B path information.
CSS-P	Controlled slip seconds path information.
SEFS-P	Severely errored framing seconds path information.
Alarm Behavior	
Displays alarm profile information.	
Loopback	
Line Number	The line number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT). **Note** The line state must be OOS_MT before you can configure the loopback type.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none).
Customer Info	

Table C-160 Field Descriptions for the DS-1 Properties Pane (continued)

Subfield	Description
STS Number	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.26.4 DS-3

The DS-3 Properties pane allows you to view and update XTC DS-3 information.

Table C-161 Field Descriptions for the DS-3 Properties Pane

Field	Description
Line Config	
Port Number	Displays the port number (1 to 3).
Port Name	Allows you to enter the name of the port. You can enter up to 32 alphanumeric or special characters. The port name is blank by default.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. Values are: • 0 - 225 (default) • 226 - 450
State	Displays the status of the line. Values are: • IS—In Service • IS_AINS—In Service–Auto In Service Soak • OOS—Out of Service • OOS_MT—Out of Service–Maintenance
AINS Soak	Automatic in-service soak. The amount of valid input signal in *hh.mm*, after which the port is set in service by the software. The range is from 0 to 48 hours, in 15-minute increments.
AINS Soak Count Down	Displays the remaining time of valid input signal in *hh.mm*, after which the card becomes IS automatically. The range is from 0 to 48 hours, in 15-minute increments.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
Line Threshold 15 Minutes	
Port Number	The port number (1 to 3).
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal seconds line.
Line Threshold 1 Day	
Port Number	The port number (1 to 3).
CV-L	Coding violations line.
ES-L	Errored seconds line.

Table C-161 Field Descriptions for the DS-3 Properties Pane (continued)

Field	Description
SES-L	Severely errored seconds line.
LOSS-L	Loss of signal seconds line.
Alarm Behavior	
Displays alarm profile information.	
Loopback	
Line Number	The line number.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT). **Note** The line state must be OOS_MT before you can configure the loopback type.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none).
Customer Info	
STS Number	Displays the STS number.
Customer ID	The customer ID.
Service ID	The service ID.

C.1.26.5 STS-1 Path

The STS-1 Properties pane allows you to view and update XTC STS-1 path information.

Table C-162 Field Descriptions for the STS-1 Path Properties Pane

Field	Description
Threshold 15 Minutes	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.

Table C-162 Field Descriptions for the STS-1 Path Properties Pane (continued)

Field	Description
Threshold 1 Day	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
PPJC-Pdet	Positive pointer justification count, STS path detected.
NPJC-Pdet	Negative pointer justification count, STS path detected.
PPJC-Pgen	Positive pointer justification count, STS path generated.
NPJC-Pgen	Negative pointer justification count, STS path generated.
PJCS-Pdet	Positive pointer justification count, STS path detected.
PJCS-Pgen	Positive pointer justification count, STS path generated.
PJC-Diff	The sum of the absolute values of differences between positive transmitted and received, and negative transmitted and received. The important metric on pointer justification is not the exact counts, but how many were absorbed.
Customer Info	
STS Number	The STS number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.1.26.6 VT1.5 Path

The VT1.5 Path Properties pane allows you to view and update XTC VT1.5 path information.

Table C-163 Field Descriptions for the VT1.5 Path Properties Pane

Field	Description
Threshold 15 Minutes STS Term	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Threshold 1 Day STS Term	
STS Number	The synchronous transport signal number.
CV-P	Coding violations path.
ES-P	Errored seconds path.

Table C-163 Field Descriptions for the VT1.5 Path Properties Pane (continued)

Field	Description
SES-P	Severely errored seconds path.
UAS-P	Unavailable seconds path.
FC-P	Failure count path.
Threshold 15 Minutes VT Term	
VT Number	The virtual terminal number.
CV-V	Coding violations–VT path.
ES-V	Errored seconds–VT path.
SES-V	Severely errored seconds–VT path.
UAS-V	Unavailable seconds–VT path.
Threshold 1 Day VT Term	
VT Number	The virtual terminal number.
CV-V	Coding violations–VT path.
ES-V	Errored seconds–VT path.
SES-V	Severely errored seconds–VT path.
UAS-V	Unavailable seconds–VT path.
Customer Info	
VT Number	The virtual terminal number.
Customer ID	The user-defined customer ID number.
Service ID	The user-defined service ID number.

C.1.26.7 Alarm Extenders

The Alarm Extenders Properties pane allows you view XTC alarm information. The Alarm Extenders Properties pane contains the following tabs:

- C.1.26.7.1 External Alarms Tab, page C-109
- C.1.26.7.2 External Controls Tab, page C-110

C.1.26.7.1 External Alarms Tab

The External Alarms tab allows you to view and update external alarm information.

Table C-164 Field Descriptions for the External Alarms Tab

Field	Description
Input Number	The alarm input number.
Enabled	Check to activate the fields for the alarm input number.
Alarm Type	Choose an alarm type from the provided list.
Severity	Choose a severity from the list.
Raised When	Choose the contact condition that will trigger the alarm in CTC.

Table C-164 Field Descriptions for the External Alarms Tab (continued)

Field	Description
Virtual Wire	To assign the external device to a virtual wire, choose a virtual wire from the list, or choose None if no assignment is required.
Description	A default description is provided in this line for every external alarm that is enabled.
Raised	Indicates if an alarm has been raised.
Contact Status	Indicates the current status of the contact.

C.1.26.7.2 External Controls Tab

The External Controls tab allows you to view and update external controls.

Table C-165 Field Descriptions for the External Controls Tab

Field	Description
Control Number	The control number.
Enabled	Check to activate the fields for the control number.
Control Type	Choose a control type from the provided list.
Trigger Type	Choose a trigger type: a local minor, major, or critical alarm; a remote minor, major, or critical alarm; or a virtual wire activation.
Description	Enter a description.
Current State	The current state of the control.
Auto State	The auto state of the control.
Contact Setting	The current contact setting.

C.1.26.8 Protection

The Protection Properties pane allows you to view and update XTC protection group information.

Table C-166 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection group.

C.1.26.9 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table C-167 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	Displays the STS number.

Table C-167 Field Descriptions for the J1 Path Trace Properties Pane (continued)

Field	Description
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.
Mismatch	Indicates whether there is a mismatch in the C2 byte received.
Vcat Member Number	Displays the virtual concatenation (VCAT) member number.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2 DWDM Cards

This section describes the following DWDM cards supported within Prime Optical:

- C.2.1 Slot Properties—2.5G_DM, page C-112
- C.2.2 Slot Properties—2.5G_DMP, page C-126
- C.2.3 Slot Properties—2.5G Multirate Transponder, page C-139
- C.2.4 Slot Properties—32DMX, page C-159
- C.2.5 Slot Properties—32DMX-L, page C-166
- C.2.6 Slot Properties—32DMX_O, page C-173
- C.2.7 Slot Properties—40-DMX-C, page C-177
- C.2.8 Slot Properties—32MUX_O, page C-184
- C.2.9 Slot Properties—40-MUX-C, page C-189
- C.2.10 Slot Properties—32WSS, page C-196
- C.2.11 Slot Properties—32WSS-L, page C-203
- C.2.12 Slot Properties—40-WSS-C, page C-210
- C.2.13 Slot Properties—40-WXC-C, page C-218
- C.2.14 Slot Properties—80-WXC-C, page C-226
- C.2.15 Slot Properties—40G-MXP-C, page C-238
- C.2.16 Slot Properties—4MD_xx.x, page C-255
- C.2.17 Slot Properties—AD_1B_xx.x, page C-259
- C.2.18 Slot Properties—AD_1C_xx.x, page C-264
- C.2.19 Slot Properties—AD_2C_xx.x, page C-269
- C.2.20 Slot Properties—AD_4B_xx.x, page C-273

- C.2.21 Slot Properties—AD_4C_xx.x, page C-278
- C.2.22 Slot Properties—ADM-10G, page C-283
- C.2.23 Slot Properties—GE_XP and 10GE_XP, page C-304
- C.2.24 Slot Properties—MXP_2.5G_10E, page C-346
- C.2.25 Slot Properties—MXP_2.5G_10G, page C-365
- C.2.26 Slot Properties—MXP_MR_10DME, page C-378
- C.2.27 Slot Properties—OPT-AMP-17-C and OPT-AMP-C, page C-399
- C.2.28 Slot Properties—OPT-AMP-L, page C-408
- C.2.29 Slot Properties—OPT-RAMP-C and OPT-RAMP-CE, page C-414
- C.2.30 Slot Properties—OPT-BST, page C-423
- C.2.31 Slot Properties—OPT-BST-E, page C-429
- C.2.32 Slot Properties—OPT-BST-L, page C-435
- C.2.33 Slot Properties—OPT-EDFA-17 and OPT-EDFA-24, page C-442
- C.2.34 Slot Properties—OPT-PRE, page C-448
- C.2.35 Slot Properties—OSC-CSM, page C-453
- C.2.36 Slot Properties—OTU2_XP, page C-458
- C.2.37 Slot Properties—PSM, page C-484
- C.2.38 Slot Properties—RAMAN-CTP and RAMAN-COP, page C-491
- C.2.39 Slot Properties—SMR-C, page C-498
- C.2.40 Slot Properties—T-DCU (TDC-CC and TDC-FC), page C-511
- C.2.41 Slot Properties—TXP_MR_10E, page C-515
- C.2.42 Slot Properties—TXP_MR_10E_C, page C-542
- C.2.43 Slot Properties—TXP_MR_10G, page C-563
- C.2.44 Slot Properties—PTF_10GE_4, page C-576
- C.2.45 Slot Properties—AR_MXP, AR_XP and AR_XPE, page C-588
- C.2.46 Slot Properties—10x10G_LC, 100G_LC_C, and CFP_LC, page C-621

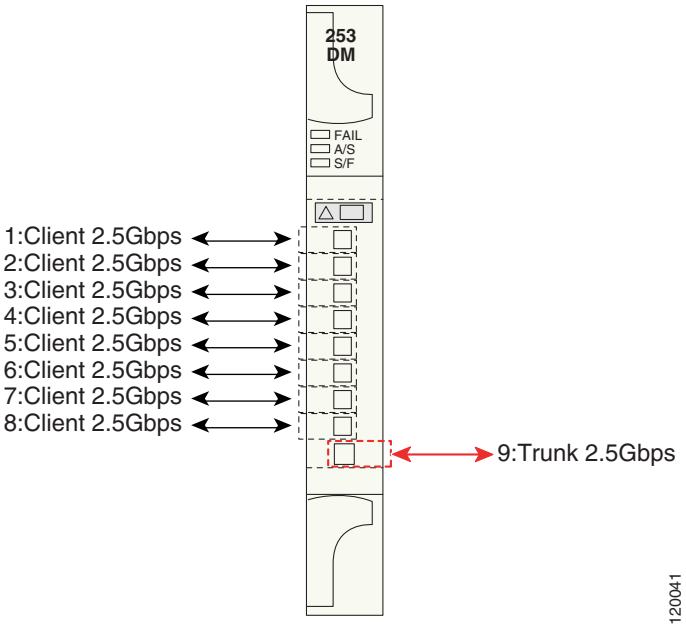
C.2.1 Slot Properties—2.5G_DM

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 2.5G-DM card is capable of translating client input GE, ESCON, FICON, 1G and 2G Fiber Channel, and IBM GDPS optical signal into an optical signal with an optical frequency on the 100-GHz spacing frequency grid according to ITU-T G.692. The datamux cards are GR-253 and G.957 compliant. This card supports 8 client interfaces utilizing SFP technology, and 32 ITU wavelengths are supported. Each card supports tunability over 4 wavelengths. The card is supported on ONS 15454 SONET and ONS 15454 SDH platforms.

The following figure shows the card faceplate.

Figure C-7 2.5G-DM Module



For the 2.5G_DM module, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

Note The properties shown depend on the NE configuration.

C.2.1.1 Module View

The Module View displays a graphic of the 2.5G_DM that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.1.2 Identification

The Identification Properties pane allows you to view and update 2.5G_DM identification information.

Table C-168 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.

Table C-168 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.1.3 Card

The Card Properties pane allows you to view and update card information.

Table C-169 Field Descriptions for the Card Properties Pane

Field	Description
Card Mode	Allows you to select a card mode. Select from: • FC_GE—Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards. • Mixed—Supports 1G FC or GE traffic on port 1, and ESCON traffic on ports 5 through 8. • ESCON—Supports 8 ports of ESCON traffic.

C.2.1.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-170 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
Pluggable Number	Displays the identifier of the plugin module.
Equipment Type	Displays the equipment type that the slot is provisioned for.

Table C-170 Field Descriptions for the PPM Properties Pane (continued)

Field	Description
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a plugin module ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the plugin module.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this plugin module and its port(s).
PPM	
Pluggable Number	Displays the identifier of the plugin module.
Equipment Type	Displays the plugin type that the port is provisioned for.

C.2.1.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.1.5 Line

The Line Properties pane allows you to configure line information. If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.1.5.1 Section Trace Tab, page C-116
- C.2.1.5.2 SONET Tab, page C-116
- C.2.1.5.3 Section Thresh 15 Min Tab, page C-117

- C.2.1.5.4 Section Thresh 1 Day Tab, page C-117
- C.2.1.5.5 Line Thresh 15 Min Tab, page C-118
- C.2.1.5.6 Line Thresh 1 Day Tab, page C-118
- C.2.1.5.7 Wavelength Trunk Settings Tab, page C-119
- C.2.1.5.8 Client Tab, page C-119
- C.2.1.5.9 RMON Thresholds Tab, page C-121
- C.2.1.5.10 Distance Extension Tab, page C-122
- C.2.1.5.11 Enhanced FC/FICON ISL Tab, page C-122

Note If the card is installed on an ONS 15454 SDH NE, see the SDH Line section. The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

C.2.1.5.1 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the 2.5G-DM card.

Table C-171 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.1.5.2 SONET Tab

The SONET tab allows you to view and change the SONET line settings for the 2.5G-DM module.

Table C-172 Field Descriptions for the SONET Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance

Table C-172 Field Descriptions for the SONET Tab (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Type	Defines the port.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
SendDoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin SSM	Overrides the synchronization status message (SSM) synchronization traceability unknown (STU) value. If the node does not receive an SSM signal, it defaults to STU.

C.2.1.5.3 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change 15-minute near-end section thresholds for the 2.5G_DM module.

Table C-173 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.5.4 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change 1-day near-end regenerator section thresholds for the 2.5G_DM module.

Table C-174 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.

Table C-174 Field Descriptions for the Section Thresh 1 Day Tab (continued)

Field	Description
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.5.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change 15-minute near- and far-end line thresholds for the 2.5G_DM module.

Table C-175 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	The port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.5.6 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change 1-day near- and far-end line thresholds for the 2.5G_DM module.

Table C-176 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	The port number.

Table C-176 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
CV-L	Coding violations line.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.5.7 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the 2.5G_DM card.

Table C-177 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table (11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13) for details of wavelengths supported.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.

C.2.1.5.8 Client Tab

The Client tab allows you to provision PPM parameters for the 2.5G_DM card.

Table C-178 Field Descriptions for the Client Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you enter a port name.

Table C-178 Field Descriptions for the Client Tab (continued)

Field	Description
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-178 Field Descriptions for the Client Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.1.5.9 RMON Thresholds Tab

The RMON Thresholds Properties pane allows you to view RMON thresholds for the 2.5G_DM module.

Table C-179 Field Descriptions for the RMON Thresholds Tab

Field	Description
Show all RMON Thresholds	When checked, shows all RMON thresholds.
Index Number	Displays the optical port number.
Slot	Displays the slot.

Table C-179 Field Descriptions for the RMON Thresholds Tab (continued)

Field	Description
Port	Displays the port.
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising and Falling.
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period (sec)	Displays the Ethernet threshold sample period, in seconds.
Rising Thresh	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresh	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.

C.2.1.5.10 Distance Extension Tab

The Distance Extension tab allows you to enable the buffer-to-buffer extension between the client and the 2.5G_DM card in order to increase the DWDM distance without affecting the throughput.

Table C-180 Field Descriptions for the Distance Extension Tab

Field	Description
Port Number	Displays the port number. • Client interface: 1 to 8 • Trunk: 9
Enable Distance Extension	Allows end-to-end distances of up to 1600 km for 1 GFC and up to 800 km for 2 GFC.
Auto Detect Credits	Allows automatic detection of buffer credits for flow control.
Credits Available	Displays the number of credits available.
Autoadjust GFP Buffer Threshold	Allows the threshold of the generic framing procedure (GFP) buffer between two 2.5G_DM cards. This is automatically adjusted.
GFP Buffers Available	Displays the number of GFP buffers available between two 2.5G_DM cards.

C.2.1.5.11 Enhanced FC/FICON ISL Tab

The Enhanced FC/FICON ISL tab allows you to enable the field programmable gate array (FPGA) to drop duplicate frames.

Table C-181 Field Descriptions for the Enhanced FC/FICON ISL Tab

Field	Description
Port Number	Displays the port number.
Maximum Frame Size	Allows you to select the maximum frame size supported by the FICON/FC. Valid range is from 2148 to 2172.

C.2.1.6 Loopback

The Loopback Properties pane allows you to view and update 2.5G_DM loopback information.

Table C-182 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.1.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-183 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.1.8 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.1.8.1 TCA 15 Min Tab, page C-124
- C.2.1.8.2 TCA 1 Day Tab, page C-124
- C.2.1.8.3 Alarm Thresh Tab, page C-124

C.2.1.8.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-184 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.8.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-185 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.8.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-186 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.1.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update 2.5G_DM alarm profile information.

Table C-187 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.1.10 Protection

The Protection Properties pane allows you to view and update 2.5G_DM protection group information.

Table C-188 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.1.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the 2.5G_DM card.

Table C-189 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

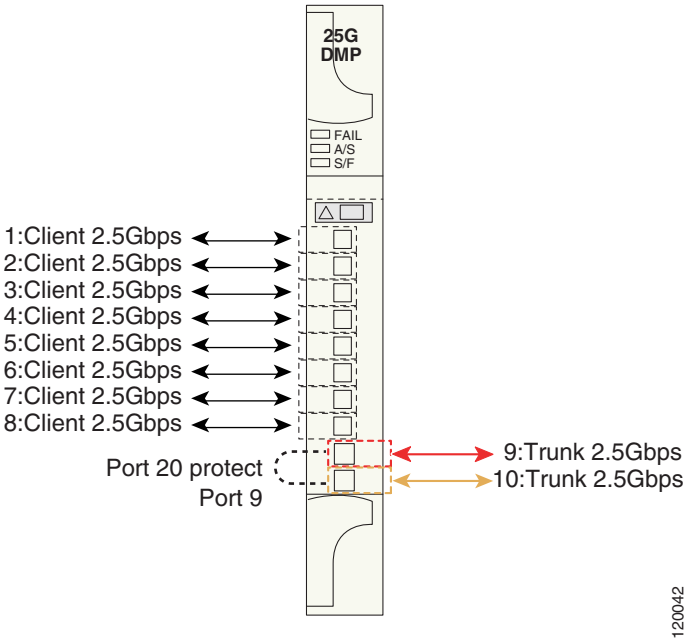
C.2.2 Slot Properties—2.5G_DMP

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 2.5G-DMP card is capable of translating client input GE, ESCON, FICON, 1G and 2G Fiber Channel, and IBM GDPS optical signal into an optical signal with an optical frequency on the 100 GHz spacing frequency grid according to ITU-T G.692. The datamux cards are GR-253 and G.957 compliant. This card supports eight client interfaces utilizing SFP technology and protection on the trunk side. 32 ITU wavelengths are supported. Each card supports tunability over four wavelengths. This card is supported on ONS 15454 SONET and ONS 15454 SDH platforms.

The following figure shows the card faceplate.

Figure C-8 2.5G-DMP Module



For the 2.5G_DMP module, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

Note Properties shown depend on whether the NE is a SONET or an SDH node.

C.2.2.1 Module View

The Module View displays a graphic of the 2.5G_DMP that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.2.2 Identification

The Identification Properties pane allows you to view and update 2.5G_DMP identification information.

Table C-190 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.2.3 Card

The Card Properties pane allows you to view and update card information.

Table C-191 Field Descriptions for the Card Properties Pane

Field	Description
Card Mode	Allows you to select a card mode. Select from: • FC_GE—Allows you to select a multicard Ether Switch group, a single-card Ether Switch group, or the Port Mapped mode for E-series cards. • Mixed—Supports 1G FC or GE traffic on port 1, and ESCON traffic on ports 5 through 8. • ESCON—Supports 8 ports of ESCON traffic.

C.2.2.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-192 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules (PPM)	
Pluggable Number	Displays the identifier of the plugin module.
Equipment Type	Displays the equipment type that the slot is provisioned for.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware revision number.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Actual Equipment Type	Displays the actual card that is installed in the slot. Values are single mode or multimode.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
User Code	Allows you to enter an ASCII string to identify the card. The user code is stored in nonvolatile memory so that it is not lost when the unit is moved or stored as a spare.
Product ID	Displays a plugin module ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	Displays the port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the plugin module.
Alarm Profile	Sets the alarm profile for the card.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this plugin module and its port(s).
PPM	
Pluggable Number	Displays the identifier of the plugin module.
Equipment Type	Displays the plugin type that the port is provisioned for.

C.2.2.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.2.5 Line

The Line Properties pane allows you to configure line information. If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.2.5.1 Section Trace Tab, page C-129
- C.2.2.5.2 SONET Tab, page C-129
- C.2.2.5.3 Section Thresh 15 Min Tab, page C-130
- C.2.2.5.4 Section Thresh 1 Day Tab, page C-130
- C.2.2.5.5 Line Thresh 15 Min Tab, page C-131
- C.2.2.5.6 Line Thresh 1 Day Tab, page C-131
- C.2.2.5.7 Wavelength Trunk Settings Tab, page C-132
- C.2.2.5.8 Client Tab, page C-132
- C.2.2.5.9 RMON Thresholds Tab, page C-134
- C.2.2.5.10 Distance Extension Tab, page C-135
- C.2.2.5.11 Enhanced FC/FICON ISL Tab, page C-135

Note If the card is installed on an ONS 15454 SDH NE, see the SDH Line section. The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

C.2.2.5.1 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the 2.5G_DMP card.

Table C-193 Field Descriptions for the Section Trace Tab

Field	Description
Port Number	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.2.5.2 SONET Tab

The SONET tab allows you to view and change the SONET line settings for the 2.5G-DMP module.

Table C-194 Field Descriptions for the SONET Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
SF BER	Sets the signal fail bit error rate.
SD BER	Sets the signal degrade bit error rate.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).

C.2.2.5.3 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute near-end section thresholds of the 2.5G_DMP card.

Table C-195 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays Errored seconds section.
SES-S	Displays Severely errored seconds section.
SEFS-S	Displays Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.5.4 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day near-end section thresholds of the 2.5G_DMP card.

Table C-196 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port Number	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.5.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end line thresholds of the 2.5G_DMP card.

Table C-197 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	The port number.
ES-L	Errored seconds line
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
ES-L	Errored seconds line
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.5.6 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day near- and far-end line thresholds of the 2.5G_DMP card.

Table C-198 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.5.7 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the 2.5G_DMP card.

Table C-199 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.

C.2.2.5.8 Client Tab

The Client tab allows you to provision PPM parameters for the 2.5G_DMP card.

Table C-200 Field Descriptions for the Client Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter a port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-200 Field Descriptions for the Client Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.2.5.9 RMON Thresholds Tab

The RMON Thresholds tab allows you to view, create, and delete RMON threshold settings for the 2.5G_DMP card.

Table C-201 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index Number	Displays the optical port number.
Slot	Displays the slot.
Port	Displays the port.

Table C-201 Field Descriptions for the RMON Thresholds Tab (continued)

Field	Description
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising and Falling.
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. **Relative** restricts the threshold to using the number of occurrences in the user-set sample period. **Absolute** sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period (sec)	Displays the Ethernet threshold sample period, in seconds.
Rising Thresholds	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresholds	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.
Create	Click the **Create** button to create an RMON threshold.
Delete	Select an RMON threshold from the list displayed and click the **Delete** button.

C.2.2.5.10 Distance Extension Tab

The Distance Extension tab allows you to enable the buffer-to-buffer extension between the client and the 2.5G_DMP card in order to increase the DWDM distance without affecting the throughput.

Table C-202 Field Descriptions for the Distance Extension Tab

Field	Description
Port Number	Displays the port number. • Client Interface: 1 to 8 • Trunk: 9 to 10
Enable Distance Extension	Allows end-to-end distances of up to 1600 km for 1 GFC and up to 800 km for 2 GFC.
Auto Detect Credits	Allows automatic detection of buffer credits for flow control.
Credits Available	Displays the number of credits available.
Autoadjust GFP Buffer Threshold	Allows the threshold of the GFP buffer between two 2.5G_DMP cards. This is automatically adjusted.
GFP Buffers Available	Displays the number of GFP buffers available between two 2.5G_DMP cards.

C.2.2.5.11 Enhanced FC/FICON ISL Tab

The Enhanced FC/RCON ISL tab allows you to enable the FCGA to drop duplicate frames.

Table C-203 Field Descriptions for the Enhanced FC/FICON ISL Tab

Field	Description
Port Number	Displays the port number.
Maximum Frame Size	Allows you to select the maximum frame size supported by the FICON/FC. Valid range is from 2148 to 2172.

C.2.2.6 Loopback

The Loopback Properties pane allows you to view and update 2.5G_DMP loopback information.

Table C-204 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.2.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-205 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 2.0 to 100.0 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 60 to 300 seconds.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.2.8 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.2.8.1 TCA 15 Min Tab, page C-137
- C.2.2.8.2 TCA 1 Day Tab, page C-137
- C.2.2.8.3 Alarm Thresh Tab, page C-137

C.2.2.8.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-206 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.8.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-207 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.8.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-208 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.2.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update 2.5G_DMP alarm profile information.

Table C-209 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.2.10 Protection

The Protection Properties pane allows you to view and update 2.5G_DMP protection group information.

Table C-210 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.2.11 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the 2.5G_DMP card.

Table C-211 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.3 Slot Properties—2.5G Multirate Transponder

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 2.5-Gb/s multirate transponder cards operate on the ITU grid and provide the ONS 15454 SONET and ONS 15454 SDH with enhanced economics in metro DWDM solutions. The multirate transponder cards provide a 2R/3R transponder functionality over a bit rate of 100 Mb/s to 2.5 Gb/s. The cards also provide a single-mode fiber DWDM interface. Multirate transponder cards use pluggable small form factor client interfaces. The cards translate the client input optical signal into an optical signal with an optical frequency on the spacing frequency grid according to ITU-T G.692. The cards are GR-253 and G.957 compliant.

There are two versions of the multirate 2.5G transponder card:

- Multirate 2.5G transponder, nonfiber-protected (TXP_MR_2.5G_xx.x)
- Multirate 2.5G transponder, fiber-protected (TXPP_MR_2.5G_xx.x)

Prime Optical supports DVB-ASI and ISC1 payloads on TXP_MR_2.5G and TXPP _MR_2.5G cards. Using these payloads, you can:

- Manage L1 circuits and links with endpoints.
- Manage historical PM data and alarms related to the client payloads for TXP-MR-2.5G and TXPP-MR-2.5G cards.
- Retrieve and set RMON thresholds.

Perform the following steps to provision the payloads:

Step 1 Click the **OTN** Properties pane.

Step 2 Disable FEC and G709 OTN. If G709 is not disabled, PPM cannot be enabled.

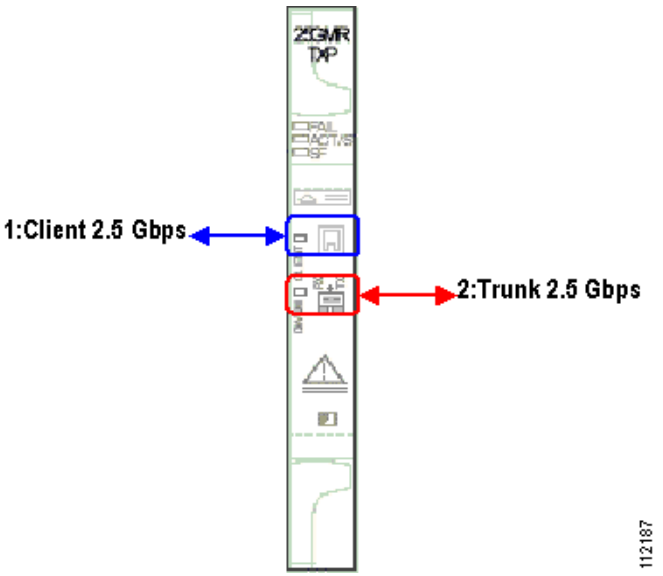
Step 3 Click the **PPM** Properties pane and create a PPM for port 1.

Step 4 Provision the rate DVB-ASI or ISC1 by selecting the appropriate rate in the **Port Rate** drop-down list.

Note When using protection groups, you can provision only the working port.

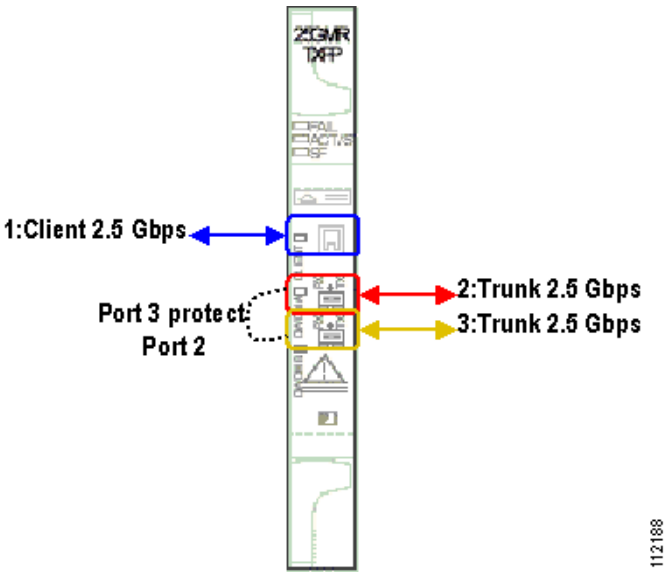
The following figure shows the multirate 2.5G transponder, nonfiber-protected (TXP_MR_2.5G_xx.x) card faceplate.

Figure C-9 TXP_MR_2.5G_xx.x Module



The following figure shows the multirate 2.5G transponder, fiber-protected (TXPP_MR_2.5G_xx.x) card faceplate.

Figure C-10 TXPP_MR_2.5G_xx.x Module



For the 2.5G Multirate Transponder, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info. The properties shown depend on the NE configuration.

C.2.3.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.3.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-212 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Admin State	Displays the admin state of the card.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.3.3 Card

The Card Properties pane allows you to view and update card information.

Table C-213 Field Descriptions for the Card Properties Pane

Field	Description
Framing Type	*Display only.* The framing type is unframed.
Termination Mode	Allows you to set the mode of termination. The termination mode can be transparent, multiplexer section (MS), or regeneration section (RS). The Termination Mode is displayed as transparent and is read-only if you configured DVB-ASI or ISC1.

Table C-213 Field Descriptions for the Card Properties Pane (continued)

Field	Description
Regeneration Peer Slot	Allows you to select like cards so that you can configure a regeneration peer group.
Regeneration Group Name	(Optional) Allows you to set the name of the regeneration group.

C.2.3.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-214 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	Displays the service state of the plugin module. Values are: • Unknown—The state cannot be determined. • Not Installed—The plugin module is not installed. • Out of Service—The plugin module is installed but is not commissioned and is not carrying traffic. • In Service—The plugin module is commissioned and carrying traffic.

Table C-215 Description of Ports Configured in the PPM

Field	Description
Port	Displays the port configured in the PPM.
Rate	Displays the rate provisioned for the port.

C.2.3.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.3.5 Line

The Line Properties pane allows you to configure line information.

If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.3.5.1 Line Config Tab, page C-143

- C.2.3.5.2 Section Trace Tab, page C-144
- C.2.3.5.3 SONET Line Tab, page C-145
- C.2.3.5.4 Section Thresh 15 Min Tab, page C-146
- C.2.3.5.5 Section Thresh 1 Day Tab, page C-147
- C.2.3.5.6 Line Thresh 15 Min Tab, page C-147
- C.2.3.5.7 Line Thresh 1 Day Tab, page C-148
- C.2.3.5.8 Wavelength Trunk Settings Tab, page C-148

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.3.5.9 Line Config Tab, page C-149
- C.2.3.5.10 Section Trace Tab, page C-150
- C.2.3.5.11 SDH Line Tab, page C-151
- C.2.3.5.12 RS Thresh 15 Min Tab, page C-152
- C.2.3.5.13 RS Thresh 1 Day Tab, page C-153
- C.2.3.5.14 MS Thresh 15 Min Tab, page C-153
- C.2.3.5.15 MS Thresh 1 Day Tab, page C-153
- C.2.3.5.16 Wavelength Trunk Settings Tab, page C-154

C.2.3.5.1 Line Config Tab

The Line Config tab allows you to provision PPM parameters of a multirate 2.5G transponder card.

Table C-216 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-216 Field Descriptions for the Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.3.5.2 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-217 Field Descriptions for the Section Trace Tab

Field	Description
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.

Table C-217 Field Descriptions for the Section Trace Tab (continued)

Field	Description
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.3.5.3 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-218 Field Descriptions for the SONET Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.

Table C-218 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.3.5.4 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute section threshold information for the card.

Table C-219 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.

Table C-219 Field Descriptions for the Section Thresh 15 Min Tab (continued)

Field	Description
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.5 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day section threshold information for the card.

Table C-220 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.6 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold information for the card.

Table C-221 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.

Table C-221 Field Descriptions for the Line Thresh 15 Min Tab (continued)

Field	Description
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.7 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold information for the card.

Table C-222 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.8 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-223 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.

Table C-223 Field Descriptions for the Wavelength Trunk Settings Tab (continued)

Field	Description
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.3.5.9 Line Config Tab

The Line Config tab allows you to provision PPM parameters of a multirate 2.5G transponder card.

Table C-224 Field Descriptions for the Line Config Tab

Field	Description
Port Number	Displays the port number.
Port Name	Allows you to add a port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

Table C-224 Field Descriptions for the Line Config Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.3.5.10 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-225 Field Descriptions for the Section Trace Tab

Field	Description
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.

Table C-225 Field Descriptions for the Section Trace Tab (continued)

Field	Description
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.3.5.11 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the card.

Table C-226 Field Descriptions for the SDH Line Tab

Field	Description
Port No.	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.

Table C-226 Field Descriptions for the SDH Line Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.3.5.12 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute regeneration section threshold for the card.

Table C-227 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.

Table C-227 Field Descriptions for the RS Thresh 15 Min Tab (continued)

Field	Description
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.13 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day regeneration section threshold for the card.

Table C-228 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.14 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end multiplex section threshold for the card.

Table C-229 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.15 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day near- and far-end multiplex section threshold for the card.

Table C-230 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.5.16 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-231 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.3.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for multirate transponder cards. If you provisioned the payloads DVB-ASI or ISC1, all other subtabs except OTN Line are blank.

Note OTN is supported only for trunk ports.

Table C-232 Field Descriptions for the OTN Properties Pane

Field	Description
G.709 Thresh 15 Min	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.

Table C-232 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
G.709 Thresh 1 Day	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
FEC Thresh 15 Minutes	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
FEC Thresh 1 Day	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in one-day intervals.

Table C-232 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
Uncorrectable Words	Displays the uncorrectable words in one-day intervals.
Trail Trace Identifier	
Port No.	The port number.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.
OTN Line	
Port No.	The port number.
G.709 OTN	Disables or enables the G.709 OTN feature. If you provisioned the payloads DVB-ASI or ISC1, this field displays the current status of the G.709 OTN feature: enabled or disabled.
FEC	Disables or enables forward error correction. If you provisioned the payloads DVB-ASI or ISC1, this field displays the status of forward error correction: enabled or disabled. **Note** OTN must be enabled before you can enable FEC.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.3.7 Loopback

The Loopback Properties pane allows you to view and update card loopback information.

Table C-233 Field Descriptions for the Loopback Properties Pane

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance

Table C-233 Field Descriptions for the Loopback Properties Pane (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.3.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown (ALS) parameters.

Table C-234 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the received laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the received laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.3.9 Optical Threshold

The Optical Threshold Properties pane allows you to view and update optical threshold information.

Table C-235 Field Descriptions for the Optical Threshold Properties Pane

Field	Description
Warning 15 Min	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.

Table C-235 Field Descriptions for the Optical Threshold Properties Pane (continued)

Field	Description
Reset to Defaults button	Resets the value of the port parameters to the default value.
Warning 1 Day	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Alarm Threshold	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.3.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-236 Field Descriptions for the Alarm Behavior

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.3.11 Protection

The Protection Properties pane allows you to view and update card protection group information.

Note When using protection groups, you can provision only the working port.

Table C-237 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups. Y-cable (TXP_MR_2.5G) and splitter (TXPP_MR_2.5G) protection groups are supported.
Protection Group Details	Displays details about the selected protection groups, such as which port is the protected port and which port is the working port. Also allows you to execute switch commands.
Switch Commands	Allows you to perform a manual switch, perform a forced switch, or clear the existing command switching.
Inhibit Switching	Allows you to inhibit unlock switching, lock-out switching, or lock-on switching.

C.2.3.12 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-238 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.4 Slot Properties—32DMX

The slot properties pane displays information about the 32-channel demultiplexer that is selected in the NE Explorer. Use this properties pane to change the card properties.

The 32-Channel Demultiplexer card (32DMX) is a single-slot optical demultiplexer. The card receives an aggregate optical signal on its COM RX port and demultiplexes it into to 32 100-GHz-spaced channels.

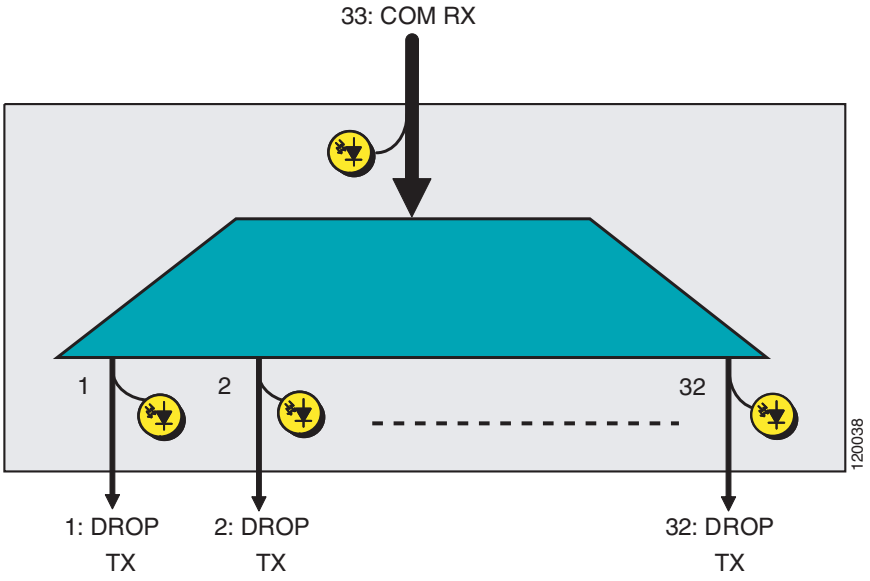
The 32DMX includes these high-level features:

- COM RX port—The input port for the aggregate optical signal being demultiplexed. This port is supported by both a VOA for optical power regulation and a photodiode for optical power monitoring.
- DROP ports (1-32)—On its output, the 32DMX provides 32 drop ports that are typically used for dropping channels within the ROADM node. Each drop port has a photodiode for optical power monitoring. Unlike the two-slot 32DMX-O demultiplexer, the drop ports on the 32DMX do not have a VOA per channel for optical power regulation.

Note The 32DMX card works in conjunction with the 32WSS card to create a software-controlled NE with ROADM functionality.

The following figure shows the block diagram.

Figure C-11 32DMX Module



For the 32DMX module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Inventory, and Alarm Behavior.

C.2.4.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.4.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-239 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.4.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.4.3.1 Parameters Tab, page C-161
- C.2.4.3.2 Warning Thresh 15 Min Tab, page C-162
- C.2.4.3.3 Warning Thresh 1 Day Tab, page C-163
- C.2.4.3.4 Alarm Thresh Tab, page C-163

C.2.4.3.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-240 Field Descriptions for the Parameters Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).

Table C-240 Field Descriptions for the Parameters Tab (continued)

Field	Description
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Power ADD	Displays the input power of the channel that is in ADD.
Path Value	Select if the path is in use (Active) or not (Standby) for each channel in ADD.

C.2.4.3.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-241 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).

Table C-241 Field Descriptions for the Warning Thresh 15 Min Tab (continued)

Field	Description
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.4.3.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-242 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.4.3.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-243 Field Descriptions for the Alarm Thresh Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
Power Add Fail Low	Displays the threshold of low power failure on the add channel port. The crossing of this threshold generates an LOS-P alarm.

C.2.4.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.4.4.1 Parameters Tab, page C-163
- C.2.4.4.2 Warning Thresh 15 Min Tab, page C-164
- C.2.4.4.3 Warning Thresh 1 Day Tab, page C-165
- C.2.4.4.4 Alarm Thresh Tab, page C-165

C.2.4.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-244 Field Descriptions for the Parameters Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Power ADD	Displays the input power of the channel that is in ADD.
Path Value	Select if the path is in use (Active) or not (Standby) for each channel in ADD.

C.2.4.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-245 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.4.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-246 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.4.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-247 Field Descriptions for the Alarm Thresh Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
Power Add Fail Low	Displays the threshold of low power failure on the add channel port. The crossing of this threshold generates an LOS-P alarm.

C.2.4.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-248 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.4.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-249 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.5 Slot Properties—32DMX-L

The slot properties pane displays information about the 32-channel demultiplexer L-band that is selected in the NE Explorer. Use this properties pane to change the card properties.

The 32-Channel Demultiplexer L-Band card (32DMX-L) is a single-slot optical demultiplexer. The card receives an aggregate optical signal on its COM RX port and demultiplexes it into 32 100-GHz-spaced channels. The 32DMX-L card is particularly well suited for use in networks that employ DS fiber or SMF-28 single-mode fiber. The 32DMX-L card can be installed in slots 1 to 6 and in slots 12 to 17.

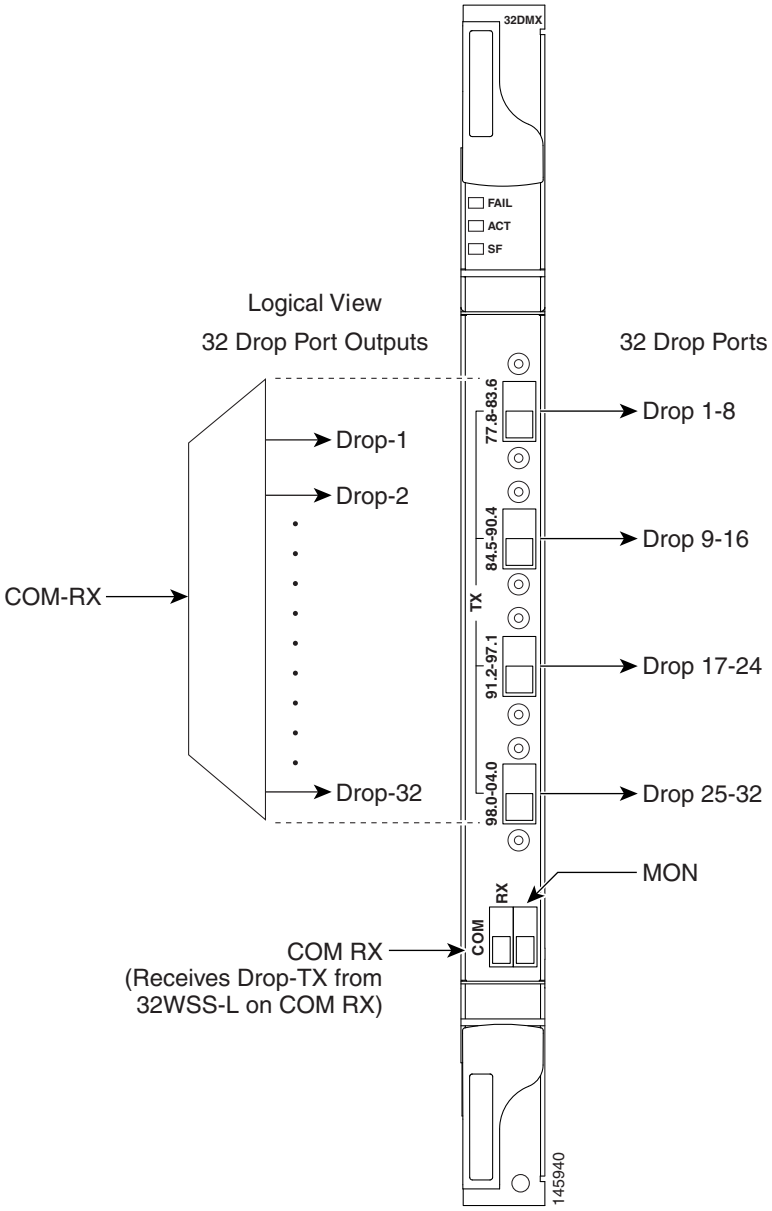
The 32DMX-L card includes these high-level features:

- COM RX port—The input port for the aggregate optical signal being demultiplexed. This port is supported by both a VOA for optical power regulation and a photodiode for optical power monitoring.
- DROP ports (1 to 32)—On its output, the 32DMX-L card provides 32 drop ports that are typically used for dropping channels within the ROADM node. Each drop port has a photodiode for optical power monitoring. Unlike the two-slot 32DMX-O demultiplexer, the drop ports on the 32DMX-L do not have a VOA per channel for optical power regulation.

A terminal site can be configured using only a 32WSS-L card and a 32DMX-L card plugged into the east or west side of the shelf.

The following figure shows the 32DMX-L card front panel and the basic traffic flow through the ports.

Figure C-12 32DMX-L Faceplate and Ports



For the 32DMX-L module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Inventory, and Alarm Behavior.

C.2.5.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.5.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-250 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.5.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.5.3.1 Parameters Tab, page C-168
- C.2.5.3.2 Warning Thresh 15 Min Tab, page C-169
- C.2.5.3.3 Warning Thresh 1 Day Tab, page C-169
- C.2.5.3.4 Alarm Thresh Tab, page C-170

C.2.5.3.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-251 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

C.2.5.3.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-252 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.5.3.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-253 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).

Table C-253 Field Descriptions for the Warning Thresh 1 Day Tab (continued)

Field	Description
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.5.3.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-254 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.

C.2.5.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.5.4.1 Parameters Tab, page C-170
- C.2.5.4.2 Warning Thresh 15 Min Tab, page C-171
- C.2.5.4.3 Warning Thresh 1 Day Tab, page C-171
- C.2.5.4.4 Alarm Thresh Tab, page C-172

C.2.5.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-255 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-255 Field Descriptions for the Parameters Tab (continued)

Field	Description
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.

C.2.5.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-256 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.5.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-257 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.5.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-258 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
Power Add Fail Low	Displays the threshold of low power failure on the add channel port. The crossing of this threshold generates an LOS-P alarm.

C.2.5.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-259 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.5.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-260 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.6 Slot Properties—32DMX_O

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 32-Channel Demultiplexer (32DMX_O) card demultiplexes 32 100-GHz-spaced channels identified in the channel plan.

The 32DMX_O features include:

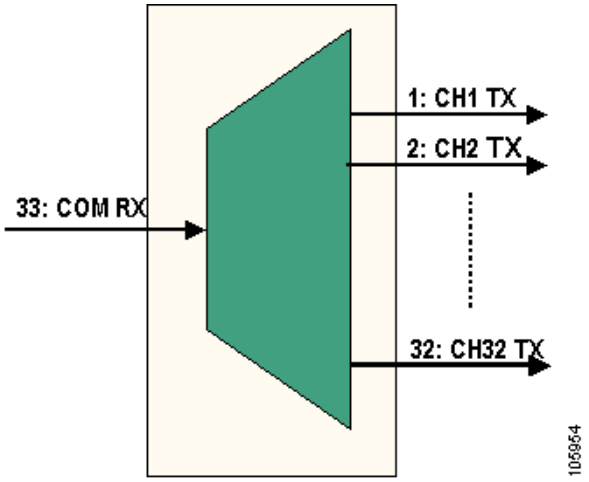
- AWG that enables channel demultiplexing functions.
- Single-channel ports equipped with VOAs for automatic optical power regulation after demultiplexing. In the case of electrical power failure, the VOA is set to its maximum attenuation for safety purposes. A manual VOA setting is also available.

Note In contrast, the single-slot 32DMX card does not have VOAs on each drop port for optical power regulation. The 32DMX optical demultiplexer module is used in conjunction with the 32-Channel Wavelength Selective Switch (32WSS) card in ONS 15454 Multiservice Transport Platform (MSTP) nodes.

- Each single-channel port is monitored using a photodiode to enable automatic power regulation.

The following figure shows the block diagram.

Figure C-13 32DMX_O Module



For the 32DMX_O module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Inventory, and Alarm Behavior.

C.2.6.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.6.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-261 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.6.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information.

Table C-262 Field Descriptions for the Optical Channel Properties Pane

Field	Description
Parameters	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Displays the status of the line. The line can be In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT). **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.

C.2.6.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-263 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Type	The type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.6.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-264 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
HW Version	The hardware version number.
IL-REF	The reference insertion loss.

Table C-264 Field Descriptions for the Inventory Properties Pane (continued)

Field	Description
Serial Number	The serial number that is unique to each card.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.
Part Number	The part number that is printed on the top of the card.

C.2.6.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-265 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.7 Slot Properties—40-DMX-C

The single-slot 40-Channel Demultiplexer C-Band (40-DMX-C) card demultiplexes forty 100 GHz-spaced channels identified in the channel plan, and sends them to dedicated output ports. The overall optical power can be adjusted using a single VOA that is common to all channels. The 40-DMX-C card is unidirectional, is optically passive, and can be installed in slots 1 to 6 and 12 to 17.

The 40-DMX card supports the Even and Odd bands. 40-DMX cards provisioned in the Even band support only card provisioning; circuits, links, and patchcords are not supported. The card name depends on the wavelength that is provisioned on the card. The card name is 40-DMX-CE if the supported wavelength belongs to the Even band and 40-DMX-CO if the supported wavelength belongs to the Odd band. When an actual card is plugged into a slot where the same card is preprovisioned, an alarm mismatch is raised if there is a conflict between the wavelength set on the preprovisioned card and the wavelength set on the actual card.

C.2.7.1 40-DMX-C Faceplate Ports

The 40-DMX-C card has two types of ports:

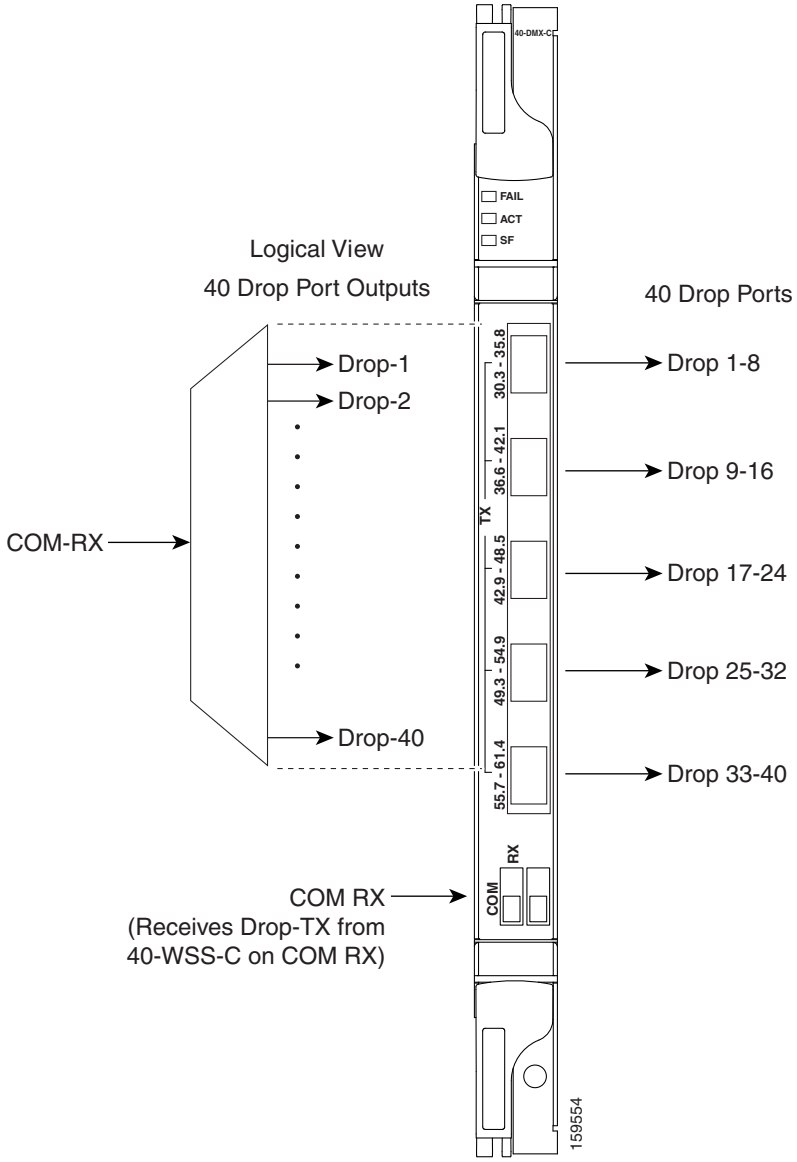
- COM RX port—Refers to the line input port for the aggregate optical signal being demultiplexed. This port is supported by a VOA for optical power regulation and a photodiode for per-channel optical power monitoring.

  Note By default, the VOA is set to its maximum attenuation for safety purposes (for example, to regulate power during electrical power failure). A manual VOA setting is also available.

- DROP TX ports (1 to 40)—On its output, the 40-DMX-C card provides 40 drop ports that are typically used for dropping channels within the ROADM node. These ports are connected using five physical connectors on the front panel that accept MPO client input cables. (MPO cables break out into eight separate cables.) The 40-DMX-C card also has one LC-PC-II optical connector for the main input.

The following figure shows the 40-DMX-C card faceplate.

Figure C-14 40-DMX-C Faceplate



For the 40-DMX-C module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Inventory, and Alarm Behavior.

C.2.7.2 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.7.3 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-266 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.7.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.7.4.1 Parameters Tab, page C-180
- C.2.7.4.2 Warning Thresh 15 Min Tab, page C-181
- C.2.7.4.3 Warning Thresh 1 Day Tab, page C-181
- C.2.7.4.4 Alarm Thresh Tab, page C-182

C.2.7.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-267 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.

C.2.7.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-268 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.7.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-269 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-269 Field Descriptions for the Warning Thresh 1 Day Tab (continued)

Field	Description
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.7.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-270 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.7.5 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.7.5.1 Parameters Tab, page C-182
- C.2.7.5.2 Warning Thresh 15 Min Tab, page C-183
- C.2.7.5.3 Warning Thresh 1 Day Tab, page C-183
- C.2.7.5.4 Alarm Thresh Tab, page C-183

C.2.7.5.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-271 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-271 Field Descriptions for the Parameters Tab (continued)

Field	Description
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.

C.2.7.5.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-272 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.7.5.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-273 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.7.5.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-274 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.7.6 Inventory

The Inventory Properties pane allows you to view card inventory information.

Table C-275 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.7.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-276 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the port number.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.8 Slot Properties—32MUX_O

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

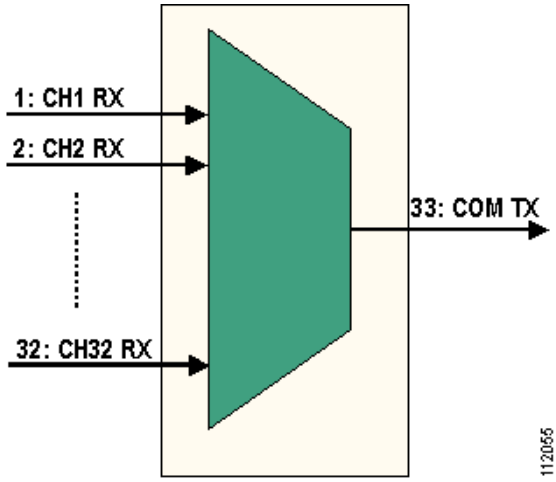
The 32-Channel Multiplexer (32MUX_O) card is typically used in hub nodes and provides the multiplexing of 32 channels, spaced at 100 GHz, into one fiber before their amplification and transmission along the line.

The 32MUX_O features include:

- Arrayed waveguide grating (AWG) device that enables full multiplexing functions for the channels.
- Each single-channel port is equipped with VOAs for automatic optical power regulation prior to multiplexing. In the case of electrical power failure, the VOA is set to its maximum attenuation for safety purposes. A manual VOA setting is also available.
- Each single-channel port is monitored using a photodiode to enable automatic power regulation.
- Additional optical monitoring port with 1/99 splitting ratio available.

The following figure shows the block diagram.

Figure C-15 32MUX_O Module



For the 32MUX_O module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Inventory, and Alarm Behavior.

C.2.8.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.8.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-277 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.

Table C-277 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.8.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information.

Table C-278 Field Descriptions for the Optical Channel Properties Pane

Field	Description
Parameters	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).

Table C-278 Field Descriptions for the Optical Channel Properties Pane (continued)

Field	Description
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.

C.2.8.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-279 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.

Table C-279 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.

C.2.8.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-280 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
HW Version	The hardware version number.
IL-REF	The reference insertion loss.
Serial Number	The serial number that is unique to each card.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.
Part Number	The part number that is printed on the top of the card.

C.2.8.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-281 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.9 Slot Properties—40-MUX-C

The single-slot 40-Channel Multiplexer C-Band (40-MUX-C) card multiplexes forty ITU-T 100 GHz-spaced channels identified in the channel plan. The 40-MUX-C card can be installed in slots 1 to 6 and 12 to 17. The 40-MUX-C card is typically used in hub nodes.

Y-cable protection between the same card type is supported only on ports with the same port number and signal rate. Y-cable protection is provided at the client port level.

C.2.9.1 40-MUX-C Faceplate Ports

The 40-MUX-C has two types of ports:

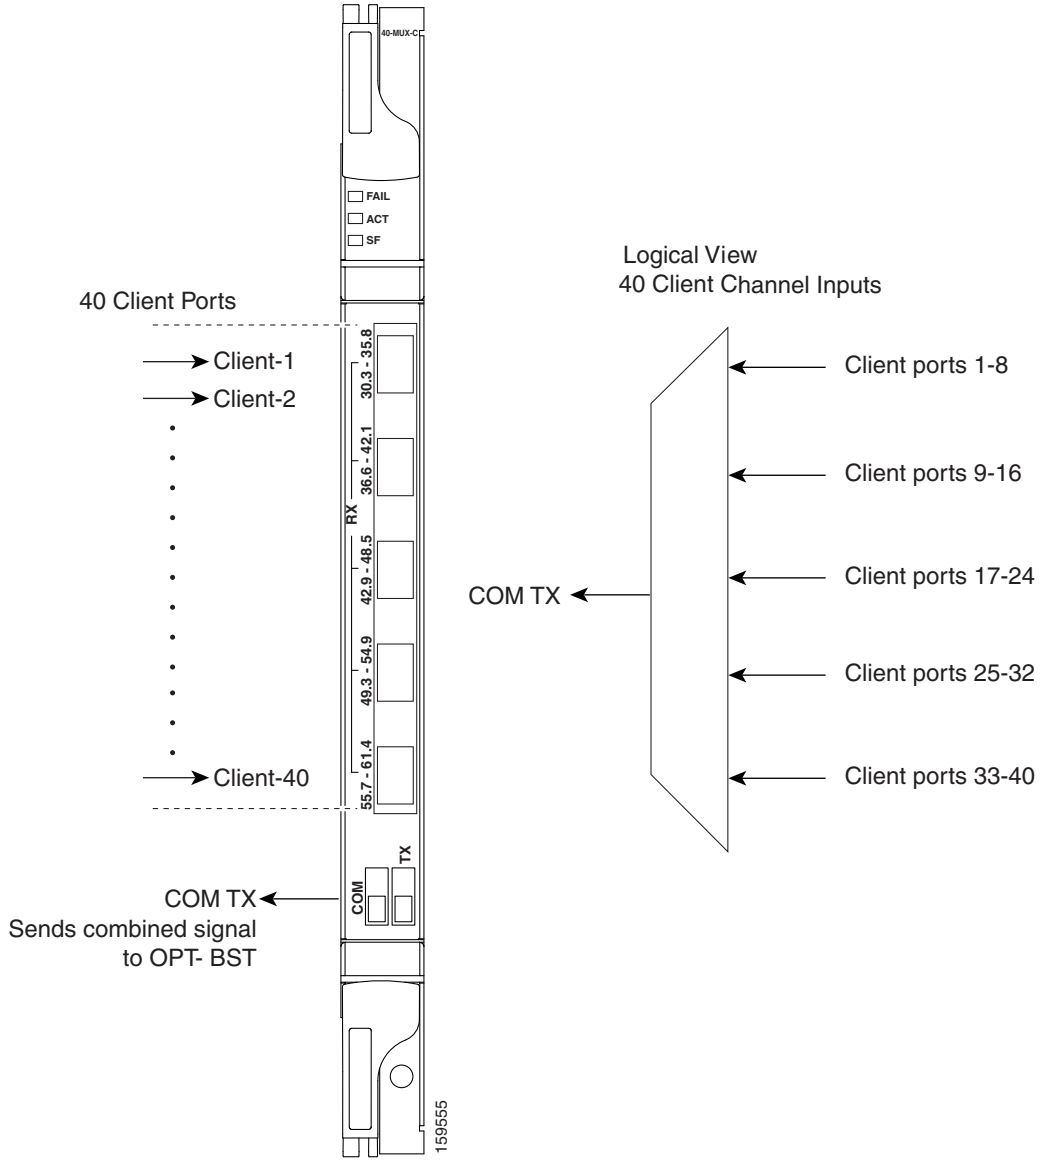
- COM TX port—Refers to the line output port for the aggregate optical signal being multiplexed. This port is supported by both a VOA for optical power regulation and a photodiode for per-channel optical power monitoring.

  Note By default, the VOA is set to its maximum attenuation for safety purposes (for example, to regulate power during electrical power failure). A manual VOA setting is also available.

- DROP RX ports (1 to 40)—Provides 40 input optical channels. These ports are connected using five physical receive connectors on the card's front panel that accept MPO cables for the client input interfaces. MPO cables break out into eight separate cables. The 40-DMX-C card also has one LC-PC-II optical connector for the main output.

The following figure shows the 40-MUX-C card faceplate.

Figure C-16 40-MUX-C Card Faceplate



For the 40-MUX-C module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Inventory, and Alarm Behavior.

C.2.9.2 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.9.3 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-282 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.9.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.9.4.1 Parameters Tab, page C-191
- C.2.9.4.2 Warning Thresh 15 Min Tab, page C-192
- C.2.9.4.3 Warning Thresh 1 Day Tab, page C-192
- C.2.9.4.4 Alarm Thresh Tab, page C-193

C.2.9.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-283 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance • Locked, disabled • Locked, maintenance • Unlocked, automatic in service
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port.

C.2.9.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-284 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.9.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-285 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.9.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-286 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.9.5 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.9.5.1 Parameters Tab, page C-193
- C.2.9.5.2 Warning Thresh 15 Min Tab, page C-194
- C.2.9.5.3 Warning Thresh 1 Day Tab, page C-194
- C.2.9.5.4 Alarm Thresh Tab, page C-195

C.2.9.5.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-287 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-287 Field Descriptions for the Parameters Tab (continued)

Field	Description
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance • Locked, disabled • Locked, maintenance • Unlocked, automatic in service
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.

C.2.9.5.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-288 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.9.5.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-289 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.9.5.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-290 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.9.6 Inventory

The Inventory Properties pane allows you to view card inventory information.

Table C-291 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.9.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-292 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list.
Suppress Alarms	When checked, all alarms are suppressed for the card or its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.10 Slot Properties—32WSS

The slot properties pane displays information about the 32-channel Wavelength Selective Switch (32WSS) module that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The 32-channel Wavelength Selective Switch (32WSS) card performs channel add/drop processing within the ONS 15454 DWDM node. The 32WSS works in conjunction with the 32DMX to implement ROADM functionality. Equipped with ROADM functionality, the ONS 15454 DWDM can be configured to add or drop individual optical channels using CTC, Cisco MetroPlanner, and Prime Optical.

An ROADM NE utilizes two 32WSS cards (two slots each) and two 32DMX cards (one slot each), for a total of six slots in the chassis, as follows:

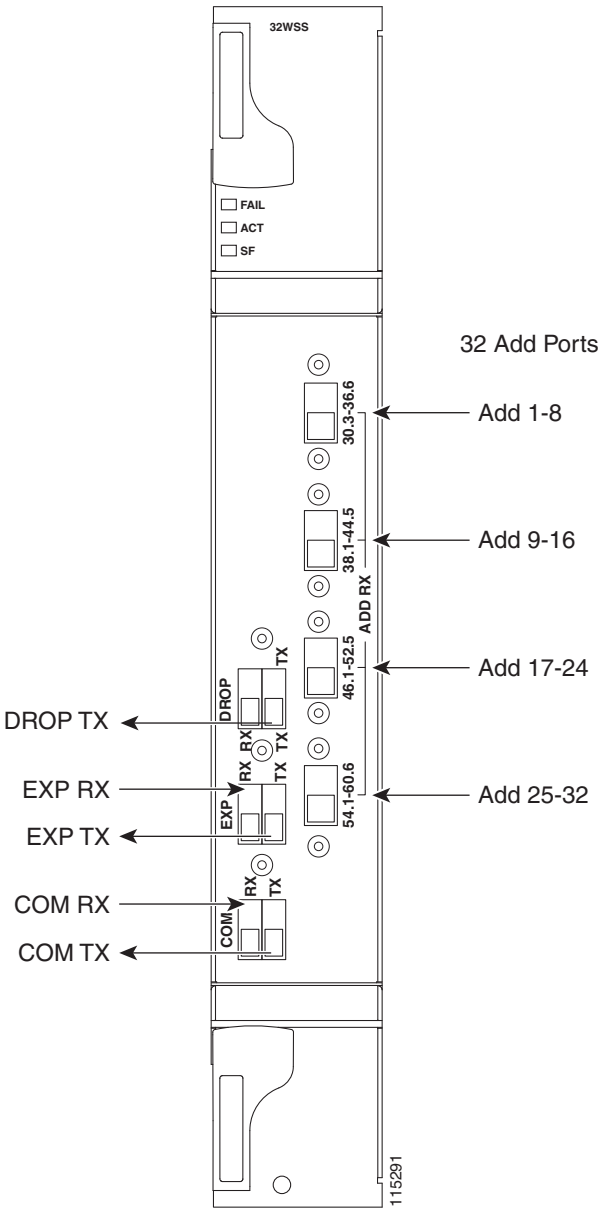
- ADD RX ports (1 to 32)—Used for adding channels. Each add channel is associated with an individual switch element that selects whether an individual channel is added. Each add port has optical power regulation provided by a VOA. The 32WSS has four physical receive connectors that accept MPO cables on the card's front panel for the client input interfaces. MPO cables break out into eight separate cables.
- EXP RX port—Receives an optical signal from another 32WSS module in the same NE.
- EXP TX port—Sends an optical signal to the other 32WSS module within the NE.
- COM TX port—Sends an aggregate optical signal to a booster amplifier card (for example, OPT-BST) for transmission outside of the NE.
- COM RX port—Receives the optical signal from a preamplifier and sends it to the optical splitter.
- DROP TX port—Sends the split-off optical signal that contains drop channels to the 32DMX card, where the channels are further processed and dropped.

Note A terminal site can be configured using only a 32WSS card and a 32DMX card plugged into the east or west side of the shelf.

Note The 32WSS works in conjunction with the 32DMX to implement ROADM functionality.

The following figure shows the 32WSS module front panel and identifies the traffic flow through the ports.

Figure C-17 32WSS Faceplate and Ports



For the 32WSS module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Maintenance, Inventory, and Alarm Behavior.

C.2.10.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.10.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-293 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.10.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.10.3.1 Parameters Tab, page C-198
- C.2.10.3.2 Warning Thresh 15 Min Tab, page C-199
- C.2.10.3.3 Warning Thresh 1 Day Tab, page C-200
- C.2.10.3.4 Alarm Thresh Tab, page C-200

C.2.10.3.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-294 Field Descriptions for the Parameters Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Power ADD	Displays the input power of the channel that is in ADD.
Path Value	Select if the path is in use (Active) or not (Standby) for each channel in ADD.

C.2.10.3.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-295 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.10.3.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-296 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.10.3.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-297 Field Descriptions for the Alarm Thresh Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
Power Add Fail Low	Displays the thresholds of low power failure on the add channel port. The crossing of this threshold generates an LOS-P alarm.

C.2.10.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.10.4.1 Parameters Tab, page C-201
- C.2.10.4.2 Warning Thresh 15 Min Tab, page C-201
- C.2.10.4.3 Warning Thresh 1 Day Tab, page C-201
- C.2.10.4.4 Alarm Thresh Tab, page C-202

C.2.10.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-298 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

C.2.10.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-299 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.10.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-300 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-300 Field Descriptions for the Warning Thresh 1 Day Tab (continued)

Field	Description
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.10.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-301 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
Power Add Fail Low	Displays the thresholds of low power failure on the add channel port. The crossing of this threshold generates an LOS-P alarm.

C.2.10.5 Maintenance

The Maintenance Properties pane allows you to assign the optical channel operating mode for each wavelength.

Table C-302 Field Descriptions for the Maintenance Properties Pane

Field	Description
Optical Connector 1 through 5	
Channel Number	Displays the channel number.
OCHNC Wavelength	Displays the wavelength assigned to the channel.
Operating Mode	Select the operating mode to assign to the wavelength: • Not assigned • Add/drop • Pass-through

C.2.10.6 Inventory

The Inventory Properties pane allows you to view card inventory information.

Table C-303 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.10.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-304 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.11 Slot Properties—32WSS-L

The 32-Channel Wavelength Selective Switch L-Band (32WSS-L) card performs channel add/drop processing within the ONS 15454 DWDM node. The 32WSS-L works in conjunction with the 32DMX-L to implement ROADM functionality within the L-band (1570 to 1620 nm). The 32WSS-L card is particularly well suited for use in networks that employ DS fiber or SMF-28 single-mode fiber. Equipped with ROADM functionality, the ONS 15454 DWDM can be configured to add or drop individual optical channels using CTC, Cisco MetroPlanner, and Prime Optical.

An ROADM NE utilizes two 32WSS-L cards (two slots each) and two 32DMX-L cards (one slot each), for a total of six slots in the chassis. The 32WSS-L card can be installed in slots 1 and 2, 3 and 4, 5 and 6, 12 and 13, 14 and 15, or 16 and 17.

The 32WSS-L has six types of ports:

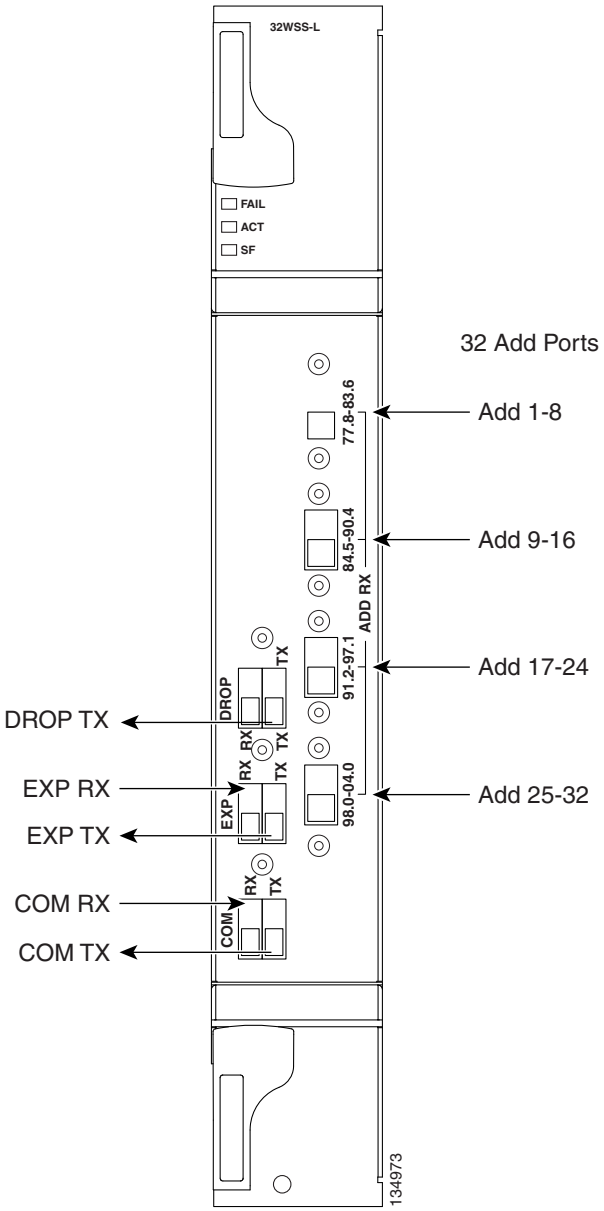
- ADD RX ports (1 to 32)—Used for adding channels. Each add channel is associated with an individual switch element that selects whether an individual channel is added. Each add port has optical power regulation provided by a VOA.
- EXP RX port—Receives an optical signal from another 32WSS-L module in the same NE.
- EXP TX port—Sends an optical signal to the other 32WSS-L module within the NE.

- COM TX port—Sends an aggregate optical signal to a booster amplifier card (for example, OPT-BST) for transmission outside of the NE.
- COM RX port—Receives the optical signal from a preamplifier and sends it to the optical splitter.
- DROP TX port—Sends the split-off optical signal that contains drop channels to the 32DMX-L card, where the channels are further processed and dropped.

A terminal site can be configured using only a 32WSS-L card and a 32DMX-L card plugged into the east or west side of the shelf.

The following figure shows the 32WSS-L module front panel and identifies the traffic flow through the ports.

Figure C-18 WSS-L Faceplate and Ports



For the 32WSS-L module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Maintenance, Inventory, and Alarm Behavior.

C.2.11.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.11.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-305 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.11.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.11.3.1 Parameters Tab, page C-206

- C.2.11.3.2 Warning Thresh 15 Min Tab, page C-207
- C.2.11.3.3 Warning Thresh 1 Day Tab, page C-207
- C.2.11.3.4 Alarm Thresh Tab, page C-207

C.2.11.3.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-306 Field Descriptions for the Parameters Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Power ADD	Displays the input power of the channel that is in ADD.
Path Value Display	Select if the path is in use (Active) or not (Standby) for each channel in ADD.

C.2.11.3.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-307 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.11.3.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-308 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.11.3.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-309 Field Descriptions for the Alarm Thresh Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
Power Add Fail Low	Displays the thresholds of low power failure on the add channel port. The crossing of this threshold generates an LOS-P alarm.

C.2.11.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.11.4.1 Parameters Tab, page C-208
- C.2.11.4.2 Warning Thresh 15 Min Tab, page C-208

- C.2.11.4.3 Warning Thresh 1 Day Tab, page C-208
- C.2.11.4.4 Alarm Thresh Tab, page C-209

C.2.11.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-310 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

C.2.11.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-311 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.11.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-312 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.11.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-313 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.

C.2.11.5 Maintenance

The Maintenance Properties pane allows you to assign the optical channel operating mode for each wavelength.

Table C-314 Field Descriptions for the Maintenance Properties Pane

Field	Description
Optical Connector 1 through 5	
Channel Number	Displays the channel number.
OCHNC Wavelength	Displays the wavelength assigned to the channel.
Operating Mode	Select the operating mode to assign to the wavelength: • Not assigned • Ad/drop • Pass-through

C.2.11.6 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-315 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.11.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-316 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Select the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Alarm Profile	Displays the alarm profile for the port.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.12 Slot Properties—40-WSS-C

The double-slot 40-Channel Wavelength Selective Switch C-Band (40-WSS-C) card switches forty ITU-T 100 GHz-spaced channels and sends them to dedicated output ports. The 40-WSS-C card is bidirectional and optically passive. The card can be installed in slots 1 to 6 and 12 to 17.

The 40-WSS-C features include:

- Receipt of an aggregate DWDM signal into 40 output optical channels from the line receive port (EXP RX) in one direction and from the COM-RX port in the other direction.
- Per-channel optical power monitoring using photodiodes.
- Signal splitting in a 70%-to-30% ratio, sent to the 40-DMX-C card for dropping signals, then to the other 40-WSS-C card.
- Aggregate DWDM signal monitoring and control through a VOA. In the case of electrical power failure, the VOA is set to its maximum attenuation for safety purposes. A manual VOA setting is also available.
- Support for the Even and Odd band. 40-WSS cards provisioned in the Even band support only card provisioning; circuits, links, and patchcords are not supported. The card name depends on the wavelength that is provisioned on the card. The card name is 40-WSS-CE if the supported wavelength belongs to the Even band and 40-WSS-CO if the supported wavelength belongs to the

Odd band. When an actual card is plugged into a slot where the same card is preprovisioned, an alarm mismatch is raised if there is a conflict between the wavelength set on the preprovisioned card and the wavelength set on the actual card.

Within the 40-WSS-C card, the first arrayed waveguide grating (AWG) opens the spectrum and each wavelength is directed to one of the ports of a 1x2 optical switch. There, via MetroPlanner, the same wavelength can be passed through or stopped. If the pass-through wavelength is stopped, a new channel can be added at the ADD port. The card's second AWG multiplexes all of the wavelengths, and the aggregate signal is output through the COM-TX port.

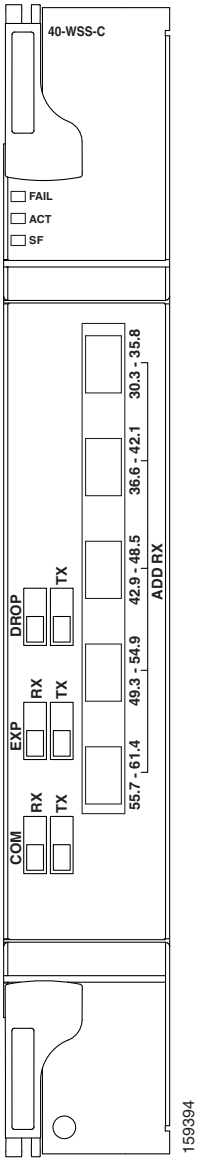
C.2.12.1 40-WSS-C Faceplate Ports

The 40-WSS-C has eight types of ports:

- ADD RX ports (1 to 40)—Used for adding channels. Each add channel is associated with an individual switch element that selects whether an individual channel is added. Each add port has optical power regulation provided by a VOA. The five connectors on the card faceplate accept MPO cables for the client input interfaces. MPO cables break out into eight separate cables. The 40-WSS-C card also has one LC-PC-II optical connector for the main input.
- COM RX—Receives the optical signal from a preamplifier (such as the OPT-PRE) and sends it to the optical splitter.
- COM TX—Sends an aggregate optical signal to a booster amplifier card (for example, the OPT-BST card) for transmission outside of the NE.
- EXP RX port—Receives an optical signal from another 40-WSS-C card in the same NE.
- EXP TX—Sends an optical signal to the other 40-WSS-C card within the NE.
- DROP TX port—Sends the split-off optical signal that contains drop channels to the 40-DMX-C card, where the channels are further processed and dropped.

The following figure shows the 40-WSS-C card faceplate.

Figure C-19 40-WSS-C Faceplate



For the 40-WSS-C module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Line, Maintenance, Inventory, and Alarm Behavior.

C.2.12.2 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.12.3 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-317 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.12.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.12.4.1 Parameters Tab, page C-213
- C.2.12.4.2 Warning Thresh 15 Min Tab, page C-214
- C.2.12.4.3 Warning Thresh 1 Day Tab, page C-215
- C.2.12.4.4 Alarm Thresh Tab, page C-215

C.2.12.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-318 Field Descriptions for the Parameters Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Displays the status of the line. Values are: • OOS_DSBLD—Out of Service–Disabled. Unable to carry traffic. • IS_AINS—In Service–Auto In Service. Alarm reporting is suppressed, but traffic is carried. • OOS_MT—Out of Service–Maintenance. Alarm reporting is suppressed, but traffic is carried and loopbacks are allowed.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Path Value	Select if the path is in use (Active) or not (Standby) for each channel in ADD.

C.2.12.4.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-319 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-319 Field Descriptions for the Warning Thresh 15 Min Tab (continued)

Field	Description
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.12.4.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-320 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.12.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-321 Field Descriptions for the Alarm Thresh Tab

Field	Description
Optical Connector 1 through Optical Connector 5	
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.

C.2.12.5 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.12.5.1 Parameters Tab, page C-215
- C.2.12.5.2 Warning Thresh 15 Min Tab, page C-216
- C.2.12.5.3 Warning Thresh 1 Day Tab, page C-216
- C.2.12.5.4 Alarm Thresh Tab, page C-217

C.2.12.5.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-322 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Input Express, Output Com, Input Line, Output Line, Input OSC, Output OSC, or Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Displays the status of the line. Values are: • OOS_DSBLD—Out of Service–Disabled. Unable to carry traffic. • IS_AINS—In Service–Auto In Service. Alarm reporting is suppressed, but traffic is carried. • OOS_MT—Out of Service–Maintenance. Alarm reporting is suppressed, but traffic is carried and loopbacks are allowed.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.

C.2.12.5.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-323 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.12.5.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-324 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.12.5.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-325 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.12.6 Maintenance

The Maintenance Properties pane allows you to assign the optical channel operating mode for each wavelength.

Table C-326 Field Descriptions for the Maintenance

Field	Description
Optical Connector 1 through 5	
Channel Number	Displays the channel number.
OCHNC Wavelength	Displays the wavelength assigned to the channel.
Operating Mode	Select the operating mode to assign to the wavelength: • Not assigned • Add/drop • Pass-through

C.2.12.7 Inventory

The Inventory Properties pane allows you to view card inventory information.

Table C-327 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.12.8 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-328 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the port number.
Alarm Profile	Choose an alarm profile for all ports.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.13 Slot Properties—40-WXC-C

The double-slot 40-Channel Wavelength Cross-Connect C-Band (40-WXC-C) card selectively sends any wavelength combination coming from nine input ports to a common output port. The device can manage up to 41 channels spaced at 100 GHz on each port according to the channel grid. Each channel can be selected from any input. The card is optically passive and provides bidirectional capability. It can be installed in slots 1 to 5 and 12 to 16.

The 40-WXC-C card provides the following features:

- Demultiplexing, selection, and multiplexing of DWDM aggregate signals from input ports to a common output port.
- Aggregate DWDM signal monitoring and control through a VOA.
- VOAs are deployed in every channel path in order to regulate the channel's optical power. In case of an electrical power failure, VOAs are set to their maximum attenuation value, or to a fixed and configurable one. The VOA can also be set manually.
- Per-channel optical power monitoring using photodiodes.

The 40-WXC-C card acts as a selector element with the following characteristics:

- Selects a wavelength from one input port and passes the wavelength through to the common output port. Simultaneously, the card can block the same wavelength coming from the other eight input ports.
- Stops wavelengths from all nine input ports.
- Monitors optical power and controls path attenuation using per-channel VOA independently of the wavelength input-to-output port connection.

C.2.13.1 40-WXC-C Faceplate Ports

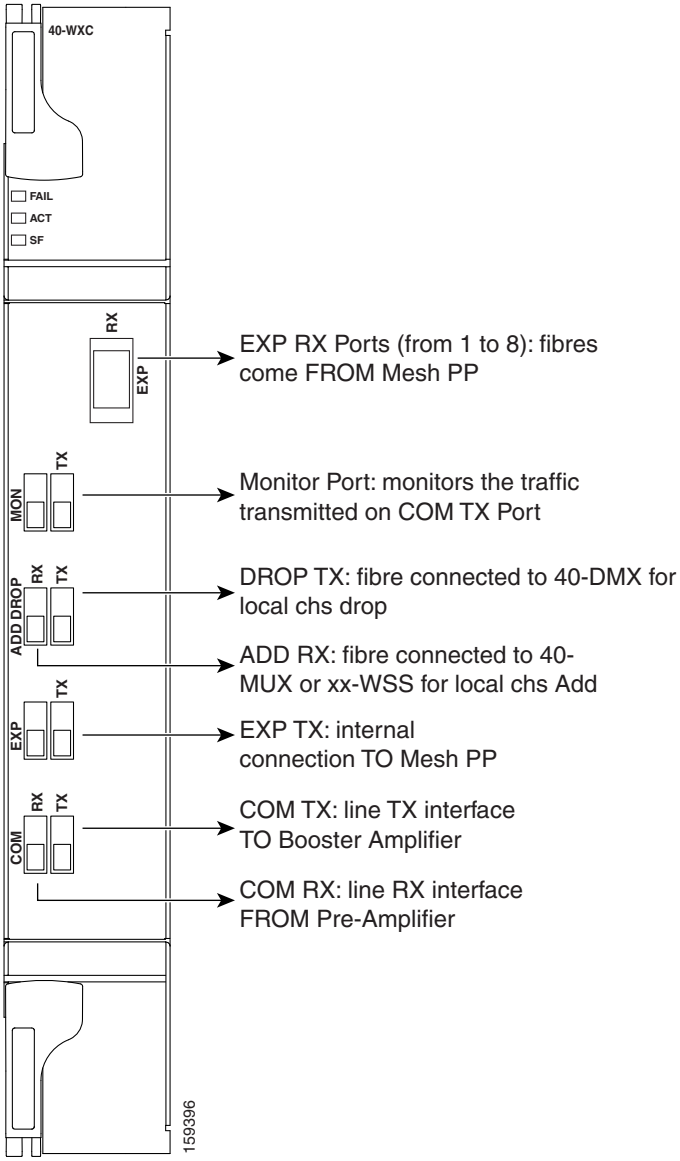
The 40-WXC-C card has six types of ports:

- COM RX—Receives the optical signal from a preamplifier (such as the OPT-PRE card) and sends it to the optical splitter.

- COM TX—Sends an aggregate optical signal to a booster amplifier card (for example, the OPT-BST card) for transmission outside of the NE.
- EXP TX—Sends an optical signal to the other 40-WXC-C card within the NE.
- MON TX—Refers to the optical service channel (OSC) monitor port.
- ADD/DROP RX—Provides 40 input optical channels. These ports are connected using five physical receive connectors on the card's front panel that accept MPO cables for the client input interfaces. MPO cables break out into eight separate cables.
- ADD/DROP TX—Sends the split-off optical signal that contains drop channels to the 40-WXC-C card, where the channels are further processed and dropped.

The following figure shows the 40-WXC-C card faceplate.

Figure C-20 40-WXC-C Faceplate



For the 40-WXC-C module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, WXC Line, Optical Line, Maintenance, Inventory, and Alarm Behavior.

C.2.13.2 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.13.3 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-329 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.

Table C-329 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Side	Displays side settings. Automatic node setup (ANS) assumes that every DWDM port has a line direction parameter that is either side A to side B or side B to side A. ANS automatically configures the mandatory optical connections according to following main rules: • Cards equipped in slots 1 to 5 have a drop section facing side A. • Cards equipped in slots 12 to 16 have a drop section facing side B for DWDM nodes in nonmesh networks. • Nodes in DWDM mesh networks have sides A, B, C, D, E, F, G, or H.

C.2.13.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.13.4.1 Parameters Tab, page C-221
- C.2.13.4.2 OCH Thresh 15 Min Tab, page C-222
- C.2.13.4.3 OCH Thresh 1 Day Tab, page C-222
- C.2.13.4.4 Alarm Thresh Tab, page C-222

C.2.13.4.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-330 Field Descriptions for the Parameters Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
State	Displays the status of the line. Values are: • OOS_DSBLD—Out of Service–Disabled. Unable to carry traffic. • IS_AINS—In Service–Auto In Service. Alarm reporting is suppressed, but traffic is carried. • OOS_MT—Out of Service–Maintenance. Alarm reporting is suppressed, but traffic is carried and loopbacks are allowed.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
From	Shows the incoming Input Express (EXP_RX) port.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.

Table C-330 Field Descriptions for the Parameters Tab (continued)

Field	Description
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.

C.2.13.4.2 OCH Thresh 15 Min Tab

The OCH Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-331 Field Descriptions for the OCH Thresh 15 Min Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.13.4.3 OCH Thresh 1 Day Tab

The OCH Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-332 Field Descriptions for the OCH Thresh 1 Day Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.13.4.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-333 Field Descriptions for the Alarm Thresh Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Power Failure Low (dBm)	Allows you to set the low power failure settings.
Power Degrade High (dBm)	Allows you to set the high power settings.
Power Degrade Low (dBm)	Allows you to set the low power settings.

C.2.13.5 WXC Line

The WXC Line Properties pane allows you to view and update 40-WXC-C line threshold information.

Table C-334 Field Descriptions for the WXC Line

Field	Description
Parameters	
Port Number	Displays the card port number.
Type	Identifies the type of port, such as Input Line, Output Line, Input COM, Output COM, Input Express, Output Express, Input OSC, Output OSC, Add, Drop, or Pass-through.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Displays the port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked,automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled,automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled,disabled. • locked,maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled,maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

C.2.13.6 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.13.6.1 Parameters Tab, page C-223
- C.2.13.6.2 Warning Thresh 15 Min Tab, page C-224
- C.2.13.6.3 Warning Thresh 1 Day Tab, page C-224
- C.2.13.6.4 Alarm Thresh Tab, page C-225

C.2.13.6.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-335 Field Descriptions for the Parameters Tab

Field	Description
Port Number	Displays the card port number.
Type	Identifies the type of port, such as Input Express, Output Express, Input COM, Output COM, Input Line, Output Line, Input OSC, Output OSC, or Drop.

Table C-335 Field Descriptions for the Parameters Tab (continued)

Field	Description
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Displays the port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked,automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled,automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled,disabled. • locked,maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled,maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Displays the automatic in-service soak time. The duration of time that must pass with an uninterrupted signal before the traffic/termination transitions to the unlocked-enabled service state.

C.2.13.6.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-336 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.13.6.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-337 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.13.6.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-338 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure settings.

C.2.13.7 Maintenance

The Maintenance Properties pane allows you to display the insert and return values for each wavelength.

Table C-339 Field Descriptions for the Maintenance

Field	Description
Insert Value	
Target Power	Displays the default target power. The value is retrieved from the ANS parameter for the side where the 40-WXC-C card is inserted. You can edit this field with a new value as needed.
Input Port	Displays the input port number.
VOA Attenuation	Displays the default VOA attenuation value. The value is retrieved from the ANS parameter for the side where the 40-WXC-C card is inserted. You can edit this field with a new value as needed.
Wavelength	Displays the wavelength assigned to the channel. Maintenance mode is known as lambda zero. You can use this mode when you do not want to use one of the 40 system channels. For example, maintenance can be used in a degree upgrade when the system is up and running. Also, during installation, you can use maintenance or one of the 40 system channels, depending on your site requirements.
Return Value COM-TX on Selected Wavelength	
Actual Power	Displays the value returned by the card. This field indicates that the power on the cross-connection (also called OCHTerm) was created with the selected lambda and the incoming port that is calculated on the COM-TX port.
Refresh	Updates the actual power that is displayed in the Actual Power field.
Delete	Stops the unit from working in maintenance mode for the given port and lambda. You must click Delete when maintenance is complete. Exiting this screen without clicking Delete does not stop the maintenance mode.

C.2.13.8 Inventory

The Inventory Properties pane allows you to view card inventory information.

Table C-340 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the object that can be inventoried.
Value	Displays the value of the object that is inventoried.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.13.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-341 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Port Number	Displays the port number.
Alarm Profile	Choose an alarm profile for all ports.
Suppress Alarms	Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.14 Slot Properties—80-WXC-C

The double-slot 80-Channel Wavelength Cross-Connect C-Band (80-WXC-C) card selectively sends any wavelength combination coming from nine input ports to a common output port. The device can manage up to 80 channels spaced at 50 GHz on each port according to the channel grid. Each channel can be selected from any input. The card is optically passive and provides bidirectional capability.

These cards can only be installed in the following slots:

- 1 to 5 and 12 to 16 on the Cisco ONS 15454 M2 chassis
- 2 to 6 on the Cisco ONS 15454 M6 chassis

Note The 80-WXC-C is meant to be used in conjunction with the following:

- Passive (athermal) ONS 15216 odd/even multiplexer/demultiplexer 40-channel patch panels
- ONS 15216 multiplexer/demultiplexer patch panel 50-GHz interleaver/deinterleaver modules

Prime Optical does not manage these devices.

The 80-WXC-C card provides the following features:

- Card mode can be set to multiplexer, de-multiplexer, or bidirectional.
- When used in the multiplexer or bidirectional mode, the 80-WXC-C card allows selection of a single wavelength or any combination of wavelengths from any of the nine input ports to the common output port.
- VOAs are deployed in every channel path in order to regulate the channel's optical power. In case of an electrical power failure, VOAs are set to their maximum attenuation value, or to a fixed and configurable one. The VOA can also be set manually.

The 80-WXC-C card acts as a selector element with the following characteristics:

- Selects a wavelength from nine input ports and passes the wavelength through to the common output port. Simultaneously, the card can block the same wavelength coming from the other input ports.
- Stops wavelengths from all nine input ports.
- Monitors optical power and controls path attenuation using per-channel VOA independently of the wavelength input-to-output port connection.

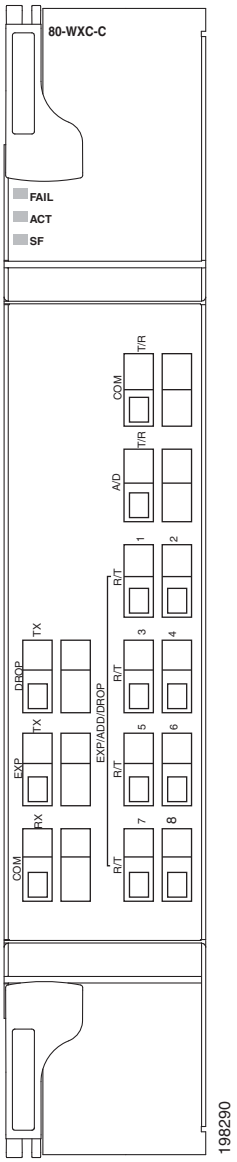
C.2.14.1 80-WXC-C Faceplate Ports

The 80-WXC-C card has 14 types of ports:

- EXPRESS/ADD/DROP T/R (1 to 8)—Functions as a EXP port in the bidirectional mode, as a ADD port in the multiplexer mode, and as a DROP port in the demultiplexer mode.
- MON—Monitors power on the COM T/R port.
- COM RX—Receives the optical signal from a preamplifier (such as the OPT-PRE card) and sends it to the optical splitter.
- DROP TX—Sends the split-off optical signal that contains drop channels to the 80-WXC-C card, where the channels are further processed and dropped.
- EXP TX—Sends the split-off optical signal that contains pass-through channels to the other side of the NE.
- COM T/R—Functions as a COM TX port in the multiplexer mode and as a COM RX port in the demultiplexer mode. The COM port is a bidirectional port.
- ADD/DROP T/R—Functions as an ADD RX port in the bidirectional and multiplexer mode and as a DROP port in the demultiplexer mode.

The following figure shows the 80-WXC-C card faceplate.

Figure C-21 80-WXC-C Faceplate



For the 80-WXC-C module, the slot properties pane displays the following properties: Module View, Identification, Inventory, Alarm Behavior, Card, Maintenance, Optical Channel, Optical Line, Wavelength Power, and WXC Line.

C.2.14.2 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.14.3 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-342 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
Hardware Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Side	Displays side settings. Automatic node setup (ANS) assumes that every DWDM port has a line direction parameter that is either side A to side B or side B to side A. ANS automatically configures the mandatory optical connections according to following main rules: • Cards equipped in slots 1 to 5 have a drop section facing side A. • Cards equipped in slots 12 to 16 have a drop section facing side B for DWDM nodes in nonmesh networks. • Nodes in DWDM mesh networks have sides A, B, C, D, E, F, G, or H.

C.2.14.4 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-343 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.

Table C-343 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.14.5 Card

The Card Properties pane allows you to view and update card information.

Table C-344 Field Descriptions for the Card Properties Pane

Field	Descriptions
Card Mode	Allows you to select a card mode. Select from: • Bidirectional • Multiplexer • De-multiplexer

C.2.14.6 Inventory

The Inventory Properties pane allows you to view card inventory information.

Table C-345 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.14.7 Maintenance

The Maintenance Properties pane allows you to display the insert and return values for each wavelength.

Table C-346 Field Descriptions for the Maintenance Properties Pane

Field	Description
Insert Value	
Target Power (dBm)	Displays the default target power. The value is retrieved from the ANS parameter for the side where the 80-WXC-C card is inserted. You can edit this field with a new value as needed.
Input Port	Displays the input port number.
Wavelength	Displays the wavelength assigned to the channel. Maintenance mode is known as lambda zero. You can use this mode when you do not want to use one of the 80 system channels. For example, maintenance can be used in a degree upgrade when the system is up and running. Also, during installation, you can use maintenance or one of the 80 system channels, depending on your site requirements.
Return Value COM on Selected Wavelength	
Actual Power (dBm)	Displays the value returned by the card. This field indicates that the power on the cross-connection (also called OCHTerm) was created with the selected lambda and the incoming port that is calculated on the COM port.
Refresh	Updates the actual power that is displayed in the Actual Power field.
Delete	Stops the unit from working in maintenance mode for the given port and lambda. You must click Delete when maintenance is complete. Exiting this screen without clicking Delete does not stop the unit from working in maintenance mode.

C.2.14.8 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information. The Properties pane contains the following tabs:

- C.2.14.8.1 Parameters Tab, page C-231
- C.2.14.8.2 OCH Thresh 15 Min Tab, page C-232
- C.2.14.8.3 OCH Thresh 1 Day Tab, page C-233
- C.2.14.8.4 Alarm Thresh Tab, page C-233

C.2.14.8.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors. To view optical channels, select the wavelength from the wavelength drop-down list and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-347 Field Descriptions for the Parameters Tab

Field	Description
Circuit Name	Displays the name of the circuit.
State	Displays the status of the line. Values are: • OOS_DSBLD—Out of Service–Disabled. Unable to carry traffic. • IS_AINS—In Service–Auto In Service. Alarm reporting is suppressed, but traffic is carried. • OOS_MT—Out of Service–Maintenance. Alarm reporting is suppressed, but traffic is carried and loopbacks are allowed.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
From	Shows the incoming Input Express (EXP_RX) port.
Power From	Displays the power of the port from which the circuit starts.
To	Displays the port to which the circuit is connected.
Power To	Displays the power of the port to which the circuit is connected.
Force Channel	Allows you to start the channel by moving the VOA from Open to Closed loop. You can force VOA only when the Force Channel Status is in the Unlocked state.
Force Channel Status	Displays the channel status. The different statuses are: • Unlocked—Can force channel startup. • Locked—Cannot force channel startup; the device is under the control of some other function, such as Optical safety. • Forced—Channel startup has already been forced.
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).

C.2.14.8.2 OCH Thresh 15 Min Tab

The OCH Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation. To view optical channels, select both wavelength and port type from the drop-down lists and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-348 Field Descriptions for the OCH Thresh 15 Min Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.14.8.3 OCH Thresh 1 Day Tab

The OCH Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation. To view optical channels, select both wavelength and port type from the drop-down lists and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-349 Field Descriptions for the OCH Thresh 1 Day Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Power Low (dBm)	Allows you to set the low power settings.
Power High (dBm)	Allows you to set the high power settings.

C.2.14.8.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation. To view optical channels, select both wavelength and port type from the drop-down lists and click **Retrieve**.

Note Wavelengths with two asterisks (**) denote available optical channels.

Table C-350 Field Descriptions for the Alarm Thresh Tab

Field	Description
Circuit Name	Displays the name of the circuit.
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Type	Identifies the type of port.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.

Table C-350 Field Descriptions for the Alarm Thresh Tab (continued)

Field	Description
Power Failure Low (dBm)	Allows you to set the low power failure settings.
Power Degrade High (dBm)	Allows you to set the high power settings.
Power Degrade Low (dBm)	Allows you to set the low power settings.

C.2.14.9 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information. The Properties pane contains the following tabs:

- C.2.14.9.1 Parameters Tab, page C-234
- C.2.14.9.2 Warning 15 Min Tab, page C-235
- C.2.14.9.3 Warning Thresh 1 Day Tab, page C-235
- C.2.14.9.4 Alarm Thresh Tab, page C-235

C.2.14.9.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-351 Field Descriptions for the Parameters Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Displays the port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance • Locked, disabled • Locked, maintenance • Unlocked, automatic in service
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
Active Channels	Indicates how many channels the card/port is carrying. The value generally reflects the number of provisioned channels passing through the port.
VOA Mode	Shows the current functional mode of the VOA. The value is not provisionable and is read from the card.
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.

Table C-351 Field Descriptions for the Parameters Tab (continued)

Field	Description
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation reference value of the VOA. The value is established by the manufacturer.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, per channel, if necessary. The sum of the Power Reference and Power Calibration, for each single channel, defines the Power Set Point.

C.2.14.9.2 Warning 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-352 Field Descriptions for the Warning 15 Min Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.

C.2.14.9.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-353 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.

C.2.14.9.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-354 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Power Failure Low	Allows you to set the low power failure threshold.

C.2.14.10 Wavelength Power

The Wavelength Power Properties pane displays wavelength power data. To view optical channels, select the port type from the port drop-down list and click **Retrieve**.

Table C-355 Field Descriptions for the Wavelength Power Properties Pane

Field	Description
Wavelength	Displays the wavelength number.
Measured Power	Displays the power.
Status	Displays the status.
Used	Whether or not the wavelength is being used. Values are Yes and No.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.14.11 WXC Line

The WXC Line Properties pane allows you to view and update 80-WXC-C line threshold information. The Properties pane contains the following tabs:

- C.2.14.11.1 Parameters Tab, page C-236
- C.2.14.11.2 Warning Thresh 15 Min Tab, page C-237
- C.2.14.11.3 Warning Thresh 1 Day Tab, page C-237
- C.2.14.11.4 Alarm Thresh Tab, page C-237

C.2.14.11.1 Parameters Tab

The Parameters tab provides information on the status and directions specified for the optical connectors.

Table C-356 Field Descriptions for the WXC Line Tab

Field	Description
Port Number	Displays the card port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Add, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-356 Field Descriptions for the WXC Line Tab (continued)

Field	Description
State	Displays the port administration state. It can be: • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance • Locked, disabled • Locked, maintenance • Unlocked, automatic in service
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.

C.2.14.11.2 Warning Thresh 15 Min Tab

The Warning Thresh 15 Min tab allows you to set thresholds for 15-minute threshold crossing alert generation.

Table C-357 Field Descriptions for the Warning Thresh 15 Min Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.

C.2.14.11.3 Warning Thresh 1 Day Tab

The Warning Thresh 1 Day tab allows you to set thresholds for 1-day threshold crossing alert generation.

Table C-358 Field Descriptions for the Warning Thresh 1 Day Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.

C.2.14.11.4 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-359 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	The port number.
Type	Identifies the type of port.
Power Failure Low (dBm)	Allows you to set the low power failure threshold.

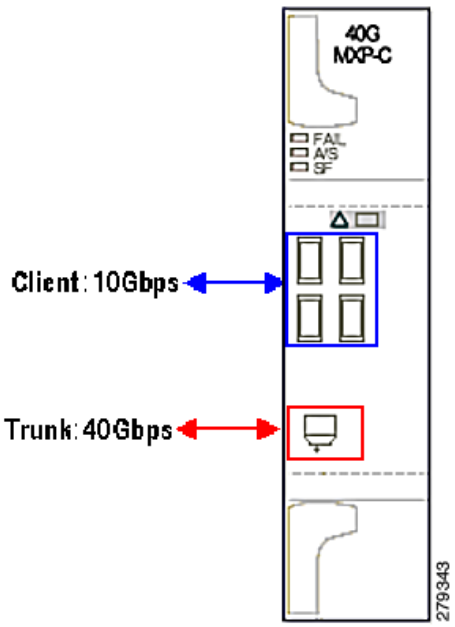
Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.15 Slot Properties—40G-MXP-C

The slot properties pane displays information about the Cisco ONS 15454 MSTP slot that is selected in the NE Explorer tree. Use this properties pane to change the card details.

The following figure shows the 40-MXP-C card faceplate.

Figure C-22 40G-MXP-C Faceplate



The following are the main features of the card:

- The card is two slots wide.
- Overclock mode is available on the trunk port.

- The card has four client ports and one trunk port. The client operates with OC-192/STM 64, 10GE, 10G FC, OTU2, or Fiber Channel 8 Gb (FC8G) payloads. All client ports are pluggable, and there is no default value associated with the client port. The four client ports can have different payloads. G.709 is always enabled on all clients ports and cannot be disabled.
- The trunk port is DWDM-capable. G.709 is enabled on the trunk port by default. Besides the Standard mode, the trunk port can also be set for Overclock mode. If you enable the Overclock option, the trunk can operate with FC10G or OTU2 payloads.
- Links have Y-cable protection.
- PPM supports the following rates:
  - On client ports: TEN_GE, FC_10G, OC_192, FC8G, and OTU2
  - On the trunk port: FORTY_GE and OC_768.
- Regeneration peer group is supported.

C.2.15.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.15.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-360 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-360 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.15.3 Card

The card Properties pane allows you to view and update card information.

Table C-361 Field Descriptions for the Card Properties Pane

Field	Description
Card Mode	Allows you to set the card mode.
Regeneration Peer Slot	Allows you to select similar cards so that you can configure a peer group.
Regeneration Group Name	Allows you to set the name of the peer group.

C.2.15.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-362 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate. To enable FC 10G payload, enable Overclock mode in the **Line** Properties pane > **Ports** tab.

C.2.15.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. You can create no more than four PPMs at a time. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.15.5 Line

The Line Properties pane allows you to configure line information.

If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the following tabs:

- C.2.15.5.1 Section Trace Tab, page C-241
- C.2.15.5.2 SONET Line Tab, page C-241
- C.2.15.5.3 Section Thresh 15 Min Tab, page C-242
- C.2.15.5.4 Section Thresh 1 Day Tab, page C-242
- C.2.15.5.5 Line Thresh 15 Min Tab, page C-243
- C.2.15.5.6 Line Thresh 1 Day Tab, page C-243
- C.2.15.5.7 RMON Tab, page C-244
- C.2.15.5.8 Ethernet Tab, page C-244
- C.2.15.5.9 Ports Tab, page C-245

C.2.15.5.1 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-363 Field Descriptions for the Section Trace Tab

Field	Description
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Default button	Resets the value of the port parameters to the default value.

C.2.15.5.2 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-364 Field Descriptions for the SONET Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Termination Mode	Allows you to set the mode of termination.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.

Table C-364 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Type	Defines the port as SONET or SDH.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
AdminSSM	Allows you to override the STU value with one of the following: • PRS—Primary Reference Source (Stratum 1) • STU • ST2—Stratum 2 • ST3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4 • DUS—Do not use for timing synchronization • RES—Reserved; quality level set by user
ProvidesSync	When checked, the card is provisioned as an NE timing reference.

C.2.15.5.3 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute section threshold information for the card.

Table C-365 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.5.4 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day section threshold information for the card.

Table C-366 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.

Table C-366 Field Descriptions for the Section Thresh 1 Day Tab (continued)

Field	Description
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.5.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold information for the card.

Table C-367 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.5.6 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold information for the card.

Table C-368 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.

Table C-368 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.5.7 RMON Tab

The RMON Thresholds Properties pane allows you to view RMON thresholds for the card.

Table C-369 Field Descriptions for the RMON Tab

Field	Description
Create button	Allows you to create an RMON threshold. For more information, see 6.5.4 Creating RMON Thresholds, page 6-11.
Index Number	Displays the optical port number.
Slot	Displays the slot.
Port	Displays the port.
Variable	Displays the Ethernet threshold variable. The variable depends on the card type.
Alarm Type	Displays the Ethernet threshold alarm type. Values are Rising, Falling, or Rising and Falling.
Sample Type	Displays the Ethernet threshold sample type. Values are Relative and Absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of any time period.
Sample Period (sec)	Displays the Ethernet threshold sample period, in seconds.
Rising Thresholds (Count)	Displays a count of the number of times an alarm entry crosses the rising threshold and the entry generates an event.
Falling Thresholds (Count)	Displays a count of the number of times an alarm entry crosses the falling threshold and the entry generates an event.

C.2.15.5.8 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information.

Table C-370 Field Descriptions for the Ethernet Tab

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
Max. Size	To permit the acceptance of jumbo-size Ethernet frames, select Jumbo (default).

C.2.15.5.9 Ports Tab

Table C-371 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak (H:M)	Automatic in-service soak. The amount of time left before the traffic/termination transitions to the IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.
Overclock	Allows you to enable or disable Overclock mode. Enable the mode to set the data rate to FC 10G for PPM.
Rx Wavelength	Displays the configuration parameter for modulation/demodulation.

Table C-371 Field Descriptions for the Ports Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.15.6 Path

The Path Properties pane contains the following tabs:

- C.2.15.6.1 SONET Tab, page C-247
- C.2.15.6.2 J1 Path Trace Tab, page C-247

C.2.15.6.1 SONET Tab

The SONET tab allows you to view and change the SONET path settings for the OTU2_XP module.

Table C-372 Field Descriptions for the SONET Tab

Field	Descriptions
Port No.	Displays the port number.
SF BER Level	Sets the signal fail bit error rate.
SD BER Level	Sets the signal degrade bit rate.

Note The SDH tab is displayed if the card is installed on an ONS 15454 SDH NE.

C.2.15.6.2 J1 Path Trace Tab

The J1 Path Trace tab allows you to view and update J1 path trace information.

Table C-373 Field Descriptions for the J1 Path Trace Tab

Field	Descriptions
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. See 7.2.21 Modifying Traces, page 7-177 for more information.
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Default button	Resets the value of the port parameters to the default value.

Note These properties are affected only when 10GE LAN to WAN card mode is configured.

C.2.15.7 OTN

The OTN Properties pane contains the following tabs:

- C.2.15.7.1 OTN Line Tab, page C-248
- C.2.15.7.2 G.709 Thresh 15 Min Tab, page C-248
- C.2.15.7.3 G.709 Thresh 1 Day Tab, page C-249
- C.2.15.7.4 FEC Thresh 15 Min Tab, page C-250
- C.2.15.7.5 FEC Thresh 1 Day Tab, page C-250

- C.2.15.7.6 Trail Trace Identifier Tab, page C-251

C.2.15.7.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-374 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	Displays the port number. If you set the payload as OTU2 in the PPM Properties pane, a new port is added to the OTN Line tab.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.15.7.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information and allows you to change these card threshold values.

Table C-375 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.

Table C-375 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.7.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information and allows you to change these card threshold values.

Table C-376 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.

Table C-376 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.7.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-377 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.15.7.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-378 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.15.7.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-379 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. For more information, see 7.2.21 Modifying Traces, page 7-177.
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.15.8 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table C-380 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The port state must be OOS_MT before you can configure the loopback type.

C.2.15.9 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-381 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur.	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int.	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Indicates whether the laser is currently shut down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.15.10 Optical Thresh

The Optical Thresh Properties pane contains the following tabs:

- C.2.15.10.1 TCA 15 Min Tab, page C-252
- C.2.15.10.2 TCA 1 Day Tab, page C-252
- C.2.15.10.3 Alarm Thresh Tab, page C-253

C.2.15.10.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of the card.

Table C-382 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.10.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of the card.

Table C-383 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.10.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-384 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.15.11 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-385 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Table C-385 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Payload	
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
GFP	
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.

C.2.15.12 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-386 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.15.13 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-387 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

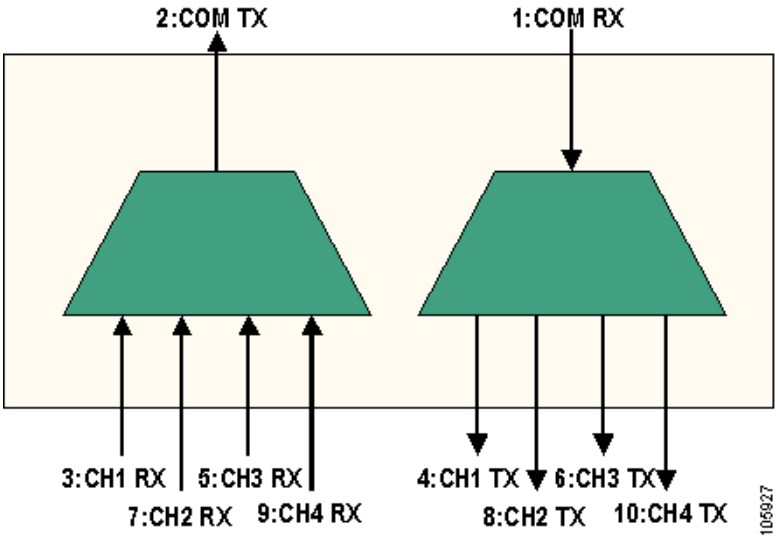
C.2.16 Slot Properties—4MD_xx.x

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The four-channel multiplexer/demultiplexer (4MD_xx.x) module is a single-slot card that features interferential filters with VOAs and photodiode for each input port. Each VOA is software controlled. The 4MD_xx.x card has ten LC-PC-II optical connectors.

The following figure shows the block diagram.

Figure C-23 4MD_xx.x Module



For the 4MD_xx.x module, the slot properties pane displays the following properties: Module View, Identification, Optical Channel, Optical Band, Inventory, and Alarm Behavior.

C.2.16.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.16.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-388 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.

Table C-388 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.16.3 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information.

Table C-389 Field Descriptions for the Optical Channel Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-389 Field Descriptions for the Optical Channel Properties Pane (continued)

Field	Description
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.

C.2.16.4 Optical Band

The Optical Band Properties pane allows you to view and update optical band threshold information.

Table C-390 Field Descriptions for the Optical Band Properties Pane

Field	Description
Parameters	
Port Number	Displays the identifier of the port (and specific channel information: Add, Drop, Tx, or Rx).
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-390 Field Descriptions for the Optical Band Properties Pane (continued)

Field	Description
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
VOA Degrade High	The high VOA degrade threshold.
VOA Degrade Low	The low VOA degrade threshold.

C.2.16.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-391 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
HW Version	The hardware version number.
IL-REF	The reference insertion loss.
Serial Number	The serial number that is unique to each card.

Table C-391 Field Descriptions for the Inventory Properties Pane (continued)

Field	Description
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.
Part Number	The part number that is printed on the top of the card.

C.2.16.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-392 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

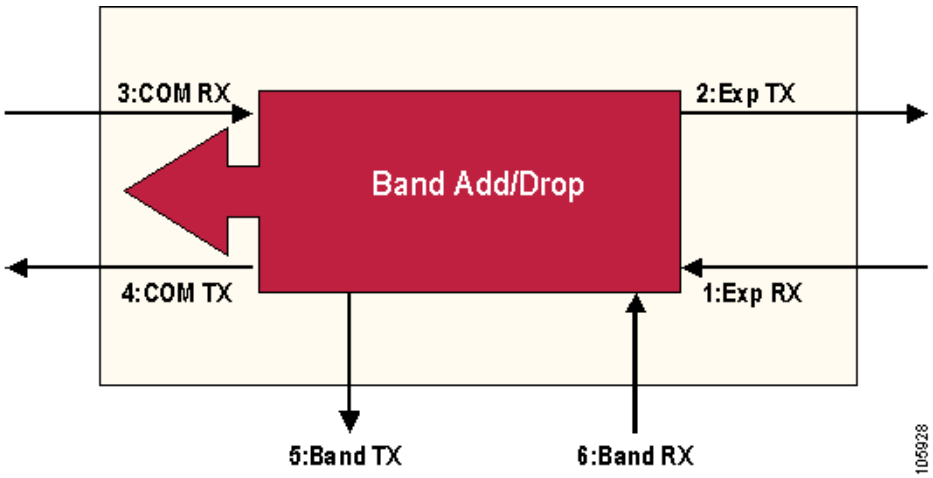
C.2.17 Slot Properties—AD_1B_xx.x

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The AD_1B_xx.x module is a single-slot, one-band OADM filter card that has interferential filters with VOAs and photodiode for each output port. Each VOA is software controlled. The AD_1B_xx.x card features six LC-PC-II optical connectors.

The following figure shows the block diagram.

Figure C-24 AD_1B_xx.x Module



For the AD_1B_xx.x module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Band, Inventory, and Alarm Behavior.

C.2.17.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.17.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-393 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.

Table C-393 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.17.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-394 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.

Table C-394 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Sets the high VOA settings.
VOA Degrade Low	Sets the low VOA settings.

C.2.17.4 Optical Band

The Optical Band Properties pane allows you to view and update optical band threshold information.

Table C-395 Field Descriptions for the Optical Band Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Band	Shows the current optical band setting.

Table C-395 Field Descriptions for the Optical Band Properties Pane (continued)

Field	Description
Expected Band	Allows you to set the expected band.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Allows you to set the high VOA settings.
VOA Degrade Low	Allows you to set the low VOA settings.

C.2.17.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-396 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
IL-REF	The reference insertion loss.
Serial Number	The serial number that is unique to each card.
Part Number	The part number that is printed on the top of the card.
HW Version	The hardware version number.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.

C.2.17.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-397 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.

Table C-397 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

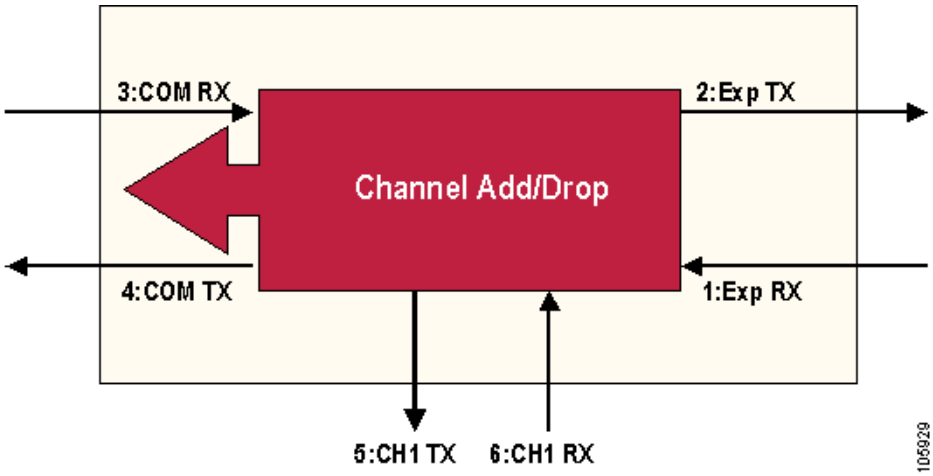
C.2.18 Slot Properties—AD_1C_xx.x

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The AD_1C_xx.x module is a single-slot one-channel OADM filter card that has interferential filters with VOAs and photodiode for each input port. Each VOA is software controlled per channel input power. The AD_1C_xx.x card features six LC-PC-II optical connectors.

The following figure shows the block diagram.

Figure C-25 AD_1C_xx.x Module



For the AD_1C_xx.x module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Channel, Inventory, and Alarm Behavior.

C.2.18.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.18.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-398 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.18.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-399 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Sets the high VOA settings.
VOA Degrade Low	Sets the low VOA settings.

C.2.18.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information.

Table C-400 Field Descriptions for the Optical Channel Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.

Table C-400 Field Descriptions for the Optical Channel Properties Pane (continued)

Field	Description
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Allows you to set the high VOA settings.
VOA Degrade Low	Allows you to set the low VOA settings.

C.2.18.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-401 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
IL-REF	The reference insertion loss.
Serial Number	The serial number that is unique to each card.
Part Number	The part number that is printed on the top of the card.
HW Version	The hardware version number.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.

C.2.18.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-402 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

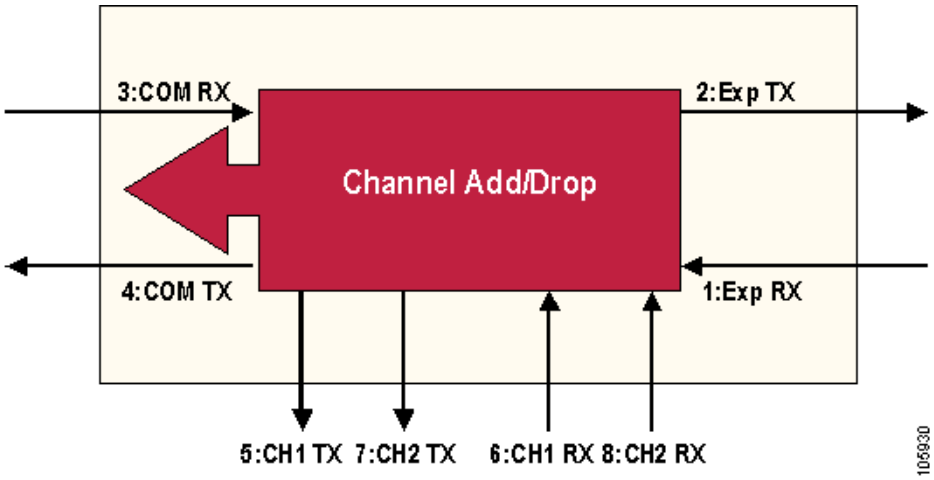
C.2.19 Slot Properties—AD_2C_xx.x

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The AD_2C_xx.x module is a single-slot two-channel OADM filter card that has interferential filters with VOAs and photodiode for each input port. Each VOA is software controlled per channel input power. The AD_2C_xx.x card features eight LC-PC-II optical connectors.

The following figure shows the block diagram.

Figure C-26 AD_2C_xx.x Module



For the AD_2C_xx.x module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Channel, Inventory, and Alarm Behavior.

C.2.19.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.19.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-403 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.

Table C-403 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.19.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-404 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).

Table C-404 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
VOA Attenuation Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Sets the high VOA settings.
VOA Degrade Low	Sets the low VOA settings.

C.2.19.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information.

Table C-405 Field Descriptions for the Optical Channel Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-405 Field Descriptions for the Optical Channel Properties Pane (continued)

Field	Description
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Allows you to set the high VOA settings.
VOA Degrade Low	Allows you to set the low VOA settings.

C.2.19.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-406 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
IL-REF	The reference insertion loss.
IL04	The insertion loss between the specified ports.

Table C-406 Field Descriptions for the Inventory Properties Pane (continued)

Field	Description
IL06	The insertion loss between the specified ports.
IL05	The insertion loss between the specified ports.
IL02	The insertion loss between the specified ports.
Serial Number	The serial number that is unique to each card.
Part Number	The part number that is printed on the top of the card.
HW Version	The hardware version number.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.

C.2.19.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-407 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

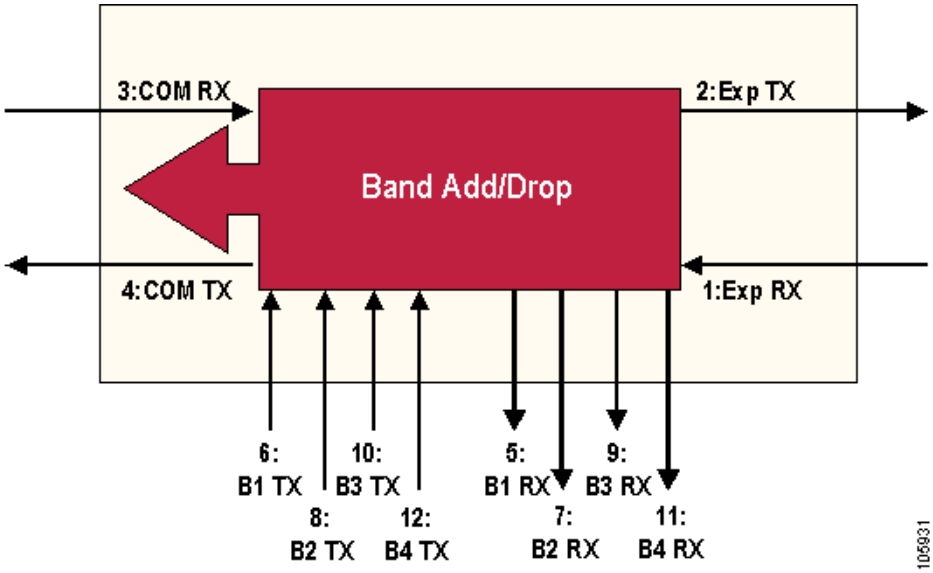
C.2.20 Slot Properties—AD_4B_xx.x

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The AD_4B_xx.x module is a single-slot, four-band OADM filter card that has interferential filters with VOAs and photodiode for each output port. Each VOA is software controlled. The AD_4B_xx.x card features twelve LC-PC-II optical connectors.

The following figure shows the block diagram.

Figure C-27 AD_4B_xx.x Module



For the AD_4B_xx.x module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Band, Inventory, and Alarm Behavior.

C.2.20.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.20.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-408 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.

Table C-408 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.20.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-409 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) and APC are the only functions that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Warning Thresh 15 Min	

Table C-409 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Sets the high VOA settings.
VOA Degrade Low	Sets the low VOA settings.

C.2.20.4 Optical Band

The Optical Band Properties pane allows you to view and update optical band threshold information.

Table C-410 Field Descriptions for the Optical Band Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.

Table C-410 Field Descriptions for the Optical Band Properties Pane (continued)

Field	Description
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Band	Shows the current optical band setting.
Expected Band	Allows you to set the expected band.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Allows you to set the high VOA settings.
VOA Degrade Low	Allows you to set the low VOA settings.

C.2.20.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-411 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
IL-REF	The reference insertion loss.
Serial Number	The serial number that is unique to each card.
Part Number	The part number that is printed on the top of the card.
HW Version	The hardware version number.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.

C.2.20.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-412 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

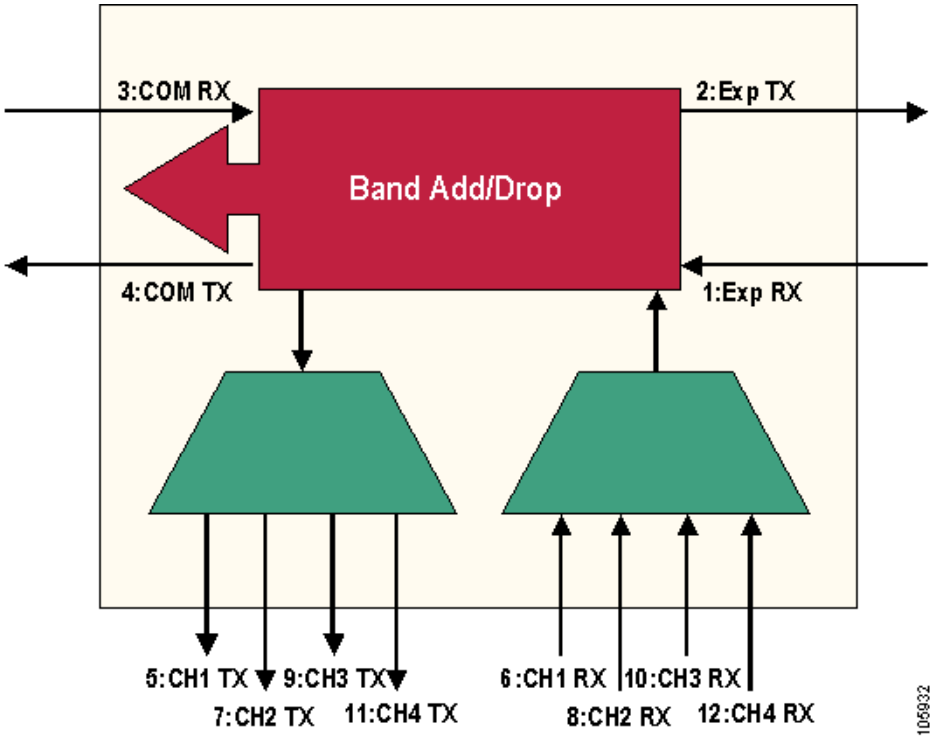
C.2.21 Slot Properties—AD_4C_xx.x

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The AD-4C-xx.x module is a single-slot four-channel OADM filter card that has interferential filters with VOAs and photodiode for each input port. Each VOA is software controlled per channel input power. The AD_4C_xx.x card features twelve LC-PC-II optical connectors.

The following figure shows the block diagram.

Figure C-28 AD_4C_xx.x Module



For the AD_4C_xx.x module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Channel, Inventory, and Alarm Behavior.

C.2.21.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.21.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-413 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.

Table C-413 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.21.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-414 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Status	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).

Table C-414 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
VOA Attenuation Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Sets the high VOA settings.
VOA Degrade Low	Sets the low VOA settings.

C.2.21.4 Optical Channel

The Optical Channel Properties pane allows you to view and update optical channel threshold information.

Table C-415 Field Descriptions for the Optical Channel Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	Places the port in In Service (IS), In Service–Auto In Service Soak (IS_AINS), Out of Service (OOS), or Out of Service–Maintenance (OOS_MT) state. **Note** You can only change the state from OOS to OOS_MT or vice versa. All other state transitions are controlled by the NE's software.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.

Table C-415 Field Descriptions for the Optical Channel Properties Pane (continued)

Field	Description
Power	Shows the current power level per port.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Power Ref.	Shows the value of the optical output power going to a VOA when constant power mode is active. Automatic Node Setup (ANS) is the only function that can modify this value.
VOA Attenuation Calib.	Allows you to modify the attenuation value of the VOA, if necessary, when the VOA mode is set for constant attenuation.
VOA Power Calib.	Allows you to modify the optical output power to the VOA, if necessary.
VOA Attenuation Ref.	Shows the attenuation value of the VOA when the VOA is set in attenuation mode. ANS and APC are the only functions that can modify this value.
Actual Wavelength	Shows the wavelength specified by the manufacturing data. This field cannot be set manually.
Expected Wavelength	Shows the value of the expected wavelength for the given port. The wavelengths for these ports are not provisionable.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power settings.
Power High	Allows you to set the high power settings.
Alarm Threshold	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure settings.
Power Degrade High	Allows you to set the high power settings.
Power Degrade Low	Allows you to set the low power settings.
VOA Degrade High	Allows you to set the high VOA settings.
VOA Degrade Low	Allows you to set the low VOA settings.

C.2.21.5 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-416 Field Descriptions for the Inventory Properties Pane

Field	Description
Vendor ID	The ID of the vendor.
IL-REF	The reference insertion loss.
Serial Number	The serial number that is unique to each card.

Table C-416 Field Descriptions for the Inventory Properties Pane (continued)

Field	Description
Part Number	The part number that is printed on the top of the card.
HW Version	The hardware version number.
Firmware Version	The revision number of the software used by the ASIC chip installed on the card.

C.2.21.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-417 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.22 Slot Properties—ADM-10G

The slot properties pane displays information about the ADM-10G card that is selected in the NE Explorer. Use this properties pane to change the card properties.

The ADM-10G card operates on ONS 15454 SONET, ONS 15454 SDH, and DWDM networks to carry optical signals and Gigabit Ethernet signals over DWDM wavelengths for transport. The card aggregates lower bit-rate client SONET or SDH signals (OC-3/STM-1, OC-12/STM-4, OC-48/STM-16, or Gigabit Ethernet) onto a C-band tunable DWDM trunk operating at a higher OC-192/STM-64 rate. In a DWDM network, the ADM-10G card transports traffic over DWDM by mapping Gigabit Ethernet and SONET or SDH circuits onto the same wavelength with multiple protection options.

The ADM-10G card is a double-slot card that can be installed in slots 1 through 5 or 12 through 16 in standard and high-density SONET shelves (15454-SA-ANSI or 15454-SA-HD), the ONS 15454 SDH standard shelf assembly, or the ONS 15454 SDH high-density shelf assembly. Installation is supported in any of these slots.

Note

- The recommended slots are 1, 3, 5 and 12, 14, 16.
- In a single-card configuration, you can configure ports 17, 18, and 19 as trunk ports supporting the OC-192 payload. After it is configured as trunk ports, you can use ports 17, 18 and 19 in circuit, link, and server trail configurations.

Caution Fan-tray assembly 15454E-CC-FTA (ETSI shelf)/15454-CC-FTA (ANSI shelf) must be installed on a shelf where the ADM-10G card is installed.

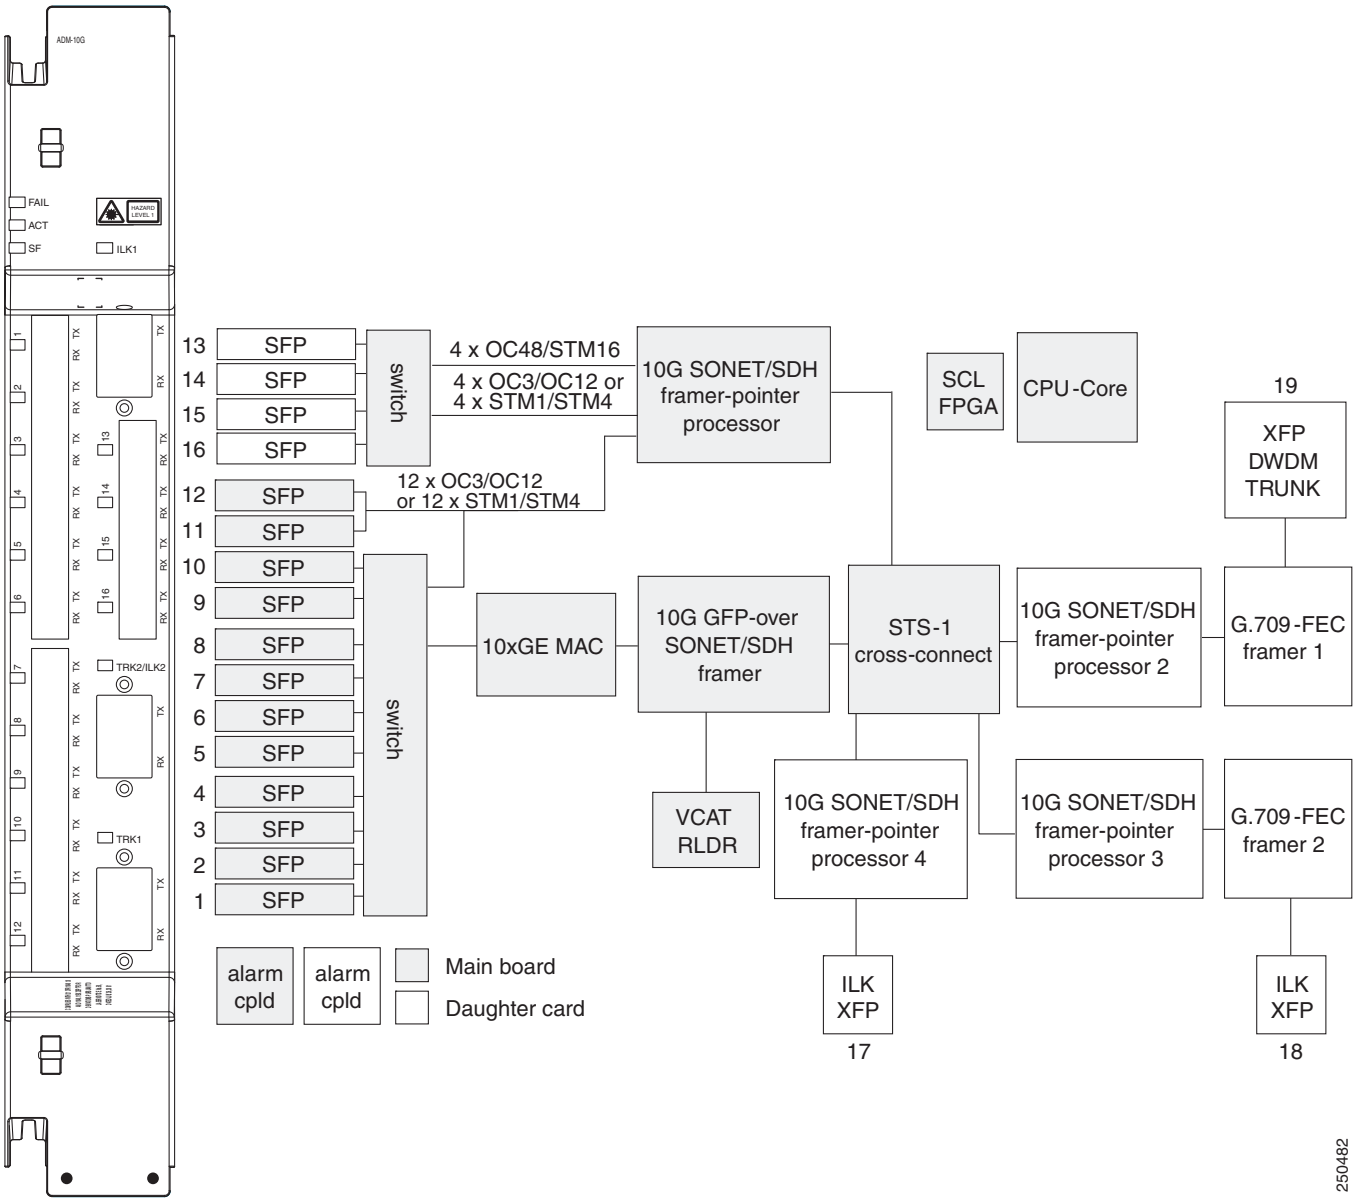
The card is compliant with ITU-T G.825 and ITU-T G.783 for SDH signals. It supports concatenated and nonconcatenated AU-4 mapped STM-1, STM-4, and STM-16 signals as specified in ITU-T G.707. The card also complies with Section 5.6 of Telcordia GR-253-CORE and supports synchronous transport signal (STS) mapped OC-3, OC-12, and OC-48 signals as specified in the standard.

The client SFP and trunk XFP are compliant with interface requirements in Telcordia GR-253-CORE, ITU-T G.957 and/or ITU-T G.959.1, and IEEE 802.3.

The ADM-10G card defaults to GFP-F encapsulation that is compliant with ITU-T G.7041. This mode allows the card to operate with ONS 15310 CL, ONS 15310 MA, or ONS 15454 data cards (for example, ONS 15454 CE-100T-8 or ML1000-2 cards). GFP encapsulation also allows the ADM-10G card to interoperate with other vendors' Gigabit Ethernet interfaces that adhere to the ITU-T G.7041 standard.

The following figure shows the card faceplate.

Figure C-29 ADM-10G Faceplate



C.2.22.1 Module View

The Module View displays a graphic of the ADM-10G card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.2.22.2 Identification

The Identification Properties pane allows you to view and update identification information.

Table C-418 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.22.3 Card

The Card Properties pane allows you to view and update card information.

Table C-419 Field Descriptions for the Card Properties Pane

Field	Description
Regeneration Peer Slot	Allows you to select like cards so that you can configure a peer group.
Regeneration Group Name	Allows you to set the name of the peer group.

C.2.22.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-420 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.22.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.22.5 Line

The Line Properties pane allows you to configure line settings. If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the subtabs and fields in Table C-421. If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the subtabs and fields in Table C-422.

Table C-421 Field Descriptions for the Line Properties Pane — ONS 15454 SONET

Field	Description
Section Trace	
Port No.	The port number.
Trace Mode	The trace mode (Off or Manual).
Disable AIS/RDI on TIM-S	Disables the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Allows you to select a transmit length for the trace. Values are 1 byte or 16 bytes; the default is 16 bytes.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Ports	
Port No.	The port number.
Port Name	The port name.

Table C-421 Field Descriptions for the Line Properties Pane — ONS 15454 SONET (continued)

Field	Description
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state. The range is from 15 minutes to 48 hours.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664. ALS can be provisioned on client and trunk ports for SONET and SDH payload types only.

Table C-421 Field Descriptions for the Line Properties Pane — ONS 15454 SONET (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance) • CWDM • DWDM
Wavelength	Allows you to provision the wavelength frequency.
SONET Line	
Port No.	The port number.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	The port type (SONET).
ProvidesSync	When checked, the card is provisioned as an NE timing reference.

Table C-421 Field Descriptions for the Line Properties Pane — ONS 15454 SONET (continued)

Field	Description
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Admin SSM	Allows you to override the STU value with one of the following: • PRS—Primary Reference Source (Stratum 1) • STU • ST2—Stratum 2 • ST3—Stratum 3 • SMC—SONET minimum clock • ST4—Stratum 4 • DUS—Do not use for timing synchronization • RES—Reserved; quality level set by user
Ethernet	
Port No.	The port number of the client port.
MTU	Maximum transmission unit (MTU). The largest acceptable packet size configured for that port. The default value is 1548.
Mode	Values are 1000 Mb/s or Auto.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Framing	Shows the encapsulation type. Values are: • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices.
CRC Encap	Shows the cyclic redundancy check (CRC) encapsulation size. Values are 32-bit and None.
Section Thresh 15 Min - Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Section Thresh 1 Day - Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.

Table C-421 Field Descriptions for the Line Properties Pane — ONS 15454 SONET (continued)

Field	Description
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Thresh 15 Min - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line.
PSC	Protection Switching Count (PSC) is a count of the number of times service switches from a working port to a protection port, plus the number of times service switches back to the working port. For a protection port, PSC is a count of the number of times service switches to a working port from a protection port, plus the number of times service switches back to the protection port.
PSD	Protection Switching Duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, PSD is a count of the seconds that the line was used to carry service.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Thresh 1 Day - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Failure count line.
PSC	Protection Switching Count (PSC) is a count of the number of times service switches from a working port to a protection port, plus the number of times service switches back to the working port. For a protection port, PSC is a count of the number of times service switches to a working port from a protection port, plus the number of times service switches back to the protection port.
PSD	Protection Switching Duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, PSD is a count of the seconds that the line was used to carry service.
Reset to Defaults button	Resets the value of the port parameters to the default value.
RMON Thresholds	
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.

Table C-421 Field Descriptions for the Line Properties Pane — ONS 15454 SONET (continued)

Field	Description
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period (sec)	Displays the sample period, in seconds.
Rising Thresholds (count)	Displays the number of occurrences for the rising threshold.
Falling Thresholds (count)	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
STS	
STS Number	Displays the synchronous transport signal number information.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

Table C-422 Field Descriptions for the Line Properties Pane — ONS 15454 SDH

Field	Description
Section Trace	
Port No.	The port number.
Trace Mode	The trace mode (Off or Manual).
Disable AIS/RDI on TIM-S	Disables the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Allows you to select a transmit length for the trace. Values are 1 byte or 16 bytes; the default is 16 bytes.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
Ports	
Port No.	The port number.
Port Name	The port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.

Table C-422 Field Descriptions for the Line Properties Pane — ONS 15454 SDH (continued)

Field	Description
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state. The range from is 15 minutes to 48 hours.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664. ALS can be provisioned on client and trunk ports for SONET and SDH payload types only.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance) • CWDM • DWDM
Wavelength	Allows you to provision the wavelength frequency.
SDH Line	
Port No.	The port number.
SD BER	Sets the signal degrade bit error rate.

Table C-422 Field Descriptions for the Line Properties Pane — ONS 15454 SDH (continued)

Field	Description
SF BER	Sets the signal fail bit error rate.
Type	The port type (SDH).
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Admin SSM	Allows you to override the STU value with one of the following: • G811 • STU • G812T • G812L • SETS • DUS
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Ethernet	
Port No.	The port number of the client port.
MTU	Maximum transmission unit (MTU). The largest acceptable packet size configured for that port. Possible values are 1548 (default) and Jumbo.
Mode	Values are 1000 Mb/s or Auto.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
Framing	Shows the encapsulation type. Values are: • GFP-F—Frame-mapped generic framing procedure; a protocol data unit (PDU)-oriented adaptation mode that maps a client frame into one GFP frame. • HDLC—High-level data link control; does not support VLAN trunking. Standard on most Cisco data devices.
CRC Encap	Sets the cyclic redundancy check (CRC) encapsulation size. Values are 32-bit and None.
RS Thresh 15 Min - Near End	
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
RS Thresh 1 Day - Near End	
Port No.	The port number.
EB-RS	Errored blocks regenerator section.

Table C-422 Field Descriptions for the Line Properties Pane — ONS 15454 SDH (continued)

Field	Description
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Thresh 15 Min - Near End, Far End	
Port No.	The port number.
EB-MS	Errored blocks–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection Switching Count (PSC) is a count of the number of times service switches from a working port to a protection port, plus the number of times service switches back to the working port. For a protection port, PSC is a count of the number of times service switches to a working port from a protection port, plus the number of times service switches back to the protection port.
PSD	Protection Switching Duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, PSD is a count of the seconds that the line was used to carry service.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Thresh 1 Day - Near End, Far End	
Port No.	The port number.
EB-MS	Errored blocks–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
PSC	Protection Switching Count (PSC) is a count of the number of times service switches from a working port to a protection port, plus the number of times service switches back to the working port. For a protection port, PSC is a count of the number of times service switches to a working port from a protection port, plus the number of times service switches back to the protection port.
PSD	Protection Switching Duration (PSD) applies to the length of time, in seconds, that service is carried on another line. For a working line, PSD is a count of the number of seconds that service was carried on the protection line. For the protection line, PSD is a count of the seconds that the line was used to carry service.
Reset to Defaults button	Resets the value of the port parameters to the default value.
RMON Thresholds	

Table C-422 Field Descriptions for the Line Properties Pane — ONS 15454 SDH (continued)

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period (sec)	Displays the sample period, in seconds.
Rising Thresholds (count)	Displays the number of occurrences for the rising threshold.
Falling Thresholds (count)	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
VC4	
VC No.	Displays the VC number.
IPPM Enabled	Check to enable intermediate path performance monitoring (IPPM) and uncheck to disable IPPM.

C.2.22.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for cards. The Properties pane contains the following tabs:

- C.2.22.6.1 OTN Line Tab, page C-296
- C.2.22.6.2 G.709 Thresh 15 Min Tab, page C-297
- C.2.22.6.3 G.709 Thresh 1 Day Tab, page C-298
- C.2.22.6.4 FEC Thresh 15 Min Tab, page C-299
- C.2.22.6.5 FEC Thresh 1 Day Tab, page C-299
- C.2.22.6.6 Trail Trace Identifier Tab, page C-299

C.2.22.6.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the ADM-10G card.

Table C-423 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	Displays the port number.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.

Table C-423 Field Descriptions for the OTN Line Tab (continued)

Field	Description
Asynch/Synch Mapping	The card can perform multiplexing per ITU-T G.709. The ODUK (client SONET/SDH payload) can be mapped to the optical channel (OTUK) synchronously (synch mapping) with this setting.
SF BER	Displays the signal fail bit error rate.
SD BER	Displays the signal degrade bit error rate.

C.2.22.6.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-424 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	

Table C-424 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.22.6.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-425 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.

Table C-425 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.22.6.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold information of the ADM-10G card.

Table C-426 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.22.6.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold information of the ADM-10G card.

Table C-427 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.22.6.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the ADM-10G card.

Table C-428 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.22.7 Loopback

The Loopback Properties pane allows you to view and update ADM-10G loopback information.

Table C-429 Field Descriptions for the Loopback Properties Pane

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none). **Note** The line state must be OOS_MT before you can configure the loopback type.

C.2.22.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-430 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).

Table C-430 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.22.9 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.22.9.1 TCA 15 Min Tab, page C-301
- C.2.22.9.2 TCA 1 Day Tab, page C-301
- C.2.22.9.3 Alarm Thresh Tab, page C-302

C.2.22.9.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of the ADM-10G card.

Table C-431 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.22.9.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of the ADM-10G card.

Table C-432 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.

Table C-432 Field Descriptions for the TCA 1 Day Tab (continued)

Field	Description
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.22.9.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-433 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.22.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table C-434 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.

Table C-434 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
GFP	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.22.11 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-435 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.22.12 J1 Path Trace

The J1 Path Trace Properties pane allows you to view and update J1 path trace information.

Table C-436 Field Descriptions for the J1 Path Trace Properties Pane

Field	Description
Port Number	Displays the port number.
STS Number	(*Available in ONS 15454 SONET only*) Displays the STS number.
VC4 Number	(*Available in ONS 15454 SDH only*) Displays the VC number.
Expected String	Displays the current expected string.
Received String	Displays the current received string.
Mode	Displays the path trace mode (Off/None, Auto, or Manual).
C2	Represents a machine-generated J1/J2 payload label byte.

C.2.22.13 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-437 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.23 Slot Properties—GE_XP and 10GE_XP

The GE_XP and 10GE_XP cards are Gigabit Ethernet (GE) transponders for the ONS 15454 SONET and ONS 15454 SDH platforms. The cards aggregate Ethernet packets received on the client ports for transport on C-band trunk ports that operate on a 100-GHz grid. The trunk ports operate with ITU-T G.709 framing and either FEC or E-FEC. The GE_XP and 10GE_XP cards are designed for bulk point-to-point transport over 10GE LAN PHY wavelengths for video-on-demand (VoD), or broadcast video across protected 10GE LAN PHY wavelengths.

The GE_XP and 10GE_XP cards can be installed in slots 1 through 6 or 12 through 17. The GE_XP is a double-slot card with twenty GE client ports and two 10 GE trunk ports. The 10GE_XP is a single-slot card with two 10 GE client ports and two 10 GE trunk ports. The client ports support SX, LX, and ZX SFPs, and SR and 10GBASE-LR XFPs. (LR2 XFPs are not supported.) The trunk ports support a DWDM XFP.

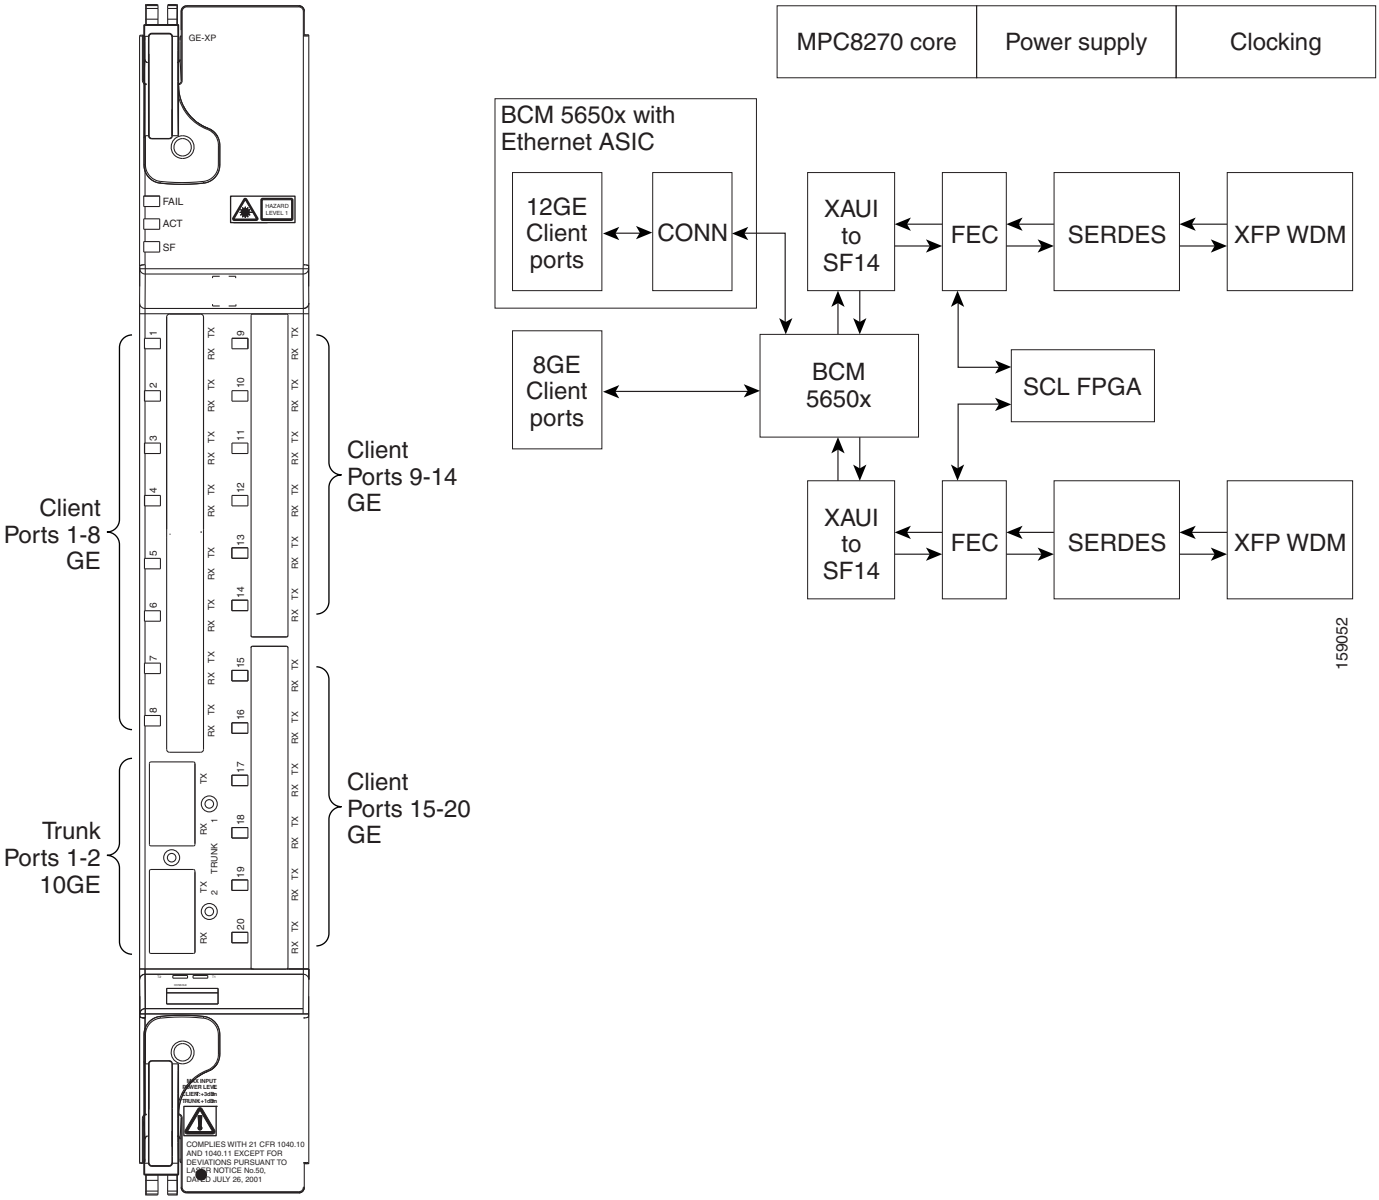
Caution A fan-tray assembly (15454E-CC-FTA for the SDH shelf, or 15454-CC-FTA for the SONET shelf) must be installed on a shelf where a GE_XP or 10GE_XP card is installed.

GE_XP and 10GE_XP cards can be provisioned to perform different GE transport roles. Both cards can perform as Layer 2 switches. However, the 10GE_XP can also perform as a 10GE transponder, and the GE_XP can perform as a 10GE or 20GE muxponder.

Prime Optical supports the FE payload on RAD SFPs. For the 10GE_XP card, Prime Optical supports the 10GE payload, and for the GE_XP card, Prime Optical supports the 10GE payload on trunk ports 21 and 22.

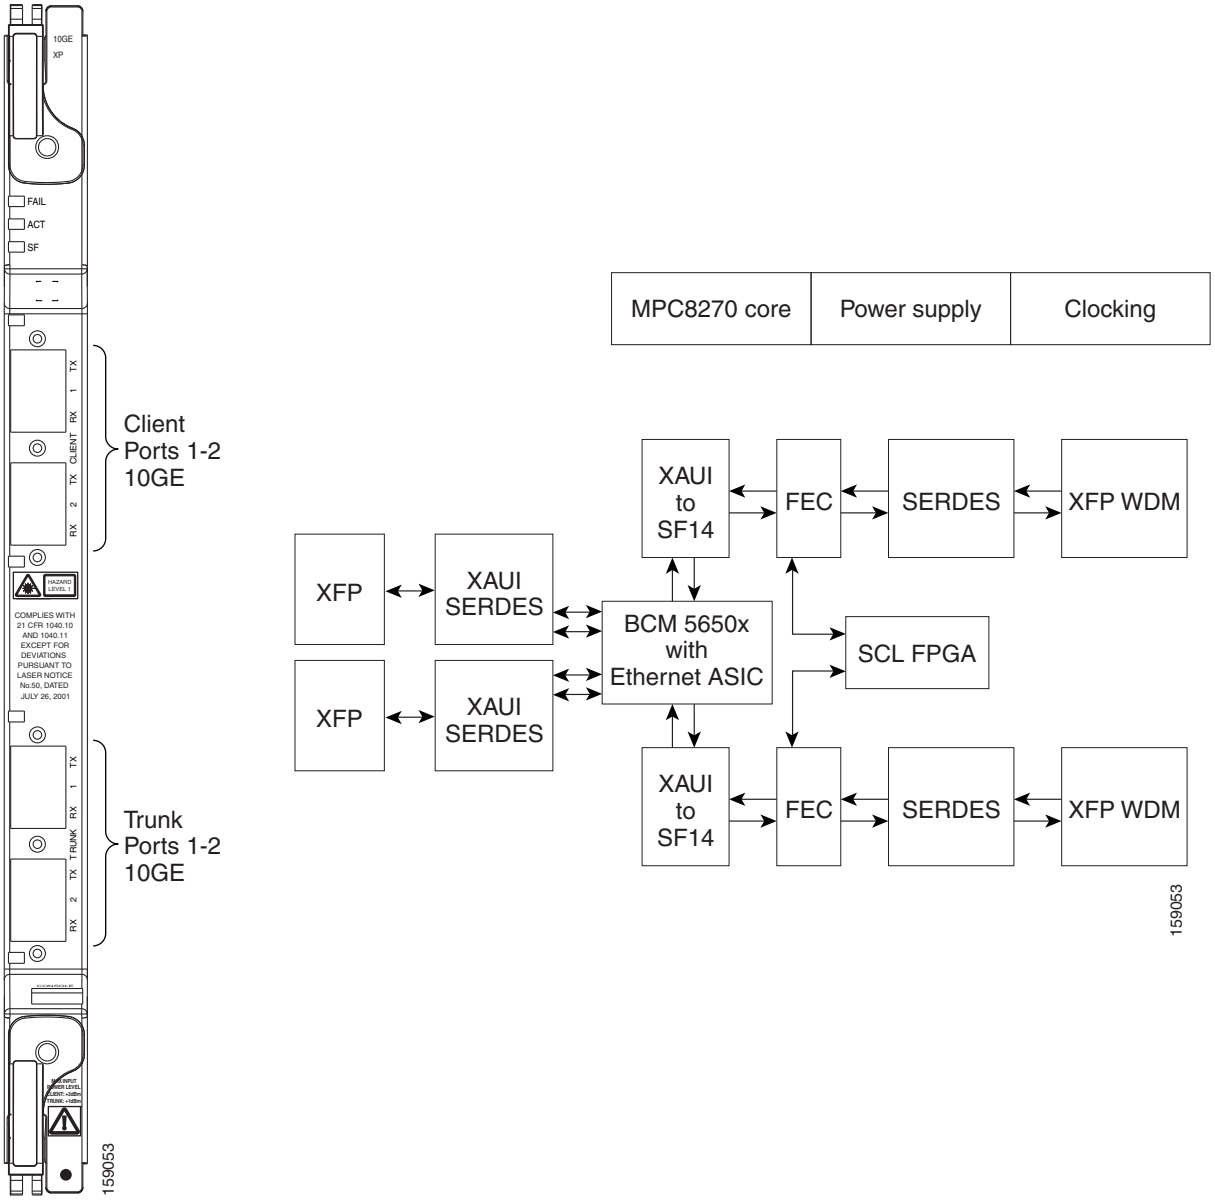
The following figure shows the GE_XP faceplate and block diagram.

Figure C-30 GE_XP Faceplate and Block Diagram



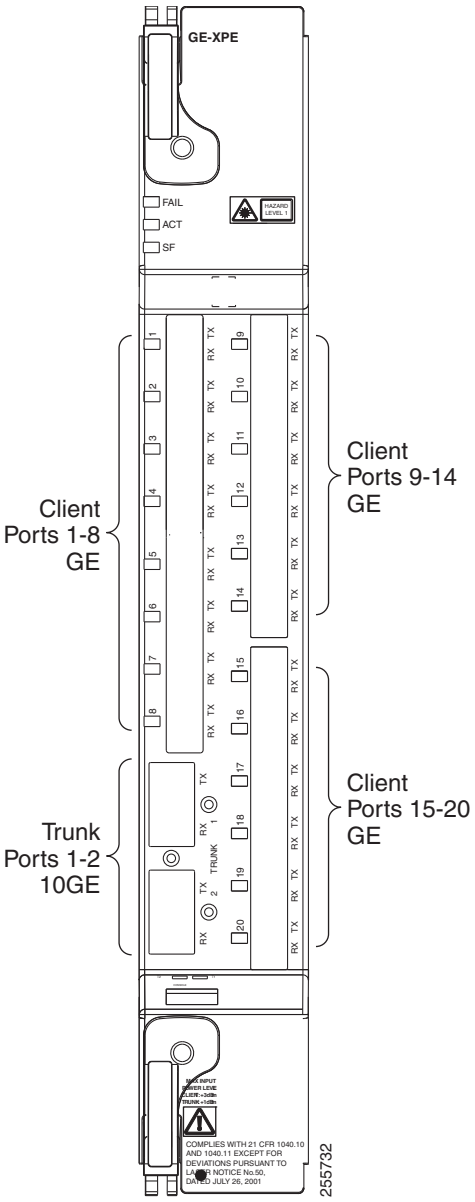
The following figure shows the 10GE_XP faceplate and block diagram.

Figure C-31 10GE_XP Faceplate and Block Diagram



The following figure shows the GE_XPE faceplate.

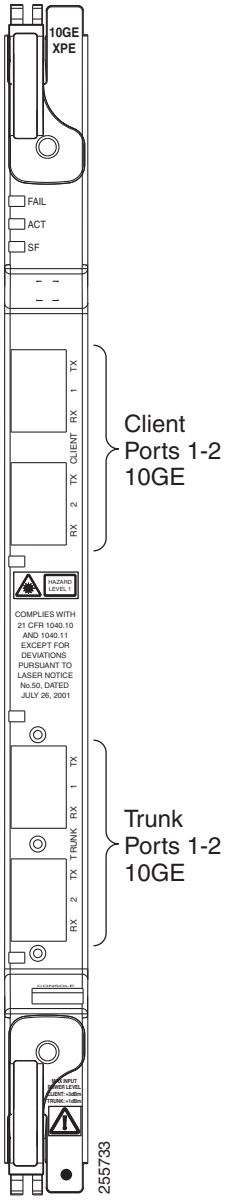
Figure C-32 GE_XPE Faceplate



Note GE_XPE card is an enhanced version of the GE_XP card. GE_XPE trunk ports 1-2 are mapped to physical ports 21 and 22.

The following figure shows the 10GE_XPE faceplate.

Figure C-33 10GE_XPE Faceplate



Note 10GE_XPE card is an enhanced version of the 10GE_XP card. 10GE_XPE trunk ports 1-2 are mapped to physical ports 3 and 4.

For GE_XP and 10GE_XP cards, the slot properties pane displays the following properties: Module View, Identification, Alarm Behavior, Auto Laser Shutdown, Card, CFM, Channel Groups, EFM, Ether Ports, Info, Loopback, MAC Addresses, MVR, Optical Thresh, OTN, PPM, Profiles Mapping, Protection, Protection Groups, QinQ, QoS, REP, RMON Thresholds, Security, Show Command, SVLAN, and SVLAN AIS.

C.2.23.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Moving the mouse pointer over the graphic also displays the alarm counts.) Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.23.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-438 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance • Unlocked • Locked, disabled • Unlocked, automatic In Service • Locked, maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.23.3 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table C-439 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, all alarms are suppressed for the card or its port(s).
DWDM	
Port No.	Displays the card port number. **Note** DWDM ports are trunk ports.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number. **Note** Payload ports are client ports.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Channel Groups	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.23.4 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-440 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is set to Shutdown.

C.2.23.5 Card

The Card Properties pane allows you to provision GE_XP and 10GE_XP card parameters.

Table C-441 Field Descriptions for the Card Properties Pane

Field	Description
Card Mode	Sets the card mode: **Note** Any provisioned client or trunk ports must be in the OOS-MA,DSBLD (SONET) or Locked-enabled,disabled (SDH) service state. You can change the state on the Ether Ports Properties pane > Ethernet tab. • L2 over DWDM—(GE_XP and 10GE_XP) Provisions the GE_XP or 10GE_XP as a Layer 2 switch. • 10GE TXP—(10GE_XP only) Provisions the 10GE_XP as a 10GE transponder. Traffic received on the 10GE client port 1-1 is sent to 10GE trunk port 3-1, and traffic received on 10GE client port 2-1 is sent to 10GE trunk port 4-1. • 10GE MXP—(GE_XP) Provisions the GE_XP as a 10GE muxponder. Traffic received on GE client ports 1-1 through 10-1 is multiplexed and sent to 10GE trunk port 21-1, and traffic received on GE client ports 11-1 through 20-1 is multiplexed and sent to 10GE trunk port 22-1. • 20GE MXP—(GE_XP) Provisions the GE_XP as a 20GE muxponder. Traffic received on GE client ports 1-1 through 20-1 is multiplexed and sent to 10GE trunk port 21-1. Trunk port 22-1 is not used.

C.2.23.6 CFM

The CFM Properties pane allows you to enable or disable CFM on the cards.

Note For the CFM Properties pane to be enabled, the card mode must be L2 over DWDM.

C.2.23.6.1 Configuration Tab

The Configuration tab allows you to enable or disable CFM for each port on the cards.

Table C-442 Field Descriptions for the Configuration Tab

Field	Description
Interface Configuration	
Port	*Display only.* Port number (n-n) and rate (ONE_GE or TEN_GE).
Enable CFM check box	Check the CFM check box to enable CFM on a port.
Card Configuration	
Enable CFM check box	Check the CFM check box to enable CFM on the card.
CC Timer	Choose the value for the CC Timer. Values are: • 1 second • 10 seconds • 1 minute

C.2.23.7 Channel Groups

The Channel Groups Properties pane allows you to manage channel group settings for GE_XP and 10GE_XP cards.

Note For the Channel Groups Properties pane to be enabled, the card mode must be L2 over DWDM.

Table C-443 Field Descriptions for the Channel Groups Properties Pane

Field	Description
Channel Group	*Display only.* ID and name of the channel group.
Port Name	Displays the name of the channel group.
Ports	*Display only.* Port number (n-n) and rate (ONE_GE or TEN_GE of the channel group).
LACP Mode	Sets the LACP mode. The channel group must be in OOS-DSBLD admin state. The options are: • On—Default mode. Ports will not exchange LACP packets with the partner ports. • Active—Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets. • Passive—Places a port into a passive negotiating state, in which the port responds to LACP packets it receives, but does not initiate LACP negotiation. In this mode, the port channel group attaches the interface to the bundle.

Table C-443 Field Descriptions for the Channel Groups Properties Pane (continued)

Field	Description
Hashing	Sets the LACP hashing algorithm. The channel group must be in OOS-DSBLD admin state. The following hashing algorithms are supported: • Unicast SA VLAN Incoming Port • Unicast DA VLAN Incoming Port • Unicast SA DA VLAN Incoming port • Unicast Src IP TCP UDP • Unicast Dst IP TCP UDP • Unicast Src Dst IP TCP UDP
Admin State	Sets the administrative state on the channel group. The Admin State can be: • IS—In Service • OOS, DSBLD—Out of Service, Disabled
Service State	*Display only.* Sets the service state that indicates the operational state of the channel group. The Service State can be: • IS-NR—In Service–Normal. • OOS-MA, DSBLD—Out of Service and Management, Disabled.
MTU	Sets the maximum transfer unit (MTU), which sets the maximum number of bytes per frame accepted on the port. The member ports must be in OOS-DSBLD admin state. The default MTU value in the channel group is taken from the default settings in the node. The default value is 9700. The valid range is from 64 to 9700.
Mode	Sets the provisional port mode. If the port mode is Auto, the Expected Speed field determines which ports can belong to the bundle. The member ports must be in OOS-DSBLD admin state. The values are: • Auto • 1000 Mb/s
Expected Speed	Sets the expected speed of ports of the channel group. The channel group must be in OOS-DSBLD admin state. The values are: • 10 Mb/s • 100 Mb/s • 1000 Mb/s
Duplex	*Display only.* Expected duplex capability of ports of the channel group. The value is Full.
Committed Info Rate	Sets the guaranteed information rate as per the service provider service-level agreement. The channel group must be in OOS-DSBLD admin state. The default value is 100. The valid range is from 0 to 100 percent.

Table C-443 Field Descriptions for the Channel Groups Properties Pane (continued)

Field	Description
Committed Burst Size	Sets the maximum number of bits transferred per second. The channel group must be in OOS-DSBLD admin state. The options are: • 4 k (default) • 8 k • 16 k • 32 k • 64 k • 128 k • 256 k • 512 k • 1 M • 2 M • 4 M • 8 M • 16 M
Excess Burst Size	Sets the maximum number of bits credited for later transfer if the committed burst rate cannot be transmitted. The channel group must be in OOS-DSBLD admin state. The options are: • 4 k (default) • 8 k • 16 k • 32 k • 64 k • 128 k • 256 k • 512 k • 1 M • 2 M • 4 M • 8 M • 16 M

Table C-443 Field Descriptions for the Channel Groups Properties Pane (continued)

Field	Description
NIM	Sets the port network interface mode (NIM) for the channel group. The member ports must be in OOS-DSBLD admin state. The channel group NIM is set to UNI or NNI based on the mode of the first port that is added to the channel group. The options are: • UNI Mode (Default)—Provisions the port as a UNI. This is the interface that faces the subscriber. • NNI Mode—Provisions the port as an NNI. This is the interface that faces the service provider network.
Ingress CoS	Provisions the IEEE 802.1p ingress class of service (CoS). Ingress CoS is used to set the priority of the Ethernet frame in the service provider network. The member ports must be in OOS-DSBLD admin state. The options are: • 0 • 1 • 2 • 3 • 4 • 5 • 6 • 7 • Trust • CVLAN • Differentiated Services Code Point (DSCP)
Inner Ethertype (Hex)	Defines the Inner Ethertype field. The Inner Ethertype field indicates which protocol is being transported in an Ethernet frame. The member ports must be in OOS-DSBLD admin state to modify the Inner Ethertype value to a non-default value. The default is 8100 (IEEE Standard 802.1Q customer VLAN tag type) and the range is from 0x600 to 0xffff.
Outer Ethertype (Hex)	Defines the Outer Ethertype field. The Outer Ethertype field identifies which protocol is being transported in an Ethernet frame. The member ports must be in OOS-DSBLD admin state. The default is 8100 (IEEE standard 802.1Q service provider VLAN tag type) and the range is from 0x600 to 0xffff.
MAC Learning	Enables or disables MAC learning for the port on GE_XP, 10GE_XP, GE_XPE, and 10GE_XPE cards. MAC learning is used by Layer 2 switches to learn the MAC addresses of network nodes so that the Layer 2 switches send traffic to the right location. On GE_XPE or 10GE_XPE cards, enable MAC address learning per SVLAN. The options are: • Checked—MAC learning is enabled for this port. • Unchecked—(Default) MAC learning is disabled for this port.
Delete	Allows you to delete an existing row from the LACP table. The Delete button is enabled when a particular row is selected in the table.

Table C-443 Field Descriptions for the Channel Groups Properties Pane (continued)

Field	Description
Add/Remove Ports	Allows you to add or remove ports to an existing channel group. Click the **Add/Remove Ports** button to open the Add/Remove Ports dialog box. To add ports to an existing channel group, complete the following: • Choose the required ports from the Standalone list. • Click the arrow (>>) to move the selected ports to the Bundled list. To remove ports from an existing channel group, complete the following: • Choose the required ports from the Bundled list. • Click the arrow (<<) to move the selected ports to the Standalone list. Click **Apply** to save the changes or click **Cancel** to exit without saving.
Create	Allows you to add a new row to the LACP table. Click **Create**. The Create Channel Group dialog box appears. Do the following: • Enter the name of the channel group in the Name field. • From the ID drop-down list, select a valid group ID. • From the Standalone list, choose the ports that will belong to this channel group and click the right arrow button to move the selected ports to the Bundled list. • From the LACP Mode drop-down list, choose the LACP mode as needed: – On – Active – Passive • From the LACP Hashing drop-down list, select the LACP hashing algorithm that the protocol uses to perform the load balancing task between the bundled ports. The following hashing algorithms are supported: – Unicast SA VLAN Incoming Port – Unicast DA VLAN Incoming Port – Unicast SA DA VLAN Incoming port – Unicast Src IP TCP UDP – Unicast Dst IP TCP UDP – Unicast Src Dst IP TCP UDP Click **Create** to create a new channel group or click **Cancel** to exit without saving. A new row is added to the Channel Groups Properties pane.

C.2.23.8 EFM

The EFM Properties pane allows you to configure EFM parameters, link monitoring parameters, and enable remote loopback on each port on the GE_XP and 10GE_XP cards. The Properties pane contains the following tabs:

- C.2.23.8.1 Configuration Tab, page C-317
- C.2.23.8.2 Link Monitoring Tab, page C-317

- C.2.23.8.3 Loopback Tab, page C-318

Note This Properties pane is applicable only when the Card Mode is set to L2 over DWDM in the Card Properties pane.

C.2.23.8.1 Configuration Tab

The Configuration tab allows you to configure EFM parameters on the GE_XP and 10GE_XP cards.

Table C-444 Field Descriptions for the Configuration Tab

Field	Description
Port	*Display only.* Port number (n-n) and rate (ONE_GE or TEN_GE).
EFM State	Sets the state of the EFM protocol for each port. Values are: • Enabled—Enables EFM for that port. • Disabled—Disables EFM for that port.
Mode	Sets the operating mode of the port. Values are: • Active—The port sends OAM Protocol Data Units (OAMPDUs) at regular intervals to the partner ports. • Passive—The port will not send OAMPDUs until the partner ports send OAMPDUs.
Link Fault	Sets the Remote Failure Indication (RFI) action. If the link is down on a port, the link fault RFI is sent to the partner port through OAMPDU. An alarm indicating the remote failure indication link fault (RFI-LF) is raised. The alarm is cleared after you clear the link fault condition. You can specify the following actions for link fault RFI: • Error Block—The interface is placed in the error-block state and the RFI-LF alarm is raised. • NONE—Only the RFI-LF alarm is raised.
Session Timer	Sets the duration up to when the EFM session is retained with the partner port without receiving OAMPDUs. The valid range is from 2 to 30 seconds.

C.2.23.8.2 Link Monitoring Tab

The Link Monitoring tab allows you to configure EFM link monitoring parameters for each port on the GE_XP and 10GE_XP cards.

Table C-445 Field Descriptions for the Link Monitoring Tab

Field	Description
Port	*Display only.* Port number (n-n) and rate (ONE_GE or TEN_GE).
EF Max	Sets the threshold value for the maximum number of errored frames to detect during a specific period. The valid range is from 0 to 65535. **Note** If the EF max value is set to zero, 0 (Not Provisioned) is displayed.
EF Min	Sets the threshold value for the minimum number of errored frames to detect during a specific period. The valid range is from 0 to 65535.

Table C-445 Field Descriptions for the Link Monitoring Tab (continued)

Field	Description
EF Action	The following EF actions are available: • NONE—If the parameter value exceeds the maximum threshold value, the applicable action is None. • Squelch—If the parameter value falls below the minimum threshold value, a threshold crossing alert (transient condition) is generated.
EF Window	Sets the threshold value for the maximum number of errored frames within the last *n* frames. The valid range is from 10 to 600.
EFP Max	Sets the threshold value for the maximum number of errored frames within the last *n* frames. The valid range is from 0 to 65535. **Note** If the EFP max value is set to zero, 0 (Not Provisioned) is displayed.
EFP Min	Sets the threshold value for the minimum number of errored frames within the last *n* frames. The valid range is from 0 to 65535.
EFP Action	The following EFP actions are available: • NONE—If the parameter value exceeds the maximum threshold value, the applicable action is NONE. • Squelch—If the parameter value falls below the minimum threshold value, a threshold crossing alert (transient condition) is generated.
EFP Window	Period in which the EFP parameters are monitored. The valid range is from 1 to 65535.
EFSS Max	Sets the threshold value for the maximum number of errored seconds within the last *m* seconds. The valid range is from 0 to 900. **Note** If the EFSS max value is set to zero, 0 (Not Provisioned) is displayed.
EFSS Min	Sets the threshold value for the minimum number of errored seconds within the last *m* seconds. The valid range is from 0 to 900.
EFSS Action	The following EFSS actions are available: • NONE—If the parameter value exceeds the maximum threshold value, the applicable action is None. • Squelch—If the parameter value falls below the minimum threshold value, a threshold crossing alert (transient condition) is generated.
EFSS Window	Specifies the period when the EFSS parameters are monitored. The valid range is from 100 to 9000.

C.2.23.8.3 Loopback Tab

The Loopback tab allows you to enable remote loopback for each port on the GE_XP and 10GE_XP cards.

Table C-446 Field Descriptions for the Loopback Tab

Field	Description
Port	*Display only.* Port number (n-n) and rate (ONE_GE or TEN_GE).
Remote Loopback Type	Ensures link quality with a remote peer during installation or troubleshooting. Values are: • Remote Loopback—Allows you to configure a port to terminal loopback. • NONE—Allows you to clear the current loopback.

C.2.23.9 Ether Ports

The Ether Ports Properties pane allows you to provision Ethernet ports for GE_XP and 10GE_XP cards. The options that can be set depend on the card mode. You can set the card mode in the Card Properties pane.The Ether Ports contains the following tabs:

- C.2.23.9.1 Ports Tab, page C-319
- C.2.23.9.2 Ethernet Tab, page C-320
- C.2.23.9.3 PDH Ethernet Parameters Tab, page C-324
- C.2.23.9.4 DS1 Line Tab, page C-324
- C.2.23.9.5 DS3 Line Tab, page C-325

C.2.23.9.1 Ports Tab

The Ports tab allows you to view and change the port settings.

Table C-447 Field Descriptions for the Ports Tab

Field	Description
Port Number	Displays the port number on the selected card.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Admin State	Displays the status of the line. The line can be In Service (IS); In Service–Auto In Service Soak (IS_AINS); Out of Service (OOS); Out of Service–Maintenance (OOS_MT); unlocked; locked, disabled; or locked, maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664. ALS can be provisioned on client and trunk ports for SONET and SDH payload types only.
AINS Soak	Automatic in-service soak. The duration remaining before the traffic/termination transitions to IS state.

Table C-447 Field Descriptions for the Ports Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card and line (client or trunk) that are selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance) • CWDM • DWDM
Wavelength	Allows you to provision the wavelength frequency.

C.2.23.9.2 Ethernet Tab

The Ethernet tab allows you to view Ethernet line information.

Table C-448 Field Descriptions for the Ethernet Tab

Field	Description
Port	Displays the card port number. The GE_XP is a double-slot card with twenty GE client ports (displayed as ONE_GE) and two 10 GE trunk ports (displayed as TEN_GE). The 10GE_XP is a single-slot card with two 10 GE client ports and two 10 GE trunk ports (all displayed as TEN_GE).
Egress QoS	Enables Quality of Service (QoS) on the port's egress, or output queues. The options are: • Checked—QoS is enabled on the port's egress queues. • Unchecked—(Default) QoS is disabled on the port's egress queues. To set this option, the card mode must be L2 over DWDM.
IGMP Static Router Port	Adds multicast-capable ports to the forwarding table for every IP multicast. The options are: • Checked—IGMP static router port is enabled. • Unchecked—(Default) IGMP static router port is disabled. To set this option, the card mode must be L2 over DWDM.
AIS Action	Defines the AIS action type provisioned on the port. The options are: • None—No action. • Squelch—When an AIS packet is received on a SVLAN terminating on the UNI-port, the UNI port is squelched. To set this option, the card mode must be L2 over DWDM.
Protection Action	Configures the standby port behavior. The options are: • None—No action. • Squelch—The laser on the standby port in a 1+1 protection group is squelched. This setting has no effect if the port is not part of the 1+1 protection group. To set this option, the card mode must be L2 over DWDM.
MTU	Sets the maximum transmission unit (MTU), which is the largest acceptable packet size configured for that port. The range is from 64 to 9700 bytes; the default size is 1548. To set this option, the card mode must be one of the following values: • L2 over DWDM • 10GE TXP • 10GE MXP • 20GE MXP
Mode	Displays the Ethernet mode. The values are: • Auto (default, GE ports only) • 1000 Mb/s (GE ports only) • 10000 Mb/s (default, 10 GE ports only) To set this option, the card mode must be one of the following: • L2 over DWDM • 10GE TXP • 10GE MXP • 20GE MXP

Table C-448 Field Descriptions for the Ethernet Tab (continued)

Field	Description
Flow Control	Enables or disables flow control messaging with its peer port. When enabled, the port can send and receive PAUSE frames when buffer congestion occurs. Values are: • ON—Flow control is enabled • OFF—(Default) Flow control is disabled To set this option, the card mode must be one of the following: • L2 over DWDM • 10GE MXP • 20GE MXP
Media Type	(GE_XPE card only) Sets the Media Type. To set this option, the card mode must be one of the following: • L2 over DWDM • 10GE MXP • 20GE MXP
Committed Info Rate	Sets the guaranteed information rate as provided by the service provider service-level agreement. To set this option, the card mode must be one of the following: • L2 over DWDM • 10GE MXP • 20GE MXP
Committed Burst Size	In Frame Relay links, sets the maximum number of bits that are transferred per second. To set this option, the card mode must be one of the following: • L2 over DWDM • 10GE MXP • 20GE MXP
Excess Burst Size	Sets the maximum number of bits that are credited for later transfer in the event the committed burst rate cannot be transmitted. To set this option, the card mode must be one of the following: • L2 over DWDM • 10GE MXP • 20GE MXP
NIM	Sets the port network interface mode (NIM). This parameter classifies port types designed for the Metro Ethernet market to simplify deployment, management, and troubleshooting. The options are: • UNI Mode—Provisions the port as a user-to-network interface (UNI). This is the interface that faces the subscriber. • NNI Mode—Provisions the port as a network-to-network interface (NNI). This is the interface that faces the service provider network. When a port is in UNI mode, tagging can be configured as transparent or selective. In transparent mode, only service provider virtual LANs (SVLANs) in the node VLAN database can be configured. In selective mode, the customer virtual LAN (CVLAN)-to-SVLAN relationship can be defined. To set this option, the card mode must be L2 over DWDM.

Table C-448 Field Descriptions for the Ethernet Tab (continued)

Field	Description
MAC Learning	Enables or disables MAC learning for the port. MAC learning is used by Layer 2 switches to learn the MAC addresses of network nodes so they know where to send traffic. Layer 2 switches—including GE_XP and 10GE_XP cards in L2 over DWDM mode—maintain a MAC learning table that associates the MAC addresses and VLANs with a given port. **Note** MAC address table aging is 300 seconds. It cannot be changed. To set this option, the card mode must be L2 over DWDM.
Ingress CoS	Provisions the IEEE 802.1p ingress Class of Service (CoS). The CoS .1p bits set the Ethernet frame priority. The options are: • 0—(Default) Sets the .1p bit to 0. • 1—Sets the .1p bit to 1. • 2—Sets the .1p bit to 2. • 3—Sets the .1p bit to 3. • 4—Sets the .1p bit to 4. • 5—Sets the .1p bit to 5. • 6—Sets the .1p bit to 6. • 7—Sets the .1p bit to 7. • Trust—Copies the .1p bit from the incoming packet. • Differentiated Services Code Point (DSCP) **Note** Ingress CoS applies only to ports provisioned as UNI mode. It does not apply to ports provisioned as NNI mode. To set this option, the card mode must be L2 over DWDM.
Inner Ethertype (Hex)	Defines the Inner Ethertype field. The Ethertype field indicates which protocol is being transported in an Ethernet frame. The inner Ethertype applies to ports provisioned for UNI mode only. It does not apply to ports provisioned for NNI mode. The ports must be out of service (OOS) before the inner Ethertype can be provisioned. The default is 8100 (IEEE standard 802.1Q customer VLAN tag type) and the range is from 0x600 to 0xfff. To set this option, the card mode must be L2 over DWDM.
Outer Ethertype (Hex)	Defines the Outer Ethertype field. The Ethertype field indicates which protocol is being transported in an Ethernet frame. The default is 8100 (IEEE standard 802.1Q customer VLAN tag type) and the range is from 0x600 to 0xfff. To set this option, the card mode must be L2 over DWDM.
Speed	Displays the operating speed for the ports.
Duplex	Actual setting of the port. Values are Auto, Full, and Half.

C.2.23.9.3 PDH Ethernet Parameters Tab

Note
- The PDH Ethernet Parameters tab is available in GE_XP card view only, provided the PPM for the card ports are created in Fast Ethernet (FE) mode.
- The PDH Ethernet Parameters tab is enabled only when the Card Mode is set to L2 over DWDM in the Card Properties pane.

Table C-449 Field Descriptions for the PDH Ethernet Parameters Tab

Field	Description
Port No	Displays the port number.
Port Name	Displays the name of the port.
MPLS Inner Label	Sets the MPLS Inner Label value. The default value is 16. The valid range is from 1 to 127.
MPLS Outer Label	Sets the MPLS Outer Label value. The default value is 16. The valid range is from 1 to 8063.
Jitter Buffer	Sets the jitter buffer value. The default value is 1500. The valid range is from 400 to 200000.
RX Sensitivity	Sets the RX sensitivity value.
Source IP Address	Allows you to enter the source IP address. Only Unicast IP addresses are accepted.
Peer IP Address	Allows you to enter the peer IP address. Only Unicast IP addresses are accepted.

C.2.23.9.4 DS1 Line Tab

The DS1 Line tab allows you to view and change the DS1 line settings.

Note
- The DS1 Line tab is available in GE_XP card view only, provided the PPM for the card ports are created in FE mode.
- The DS1 Line tab is enabled only when the Card Mode is set to L2 over DWDM in the Card Properties pane.

Table C-450 Field Descriptions for the DS1 Line Tab

Field	Description
Port No	Displays the port number.
Port Name	Displays the name of the port.
Clock Source	Sets the Clock Source.
Line Type	Allows you to select the line framing type.

Table C-450 Field Descriptions for the DS1 Line Tab (continued)

Field	Description
Line Coding	Allows you to define the DS-1 transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262 • 263–393 • 394–524 • 525–655

C.2.23.9.5 DS3 Line Tab

The DS3 Line tab allows you to view and change the DS3 line settings.

Note
- The DS3 Line tab is available in GE_XP card view only, provided the PPM for the card ports are created in FE mode.
- The DS3 Line tab is enabled only when the Card Mode is set to L2 over DWDM in the Card Properties pane.

Table C-451 Field Descriptions for the DS3 Line Tab

Field	Description
Port No	Displays the port number.
Port Name	Displays the name of the port.
Clock Source	Sets the Clock Source.
Line Type	Allows you to select the line framing type.
Line Coding	Allows you to define the DS-1 transmission coding type.
Line Length	Defines the distance (in feet) from backplane connection to the next termination point. • 0–131 (default) • 132–262 • 263–393 • 394–524 • 525–655

C.2.23.10 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-452 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.23.11 Loopback

The Loopback Properties pane allows you to view and update GE_XP and 10GE_XP loopback information.

Table C-453 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance • Unlocked • Locked, disabled • Locked, maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (None).

C.2.23.12 MAC Addresses

The MAC Addresses Properties pane allows you to configure MAC address learning, which facilitates switch processing. The Properties pane contains the following tabs:

- C.2.23.12.1 Multicast Tab, page C-326
- C.2.23.12.2 Card Tab, page C-327
- C.2.23.12.3 Learned Tab, page C-327

C.2.23.12.1 Multicast Tab

The Multicast tab allows you to view multicast port information for GE_XP and 10GE_XP cards.

Table C-454 Field Descriptions for the Multicast Tab

Field	Description
Multicast IP Address	Displays the multicast IP address.
SVLAN	Displays the SVLAN number.
Multicast dialog box	This dialog box appears when you double-click a row in the table. It provides a list of ports that are related to the selected SVLAN.

C.2.23.12.2 Card Tab

The Card tab allows you to retrieve a list of internal MAC addresses on GE_XP and 10GE_XP cards. Internal card MAC addresses are retrieved as cached values from the Prime Optical database.

Table C-455 Field Descriptions for the Card Properties Pane Tab

Field	Description
Port	Displays the port number. There is one MAC address per port, plus one MAC address that identifies the CPU.
MAC Address	Displays the MAC address that corresponds to the selected port.

C.2.23.12.3 Learned Tab

The Learned tab allows you to retrieve learned MAC addresses per SVLAN on GE_XP and 10GE_XP cards, which support 32K MAC addresses. Learned MAC addresses are not cached and are retrieved directly from the NE. The cards learn the MAC address of packets they receive on each port and add the MAC address and its associated port number to the MAC address learning table. As stations are added or removed from the network, the GE_XP and 10 GE_XP cards update the MAC address learning table, adding new dynamic addresses and aging out those that are no longer in use.

Table C-456 Field Descriptions for the Learned Tab

Field	Description
MAC Address	Displays the learned MAC address on the GE_XP or 10GE_XP card.
SVLAN	Displays the SVLAN ID associated with the learned MAC address.
SVLAN Name	Displays the SVLAN name associated with the SVLAN ID. The following values are displayed in the SVLAN Name field if the SVLAN ID is invalid: • N/A—Unable to associate a valid SVLAN ID to a valid SVLAN name. • Invalid—Invalid SVLAN ID.
Port	Displays the port associated with the learned MAC address.
SVLANs text box	Enter a single SVLAN or a range of SVLANs for which to retrieve learned MAC addresses. The range is from 1 to 4093 SVLANs.

Table C-456 Field Descriptions for the Learned Tab (continued)

Field	Description
Refresh	After specifying the SVLAN range, click the **Refresh** button to monitor the progress of the learned MAC address retrieval. If the TCC card is busy processing another request on the same GE_XP or 10GE_XP card, the following error message is displayed: `The resource is already in use. Try again later.`
Clear	Click the **Clear** button to clear the learned MAC addresses from the GE_XP or 10GE_XP card. The following warning message is displayed: `You are about to clear all of the learned MAC addresses on the card. Do you want to continue?`

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.23.13 MVR

The MVR Properties pane allows you to enable multicast VLAN registration (MVR) and set a multicast address for a single multicast SVLAN.

Table C-457 Field Descriptions for the MVR Properties Pane

Field	Description
Enabled check box	When checked, enables MVR on the card. If unchecked, disables MVR on the card.
IGMP CVLAN check box	When checked, enables IGMP snooping on CVLAN. The IGMP CVLAN check box is not enabled if MVR on the card is not enabled.
Multicast SVLAN	Sets the MVR VLAN ID. From the list of available IDs, select an SVLAN ID that is not part of the QinQ configuration on any of the card's UNI ports.
Multicast Address	Sets the specified multicast group address as the MVR multicast group. The range is from 224.0.0.0 to 239.255.255.255, excluding the following IP addresses: (224-239).0/128.0.(0-255)
Count	Sets the range of multicast group addresses. The count range is from 1 to 256.

C.2.23.14 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.23.14.1 TCA 15 Min Tab, page C-328
- C.2.23.14.2 TCA 1 Day Tab, page C-329
- C.2.23.14.3 Alarm Thresh Tab, page C-329

C.2.23.14.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of GE_XP and 10GE_XP cards.

Table C-458 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.14.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of GE_XP and 10GE_XP cards.

Table C-459 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.14.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-460 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.15 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for cards. The Properties pane contains the following tabs:

- C.2.23.15.1 OTN Line Tab, page C-330
- C.2.23.15.2 G.709 Thresh 15 Min Tab, page C-330
- C.2.23.15.3 G.709 Thresh 1 Day Tab, page C-331
- C.2.23.15.4 FEC Thresh 15 Min Tab, page C-332
- C.2.23.15.5 FEC Thresh 1 Day Tab, page C-333
- C.2.23.15.6 Trail Trace Identifier Tab, page C-333

C.2.23.15.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of GE_XP and 10GE_XP cards.

Table C-461 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	Displays the port number.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
Asynch/Synch Mapping	Indicates whether the card can perform multiplexing per ITU-T G.709. The ODUK (client SONET/SDH payload) can be mapped to the optical channel (OTUK) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting. **Note** For 10GE_XP and GE_XP cards, this field is set to “Not Used” and is not editable.
SF BER	Displays the signal fail bit error rate.
SD BER	Displays the signal degrade bit error rate.

C.2.23.15.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-462 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.

Table C-462 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.15.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-463 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.

Table C-463 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.15.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold information of GE_XP and 10GE_XP cards.

Table C-464 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.15.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold information of GE_XP and 10GE_XP cards.

Table C-465 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.23.15.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for GE_XP and 10GE_XP cards.

Table C-466 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Modify button	Allows you to open the Modify Trace dialog box, where you can change the section trace information for applicable cards. For more information, see 7.2.21 Modifying Traces, page 7-177.
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.23.16 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-467 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.23.16.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.23.17 Profiles Mapping

The Profiles Mapping Properties pane allows you to map a port to an SVLAN and a CVLAN with a specific profile. The Properties pane contains a row for each VLAN that is present in the card's VLAN database, plus a column for each port. The Properties pane contains the following tabs:

- C.2.23.17.1 SVLAN Tab, page C-334
- C.2.23.17.2 CVLAN Tab, page C-335

C.2.23.17.1 SVLAN Tab

The SVLAN tab allows you to associate the SVLAN profile to an SVLAN on a port.

Table C-468 Field Descriptions for the SVLAN Tab

Field	Description
SVLAN	*Display only*. Lists each VLAN that is present in the card's VLAN database.
Port (*number*)	Lists each port number. When you click a cell, the drop-down list displays all of the SVLAN profiles created for the NE. To map a port to a VLAN with a specific profile, click the port's cell, choose the profile, and click **Apply**. To detach a previously mapped profile, click the port's cell, choose **Detach Current**, and click **Apply**.

C.2.23.17.2 CVLAN Tab

The CVLAN tab allows you to associate the CVLAN profile to a CVLAN on a UNI port.

Table C-469 Field Descriptions for the CVLAN Tab

Field	Description
CVLAN	*Display only.* Lists each VLAN that is present in the card's VLAN database.
Port (number)	Lists each port number. When you click a cell, the drop-down list displays all of the CVLAN profiles created for the NE. To map a port to a VLAN with a specific profile, click the port's cell, choose the profile, and click **Apply**.

C.2.23.18 Protection

The Protection Properties pane allows you to provision protection for GE_XP and 10GE_XP cards. To provision protection, the card mode must be L2 over DWDM. You can set the card mode on the Card Properties pane.

Table C-470 Field Descriptions for the Protection Properties Pane

Field	Description
Port	Displays the card port number.
Status	Sets the spanning-tree protocol port states. If you have designated the card as a master, you must set one of the trunk ports to the blocked state to avoid loops in the network. • Blocking—Sets the port to the blocked (standby) state. A port in the blocked state does not participate in frame forwarding. • Forwarding—Sets the port to the forwarded state. A port in the forwarded state forwards frames.
Actual Status	Sets the port states. It can be: • Blocking—Sets the port to the blocked state. A port in the blocked state blocks the Ethernet packets that are received by the port. • Forwarding—Sets the port to the forwarded state. A port in the forwarding state forwards the Ethernet packets that are received by the port.
Protection	Sets the protection: • Enabled—Enables protection. • Disabled—Disables protection. • Forced—Forces the protection.

Table C-470 Field Descriptions for the Protection Properties Pane (continued)

Field	Description
Master	Sets the card as the master card for the network. Only one card in the network should be set as a master card.
Hold Off Time	Sets the hold off time. Choose one of the following values from the Hold Off Time drop-down list: • Disabled—Disables Fast Automatic Protection Switch (FAPS) protection (default) • 50 milliseconds • 100 milliseconds • 200 milliseconds • 500 milliseconds • 1 sec • 2 sec • 5 sec

C.2.23.19 Protection Groups

The Protection Groups Properties pane allows you to view and update protection group information.

Table C-471 Field Descriptions for the Protection Groups Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.23.20 QinQ

The QinQ Properties pane allows you to provision the IEEE 802.1 QinQ VLAN tags on GE_XP or 10GE_XP cards. QinQ tags expand the VLAN capability by tagging the tagged packets to produce a "double-tagged" Ethernet frame. For service providers, the expanded VLAN allows specific services to be provided on specific VLANs for specific customers, while other types of services can be provided to other customers on other VLANs.

To provision QinQ settings, the card mode must be L2 over DWDM. You can set the card mode on the Card Properties pane.

The QinQ tab displays only ports in UNI mode. You can set UNI mode on the Ether Ports Properties pane > Ethernet tab.

Table C-472 Field Descriptions for the QinQ Properties Pane

Field	Description
Port Configuration	
Port	Sets the port where you want to provision QinQ. **Note** Channel groups configured in UNI mode appear in the Port field along with the physical ports.

Table C-472 Field Descriptions for the QinQ Properties Pane (continued)

Field	Description
QinQ Mode	Sets the QinQ mode. The options are: • Selective—Allows you to specify the mapping between CVLANs and SVLANs. • Transparent—Allows you to specify a single SVLAN.
BPDU	Sets the bridge protocol data unit (BPDU) modes. The options are: • Drop—Discards incoming packets with the MAC address on the BPDU list. • Tunnel—Transports packets with MAC addresses on the BPDU list. BPDU list: • 01-80-c2-00-00-00 (802.1D) • 01-80-c2-00-00-02 (LACP) • 01-00-0c-cc-cc-cd (PVST+) • 01-00-0c-cc-cc-cc (CDP (type 0x2000), VTP (type 0x2003), PAgP (type 0x0104), UDLD (type 0x0111), DTP (type 0x2004)
Transparent SVLAN ID	Displays the SVLAN ID used when the QinQ mode is set to transparent. When the QinQ mode is set to selective, you can specify the mapping between the customer VLAN and the service VLAN.
DSCP-CoS	Click the **DSCP-CoS** button. The DSCP-CoS mapping table to provision the CoS based on DSCP for each port is displayed with the following information: • DSCP—Displays the DSCP value. • CoS Value—Displays the CoS value. Choose a CoS value from 0 to 7 and click **OK**. The **DSCP-CoS** button is enabled only when the following conditions are met: • QinQ mode is set to Selective. • Ingress CoS is set to DSCP on Ether and Channel Group ports. **Note** The DSCP-CoS button is enabled only if XPE cards are provisioned in the slot.
Selective Mode	
Filter	Click the filter icon to view the SVLAN details. A text box is available under each head; type the parameter based on which you want the data to be filtered. To sort the data, click the column title.
Add Row	Click the **Add Row** button to add a new QinQ setting to the table. The QinQ mode must be set to Selective. If the client source port mode is set to Transparent, the Add Row button is dimmed.
Add Range	Click the **Add Range** button to open the Add CVLAN Range dialog box and specify a CVLAN range. In the SVLAN drop-down list, choose the SVLAN ID. In the Range text field, specify the CVLAN range; then, click **OK**. A source QinQ table entry will be added for each CVLAN in the range. The QinQ mode must be set to Selective. If the client source port mode is set to Transparent, the **Add Range** button is dimmed.
Remove Row	Click the **Remove Row** button to remove an existing source QinQ table entry. The QinQ mode must be set to Selective. If the client source port mode is set to Transparent, the Remove Row button is dimmed.

Table C-472 Field Descriptions for the QinQ Properties Pane (continued)

Field	Description
Show VLAN	Click the **Show VLAN** button to show the VLAN name. The VLAN name gets added to the SVLAN column. Click the **Show VLAN** button again to remove the VLAN name.
CVLAN	Enter the CVLAN range.
SVLAN	Choose the SVLAN from the drop-down list. You can also perform the following activities: • To show the VLAN name—Click the **Show VLAN** button. • To update the list of VLAN names—Click the **Update** button in the NE Explorer. • To hide the VLAN name—Click the **Show VLAN** button again.
Operation	Sets the operation mode. The options are: • Add—Appends a new .1Q tag with a specific SVLAN ID to all the incoming Ethernet frames tagged with a CVLAN ID. • Double Add—Adds a double tag for the incoming untagged packets. • Translate—Translates the incoming VLAN ID of the incoming Ethernet frames tagged with a CVLAN ID. The CVLAN ID is translated into an SVLAN ID. After this translation, the .1Q tag of the frame is SVLAN. • Translate Add—Adds the outer SVLAN and translates the inner VLAN for incoming single-tagged packets.
Inner SVLAN	This parameter is configurable only when the Operation field is set to Double Add or Translate Add. • If Double Add is chosen, the incoming frame must be untagged and the card will first add the inner SVLAN and then the SVLAN. • If Translate Add is chosen, the incoming frame must be tagged and the card will translate the CVLAN tag with the Inner SVLAN and then will add the SVLAN.

Table C-472 Field Descriptions for the QinQ Properties Pane (continued)

Field	Description
CoS	Class of service for the CVLAN. The CoS .1p bits set the Ethernet frame priority. The options are: • 0 (default)—Sets the .1p bit to 0. • 1—Sets the .1p bit to 1. • 2—Sets the .1p bit to 2. • 3—Sets the .1p bit to 3. • 4—Sets the .1p bit to 4. • 5—Sets the .1p bit to 5. • 6—Sets the .1p bit to 6. • 7—Sets the .1p bit to 7.
IGMP CVLAN	Displays the IGMP CVLAN values. An IGMP CVLAN check box is provided for each row to set the IGMP CVLAN. Note the following IGMP CVLAN setting restrictions: • You can only set one IGMP CVLAN. • You cannot set IGMP CVLAN on the CVLAN range. • You cannot set IGMP CVLAN when the operation mode is set to either Double Add or Translate Add. To set this option, the card mode must be L2 over DWDM. **Note** If the IGMP CVLAN check box is not enabled in the MVR Properties pane, the field shows N/A.

C.2.23.21 QoS

The QoS Properties pane allows you to provision the Weighted Round Robin (WRR) value and bandwidth for QoS Class of Service (CoS) egress queues on GE_XP and 10GE_XP card ports.

To provision QoS settings, the card mode must be L2 over DWDM. You can set the card mode on the Card Properties pane.

You can perform this task only on ports with QoS enabled. You can enable QoS on the Ether Ports Properties pane > Ethernet tab.

Table C-473 Field Descriptions for the QoS Properties Pane

Field	Description
CoS	Displays the CoS egress queue (0 through 7).
Bandwidth	Sets the bandwidth allocated for the CoS egress queue. 100 is the default.
WRR Weight	Sets the Weighted Round Robin (WRR) level for the CoS egress queue. The default is 0 (Strict Priority). The range is from 0 to 15.
Port	Sets the port where you want to provision the QoS settings.

C.2.23.22 REP

The REP Properties pane allows you to control network loops, handle link failures, and improve the convergence time. The Properties pane contains the following tabs:

- C.2.23.22.1 Admin VLAN Configuration Tab, page C-340
- C.2.23.22.2 Segment Tab, page C-340

Note For the REP Properties pane to be enabled, the card mode must be L2 over DWDM.

C.2.23.22.1 Admin VLAN Configuration Tab

The Admin VLAN Configuration tab allows you to manage the VLAN configuration.

Table C-474 Field Descriptions for the Admin VLAN Configuration Tab

Field	Description
Admin VLANs	
SVLAN	Choose the SVLAN from the drop-down list. The valid range is from 1 to 4093.
CVLAN	Sets the CVLAN value. The valid range is from 1 to 4094.

C.2.23.22.2 Segment Tab

The Segment tab allows you to view, create, edit, and delete the segment parameters.

Table C-475 Field Descriptions for the Segment Tab

Field	Description
Segment	Choose the segment from the Segment drop-down list.
Selected Segment	
Port	Displays the port number.
Port Role	Displays the port role. The port is configured as an edge port or as a regular port. The options are: • Edge—The port is configured as an edge port. • None—The port is configured as a regular port.
Port Preferred	Check the Port Preferred check box to configure the regular port as a preferred alternate port.
VLB Enabled	Check the VLAN Load Balancing (VLB) check box to enable VLB. VLAN Load Balancing is configured on GE_XP and 10GE_XP by specifying the VLB preempt delay.
SVLAN	Lists the available SVLANs on the selected card.
VLB Preempt Delay	Displays the trigger delay for automatic VLB activation.
VLB Port ID	Specifies the port identifier that is set for the VLB.
VLB Preferred Port	Specifies if the preferred port identifier should be used for VLB.
STCN Enabled	If checked, enables the show topology change notification (STCN).
STCN Port	Specifies the port used for STCN.

Table C-475 Field Descriptions for the Segment Tab (continued)

Field	Description
STCN Segment	Specifies the segment used for STCN.
Create button	Click the Create button to create a new REP segment.
Edit button	Click the Edit button to edit an existing REP segment.
Activate VLB button	Click the Activate VLB button to activate VLAN load balancing.
Deactivate VLB button	Click the Deactivate VLB button to deactivate VLAN load balancing.
Delete button	Click the Delete button to delete an existing REP segment.

C.2.23.23 RMON Thresholds

The RMON Thresholds Properties pane allows you to view RMON thresholds for GE_XP and 10GE_XP cards.

Table C-476 Field Descriptions for the RMON Thresholds Properties Pane

Field	Description
Port No.	Displays the port number.
Index No.	Displays the selected interface number.
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period	Displays the sample period, in seconds.
Rising Thresholds	Displays the number of occurrences for the rising threshold.
Falling Thresholds	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the POS ports. **Note** You can select a Channel Group when you create a threshold.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.23.24 Security

The Security Properties pane allows you to change the MAC filtering properties on the Ethernet ports and provision storm control settings on GE_XP and 10GE_XP cards. The Properties pane contains the following tabs:

- C.2.23.24.1 MAC Filter Tab, page C-342
- C.2.23.24.2 Storm Control Tab, page C-342

Note For the Security Properties pane to be enabled, the card mode must be L2 over DWDM.

C.2.23.24.1 MAC Filter Tab

The MAC Filter Properties pane allows you to provision MAC addresses filter for GE_XP and 10GE_XP cards.

Table C-477 Field Descriptions for the MAC Filter Tab

Field	Description
Port	Displays the port on the selected card.
MAC List	Displays the list of MAC addresses that are filtered or allowed on the Ethernet port. Click the MAC address fields to edit them.
Allowed	Check the **Allowed** check box to specify that only the MAC address listed will be allowed to pass through. If left unchecked, the MAC address will be denied by the port.
Create	Click the **Create** button to add new MAC addresses to the MAC list. A maximum of eight MAC addresses are allowed.
Delete	Click the **Delete** button to delete MAC addresses from the MAC list.

C.2.23.24.2 Storm Control Tab

The Storm Control Properties pane allows you to provision storm control settings for the GE_XP and 10GE_XPE cards.

Table C-478 Field Descriptions for the Storm Control Tab

Field	Description
Port	Displays the port on the selected card.
DLF Storm Control	Enables or disables DLF storm control on the card. The options are: • Checked—DLF storm control is enabled. • Unchecked—DLF storm control is disabled.
DLF Storm Control Threshold (pps)	Enables you to set the threshold value for the number of unknown unicast packets per second. The valid range is from 0 to 16777215 packets per second.
Mcast Storm Control	Enables or disables Multicast storm control on the card. The options are: • Checked—Multicast storm control is enabled. • Unchecked—Multicast storm control is disabled.
Mcast Storm Control Threshold (pps)	Enables you to set the threshold value for the number of multicast packets per second. The valid range is from 0 to 16777215 packets per second.
Bcast Storm Control	Enables or disables Broadcast storm control on the card. The options are: • Checked—Broadcast storm control is enabled. • Unchecked—Broadcast storm control is disabled.
Bcast Storm Control Threshold (pps)	Enables you to set the threshold value for the number of broadcast packets per second. The valid range is from 0 to 16777215 packets per second.

C.2.23.25 Show Command

The Show Command Properties pane allows you to run commands on the node.

Table C-479 Field Descriptions for the Show Command

Field	Description
Command	Choose a command from the Command drop-down list. Values are: • ETH LACP—Displays detailed LACP information from the GE_XP and 10GE_XP cards. • REP TOPO—Displays the topology information for a specific Resilient Ethernet Protocol (REP) segment. • REP TOPO ARCHIVE—Displays the previous topology information for a specific REP segment. • REP INTERFACE—Displays information on the REP interface status and configuration. You can retrieve detailed information for each segment by selecting Detailed from the Level drop-down list and providing the segment ID. • OAM DISCOVERY—Displays discovery information for all the EFM interfaces or for a specific EFM interface. • OAM STATUS—Displays information about the EFM configurations for all the EFM interfaces or for a specific interface. • OAM SUMMARY—Displays the active EFM sessions on a device. • OAM STATISTICS—Displays detailed information about the EFM packets.
Level	Choose the level from the Level drop-down list. Values are: • Normal—Displays the normal information about the segments. • Detailed—Displays the detailed information about the segments.
Key	Enter the key for the selected command. The key value should be an integer. **Note** The Key field is editable only when the command is set to REP.

Table C-479 Field Descriptions for the Show Command (continued)

Field	Description
Show	Click the **Show** button. Depending on the command, the appropriate output appears in the text area.

Save to File	Click the **Save to File** button to save the details of the result to a file on your PC. The Save In window is displayed. Specify the filename and the destination directory. The default location is *client-installation-directory/reports/*.
	Note The **Save to File** button is enabled only when the command output is executed.
	The following message appears in the dialog box. Click **Yes** to overwrite or **No** to cancel the operation.
	`File already exist, Overwrite?`
	The following input/output (I/O) exception appears while saving the file.
	`File not saved, IO Exception occurred`
	Reasons for exception:
	• Failed I/O operations
	• Interrupted I/O operations
	• File directory is write-access protected
	• Access denied to the user

C.2.23.26 SVLAN

The SVLAN Properties pane allows you to change the SVLAN settings for GE_XP or 10GE_XP cards.

To provision SVLAN settings, the card mode must be L2 over DWDM. You can set the card mode on the Card Properties pane. You can perform this task only on ports provisioned as NNI. You can set NNI on the Ether Ports Properties pane > Ethernet tab.

The SVLAN Properties pane contains the following tabs:

- C.2.23.26.1 SVLAN Tab, page C-344
- C.2.23.26.2 SVLAN Database Tab, page C-345

C.2.23.26.1 SVLAN Tab

The SVLAN tab allows you to add an SVLAN to a GE_XP or 10GE_XP port.

Table C-480 Field Descriptions for the SVLAN Tab

Field	Description
SVLAN	Lists the available SVLANs on the selected card.
Port *port number*	Check the port check box to enable the SVLAN on that port. Uncheck the check box to disable the SVLAN on that port. A warning message is displayed when you disable an SVLAN. The SVLAN tab uses the following visual indicators to highlight user changes: • If the background color of the port check box is white, the value has not been modified by a user. • If the background color of the port check box is gray, the value has been modified by a user. • If an SVLAN has been modified by a user, the SVLAN name appears in bold font in the SVLAN list. **Note** Ports assigned to channel groups in the NNI mode will be displayed.

C.2.23.26.2 SVLAN Database Tab

The SVLAN Database tab allows you to view SVLAN database information on a GE_XP or 10GE_XP card.

Table C-481 Field Descriptions for the SVLAN Database Tab

Fields	Description
SVLAN ID	*Display only.* Displays the SVLAN identifier.
SVLAN Name	*Display only.* Displays the SVLAN name.
Protection	*Display only.* Displays whether VLAN protection is enabled.
MAC Learning	*Display only.* Displays whether MAC learning is enabled for the port. MAC learning is used by Layer 2 switches to learn the MAC addresses of network nodes so they know where to send traffic. Layer 2 switches—including GE_XP and 10GE_XP cards in L2 over DWDM mode—maintain a MAC learning table that associates the MAC addresses and VLANs with a given port. **Note** MAC address table aging is 300 seconds. It cannot be changed. For MAC learning to be enabled, the card mode must be L2 over DWDM.
IGMP	*Display only.* Displays whether Internet Group Management Protocol (IGMP) is enabled. IGMP is a protocol used by IPv4 systems to report IP multicast memberships to neighboring multicast routers. IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. IGMP provides a means to automatically control and limit the flow of multicast traffic throughout your network with the use of special multicast queriers and hosts.
IGMP Fast Leave	*Display only.* Displays whether IGMP fast leave is enabled. IGMP-snooping, fast-leave processing allows the switch to remove an interface from the forwarding table entry without first sending out MAC-based general queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Fast-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are being used simultaneously.

Table C-481 Field Descriptions for the SVLAN Database Tab (continued)

Fields	Description
IGMP Suppression	*Display only.* Displays whether IGMP report suppression is enabled. Switches use IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.
Load	Click the **Load** button to display or reload the SVLAN database information for the GE_XP or 10GE_XP card.

C.2.23.27 SVLAN AIS

The SVLAN AIS Properties pane allows you to view the SVLAN AIS port information for GE_XP and 10GE_XP cards.

Table C-482 Field Descriptions for the SVLAN AIS Properties Pane

Field	Description
Port	Displays the SVLAN AIS port.
SVLAN AIS dialog box	This dialog box appears when you double-click a row in the table. It provides a list of VLAN IDs that are related to the selected port.

C.2.24 Slot Properties—MXP_2.5G_10E

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The MXP_2.5G_10E card is a DWDM muxponder for the ONS 15454 platform that supports full optical transparency on the client side. The card multiplexes four 2.5-Gb/s client signals (4 x OC48/STM-16 SFP) into a single 10-Gb/s DWDM optical signal on the trunk side. The MXP_2.5G_10E provides wavelength transmission service for the four incoming 2.5-Gb/s client interfaces. The MXP_2.5G_10E muxponder passes all SONET/SDH overhead bytes transparently.

The MXP_2.5G_10E_C and MXP_2.5G_10E_L cards are DWDM muxponders for the ONS 15454 platform that support full optical transparency on the client side. The cards multiplex four 2.5-Gb/s client signals (4 x OC48/STM-16 SFP) into a single 10-Gb/s DWDM optical signal on the trunk side. The MXP_2.5G_10E_C and MXP_2.5G_10E_L cards provide wavelength transmission service for the four incoming 2.5-Gb/s client interfaces. The MXP_2.5G_10E_C and MXP_2.5G_10E_L muxponders pass all SONET/SDH overhead bytes transparently.

Note When an MLSE transponder module is installed on the MXP_2.5G_10E_C card, Prime Optical displays the card as MXP_2.5G_10EX.

The digital wrapper function (ITU-T G.709 compliant) formats the DWDM wavelength so that it can be used to set up GCCs for data communications, enable FEC, or facilitate PM.

The MXP_2.5G_10E_C and MXP_2.5G_10E_L cards work with OTN devices defined in ITU-T G.709. The cards support ODU1-to-OTU2 multiplexing, an industry-standard method for asynchronously mapping a SONET/SDH payload into a digitally wrapped envelope.

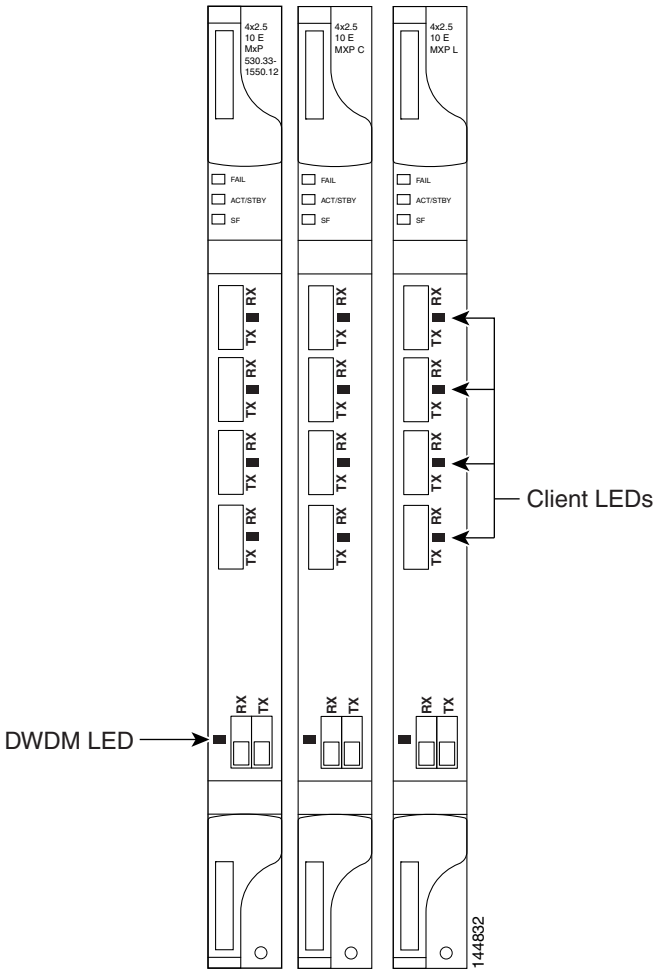
The MXP_2.5G_10E_C and MXP_2.5G_10E_L cards are not compatible with the MXP_2.5G_10G card, which does not support full optical transparency. The faceplate designation of the cards is 4x2.5G 10E MXP C for the MXP_2.5G_10E_C card and 4x2.5G 10E MXP L for the MXP_2.5G_10E_L card.

You can install MXP_2.5G_10E_C and MXP_2.5G_10E_L cards in slots 1 to 6 and 12 to 17. You can provision a card in a linear configuration, as a BLSR/MS-SPRing, a UPSR/SNCP, or a regenerator. The cards can be used in the middle of BLSR/MS-SPRing or 1+1 spans when the cards are configured for transparent termination mode.

The MXP_2.5G_10E_C card features a tunable 1550-nm C-band laser on the trunk port. The laser is tunable across 82 wavelengths on the ITU grid with 50-GHz spacing between wavelengths. The MXP_2.5G_10E_L features a tunable 1580-nm L-band laser on the trunk port. The laser is tunable across 80 wavelengths on the ITU grid, also with 50-GHz spacing. Each card features four 1310-nm lasers on the client ports and contains five transmit and receive connector pairs (labeled) on the card faceplate. The cards use dual LC connectors on the trunk side and SFP modules on the client side for optical cable termination. The SFP pluggable modules are SR or IR and support an LC fiber connector.

The following figure shows the card faceplates.

Figure C-34 MXP-2.5G-10E, MXP-2.5G-10E-C, and MXP-2.5G-10E-L Faceplates



For the MXP_2.5G_10E module, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

Note The properties shown depend on the NE configuration.

C.2.24.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.24.2 Identification

The Identification Properties pane allows you to view and update identification information.

Table C-483 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.24.3 Card

The Card Properties pane allows you to view and update card information.

Table C-484 Field Descriptions for the Card Properties Pane

Field	Description
Termination Mode	Allows you to set the mode of termination.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.

C.2.24.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-485 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.24.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.24.5 Line

The Line Properties pane allows you to configure line settings. If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the subtabs and fields in Table C-486. If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the subtabs and fields in Table C-487.

Note The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

Table C-486 Field Descriptions for the Line Properties Pane (SONET)

Field	Description
Section Trace	
Port No.	The port number.
Trace Mode	The trace mode (Off or Manual).
Disable AIS/RDI on TIM-S	Disables the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Allows you to select a transmit length for the trace. Values are 1 byte or 16 bytes; the default is 16 bytes.

Table C-486 Field Descriptions for the Line Properties Pane (SONET) (continued)

Field	Description
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
SONET Line	
Port No.	The port number.
Port Name	The port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state. The range is from 15 minutes to 48 hours.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664. ALS can be provisioned on client and trunk ports for SONET and SDH payload types only.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	The port type (SONET or SDH).
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.

Table C-486 Field Descriptions for the Line Properties Pane (SONET) (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.
Section Thresh 15 Min - Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Section Thresh 1 Day - Near End	
Port No.	The port number.

Table C-486 Field Descriptions for the Line Properties Pane (SONET) (continued)

Field	Description
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Thresh 15 Min - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Thresh 1 Day - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Wavelength Trunk Settings	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). This single-band card's value is set to *C*.
Trunk	
Port No.	The port number.
Port Name	The port name.

Table C-486 Field Descriptions for the Line Properties Pane (SONET) (continued)

Field	Description
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Error Decorrelator Settings	
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-487 Field Descriptions for the Line Properties Pane (SDH)

Field	Description
Section Trace	
Port No.	The port number.
Trace Mode	The trace mode (Off or Manual).
Disable AIS/RDI on TIM-S	Disables the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Allows you to select a transmit length for the trace. Values are 1 byte or 16 bytes; the default is 16 bytes.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
SDH Line	
Port No.	The port number.
Port Name	The port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance

Table C-487 Field Descriptions for the Line Properties Pane (SDH) (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state. The range is from 15 minutes to 48 hours.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664. ALS can be provisioned on client and trunk ports for SONET and SDH payload types only.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	The port type (SONET or SDH).
ProvidesSync	When checked, the card is provisioned as an NE timing reference.
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.

Table C-487 Field Descriptions for the Line Properties Pane (SDH) (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.
RS Thresh 15 Min	
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
RS Thresh 1 Day	

Table C-487 Field Descriptions for the Line Properties Pane (SDH) (continued)

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Thresh 15 Min - Near End, Far End	
Port No.	The port number.
EB-MS	Errored blocks–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Thresh 1 Day - Near End, Far End	
Port No.	The port number.
EB-MS	Errored blocks–multiplex section.
ES-MS	Errored seconds–multiplex section.
SES-MS	Severely errored seconds–multiplex section.
BBE-MS	Background block errors–multiplex section.
UAS-MS	Unavailable seconds–multiplex section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Wavelength Trunk Settings	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). This single-band card's value is set to *C*.
Trunk	
Port No.	The port number
Port Name	The port name.

Table C-487 Field Descriptions for the Line Properties Pane (SDH) (continued)

Field	Description
State	Displays the port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • unlocked—Puts the port in service. The port service state changes to unlocked-enabled. • unlocked,automaticInService—Puts the port in automatic in-service. The port service state changes to unlocked-disabled,automaticInService. • locked-disabled—Removes the port from service and disables it. The port service state changes to locked-enabled,disabled. • locked,maintenance—Removes the port from service for maintenance. The port service state changes to locked-enabled,maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Error Decorrelator Settings	
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.24.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for cards. The Properties pane contains the following tabs:

- C.2.24.6.1 OTN Line Tab, page C-358
- C.2.24.6.2 G.709 Thresh 15 Min Tab, page C-359
- C.2.24.6.3 G.709 Thresh 1 Day Tab, page C-360
- C.2.24.6.4 FEC Thresh 15 Min Tab, page C-361
- C.2.24.6.5 FEC Thresh 1 Day Tab, page C-361
- C.2.24.6.6 Trail Trace Identifier Tab, page C-361

C.2.24.6.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the MXP-2.5G-10E card.

Table C-488 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	Displays the port number.
G.709 OTN	Disables or enables the G.709 OTN feature.

Table C-488 Field Descriptions for the OTN Line Tab (continued)

Field	Description
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
Asynch/Synch Mapping	The card can perform multiplexing per ITU-T G.709. The ODUK (client SONET/SDH payload) can be mapped to the optical channel (OTUK) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
SF BER	Displays the signal fail bit error rate.
SD BER	Displays the signal degrade bit error rate.

C.2.24.6.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-489 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.

Table C-489 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.24.6.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-490 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port Number	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.

Table C-490 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port Number	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.24.6.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold information of the MXP-2.5G-10E card.

Table C-491 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.24.6.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold information of the MXP-2.5G-10E card.

Table C-492 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port Number	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.24.6.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the MXP-2.5G-10E card.

Table C-493 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Port Number	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.24.7 Loopback

The Loopback Properties pane allows you to view and update MXP-2.5G-10E loopback information.

Table C-494 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (none).

C.2.24.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-495 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.

Table C-495 Field Descriptions for the Auto Laser Shutdown Properties Pane (continued)

Field	Description
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.24.9 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.24.9.1 TCA 15 Min Tab, page C-363
- C.2.24.9.2 TCA 1 Day Tab, page C-363
- C.2.24.9.3 Alarm Thresh Tab, page C-364

C.2.24.9.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of the MXP-2.5G-10E card.

Table C-496 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.24.9.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of the MXP-2.5G-10E card.

Table C-497 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.

Table C-497 Field Descriptions for the TCA 1 Day Tab (continued)

Field	Description
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.24.9.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-498 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.24.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table C-499 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.

Table C-499 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.24.11 Protection

The Protection Properties pane allows you to view and update protection group information.

Table C-500 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.24.12 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-501 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.25 Slot Properties—MXP_2.5G_10G

The slot properties pane displays information about the Cisco ONS 15454 SONET and ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

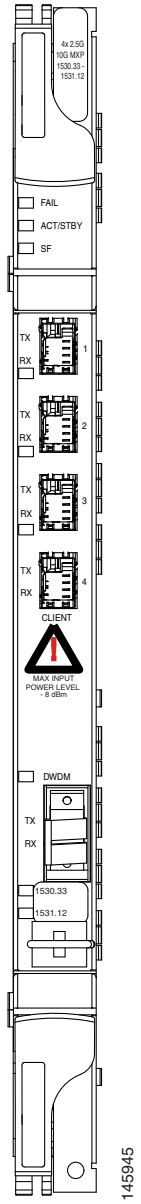
The MXP_2.5G_10G card multiplexes/demultiplexes four 2.5-Gb/s signals (client side) into one 10-Gb/s, 100-GHz DWDM signal (trunk side). It provides one extended long-range STM-64/OC-192 port per card on the trunk side (compliant with ITU-T G.707, ITU-T G.709, ITU-T G.957, and Telcordia GR-253-CORE) and four intermediate- or short-range OC-48/STM-16 ports per card on the client side. The port operates at 9.95328 Gb/s over unamplified distances up to 80 km (50 miles) with different types of fiber such as C-SMF or dispersion-compensated fiber limited by loss and/or dispersion. Prime Optical supports the STM-16 L1 payload over 4x2.5G MXP.

Client ports on the MXP_2.5G_10G card are also interoperable with SONET OC-1 (STS-1) fiber optic signals defined in Telcordia GR-253-CORE. An OC-1 signal is the equivalent of one DS-3 channel transmitted across optical fiber. OC-1 is primarily used for trunk interfaces to phone switches in the United States. There is no SDH equivalent for SONET OC-1.

The MXP_2.5G_10G card is tunable over two neighboring wavelengths in the 1550-nm, ITU 100-GHz range. It is available in 16 different versions, each of which covers two wavelengths, for a total coverage of 32 different wavelengths in the 1550-nm range.

The following figure shows the card faceplate.

Figure C-35 MXP_2.5G_10G Faceplate



For the MXP_2.5G_10G module, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, Inventory, and Info. The properties shown depend on the NE configuration.

C.2.25.1 Module View

The Module View displays a graphic of the MXP_2.5G_10G that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.25.2 Identification

The Identification Properties pane allows you to view and update MXP_2.5G_10G identification information.

Table C-502 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.25.3 Card

The Card Properties pane allows you to view and update card information.

Table C-503 Field Descriptions for the Card Properties Pane

Field	Description
Termination Mode	Allows you to set the mode of termination.

C.2.25.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-504 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.25.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.25.5 Line

The Line Properties pane allows you to configure line settings. If the card is installed on an ONS 15454 SONET NE, the Properties pane contains the subtabs and fields in Table C-505. If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the subtabs and fields in Table C-506.

Note The following information is the same if the payload is SDH on an ONS 15454 SONET NE.

Table C-505 Field Descriptions for the Line Properties Pane (SONET)

Field	Description
Section Trace	
Port No.	The port number.
Trace Mode	The trace mode (Off or Manual).
Disable AIS/RDI on TIM-S	Disables the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Allows you to select a transmit length for the trace. Values are 1 byte or 16 bytes; the default is 16 bytes.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
SONET Line	
Port No.	The port number.
Port Name	The port name.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state. The range is from 15 minutes to 48 hours.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test). ALS is a laser safety feature defined by ITU G.664. ALS can be provisioned on client and trunk ports for SONET and SDH payload types only.
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	The port type (SONET or SDH).
Section Thresh 15 Min - Near End	
Port No.	The port number.
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Section Thresh 1 Day - Near End	
Port No.	The port number.

Table C-505 Field Descriptions for the Line Properties Pane (SONET) (continued)

Field	Description
CV-S	Coding violations section.
ES-S	Errored seconds section.
SES-S	Severely errored seconds section.
SEFS-S	Severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Thresh 15 Min - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Line Thresh 1 Day - Near End, Far End	
Port No.	The port number.
ES-L	Errored seconds line.
SES-L	Severely errored seconds line.
CV-L	Coding violations line.
UAS-L	Unavailable seconds line.
FC-L	Failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Wavelength Trunk Settings	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.

Table C-506 Field Descriptions for the Line Properties Pane (SDH)

Field	Description
Section Trace	
Port Number	The port number.
Trace Mode	Set the trace mode (Off/None or Manual).

Table C-506 Field Descriptions for the Line Properties Pane (SDH) (continued)

Field	Description
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string; sets a new transmit string.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.
SDH Line	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	Displays the administration state. The state can either be Unlocked or Locked, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	The port type (SONET or SDH).
RS Thresh 15 Minutes - Near End	
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
SES-RS	Severely errored seconds regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
RS Thresh 1 Day - Near End	
Port Number	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
SES-RS	Severely errored seconds regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Thresh 15 Minutes - Near End, Far End	
Port Number	The port number.

Table C-506 Field Descriptions for the Line Properties Pane (SDH) (continued)

Field	Description
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
MS Thresh 1 Day - Near End, Far End	
Port Number	The port number.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
EB-MS	Errored blocks multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Wavelength Trunk Settings	
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). For this single-band card, the band value is fixed to *C*, and this value cannot be altered.

C.2.25.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for MXP_2.5G_10G cards.

Table C-507 Field Descriptions for the OTN Properties Pane

Field	Description
OTN Line	
Port No.	The port number.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

Table C-507 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
G.709 Thresh 15 Min	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
G.709 Thresh 1 Day	
SM (OTUK) Near End, Far End	
Port No.	The port number.
BBE-SM	Background block errors.
ES-SM	Errored seconds.
SES-SM	Severely errored seconds.
UAS-SM	Unavailable seconds.
FC-SM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End, Far End	
Port No.	The port number.
BBE-PM	Background block errors.
ES-PM	Errored seconds.
SES-PM	Severely errored seconds.
UAS-PM	Unavailable seconds.
FC-PM	Failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
FEC Thresh 15 Minutes	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.

Table C-507 Field Descriptions for the OTN Properties Pane (continued)

Field	Description
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.
FEC Thresh 1 Day	
Port Number	Displays the port number.
Bit Errors Corrected	Displays the bit errors corrected in one-day intervals.
Uncorrectable Words	Displays the uncorrectable words in one-day intervals.
Trail Trace Identifier	
Port No.	The port number.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.25.7 Loopback

The Loopback Properties pane allows you to view and update MXP_2.5G_10G loopback information.

Table C-508 Field Descriptions for the Loopback Properties Pane

Field	Description
Port Number	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or Facility (Line), or clear the current loopback (none).

C.2.25.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-509 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.25.9 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings.

Table C-510 Field Descriptions for the Optical Thresh Properties Pane

Field	Description
TCA 15 Min	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.
TCA 1 Day	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Rx Power High	Displays the upper receive power threshold.

Table C-510 Field Descriptions for the Optical Thresh Properties Pane (continued)

Field	Description
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Alarm Thresh	
Port Number	Displays the port number.
Tx Power High	Displays the upper transmit power threshold. **Note** Tx Power High is not supported on trunk ports.
Tx Power Low	Displays the lower transmit power threshold. **Note** Tx Power Low is not supported on trunk ports.
Rx Power High	Displays the upper receive power threshold.
Rx Power Low	Displays the lower receive power threshold.
Laser Bias High	Displays the upper laser bias threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.25.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update MXP_2.5G_10G alarm profile information.

Table C-511 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Table C-511 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
GFP	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.25.11 Protection

The Protection Properties pane allows you to view and update MXP_2.5G_10G protection group information.

Table C-512 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.25.12 Info

The Info Properties pane allows you to view nominal operating values set during manufacturing for the MXP_2.5G_10G module.

Table C-513 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.26 Slot Properties—MXP_MR_10DME

The MXP_MR_10DME-C and MXP_MR_10DME-L cards aggregate a mix of client SAN service client inputs (GE, FICON, and Fibre Channel) into one 10.0-Gb/s STM-64/OC-192 DWDM signal on the trunk side. It provides one long-reach STM-64/OC-192 port per card and is compliant with Telcordia GR-253-CORE and ITU-T G.957.

The cards support aggregation of the following signal types:

- 1-Gigabit Fibre Channel
- 2-Gigabit Fibre Channel
- 4-Gigabit Fibre Channel
- 1-Gigabit Ethernet
- 1-Gigabit ISC-Compatible (ISC-1)
- 2-Gigabit ISC-Peer (ISC-3

The MXP_MR_10DME-C and MXP_MR_10DME-L muxponders pass all SONET/SDH overhead bytes transparently.

The digital wrapper function (ITU-T G.709 compliant) formats the DWDM wavelength so that it can be used to set up GCCs for data communications, enable FEC, or facilitate PM. The MXP_MR_10DME-C and MXP_MR_10DME-L cards work with the OTN devices defined in ITU-T G.709. The cards support ODU1-to-OTU2 multiplexing, an industry-standard method for asynchronously mapping a SONET/SDH payload into a digitally wrapped envelope.

Note Because the client payload cannot oversubscribe the trunk, a mix of client signals can be accepted, up to a maximum limit of 10 Gb/s.

You can install MXP_MR_10DME-C and MXP_MR_10DME-L cards in slots 1 to 6 and 12 to 17.

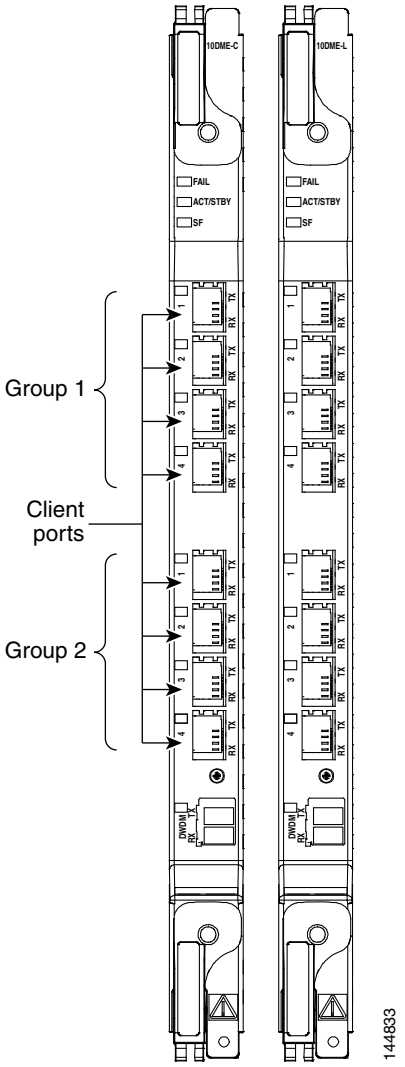
Note

- When an MLSE transponder module is installed on the MXP_MR_10DME-C card, Prime Optical displays the card as MXP_MR_10DMEX.
- On the card faceplates, the MXP_MR_10DME-C and MXP_MR_10DME-L cards are displayed as 10DME-C and 10DME-L, respectively.
- The MXP_MR_10DME-C and MXP_MR_10DME-L cards are not compatible with the MXP_2.5G_10G card, which does not support full optical transparency.

The MXP_MR_10DME-C card features a tunable 1550-nm C-band laser on the trunk port. The laser is tunable across 82 wavelengths on the ITU grid with 50-GHz spacing between wavelengths. The MXP_MR_10DME_L features a tunable 1580-nm L-band laser on the trunk port. The laser is tunable across 80 wavelengths on the ITU grid, also with 50-GHz spacing. Each card features four 1310-nm lasers on the client ports and contains five transmit and receive connector pairs (labeled) on the card faceplate. The cards use dual LC connectors on the trunk side and SFP modules on the client side for optical cable termination. The SFP pluggable modules are SR or IR and support an LC fiber connector.

The following figure shows the MXP_MR_10DME-C and MXP_MR_10DME-L faceplates.

Figure C-36 MXP_MR_10DME-C and MXP_MR_10DME-L Faceplates



For the card, the slot properties pane displays the following properties: Module View, Identification, Card, PPM, Line, OTN, Loopback, Auto Laser Shutdown, Optical Thresh, Alarm Behavior, Protection, and Info.

Note The properties shown depend on the NE configuration.

C.2.26.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset, delete, or change the card.

C.2.26.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-514 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part No.	Displays the part number that is printed on the top of the card.
HW Revision	Displays the hardware version number of the card.
Serial No.	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).
Suppress Alarms	When checked, all alarms are suppressed for the port.

C.2.26.3 Card

The Card Properties pane allows you to change the working mode of the selected card.

Table C-515 Field Descriptions for the Card Properties Pane

Field	Description
Card Mode	Select the card mode. It can be: • Port 1-4: FC-GE-ISC, Port 5-8: FC-GE-ISC • Port 1-4: FC-GE-ISC, Port 5-8: FC4G • Port 1-4: FC4G Port, 5-8: FC-GE-ISC • Port 1-4: FC4G Port, 5-8: FC4G

C.2.26.4 PPM

The PPM Properties pane allows you to view and provision the PPM and the ports inside the PPM.

Table C-516 Field Descriptions for the PPM Properties Pane

Field	Description
Pluggable Port Modules	
Pluggable Number	Displays the identifier of the plugin module.
Actual Equipment Type	Displays the actual plugin module that is installed in the slot.
Equipment State	Displays the equipment state of the plugin module.
Admin State	Displays the status of the plugin module: In Service (IS); Out of Service–Maintenance (OOS_MT); Unlocked; or Locked, Maintenance. **Note** You can edit the Admin State value only for actual equipment, not preprovisioned equipment.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
PPM	
Port	Displays the PPM number and port number.
Rate	Displays the port rate.

C.2.26.4.1 Provision Pluggable Dialog Box

Click the **Create** button to launch the Provision Pluggable dialog box. This dialog box allows you to provision the PPM and to create the ports inside this entity. See C.1.4.5.1 Provision Pluggable Dialog Box, page C-28 for more information.

C.2.26.5 Line

The Line Properties pane allows you to configure line information.

If the card is installed on an ONS 15454 SONET NE, the Line Properties pane contains the following tabs:

- C.2.26.5.1 Section Trace Tab, page C-382
- C.2.26.5.2 SONET Line Tab, page C-382
- C.2.26.5.3 Section Thresh 15 Min Tab, page C-383
- C.2.26.5.4 Section Thresh 1 Day Tab, page C-383
- C.2.26.5.5 Line Thresh 15 Min Tab, page C-383
- C.2.26.5.6 Line Thresh 1 Day Tab, page C-384
- C.2.26.5.7 Client Tab, page C-385
- C.2.26.5.8 RMON Thresholds Tab, page C-386
- C.2.26.5.9 Distance Extension Tab, page C-387
- C.2.26.5.10 Wavelength Trunk Settings Tab, page C-387
- C.2.26.5.11 Error Decorrelator Settings Tab, page C-388

If the card is installed on an ONS 15454 SDH NE, the Properties pane contains the following tabs:

- C.2.26.5.12 SDH Line Tab, page C-388
- C.2.26.5.13 RS Thresh 15 Min Tab, page C-389
- C.2.26.5.14 RS Thresh 1 Day Tab, page C-390
- C.2.26.5.15 MS Thresh 15 Min Tab, page C-390
- C.2.26.5.16 MS Thresh 1 Day Tab, page C-391
- C.2.26.5.17 Wavelength Trunk Settings Tab, page C-391
- C.2.26.5.18 Error Decorrelator Settings Tab, page C-391

C.2.26.5.1 Section Trace Tab

The Section Trace tab allows you to change the section trace settings for the card.

Table C-517 Field Descriptions for the Section Trace Tab

Field	Description
Port No.	Displays the port number.
Trace Mode	The trace mode (Off/None or Manual).
Disable AIS/RDI on TIM-S	Allows you to disable the Alarm Indication Signal (AIS) and the Remote Defect Indication (RDI) when the path Trace Identifier Mismatch Section (TIM-S) alarm is detected.
Transmit Length	Select a transmit length for the trace.
Current Transmit String	Displays the current transmit string. The trail trace identifier is either 1 or 16 bytes.
Current Expected String	Displays the current expected string; sets a new expected string.
Current Received String	Displays the current received string.

C.2.26.5.2 SONET Line Tab

The SONET Line tab allows you to view and change the SONET line settings of the card.

Table C-518 Field Descriptions for the SONET Line Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a name for the optical port.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.

Table C-518 Field Descriptions for the SONET Line Tab (continued)

Field	Description
Provides Sync	When checked, the card is provisioned as an NE timing reference.
Enable Sync Msg	When checked, enables synchronization status messages, which allow the node to choose the best timing source.
Send Do Not Use	When checked, sends a do not use (DUS) message on the S1 byte.
Wavelength Trunk Settings	Allows you to provision the wavelength frequency and reach value.

C.2.26.5.3 Section Thresh 15 Min Tab

The Section Thresh 15 Min tab allows you to view and change the 15-minute section threshold information for the card.

Table C-519 Field Descriptions for the Section Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.4 Section Thresh 1 Day Tab

The Section Thresh 1 Day tab allows you to view and change the 1-day section threshold information for the card.

Table C-520 Field Descriptions for the Section Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the port number.
CV-S	Displays the coding violations section.
ES-S	Displays the errored seconds section.
SES-S	Displays the severely errored seconds section.
SEFS-S	Displays the severely errored framing seconds section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.5 Line Thresh 15 Min Tab

The Line Thresh 15 Min tab allows you to view and change the 15-minute line threshold information for the card.

Table C-521 Field Descriptions for the Line Thresh 15 Min Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.6 Line Thresh 1 Day Tab

The Line Thresh 1 Day tab allows you to view and change the 1-day line threshold information for the card.

Table C-522 Field Descriptions for the Line Thresh 1 Day Tab

Field	Description
Near End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.
Far End	
Port No.	Displays the optical port number.
ES-L	Displays the errored seconds line.
SES-L	Displays the severely errored seconds line.
CV-L	Displays the coding violations line.

Table C-522 Field Descriptions for the Line Thresh 1 Day Tab (continued)

Field	Description
UAS-L	Displays the unavailable seconds line information.
FC-L	Displays the failure count line.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.7 Client Tab

The Client tab allows you to provision PPM parameters for the MXP_MR_10DME-C and MXP_MR_10DME-L cards.

Table C-523 Field Descriptions for the Client Tab

Field	Description
Port No.	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
AINS Soak (H:M)	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
AIS/Squelch Configuration	Allows you to configure the remote client to squelch or send an AIS signal.

Table C-523 Field Descriptions for the Client Tab (continued)

Field	Description
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.26.5.8 RMON Thresholds Tab

The RMON Thresholds tab allows you to view RMON thresholds for the MXP_MR_10DME-C and MXP_MR_10DME-L cards.

Table C-524 Field Descriptions for the RMON Thresholds Tab

Field	Description
Index No.	Displays the selected interface number.
Slot	Displays the selected card.
Port	Displays the port on the selected card.

Table C-524 Field Descriptions for the RMON Thresholds Tab (continued)

Field	Description
Variable	Displays the MIB variable that is being monitored.
Alarm Type	Indicates whether the event is triggered by the rising threshold, falling threshold, or both the rising and falling thresholds.
Sample Type	Indicates whether the sample type is relative or absolute. Relative restricts the threshold to using the number of occurrences in the user-set sample period. Absolute sets the threshold to use the total number of occurrences, regardless of time period.
Sample Period (sec)	Displays the sample period, in seconds.
Rising Thresholds (count)	Displays the number of occurrences for the rising threshold.
Falling Thresholds (count)	Displays the number of occurrences for the falling threshold. In most cases, the falling threshold is set lower than the rising threshold.
Create	Click the **Create** button to create a threshold for the ports.
Delete	Select a threshold from the list displayed and click the **Delete** button.

C.2.26.5.9 Distance Extension Tab

The Distance Extension tab allows you to enable the buffer-to-buffer extension between the client and the MXP_MR_10DME card.

Table C-525 Field Descriptions for the Distance Extension Tab

Field	Description
Port No.	Displays the port number.
Enable Distance Extension	Check to enable end-to-end distances of up to 1600 km for 1 GFC and up to 800 km for 2 GFC. When enabled, all the fields for the port are enabled.
Fast Switch	Check to allow the interoperability of MXP_MR_10DME card with other devices. **Note** To allow interoperability, the MXP_MR_10DME card should be Y-cable configured.

C.2.26.5.10 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-526 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.

Table C-526 Field Descriptions for the Wavelength Trunk Settings Tab (continued)

Field	Description
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L- or C-band.

C.2.26.5.11 Error Decorrelator Settings Tab

Note This Properties pane appears only when the MLSE transponder module is installed.

The Error Decorrelator Settings tab allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-527 Field Descriptions for the Error Decorrelator Settings Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.26.5.12 SDH Line Tab

The SDH Line tab allows you to view and change the SDH line settings of the card.

Table C-528 Field Descriptions for the SDH Line Tab

Field	Description
Port No.	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Administration State	The port administration state.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
AINS Soak	Automatic in-service soak. The determination of duration left before the traffic/termination transitions to IS state.
ALS Mode	Allows you to select the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
SD BER	Sets the signal degrade bit error rate.
SF BER	Sets the signal fail bit error rate.
Type	Defines the port as SONET or SDH.
ProvidesSync	When checked, the card is provisioned as an NE timing reference.

Table C-528 Field Descriptions for the SDH Line Tab (continued)

Field	Description
EnableSyncMsg	Enables synchronization status messages (S1 byte), which allow the node to choose the best timing source.
Send DoNotUse	When checked, sends a do not use (DUS) message on the S1 byte.
Reach	Allows you to provision the reach value. You can choose Auto Provision, which allows the system to automatically provision the reach from the PPM reach value on the hardware. Choose one of the following reach distances: **Note** The reach distance options that appear in the drop-down list depend on the card selected. • SR (short reach, up to 2 km distance) • SR 1 (up to 2 km distance) • IR 1 (intermediate reach, up to 15 km distance) • IR 2 (up to 40 km distance) • LR 1 (long reach, up to 40 km distance) • LR 2 (up to 80 km distance) • LR 3 (up to 80 km distance) • I1 • S1 • S2 • L1 • L2 • L3 • SX (up to 550 m or 270 m distance based on 50 um/62.5 um diameter fiber) • LX (up to 10 km or 550 m distance based on 50 um/62.5 um diameter fiber) • CX • T • DX (up to 40 km distance) • HX (up to 40 km distance) • ZX (up to 80 km distance) • VX (up to 100 km distance)
Wavelength	Allows you to provision the wavelength frequency.

C.2.26.5.13 RS Thresh 15 Min Tab

The RS Thresh 15 Min tab allows you to view and change the 15-minute regeneration section threshold for the card.

Table C-529 Field Descriptions for the RS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.14 RS Thresh 1 Day Tab

The RS Thresh 1 Day tab allows you to view and change the 1-day regeneration section threshold for the card.

Table C-530 Field Descriptions for the RS Thresh 1 Day Tab

Field	Description
Port No.	The port number.
EB-RS	Errored blocks regenerator section.
ES-RS	Errored seconds regenerator section.
SES-RS	Severely errored seconds regenerator section.
BBE-RS	Background block errors regenerator section.
UAS-RS	Unavailable seconds regenerator section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.15 MS Thresh 15 Min Tab

The MS Thresh 15 Min tab allows you to view and change the 15-minute near- and far-end multiplex section threshold for the card.

Table C-531 Field Descriptions for the MS Thresh 15 Min Tab

Field	Description
Port No.	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.16 MS Thresh 1 Day Tab

The MS Thresh 1 Day tab allows you to view and change the 1-day near- and far-end multiplex section threshold for the card.

Table C-532 Field Descriptions for the MS Thresh 1 Day Tab

Field	Description
Port Number	The port number.
EB-MS	Errored blocks multiplexer section.
ES-MS	Errored seconds multiplexer section.
SES-MS	Severely errored seconds multiplexer section.
BBE-MS	Background block errors multiplexer section.
UAS-MS	Unavailable seconds multiplexer section.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.5.17 Wavelength Trunk Settings Tab

The Wavelength Trunk Settings tab allows you to change the wavelength and band settings for the card.

Table C-533 Field Descriptions for the Wavelength Trunk Settings Tab

Field	Description
Port Number	Displays the optical port number.
Port Name	Allows you to enter an optical port name.
Wavelength	Allows you to provision the wavelength frequency. The Wavelength column lists the correct wavelengths, depending on the type of card and the band selected. Refer to the *Other Information* field in the Equipment Inventory table for details of wavelengths supported. See 11.3.1.3 Equipment Inventory Table for CTC-Based NEs, page 11-13.
Band	The Band column reduces the number of selectable wavelengths (82/80 lambdas only). When the card is plugged in, the selection is disabled and the correct value of the band is displayed. When the card is preprovisioned, you can select either L - or C-band.

C.2.26.5.18 Error Decorrelator Settings Tab

Note This Properties pane appears only when the MLSE transponder module is installed.

The Error Decorrelator Settings tab allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

Table C-534 Field Descriptions for the Error Decorrelator Settings Tab

Field	Description
Port No.	Displays the port number.
Port Name	Allows you to add a port name.
Error Decorrelator	Allows you to enable or disable Prime Optical from retrieving the error decorrelator value.

C.2.26.6 OTN

The OTN Properties pane allows you to change the line optical transport network (OTN) settings for MXP_MR_10DME cards. The Properties pane contains the following tabs:

- C.2.26.6.1 OTN Line Tab, page C-392
- C.2.26.6.2 G.709 Thresh 15 Min Tab, page C-392
- C.2.26.6.3 G.709 Thresh 1 Day Tab, page C-393
- C.2.26.6.4 FEC Thresh 15 Min Tab, page C-394
- C.2.26.6.5 FEC Thresh 1 Day Tab, page C-395
- C.2.26.6.6 Trail Trace Identifier Tab, page C-395

C.2.26.6.1 OTN Line Tab

The OTN Line tab allows you to view and change the OTN line settings of the card.

Table C-535 Field Descriptions for the OTN Line Tab

Field	Description
Port No.	The port number.
G.709 OTN	Disables or enables the G.709 OTN feature.
FEC	Disables or enables forward error correction. **Note** OTN must be enabled before you can enable FEC.
Asynch/Synch Mapping	The card can perform multiplexing per ITU-T G.709. The ODUK (client SONET/SDH payload) can be mapped to the optical channel (OTUK) either asynchronously (asynch mapping) or synchronously (synch mapping) with this setting.
SF BER	The signal fail bit error rate.
SD BER	The signal degrade bit error rate.

C.2.26.6.2 G.709 Thresh 15 Min Tab

The G.709 Thresh 15 Min tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 15 minutes.

Table C-536 Field Descriptions for the G.709 Thresh 15 Min Tab

Field	Description
SM (OTUK) Near End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.

Table C-536 Field Descriptions for the G.709 Thresh 15 Min Tab (continued)

Field	Description
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.6.3 G.709 Thresh 1 Day Tab

The G.709 Thresh 1 Day tab displays near- and far-end SM optical channel transport unit (OTUK), and near- and far-end PM optical channel data unit (ODUK) threshold information received during the past 24 hours.

Table C-537 Field Descriptions for the G.709 Thresh 1 Day Tab

Field	Description
SM (OTUK) Near End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.

Table C-537 Field Descriptions for the G.709 Thresh 1 Day Tab (continued)

Field	Description
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
SM (OTUK) Far End	
Port No.	Displays the optical port number.
BBE-SM	Displays the background block errors.
ES-SM	Displays the errored seconds.
SES-SM	Displays the severely errored seconds.
UAS-SM	Displays the unavailable seconds.
FC-SM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Near End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.
PM (ODUK) Far End	
Port No.	Displays the optical port number.
BBE-PM	Displays the background block errors.
ES-PM	Displays the errored seconds.
SES-PM	Displays the severely errored seconds.
UAS-PM	Displays the unavailable seconds.
FC-PM	Displays the failure count.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.6.4 FEC Thresh 15 Min Tab

The FEC Thresh 15 Min tab allows you to view and change the 15-minute FEC threshold values of the card.

Table C-538 Field Descriptions for the FEC Thresh 15 Min Tab

Field	Description
Port No.	Displays port number information.

Table C-538 Field Descriptions for the FEC Thresh 15 Min Tab (continued)

Field	Description
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.26.6.5 FEC Thresh 1 Day Tab

The FEC Thresh 1 Day tab allows you to view and change the 1-day FEC threshold values of the card.

Table C-539 Field Descriptions for the FEC Thresh 1 Day Tab

Field	Description
Port No.	Displays port number information.
Bit Errors Corrected	Displays the bit errors corrected in 15-minute intervals.
Uncorrectable Words	Displays the uncorrectable words in 15-minute intervals.

C.2.26.6.6 Trail Trace Identifier Tab

The Trail Trace Identifier tab allows you to provision the trail trace identifier for the card.

Table C-540 Field Descriptions for the Trail Trace Identifier Tab

Field	Description
Port No.	Displays port number information.
Level	Displays the trail trace identifier level (Section or Path).
Trace Mode	Allows you to set the trace mode (Off or Manual).
Disable FDI on TTIM	Allows you to disable forward defect indication (FDI) for trail trace identifier mismatch (TTIM) alarms.
Current Transmit String	Displays the current transmit string. The trail trace identifier is 64 bytes in length.
Current Expected String	Displays the current expected string.
Current Received String	Displays the current received string.

C.2.26.7 Loopback

The Loopback Properties pane allows you to view and update loopback information.

Table C-541 Field Descriptions for the Loopback Properties Pane

Field	Description
Port No.	Displays the port number.
Port Name	Displays the name of the port.
Administration State	The port administration state.

Table C-541 Field Descriptions for the Loopback Properties Pane (continued)

Field	Description
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Loopback Type	Allows you to configure a port to terminal loopback (Inward) or clear the current loopback (None).

C.2.26.8 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-542 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port No.	Displays the port number.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur. (sec)	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int. (sec)	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Status	Displays the current laser status. Values are Shut Down or Not Shut Down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

C.2.26.9 Optical Thresh

The Optical Thresh Properties pane allows you to view and provision optical threshold settings. The Properties pane contains the following tabs:

- C.2.26.9.1 TCA 15 Min Tab, page C-396
- C.2.26.9.2 TCA 1 Day Tab, page C-397
- C.2.26.9.3 Alarm Thresh Tab, page C-397

C.2.26.9.1 TCA 15 Min Tab

The TCA 15 Min tab allows you to view and change the 15-minute TCA settings of the card.

Table C-543 Field Descriptions for the TCA 15 Min Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.

Table C-543 Field Descriptions for the TCA 15 Min Tab (continued)

Field	Description
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.9.2 TCA 1 Day Tab

The TCA 1 Day tab allows you to view and change the 1-day TCA settings of the card.

Table C-544 Field Descriptions for the TCA 1 Day Tab

Field	Description
Port No.	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.9.3 Alarm Thresh Tab

The Alarm Thresh tab allows you to select thresholds for alarm generation.

Table C-545 Field Descriptions for the Alarm Thresh Tab

Field	Description
Port Number	Displays the port number.
Laser Bias High (%)	Displays the upper laser bias threshold.
Rx Power High (dBm)	Displays the upper receive power threshold.
Rx Power Low (dBm)	Displays the lower receive power threshold.
Tx Power High (dBm)	Displays the upper transmit power threshold.
Tx Power Low (dBm)	Displays the lower transmit power threshold.
Reset to Defaults button	Resets the value of the port parameters to the default value.

C.2.26.10 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update alarm profile information.

Table C-546 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Card Profile	
Alarm Profile	Displays the alarm profile that has been configured for the card.

Table C-546 Field Descriptions for the Alarm Behavior Properties Pane (continued)

Field	Description
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
DWDM	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
Payload	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.
GFP	
Port No.	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.26.11 Protection

The Protection Properties pane allows you to view and update card protection group information.

Table C-547 Field Descriptions for the Protection Properties Pane

Field	Description
Protection Groups	Displays a list of available protection groups.
Protection Group Details	Displays details about the selected protection groups and allows you to execute switch commands.

C.2.26.12 Info

The Info Properties pane allows you to view nominal operating values set for the card during manufacturing.

Table C-548 Field Descriptions for the Info Properties Pane

Field	Description
Attribute	Displays the nominal card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of measure (when applicable) of the object that is inventoried.

C.2.27 Slot Properties—OPT-AMP-17-C and OPT-AMP-C

This section contains information about the following cards:

- C.2.27.1 OPT-APM-17-C, page C-399
- C.2.27.2 OPT-AMP-C, page C-401

C.2.27.1 OPT-APM-17-C

The OPT-AMP-17-C is a 17-dB gain, C-band, DWDM EDFA amplifier/preamplifier with OSC add-and-drop capability. It supports 80 channels at 50-GHz channel spacing in the C-band (that is, the 1529 nm to 1562.5 nm wavelength range). When an ONS 15454 has an OPT-AMP-17-C installed, an OSCM card is needed to process the OSC. You can install the OPT-AMP-17-C in slots 1 to 6 and 12 to 17.

The card's features include:

- Fixed gain mode (no programmable tilt)
- Standard gain range of 14 to 20 dB at startup when configured as a preamplifier
- Standard gain range of 20 to 23 dB in the transient mode when configured as a preamplifier
- Gain range of 14 to 23 dB (with no transient gain range) when configured as a booster amplifier
- True variable gain
- Fast transient suppression
- Nondistorting low-frequency transfer function
- Settable maximum output power
- Fixed output power mode (mode used during provisioning)
- ASE compensation in fixed gain mode
- Full monitoring and alarm handling with settable thresholds
- Optical safety remote interlock (OSRI)
- ALS

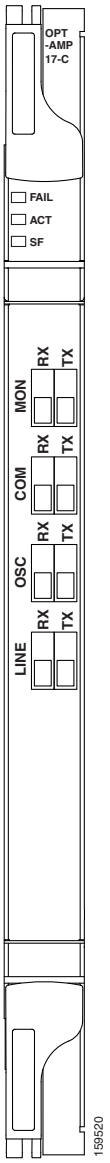
The OPT-AMP-17-C amplifier card has eight optical ports located on the faceplate:

- MON RX—Output monitor port (receive section).
- MON TX—Output monitor port.
- COM RX—Input signal port.

- LINE TX—Output signal port.
- LINE RX—Input signal port (receive section).
- COM TX—Output signal port (receive section).
- OSC RX—OSC add input port.
- OSC TX—OSC drop output port.

The following figure shows the OPT-AMP-17-C amplifier card faceplate.

Figure C-37 OPT-AMP-17-C Faceplate



C.2.27.2 OPT-AMP-C

The OPT-AMP-C is a 20-dB output power, C-band, DWDM EDFA amplifier/preamplifier. It contains midstage access loss for a Dispersion Compensation Unit (DCU). To control gain tilt, a VOA is used. The VOA is also used to pad the DCU to a reference value. The amplifier module also includes the OSC add (TX direction) and drop (RX direction) optical filters.

The OPT-AMP-C supports 80 channels at 50-GHz channel spacing in the C-band (that is, the 1529 nm to 1562.5 nm wavelength range). When an ONS 15454 has an OPT-AMP-C installed, an OSCM card is needed to process the OSC. You can install the OPT-AMP-C in slots 1 to 6 and 12 to 17. Slots 2 to 6 and slots 12 to 16 are the default slots for provisioning the OPT-AMP-C card as a preamplifier, and slots 1 and 17 are the default slots for provisioning the OPT-AMP-C card as a booster amplifier.

The card's features include:

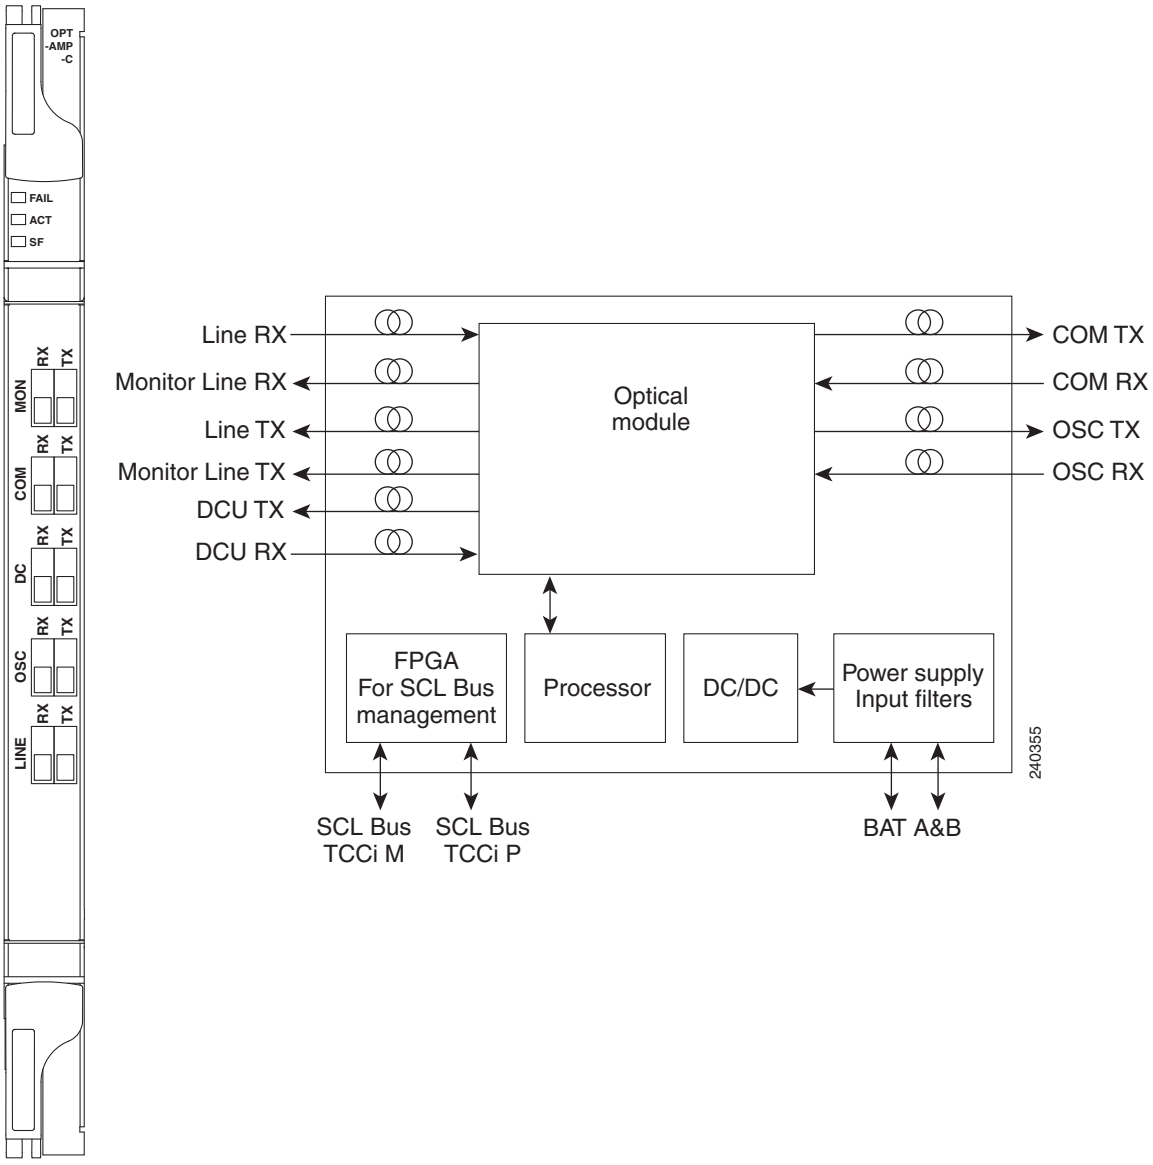
- Fast transient suppression
- Nondistorting low-frequency transfer function
- Midstage access for dispersion compensation unit
- Constant pump current mode (test mode)
- Fixed output power mode (mode used during provisioning)
- Constant gain mode
- ASE compensation in constant gain and constant output power modes
- Programmable tilt
- Full monitoring and alarm handling capability
- Gain range with gain tilt control of 12 to 24 dB
- Extended gain range (with uncontrolled tilt) of 24 to 35 dB
- Full monitoring and alarm handling with settable thresholds
- OSRI
- ALS

The OPT-AMP-C amplifier card has 10 optical ports located on the faceplate:

- MON RX is the output monitor port (receive section).
- MON TX is the output monitor port.
- COM RX is the input signal port.
- COM TX is the output signal port (receive section).
- DC RX is the input DCU port.
- DC TX is the output DCU port.
- OSC RX is the OSC add input port.
- OSC TX is the OSC drop output port.
- LINE RX is the input signal port (receive section).
- LINE TX is the output signal port.

The following figure shows the OPT-AMP-C amplifier card faceplate.

Figure C-38 OPT-AMP-C Faceplate



For the OPT-AMP-17-C and OPT-AMP-C modules, the slot properties pane displays the following properties: Module View, Identification, Card, Optical Line, Optical Amplified Line, Inventory, Alarm Behavior, and Auto Laser Shutdown.

C.2.27.3 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.27.4 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-549 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.27.5 Card

The Card Properties pane allows you to change the working mode of the selected card.

Table C-550 Field Descriptions for the Card Properties Pane

Field	Description
Card Working Mode	Select the card working mode: • OPT_LINE—The card is working as a booster amplifier. • OPT_PRE—The card is working as a preamplifier. In this state the OSC ports are disabled.

C.2.27.6 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-551 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS, AINS—In Service. The port service state changes to IS_NR. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state.
Attenuator Value	Displays the value of an external attenuator required by DWDM network design.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.
Alarm Thresh	

Table C-551 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low (dBm)	Allows you to set the low power failure threshold.
Power Degrade High (dBm)	Allows you to set the high power degrade threshold.
Power Degrade Low (dBm)	Allows you to set the low power degrade threshold.
Gain Degrade Low (dBm)	Allows you to set the low gain degrade threshold.
Gain Degrade High (dBm)	Allows you to set the high gain degrade threshold.
OSC Power Failure High	Allows you to set the high OSC power failure threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.27.7 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-552 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Total Output Power	Shows the current power level per port.
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Signal Output Power	Shows the current output power leaving the amplifier, including the ASE contribution.
Attenuator Value	Displays the value of an external attenuator required by DWDM network design.

Table C-552 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
OSC Power	Shows the current optical service channel (OSC) power level per port.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
AINS Soak	The automatic in-service soak period.
Tilt Calibration	(*Available in the OPT-AMP-C card only*) Allows you to manually set the amplifier tilt.
DCU Insertion Loss	(*Available in the OPT-AMP-C card only*) The dispersion compensation unit (DCU) insertion loss.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure High	Allows you to set the high OSC power failure threshold.

Table C-552 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
OSC Power Failure Low	Allows you to set the low OSC power failure threshold
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.27.8 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-553 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.27.9 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-554 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.27.10 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-555 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur.	Allows you to set the recovery laser pulse duration, in seconds. The range is from 60 to 200 seconds.
Rec. Pulse Int.	Allows you to set the recovery laser pulse interval, in seconds. The range is from 100 to 2000 seconds for client ports and from 200 to 2000 seconds for trunk ports.
Currently Shutdown	Indicates whether the laser is currently shut down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.28 Slot Properties—OPT-AMP-L

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

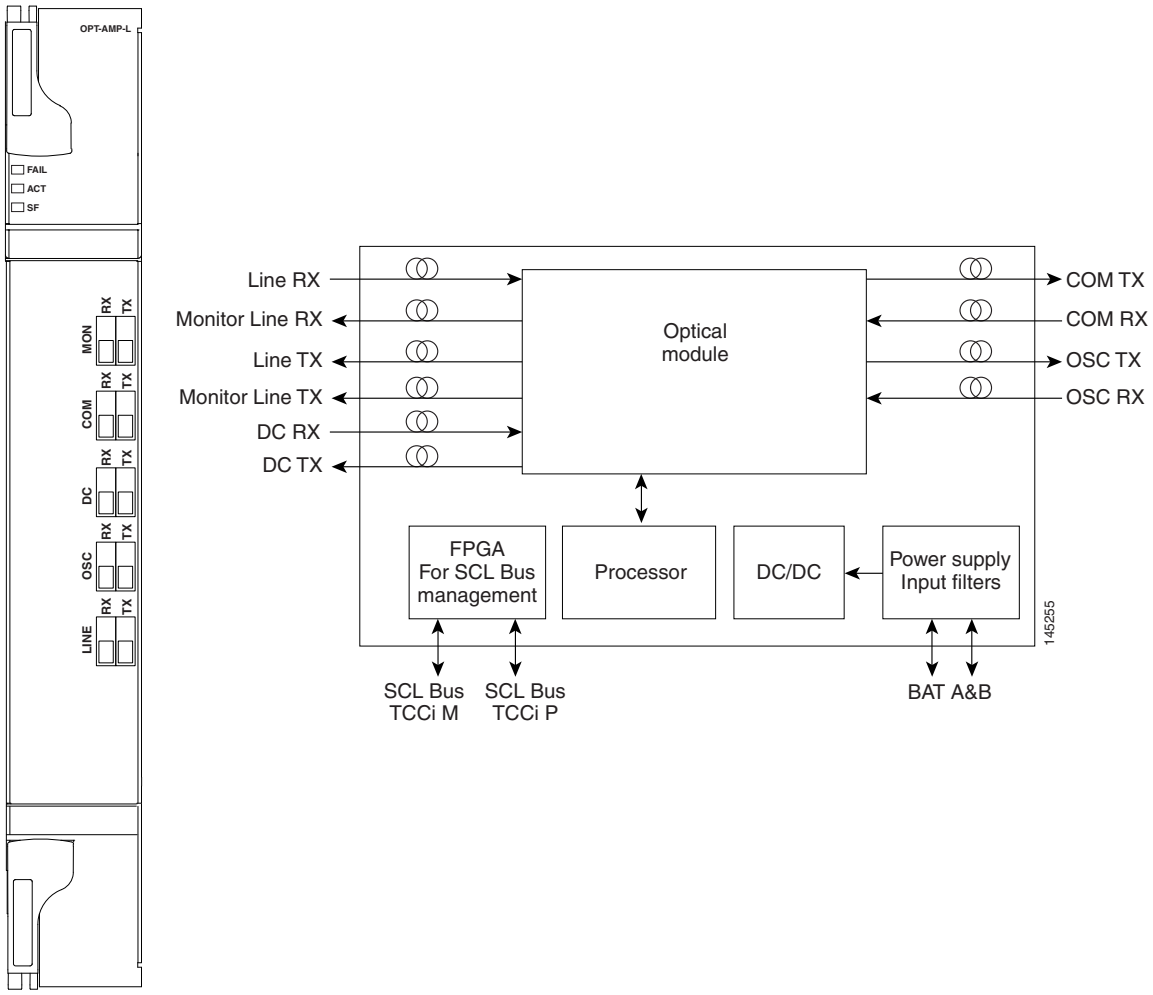
The OPT-AMP-L is an L-band DWDM optical amplifier module consisting of a two-stage EDFA with midstage access loss (MSL) for an external DCU and OSC add-and-drop capability. Using CTC, the card is provisionable as a preamplifier or booster amplifier and is well suited for use in networks that employ DS fiber or SMF-28 single-mode fiber. The amplifier can operate up to 64 optical transmission channels at a channel spacing of 50 GHz in the wavelength range from 1570 nm to 1605 nm.

The OPT-AMP-L can achieve a maximum signal power of 20 dBm throughout the gain and MSL ranges. The amplifier has a variable gain range that is settable from 12-dBm to 24-dBm in the standard gain range and from 24-dBm to 35-dBm with uncontrolled gain tilt. It also provides up to 12-dBm MSL for an external DCU.

When an ONS 15454 has an OPT-AMP-L installed, you only need the OSCM to process the OSC. You can install the two-slot OPT-AMP-L in slots 1 to 6 and 12 to 17. To control the gain tilt, the OPT-AMP-L is equipped with a built-in VOA.

The following figure shows the OPT-AMP-L amplifier faceplate and block diagram.

Figure C-39 OPT-AMP-L Faceplate



For the OPT-AMP-L module, the slot properties pane displays the following properties: Module View, Identification, Card, Optical Line, Optical Amplified Line, Inventory, and Alarm Behavior.

C.2.28.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.28.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-556 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.28.3 Card

The Card Properties pane allows you to change the working mode of the selected card.

Table C-557 Field Descriptions for the Card Properties Pane

Field	Description
Card Working Mode	Select the card working mode: • OPT-LINE—The card is working as preamplifier. In this state the OSC ports are disabled. • OPT_PRE—The card is working as booster amplifier.

C.2.28.4 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-558 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS, AINS—In Service. The port service state changes to IS_NR. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.

Table C-558 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.28.5 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-559 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Total Output Power	Shows the current power level per port.
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.

Table C-559 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
DCU Insertion Loss	The dispersion compensation unit (DCU) insertion loss.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.28.6 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-560 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.

Table C-560 Field Descriptions for the Inventory Properties Pane (continued)

Field	Description
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

C.2.28.7 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-561 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

C.2.29 Slot Properties—OPT-RAMP-C and OPT-RAMP-CE

The OPT-RAMP-C is a double slot unit and improves unregenerated sections in long spans using the span fiber to amplify the optical signal. To achieve Raman amplification, two Raman signals (that do not carry any payload or overhead) are transmitted on the fiber and are used because the gain generated by one signal is not flat (different wavelengths in C-band receive different gain values). The energy of these Raman signals transfers to the higher region of the spectrum, thereby amplifying the signals transmitted at higher wavelengths. The Raman effect reduces span loss and does not compensate it completely.

The unit operates up to 80 optical transmission channels at 50-GHz channel spacing over the C-band of the optical spectrum (wavelengths from 1529 nm to 1562.5 nm). To provide a counter-propagating Raman pump into the transmission fiber, the Raman amplifier provides up to 500 mW at the LINE-RX connector. The OPT-RAMP-C card can be installed in slots 1 to 5 and 12 to 16. The OPT-RAMP-C card supports all network configurations. However, it can be equipped only on the endpoints of a span.

The OPT-RAMP-CE card is a 20-dBm output power, gain-enhanced version of the OPT-RAMP-C card and is optimized for short span. The OPT-RAMP-C or OPT-RAMP-CE card can operate up to 80 optical transmission channels at 50-GHz channel spacing over the C-band of the optical spectrum (wavelengths from 1529 nm to 1562.5 nm). To provide a counter-propagating Raman pump into the transmission fiber, the Raman amplifier provides up to 500 mW at the LINE-RX connector. The OPT-RAMP-C or

OPT-RAMP-CE card can be installed in Slots 1 to 5 and 12 to 16, and supports all network configurations. However, the OPT-RAMP-C or OPT-RAMP-CE card can be equipped only on endpoints of a span.

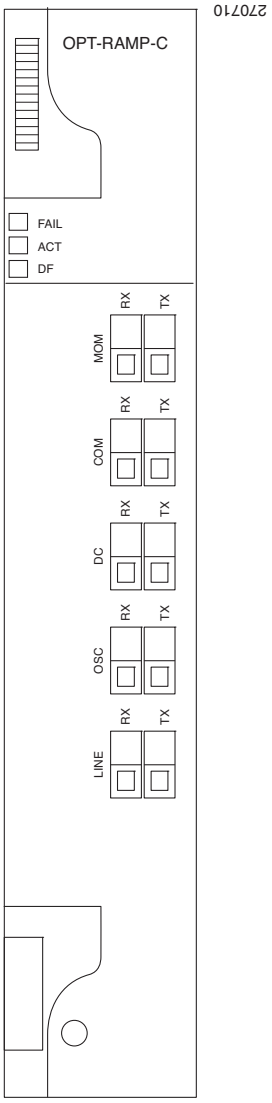
When the Raman optical powers are set correctly, a gain profile with limited ripple is achieved. The wavelengths of the Raman signals are not in the C-band of the spectrum (used by MSTP for payload signals). The two Raman wavelengths are fixed and always the same. Due to a limited Raman gain, an EDFA amplifier is embedded on the card to generate a higher total gain. An embedded EDFA gain block provides a first amplification stage, while the midstage access (MSA) is used for DCU loss compensation.

The features of the OPT-RAMP-C and OPT-RAMP-CE card include:

- Raman pump with embedded EDFA gain block
- Raman section: 500 mW total pump power for two pump wavelengths
- EDFA section:
  - OPT-RAMP-C: 16 dB gain and 17 dB output power
  - OPT-RAMP-CE: 11 dB gain and 20 dB output power
- Gain Flattening Filter (GFF) for Raman plus EDFA ripple compensation
- MSA for DC units
- VOA for DC input power control
- Full monitoring of pump, OSC, and signal power
- Fast gain control for transient suppression
- Low-FIT (hardware-managed) optical laser safety
- Hardware output signals for LOS monitoring at input photodiodes
- Optical service channel add and drop filters
- Raman pump back-reflection detector

The following figure shows the OPT-RAMP-C card faceplate.

Figure C-40 OPT-RAMP-C Faceplate



For the OPT-RAMP-C and OPT-RAMP-CE modules, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Amplified Line, Optical Raman Line, Alarm Behavior, Auto Laser Shutdown, Installation, and Inventory.

C.2.29.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.29.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-562 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.
Version ID	Displays a version ID string in the format “V99_.” The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.29.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-563 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.

Table C-563 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
State	The port administration state. Choosing an administration state from the drop-down list and clicking Apply changes the port's service state unless network conditions prevent the change. Administration states include: • IS—In Service. The port service state changes to IS_NR. • IS, AINS—Automatic In Service. The port service state changes to OOS_AU, AINS. • OOS, DSBLD—Out of Service, Disabled. The port service state changes to OOS_MA, DSBLD. • OOS, MT—Out of Service, Maintenance. The port service state changes to OOS_MA, MT. For loopbacks, the OOS, MT Administration State must be initiated.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.
AINS Soak	Auto in service soak. The determination of duration left before the traffic/termination transitions to IS state.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Low (dBm)	Allows you to set the low power threshold.
Power High (dBm)	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power Failure Low (dBm)	Allows you to set the low power failure threshold.
Power Degrade High (dBm)	Allows you to set the high power degrade threshold.
Power Degrade Low (dBm)	Allows you to set the low power degrade threshold.
Gain Degrade Low (dBm)	Allows you to set the low gain degrade threshold.
Gain Degrade High (dBm)	Allows you to set the high gain degrade threshold.

C.2.29.4 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-564 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS—In Service. • IS, AINS—Automatic In Service. • OOS, DSBLD—Out of Service, Disabled. • OOS, MT—Out of Service, Maintenance.
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Total Output Power	Shows the current power level per port.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Signal Output Power	Shows the current output power leaving the amplifier, including the ASE contribution.
Mode	Shows the working mode of the amplifier: control gain or control power.
VOA Mode	Shows the current functional mode of the VOA: constant gain mode, constant power mode, or not in use (N/A).
VOA Attenuation Ref	The VOA reference attenuation.
VOA Attenuation Calib	The VOA calibration attenuation.
DCU Insertion Loss	(*Available in the OPT-RAMP-C card only*) The dispersion compensation unit (DCU) insertion loss.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
AINS Soak	The automatic in-service soak period.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Warning Thresh 15 Min	
Port Number	The port number.

Table C-564 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.

C.2.29.5 Optical Raman Line

The Optical Raman Line Properties pane allows you to view and update optical Raman line information.

Table C-565 Field Descriptions for the Optical Raman Line

Field	Description
Parameters	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
State	The port administration state. It can be: • IS, AINS—Automatic In Service • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Power	Shows the current power level per port.

Table C-565 Field Descriptions for the Optical Raman Line (continued)

Field	Description
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.
Ratio	Displays the Raman pump ratio in percentage value.
Expected Total Power	Displays the Raman pump expected total power.
Warning Thresh 15 Min	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, Output Line, Input Line, and Drop.
Power Failure Low	Allows you to set the low power failure threshold.
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.

C.2.29.6 Alarm Behavior

The Alarm Behavior Properties pane allows you to view and update card alarm profile information.

Table C-566 Field Descriptions for the Alarm Behavior Properties Pane

Field	Description
Alarm Profile	Displays the alarm profile that has been configured for the card.
Suppress Alarms	When checked, indicates that all alarms are suppressed for the card.
Port Number	Displays the card port number.
Alarm Profile	Choose an alarm profile for the port from the drop-down list. Values are Default, Inherited, or a customized alarm profile.
Suppress Alarms	When checked, all alarms are suppressed for the port.
Alarm Profile	Choose an alarm profile for all ports.
Force to All Ports	When clicked, forces all the ports to the selected alarm profile.

C.2.29.7 Auto Laser Shutdown

The Auto Laser Shutdown Properties pane allows you to view and update the automatic laser shutdown parameters.

Table C-567 Field Descriptions for the Auto Laser Shutdown Properties Pane

Field	Description
Port Number	Displays the card port number.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
OSRI	Allows you to turn the optical safety remote interlock (OSRI) on or off.
ALS Mode	Displays the auto laser shutdown mode (Disabled, Auto Restart, Manual Restart, or Manual Restart for Test).
Rec. Pulse Dur.	*Display only.* Allows you to set the recovery laser pulse duration, in seconds, for the initial recovery optical power pulse following a laser shutdown.
Rec. Pulse Int.	*Display only.* Allows you to set the recovery laser pulse interval, in seconds. This is the period of time that must pass before the recovery pulse is repeated.
Currently Shutdown	Indicates whether the laser is currently shut down.
Request Restart	When selected, allows you to request a laser restart. This parameter is configurable only when the ALS mode is set to Manual Restart or Manual Restart for Test and when the laser status is Shut Down.
OSC Based Startup	When true, enables OSC-based startup for Raman optics line.

C.2.29.8 Installation

The Installation Properties pane displays installation information.

Table C-568 Field Descriptions for the Installation Properties Pane

Field	Description
Username	Provides the string for user login for the setup.
Status	Displays whether Raman is tuned or not tuned.
Gain	Displays the actual Raman gain.
Actual Tilt	Displays the actual Raman tilt.
Date	Displays the date and time for the setup.
Power	Displays the Raman pump total power.
Ratio	Displays the Raman pump ratio.
Fiber Cut Recovery	Displays the status of the Restore from Fiber Cut operation. Valid values are: • Not Need • Failed • Executed • Pending
Fiber Cut Date	Displays the date when the Restore from Fiber Cut operation was executed.

Table C-568 Field Descriptions for the Installation Properties Pane (continued)

Field	Description
S1 Low	Displays the power at node B when wavelength 1 is switched on at node A and the power is low.
S1 High	Displays the power at node B when wavelength 1 is switched on at node A and the power is high.
S2 Low	Displays the power at node B when wavelength 2 is switched on at node A and the power is low.
S2 High	Displays the power at node B when wavelength 2 is switched on at node A and the power is high.

C.2.29.9 Inventory

The Inventory Properties pane allows you to view the card inventory information.

Table C-569 Field Descriptions for the Inventory Properties Pane

Field	Description
Attribute	Displays the card specification.
Value	Displays the value of the attribute.
Units	Displays the unit of the attribute value.

Note See Table 1-22 on page 1-48 for descriptions of actions that you can perform using the buttons at the bottom of the window.

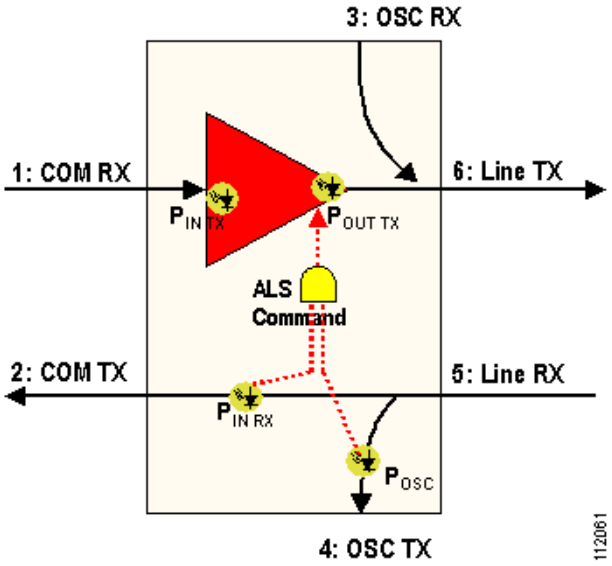
C.2.30 Slot Properties—OPT-BST

The slot properties pane displays information about the Cisco ONS 15454 SONET or ONS 15454 SDH slot that is selected in the NE Explorer tree. Use this properties pane to change the card properties.

The Optical Booster Amplifier (OPT-BST) module is a single-slot card that has eight LC-PC-II optical connectors. The card features true variable gain, fixed gain mode (with programmable tilt), fast transient suppression, and configurable maximum output power. The OPT-BST card supports optical safety functionality by signal loss detection and alarm, fast power down control, and reduced maximum output power in safe power mode.

The following figure shows the block diagram.

Figure C-41 OPT-BST Module



For the OPT-BST module, the slot properties pane displays the following properties: Module View, Identification, Optical Line, Optical Amplified Line, Inventory, Alarm Behavior, and Auto Laser Shutdown.

C.2.30.1 Module View

The Module View displays a graphic of the card that is installed in the slot. The number of critical, major, minor, and warning alarms for the module is displayed under Alarm Status. (Alarms are also displayed when you move the mouse pointer over the graphic.) The Suppress Alarms check box is display-only and indicates whether all alarms are suppressed for the card and its port(s). Right-clicking the graphic opens a shortcut menu that you can use to reset or delete the card.

C.2.30.2 Identification

The Identification Properties pane allows you to view and update card identification information.

Table C-570 Field Descriptions for the Identification Properties Pane

Field	Description
Equipment Type	Displays the equipment type the slot is provisioned for.
Actual Equipment Type	Displays the actual card that is installed in the slot.
HW Part Number	Displays the part number that is printed on the top of the card.
Hardware Revision	Displays the hardware version number of the card.
Serial Number	Displays the serial number that is unique to each card.
CLEI Code	Displays the CLEI code.
Firmware Version	Displays the revision number of the software used by the ASIC chip installed on the card.
Product ID	Displays a product ID string of 63 characters maximum. If the card does not support the product ID, the field shows N/A.

Table C-570 Field Descriptions for the Identification Properties Pane (continued)

Field	Description
Version ID	Displays a version ID string in the format "V99_." The version ID always begins with a V and ends with a space. If the card does not support the version ID, the field shows N/A.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Equipment State	Displays the equipment state of the card.
Alarm Profile	Sets the alarm profile for the card. Check the **Suppress Alarms** check box to suppress all alarms for this card and its port(s).

C.2.30.3 Optical Line

The Optical Line Properties pane allows you to view and update optical line threshold information.

Table C-571 Field Descriptions for the Optical Line Properties Pane

Field	Description
Parameters	
Port Number	Displays the port number.
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Power	Shows the current power level per port.
OSC Power	Shows the current optical service channel (OSC) power level per port.
Active Channels	Indicates how many channels the amplifier is carrying. The value generally reflects the number of provisioned channels.

Table C-571 Field Descriptions for the Optical Line Properties Pane (continued)

Field	Description
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
OSC Power Low	Allows you to set the low OSC power threshold.
OSC Power High	Allows you to set the high OSC power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold. The range for each port is: • Port 1: –40 to 11-dBm • Port 2: –42 to 11-dBm • Port 3: N/A • Port 4: –43 to –2-dBm • Port 5: N/A
Power Degrade High	Allows you to set the high power degrade threshold.
Power Degrade Low	Allows you to set the low power degrade threshold.
Gain Degrade Low	Allows you to set the low gain degrade threshold.
Gain Degrade High	Allows you to set the high gain degrade threshold.
OSC Power Failure Low	Allows you to set the low OSC power failure threshold.
OSC Power Degrade High	Allows you to set the high OSC power degrade threshold.
OSC Power Degrade Low	Allows you to set the low OSC power degrade threshold.

C.2.30.4 Optical Amplified Line

The Optical Amplified Line Properties pane allows you to view and update optical amplified line threshold information.

Table C-572 Field Descriptions for the Optical Amplified Line Properties Pane

Field	Description
Parameters	
Port Number	The port number.

Table C-572 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Port Name	Allows you to assign the specified port a user-defined name. The port name can be up to 32 alphanumeric or special characters. The port name is blank by default.
Administration State	The port administration state. It can be: • IS—In Service • IS, AINS—Automatic In Service • OOS, DSBLD—Out of Service, Disabled • OOS, MT—Out of Service, Maintenance
Service State	An autonomously generated state that gives the overall condition of the entity. Service states appear in the format *Administrative_State-Operational_State*, *Status_Attribute*.
Line Direction (*available in CTM R7.2 and earlier*)	Allows you to associate a card with the line direction. Use this field if you have two cards on the same shelf and must designate which one will carry the traffic flow from east-to-west. The second card will carry traffic from west-to-east.
Type	Identifies the type of port, such as Output Express, Input Express, Output COM, Input COM, and Drop.
Total Output Power	Shows the current power level per port.
Output Power Setpoint	Shows the total optical power going to the amplifier.
Channel Power Ref.	Shows the channel power setpoint.
Offset	Allows you to manually set the total optical power going to the amplifiers.
Mode	Shows the working mode of the amplifier: control gain or control power.
Gain	The current gain of the amplifiers.
Gain Set Point	The value of the gain that the amplifier must achieve. The value is display-only or numeric depending on the mode setting. When the system is configured as metro core, this field is display-only. When the system is configured as metro access, this field is configurable.
Tilt Reference	This field is set to zero. It represents the default value for the amplifier tilt. In a future software release this value will be managed by APC.
Tilt Calibration	Allows you to manually set the amplifier tilt.
Warning Thresh 15 Min	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Warning Thresh 1 Day	
Port Number	The port number.
Power Low	Allows you to set the low power threshold.
Power High	Allows you to set the high power threshold.
Alarm Thresh	
Port Number	The port number.
Power Failure Low	Allows you to set the low power failure threshold. The range is from –10 to 20-dBm.
Power Degrade High	Allows you to set the high power degrade threshold. The range is from –10 to 20-dBm.

Table C-572 Field Descriptions for the Optical Amplified Line Properties Pane (continued)

Field	Description
Power Degrade Low	Allows you to set the low power degrade threshold. The range is from –10 to 20-dBm.
