

Configuring IP Unicast Layer 3 Switching

This chapter describes how to configure IP unicast Layer 3 switching on Cisco 7600 series routers.

Note

For complete syntax and usage information for the commands used in this chapter, refer to these publications:

- The Cisco 7600 Series Routers Command References at this URL:
http://www.cisco.com/en/US/products/hw/routers/ps368/prod_command_reference_list.html
- The Release 12.2 publications at this URL:
<http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/index.htm>

This chapter consists of these sections:

- [Understanding How Layer 3 Switching Works](#), page 29-1
- [Default Hardware Layer 3 Switching Configuration](#), page 29-4
- [Configuration Guidelines and Restrictions](#), page 29-4
- [Configuring Hardware Layer 3 Switching](#), page 29-4
- [Displaying Hardware Layer 3 Switching Statistics](#), page 29-5

Note

- IPX traffic is fast switched on the MSFC. For more information, refer to this URL:
http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fatipx_c/index.htm
- For information about IP multicast Layer 3 switching, see [Chapter 31, “Configuring IPv4 Multicast Layer 3 Switching.”](#)

Understanding How Layer 3 Switching Works

These sections describe Layer 3 switching:

- [Understanding Hardware Layer 3 Switching](#), page 29-2
- [Understanding Layer 3-Switched Packet Rewrite](#), page 29-2

Understanding Hardware Layer 3 Switching

Hardware Layer 3 switching allows the PFC and DFCs, instead of the MSFC, to forward IP unicast traffic between subnets. Hardware Layer 3 switching provides wire-speed forwarding on the PFC and DFCs, instead of in software on the MSFC. Hardware Layer 3 switching requires minimal support from the MSFC. The MSFC routes any traffic that cannot be hardware Layer 3 switched.

Hardware Layer 3 switching supports the routing protocols configured on the MSFC. Hardware Layer 3 switching does not replace the routing protocols configured on the MSFC.

Hardware Layer 3 switching runs equally on the PFC and DFCs to provide IP unicast Layer 3 switching locally on each module. Hardware Layer 3 switching provides the following functions:

- Hardware access control list (ACL) switching for policy-based routing (PBR)
- Hardware NetFlow switching for TCP intercept, reflexive ACL forwarding decisions
- Hardware Cisco Express Forwarding (CEF) switching for all other IP unicast traffic

Hardware Layer 3 switching on the PFC supports modules that do not have a DFC. The MSFC forwards traffic that cannot be Layer 3 switched.

Traffic is hardware Layer 3 switched after being processed by access lists and quality of service (QoS).

Hardware Layer 3 switching makes a forwarding decision locally on the ingress-port module for each packet and sends the rewrite information for each packet to the egress port, where the rewrite occurs when the packet is transmitted from the Cisco 7600 series router.

Hardware Layer 3 switching generates flow statistics for Layer 3-switched traffic. Hardware Layer 3 flow statistics can be used for NetFlow Data Export (NDE). (See [Chapter 56, “Configuring NetFlow and NDE”](#).)

Understanding Layer 3-Switched Packet Rewrite

When a packet is Layer 3 switched from a source in one subnet to a destination in another subnet, the Cisco 7600 series router performs a packet rewrite at the egress port based on information learned from the MSFC so that the packets appear to have been routed by the MSFC.

Packet rewrite alters five fields:

- Layer 2 (MAC) destination address
- Layer 2 (MAC) source address
- Layer 3 IP Time to Live (TTL)
- Layer 3 checksum
- Layer 2 (MAC) checksum (also called the frame checksum or FCS)

**Note**

Packets are rewritten with the encapsulation appropriate for the next-hop subnet.

If Source A and Destination B are in different subnets and Source A sends a packet to the MSFC to be routed to Destination B, the router recognizes that the packet was sent to the Layer 2 (MAC) address of the MSFC.

To perform Layer 3 switching, the router rewrites the Layer 2 frame header, changing the Layer 2 destination address to the Layer 2 address of Destination B and the Layer 2 source address to the Layer 2 address of the MSFC. The Layer 3 addresses remain the same.

In IP unicast and IP multicast traffic, the router decrements the Layer 3 TTL value by 1 and recomputes the Layer 3 packet checksum. The router recomputes the Layer 2 frame checksum and forwards (or, for multicast packets, replicates as necessary) the rewritten packet to Destination B's subnet.

A received IP unicast packet is formatted (conceptually) as follows:

Layer 2 Frame Header		Layer 3 IP Header				Data	FCS
Destination	Source	Destination	Source	TTL	Checksum		
MSFC MAC	Source A MAC	Destination B IP	Source A IP	n	calculation1		

After the router rewrites an IP unicast packet, it is formatted (conceptually) as follows:

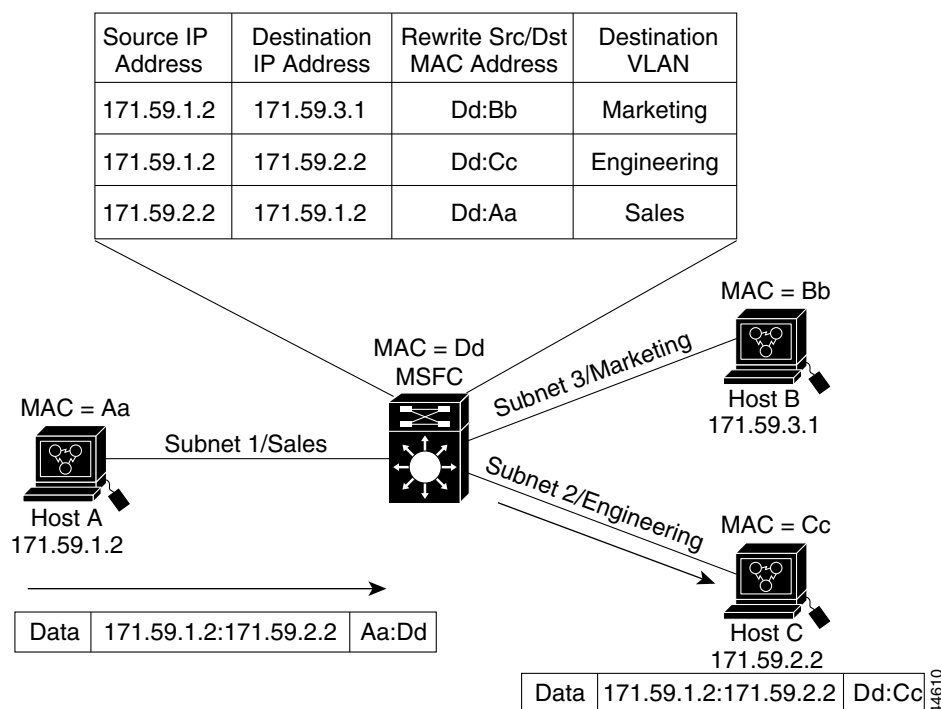

Layer 2 Frame Header		Layer 3 IP Header				Data	FCS
Destination	Source	Destination	Source	TTL	Checksum		
Destination B MAC	MSFC MAC	Destination B IP	Source A IP	n-1	calculation2		

Hardware Layer 3 Switching Examples

Figure 29-1 on page 29-3 shows a simple network topology. In this example, Host A is on the Sales VLAN (IP subnet 171.59.1.0), Host B is on the Marketing VLAN (IP subnet 171.59.3.0), and Host C is on the Engineering VLAN (IP subnet 171.59.2.0).

When Host A initiates an HTTP file transfer to Host C, Hardware Layer 3 switching uses the information in the local forwarding information base (FIB) and adjacency table to forward packets from Host A to Host C.

Figure 29-1 Hardware Layer 3 Switching Example Topology

Default Hardware Layer 3 Switching Configuration

Table 29-1 shows the default hardware Layer 3 switching configuration.

Table 29-1 *Default Hardware Layer 3 Switching Configuration*

Feature	Default Value
Hardware Layer 3 switching enable state	Enabled (cannot be disabled)
Cisco IOS CEF enable state on MSFC	Enabled (cannot be disabled)
Cisco IOS dCEF ¹ enable state on MSFC	Enabled (cannot be disabled)

1. dCEF = Distributed Cisco Express Forwarding

Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when configuring hardware Layer 3 switching:

- Hardware Layer 3 switching supports the following ingress and egress encapsulations:
 - Ethernet V2.0 (ARPA)
 - 802.3 with 802.2 with 1 byte control (SAP1)
 - 802.3 with 802.2 and SNAP

Configuring Hardware Layer 3 Switching

Note

For information on configuring unicast routing on the MSFC, see [Chapter 22, “Configuring Layer 3 Interfaces.”](#)

Hardware Layer 3 switching is permanently enabled. No configuration is required.

To display information about Layer 3-switched traffic, perform this task:

Command	Purpose
Router# show interface {{type ¹ slot/port} {port-channel number}} begin L3	Displays a summary of Layer 3-switched traffic.

1. *type* = ethernet, fastethernet, gigabitethernet, or tengigabitethernet

This example shows how to display information about hardware Layer 3-switched traffic on Fast Ethernet port 3/3:

```
Router# show interface fastethernet 3/3 | begin L3
L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 12 pkt, 778 bytes mcast
L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
4046399 packets input, 349370039 bytes, 0 no buffer
Received 3795255 broadcasts, 2 runts, 0 giants, 0 throttles
<...output truncated...>
Router#
```

**Note**

The Layer 3 switching packet count is updated approximately every five seconds.

Cisco IOS CEF and dCEF are permanently enabled. No configuration is required to support hardware Layer 3 switching.

With a PFC (and DFCs, if present), hardware Layer 3 switching uses per-flow load balancing based on IP source and destination addresses. Per-flow load balancing avoids the packet reordering that can be necessary with per-packet load balancing. For any given flow, all PFC- and DFC-equipped switches make exactly the same load-balancing decision, which can result in nonrandom load balancing.

The Cisco IOS CEF **ip load-sharing per-packet**, **ip cef accounting per-prefix**, and **ip cef accounting non-recursive** commands are not supported on the C7600 series routers.

For information about Cisco IOS CEF and dCEF on the MSFC, refer to these publications:

- The “Cisco Express Forwarding” sections at this URL:
http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fswtch_c/swprt1/index.htm
- The *Cisco IOS Switching Services Command Reference* publication at this URL:
http://www.cisco.com/en/US/docs/ios/12_2/switch/command/reference/fswtch_r.html

Displaying Hardware Layer 3 Switching Statistics

Hardware Layer 3 switching statistics are obtained on a per-VLAN basis.

To display hardware Layer 3 switching statistics, perform this task:

Command	Purpose
Router# show interfaces <i>{{type¹ slot/port} {port-channel number}}</i>	Displays hardware Layer 3 switching statistics.

1. *type* = ethernet, fastethernet, gigabitethernet, or tengigabitethernet

This example shows how to display hardware Layer 3 switching statistics:

```
Router# show interfaces gigabitethernet 9/5 | include Switched
L2 Switched: ucast: 8199 pkt, 1362060 bytes - mcast: 6980 pkt, 371952 bytes
L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes mcast
L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
```

To display adjacency table information, perform this task:

Command	Purpose
Router# show adjacency <i>[{{type¹ slot/port} {port-channel number}} detail internal summary]</i>	Displays adjacency table information. The optional detail keyword displays detailed adjacency information, including Layer 2 information.

1. *type* = ethernet, fastethernet, gigabitethernet, or tengigabitethernet

This example shows how to display adjacency statistics:

```
Router# show adjacency gigabitethernet 9/5 detail
```

■ Displaying Hardware Layer 3 Switching Statistics

Protocol	Interface	Address
IP	GigabitEthernet9/5	172.20.53.206(11)
		504 packets, 6110 bytes
		00605C865B82
		000164F83FA50800
ARP		03:49:31

**Note**

Adjacency statistics are updated approximately every 60 seconds.
