

## Pseudo Command Line Interface Reference

This chapter describes Pseudo-IOS command line interface (PCLI) for GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE cards.

Unless otherwise specified, “ONS 15454” refers to both ANSI and ETSI shelf assemblies.

### C.1 Understanding PCLI

PCLI provides an IOS-like command line interface for GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE cards in Layer 2 (L2) mode. PCLI employs the Cisco IOS Modular QoS CLI (MQC).

PCLI is a text interface from where you can operate, provision and retrieve GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE card information. PCLI runs on the Timing, Communications, and Control (TCC) of the node controller, to access card level information. PCLI acts as a Corba client and provides the same provisioning mechanisms as CTC or TL1. PCLI can be accessed via CTC by selecting **Tools > Open Pseudo IOS Connection** menu option or right-click on the node in the Network View and select **Open Pseudo IOS Connection**. To access the PCLI text interface use Telnet, or SSH to open a shell session to connect to a GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE card and input IOS-like commands.

To access PCLI from Windows XP, enter the following command at the Windows command prompt:

```
telnet <node name> <port number>
```

To access PCLI from Solaris 8, enter the following command:

```
ssh -p <Port Number> <Node Name>
telnet <Node Name> <Port Number>
```

The PCLI shell supports the 454 multi-shelf architecture. Multi-shelf supports 16 shelves with each shelf containing 17 slots. The GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE cards can be inserted in any Input/Output (IO) slot or shelf. PCLI also provides a command to virtually connect to a specified shelf/slot. However, connection to a non-Xponder slot or to an Xponder slot that is not in L2 mode is not supported. PCLI supports a maximum of 16 concurrent login sessions per node controller. A session can be cancelled by logging out of the PCLI session or when the idle timer times out.

PCLI adheres to the idle user timeout period security policy set via CTC or TL1.

**C.1.1 PCLI Security**

**Note** For information on viewing security policies, refer the task, “DLP-G189 Change Security Policy for Multiple Nodes” in the *Cisco ONS 15454 DWDM Procedure Guide*.

If a PCLI session on a node using a given port number is open, the port number used by the PCLI session cannot be changed. When connecting in a Non-Secure state to a node and a port, use the configured port number for non-secured mode only, and when connecting via a Secure state to a node and a port, use the configured port number for Secure mode.

## C.1.1 PCLI Security

PCLI supports configurable secure or unsecure access with a configurable port number per access mechanism. Use CTC to view or modify these settings. The default access state is “Non-secure” and the default port number is “65000”.

PCLI supports an unsecured connection via Telnet and a secure connection via Secure Shell (SSH) by using existing system authentication, authorization and accounting (AAA) mechanisms. Login with user/password that is configured at the Network Element (NE). Use CTC or TL1 to manage user accounts.

**Note** If you have logged in to a PCLI connection in a Non-Secure state and change the connection via CTC to a Secure one (or vice versa), the Non-Secure state in PCLI (or Secure, as the case may be) is closed once the CTC configuration is completed.

For information on setting the access states (Non-secure or Secure), refer *Cisco ONS 15454 DWDM Procedure Guide*.

## C.2 PCLI Command Modes

The PCLI supports eight different command modes. Each command mode can be accessed by specifying a command. The prompt changes to reflect the new command mode that you are in. Consequently, the set of valid commands changes to reflect the sub-commands that are allowed within that mode.

The following section shows supported PCLI commands for each command mode.

### C.2.1 Common Commands

The following commands are common across all command modes.

- ?—Enter a question mark (?) at the system prompt to display a list of commands available in each command mode.
- !— Enter an exclamation symbol (!) at the system prompt to add comments.
- exit—Enter exit at the system prompt to exit from the mode you are currently in.

### C.2.2 User EXEC Mode

Prompt: (>)

After a successful login, the system goes to User Executive (EXEC) command mode. Most PCLI commands in the User EXEC mode do not change system operation. The User EXEC mode allows you to work on multiple GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE cards during a single session while restricting the view at any given time to a single card in a specific shelf and slot. This mode displays system wide parameters that span all cards in the node.

The following commands are supported in the User EXEC mode:

- [enable shelf/slot](#)
- [show modules](#)
- [show users](#)

## C.2.3 Privileged EXEC Mode

Prompt: (#)

In general, the Privileged EXEC commands allow you to connect to remote devices, perform basic tests, and lists system information. Most CLI commands in Privileged EXEC mode do not change or modify provisioning and system operation. The most common EXEC commands are show commands and are used to display configuration or operational data, and do not have capability to modify provisioning.

To enter privileged EXEC mode, use the [enable shelf/slot](#) command.

The following commands are part of Privileged EXEC mode:

- [configure terminal](#)
- [reload](#)
- [show startup-config](#)
- [show users](#)
- [show ip igmp snooping groups vlan vlanid](#)
- [show interfaces](#)
- [show ethernet service instance name](#)
- [show vlan profiles](#)
- [show vlans](#)
- [show modules](#)
- [show controllers type port](#)
- [show history](#)
- [show policy-maps](#)
- [show policy-map name](#)
- [show policy-map type port](#)

## C.2.4 Global Configuration Mode

Prompt: Node Name# (Config)

Enter global configuration mode from privileged EXEC mode. Global configuration commands generally apply to the whole system rather than just one protocol or interface. You can enter other configuration sub modes listed in this section from global configuration mode.

**C.2.5 VLAN Configuration Mode**

To enter global configuration mode, use the [configure terminal](#) command.

**Note** The node name can be configured by using CTC. Select **Node view > General > General > Node Name**

The following commands are part of global configuration mode:

- [mac-address-table learning vlan \*\*vlanid\*\*](#)
- [\[no\] mac-address-table learning interface type port](#)
- [\[no\] vlan \*\*vlan-id\*\*](#)
- [interface gigabitethernet port](#)
- [interface tengigabitethernet port](#)
- [policy-map name](#)
- [\[no\] mvr](#)
- [mvr \*\*vlan\*\*](#)
- [mvr group ip address count](#)

**C.2.5 VLAN Configuration Mode**

Prompt: (config-vlan)

Enter VLAN configuration mode from global configuration mode. You can configure parameters for an individual VLAN.

To enter VLAN configuration mode, use the **vlan <vlanid>** command.

The following commands are part of VLAN configuration mode:

- [name \*\*vlan name\*\*](#)
- [protected](#)
- [ip igmp snooping](#)
- [ip igmp snooping immediate-leave](#)
- [ip igmp snooping report-suppression](#)

**C.2.6 Interface Configuration Mode**

Prompt: (config-if)

Enter interface configuration mode from global configuration mode. In this mode and other interface sub modes, a wide variety of capabilities are supported. You can configure provisioning on a specific module interface, i.e. port.

To enter interface configuration mode, use the [interface gigabitethernet port](#) or [interface tengigabitethernet port](#) command.

The following commands are part of interface configuration mode:

- [description \*\*description\*\*](#)
- [shutdown](#)
- [mtu \*\*bytes\*\*](#)

- speed auto|1000, 10000
- flowcontrol on|off
- switchport mode trunk
- switchport mode dot1q-tunnel
- service-policy input name
- service-policy output name
- service instance ethernet name
- l2protocol-tunnel
- [no] switchport port-security mac-address mac-address
- ip igmp snooping mrouter

## C.2.7 Service Instance Configuration Mode

Prompt: (config-if-srv)

Service instance configuration mode is a sub mode of the interface configuration mode and can be used to define service instances, i.e. Ethernet Flow Points (EFPs). EFPs are specific to a particular interface. Multiple EFPs can be strung together to make an Ethernet Virtual Circuit (EVC).

The encapsulation commands can be used in any combination to implement flexible EFPs. However, the **dot1q** and **untagged** commands must be used for selective mode translations, and the **default** command must be used for transparent mode translations. The following restrictions apply to encapsulation commands:

- Selective and transparent mode apply to a whole port and are mutually exclusive.
- Encapsulation default is for transparent translations. Only one transparent service instance is allowed per port.
- Encapsulation untagged is for selective translation with no *cvlan* tag. If the operation is **DOUBLE\_ADD (rewrite ingress tag push dot1q <multipurpose vlan> second-dot1q <svlan>)**, only one service instance is allowed per port.

To enter service instance configuration mode, use the **service instance ethernet name** command.

The following commands are part of service instance configuration mode:

- **encapsulation default**
- **encapsulation dot1q first cvlan last cvlan**
- **encapsulation untagged**
- **service-policy input name**
- **bridge-domain svlan**

The encapsulation and rewrite commands work together. These commands take effect only if the following sequence is followed:

1. Enter the encapsulation command.
2. Enter the rewrite command.

**C.2.8 Policy Map Configuration Mode**

**Note** A service instance cannot be edited once user exits the service instance configuration mode. To make changes to any of these parameters, delete the service instance and recreate it.

---

## C.2.8 Policy Map Configuration Mode

Prompt: (config-pmap)

Enter policy map configuration mode from global configuration mode by using the **policy-map** command to create a policy map or modify an existing policy map. This mode is part of the quality-of-service (QoS) feature.

To attach a QoS policy to a specific interface, you must enter interface configuration mode from global configuration mode by identifying the interface and then using the **service-policy** command to attach an existing policy. QoS policy map provisioning can be accessed across multiple GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE cards.

To enter policy map configuration mode, enter the **policy-map name** command from the global config mode.

The following commands are part of policy map configuration mode:

- **police cir percent % bc bytes be bytes**
- **set cos number**
- **wrr-queue cos-map queue-id cos1 ... cosn**
- **wrr-queue queue-id weight 1-16 bandwidth percent %**

## C.2.9 VLAN Profile Config Mode

Prompt: (config-profile)

VLAN profile configuration mode can be used to provision the parameters for a VLAN profile. A VLAN profile can later be applied to multiple VLANs. VLAN profile provisioning can be accessed across multiple GE cards.

To enter VLAN profile configuration mode, use the **vlan profile name** command from the global config mode.

The following commands are part of VLAN profile configuration mode:

- **police cir percent % bc bytes be bytes**

## enable *shelf/slot*

To enter privileged EXEC mode, use the **enable** command in user EXEC mode.

**enable *shelf/slot***

<b>Syntax Description</b>	<i>shelf/slot</i> Shelf and slot number.
<b>Command Modes</b>	User EXEC
<b>Usage Guidelines</b>	Use this command to enter privileged configuration mode. Entering privileged EXEC mode enables the use of privileged commands. Note the prompt for user EXEC mode is the greater than symbol (>), and the prompt for privileged EXEC mode is the hash symbol (#).
<b>Examples</b>	MSTP-176> <b>enable 2/12</b> MSTP-176#

**■ configure terminal**

# configure terminal

To enter global configuration mode, use the **configure terminal** command in privileged EXEC mode.

**configure terminal**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

**Usage Guidelines** Use this command to enter global configuration mode.

After you enter the **configure terminal** command, the system prompt changes from <node-name># to <node-name>(config)#, indicating that the card is now in global configuration mode. To leave global configuration mode and return to privileged EXEC mode, type **exit**.

**Examples**

```
MSTP-176# configure terminal  
MSTP-176(config)#[/pre]
```

# show modules

To display summary information (shelf/slot/port, equipment type, service state) of the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE card, use the **show modules** command in User EXEC and privileged EXEC mode.

## show modules

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** User EXEC and Privileged EXEC

**Examples** The following is sample output of the **show modules** command:

```
MSTP-176# show modules
Shelf/Slot/Port      EquipType          ServiceState
1/NA/NA              BIC_UNKNOWN        IS-NR
1/1 /NA              XP_GE_LINE_CARD   IS-NR
1/1 /1               PPM_1_PORT        OOS-AU,AINS&UEQ
1/1 /2               PPM_1_PORT        OOS-AU,AINS&UEQ
1/1 /8               PPM_1_PORT        OOS-AU,AINS&UEQ
1/1 /9               PPM_1_PORT        OOS-AU,AINS&UEQ
1/1 /11              PPM_1_PORT        IS-NR
1/1 /15              PPM_1_PORT        IS-NR
1/1 /16              PPM_1_PORT        OOS-AU,AINS&UEQ
MSTP-176#
```

**show vlans**

## show vlans

To display VLAN information, use the **show vlans** command in privileged EXEC mode.

**show vlans**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values

**Command Modes** Privileged EXEC

**Examples** The following is sample output of the **show vlans** command which shows the status of 1+1 protection, MAC address learning, IGMP snooping, immediate leave, and report suppression on the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE card for a given VLAN.

```
MSTP-176# show vlans
          IGMP
VLAN Name Prot MAC Learn   Enable Immed Suppress
 2      F   F           F     F     T
 50     F   F           F     F     F
100    F   F           T     F     T
101    F   F           F     F     T
MSTP-176#
```

# show interfaces

To display port level parameters and statistics of interfaces configured on the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE, use the **show interfaces** command in privileged EXEC mode.

## show interfaces

**Syntax Description** This command has no arguments or keywords.

**Defaults** Privileged EXEC

**Examples** The following is sample output of the **show interfaces** command. The output in the example depends on the type and number of interfaces in the card. For this reason only a part of the output is shown.

```
MSTP-176# show interfaces
Port 22 (Trunk), Port name:
Admin State: ADMIN_IS, Service State: IS_NR

MSTP-176#
```

**show policy-maps**

# show policy-maps

To display all policy maps in the node, use the **show policy-maps** command.

**Syntax Description** This command has no arguments or keywords.

**Defaults** Privileged EXEC

**Examples** The following example displays all the policy maps on the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE cards:

```
MSTP-176# show policy-map
Policy Name: port1
Policy Type: SERVICE INSTANCE
CoS: 2

Policy Name: cos3
Policy Type: INGRESS
Ingress CoS: 3 Committed Info Rate: 80 Committed Burst Size: 1
Excess Burst Size: 2 Excess Info Rate: 100
MSTP-176#
```

## show policy-map *name*

To display the information of an unnamed class, use the **show policy-map** command in privileged EXEC mode.

**show policy-map *name***

<b>Syntax Description</b>	<i>name</i>	(Optional) The name of the service policy map whose complete configuration is to be displayed. The name can be a maximum of 31 characters.
---------------------------	-------------	--

**Defaults** Existing policy map configurations are displayed.

**Command Modes** Privileged EXEC

**Examples** The **show policy-map** command displays the configuration of a service policy map that was created using the [policy-map \*name\*](#) command.

The following example displays the contents of policy map “pmapegress” on the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE card:

```
MSTP-176# show policy-maps pmapegress
Policy Name: pmapegress
Policy Type: EGRESS
CoS: 0 Queue: 0 Bandwidth: 15 Weight: 1
CoS: 1 Queue: 1 Bandwidth: 100 Weight: 1
CoS: 2 Queue: 2 Bandwidth: 100 Weight: 1
CoS: 3 Queue: 3 Bandwidth: 100 Weight: 1
CoS: 4 Queue: 4 Bandwidth: 100 Weight: 1
CoS: 5 Queue: 5 Bandwidth: 100 Weight: 1
CoS: 6 Queue: 6 Bandwidth: 100 Weight: 1
CoS: 7 Queue: 7 Bandwidth: 100 Weight: 1
MSTP-176#
```

---

■ **show policy-map type port**

## show policy-map *type port*

To display all the policy maps configured on the port, use the **show policy-map type port** in privileged EXEC mode.

**show policy-map type port**

<b>Syntax Description</b>	<i>type port</i> Interface type and port number.
<b>Command Default</b>	This command has no default behavior or values.
<b>Command Modes</b>	Privileged EXEC
<b>Usage Guidelines</b>	The <b>show policy-map type port</b> command displays the configuration of classes on the specified interface.
<b>Examples</b>	<p>This section provides sample output of a typical <b>show policy-map type port</b> command. The output in the example depends on the type, number of interfaces and options enabled on the card. For this reason only a part of the output is shown and may vary.</p> <pre>MSTP-176# show policy-map int g 1 Policy Name: ingress Policy Type: INGRESS Ingress CoS: 3    Committed Info Rate: 50    Committed Burst Size: 4K Excess Burst Size: 4K  Policy Name: new Policy Type: EGRESS CoS: 0    Queue: 0    Bandwidth: 100    Weight: 1 CoS: 1    Queue: 1    Bandwidth: 90     Weight: 2 CoS: 2    Queue: 0    Bandwidth: 100    Weight: 1 CoS: 3    Queue: 3    Bandwidth: 100    Weight: 1 CoS: 4    Queue: 4    Bandwidth: 100    Weight: 1 CoS: 5    Queue: 5    Bandwidth: 100    Weight: 1 CoS: 6    Queue: 6    Bandwidth: 100    Weight: 1 CoS: 7    Queue: 7    Bandwidth: 100    Weight: 1  MSTP-176#</pre>

## show controllers *type port*

To display information about Small Form-factor Pluggable (SFP) installed, use the **show controllers *type port*** command in privileged EXEC mode.

**show controllers *type port***

<b>Syntax Description</b>	<i>type port</i>	Interface type and port number.
<b>Defaults</b>	No defaults	
<b>Command Modes</b>	Privileged EXEC	
<b>Examples</b>	This section provides sample output of a typical <b>show controllers <i>type port</i></b> command.	
<pre>MSTP-176# show controllers g 2 Port 22 SFP is Present Equipment Type : 1GE/1FC/2FC-1310nm HW Part Number : 10-2273-01 HW Revision : A Serial Number : FNS1032J435 CLEI Code : WMOTB17AAA Product ID : ONS-SE-G2F-LX Version ID : V01</pre>		
MSTP-176#		

**show vlan profiles**

# show vlan profiles

To display the parameters of all configured VLANs or one VLAN (if the VLAN ID or name is specified), use the **show vlan profiles** command in privileged EXEC mode.

**Note**

A vlan profile is a named set of vlan attributes. A profile can be associated to a VLAN ID on an interface. A profile can be attached to multiple vlan/interface pairs.

**show vlan profiles**

<b>Command Modes</b>	Privileged EXEC
----------------------	-----------------

**Examples**

The following example shows the output of the **show vlan profiles** command:

```
MSTP-176# show vlan profiles
Name      CIR BC    PIR BE    LinkIntegrity
a_profile 100 4    100 4    F
d_profile 200 4    100 4    T
e_profile 300 4    100 4    F
v_profile 400 4    100 4    T

MSTP-176#
```

## show vlan profiles *name*

To display the parameters of all configured VLANs or one VLAN (if the VLAN ID or name is specified), use the **show vlan profiles *name*** command in privileged EXEC mode.

### Syntax Description

<i>name</i>	Displays information about a single VLAN identified by VLAN name.
-------------	---

**Note** A vlan profile is a named set of vlan attributes. A profile can be associated to a VLAN ID on an interface. A profile can be attached to multiple vlan/interface pairs.

### Command Modes

Privileged EXEC

### Examples

The following example shows the output of the **show vlan profiles *name*** command:

```
MSTP-176# show vlan profiles a_profile
Name          CIR BC    PIR BE    LinkIntegrity
a_profile     100 4     100 4      F
```

---

■ show ethernet service instance name

## show ethernet service instance *name*

To display information about ethernet customer service instances, use the **show ethernet service instance *name*** command in privileged EXEC mode.

**show ethernet service instance *name***

<b>Syntax Description</b>	<i>name</i>	Displays service instance information of the specified service instance.
<b>Command Modes</b>	Privileged EXEC	
<b>Usage Guidelines</b>	This command is useful for system monitoring and troubleshooting.	

**Examples** The following is an example of output from the **show ethernet service instance** command:

```
MSTP-176# show ethernet service instance
Identifier Interface          CE-Vlans
222      FastEthernet0/1      untagged,1-4093
10       FastEthernet0/2
222      FastEthernet0/2      200
333      FastEthernet0/2      default
10       FastEthernet0/3      300
11       FastEthernet0/3
10       FastEthernet0/4      300
10       FastEthernet0/6      untagged,1-4093
10       FastEthernet0/7      untagged,1-4093
10       FastEthernet0/8      untagged,1-4093
10       FastEthernet0/9      untagged
20       FastEthernet0/9
222      FastEthernet0/11     300-350,900-999
333      FastEthernet0/11     100-200,1000,1999-4093
222      FastEthernet0/12     20
333      FastEthernet0/12     10
10       FastEthernet0/13     10
20       FastEthernet0/13     20
30       FastEthernet0/13     30
200      FastEthernet0/13     222
200      FastEthernet0/14     200,222
300      FastEthernet0/14     333
555      FastEthernet0/14     555
```

# show users

To display information about the active users on the node, use the **show users** command in user EXEC or privileged EXEC mode.

## show users

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC or Privileged EXEC

**Usage Guidelines** This command displays user name, security level, applications users are using and login time of all users on the node.

**Examples** The following is a sample output of the **show users** command:

```
MSTP-176# show users
User1, SUPERUSER, PCLI, loginTime:05.13.2000 10:08:29

```

**reload**

## reload

To reset a card, use the **reload** command in privileged EXEC mode.

**reload**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

**Usage Guidelines** This command resets the card that is currently used.

**Examples** The following is a sample output of the **reload** command:

```
MSTP-176> reload
Warning! Resetting this card may impact traffic.
Please confirm (yes/no): n
Command cancelled.
```

```
MSTP-176>
```

# show history

To list the commands you have entered in the current session (in all modes), use the **show history** command.

## show history

**Syntax Description** This command has no arguments or keywords.

**Command Modes** All modes

**Usage Guidelines** The **show history** command provides a record of commands you have entered. The history buffer records 100 commands.

The **show history** command can be used with the help of certain keys as shown in [Table 3-1](#).

**Table 3-1 History Keys**

Card	Port Description
Ctrl-P or Up Arrow <sup>1</sup>	Recalls commands in the history buffer in a backward sequence, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
Ctrl-N or Down Arrow <sup>1</sup>	Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the Up Arrow. Repeat the key sequence to recall successively more recent commands.

1. The arrow keys function only with ANSI-compatible terminals.

## Examples

The following is a sample output from the **show history** command, which lists the commands the user has entered in privileged EXEC mode for this session:

```
MSTP-176# show history
help
show users
show history
MSTP-176#
```

**show startup-config**

# show startup-config

To display the current configuration of the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE card, use the **show startup-config** command in privileged EXEC mode. The start-up config and the running-config are the same.

**show startup-config**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

**Command Default** No defaults

**Examples** The following partial sample output displays the configuration file named startup-config:

```
MSTP-176# show startup-config

interface tengigabitethernet 22
speed 10000
mtu 9700
flowcontrol off
switchport mode trunk
switchport dot1q ethertype 8100
switchport dot1q ethertype inner 8100
no ip igmp snooping mrouter
switchport port-security mac-address blocked
no l2protocol-tunnel
link integrity action none
service instance ethernet
no shutdown

vlan profile a
no link integrity
police cir percent 100 pir percent 100 bc 4 be 4

no mac-address-table learning interface gigabitethernet 11
no mac-address-table learning interface gigabitethernet 13
no mac-address-table learning interface tengigabitethernet 21
no mac-address-table learning interface tengigabitethernet 22
end
MSTP-176#
```

## show ip igmp snooping groups vlan *vlanid*

To display the multicast groups that were learned through Internet Group Management Protocol (IGMP) on a given SVLAN/MVLAN, use the **show ip igmp groups vlan *vlanid*** in privileged EXEC mode.

**show ip igmp groups vlan *vlanid***

<b>Syntax Description</b>	<i>vlanid</i> VLAN ID range is 1 to 4093.
---------------------------	--

<b>Command Modes</b>	Privileged EXEC
----------------------	-----------------

<b>Command Default</b>	No defaults.
------------------------	--------------

**Examples** The following partial sample output displays the multicast groups for VLAN 10:

```
MSTP-176# show ip igmp sn gr vlan 128
MCAST IP ADDR          VLAN      Ports
224.1.1.1                128      ETHER(99)/SH-1/SL-13/PRT-2
224.1.1.2                128      ETHER(99)/SH-1/SL-13/PRT-2
224.1.1.3                128      ETHER(99)/SH-1/SL-13/PRT-2

MSTP-176#
```

---

 mac-address-table learning vlan *vlanid*

## mac-address-table learning vlan *vlanid*

Use the **mac-address-table learning vlan** global configuration command to enable MAC address learning on a VLAN. Use the no form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

**mac-address-table learning vlan *vlanid***

**no mac-address-table learning vlan <vlanid>**

<b>Syntax Description</b>	<i>vlanid</i> VLAN ID range is 1 to 4093.
<b>Command Modes</b>	Global configuration
<b>Command Default</b>	By default, MAC address learning is disabled on all VLANs.
<b>Usage Guidelines</b>	Customers in a service provider network can tunnel a large number of MAC addresses through the network and fill the available MAC address table space. When you control MAC address learning on a VLAN, you can manage the available MAC address table space by controlling which VLANs, and therefore which ports, can learn MAC addresses.
<b>Examples</b>	An example to enable MAC address learning on VLAN 10 is shown:  MSTP-176# <b>mac-address-table learning vlan 10</b> MSTP-176#

## [no] mac-address-table learning interface *type port*

Use the **mac-address-table learning interface *type port*** global configuration command to specify interface based learning of MAC addresses.

<b>Syntax Description</b>	<i>type/port</i> Interface type, and the port number.
<b>Command Modes</b>	Global configuration
<b>Command Default</b>	None
<b>Usage Guidelines</b>	None
<b>Examples</b>	This example shows how to enable MAC-address learning on an interface:  MSTP-176# <b>mac-address-table learning interface gig 1</b> MSTP-176#

---

[no] **vlan** *vlan-id*

## [no] **vlan** *vlan-id*

To add a VLAN and enter config-VLAN submode, use the **vlan** command. Use the no form of this command to delete the VLAN.

**vlan** *vlan-id*

Syntax	<i>vlan-id</i>	VLAN ID.
--------	----------------	----------

---

**Command Modes** Global configuration

---

**Command Default** None

---

**Usage Guidelines** None

---

**Examples** This example shows how to add a new VLAN and to enter config-VLAN submode:

```
MSTP-176# (config)# vlan 2
MSTP-176# (config-vlan)#{
```

# interface gigabitethernet *port*

To enter gigabit ethernet (GigE) interface configuration, use the **interface gigabitethernet** command in the appropriate configuration mode.

**interface gigabitethernet *port***

---

**Syntax Description**

*port* Enter port number 1-20.

---

**Command Modes**

Global configuration

**Command Default****Usage Guidelines**

---

**Examples**

This example shows how to enter Gigabit Ethernet interface on port 2:

```
MSTP-176(config)# interface gigabitethernet 2  
MSTP-176(config-if)#
```

■ **interface tengigabitethernet port**

## interface tengigabitethernet *port*

To enter ten gigabit ethernet (10 GigE) interface configuration, use the **interface tengigabitethernet** command in the appropriate configuration mode.

**interface tengigabitethernet *port***

Syntax Description	<i>port</i>	Enter port number 21-22.
--------------------	-------------	--------------------------

Command Modes	Global configuration
---------------	----------------------

### Command Default

### Usage Guidelines

**Examples** This example shows how to enter 10GigE interface on port 21:

```
MSTP-176(config)# interface tengigabitethernet 21  
MSTP-176(config-if)#
```

## policy-map *name*

To configure the Quality of Service (QoS) policy map, use the **policy-map** command. Use the no form of this command to delete a policy map.

**policy-map** *name*

[no] **policy-map** *name*

<b>Syntax Description</b>	<i>name</i> Policy map name.
<b>Command Modes</b>	Global configuration
<b>Command Default</b>	None
<b>Usage Guidelines</b>	None
<b>Examples</b>	<p>This example shows how to create a QoS policy for ingress traffic on an interface command:</p> <pre>MSTP-176(config)# policy map pmap MSTP-176(config-pmap)# police cir percent 60 pir percent 80 bc 4 be 16 MSTP-176(config-pmap)# set cos 8 MSTP-176(config-pmap)# service-policy input servpoll MSTP-176# end</pre>

**[no] mvr**

## [no] mvr

Use the **mvr** global configuration command to enable the multicast VLAN registration (MVR) feature on the GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE. Use the **[no] mvr** form of this command to disable MVR and its options.

**mvr group ip-address vlan *vlan-id***

**[no] mvr group ip-address vlan *vlan-id***

---

**Command Modes** Global Configuration

---

**Command Default** MVR is disabled by default.

---

**Usage Guidelines** A maximum of 256 MVR multicast groups can be configured on the GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE. MVR can be enabled only after the multi-group address and VLAN are configured.

---

**Examples** This example shows how to configure 228.1.23.4 as an IP multicast address:

```
MSTP-176(config)# mvr group 228.1.23.4
```

This example shows how to set VLAN 2 as the multicast VLAN:

```
MSTP-176(config)# mvr vlan 2
```

This example shows how to enable MVR:

```
MSTP-176(config)# mvr
```

This example shows how to disable MVR:

```
MSTP-176(config)# no mvr
```

## mvr vlan

To specify the VLAN (SVLAN) to act as a multicast VLAN, use the **mvr vlan** command. All ports must belong to this VLAN.

**mvr vlan *svlan***

Syntax Description	<i>svlan</i> SVLAN ID.
Command Modes	Global Configuration
Command Default	By default MVR is disabled on a SVLAN.
Usage Guidelines	None
Examples	This example shows how to set a VLAN to act as the multicast VLAN: MSTP-176(config)# mvr vlan 22

---

 mvr group ip address count

## mvr group *ip address count*

To configure an IP multicast address on the GE\_XP, 10GE\_XP, GE\_XPE, or 10GE\_XPE card, use the *count* parameter to configure a contiguous series of MVR group addresses. Any multicast data sent to this address is sent to all source ports on the switch and all receiver ports that have elected to receive data on that multicast address. Each multicast address would correspond to one television channel.

**mvr group *ip address count***

---

<b>Syntax Description</b>	<i>count</i> The range for <i>count</i> is 1 to 256.
---------------------------	--

---

<b>Command Modes</b>	Global Configuration
----------------------	----------------------

<b>Command Default</b>	By default MVR is disabled on a SVLAN.
------------------------	--

<b>Examples</b>	This example shows how to configure two contiguous MVR address groups.
-----------------	--

```
MSTP-176(config)# mvr group 228.1.23.4 2
```

## name vlan *name*

To configure the VLAN, use the **name <vlan name>** command.

**name vlan *name***

<b>Syntax Description</b>	<i>name</i> Specify the name of the VLAN.
<b>Command Modes</b>	VLAN interface configuration
<b>Command Default</b>	By default, no name is assigned to a VLAN.
<b>Usage Guidelines</b>	Names with blank spaces can be provided by enclosing the name within double quotes.
<b>Examples</b>	The following example shows how to set the VLAN name: <pre>MSTP-176(config-vlan)# name MYVLAN</pre>

**■ protected**

## protected

To enables or disable Fast Automatic Protection Switching (FAPS) on the specified SVLAN, use the protected command.

**protected****[no] protected**

---

**Syntax Description** This command has no arguments or keywords.

---

**Command Modes** VLAN interface configuration

---

**Command Default** By default, FAPS is disabled on all SVLANS.

---

**Examples** The following example shows how to configure the card for protection:

```
MSTP-176(config-vlan)# protected
```

# ip igmp snooping

To enable IGMP snooping, use the **ip igmp snooping** command. Use the no form of this command to disable IGMP snooping.

**ip igmp snooping**

**no ip igmp snooping**

**Syntax Description** This command has no arguments or keywords.

**Command Default** By default, IGMP snooping is disabled on all SVLANs.

**Command Modes** VLAN interface configuration

**Usage Guidelines** Before you can enable IGMP snooping configure the VLAN interface for multicast routing.

**Examples** This example shows how to enable IGMP snooping:

```
MSTP-176(config-vlan)# ip igmp snooping  
MSTP-176(config-vlan)#{
```

**ip igmp snooping immediate-leave**

# ip igmp snooping immediate-leave

To enable IGMPv2 snooping immediate-leave processing on all existing VLAN interfaces, use the **ip igmp snooping immediate-leave** command. Use the no form of this command to disable immediate-leave processing.

**ip igmp snooping immediate-leave**

**no ip igmp snooping immediate-leave**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** By default, IGMP snooping immediate leave is disabled on all SVLANs.

---

**Command Modes** VLAN interface configuration

---

**Usage Guidelines** The immediate-leave feature is supported only with IGMP version 2.

---

**Examples** This example shows how to enable IGMP immediate-leave processing:

```
MSTP-176(config-vlan)# ip igmp snooping immediate-leave
MSTP-176(config-vlan)#{
```

# ip igmp snooping report-suppression

To enable report suppression, use the **ip igmp snooping report-suppression** command. Use the no form of this command to disable report suppression and forward the reports to the multicast devices.

**ip igmp snooping report-suppression**

**no igmp snooping report-suppression**

**Syntax Description** This command has no arguments or keywords.

**Defaults** By default, IGMP snooping report-suppression is disabled on all SVLANs.

**Command Modes** VLAN interface configuration

**Examples** This example shows how to enable report suppression:

```
MSTP-176(config-vlan)# ip igmp snooping report-suppression  
MSTP-176(config-vlan)#{
```

This example shows how to disable report suppression:

```
MSTP-176(config-vlan)#{ no ip igmp snooping report-suppression  
MSTP-176(config-vlan)#{
```

**■ description description**

# description *description*

To specify the port name, use the **description** command in interface configuration mode.

## **description**

<b>Syntax Description</b>	<i>description</i>	Port name can be a maximum of 32 characters
---------------------------	--------------------	---

<b>Command Modes</b>	Interface configuration
----------------------	-------------------------

<b>Usage Guidelines</b>	To view the ports on an interface, use the <a href="#">show interfaces</a> command in privilege mode.
-------------------------	---

<b>Examples</b>	This example shows how to specify a port name:
-----------------	--

```
MSTP-176(config-if)# description 5p
```

The following partial sample output displays the port name that was set:

```
MSTP-176# show interface
```

```
Port 2 (Client), Port name: 5p
Admin State: ADMIN_OOS_DSBLD, Service State: OOS_MA_DSBLD
Reach: REACH_UNKNOWN, Wavelength: WV_UNKNOWN, AIS Action: NONE
Flow Control: DISABLED, Duplex Mode: FULL, Speed: SPEED_AUTO, MTU: 9700
NI Mode: UNI, MAC Learning: DISABLED, IGMP Static Router Port: DISABLED
Ingress CoS: 0, Ethertype Inner/Outer: 8100/8100, Egress QoS: DISABLED
Committed Info Rate: 100, Burst Size Committed/Excess: BCKT_4K/BCKT_4K
Failed to get PM counters for this port
```

```
MSTP-176#
```

# shutdown

To disable a port use the **shutdown** command. Use the **no shutdown** command to enable the port. This command can be executed only by administrators.

**shutdown**

**no shutdown**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Interface configuration

**Examples** This example shows how to shutdown traffic on vlan 2:

```
MSTP-176(config-if)# shutdown vlan 2
```

**mtu bytes**

## **mtu *bytes***

To set the maximum frame size that will be accepted by the port, use the **mtu** command.

To enable jumbo frames on an interface by adjusting the maximum transmission unit (MTU), use the **mtu** command.

**mtu <bytes>**

---

<b>Syntax Description</b>	<i>bytes</i> Byte size; Valid values are 64-9700.
---------------------------	---

---

<b>Defaults</b>	By default, jumbo frames are disabled. The default mtu value is 9700
-----------------	--

<b>Command Modes</b>	Interface configuration
----------------------	-------------------------

<b>Usage Guidelines</b>	Login as an administrator and make sure that the port is down administratively to make this setting.
-------------------------	--

<b>Examples</b>	This example shows how to specify an MTU of 1800 bytes:
-----------------	---

```
MSTP (config)# interface GigabitEthernet 2
MSTP (config-if)# mtu 1800
```

# speed auto|1000, 10000

To enable auto negotiation or to set the speed manually, use the **speed** command in interface configuration mode.

<b>Syntax Description</b>	<i>auto</i>	Enables Fast Ethernet auto negotiation. The interface automatically operates at 1000 Mbps or 10000 Mbps depending on environmental factors, such as the type of media and transmission speeds for the peer cards, hubs, and switches used in the network configuration. Auto negotiation is the default.
---------------------------	-------------	--

<b>Command Modes</b>	Interface configuration
----------------------	-------------------------

<b>Usage Guidelines</b>	The speed of client and trunk ports of GE_XP, 10GE_XP, GE_XPE, and 10GE_XPE can be set accordingly:
-------------------------	---

**Table C-2      Setting speed values**

Card	Ports	Speed
GE_XP and GE_XPE	Client ports 1 to 20	auto 1000 Mbps
GE_XP and GE_XPE	Trunk ports 21 and 22	10000
10 GE-XP and 10 GE_XPE	Trunk ports 1 to 4	10000

<b>Examples</b>	The following example specifies 1000 Mbps operation:
	MSTP-176(config-if)# speed 1000

**flowcontrol on|off**

## flowcontrol on|off

To set a gigabit ethernet interface to send or receive pause frames, use the **flowcontrol** ON or OFF command.

**flowcontrol on|off**

<b>Syntax Description</b>	<p><b>on</b> Enables a port to receive and process pause frames from remote ports or send pause frames to remote ports.</p> <p><b>off</b> Prevents a port from receiving and processing pause frames from remote ports or from sending pause frames to remote ports.</p>
---------------------------	--

**Defaults** By default, Gigabit Ethernet and 10 Gigabit Ethernet interface ports are set to off.

**Command Modes** Interface configuration

**Usage Guidelines** Pause frames are special packets that signal a source to stop sending frames for a specific period of time because the buffers are full.

**Examples** This example shows how to enable a port to pause frames:

```
MSTP-176(config-if)# flowcontrol receive on
MSTP-176(config-if)#{
```

# switchport mode trunk

To set a port as UNI/NNI, use the **switchport mode trunk** command.

## switchport mode trunk

---

### Defaults

By default, all client ports are dot1q-tunnel and all trunk ports are trunk.

---

### Command Modes

Interface configuration

---

### Usage Guidelines

The port has to be administratively down to make these settings

---

### Examples

This example shows how to configure a port for trunk mode:

```
MSTP(config-if)# switchport mode trunk
```

To verify your settings enter the [show interfaces](#) privileged EXEC command.

**switchport mode dot1q-tunnel**

## switchport mode dot1q-tunnel

These commands set a port as UNI/NNI, use the **switchport mode trunk** command.

**switchport mode dot1q-tunnel**

**Syntax Description** This command has no arguments or keywords.

**Defaults** By default, all client ports are dot1q-tunnel and all trunk ports are trunk

**Command Modes** Interface configuration

**Usage Guidelines** Use the **switchport mode trunk** command to cause the interface to become a trunk.

**Examples** This example shows how to configure a port as an IEEE 802.1Q tunnel port:

```
MSTP-176(config-if)# switchport mode dot1q-tunnel
```

To verify your settings enter the **show interfaces** privileged EXEC command.

# service-policy input *name*

To set the ingress and egress QoS parameters on the port by mapping relevant policies to the port, use the **service-policy input** command.

**service-policy input *name***

[no] **service-policy input *name***

<b>Syntax Description</b>	<i>name</i> Name of a service policy map to be attached.
<b>Defaults</b>	No policy maps are attached.
<b>Command Modes</b>	Interface configuration
<b>Usage Guidelines</b>	The port must be administratively down for configuring.
<b>Examples</b>	This example shows how to attach a policy map to an interface:  MSTP-176(config-if)# service-policy input pmap1 MSTP-176(config-if)#

---

 ■ **service-policy output name**

## service-policy output *name*

To set the ingress and egress QoS parameters on the port by mapping relevant policies to the port, use the **service-policy output *name*** command in interface configuration command.

**service-policy output *name***

[no] **service-policy output *name***

<b>Syntax Description</b>	<i>name</i> Name of a service policy map to be attached.
<b>Defaults</b>	No policy map is attached.
<b>Command Modes</b>	Interface configuration
<b>Examples</b>	This example shows how to attach a policy map to an output interface:  MSTP-176(config-if)# service-policy output <i>policy9</i> MSTP-176(config-if)#

## service instance ethernet *name*

To create a service instance on an interface, use the **service instance ethernet *name*** command.

**service instance ethernet *name***

Syntax Description	<i>name</i>	Name of a service instance. Maximum characters are 32
--------------------	-------------	---

Command Modes	Interface configuration
---------------	-------------------------

**Examples** This example shows how to create a service instance:

```
MSTP-176(config-if)# service instance Ethernet servether1  
MSTP-176(config-if)#
```

**■ l2protocol-tunnel**

# **l2protocol-tunnel**

To enable protocol tunneling on an interface, use the **l2protocol-tunnel** command.

## **l2protocol-tunnel**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No Layer 2 protocol packets are tunneled.

**Command Modes** Interface configuration

**Examples** This example shows how to enable protocol tunneling:

```
MSTP-176(config-if)# l2protocol-tunnel  
MSTP-176(config-if)#
```

## [no] switchport port-security mac-address *mac-address*

To configure a secure MAC address for an interface, use the **switchport port-security mac-address** command.

**switchport port-security mac-address *mac-address***

**[no] switchport port-security mac-address *mac-address***

Syntax	Description
	<i>mac-address</i> MAC address of the port. The format is 00:00:00:00:00:00
<b>Defaults</b>	MAC address is not secured on the port.
<b>Command Modes</b>	Interface configuration
<b>Examples</b>	This example shows how to configure a MAC address as secure on the interface: <pre>MSTP-176(config-if)# switchport port-security mac-address ff:ee:00:12:30:04</pre>

**ip igmp snooping mrouter**

# ip igmp snooping mrouter

To configure a Layer 2 port as a multicast router port, use the ip igmp snooping mrouter command. Use the no form of this command to remove the configuration.

**ip igmp snooping mroute**

---

**Command Modes** Interface configuration

---

**Usage Guidelines** Takes effect on SVLANS associated with the port where IGMP is enabled.

---

**Examples** This example shows how to specify the next-hop interface to the multicast router:

```
MSTP-176(config-if)# ip igmp snooping mrouter interface gigabitethernet 5  
MSTP-176(config-if)#[/pre]
```

# encapsulation default

To set the encapsulation method used by the interface, use the **encapsulation default** command in service interface configuration mode.

## encapsulation default

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Service instance configuration

**Usage Guidelines** Execute the `rew tag push dot1 <svlan>` command to set the port in transparent mode.

**Examples** MSTP-176(config-if-srv)# **encapsulation default**

---

encapsulation dot1q first cvlan last cvlan

## encapsulation dot1q *first cvlan* *last cvlan*

To enable IEEE 802.1Q encapsulation of traffic on a specified subinterface in a virtual LAN (VLAN), use the **encapsulation dot1q *first cvlan* *last cvlan*** command in service interface configuration mode or subinterface configuration mode

**encapsulation dot1q *first cvlan* *last cvlan***

---

<b>Syntax Description</b>	<i>&lt;first cvlan&gt; &lt;last cvlan&gt;</i> Comma must be entered to separate each customer VLAN (CVLAN) ID range from the next range.
---------------------------	--

---

This command has no arguments or keywords.

---

<b>Defaults</b>	By default, IEEE 802.1Q encapsulation is disabled.
-----------------	--

---

<b>Command Modes</b>	Service instance configuration
----------------------	--------------------------------

---

<b>Usage Guidelines</b>	IEEE 802.1Q encapsulation is configurable on interface GiGe and 10Gige interfaces. IEEE 802.1Q is a standard protocol for interconnecting cards and for defining VLAN topologies.
-------------------------	---

---

<b>Examples</b>	MSTP-176(config-if-srv)# encapsulation dot1q 1000 1002
-----------------	--

# encapsulation untagged

Defines the matching criteria to be used in order to map untagged Ethernet frames ingress on an interface to the appropriate service instance.

## encapsulation untagged

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Service instance configuration

**Examples** MSTP-176(config-if-srv)# encapsulation untagged

**bridge-domain svlan**

To enable RFC 1490 Frame Relay bridging to map a bridged VLAN to the GE\_XP, 10GE\_XP, GE\_XPE, and 10GE\_XPE card, use the **bridge-domain** command in service interface configuration mode.

### **bridge-domain *svlan***

<b>Syntax Description</b>	<i>svlan</i> SVLAN ID to be used in the bridging configuration. The valid range is from 1 to 4093.
---------------------------	--

<b>Defaults</b>	Bridging is disabled.
-----------------	-----------------------

<b>Command Modes</b>	Service instance configuration
----------------------	--------------------------------

<b>Examples</b>	The following example shows the GE_XP, 10GE_XP, GE_XPE, and 10GE_XPE being configured for IEEE 802.1Q VLAN bridging using a VLAN ID of 99:
-----------------	--

```
MSTP-176(config-if-srv)# bridge-domain 99
```

## police cir percent % bc *bytes* be *bytes*

To configure traffic policing based on a percentage of bandwidth available on an interface, use the police command in policy-map configuration mode.

**police cir percent % bc *bytes* be *bytes***

Syntax Description	
<b>cir</b>	Committed information rate. Indicates that the cir will be used for policing traffic.
<b>percent</b>	Specifies that percent of bandwidth will be used for calculating the cir.
<b>%</b>	Specifies the bandwidth percentage. Valid range is a number from 1 to 100.
<b>bc</b>	Conform burst (bc) size used by the first token bucket for policing traffic.
<b>be</b>	Peak burst (be) size used by the second token bucket for policing traffic.

**Defaults** By default, traffic policing is disabled.

**Command Modes** Policy-map configuration and VLAN profile configuration.

**Examples** The following example configures traffic policing using a cir and a pir based on a percentage of bandwidth. In this example, a cir of 20 percent and a pir of 40 percent have been specified. Additionally, an optional bc value and be value (300 ms and 400 ms, respectively) have been specified.

```
MSTP(config-pmap)# police cir percent 20 bc 300 ms be 400 ms
```

**set cos number**

## set cos *number*

To set the Layer 2 class of service (CoS) value of an outgoing packet, use the `set cos` command in policy-map class configuration mode.

**set cos *number***

Syntax Description	<i>number</i>	Specify the CoS value to be applied to the 802.1Q SVLAN tag. Values 0 through 7 specify constant values for the CoS. Values 8 and 9 mean: 8 = TRUST. This value indicates that the CVLAN CoS value must be trusted, i.e. copied into the SVLAN CoS field. 9 = CVLAN. This value indicates that the SVLAN CoS field is set based on the value of the CVLAN ID. This mapping is provided by an EVC service instance. A service instance on an interface can be defined to match frames with one or more CVLANs. That service instance can also have a policy applied that specifies a CoS. The result is a mapping from CVLAN to CoS on an interface.
--------------------	---------------	---

**Defaults** By default, no CoS value is set for the outgoing packet.

**Command Modes** Policy-map configuration.

**Usage Guidelines** Enter upto 9 CoS values.

**Examples** In the following example, the policy map called "cos-set" is created to assign different CoS values for different types of traffic.

```
MSTP(config)# policy-map cos-set
MSTP(config-pmap-c)# set cos 1
```

## wrr-queue cos-map *queue-id cos1 ... cosn*

To map CoS values to drop thresholds for a queue, use the wrr-queue cos-map command.

**wrr-queue cos-map *queue-id cos1 ... cosn***

### Syntax Description

<i>queue-id</i>	Queue number; the valid value is 1.
<i>cos1 ... cosn</i>	CoS value; valid values are from 0 to 9.

### Command Modes

Policy-map configuration.

### Examples

This example shows how to map the CoS values 0 and 1 to standard transmit queue 1

```
MSTP(config-pmap)# wrr-queue cos-map 1 1 0  
MSTP(config-pmap) #
```

---

wrr-queue queue-id weight 1-16 bandwidth percent %

## wrr-queue queue-id **weight 1-16 bandwidth percent %**

To allocate bandwidth between standard transmit queue 1 (low priority) and standard transmit queue 2 (high priority), use the **wrr-queue bandwidth** command.

**wrr-queue <queue-id> weight <1-16> bandwidth percent <%>**

---

<b>Syntax Description</b>	<i>weight &lt;1-16&gt;</i> WRR weights; valid values are 1 to 15
---------------------------	--

---

<b>Command Modes</b>	Policy-map configuration.
----------------------	---------------------------

---

<b>Examples</b>	This example shows how to allocate a three-to-one bandwidth ratio:
-----------------	--

```
MSTP(config-pmap)# wrr-queue weight 2 bandwidth 3
```
