

Border Gateway Protocol Commands

This chapter describes the commands used to configure and monitor Border Gateway Protocol (BGP) IP Version 4 (IPv4), IP Version 6 (IPv6), Virtual Private Network Version 4 (VPNv4) routing sessions.

For detailed information about BGP concepts, configuration tasks, and examples, see the *Implementing BGP* chapter in the *Routing Configuration Guide for Cisco NCS 6000 Series Routers*.

Note

Running the **show bgp** command immediately after configuring a large and complex route policy may result in timeout of the system database shown through an error message (SYSDB-SYSDB-6-TIMEOUT_EDM). It is recommended, that the show command be run, after the new route policy takes effect.

accept-own

To enable handling of self-originated VPN routes containing ACCEPT_OWN community attribute, use the **accept-own** command in neighbor VPNv4 or VPNv6 address family configuration mode. To disable this functionality, either use the **no** form of this command or use the command with **inheritance-disable** keyword.

accept-own [inheritance-disable]

no accept-own

Syntax Description	inheritance-disable	Disables handling of self-originated VPN routes containing ACCEPT_OWN community attribute and prevents inheritance of Accept Own from a parent configuration.
Command Default	Disabled	
Command Modes	Neighbor address family Neighbor address family	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		u must be in a user group associated with a task group that includes appropriate task ignment is preventing you from using a command, contact your AAA administrator
Task ID	Task ID	Operation
	bgp	read, write
Examples	RP/0/RP0/CPU0:router#	-
	RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(<pre>config) #router bgp 100 config-bgp) #neighbor 10.2.3.4 config-bgp-nbr) #address-family vpnv4 unicast config-bgp-nbr-af) #accept-own</pre>

8

additional-paths install backup

Note

Effective with Release 4.0.0, the **additional-paths install backup** command was deprecated and replaced by the **additional-paths selection** command. See the additional-paths selection, on page 13 command for more information.

To install a backup path into the forwarding table and provide prefix independent convergence (PIC) in case of a PE-CE link failure, use the **additional-paths install backup** command in an appropriate address family configuration mode. To prevent installing the backup path, use the **no** form of this command. To disable prefix independent convergence, use the **disable** keyword.

additional-paths install backup [disable] no additional-paths install backup

	no autitional-paths h	istan backup
Syntax Description	disable	Disables installing backup path into the forwarding table.
Command Default	None	
Command Modes	VRF IPv4 address fam	
	VRF IPv6 address fam	ily configuration
	VPNv4 address family	configuration
	VPNv6 address family	configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator
Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to enable installing a backup path into the forwarding table in VPNv4 address family mode:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#additional-paths install backup

Command	Description
advertise best-external, on page 21	Advertises the best-external path to the iBGP and route-reflector peers.
retain local-label, on page 236	Retains the local label until the network is converged.

additional-paths receive

To configure receive capability of multiple paths for a prefix to the capable peers, use the **additional-paths receive** command in address-family configuration mode. To disable receive capability, use the **no** form of this command. To disable add-path receive capability for all neighbors belonging to a particular VRF address-family, use the **disable** option.

additional-paths receive [disable]

no additional-paths receive

for the address family.

Syntax Description		Disable Note	es advertising additional paths receive capability. Use the disable keyword option to disable add-path receive capability for all neighbors belonging to a specified VRF address-family.
Syntax Description	This command has 1	no keyv	words or arguments.
Command Default	None		
Command Modes	IPv4 address family configuration IPv6 address family configuration VPNv4 address family configuration		
	VPNv6 address family configuration VRF IPv4 address family configuration VRF IPv6 address family configuration		
Command History	Release		Modification
	Release 5.0.0		This command was introduced.
Usage Guidelines			must be in a user group associated with a task group that includes appropriate task nment is preventing you from using a command, contact your AAA administrator
	Use the additional-paths receive command to allow add-path receive capability to be negotiated for a specified address family. When the additional-paths receive command is configured, the receive capability is automatically enabled for all internal BGP neighbors for a specified address family. When this command is either not configured or explicitly disabled, none of the neighbors are allowed to negotiate receive capability		

After enabling the receive capability, the session needs to be reset for the configuration to take into effect.

Task ID

Task ID	Task ID	Operation	
	bgp	read, write	
Examples	This example shows how to e	enable additional paths receive capability under VPNv4 unicast address family:	
	This example shows how to disable additional paths receive capability for all neighbors belonging to a particular VRF address-family (vrf1):		

Related Commands	Command	Description		
	additional-paths send, on page 15	Configures send capability of multiple paths for a prefix to the capable peers.		
	capability additional-paths send, on page 108 Advertises capability of sending additional paths to the peer.			
	capability additional-paths receive, on page 106 Advertises additional paths receive capability.			

additional-paths selection

To configure additional paths selection mode for a prefix, use the **additional-paths selection** command in address-family configuration mode. To disable the additional-paths selection mode for a prefix, use the **no** form of this command. To disable the additional-paths selection mode for a particular VRF address-family, use the **disable** option.

additional-paths selection {route-policy route-policy-name| disable} no additional-paths selection route-policy route-policy-name

Syntax Description	route-policy route-policy-name	Specifies the name of a route policy used for additional paths selection.			
	disable	Disables add-path selection for a particular VRF address-family.			
Command Default	None				
Command Modes	IPv4 address family configuration				
	IPv6 address family configuration				
	VPNv4 address family configuration				
	VPNv6 address family configuration				
	VRF IPv4 address family configuration				
	VRF IPv6 address family configuration				
Command History	Release	Modification			
	Release 5.0.0	This command was introduced.			
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.				
	To configure additional paths selection mode for some or all prefixes, use the additional-paths selection command by specifying a route-policy.				
	Use the additional-path selection command with an appropriate route-policy to calculate backup paths and to enable Prefix Independent Convergence (PIC) functionality. Refer <i>BGP Prefix Independent Convergence Unipath Primary/Backup</i> section in <i>Routing Configuration Guide for Cisco NCS 6000 Series Routers</i> for				

details on the PIC functionality.

Task ID	Task ID	Operation			
	bgp	read, write			
Examples	This example shows how to en	nable selection of additional paths:			
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# additional-paths selection route-policy ap1				
	RP/0/RP0/CPU0:router# conf RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf				
	RP/0/RP0/CPU0:router# conf RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf				

additional-paths send

To configure send capability of multiple paths for a prefix to the capable peers, use the **additional-paths send** command in address-family configuration mode. To disable the send capability, use the **no** form of this command.

additional-paths send [disable]

no additional-paths send

Syntax Description	disable Di No	 sables advertising additional paths send capability. Use the disable option to disable add-path send capability for all neighbors belonging to a particular VRF address-family. 	
Command Default	None		
Command Modes	IPv4 address family co	nfiguration	
	IPv6 address family configuration		
	VPNv4 address family configuration		
	VPNv6 address family configuration		
	VRF IPv4 address family configuration		
	VRF IPv6 address fam	ly configuration	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines	To use this command, y	ou must be in a user group associated with a task group that includes appropriate task	
	IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	Use the additional-paths send command to allow add-path send capability to be negotiated for a specified address family. When the additional-paths send command is configured, the send capability is automatically enabled for all internal BGP neighbors for the specified address family. When the command is either not configured or explicitly disabled, none of the neighbors are allowed to negotiate send capability for the address family.		
	After enabling the send capability, the session needs to be reset for the configuration to take into effect.		

Task ID	Task ID	Operation		
	bgp	read, write		
Examples	This example shows how to enable additional p	aths send capability under VPNv4 4 unicast address family:		
	RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:routerconfig)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# additional-paths send			
	This example shows how to enable add-path selection for a particular VRF address-family (vrfl): RP/0/RP0/CPU0:router#configure RP/0/RP0/CPU0:router(config-bgp)#vrf vrfl RP/0/RP0/CPU0:router(config-bgp-vrf)#address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-vrf-af)#additional-paths send disable			
Related Commands	Command	Description		
	additional-paths receive, on page 11	Configures receive capability of multiple paths for a prefix to the capable peers.		
	capability additional-paths send, on page 108	Advertises capability of sending additional paths to the peer.		
	capability additional-paths receive, on page 10	6 Advertises additional paths receive capability.		

address-family (BGP)

To enter various address family configuration modes while configuring Border Gateway Protocol (BGP), use the **address-family** command in an appropriate configuration mode. To disable support for an address family, use the **no** form of this command.

address-family {ipv4 {labeled-unicast| mdt| multicast| mvpn| rt-filter| tunnel| unicast}| ipv6 {labeled-unicast| multicast| mvpn| unicast}| l2vpn vpls-vpws| vpnv4 unicast| vpnv6 unicast| link-state link-state}

no address-family

Syntax Description	ipv4 unicast	Specifies IP Version 4 (IPv4) unicast address prefixes.
	ipv4 multicast	Specifies IPv4 multicast address prefixes.
	ipv4 labeled-unicast	Specifies IPv4 labeled-unicast address prefixes. This option is available in IPv4 neighbor configuration mode and VRF neighbor configuration mode.
	ipv4 tunnel	Specifies IPv4 tunnel address prefixes.
	ipv4 mdt	Specifies IPv4 multicast distribution tree (MDT) address prefixes. This option is available in router configuration mode and IPv4 neighbor configuration mode.
	ipv6 unicast	Specifies IP Version 6 (IPv6) unicast address prefixes.
	ipv6 multicast	Specifies IPv6 multicast address prefixes.
	ipv6 labeled-unicast	Specifies IPv6 labeled-unicast address prefixes. This option is available in IPv6 neighbor configuration mode.
	vpnv4 unicast	Specifies VPN Version 4 (VPNv4) unicast address prefixes. This option is not available in VRF or VRF neighbor configuration mode.
	vpnv6 unicast	Specifies VPN Version 6 (VPNv6) unicast address prefixes. This option is not available in VRF or VRF neighbor configuration mode.
	l2vpn vpls-vpws	Specifies L2VPN vpls-vpws address prefixes.
	ipv4 rt-filter	Specifies IPv4 rt-filter address prefixes.
	ipv4 mvpn	Specifies IPv4 mvpn address prefixes.
	ipv6 mvpn	Specifies IPv6 mvpn address prefixes.

Command Default An address family must be explicitly configured in the router configuration mode for the address family to be active in BGP. Similarly, an address family must be configured under the neighbor for the BGP session to be established for that address family. An address family must be configured in router configuration mode before it can be configured under a neighbor.

Command ModesRouter configurationNeighbor configurationNeighbor group configurationVRF configurationVRF neighbor configuration (IPv4 address families)

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **address-family** command to enter various address family configuration modes while configuring BGP routing sessions. When you enter the **address-family** command from router configuration mode, you enable the address family and enter global address family configuration mode.

The IPv4 unicast address family must be configured in router configuration mode before configuring the IPv4 labeled-unicast address family for a neighbor in neighbor configuration mode. The IPv6 unicast address family must be configured in router configuration mode before configuring the IPv6 labeled-unicast address family for a neighbor in neighbor configuration mode. See Table 1: Address Family Submode Support, on page 18

Address Family	Supported in Router Submode	Supported in Neighbor Submode	Comments
ipv4 unicast	yes	yes	
ipv4 multicast	yes	yes	
ipv4 mdt	yes	yes	
ipv4 tunnel	yes	yes	

Table 1: Address Family Submode Support

Address Family	Supported in Router Submode	Supported in Neighbor Submode	Comments
ipv4 labeled-unicast	no	yes	The ipv4 labeled-unicast address family can be configured only as a neighbor address family; however, it requires that the ipv4 unicast address family be configured as the router address family first.
vpnv4 unicast	yes	yes	—
ipv6 unicast	yes	yes	—
ipv6 multicast	yes	yes	—
ipv6 labeled-unicast	no	yes	The ipv6 labeled-unicast address family can be configured only as a neighbor address family; however, it requires that the ipv6 unicast address family be configured as the router address family first.
vpnv6 unicast	yes	yes	—
l2vpn vpls-vpws	yes	yes	—
ipv4 rt-filter	yes	yes	—
ipv4 mvpn	yes	yes	—
ipv6 mvpn	yes	yes	—

When you enter the **address-family** command from neighbor configuration mode, you activate the address family on the neighbor and enter neighbor address family configuration mode. IPv4 neighbor sessions support IPv4 unicast, multicast, labeled-unicast, and VPNv4 unicast address families. IPv6 neighbor sessions support IPv6 unicast address families.

Task ID

Task ID	Operations
bgp	read, write

Examples

The following example shows how to place the router in global address family configuration mode for the IPv4 address family:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#
```

The following example shows how to activate IPv4 multicast for neighbor 10.0.0.1 and place the router in neighbor address family configuration mode for the IPv4 multicast address family:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-af)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr)#
```

The following example shows how to place the router in global address family configuration mode for the IPv4 tunnel address family:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 12
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 tunnel
RP/0/RP0/CPU0:router(config-bgp-af)#
```

advertise best-external

To advertise the best–external path to the iBGP and route-reflector peers, when a locally selected bestpath is from an internal peer, use the **advertise best-external** command in an appropriate address family configuration mode. To prevent advertising the best–external path, use the **no** form of this command. To disable advertising the best–external path, use the **disable** keyword.

advertise best-external [disable]

no advertise best-external

Syntax Description	disable Disables best–external configuration for the VRF.	
Command Default	None	
Command Modes	VRF IPv4 address fam	nily configuration
	VRF IPv6 address fam	nily configuration
	L2VPN address family	y configuration
	VPNv4 address family	y configuration
	VPNv6 address family	y configuration
	IPv4 address family co	onfiguration
	IPv6 address family co	onfiguration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator
Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to enable advertising the best–external path VPNv4 unicast address family mode:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# advertise best-external

Command	Description
additional-paths install backup, on page 9	Installs a backup path into the forwarding table and provides prefix independent convergence (PIC) in case of a PE-CE link failure.
retain local-label, on page 236	Retains the local label until the network is converged.

advertisement-interval

To set the minimum interval between the sending of Border Gateway Protocol (BGP) routing updates, use the **advertisement-interval** command in an appropriate configuration mode. To remove the **advertisement-interval** command from the configuration file and restore the system to its default interval values, use the **no** form of this command.

advertisement-interval seconds

no advertisement-interval [seconds]

Syntax Description	seconds	Minimum interval between sending BGP routing updates (in seconds). Range is 0 to 600.
Command Default	Default minimum in	
		BGP) peers is 0 seconds
		BGP) peers is 30 seconds CE) peers is 0 seconds
Command Modes	Neighbor configurat	ion
	Neighbor group cont	figuration
	Session group config	guration
	VRF neighbor config	guration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		d, you must be in a user group associated with a task group that includes appropriate task p assignment is preventing you from using a command, contact your AAA administrator
	If this command con	figures a neighbor group or session group, all neighbors using the group inherit the s of commands configured specifically for a neighbor override inherited values.
Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to set the minimum time between sending BGP routing updates to 10 seconds:

```
RP/0/RP0/CPU0:router(config)# router bgp 5
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.1.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 100
RP/0/RP0/CPU0:router(config-bgp-nbr)# advertisement-interval 10
```

Command	Description
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
session-group, on page 254	Creates a session group and enters session group configuration mode.

af-group

To create an address family group for Border Gateway Protocol (BGP) neighbors and enter address family group configuration mode, use the **af-group** command in router configuration mode. To remove an address family group, use the **no** form of this command. af-group af-group-name address-family no af-group **Command Default** No BGP address family group is configured. **Command Modes** Router configuration **Command History** Release Modification Release 5.0.0 This command was introduced. **Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. Use the **af-group** command to group address family-specific neighbor commands within an IPv4 or IPv6 address family. Neighbors that have address family configuration are able to use the address family group. Further, neighbors inherit the configuration parameters of the entire address family group. You cannot define two address family groups with the same name in different address families. Task ID Task ID Operations bgp read, write Examples The following example shows how to create address family group group 1 and enter address family group configuration mode for IPv4 unicast. Group1 contains the next-hop-self feature, which is inherited by neighbors that use address family group1. RP/0/RP0/CPU0:router(config) # router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# af-group group1 address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-afgrp)# next-hop-self

Command	Description
neighbor (BGP), on page 186	Enters neighbor configuration mode for configuring BGP routing sessions.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
session-group, on page 254	Creates a session group and enters session group configuration mode.
use, on page 489	Inherits configuration from a neighbor group, session group, or address family group.

aggregate-address

To create an aggregate entry in a Border Gateway Protocol (BGP) routing table, use the aggregate-address command in an appropriate configuration mode. To remove the **aggregate-address** command from the configuration file and restore the system to its default condition, use the no form of this command.

aggregate-address address/mask-length [as-set] [as-confed-set] [summary-only] [route-policy route-policy-name]

no aggregate-address

Syntax D

Syntax Description	address	Aggregate address.
	/mask-length	Aggregate address mask length.
	as-set	(Optional) Generates autonomous system set path information and community information from contributing paths.
	as-confed-set	(Optional) Generates autonomous system confederation set path information from contributing paths.
	summary-only	(Optional) Filters all more-specific routes from updates.
	route-policy route-policy-name	(Optional) Specifies the name of a route policy used to set the attributes of the aggregate route.
Command Default	When you do not specify this comr	nand, no aggregate entry is created in the BGP routing table.
Command Modes	IPv4 address family configuration	
	IPv6 address family configuration	
	VRF IPv4 address family configurate	ation
	VRF IPv6 address family configura	ation

Command History Release Modification Release 5.0.0 This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can implement aggregate routing in BGP either by redistributing an aggregate route into BGP using the **network** command or the **aggregate-address** command.

Use the **aggregate-address** command without optional arguments to create an aggregate entry in the BGP routing table if any more-specific BGP routes are available that fall in the specified range. The aggregate route is advertised as coming from your autonomous system and has the atomic aggregate attribute set to show that information might be missing. (By default, the atomic aggregate attribute is set unless you specify the **as-set** keyword.)

Use of the **as-set** keyword creates an aggregate entry using the same rules that the command follows without this keyword. However, the advertised path for this route is an AS_SET, a set of all autonomous systems contained in all paths that are being summarized.

Do not use this form of the **aggregate-address** command when aggregating many paths because this route must be continually withdrawn and updated as autonomous system path reachability information for the summarized routes changes.

Use the **as-confed-set** keyword to create an AS_CONFED_SET in the autonomous system path of the aggregate from any confederation segments in the paths being summarized. This keyword takes effect only if the **as-set** keyword is also specified.

Use of the **summary-only** keyword creates an aggregate entry (for example, 10.0.0.0/8) but suppresses advertisements of more-specific routes to all neighbors. If you want to suppress only advertisements to certain neighbors, use the **route-policy (BGP)** command in neighbor address family configuration mode with caution. If a more-specific route leaks out, all BGP speakers (the local router) prefer that route over the less-specific aggregate you generate (using longest-match routing).

Use the **route-policy** keyword to specify a routing policy for the aggregate entry. The **route-policy** keyword is used to select which more-specific information to base the aggregate entry on and which more-specific information to suppress. You can also use the keyword to modify the attributes of the aggregate entry.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to create an aggregate address. The path advertised for this route is an autonomous system set consisting of all elements contained in all paths that are being summarized.

RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# aggregate-address 10.0.0.0/8 as-set

Command	Description
network (BGP), on page 190	Specifies the list of networks for the BGP routing process.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor

Command	Description
route-policy (RPL)	Defines a route policy and enters route-policy configuration mode.

aigp

To enable sending and receiving of accumulated interior gateway protocol (AiGP) attribute per eBGP neighbor, use the **aigp**command in global or VRF neighbor address family configuration mode. To disable this functionality, either use the disable keyword or use the no form of this command. aigp [disable] no aigp **Syntax Description** disable Disables sending or receiving AiGP attribute. **Command Default** Send or recive of AiGP attribute is disabled for eBGP neighbors **Command Modes** IPv4 address family configuration IPv6 address family configuration VRF IPv4 address family configuration VRF IPv6 address family configuration VPNv4 address family configuration VPNv6 address family configuration Neighbor address family configuration VRF neighbor address family configuration **Command History** Modification Release Release 5.0.0 This command was introduced. **Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. Task ID Task ID Operation read, write bgp

Examples The following example shows how to enable AiGP send and receive capability under neighbor address family (IPv4 unicast):

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# aigp

Command	Description
aigp send-cost-community	Sends AiGP value in cost community.

aigp send-cost-community

To send Accumulated Interior Gateway Protocol (AiGP) value in cost community, use the **aigp send-cost-community** command in global or VRF neighbor address family configuration mode. To disable sending AiGP value in cost community, either use the **no** form of this command or the **disable** keyword.

aigp send-cost-community {cost-id| disable} poi {igp-cost| pre-bestpath} [transitive]

no aigp send-cost-community

Syntax Description	cost-comm-id	Specifies the Cost community ID. The range is 0 to 255.
	poi	Point of insertion for bestpath calculation.
	igp-cost	Configures that cost community be used after iGP distance to next hop.
	pre-bestpath	Configures cost community as first step in best path calculation.
	transitive	(Optional) Enables transitive cost community
	disable	Disables sending AiGP value in cost community.

Command Default Sending AiGP value in cost community is disabled

Command Modes Neighbor address family configuration VRF neighbor address family configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Cost community point of insertion can be configured either to be pre-bestpath or after igp cost. The **transitive** keyword is not required for iBGP sessions. However, the **transitive** keyword is required for eBGP sessions to convert AiGP metric into cost-community and advertise to the eBGP neighbors.

Task ID	Task ID	Operation
	bgp	read, write
Examples	The following example show address family (IPv4 unicast)	how to enable sending AiGP value in cost community ID 254 under neighbor
	<pre>RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# aigp send-cost-community 254</pre>	
Related Commands	Command	Description
	aigp, on page 30Enables sending and receiving of accumula gateway protocol (AiGP) attribute.	

allocate-label

To allocate Multiprotocol Label Switching (MPLS) labels for specific IPv4 unicast or IPv6 unicast or VPN routing and forwarding (VRF) IPv4 unicast routes so that the BGP router can send labels with BGP routes to a neighboring router configured for labeled-or VPN routing and forwarding (VRF) IPv6 unicast sessions, use the **allocate-label** command in the appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

allocate-label {route-policy route-policy-name| all}
no allocate-label {route-policy route-policy-name| all}

Syntax Description	all	Allocates labels for all prefixes
	route-policy route-policy-name	Uses a route policy to select prefixes for label allocation.
Command Default	No default behavior or values	
Command Modes	IPv4 address family configuration	
	VRF IPv4 address family configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		user group associated with a task group that includes appropriate task venting you from using a command, contact your AAA administrator
	of global routes (as dictated by the rout (ASBRs) that have labeled unicast sessi	a route policy to trigger BGP to allocate labels for all or a filtered set e policy). The command enables autonomous system border routers ions to exchange Multiprotocol Label Switching (MPLS) labels with em (AS) in Layer 3 Virtual Private Network (L3VPN) inter-AS
Note		nctionally equivalent to the allocate-label route-policy

route-policy-name command when the route policy is a pass-all policy.

See *MPLS Configuration Guide for Cisco NCS 6000 Series Routers* for information on using the **allocate-label** command for L3VPN inter-AS deployments and carrier-supporting-carrier IPv4 BGP label distribution.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to enable allocating labels for IPv4 routes:

RP/0/RP0/CPU0:router(config)# router bgp 6
RP/0/RP0/CPU0:router(config-bgp)# address family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# allocate-label route-policy policy_A

allowas-in

		vider edge (PE) autonomous system number (ASN) a specified number of nd in an appropriate configuration mode. To restore the system to its default command.
	allowas-in [as-occurrence-numb	er]
	no allowas-in [as-occurrence-nu	mber]
Syntax Description	as-occurrence-number	(Optional) Number of times a PE ASN is allowed. Range is 1 to 10.
Command Default	No default behavior or values	
Command Modes	Address family group configuration Neighbor address family configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		e in a user group associated with a task group that includes appropriate task is preventing you from using a command, contact your AAA administrator
	Hub and spoke VPN networks require looping back of routing information to the hub PE through the hu customer edge (CE). See <i>MPLS Configuration Guide for Cisco NCS 6000 Series Routers</i> for information hub and spoke VPN networks. This looping back, in addition to the presence of the PE ASN, causes the looped-back information to be dropped by the hub PE. The allowas-in command prevents the looped-back information from being dropped by replacing the neigh autonomous system number (ASN) with the PE ASN in the AS path. This allows the VPN customer to s specified number of occurrences of the PE ASN in the AS path.	
	specified number of occurrences of	
Task ID	Task ID	Operations

Examples The following example shows how to allow five occurrences of the PE ASN:

RP/0/RP0/CPU0:router(config)# router bgp 6
RP/0/RP0/CPU0:router(config-bgp)# af-group group_1 address-family vpnv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# allowas-in 5

as-format

		tter's Autonomous system number (ASN) notation to asdot format, use the as-format nfig mode. To restore the system to its default condition, use the no form of this command.
	as-format asdot no	
Syntax Description	asdot	Specifies the Autonomous system number (ASN) notation to asdot format.
Command Default	The default value, in	the as-format command is not configured, is asplain.
Command Modes	XR Config	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.	
Task ID	Task ID	Operations
	bgp	read, write
Examples	-	ple shows how to configure the ASN notation to the asdot format:

as-override

To configure a provider edge (PE) router to override the autonomous system number (ASN) of a site with the ASN of a provider, use the **as-override** command in VRF neighbor address family configuration mode. To restore the system to its default condition, use the **no** form of this command.

as-override [inheritance-disable]

no as-override [inheritance-disable]

Syntax Description	inheritance-disable	(Optional) Prevents the as-override command from being inherited from a parent group.
Command Default	Automatic override of the AS	N is disabled.
Command Modes	VRF neighbor address family	configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user group assignment for assistance. Use the as-override command	ist be in a user group associated with a task group that includes appropriate task nent is preventing you from using a command, contact your AAA administrator and in conjunction with the site-of-origin (SoO) feature, identifying the site where ating routing loops between routers within a VPN.
Task ID	Task ID	Operations
Evamplas	bgp The following example shows	s how to configure an ASN override:
Examples	RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf RP/0/RP0/CPU0:router(conf	

Command	Description
site-of-origin (BGP), on page 455	Configures the site of origin filtering.

as-path-loopcheck out disable

To disable AS PATH loop checking for outbound updates, use the **as-path-loopcheck out disable** command in an appropriate address family configuration mode. To re-enable the default AS PATH loop checking, use the **no** form of this command.

as-path-loopcheck out disable

no as-path-loopcheck out disable

- Syntax Description This command has no keywords or arguments.
- **Command Default** AS PATH loop checking for outbound updates is enabled if there is only one neighbor and disabled if there are multiple neighbors in the update group.

Command ModesIPv4 address familyIPv6 address familyL2VPN address familyVPNv4 address familyVPNv4 address familyVPNv6 address familyVPNv6 address family

Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Configure the **as-path-loopcheck out disable** command to disable the default behavior of PE router not announcing BGP routes to the CE router if the routes contain an AS number matching the AS number of the receiving CE router.

Task ID	Task ID	Operation
	bgp	read, write

Examples This example shows how to configure **as-path-loopcheck out disable** under IPv6 unicast address family:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family ipv6 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#as-path-loopcheck out disable

attribute-filter group

To configure attribute-filter group command mode, use the attribute-filter group command in an appropriate configuration mode. To disable attribute-filter group command mode, use the no form of this command.

attribute-filter group group-name

no attribute-filter group group-name

Syntax Description	group-name	Specifies the name of the attribute-filter group.
Command Default	Attribute-filter group com	mand mode is disabled.
Command Modes	Router configuration	
	Neighbor configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user group assigned for assistance.	must be in a user group associated with a task group that includes appropriate task gnment is preventing you from using a command, contact your AAA administrator
	filter group for a BGP neig	roup command in neighbor configuration mode to configure a specific attribute ghbor.
Task ID	Task ID	Operation
	bgp	read, write
Examples	This example shows how t	to configure the attribute-filter group command mode:
	RP/0/RP0/CPU0:router#c RP/0/RP0/CPU0:router(c RP/0/RP0/CPU0:router(c RP/0/RP0/CPU0:router(c	onfig)# router bgp 100 onfig-bgp)# attribute-filter group ag_discard_med

This example shows how to configure the attribute filter group for a BGP neighbor:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.0.1.101
RP/0/RP0/CPU0:router(config-bgp-nbr)#remote-as 6461
RP/0/RP0/CPU0:router(config-bgp-nbr)#update in filtering
RP/0/RP0/CPU0:router(config-nbr-upd-filter)#attribute-filter group ag_discard_med

bfd (BGP)

To specify a bidirectional forwarding detection (BFD) **multiplier** and **minimum-interval** arguments per neighbor, use the **bfd** command in neighbor address family independent configuration mode. To return to the system defaults, use the **no** form of this command.

Previous to this enhancement, BFD could be configured only in global scope in BGP. This change makes available two new command-line arguments under neighbor address family independent configuration:

bfd {**multiplier** | **minimum-interval**} *value*

no bfd {multiplier | minimum-interval} value

Syntax Description	multiplier value	Specifies the BFD session's multiplier value for the neighbor.
	minimum-interval value	Specifies the BFD session's minimum-interval value for the neighbor.
Command Default	No default per neighbor parameters	are set.
Command Modes	Neighbor address family independe	nt configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		n a user group associated with a task group that includes appropriate task preventing you from using a command, contact your AAA administrator
		using the bfd minimum-interval command, the new parameter updates command mode in which the minimum interval was changed.
	If the multiplier is changed using the BFD sessions associated with the af	e bfd multiplier command, the new parameter is used to update only the ffected neighbor gets affected.
	configuration, the values for the mu per-neighbor values if they are confi mode. In the event that this has not b	0

BFD value (global)	BFD value (local)	Result
Yes	Yes	BFD value (local)
Yes	No	BFD value (global)
No	Yes	BFD value (local)
No	No	BFD value (default)

This is shown in table below where the BFD value is either multiplier or minimum-interval. Local indicates per NBR value, global is the BGP global value.

Examples

The following example shows how to specify the BFD session's multiplier value for the neighbor:

```
RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config) # router bgp 65000
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)#neighbor 3.3.3.2
RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd minimum-interval 311
RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd multiplier 7
RP/0/RP0/CPU0:router(config-bgp-nbr)# neighbor 5.5.5.2
RP/0/RP0/CPU0:router(config-bgp-nbr)# bfd minimum-interval 318
RP/0/RP0/CPU0:router(config-bgp-nbr) # bfd multiplier 4
RP/0/RP0/CPU0:router(config-bgp-nbr) # vrf one
RP/0/RP0/CPU0:router(config-bgp-vrf)# neighbor 3.12.1.2
RP/0/RP0/CPU0:router(config-bgp-vrf-nbr)# bfd minimum-interval 119
RP/0/RP0/CPU0:router(config-bgp-vrf-nbr)# bfd multiplier 10

bgp as-path-loopcheck

To enable loop checking in the autonomous system path of the prefixes advertised by internal Border Gateway Protocol (iBGP) peers, use the **bgp as-path-loopcheck** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

bgp as-path-loopcheck

no bgp as-path-loopcheck

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** When you do not specify this command, loop checking is performed only for external peers.

Command Modes Router configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to configure an autonomous system path for loop checking iBGP peers:

RP/0/RP0/CPU0:router(config)# router bgp 6
RP/0/RP0/CPU0:router(config-bgp)# bgp as-path-loopcheck

bgp attribute-download

To enable Border Gateway Protocol (BGP) attribute download, use the **bgp attribute-download** command in an appropriate configuration mode. To disable BGP attribute download, use the **no** form of this command.

bgp attribute-download

no bgp attribute-download

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** BGP attribute download is not enabled.

Command Modes IPv4 unicast address family configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When BGP attribute download is enabled using the **bgp attribute-download** command, BGP reinstalls all routes whose attributes are not currently in the RIB. Likewise, if the user disables BGP attribute download using the no form of the command, BGP reinstalls previously installed routes with a null key, and removes the attributes from the RIB.

Use the **bgp attribute-download** command to enable the Netflow BGP data export function. When attribute download is enabled, BGP downloads the attribute information for prefixes (community, extended community, and as-path) to the Routing Information Base (RIB) and Forwarding Information Base (FIB). This enables FIB to associate the prefixes with attributes and send the Netflow statistics along with the associated attributes.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows the BGP routes before and after BGP attribute download is enabled and shows how to enable BGP attribute download on BGP router 50:

RP/0/RP0/CPU0:router# show route bgp

В 100.0.1.0/24 [200/0] via 10.0.101.1, 00:00:37 100.0.2.0/24 [200/0] via 10.0.101.1, 00:00:37 100.0.3.0/24 [200/0] via 10.0.101.1, 00:00:37 100.0.4.0/24 [200/0] via 10.0.101.1, 00:00:37 В В В 100.0.5.0/24 [200/0] via 10.0.101.1, 00:00:37 В RP/0/RP0/CPU0:router(config) # router bgp 50 RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-af)# bgp attribute-download RP/0/RP0/CPU0:router# show route bgp 100.0.1.0/24 [200/0] via 10.0.101.1, 00:00:01 В Attribute ID 0x2 100.0.2.0/24 [200/0] via 10.0.101.1, 00:00:01 B Attribute ID 0x2 В 100.0.3.0/24 [200/0] via 10.0.101.1, 00:00:01 Attribute ID 0x2 100.0.4.0/24 [200/0] via 10.0.101.1, 00:00:01 В Attribute ID 0x2 В 100.0.5.0/24 [200/0] via 10.0.101.1, 00:00:01

bgp auto-policy-soft-reset disable

To disable an automatic soft reset of Border Gateway Protocol (BGP) peers when their configured route policy is modified, use the **bgp auto-policy-soft-reset disable** command in an appropriate configuration mode. To re-enable automatic soft reset of BGP peers, use the **no** form of this command.

bgp auto-policy-soft-reset disable no bgp auto-policy-soft-reset disable

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** Automatic soft reset of peers is enabled.
- Command Modes Router configuration VRF configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

If the inbound policy changes, it is not always possible to perform a soft reset. This is the case if the neighbor does not support route refresh and soft-reconfiguration inbound is not configured for the neighbor. In such instances, a message is logged in the system log indicating that a manual hard reset is needed.

 Task ID
 Operations

 bgp
 read, write

 Examples
 The following example shows how to disable an automatic soft reset of BGP peers when their configured route policy is modified:

RP/0/RP0/CPU0:router(config) # router bgp 6

RP/0/RP0/CPU0:router(config-bgp)# bgp auto-policy-soft-reset disable

bgp bestpath as-path ignore

To ignore the autonomous system path length when calculating preferred paths, use the **bgp bestpath as-path ignore** command in an appropriate configuration mode. To return the software to the default state in which it considers the autonomous system path length when calculating preferred paths, use the **no** form of this command.

bgp bestpath as-path ignore

no bgp bestpath as-path ignore

Syntax Description This command has no keywords or arguments.

Command Default The autonomous system path length is used (not ignored) when a best path is selected.

Command Modes Router configuration VRF configuration

 Command History
 Release
 Modification

 Release 5.0.0
 This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **bgp bestpath as-path ignore** command to ignore the length of autonomous system paths when the software selects a preferred path. When the best path is selected, if this command is specified, all steps are performed as usual except comparison of the autonomous path length between candidate paths.

Task ID	Task ID	Operations
-	bgp	read, write

Examples

The following example shows how to configure the software to ignore the autonomous system length when performing best-path selection:

RP/0/RP0/CPU0:router(config)# router bgp 65000
RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath as-path ignore

Command	Description
bgp bestpath compare-routerid, on page 57	Compares identical routes received from eBGP peers during the best-path selection process and selects the route with the lowest router ID.
bgp bestpath med always, on page 61	Allows the comparison of the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.
bgp bestpath med confed, on page 63	Enables MED comparison among paths learned from confederation peers.
bgp bestpath med missing-as-worst, on page 65	Enables the software to consider a missing MED attribute in a path as having a value of infinity.

bgp bestpath compare-routerid

To compare identical routes received from external BGP (eBGP) peers during the best-path selection process and select the route with the lowest router ID, use the **bgp bestpath compare-routerid** command in an appropriate configuration mode. To disable comparing identical routes received from eBGP peers during best-path selection, use the **no** form of this command.

bgp bestpath compare-routerid

no bgp bestpath compare-routerid

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** The software does not select a new best path if it is the same as the current best path (according to the BGP selection algorithm) except for the router ID.
- **Command Modes** Router configuration VRF configuration

 Command History
 Release
 Modification

 Release 5.0.0
 This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **bgp bestpath compare-routerid** command to affect how the software selects the best path, in the case where there are two paths of equal cost according to the BGP selection algorithm. This command is used to force the software to select the path with the lower router ID as the best path. If this command is not used, the software continues to use whichever path is currently the best path, regardless of which has the lower router ID.

Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to configure the BGP speaker in autonomous system 500 to compare the router IDs of similar paths:

RP/0/RP0/CPU0:router(config) # router bgp 500

RP/0/RP0/CPU0:router(config-bgp) # bgp bestpath compare-routerid

Related Commands

Command	Description
show bgp, on page 258	Displays entries in the BGP routing table.

bgp bestpath cost-community ignore

To configure a router that is running the Border Gateway Protocol (BGP) to not evaluate the cost community attribute during the best-path selection process, use the **bgp bestpath cost-community ignore** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

bgp bestpath cost-community ignore no bgp bestpath cost-community ignore

Syntax Description This command has no keywords or arguments.

Command Default The behavior of this command is enabled by default until the cost community attribute is manually configured.

Command Modes Router configuration VRF configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **bgp bestpath cost-community ignore** command to disable the evaluation of the cost community attribute to help isolate problems and troubleshoot issues that relate to BGP path selection. This command can also be used to delay the activation of cost community attribute evaluation so that cost community filtering can be deployed in a large network at the same time.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to configure a router to not evaluate the cost community attribute during the best-path selection process:

RP/0/RP0/CPU0:router(config) # router bgp 500
RP/0/RP0/CPU0:router(config-bgp) # bgp bestpath cost-community ignore

Command	Description
show bgp, on page 258	Displays entries in the BGP routing table.

bgp bestpath med always

To allow the comparison of the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems, use the **bgp bestpath med always** command in an appropriate configuration mode. To disable considering the MED attribute in comparing paths, use the **no** form of this command.

bgp bestpath med always no bgp bestpath med always

Syntax Description This command has no keywords or arguments.

Command Default The software does not compare MEDs for paths from neighbors in different autonomous systems.

Command Modes Router configuration VRF configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The MED is one of the parameters that is considered by the software when selecting the best path among many alternative paths. The software chooses the path with the lowest MED.

By default, during the best-path selection process, the software makes a MED comparison only among paths from the same autonomous system. This command changes the default behavior of the software by allowing comparison of MEDs among paths regardless of the autonomous system from which the paths are received.

When the **bgp bestpath med always** command is not enabled and distributed BGP is configured, speakers calculate partial best paths only (executes the best-path steps up to the MED comparison) and send them to BGP Routing Information Base (bRIB). bRIB calculates the final best path (executes all the steps in the best-path calculation). When the **bgp bestpath med always** command is enabled and distributed BGP is configured, speakers can compare the MED across all ASs, allowing the speaker to calculate a single best path to send it to bRIB. bRIB is the ultimate process that calculates the final best path, but when the **bgp bestpath med always** command is enabled, the speakers send a single best path instead of potentially sending multiple, partial best paths

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to configure the Border Gateway Protocol (BGP) speaker in autonomous system 100 to compare MEDs among alternative paths, regardless of the autonomous system from which the paths are received:

RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath med always

Command	Description
bgp bestpath med confed, on page 63	Enables MED comparison among paths learned from confederation peers.
bgp bestpath med missing-as-worst, on page 65	Specifies that the software consider a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path.
show bgp, on page 258	Displays entries in the BGP routing table.

bgp bestpath med confed

To enable Multi Exit Discriminator (MED) comparison among paths learned from confederation peers, use the **bgp bestpath med confed** command in an appropriate configuration mode. To disable the software from considering the MED attribute in comparing paths, use the **no** form of this command.

bgp bestpath med confed

no bgp bestpath med confed

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** The software does not compare the MED of paths containing only confederation segments, or paths containing confederation segments followed by an AS_SET, with the MED of any other paths.
- **Command Modes** Router configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, the MED of the following paths is not compared with the MED of any other path:

- · Paths with an empty autonomous system path
- Paths beginning with an AS_SET
- Paths containing only confederation segments
- Paths containing confederation segments followed by an AS_SET

Use the **bgp bestpath med confed** command to affect how the following types of paths are treated in the BGP best-path algorithm:

- Paths containing only confederation segments
- Paths containing confederation segments followed by an AS_SET

The MED for paths that start with an AS_SEQUENCE or that start with confederation segments followed by an AS_SEQUENCE only is compared with the MED of other paths that share the same first autonomous system number in the autonomous system sequence (the neighbor autonomous system number). This behavior is not affected by the **bgp bestpath med confed** command.

As an example, suppose that autonomous systems 65000, 65001, 65002, and 65004 are part of a confederation, but autonomous system 1 is not. Suppose that for a particular route, the following paths exist:

- Path 1: 65000 65004, med = 2, IGP metric = 20
- Path 2: 65001 65004, med = 3, IGP metric = 10
- Path 3: 65002 1, med = 1, IGP metric = 30

If the **bgp bestpath med confed** command is enabled, the software selects path 1 as the best path because it:

- Has a lower MED than path 2
- Has a lower IGP metric than path 3

The MED is not compared with path 3 because it has an external autonomous system number (that is, an AS_SEQUENCE) in the path. If the **bgp bestpath med confed** command is not enabled, then MED is not compared between any of these paths. Consequently, the software selects path 2 as the best path because it has the lowest IGP metric.

Task ID	Task ID	Operations
-	bgp	read, write
-		

Examples The following command shows how to enable Border Gateway Protocol (BGP) software to compare MED values for paths learned from confederation peers:

RP/0/RP0/CPU0:router(config)# router bgp 210
RP/0/RP0/CPU0:router(config-bgp)# bgp bestpath med confed

Related Commands	Command	Description
	bgp bestpath med always, on page 61	Enables MED comparison among paths from neighbors in different autonomous systems.
	bgp bestpath med missing-as-worst, on page 65	Specifies that the software consider a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path.
	show bgp, on page 258	Displays entries in the BGP routing table.

bgp bestpath med missing-as-worst

To have the software consider a missing Multi Exit Discriminator (MED) attribute in a path as having a value of infinity, making the path without a MED value the least desirable path, use the **bgp bestpath med missing-as-worst** command in an appropriate configuration mode. To disable considering the MED attribute in comparing paths, use the **no** form of this command.

bgp bestpath med missing-as-worst

no bgp bestpath med missing-as-worst

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** The software assigns a value of 0 to the missing MED, causing the path with the missing MED attribute to be considered as the best possible MED.
- **Command Modes** Router configuration VRF configuration
- Command History
 Release
 Modification

 Release 5.0.0
 This command was introduced.
- Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to direct the Border Gateway Protocol (BGP) software to consider a missing MED attribute in a path as having a value of infinity, making this path the least desirable path:

RP/0/RP0/CPU0:router(config) # router bgp 210
RP/0/RP0/CPU0:router(config-bgp) # bgp bestpath med missing-as-worst

Command	Description
bgp bestpath med always, on page 61	Enables MED comparison among paths from neighbors in different autonomous systems.
bgp bestpath med confed, on page 63	Enables MED comparison among paths learned from confederation peers.
show bgp, on page 258	Displays entries in the BGP routing table.

bgp client-to-client reflection disable

To disable reflection of routes between route-reflection clients using a Border Gateway Protocol (BGP) route reflector, use the **bgp client-to-client reflection disable** command in address family configuration mode. To re-enable client-to-client reflection, use the **no** form of this command.

bgp client-to-client reflection [cluster-id cluster-id] disable

no bgp client-to-client reflection [cluster-id cluster-id] disable

Syntax Description	cluster-id cluster-id	(Optional) Cluster ID for which intra-cluster route reflection is to be disabled; maximum of 4 bytes. Cluster ID can be entered either as an IP address or value. Range is 1 to 4294967295.
Command Default	Client-to-client reflection	is enabled.
Command Modes	Address family configura	tion
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user group assistance.By default, the clients of a and the routes from a clients	a must be in a user group associated with a task group that includes appropriate task ignment is preventing you from using a command, contact your AAA administrator a route reflector that are part of the same cluster are not required to be fully meshed int are reflected to other clients. However, if the clients are fully meshed, route If the cluster-id is not specified, then this command disables intra-cluster route
Examples	RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(RP/0/RP0/CPU0:router(<pre>neighbors are fully meshed, so client-to-client reflection is disabled: config) # router bgp 65534 config-bgp) # bgp cluster-id 2 config-bgp) # address-family ipv4 unicast config-bgp-af) # bgp client-to-client reflection cluster-id 2 disable config-bgp-af) # exit config-bgp) # neighbor-group rrclients config-bgp-nbrgrp) # remote-as 65534 config-bgp-nbrgrp) # bgp cluster-id 2 config-bgp-nbrgrp) # bgp cluster-id 2 config-bgp-nbrgrp) # address-family ipv4 unicast config-bgp-nbrgrp-af) # route-reflector-client config-bgp-nbrgrp-af) # route-reflector-client</pre>

Examples

The following example shows that autonomous systems 1090 and 1093 belong to a single confederation:

```
RP/0/RP0/CPU0:router(config)# router bgp 1090
RP/0/RP0/CPU0:router(config-bgp)# bgp confederation peers 1093
```

The following example shows that autonomous systems 1095, 1096, 1097, and 1098 belong to a single confederation:

```
RP/0/RP0/CPU0:router(config)# router bgp 1095
RP/0/RP0/CPU0:router(config-bgp)# bgp confederation peers
RP/0/RP0/CPU0:router(config-bgp-confed-peers)# 1096
RP/0/RP0/CPU0:router(config-bgp-confed-peers)# 1097
RP/0/RP0/CPU0:router(config-bgp-confed-peers)# 1098
```

Command	Description
bgp confederation identifier, on page 71	Specifies a BGP confederation identifier.

bgp dampening

To enable Border Gateway Protocol (BGP) route dampening or change various BGP route dampening factors, use the **bgp dampening** command in an appropriate configuration mode. To disable route dampening and reset default values, use the **no** form of this command.

bgp dampening [*half-life* [*reuse suppress max-suppress-time*]| **route-policy** *route-policy-name*] **no bgp dampening** [*half-life* [*reuse suppress max-suppress-time*]| **route-policy** *route-policy-name*]

Syntax Description	half-life	(Optional) Time (in minutes) after which a penalty is decreased. Once the route has been assigned a penalty, the penalty is decreased by half after the half-life period (which is 15 minutes by default). Penalty reduction happens every 5 seconds. Range of the half-life period is from 1 to 45 minutes.
	reuse	(Optional) Value for route reuse if the flapping route penalty decreases and falls below the reuse value. When this happens, the route is unsuppressed. The process of unsuppressing routes occurs at 10-second increments. Range is 1 to 20000.
	suppress	(Optional) Maximum penalty value. Suppress a route when its penalty exceeds the value specified. When this happens, the route is suppressed. Range is 1 to 20000.
	max-suppress-time	(Optional) Maximum time (in minutes) a route can be suppressed. Range is 1 to 255. If the <i>half-life</i> value is allowed to default, the maximum suppress time defaults to 60 minutes.
	route-policy route-policy-name	(Optional) Specifies the route policy to use to set dampening parameters.

Command Default	Route dampening is disabled.	
	half-life : 15 minutes	
	<i>reuse</i> : 750	
	suppress : 2000	
	max-suppress-time : four times half-life value

bgp graceful-restart

To enable graceful restart support, use the **bgp graceful-restart** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

bgp graceful-restart

no bgp graceful-restart

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** Graceful restart support is not enabled.
- **Command Modes** Router configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **bgp graceful-restart** command to enable graceful restart functionality on the router, and also to advertise graceful restart to neighboring routers.

Note

The **bgp graceful-restart** command with no options must be used to enable graceful restart before using the **bgp graceful-restart purge-time**, **bgp graceful-restart restart-time**, **bgp graceful-restart stalepath-time**, or **bgp graceful-restart graceful-rester** commands.

When graceful restart is enabled, the BGP graceful restart capability is negotiated with neighbors in the BGP OPEN message when the session is established. If the neighbor also advertises support for graceful restart, then graceful restart is activated for that neighbor session. If the neighbor does not advertise support for graceful restart, then graceful restart is not activated for that neighbor session even though it is enabled locally.

If you enter the **bgp graceful-restart** command after some BGP sessions are established, you must restart those sessions before graceful restart takes effect. Use the **clear bgp** command to restart sessions.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to enable graceful restart:

RP/0/RP0/CPU0:router(config) #router bgp 3
RP/0/RP0/CPU0:router(config-bgp)#bgp graceful-restart

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. BGP graceful restart must be enabled using the bgp graceful-restart command before setting the stalepath time using the bgp graceful-restart stalepath-time command.	
		exceeded before an End-of-RIB message is received from a neighbor, paths learned urged from the BGP routing table.
Task ID	Task ID	Operations
	bgp	read, write
Examples	The following example	shows how to change the stalepath time to 750 seconds:
		c(config)# router bgp 3 c(config-bgp)# bgp graceful-restart stalepath-time 750

Command	Description
bgp graceful-restart, on page 81	Enables a graceful restart.
show bgp, on page 258	Displays entries in the BGP routing table.
show bgp neighbors, on page 335	Displays information about BGP connections to neighbors.
show bgp process, on page 383	Displays BGP process information.

bgp import-delay

To enable delay for Border Gateway Protocol (BGP) batch import processing, use the **bgp import-delay** command in an appropriate configuration mode. To disable delay in batch import processing, use the no form of this command.

bgp import-delay seconds milliseconds

no bgp import-delay

Syntax Description	seconds	Specifies batch import processing delay in seconds. Range is 0 to 10 seconds.
	milliseconds	Specifies batch import processing delay in milliseconds. Range is 0 to 999 seconds.
Command Default	No delay is configured	d.
Command Modes	Address-family VPN	
	Address-family VPNv	'6 Unicast
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator
Task ID	Task ID	Operation
	bgp	read, write
Examples	This example shows h	now to set delay in batch import processing as two seconds and zero milliseconds:
	RP/0/RP0/CPU0:route	er#configure er(config)#router bgp 100 er(config-bgp)#address-family vpnv4 unicast er(config-bgp-af)#bgp import-delay 2 0

Related Commands	Related	l Commands

Command	Description
bgp label-delay, on page 93	Enables delay for Border Gateway Protocol (BGP) batch label processing

bgp label-delay

To enable delay for Border Gateway Protocol (BGP) batch label processing, use the **bgp import-delay** command in an appropriate configuration mode. To disable delay in batch import processing, use the no form of this command.

bgp label-delay seconds milliseconds

no bgp label-delay

Syntax Description	seconds	Specifies batch label processing delay in seconds. Range is 0 to 10 seconds.	
	milliseconds	Specifies batch label processing delay in milliseconds. Range is 0 to 999 seconds.	
Command Default	No delay is configured		
Command Modes	Address-family IPv4 U	nicast	
	Address-family IPv4 Multicast		
	Address-family IPv6 Unicast		
	Address-family IPv6 Multicast		
	Address-family VPNv4 Unicast		
	Address-family VPNv6 Unicast		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task ssignment is preventing you from using a command, contact your AAA administrator	
Task ID	Task ID	Operation	
	bgp	read, write	

Examples This example shows how to set delay in batch import processing as two seconds and zero milliseconds:

```
RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#bgp label-delay 2 0
```

Command	Description
bgp import-delay, on page 91	Enables delay for Border Gateway Protocol (BGP) batch import
	processing

bgp log neighbor changes disable

To disable logging of Border Gateway Protocol (BGP) neighbor resets, use the **bgp log neighbor changes disable** command in an appropriate configuration mode. To re-enable logging of BGP neighbor resets, use the **no** form of this command.

bgp log neighbor changes disable no bgp log neighbor changes disable

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** BGP neighbor changes are logged.
- Command Modes Router configuration VRF configuration

Command HistoryReleaseModificationRelease 5.0.0This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Logging of BGP neighbor status changes (up or down) and resets is used for troubleshooting network connectivity problems and measuring network stability. Unexpected neighbor resets might indicate high error rates or high packet loss in the network, and should be investigated.

Status change message logging does not substantially affect performance, unlike, for example, enabling per-BGP update debugging. If the UNIX syslog facility is enabled, messages are sent by the software to the UNIX host running the syslog daemon so that the messages can be stored and archived on disk. If the UNIX syslog facility is not enabled, the status change messages are kept in the internal buffer of the router, and are not stored to disk.

The neighbor status change messages are not tracked if the **bgp log neighbor changes disable** command is disabled, except for the last reset reason, which is always available as output of the **show bgp neighbors** command.

Up and down messages for BGP neighbors are logged by the software by default. Use the **bgp log neighbor changes disable** command to stop logging BGP neighbor changes.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to prevent the logging of neighbor changes for BGP:

RP/0/RP0/CPU0:router(config)# router bgp 65530
RP/0/RP0/CPU0:router(config-bgp)# bgp log neighbor changes disable

Command	Description
show bgp neighbors, on page 335	Displays information about the TCP and BGP connections to neighbors.

bgp maximum neighbor

To control the maximum number of neighbors that can be configured on the router, use the **bgp maximum neighbor** command in an appropriate configuration mode. To set the neighbor limit to the default value, use the **no** form of this command.

bgp maximum neighbor *limit*

no maximum neighbor [limit]

Syntax Description	limit	Maximum number of neighbors. Range is 1 to 15000.
Command Default	Default limit is 4000	
Command Modes	Router configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user group a for assistance.Any attempt to configut the limit below the num	you must be in a user group associated with a task group that includes appropriate task ssignment is preventing you from using a command, contact your AAA administrator re the neighbor limit below 1 or above 15000 fails. Similarly, attempting to configure ther of neighbors currently configured fails. For example, if there are 3250 neighbors set the <i>limit</i> below 3250.
Task ID	Task ID	Operations
	bgp	write
Examples	RP/0/RP0/CPU0:route	e shows how to change the default maximum neighbor limit and set it to 1200: r (config) #router bgp 65530 r (config-bgp) # bgp maximum neighbor 1200

bgp redistribute-internal

To allow the redistribution of internal Border Gateway Protocol (iBGP) routes into an Interior Gateway Protocol (IGP), such as Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF), use the **bgp redistribute-internal** command in an appropriate configuration mode. To disable the redistribution of iBGP routes into IGPs, use the **no** form of this command.

bgp redistribute-internal

no bgp redistribute-internal

- **Syntax Description** This command has no keywords or arguments.
- **Command Default** By default, iBGP routes are not redistributed into IGPs.
- **Command Modes** Router configuration VRF configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use of the **bgp redistribute-internal** command requires the **clear route** * command to be issued to reinstall all BGP routes into the IP routing table.

Note

Redistributing iBGP routes into IGPs may cause routing loops to form within an autonomous system. Use this command with caution.

Task ID

 Task ID
 Operations

 bgp
 read, write

Examples

The following example shows how to redistribute iBGP routes into OSPF:

RP/0/RP0/CPU0:router(config) #router bgp 1

```
RP/0/RP0/CPU0:router(config-bgp)# bgp redistribute-internal
RP/0/RP0/CPU0:router(config-bgp)# exit
RP/0/RP0/CPU0:router(config)# router ospf areal
RP/0/RP0/CPU0:router(config-router)# redistribute bgp 1
RP/0/RP0/CPU0:router(config-router)# end
RP/0/RP0/CPU0:router# clear route *
```

Command	Description
clear bgp, on page 116 *	Resets all BGP neighbors.
clear route *	Resets all routes.

bgp router-id

To configure a fixed router ID for a Border Gateway Protocol (BGP)-speaking router, use the **bgp router-id** command in an appropriate configuration mode. To disable a fixed router ID, use the **no** form of this command.

bgp router-id *ip-address*

no bgp router-id [ip-address]

Syntax Description	ip-address	IP Version 4 (IPv4) address to use as the router ID. Normally, this should be an IPv4 address assigned to the router.
Command Default		nfigured in BGP, BGP attempts to use the global router ID if one is configured and e, BGP uses the highest IP address configured on a loopback interface.
Command Modes	Router configuration	1
	VRF configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user grou for assistance. If you do not use the	d, you must be in a user group associated with a task group that includes appropriate task p assignment is preventing you from using a command, contact your AAA administrator e bgp router-id command to configure a router ID, an IP address is not configured on ace, and no global router ID is configured, BGP neighbors remain down.
	For more details on	router IDs, see the Routing Configuration Guide for Cisco NCS 6000 Series Routers
Task ID	Task ID	Operations
	bgp	read, write
Examples	The following exam	ple shows how to configure the local router with the router ID of 192.168.70.24:
		nter(config)# router bgp 100 nter(config-bgp)#bgp router-id 192.168.70.24

Command	Description
show bgp, on page 258	Displays entries in the BGP routing table.

bgp scan-time

To configure scanning intervals of Border Gateway Protocol (BGP)-speaking networking devices, use the **bgp scan-time** command in an appropriate configuration mode. To restore the scanning interval to its default value, use the **no** form of this command.

bgp scan-time seconds

no bgp scan-time seconds

Syntax Description	seconds	Scanning interval (in seconds) of BGP routing information. Range is 5 to 3600 seconds.
Command Default	The default scanning	interval is 60 seconds.
Command Modes	Router configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator
		ne command to change how frequently the software processes scanner tasks, such as nent, dynamic MED changes, and periodic maintenance tasks.
Task ID	Task ID	Operations
	bgp	read, write
Examples	This example shows h	now to set the scanning interval to 20 seconds:
		er(config)# router bgp 64500 er(config-bgp-af)# bgp scan-time 20

Command		Description
show bgp, on pag	e 258	Displays entries in the BGP routing table.

bgp update-delay

To set the maximum initial delay for a Border Gateway Protocol (BGP)-speaking router to send the first updates, use the **bgp update-delay** command in an appropriate configuration mode. To restore the initial delay to its default value, use the **no** form of this command.

bgp update-delay seconds [always]

nobgp update-delay [seconds][always]

Syntax Description	seconds	Delay in seconds for the router to send the first updates. Range is 0 to 3600.		
	always	(Optional) Specifies that the router always wait for the update delay time, even if all neighbors have finished sending their initial updates sooner.		
Command Default	120 seconds			
Command Modes	Router configuration	I Contraction of the second		
Command History	Release	Modification		
	Release 5.0.0	This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.			
	When BGP is started, it waits a specified period of time for its neighbors to establish peering sessions and to complete sending their initial updates. After all neighbors complete their initial updates, or after the update delay timer expires, the best path is calculated for each route, and the software starts sending advertisements out to its peers. This behavior improves convergence time. If the software were to advertise a route as soon as it learned it, it would have to readvertise the route each time it learned a new path that was preferred over all previously learned paths.			
	Use the bgp update-delay command to tune the maximum time the software waits after the first neighbor is established until it starts calculating best paths and sending out advertisements.			
Task ID	Task ID	Operations		
	bgp	read, write		

Examples The following example shows how to set the maximum initial delay to 240 seconds:

RP/0/RP0/CPU0:router(config)#router bgp 64530
RP/0/RP0/CPU0:router(config-bgp)# bgp update-delay 240

capability additional-paths receive

To advertise capability of receiving additional paths to the peer, use the **capability additional-paths receive** command in neighbor or neighbor-group or session-group configuration mode. To disable the capability of receiving additional paths, use the **no** form of this command.

capability additional-paths receive [disable]

no capability additional-paths receive

Syntax Description	disable	Disables advertising capability of receiving additional paths.		
Command Default	Capability is disable	ed.		
Command Modes	Neighbor configurat	tion		
	Neighbor group configuration			
	Session group confi	guration		
Command History	Release	Modification		
	Release 5.0.0	This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator			
	for assistance. Use the capability additional-paths receive command to selectively enable or disable additional paths receive capability negotiation for a particular neighbor or neighbor-group or session-group. Configuring additional-paths receive command in global address-family mode is a pre-requisite for negotiating additional paths receive capability with the peer.			
	If you enter the capability additional-paths receive command after some BGP sessions are established, you must restart those sessions for the new configuration to take effect. Use the clear bgp command to restart sessions.			
Task ID	Task ID	Operation		
	bgp	read, write		

Examples The following example shows how to advertise capability of receiving additional paths:

```
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)#capability additional-paths receive
```

Command	Description
additional-paths receive, on page 11	Configures receive capability of multiple paths for a prefix to the capable peers.
additional-paths send, on page 15	Configures send capability of multiple paths for a prefix to the capable peers.
capability additional-paths send, on page 108	Advertises capability of sending additional paths to the peer.

capability additional-paths send

To advertise capability of sending additional paths to the peer, use the **capability additional-paths send** command in neighbor or neighbor-group or session-group configuration mode. To disable the capability of sending additional paths, use the **no** form of this command.

capability additional paths send [disable]

no capability additional paths send

Syntax Description	disable	Disables advertise additional paths send capability		
Command Default	Capability is disabled.			
Command Modes	Neighbor configuration			
	Neighbor group configuration			
	Session group configura	tion		
Command History	Release	Modification		
	Release 5.0.0	This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.			
	Use the capability additional paths send command to selectively enable or disable additional paths send capability negotiation for a particular neighbor or neighbor-group or session-group. Configuring the additional-paths send command in global address-family mode is a pre-requisite for negotiating additional paths send capability with the peer.			
	You must restart the BGP sessions for the new configuration to take effect. Use the clear bgp command to restart sessions.			
Task ID	Task ID	Operation		
	bgp	read, write		

Examples

The following example shows how to advertise capability of sending additional paths to the peer:

```
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)# capability additional-paths send
```

Command	Description			
additional-paths receive, on page 11	Configures receive capability of multiple paths for a prefix to the capable peers.			
additional-paths send, on page 15	Configures send capability of multiple paths for a prefix to the capable peers.			
capability additional-paths receive, on page 106	Advertises additional paths receive capability.			

capability orf prefix

To advertise prefix list-based Outbound Route Filter (ORF) capability to the Border Gateway Protocol (BGP) peer, use the **capability orf prefix** command in an appropriate configuration mode. To remove the **capability orf prefix** command from the configuration file and restore the system to its default condition in which the software does not advertise the capability, use the **no** form of this command.

capability orf prefix {receive| send| both| none} no capability orf prefix [receive| send| both| none]

yntax Description	receive	Sets the capability to receive the ORF from a specified neighbor.				
	send	Sets the capability to send the ORF to a specified neighbor.				
	both	Sets the capability to receive and send the ORF from or to a specified neighbor.				
	none	Sets the capability to no for ORF receive or send from or to a specified neighbor.				
ommand Default	The routing device d	oes not receive or send route prefix filter lists.				
ommand Modes	IPv4 address family	group configuration				
	IPv6 address family group configuration					
	IPv4 neighbor address family configuration					
	VRF neighbor IPv4 address family configuration					
	IPv4 neighbor group address family configuration					
	IPv6 neighbor group	IPv6 neighbor group address family configuration				
ommand History	Release	Modification				

The advertisement of the prefix list ORF capability by a BGP speaker indicates whether the speaker can send prefix lists to the specified neighbor and whether it accepts prefix lists from the neighbor. The speaker sends a prefix list if it indicated the ability to send them, and if the neighbor indicated it was willing to accept them.

Similarly, the neighbor sends a prefix list to the speaker if it indicated the ability to send them and the speaker indicated the willingness to accept them.

	Note	The capability orf a	nd prefix list filter specif	ied by orf route-policy mu	st be explicitly configured.
		any locally configure	ed outbound filters, to lim routing updates between	it its outbound routing upda	r applies the received prefix list, plus tes to the neighbor. Increased filtering purce requirements for routing update

clear bgp

To reset a group of Border Gateway Protocol (BGP) neighbors, use the **clear bgp** command in XR EXEC mode.

clear bgp [ipv4 {unicast| multicast| labeled-unicast| all| tunnel| mdt}| ipv6 {unicast| multicast| all| labeled-unicast}| all {unicast| multicast| all| labeled-unicast| mdt| tunnel}| vpnv4 unicast| vrf {vrf-name| all} {ipv4 {unicast| labeled-unicast}| ipv6 unicast}| vpnv6 unicast]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.				
	unicast	(Optional) Specifies unicast address prefixes.				
	multicast	(Optional) Specifies multicast address prefixes.				
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.				
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.				
	tunnel	(Optional) Specifies tunnel address prefixes.				
	mdt	(Optional) Specifies IPv4 multicast distribution tree (MDT) address prefixes.				
	іруб	(Optional) Specifies IP Version 6 address prefixes.				
	all	(Optional) For address family, specifies prefixes for all address families.				
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.				
	vrf	(Optional) Specifies VPN routing and forwarding (VRF).				
	vrf-name	Name of a VRF.				
	all	(Optional) For VRF, specifies all VRFs.				
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast and labeled-unicast address families.				
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address prefixes.				
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address prefixes.				

Command Default No default behavior or values

Command Modes XR EXEC

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **clear bgp** command to reset the sessions of the specified group of neighbors (hard reset); it removes the TCP connection to the neighbor, removes all routes received from the neighbor from the BGP table, and then re-establishes the session with the neighbor.

If the **graceful** keyword is specified, the routes from the neighbor are not removed from the BGP table immediately, but are marked as stale. After the session is re-established, any stale route that has not been received again from the neighbor is removed.

Task ID	Task ID	Operations		
	bgp	execute		

Examples

The following example shows how to hard reset neighbor 10.0.0.1:

RP/0/RP0/CPU0:router# clear bgp 10.0.0.1

Command	Description
clear bgp self-originated, on page 132	Clears self-originated routes.
clear bgp soft, on page 136	Soft resets a group of BGP neighbors.
show bgp, on page 258	Displays entries in the BGP routing table.
show bgp neighbors, on page 335	Displays information about the TCP and BGP connections to neighbors.

clear bgp current-mode

To switch from one BGP mode to another, use the clear bgp current-mode command in XR EXEC mode.

clear bgp current-mode

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values

Command Modes XR EXEC

Command HistoryReleaseModificationRelease 5.0.0This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **clear bgp current-mode** command to switch from standalone to distributed mode, or from distributed to standalone mode. The **show bgp process** command indicates the current BGP mode.

Note Sv

Switching from one mode to another causes all BGP sessions to go down.

Command	Description
show bgp process, on page 383	Displays the current BGP process information.

clear bgp dampening

To clear Border Gateway Protocol (BGP) route dampening information and unsuppress the suppressed routes, use the **clear bgp dampening** command in XR EXEC mode.

clear bgp dampening

Syntax Description	ipv4	Specifies IP Version 4 address prefixes.
	unicast	Specifies unicast address prefixes.
	multicast	Specifies multicast address prefixes.
	labeled-unicast	Specifies labeled unicast address prefixes.
	all	For subaddress families, specifies prefixes for all subaddress families.
	ipv6	Specifies IP Version 6 address prefixes.
	all	For address family, specifies prefixes for all address families.
	vpnv4 unicast	Specifies VPNv4 unicast address families.
	vrf	Specifies VPN routing and forwarding (VRF).
	vrf-name	Name of a VRF.
	all	For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	For VRF, specifies IPv4 unicast and labeled-unicast address families.
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	Specifies VPNv6 unicast address families.
	ip-address	(Optional) IP address of the network about which to clear dampening information.
	/mask-length	(Optional) Network mask applied to the IP address.

Command Default If no IP address is specified, dampening information for all routes is cleared.

Command Modes XR EXEC

clear bgp flap-statistics

To clear Border Gateway Protocol (BGP) flap counts for a specified group of routes, use the **clear bgp flap-statistics** command in XR EXEC mode.

clear bgp flap-statistics

Syntax Description	ipv4	Specifies IP Version 4 address prefixes.
	unicast	Specifies unicast address prefixes.
	multicast	Specifies multicast address prefixes.
	labeled-unicast	Specifies labeled unicast address prefixes.
	all	For subaddress families, specifies prefixes for all subaddress families.
	ipv6	Specifies IP Version 6 address prefixes.
	all	For address family, specifies prefixes for all address families.
	vpnv4 unicast	Specifies VPNv4 unicast address families.
	vrf	Specifies VPN routing and forwarding (VRF).
	vrf-name	Name of a VRF.
	all	For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	Specifies VPNv6 unicast address families.
	regexp regexp	(Optional) Clears flap statistics for routes whose AS paths match the regular expression.
	route-policy route-policy-name	(Optional) Clears flap statistics for the specific route policy.
	network	(Optional) Network for which flap counts are to be cleared.
	/mask-length	(Optional) Network mask of the network for which flap counts are to be cleared.
	ip-address	(Optional) Neighbor address. Clears only flap statistics for routes received from this neighbor.

	all	For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	Specifies VPNv6 unicast address families.
Command Default	No default behavior or values	
Command Modes	XR EXEC	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Self-originated routes are routes locally originated by the **network** command, **redistribute** command, or **aggregate-address** command.

Task ID	Task ID	Operations
	bgp	execute

Examples The following example shows how to clear self-originated IPv4 routes:

RP/0/RP0/CPU0:router# clear bgp ipv4 unicast self-originated

Command	Description
aggregate-address, on page 27	Creates an aggregate entry in a BGP routing table.
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
redistribute (BGP), on page 222	Redistributes routes from another routing protocol into BGP.

clear bgp shutdown

To clear all Border Gateway Protocol (BGP) neighbors that shut down due to low memory, use the **clear bgp shutdown** command in XR EXEC mode.

 $clear bgp \{ipv4\{unicast \mid multicast \mid labeled-unicast \mid all\} \mid ipv6 \{unicast \mid multicast \mid labeled-unicast \mid all\} \mid ipv6 \{unicast \mid multicast \mid labeled-unicast \mid all\} \mid vpnv4 unicast \mid vrf \{vrf-name \mid all\} \mid vpnv6 unicast\} shutdown$

Syntax Description	ipv4	Specifies IP Version 4 address prefixes.
	unicast	Specifies unicast address prefixes.
	multicast	Specifies multicast address prefixes.
	labeled-unicast	Specifies labeled unicast address prefixes.
	all	For subaddress families, specifies prefixes for all subaddress families.
	ipv6	Specifies IP Version 6 address prefixes.
	all	For address family, specifies prefixes for all address families.
	vpnv4 unicast	Specifies VPNv4 unicast address families.
	vrf	Specifies VPN routing and forwarding (VRF).
	vrf-name	Name of a VRF.
	all	For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	Specifies VPNv6 unicast address families.

default-information originate (BGP)

To allow origination of a default route to be redistributed into the Border Gateway Protocol (BGP) from another protocol, use the **default-information originate** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

default-information originate

no default-information originate

Syntax Description This command has no arguments or keywords.

Command Default BGP does not permit redistribution of a default route into BGP.

Command Modes Router configuration VRF configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **redistribute** command to redistribute routes from another protocol into BGP. By default, if these routes include the default route (0.0.0.0/0 for IPv4 or ::/0 for IPv6), the default route is ignored. Use the **default-information originate** command to change this behavior so that the default route is not ignored and is redistributed into BGP along with the other routes for the protocol being redistributed.

Task ID Operations bgp read, write

Examples

The following example shows how to configure BGP to redistribute the default route into BGP:

RP/0/RP0/CPU0:router(config)#router bgp 164
RP/0/RP0/CPU0:router(config-bgp)# default-information originate

Command	Description	
redistribute (BGP), on page 222	Redistributes routes from another protocol into BGP.	

default-metric (BGP)

To set default metric values for the Border Gateway Protocol (BGP), use the **default-metric** command in an appropriate configuration mode. To disable metric values, use the **no** form of this command.

default-metric value

no default-metric [value]

Syntax Description	value	Default metric value appropriate for the specified routing protocol. Range is 1 to 4294967295.	
Command Default	A metric is not set.		
Command Modes	Router configuration	1	
	VRF configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. Use the default-metric command to set the Multi Exit Discriminator (MED) to advertise to peers for routes that do not already have a metric set (routes that were received with no MED attribute).		
Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The following example shows how to set the BGP default metric: RP/0/RP0/CPU0:router(config) # router bgp 109 RP/0/RP0/CPU0:router(config-bgp) # default-metric 10		

default-originate

To cause a Border Gateway Protocol (BGP) speaker (the local router) to send the default route 0.0.0.0/0 to a neighbor for use as a default route, use the **default-originate** command in an appropriate configuration mode. To disable this function, use the **no** form of this command.

default-originate [inheritance-disable| route-policy route-policy-name]

no default-originate [inheritance-disable| route-policy route-policy-name]

Syntax Description	inheritance-disable	(Optional) Prevents the default-originate command characteristics from being inherited from a parent group.			
	route-policy route-policy-name	(Optional) Specifies the name of a route policy. The route policy allows route 0.0.0.0 to be injected conditionally. IPv6 address family is supported.			
Command Default	The default route is not advertised to BGP neighbors.				
Command Modes	IPv4 neighbor address family configuration				
	IPv6 neighbor address family configuration				
	IPv4 neighbor group address family configuration				
	IPv6 neighbor group address family configuration				
	IPv4 address family group configuration				
	IPv6 address family group configuration				
	VRF IPv4 neighbor address family configuration				
	VRF IPv6 neighbor address family	y configuration			
Command History	Release	Modification			
	Release 5.0.0	This command was introduced.			
Usage Guidelines		in a user group associated with a task group that includes appropriate task			
	Release 5.0.0 To use this command, you must be	This command was introduced.			

for assistance. The **default-originate** command does not require the presence of the default route (0.0.0.0/0 for IPv4 or ::/0

for IPv6) in the local router. When the **default-originate** command is used with a route policy, the default route is advertised if any route in the BGP table matches the policy.

Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The following example sho	ows how to unconditionally advertise the route 0.0.0.0/0 to the neighbor 172.20.2.3:	
Examples	<pre>RP/0/RP0/CPU0:router(config)# router bgp 109 RP/0/RP0/CPU0:router(config-bgp)#address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.2.3 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 200 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr)# default-originate</pre>		
	• •	ows how to advertise the route $0.0.0.0/0$ to the neighbor 172.20.2.3 only if a route t matches the route policy called default-default-policy:	
	RP/0/RP0/CPU0:router(c RP/0/RP0/CPU0:router(c	onfig)# router bgp 109 onfig-bgp)# neighbor 172.20.2.3 onfig-bgp-nbr)# remote-as 200 onfig-bgp-nbr)# address-family ipv4 unicast nfig-bgp-nbr-af)# default-originate route-policy default-default-policy	

Related Commands	Command	Description
	default-information originate (BGP), on page 141	Allows the default route to be redistributed into BGP from another routing protocol.
	af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
	neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.

description (BGP)

To annotate a neighbor, neighbor group, VPN routing and forwarding (VRF) neighbor, or session group, use the **description** command in an appropriate configuration mode. To remove the annotation, use the **no** form of this command.

description text **no description** [*text*] **Syntax Description** Meaningful description or comment. Maximum of 80 characters. text **Command Default** No comment or description exists. **Command Modes** Neighbor group configuration Neighbor configuration Session group configuration VRF neighbor configuration **Command History** Modification Release Release 5.0.0 This command was introduced. **Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. Use the **description** command to provide a description of a neighbor, neighbor group, VRF neighbor, or session group. The description is used to save user comments and does not affect software function. Task ID Task ID Operations bgp read, write Examples The following example shows how to configure the description "Our best customer" on the neighbor 192.168.13.4: RP/0/RP0/CPU0:router# configure

RP/0/RP0/CPU0:router(config) #router bgp 65000
RP/0/RP0/CPU0:router(config-bgp) #neighbor 192.168.13.4
RP/0/RP0/CPU0:router(config-bgp-nbr)#description Our best customer

distance bgp

To allow the use of external, internal, and local administrative distances that could be used to prefer one class of routes over another, use the **distance bgp** command in an appropriate configuration mode. To disable the use of administrative distances, use the **nono** form of this command.

distance bgp external-distance internal-distance local-distance

no distance bgp [*external-distance internal-distance*]

Syntax Descriptionexternal-distanceAdministrative distance for Border Gateway Protocol (BGP) external routes. External
routes are routes for which the best path is learned from a neighbor external to the
autonomous system. Range is 1 to 255. Routes with a distance of 255 are not installed
in the routing table.internal-distanceAdministrative distance for BGP internal routes. Internal routes are those routes that
are learned from another BGP entity within the same autonomous system. Range is 1
to 255. Routes with a distance of 255 are not installed.local-distanceAdministrative distance for BGP local routes. The local-distance argument applies
to locally generated aggregate routes (such as the routes generated by the
aggregate-address command) and backdoor routes installed in the routing table.

Command Default external-distance : 20 internal-distance : 200 local-distance : 200

Command ModesIPv4 address family configurationIPv6 address family configurationVRF IPv4 address family configurationVRF IPv6 address family configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **distance bgp** command if another protocol is known to be able to provide a better route to a node than was actually learned using external BGP, or if some internal routes should be preferred by BGP.

Note

Changing the administrative distance of BGP internal routes is considered risky and is not recommended. One problem that can arise is the accumulation of routing table inconsistencies, which can interfere with routing.

An administrative distance is a rating of the trustworthiness of a routing information source. Numerically, an administrative distance is an integer from 1 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored.

```
Task ID
```

Task IDOperationsbgpread, write

Examples

The following example shows that iBGP routes are preferable to locally generated routes, so the administrative distance values are set accordingly:

```
RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)#distance bgp 20 20 200
```

Command	Description
distance (IS-IS)	Defines the administrative distance assigned to routes discovered by the IS-IS protocol.
distance (OSPF)	Defines OSPF route administrative distances based on route type.

dscp (BGP)

To set the differentiated services code point (DSCP) value, use the **dscp** command in the appropriate configuration mode. To remove the **dscp** command from the configuration file and restore the system to its default interval values, use the no form of this command.

dscp value

no dscp [value]

Syntax Description		Value of the DSCP. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: default, ef, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cs1, cs2, cs3, cs4, cs5, cs6, or cs7.
Command Default	No default behavi	or or values
Command Modes	Neighbor configu	ration
	Neighbor session	group configuration
	Neighbor group co	onfiguration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	To use this comma	and, you must be in a user group associated with a task group that includes appropriate task

Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the dscp command to change the minimum and maximum packet thresholds for the DSCP value.

Table 2: dscp Default Settings, on page 150 lists the DSCP default settings used by the **dscp** command. The DSCP value, corresponding minimum threshold, maximum threshold, and mark probability are listed. The last row of the table (the row labeled "default") shows the default settings used for any DSCP value not specifically shown in the table.

Table .	2: dscp	Default	Settings

session-group, on page 254

enforce-first-as

To enable the software to enforce the first autonomous system in the AS path of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, use the **enforce-first-as** command in an appropriate configuration mode. To disable enforcing the first autonomous system in the AS path of a route received from an eBGP peer to be the same as the remote autonomous system, use the **no** form of this command.

enforce-first-as

no enforce-first-as

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** By default, the software requires the first autonomous system (in the AS path) of a route received from an eBGP peer to be the same as the remote autonomous system configured.
- Command Modes Neighbor configuration Neighbor group configuration Session group configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

By default, the software ignores any update received from an eBGP neighbor that does not have the autonomous system configured for that neighbor at the beginning of the AS path. When configured, the command applies to all eBGP peers under the neighbor, neighbor group or session group.

At any given time, either the **enforce-first-as** command or the enforce-first-as-disable, on page 157 command can be configured under a given neighbor, neighbor group or session group. Configuring one command overwrites the other command.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows a configuration in which incoming updates from eBGP neighbors are checked to ensure the first AS number in the AS path is the same as the configured AS number for the neighbor:

RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)# enforce-first-as

Related Commands

Command	Description
bgp enforce-first-as disable, on page 78	Disables the software to enforce the first autonomous system in the AS path of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, in router configuration mode and VRF configuration mode.
enforce-first-as-disable, on page 157	Disables the software to enforce the first autonomous system in the AS path of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, in neighbor configuration mode, neighbor group configuration mode, and session group configuration mode.

156

enforce-first-as-disable

To disable the software to enforce the first autonomous system in the AS path of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, use the **enforce-first-as-disable** command in an appropriate configuration mode. To re-enable enforcing first autonomous system in the AS path of a route received from an eBGP peer to be the same as the remote autonomous system, use the **no** form of this command.

no enforce-first-as-disable Syntax Description This command has no arguments or keywords. **Command Default** By default, the software requires the first autonomous system (in the AS path) of a route received from an eBGP peer to be the same as the remote autonomous system configured. Command Modes Neighbor configuration Neighbor group configuration Session group configuration **Command History** Release Modification Release 5.0.0 This command was introduced. **Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. By default, the software ignores any update received from an eBGP neighbor that does not have the autonomous system configured for that neighbor at the beginning of the AS path. When configured, the command applies to all eBGP peers under the neighbor, neighbor-group or session-group. At any given time, either the enforce-first-as-disable command or the enforce-first-as, on page 155 command can be configured under a given neighbor, neighbor group or session group. Configuring one command overwrites the other command. Task ID Task ID Operations read, write bgp

Examples

The following example shows a configuration in which incoming updates from eBGP neighbors are not checked to ensure the first AS number in the AS path is the same as the configured AS number for the neighbor:

```
RP/0/RP0/CPU0:router(config)# router bgp 100
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4
RP/0/RP0/CPU0:router(config-bgp-nbr)# enforce-first-as-disable
```

Command	Description
bgp enforce-first-as disable, on page 78	Disables the software to enforce the first autonomous system in the AS path of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, in router configuration mode and VRF configuration mode.
enforce-first-as, on page 155	Enables the software to enforce the first autonomous system in the AS path of a route received from an external Border Gateway Protocol (eBGP) peer to be the same as the configured remote autonomous system, under neighbor configuration mode, neighbor group configuration mode, and session group configuration mode.

export route-policy

To configure an export route policy, use the **export route-policy** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

export route-policy policy-name

no export route-policy [policy-name]

Syntax Description	policy-name	Name of the configured route policy.
Command Default	No default behavior or value	ues
Command Modes	Global VRF IPv4 address	
	Global VRF IPv6 address	family configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Task ID	for assistance. Use the export route-poli specified route-targets.	cy command to define the conditions that allow specified routes to be tagged with
	Task ID	Operations read, write
	bgp ip-services	read, write
Examples	RP/0/RP0/CPU0:router(co	ows how to configure an export route policy: onfig) # vrf vrf-1 onfig-vrf) # address-family ipv4 unicast

Command	Description
import route-policy, on page 164	Specifies a route policy to import routes into the VRF instance.

export route-target

To configure a VPN routing and forwarding (VRF) export route-target extended community, use the **export** route-target command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

export route-target [as-number:nn | ip-address:nn]

no export route-target [as-number:nn | ip-address:nn]

Syntax Description	as-number:nn	(Optional) <i>as-number</i> —Autonomous system (AS) number of the route-target extended community.	
		• as-number	
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.	
		 Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295. 	
		 Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535. 	
		• <i>nn</i> —32-bit number	
	ip-address:nn	(Optional) IP address of the route-target extended community.	
		• <i>ip-address</i> —32-bit IP address	
		• <i>nn</i> —16-bit number	
Command Default	No default behavio	or or values	
Command Modes	Global VRF IPv4 a	address family configuration	
	Global VRF IPv6 address family configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		nd, you must be in a user group associated with a task group that includes appropriate task up assignment is preventing you from using a command, contact your AAA administrator	

Export route-target extended communities are associated with prefixes when advertised to remote provider edge (PE) routers. The remote PE routers import the route-target extended communities into a VRF instance that has the import route-targets that match the exported route-target extended communities.

To specify multiple route targets, enter export route target configuration mode then enter one route target for each command line.

Task ID

Task IDOperationsbgpread, writeip-servicesread, write

Examples

The following example shows how to specify an export route-target:

RP/0/RP0/CPU0:router(config) # vrf vrf-1
RP/0/RP0/CPU0:router(config-vrf)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-vrf-af)# export route-target 500:1

Command	Description
import route-target, on page 166	Specifies the import route-target.

ibgp policy out enforce-modifications

To allow an outbound route policy for an internal BGP (iBGP) peer to modify all BGP route attributes, only when an iBGP route is sent to another iBGP peer (only on route-reflectors), use the **ibgp policy out enforce-modifications** command in router configuration mode. To disable this feature, use the **no** form of this command.

ibgp policy out enforce-modifications no ibgp policy out enforce-modifications

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** ibgp policy out enforce-modifications is disabled.
- **Command Modes** Router configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ibgp policy out enforce-modifications** command to set and modify BGP route attributes for updates to iBGP peers.

If the **ibgp policy out enforce-modifications command** is configured under router BGP configuration, then all the changes made by the outbound policy for an iBGP peer will be present in an update message sent to the peer.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to set the ibgp policy out enforce-modifications:

RP/0/RP0/CPU0:router# configure
RP/0/RP0/CPU0:router(config)# router bgp 6500
RP/0/RP0/CPU0:router(config-bgp)# ibgp policy out enforce-modifications

import route-policy

To configure an import route policy, use the **import route-policy** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

import route-policy policy-name

no import route-policy [policy-name]

Syntax Description	policy-name	Name of the configured route policy.	
Command Default	No default behavior or val	ues	
Command Modes	Global VRF IPv4 address family configuration		
Command History	Global VRF IPv6 address		
Commanu History	Release	Modification	
Usage Guidelines	IDs. If the user group assig for assistance. Use the import route-po	must be in a user group associated with a task group that includes appropriate task gnment is preventing you from using a command, contact your AAA administrator licy command to define the conditions that allow specified routes to be imported forwarding (VRF) instance if the routes are tagged with specified route-targets.

Examples	RP/0/RP0/CPU0:router(c RP/0/RP0/CPU0:router(c	The following example shows how to allow only policy-B to be imported to VRF: P/0/RP0/CPU0:router(config) # vrf vrf-1 P/0/RP0/CPU0:router(config-vrf) # address-family ipv4 unicast P/0/RP0/CPU0:router(config-vrf-af) # import route-policy policy-B	

Command	Description
export route-policy, on page 159	Specifies a route policy to export routes from the VRF instance.

import route-target

To configure a VPN routing and forwarding (VRF) import route-target extended community, use the **import route-target** command in an appropriate configuration mode. To restore the system to its default condition, use the **no** form of this command.

import route-target [as-number:nn | ip-address:nn]

noimport route-target [as-number:nn | ip-address:nn]

Syntax Description	as-number:nn	(Optional) Autonomous system (AS) number of the route-target extended community.
		• as-number
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
		 Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
		• <i>nn</i> —32-bit number
	ip-address:nn	(Optional) IP address of the route-target extended community.
		• <i>ip-address</i> —32-bit IP address
		• <i>nn</i> —16-bit number
Command Default	No default behavio	or or values
Command Modes	Global VRF IPv4 a	address family configuration
	Global VRF IPv6 a	address family configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		nd, you must be in a user group associated with a task group that includes appropriate task up assignment is preventing you from using a command, contact your AAA administrator

Use the **import route-target** command to specify that prefixes associated with the configured import route-target extended communities are imported into the VRF instance.

To specify multiple route targets, enter import route target configuration mode, then enter one route target for each command line.

Task ID

Task ID	Operations	
bgp	read, write	
ip-services	read, write	

Examples

The following example shows how to specify an import route-target:

```
RP/0/RP0/CPU0:router(config) #vrf vrf-1
RP/0/RP0/CPU0:router(config-vrf)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-vrf-af)# import route-target 500:99
```

Related Commands	Command	Description	
	export route-target, on page 161	Specifies the export route-target.	

ignore-connected-check

To enable the software to bypass the directly connected next hop check for single-hop eBGP peering, use the **ignore-connected-check** command in an appropriate configuration mode. To re-enable the directly connected next hop check, use the **no** form of this command.

ignore-connected-check [inheritance-disable]

no ignore-connected-check

Syntax Description	inheritance-disable	Prevents the ignore-connected-check command from being inherited from the parent.		
Command Default	Ability to bypass the direct	ly connected next hop check is disabled.		
Command Modes	Neighbor configuration Neighbor group configuration Session group configuration			
Command History	Release	Modification		
	Release 5.0.0	This command was introduced.		
Usage Guidelines		must be in a user group associated with a task group that includes appropriate task nment is preventing you from using a command, contact your AAA administrator		
Task ID	Task ID	Operations		
	bgp	read, write		
Examples	The following example sho	ows how to enable ignore-connected check configuration for neighbor 10.2.3.4:		
	RP/0/RP0/CPU0:router(config)# router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.2.3.4 RP/0/RP0/CPU0:router(config-bgp-nbr)# ignore-connected-check			

keychain

	neighbors, use the	n-based authentication on a TCP connection between two Border Gateway Protocol (BGP) keychain command in an appropriate configuration mode. To disable key chain the no form of this command.
	keychain name	
	no keychain [nar	ne]
Syntax Description	name	Key chain name configured using the keychain command. The name must be a maximum of 32 alphanumeric characters.
Command Default		nd is not specified in the appropriate configuration mode, key chain authentication is not connection between two BGP neighbors.
Command Modes	Neighbor configu	ration
	Neighbor group c	onfiguration
	Session group con	figuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user gr for assistance. Specify a key cha	and, you must be in a user group associated with a task group that includes appropriate task oup assignment is preventing you from using a command, contact your AAA administrator n to enable key chain authentication between two BGP peers. Use the keychain command ess key rollover for authentication.
	If this command i	s configured for a neighbor group or a session group, a neighbor using the group inherits Values of commands configured specifically for a neighbor override inherited values.
Note	BGP only suppor	ts HMAC-MD5 and HMAC-SHA1-12 cryptographic algorithms.
Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to configure neighbor 172.20.1.1 to use the key chain authentication configured in the keychain_A key chain:

RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# keychain keychain_A

Command	Description
keychain-disable	Overrides any inherited keychain configuration from a neighbor group or session group for BGP neighbors.

keychain inheritance-disable

To override any inherited key chain configuration from a neighbor group or session group for Border Gateway Protocol (BGP) neighbors, use the **keychain inheritance-disable** command in an appropriate configuration mode. To disable overriding any inherited key chain command, use the **no** form of this command.

keychain inheritance-disable

no keychain inheritance-disable

Syntax Description This command has no arguments or keywords.

Command Default Configured key chains for neighbor and session groups are inherited.

Command Modes Neighbor configuration Neighbor group configuration Session group configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you specify a key chain on a neighbor group or session group, all users of the group inherit the key chain. Specifying a different **keychain** command specifically on a neighbor that uses the group overrides the inherited value. Specifying **keychain inheritance-disable** on a neighbor that uses the group disables key chain authentication for the neighbor.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to disable key chain authentication for neighbor 172.20.1.1, preventing it from inheriting the key chain keychain_A from session group group1:

RP/0/RP0/CPU0:router(config) #router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# session-group group1
RP/0/RP0/CPU0:router(config-bgp-sngrp)# keychain keychain_A

RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr)# keychain inheritance-disable

Command	Description
keychain, on page 169	Enables key chain authentication on a TCP connection between two BGP neighbors.

label-allocation-mode

To set the MPLS/VPN label allocation mode, use the **label-allocation-mode** command in VRF configuration mode. To remove the **label-allocation-mode** command from the configuration file and restore the system to its default condition, use the **no** form of this command.

label-allocation-mode [per-ce | per-vrf]

no label-allocation-mode

Syntax Description	per-ce	Specifies that the same label is used for all the routes advertised from a unique customer edge (CE) peer or router.	
	per-vrf	Specifies that the same label is used for all the routes advertised from a unique VRF.	
Command Default	Per-prefix is the de	fault label allocation mode.	
Command Modes	VRF configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		nd, you must be in a user group associated with a task group that includes appropriate task up assignment is preventing you from using a command, contact your AAA administrator	
	Each prefix that belongs to a VRF instance is advertised with a single label, causing an additional lookup to be performed in the VRF forwarding table to determine the customer edge (CE) next hop for the packet. Use the label-allocation-mode command with the per-ce keyword to avoid the additional lookup on the PE router and conserve label space. This mode allows the PE router to allocate one label for every immediate next hop. The label is directly mapped to the next hop so there is no VRF route lookup performed during data forwarding. However, the number of labels allocated is one for each CE rather than one for each prefix.		
Task ID	Task ID	Operations	
	bgp	read, write	

Examples The following example shows how to set the label allocation mode to customer edge:

RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# vrf vrf-1
RP/0/RP0/CPU0:router(config-bgp-vrf)# label-allocation-mode per-ce

local-as

To allow customization of the autonomous system number for external Border Gateway Protocol (eBGP) neighbor peerings, use the **local-as** command in an appropriate configuration mode. To disable customization of local autonomous system values for eBGP neighbor peerings, use the **no** form of this command.

local-as {*as-number* [no-prepend [replace-as [dual-as]]]| inheritance-disable} no local-as [*as-number* [no-prepend [replace-as [dual-as]]]| inheritance-disable]

Syntax Description	as-number	Valid autonomous system number.
		Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
		Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
		Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
		Cannot be the autonomous system number to which the neighbor belongs.
	no-prepend	(Optional) Specifies that local autonomous system values are not prepended to announcements from the neighbor.
	replace-as	(Optional) Specifies that prepend only local autonomous system values to announcements to the neighbor.
	dual-as	(Optional) Dual-AS mode.
	inheritance-disable	Prevents local AS from being inherited from the parent.
Command Default	The BGP autonomous sy	
		vstem number specified in the router bgp command is used, except when The confederation autonomous system is used for external neighbors in an autonomous of the confederation.
Command Modes	confederations are in use.	The confederation autonomous system is used for external neighbors in an autonomous
Command Modes	confederations are in use. system that is not part of	The confederation autonomous system is used for external neighbors in an autonomous the confederation.
Command Modes	confederations are in use. system that is not part of Neighbor configuration	The confederation autonomous system is used for external neighbors in an autonomous 'the confederation.
Command Modes	confederations are in use. system that is not part of Neighbor configuration VRF neighbor configura	The confederation autonomous system is used for external neighbors in an autonomous the confederation.
Command Modes	confederations are in use. system that is not part of Neighbor configuration VRF neighbor configura Neighbor group configura	The confederation autonomous system is used for external neighbors in an autonomous 'the confederation.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can specify the autonomous system number the local BGP uses to peer with each neighbor. The autonomous system number specified with this command cannot be the local BGP autonomous system number (specified with the **router bgp** command) or the autonomous system number of the neighbor (specified with the **remote-as** command). This command cannot be specified for internal neighbors or for external neighbors in an autonomous system that is part of a confederation.

If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID	Task ID	Operations	
	bgp	read, write	

Examples The following example shows BGP using autonomous system 30 for the purpose of peering with neighbor 172.20.1.1:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 300
RP/0/RP0/CPU0:router(config-bgp-nbr)# local-as 30
```

Command	Description
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
session-group, on page 254	Creates a session group and enters session group configuration mode.

maximum-paths (BGP)

To control the maximum number of parallel routes that Border Gateway Protocol (BGP) installs in the routing table, use the **maximum-paths** command in an appropriate configuration mode. To set the maximum number of parallel routes the software installs to the default value, use the **no** form of this command.

maximum-paths {ebgp| ibgp| eibgp} maximum [unequal-cost]

no maximum-paths {ebgp| ibgp| eibgp} [maximum] [unequal-cost]

Syntax Description	ebgp	Specifies external BGP multipath peers.
	ibgp	Specifies internal BGP multipath peers.
	eibgp	Specifies internal and external BGP multipath peers. eiBGP allows simultaneous use of internal and external paths.
	maximum	Maximum number of parallel routes that BGP installs in the routing table. Range is 2 to 8
	unequal-cost	(Optional) Allows iBGP multipaths to have different BGP next-hop Interior Gateway Protocol (IGP) metrics. This option is available when the ibgp keyword is used.
Command Default	One path is installed	in the routing table.
Command Default Command Modes	-	
	IPv4 address family c	configuration
	-	configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **maximum-paths** command to allow the BGP protocol to install multiple paths into the routing table for each prefix. Multiple paths are installed for external peers that are from the same autonomous system and

are equal cost (according to the BGP best-path algorithm). Similarly, multiple paths are installed for internal peers that are equal cost based on the BGP best-path algorithm. The IGP metric to the BGP next hop is the same as the best-path IGP metric unless the router is configured for unequal cost iBGP multipath or eiBGP multipath. See *Implementing BGP* in the *Routing Configuration Guide for Cisco NCS 6000 Series Routers* for information on the BGP best-path algorithm.

Note

The **maximum-paths** command with the **eibgp** keyword cannot be configured if the **ibgp** or **ebgp** keywords have been configured, because the **eibgp** keyword is a superset of the **ibgp** or **ebgp** keywords.

Task ID	
---------	--

Examples

The following example shows how to allow a maximum of four paths to a destination installed into the IPv4 unicast routing table:

RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# maximum-paths ebgp 4

maximum-prefix (BGP)

To control how many prefixes can be received from a neighbor, use the **maximum-prefix** command in an appropriate configuration mode. To set the prefix limits to the default values, use the **no** form of this command.

maximum-prefix maximum [threshold] [warning-only] [restart time-interval]

no maximum-prefix maximum [threshold] [warning-only] [restart time-interval]

Syntax Description	maximum	Maximum number of prefixes allowed from this neighbor. Range is 1 to 4294967295. Note When using additional-paths feature, each path with a unique path ID received from a peer is counted separately for the purpose of maximum-prefix functionality. Hence, the <i>maximum</i> value should be configured appropriately when the peer is capable of sending additional-paths.
threshold warning-only restart time-inter	threshold	(Optional) Integer specifying at what percentage of the <i>maximum</i> argument value the software starts to generate a warning message. Range is 1 to 100.
	warning-only	(Optional) Instructs the software to generate a log message only when the <i>maximum</i> argument value is exceeded, and not terminate the peering.
	restart time-interval	(Optional) Sets the time interval (in minutes) after which peering session should be reestablished.
		Configure restart time interval in minutes. Range is 1 to 65535.

Command Default When this command is not specified, the following defaults apply:

- IPv4 Unicast: 1048576
- IPv4 Multicast: 131072
- IPv4 Labeled-unicast: 131072
- VPNv4 Unicast: 2097152
- IPv4 MDT: 131072
- IPv4 Tunnel: 1048576
- IPv6 Unicast: 524288
- IPv6 Multicast: 131072
- IPv6 Labeled-unicast: 131072
- VPNv6 Unicast: 1048576
- L2VPN EVPN: 2097152

The default threshold when a warning message is generated is 75 percent.

Command Modes

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **maximum-prefix** command to configure a maximum number of prefixes that a BGP router is allowed to receive from a neighbor. It adds another mechanism (besides routing policy) to control prefixes received from a peer.

When the number of received prefixes exceeds the maximum number configured, the software terminates the peering, by default, after sending a cease notification to the neighbor. However, if the **warning-only** keyword is configured, the software writes only a log message, but continues peering with the sender. If the peer is terminated, the peer stays down until the **clear bgp** command is issued or the **restart** *time-interval* option is used.

This command takes effect immediately if configured on an established neighbor unless the number of prefixes received from the neighbor already exceeds the configured limits.

If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID	Task ID	Operations		
	bgp	read, write		
Examples	This example shows the maximum number of IP Version 6 (IPv6) unicast prefixes allowed from neighbor 192.168.40.25 set to 5000, threshold value 80%, and restart time interval 20 minutes:			
	RP/0/RP0/CPU0:router(config) #router bgp 100 RP/0/RP0/CPU0:router(config-bgp) #neighbor 192.168.40.25 RP/0/RP0/CPU0:router(config-bgp-nbr) #remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr) #address-family ipv6 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af) #maximum-prefix 5000 80 restart 20			
	This example shows the maximum number of IP Version 4 (IPv4) unicast prefixes allowed from the neighbor 192.168.40.24 set to 1000:			
	<pre>RP/0/RP0/CPU0:router(config-bgp)# router bgp 109 RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)#address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# maximum-prefix 1000</pre>			
Related Commands	Command	Description

neighbor (BGP)

To enter neighbor configuration mode for configuring Border Gateway Protocol (BGP) routing sessions, use the **neighbor** command in an appropriate configuration mode. To delete all configuration for a neighbor and terminate peering sessions with the neighbor, use the **no** form of this command.

neighbor ip-address

no neighbor ip-address

Syntax Description	ip-address	IPv4 or IPv6 IP address of the BGP-speaking neighbor.
Command Default	Neighbor mode is not sp	pecified.
Command Modes	Router configuration	
	VRF configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user group as for assistance.	bu must be in a user group associated with a task group that includes appropriate task signment is preventing you from using a command, contact your AAA administrator
	From neighbor configura	on mode, you can use this command to enter neighbor configuration mode. ation mode, you can enter address family configuration for the neighbor by using the nd, which allows you to configure routing sessions for IP Version 4 and IP Version
	The neighbor command does not cause the neighbor to be configured and does not result in a peering to be established with the neighbor. To create the neighbor, you configure a remote autonomous system number by entering the remote-as command, or the neighbor can inherit a remote autonomous system from a neighbor group or session group if the use command is applied.	
Note	A neighbor must have n must be enabled on the	nust a remote autonomous system number, and an IP address and address family neighbor.
		be enabled before any IPv6 neighbors can be defined. Enable IPv6 in router g the address-family command.

Note		Configuration for the neighbor cannot occur (peering is not established) until the neighbor is given a remote as-number and neighbor address.		
		The no form of this command causes the peering with the neighbor to be terminated and all configuration that relates to the neighbor to be removed.		
Task ID		Task ID	Operations	
		bgp	read, write	
Examples		The following example shows how to place the router in neighbor configuration mode for BGP routing process 1 and configure the neighbor IP address 172.168.40.24 as a BGP peer:		
			config)# router bgp 1 config-bgp)# neighbor 172.168.40.24 config-bgp-nbr)# remote-as 65000	
		The following example shows how to enable IPv6 for BGP, then place the router in neighbor configuration mode for an IPv6 neighbor, 3000::1, and configure neighbor 3000::1 as a BGP peer:		
		RP/0/RP0/CPU0:router(c RP/0/RP0/CPU0:router(c RP/0/RP0/CPU0:router(c	config)# router bgp 100 config-bgp)# address-family ipv6 unicast config-bgp-af)# exit config-bgp)# neighbor 3000::1 config-bgp-nbr)# remote-as 2002	
			config-bgp-nbr)# address-family ipv6 unicast	

Command	Description
address-family (BGP), on page 17	Enters address family configuration mode for configuring BGP routing sessions.
remote-as (BGP), on page 230	Adds an entry to the BGP neighbor table.
use, on page 489	Inherits characteristics from a neighbor group, session group, or address family group.

neighbor-group

To create a neighbor group and enter neighbor group configuration mode, use the **neighbor-group** command in router configuration mode. To remove a neighbor group and delete all configuration associated with the group, use the **no** form of this command.

neighbor-group *name*

no neighbor-group name

Syntax Description	name	Neighbor group name.
Command Default	No neighbor group mode is specified	
Command Modes	Router configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **neighbor-group** command puts the router in neighbor group configuration mode and creates a neighbor group.

A neighbor group helps you apply the same configuration to one or more neighbors. After a neighbor group is configured, each neighbor can inherit the configuration through the **use** command. If a neighbor is configured to use a neighbor group, the neighbor, by default, inherits the entire configuration of the neighbor group, which includes the address family-independent and address family-specific configurations. The inherited configuration can be overridden if you directly configure commands for the neighbor or if you configure session groups or address family groups with the **use** command.

From neighbor group configuration mode, you can configure address family-independent parameters for the neighbor group. To enter address family-specific configuration for the neighbor group, use the **address-family** command when in the neighbor group configuration mode.

If an address family is configured for a neighbor group, neighbors that use the neighbor group attempt to exchange routes in that address family.

The **no** form of this command ordinarily causes all configuration for the neighbor group to be removed. If using the **no** form would result in a neighbor losing its remote autonomous system number, the configuration is rejected. In this scenario, the neighbor configuration must be either removed or configured with a remote autonomous system number before the neighbor group configuration can be removed.

 Note
 Neighbor groups should not be configured with a mixture of IPv4 and IPv6 address families, because such a neighbor group is not usable by any neighbor. Note that within the Cisco IOS XR system configuration architecture, it is possible to create such a neighbor group; however, any attempt to use it is rejected.

 Task ID
 Operations

 bgp
 read, write

The following example shows how to create a neighbor group called group1 that has IP Version 4 (IPv4) unicast and IPv4 multicast activated along with various configuration features. The neighbor group is used by neighbor 10.0.0.1 and neighbor 10.0.0.2, which allows them to inherit the entire group1 configuration.

```
RP/0/RP0/CPU0:router(config) # router bgp 65530
RP/0/RP0/CPU0:router(config-bgp)# neighbor-group group1

Examples

Command	Description
address-family (BGP), on page 17	Enters various address family configuration modes for configuring BGP routing sessions.
neighbor (BGP), on page 186	Enters neighbor configuration mode for configuring BGP routing sessions.
use, on page 489	Inherits characteristics from a neighbor group, a session group, or an address family group.

network (BGP)

To specify that the Border Gateway Protocol (BGP) routing process should originate and advertise a locally known network to its neighbors, use the **network** command in an appropriate configuration mode. To disable originating or advertising the network to neighbors, use the **no** form of this command.

network {*ip-address/prefix-length* | *ip-address mask*} [**route-policy** *route-policy-name*] **no network**{*ip-address/prefix-length* | *ip-address mask*} [**route-policy** *route-policy-name*]

Syntax Description	ip- address	Network that BGP advertises.	
	/ prefix-length	Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.	
	ip-address mask	Network mask applied to the <i>ip-address</i> argument.	
	route-policy route-policy-name	(Optional) Specifies a route policy to use to modify the attributes of the network.	
Command Default	No networks are specified.		
Command Modes	IPv4 address family configuration		
	IPv6 address family configuration		
	VRF IPv4 address family configuration		
	VRF IPv6 address family configu	ration	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	-	A network specified with this command is originated and advertised to neighbors only if there exists a route for the network in the routing table. That is, there must be a route learned using local or connected networks,	

static routing, or a dynamic IGP such as IS-IS or OSPF.

Other than the available system resources on the router, no limit exists on the number of network commands that can be configured.

Task ID

Task ID	Operations
bgp	read, write

Examples The following example shows how to configure the local router to originate the IPv4 unicast network 172.20.0.0/16:

RP/0/RP0/CPU0:router(config)#router bgp 120
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# network 172.20.0.0/16

Related Commands

Command	Description
network backdoor, on page 192	Specifies a backdoor route to a BGP border router that provides better information about the network.
redistribute (BGP), on page 222	Redistributes routes from one routing domain into another routing domain.

network backdoor

To set the administrative distance on an external Border Gateway Protocol (eBGP) route to that of a locally sourced BGP route, causing it to be less preferred than an Interior Gateway Protocol (IGP) route, use the **network backdoor** command in an appropriate configuration mode. To disable setting the administrative distance to the value for locally sourced BGP routes, use the **no** form of this command.

network {*ip-address/prefix-length* | *ip-address mask*} **backdoor no network** {*ip-address/prefix-length* | *ip-address mask*} **backdoor**

Syntax Description		
Syntax Description	ip-address	Network that provides a backdoor route.
	/ prefix-length	Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
	mask	Network mask applied to the <i>ip-address</i> argument.
Command Default	No backdoor routes ar	e installed.
Command Modes	IPv4 address family co	onfiguration
	IPv6 address family c	onfiguration
	VRF IPv4 address fan	nily configuration
	VRF IPv6 address fan	nily configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate tast IDs. If the user group assignment is preventing you from using a command, contact your AAA administrato for assistance. Configuring the network backdoor command does not cause BGP to originate a network, even if an IGP route for the network exists. Ordinarily, the backdoor network would be learned through both an eBGP and IGP. The BGP best-path selection algorithm does not change when a network is configured as a backdoor network.	

Task ID	Task ID	Operations
	bgp	read, write
Examples	The following example shows IP Version 4 (IPv4) unicast network 192.168.40.0/24 configured as a bac network:	
	<pre>RP/0/RP0/CPU0:router(config)# router RP/0/RP0/CPU0:router(config-bgp)# ad RP/0/RP0/CPU0:router(config-bgp-af)#</pre>	dress-family ipv4 unicast

	VPNv6 neighbor group address family configuration	
	VPNv6 neighbor address family configuration	
	IPv4 labeled-unicast addres	s family configuration
	IPv6 labeled-unicast addres	s family configuration
	VRF labeled-unicast address family configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		nust be in a user group associated with a task group that includes appropriate task ment is preventing you from using a command, contact your AAA administrator

Use the **next-hop-self** command to set the BGP next-hop attribute of routes being advertised over a peering session to the local source address of the session.

This command is useful in nonmeshed networks in which BGP neighbors may not have direct access to all other neighbors on the same IP subnet.

If this command is configured for a neighbor group or address family group, a neighbor using the group inherits the configuration. Configuring the command specifically for a neighbor overrides any inherited value.

Configuring the **next-hop-self** command under IPv4 labeled-unicast, IPv6 labeled-unicast, or VRF labeled-unicast address family configuration mode enables next-hop-self for labeled prefixes advertised to an iBGP peer.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to set the next hop of the update field for all IP Version 4 (IPv4) unicast routes advertised to neighbor 172.20.1.1 to an address of the local router:

```
RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# next-hop-self
```

The following example shows how to disable the **next-hop-self** command for neighbor 172.20.1.1. If not overridden, the next hop would be inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr)# use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# next-hop-self inheritance-disable
```

nexthop route-policy

To specify that BGP routes are resolved using only next hops whose routes match specific characteristics, use the **nexthop route-policy** command in the appropriate configuration mode. To remove the **nexthop route-policy** command from the configuration file and restore the system to its default behavior, use the **no** form of this command.

nexthop route-policy *route-policy-name*

no nexthop route-policy *route-policy-name*

Syntax Description	route-policy-name	Route policy to use for filtering based on next hops.	
Command Default	No default behavior or values		
Command Modes	IPv4 address family configuration	n	
	IPv6 address family configuration	n	
	VPNv4 address family configuration	tion	
	VPNv6 address family configura	tion	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		be in a user group associated with a task group that includes appropriate task is preventing you from using a command, contact your AAA administrator	
	Use the nexthop route-policy c	command to configure route policy filtering using next hops.	
	The BGP next-hop tracking feature allows you to specify that BGP routes are resolved using only next hops whose routes have the following characteristics:		
	• To avoid the aggregate routes, the prefix length must be greater than a specified value.		
	• The source protocol must be from a selected list, ensuring that BGP routes are not used to resolve next hops that could lead to oscillation.		
	This route policy filtering is possi hop as well as the mask length as	ible because RIB identifies the source protocol of a route that resolves a next associated with the route.	
	The next-hop attach point supports matching using the protocol name and mask length. BGP marks all next hops that are rejected by the route policy as invalid, and no best path is calculated for the routes that use the		

invalid next hop. The invalid next hops continue to stay in the active cache and can be displayed as part of the **show bgp nexthop** command with an invalid status.

Task ID

Task ID	Operations
bgp	read, write

Examples The following example shows how to specify the route policy nexthop_A as the policy to use for filtering next hops:

```
RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# nexthop route-policy nexthop_A
```

Related Commands Command Description route-policy (RPL) Defines a route policy and enters route-policy configuration mode. show bgp nexthops, on page 358 Display statistical information about the BGP next hops.

nexthop trigger-delay

To specify the delay for triggering next-hop calculations, use the **nexthop trigger-delay** command in the appropriate configuration mode. To set the trigger delay to the default value, use the **no** form of this command.

nexthop trigger-delay {**critical** *delay*| **non-critical** *delay*}

no nexthop trigger-delay {critical *delay*| non-critical *delay*}

Syntax Description	critical	Specifies critical next-hop events. For example, when the next hop is unreachable.	
	delay	Trigger delay, in milliseconds. Range is 0 to 4294967295.	
	non-critical	Specifies noncritical next-hop events. For example, Interior Gateway Protocol (IGP) metric changes.	
Command Default	critical : 3000 msec f	or IPv4 address family and IPv6 address family	
	critical : msec for VP	Nv4 address family and VPNv6 address family	
	non-critical : 10000 1	msec IPv4, IPv6, VPNv4, and VPNv6 address families	
Command Modes	IPv4 address family configuration		
	Pv6 address family co	onfiguration	
	VPNv4 address famil	y configuration	
	VPNv6 address famil	y configuration	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator	
	to converge. This con in fewer interprocess	ger-delay command to allow for a dynamic way for Interior Gateway Protocol (IGP) vergence allows BGP to accumulate all notifications and trigger fewer walks, resulting communications (IPCs) to the Routing Information Base (RIB) for route addition, ation and fewer updates to peers.	

	Note	A high <i>delay</i> value can be configured to effectively turn off next-hop tracking.		
		The non-critical <i>delay</i> value must always be set to at least equal or greater than the critical <i>delay value</i>		
		The <i>delay</i> should be slip event (IGP convergence	ghtly higher than the time it takes for the IGP to settle into a steady state after some e time).	
Task ID		Task ID	Operations	
		bgp	read, write	
Examples		The following example	shows how to set the critical next-hop trigger delay to 3500 milliseconds:	
		RP/0/RP0/CPU0:router	r(config)# router bgp 109 r(config-bgp)# address-family ipv4 unicast r(config-bgp-af)# nexthop trigger-delay critical 3500	

Routing Command Reference for Cisco NCS 6000 Series Routers

nsr (BGP)

		Protocol (BGP) nonstop routing (NSR), use the nsr command in BGP XR Config JSR, use the no form of this command.
	nsr	
	no nsr	
Syntax Description	This command has no argue	ments or keywords.
Command Default	BGP NSR is not activated.	
Command Modes	XR Config	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines Task ID	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.Use the nsr command to enable the Border Gateway Protocol (BGP) Nonstop Routing (NSR) with Stateful Switchover (SSO). This enables all bgp peerings to maintain the BGP state to ensure continuous packet 	
	bgp	read, write
Examples	The following example shows how to enable BGP NSR: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 120 RP/0/RP0/CPU0:router(config-bgp)# nsr The following example shows how to disable BGP NSR: RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router# configure RP/0/RP0/CPU0:router(config)# router bgp 120	
	RP/0/RP0/CPU0:router(

Related Commands

Command	Description
router bgp, on page 245	Configures the Border Gateway Protocol (BGP) routing process.
nsr process-failures switchover	Configures failover as a recovery action in case of process failures for active instances to switch over to a standby route processor (RP) or a standby distributed route processor (DRP) to maintain nonstop routing (NSR).
show bgp nsr, on page 367	Displays Border Gateway Protocol (BGP) nonstop routing (NSR) information.

```

Related Commands

Command	Description
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.

password (BGP)

To enable Message Digest 5 (MD5) authentication on a TCP connection between two Border Gateway Protocol (BGP) neighbors, use the **password** command in an appropriate configuration mode. To disable MD5 authentication, use the **no** form of this command.

password {clear| encrypted} password

no password [clear *password*] encrypted *password*]

<u> </u>		
Syntax Description	clear	Specifies that an unencrypted password follows. The password must be a case-sensitive, clear-text unencrypted password.
	encrypted	Specifies that an encrypted password follows. The password must be a case-sensitive, encrypted password.
	password	Password of up to 80 characters. The password can contain any alphanumeric characters. However, if the first character is a number or the password contains a space, the password must be enclosed in double quotation marks; for example, "2 password."
Command Default		and is not specified in the appropriate configuration mode, MD5 authentication is not enabled ation between two BGP neighbors.
Command Modes	Neighbor configu	uration
	VRF neighbor co	onfiguration
	Neighbor group o	configuration
	Session group co	nfiguration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		hand, you must be in a user group associated with a task group that includes appropriate task roup assignment is preventing you from using a command, contact your AAA administrator
		word to enable authentication between two BGP peers. Use the password command to ent sent on the TCP connection between the peers. The same password must be configured

on both networking devices, otherwise a connection cannot be made. The authentication feature uses the MD5

algorithm. Specifying this command causes the software to generate and check the MD5 digest on every segment sent on the TCP connection.

Configuring a neighbor password does not cause the existing session for a neighbor to end. However, until the new password is configured on the remote router, the local BGP process does not receive keepalive messages from the remote device. If the password is not updated on the remote device by the end of the hold time, the session ends. The hold time can be changed using the **timers** command or the **timers bgp** command.

If this command is configured for a neighbor group or neighbor address family group, a neighbor using the group inherits the configuration. Values of commands configured specifically for a neighbor overrides inherited values.

Task ID	Task ID	Operations
	bgp	read, write

The following example shows how to configure neighbor 172.20.1.1 to use MD5 authentication with the password password1:

```
RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)#neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)#remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)#password clear password1
```

Related Commands

Examples

Command	Description
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
password-disable, on page 211	Overrides any inherited password configuration from a neighbor group or session group for BGP neighbors.
session-group, on page 254	Creates a session group and enters session group configuration mode.
timers (BGP), on page 467	Set the timers for a specific BGP neighbor.

password (rpki-server)

To specify a SSH password for the RPKI cache-server, use the **password** command in rpki-server configuration mode. To remove the SSH passwords, use the **no** form of this command.

password password

no password password

Syntax Description	password	Enters a password to be used for the SSH transport mechanism.
Command Default	Password is not configu	ured.
Command Modes	RPKI server configurat	ion
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user group as for assistance.SSH expects to use an a to connect to RPKI service.	you must be in a user group associated with a task group that includes appropriate task ssignment is preventing you from using a command, contact your AAA administrator authentication method to connect to a remote server. The SSH authentication method ver is password-based. So, the RPKI cache-server must be configured with username ame and password must be configure for each server configured under BGP that uses
Task ID	Task ID	Operation
	bgp	read, write
Examples	cache-server SSH trans RP/0/RP0/CPU0:router RP/0/RP0/CPU0:router RP/0/RP0/CPU0:router RP/0/RP0/CPU0:router	-

RP/0/RP0/CPU0:router(config-bgp-rpki-cache) #password rpki-ssh-pass

password-disable

To override any inherited password configuration from a neighbor group or session group for Border Gateway Protocol (BGP) neighbors, use the **password-disable** command in an appropriate configuration mode. To disable overriding any inherited password command, use the **no** form of this command.

password-disable

no password-disable

Syntax Description	This command has no argument	s or keywords.
--------------------	------------------------------	----------------

Command Default Configured passwords for neighbor and session groups are inherited.

Command Modes Neighbor configuration VRF neighbor configuration Neighbor group configuration

Session group configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you specify a password on a neighbor group or session group, all users of the group inherit the password. Specifying a different **password** command specifically on a neighbor that uses the group overrides the inherited value. Specifying **password-disable** on a neighbor that uses the group disables password authentication for the neighbor.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to disable MD5 authentication for neighbor 172.20.1.1, preventing it from inheriting the password password1 from session group group1:

RP/0/RP0/CPU0:router(config) # router bgp 140

RP/0/RP0/CPU0:router(config-bgp)# session-group group1 RP/0/RP0/CPU0:router(config-bgp-sngrp)# password clear password1 RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 2 RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group group1 RP/0/RP0/CPU0:router(config-bgp-nbr)# password-disable

Related Commands

precedence

To set the precedence level, use the **precedence** command in the appropriate configuration mode. To remove the **precedence** command from the configuration file and restore the system to its default interval values, use the **no** form of this command.

precedence value

no precedence [value]

 Syntax Description
 value
 Value of the precedence. The precedence value can be a number from 0 to 7, or it can be one of the following keywords:

 critical —Set packets with critical precedence (5)
 flash — Set packets with flash precedence (3)

 flash — Set packets with flash precedence (3)
 flash-override —Set packets with flash override precedence (4)

 immediate —Set packets with immediate precedence (2)
 internet —Set packets with internetwork control precedence (6)

 network —Set packets with network control precedence (7)
 priority —Set packets with priority precedence (1)

 routine —Set packets with routine precedence (0)
 flash - Set packets with routine precedence (0)

Command Default No default behavior or values

Command ModesNeighbor configurationNeighbor session group configurationNeighbor group configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the precedence command to set the precedence value.

Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The following example sho	The following example shows how to set the precedence to 2:	

RP/0/RP0/CPU0:router(config)# router bgp 5

rd

rd

		e distinguisher, use the rd command in VRF configuration mode. To disable the route no form of this command.
	rd { <i>as-number</i> : <i>nn</i>	<i>ip-address</i> : <i>nn</i> auto }
	no rd {as-number :	nn ip-address : nn auto}
Syntax Description	as-number:nn	• <i>as-number</i> —16-bit Autonomous system (AS) number of the route distinguisher
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
		 Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
		• nn —32-bit number
	ip-address:nn	IP address of the route distinguisher.
		• <i>ip-address</i> —32-bit IP address
		• nn —16-bit number
	auto	Automatically assigns a unique route distinguisher.
Command Default Command Modes	No default behavior VRF configuration	or values
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines	IDs. If the user grou for assistance.	d, you must be in a user group associated with a task group that includes appropriate task p assignment is preventing you from using a command, contact your AAA administrator

Use the **rd** command to make the prefix unique across multiple VRFs.

Auto assignment of route distinguishers can be done only if a router ID is assigned using the **bgp router-id** command in BGP router configuration mode. The unique router ID is used for automatic route distinguisher generation.

The following are restrictions when configuring route distinguishers:

- BGP router-id must be configured before rd auto can be configured
- Route distinguisher cannot be changed or removed when an IPv4 unicast address family is configured under VRF.
- BGP router-id cannot be changed or removed when rd auto is configured under a VRF.
- When **rd auto** is configured under a VRF, the IP address for the router distinguisher configured under another VRF must be different from that of the BGP router-id
- If a route distinguisher with same IP address as BGP router-id exists, the rd auto is not permitted.

Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to automatically assign a unique route distinguisher to VRF instance vrf-1:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# vrf vrf-1
RP/0/RP0/CPU0:router(config-bgp-vrf)# rd auto

Command	Description
bgp router-id, on page 100	Configures a fixed router ID for a BGP-speaking router.
export route-target, on page 161	Configures a VRF export route-target extended community.
import route-target, on page 166	Configures a VRF import route-target extended community.

receive-buffer-size

To set the size of the receive buffers for a Border Gateway Protocol (BGP) neighbor, use the **receive-buffer-size** command in an appropriate configuration mode. To remove the **receive-buffer-size** command from the configuration file and restore the system to its default condition in which the software uses the default size, use the **no** form of this command.

receive-buffer-size socket-size [bgp-size]
no receive-buffer-size [socket-size] [bgp-size]

Syntax Description	socket-size	Size, in bytes, of the receive-side socket buffer. Range is 512 to 131072.	
	bgp-size	(Optional) Size, in bytes, of the receive buffer in BGP. Range is 512 to 131072.	
Command Default	socket-size : 32,768 bytes		
	<i>bgp-size</i> : 4,032 bytes		
Command Modes	Neighbor configuration		
	VRF neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		nust be in a user group associated with a task group that includes appropriate task ment is preventing you from using a command, contact your AAA administrator	
•	Using larger buffers can imp	e command to increase the buffer size when receiving updates from a neighbor. prove convergence time because it allows the software to process a larger number However, allocating larger buffers consumes more memory on the router.	

Increasing the socket buffer size uses more memory only when more messages are waiting to be processed by the software. In contrast, increasing the BGP buffer size uses extra memory indefinitely.

If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID

 Task ID
 Operations

 bgp
 read, write

Examples

The following example shows how to set the receive buffer sizes for neighbor 172.20.1.1 to be 65,536 bytes for the socket buffer and 8192 bytes for the BGP buffer:

```
RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# receive-buffer-size 65536 8192
```

Command	Description
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
send-buffer-size, on page 248	Sets the size of the send buffers for a BGP neighbor.
session-group, on page 254	Creates a session group and enters session group configuration mode.
socket receive-buffer-size, on page 457	Sets the size of the receive buffers for all BGP neighbors.

redistribute (BGP)

To redistribute routes from one routing domain into Border Gateway Protocol (BGP), use the **redistribute** command in an appropriate configuration mode. To disable route redistribution, use the **no** form of this command.

Connected

redistribute connected [metric metric-value] [route-policy route-policy-name]

no redistribute connected [metric metric-value] [route-policy route-policy-name]

Enhanced Interior Gateway Routing Protocol (EIGRP)

redistribute eigrp *process-id* [match {external| internal}] [metric *metric-value*] [route-policy *route-policy-name*]

no redistribute eigrp *process-id* [**match** {**external**| **internal**}] [**metric** *metric-value*] [**route-policy** *route-policy-name*]

Intermediate System-to-Intermediate System (IS-IS)

redistribute isis *process-id* [level| {1| 1-inter-area | 2}] [metric *metric-value*] [route-policy *route-policy-name*] no redistribute isis *process-id* [level| {1| 1-inter-area | 2}] [metric *metric-value*] [route-policy *route-policy-name*]

Open Shortest Path First (OSPF)

redistribute ospf *process-id* no redistribute ospf *process-id*

Routing Information Protocol

redistribute rip [metric metric-value] [route-policy route-policy-name]
no redistribute rip [metric metric-value] [route-policy route-policy-name]

Static

redistribute static [metric metric-value] [route-policy route-policy-name]
no redistribute static [metric metric-value] [route-policy route-policy-name]

Syntax Description	connected	Redistributes connected routes. Connected routes are established automatically when IP is enabled on an interface.
	metric metric-value	(Optional) Specifies the Multi Exit Discriminator (MED) attribute used for the redistributed route. Range is 0 to 4294967295. Use a value consistent with the destination protocol.
		By default, the Interior Gateway Protocol (IGP) metric is assigned to the route. For connected and static routes the default metric is 0.

route-policy route-policy-name	(Optional) Specifies a configured routing policy to filter redistributed routes. A route policy is used to filter the importation of routes from this source routing protocol to BGP.	
eigrp	Specifies that routes are distributed from EIGRP. You must be in IPv4 unicast of multicast address family configuration mode or in VRF IPv4 address family configuration mode.	
process-id	For the eigrp keyword, an EIGRP instance name from which routes are to be redistributed.	
	For the isis keyword, an IS-IS instance name from which routes are to be redistributed.	
	For the ospf keyword, an OSPF instance name from which routes are to be redistributed.	
	The <i>process-id</i> value takes the form of a string. A decimal number can be entered but it is stored internally as a string.	
match { internal external [1 2]	(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one or more of the following:	
nssa-external [1 2]}	• internal —Routes that are internal to a specific autonomous system (intra- and inter-area OSPF routes).	
	• external [1 2]—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 external routes.	
	• nssa-external [1 2]—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 or Type 2 not-so-stubby area (NSSA) external routes.	
	For the external and nssa-external options, if a type is not specified, then both Type 1 and Type 2 are assumed.	
isis	Specifies that routes are distributed from the IS-IS protocol.	
	Redistribution from IS-IS is allowed under IPv4 unicast, IPv4 multicast, IPv6 unicast and address-families. Redistribution is not allowed under VPNv4 address-families	
level { 1 1-inter-area 2 }	(Optional) Specifies the IS-IS level from which routes are redistributed. It can be one of the following:	
	• 1 —Routes are redistributed from Level 1 routes.	
	• 1-inter-area — Routes are redistributed from Level 1 interarea routes.	
	• 2 —Routes are redistributed from Level 2 routes.	
ospf	Specifies that routes are distributed from the OSPF protocol. You must be in IPv4 unicast or multicast address family configuration mode or in VRF IPv4 address family configuration mode.	

	ospfv3	Specifies that routes are distributed from the OSPFv3 protocol. You must be in IPv6 unicast or multicast address family configuration mode or in VRF IPv4 address family configuration mode.	
	rip	Specifies that routes are distributed from RIP. You must be in IPv4 unicast or multicast address family configuration mode.	
	static	Redistributes IP static routes.	
Command Default	Route redistribut		
	ŕ	fault is to redistribute Level 1 and Level 2 routes.	
	For OSPF, the de	efault is to redistribute internal, external, and NSSA external routes of Type 1 and Type 2.	
	For OSPFv3, the	e default is to redistribute internal, external, and NSSA external routes of Type 1 and Type 2	
	By default, the Interior Gateway Protocol (IGP) metric is assigned to the route. For connected and static routes the default metric is 0.		
	metric metric-value: 0		
	match { intern : match all routes.	al external $[1 2]$ nssa-external $[1 2]$: If no match is specified, the default is to	
Command Modes	IPv4 address fan are supported)	nily configuration, both unicast and multicast (connected, eigrp, isis, ospf, rip, and static

	VRF IPv4 addres	ss family configuration (connected , eigrp , ospf , rip , and static are supported)	
	VRF IPv6 addre	ss family configuration (connected , eigrp , and static are supported)	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		nand, you must be in a user group associated with a task group that includes appropriate task group assignment is preventing you from using a command, contact your AAA administrator	
	101 ubbibtuilee.		

When redistributing routes (into BGP) using both command keywords for setting or matching of attributes and a route policy, the routes are run through the route policy first, followed by the keyword matching and setting.

Each instance of a protocol may be redistributed independently of the others. Changing or removing redistribution for a particular instance does not affect the redistribution capability of other protocols or other instances of the same protocol.

Networks specified using the **network** command are not affected by the **redistribute** command; that is, the routing policy specified in the **network** command takes precedence over the policy specified through the **redistribute** command.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to redistribute IP Version 4 (IPv4) unicast OSPF routes from OSPF instance 110 into BGP:

RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# redistribute ospf 110

Related Commands	Command	Description
	network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.

refresh-time (rpki-server)

To configure the time BGP waits in between sending periodic serial queries to the RPKI server, use the **refresh-time** command in rpki-server configuration mode. To remove the refresh-time configuration, use the **no** form of this command.

refresh-time {time-in-seconds| off}

no refresh-time {*time-in-seconds*| **off**}

Syntax Description	off	Specifies not to send serial queries periodically.
	time-in-seconds	Sets the refresh-time in seconds. Range is 30 to 3600 seconds.
Command Default	Refresh-time is not set.	
Command Modes	RPKI cache configuration	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		must be in a user group associated with a task group that includes appropriate task nment is preventing you from using a command, contact your AAA administrator
Task ID	Task ID	Operation
	bgp	read, write
Examples	to the server as 30 seconds:	
	RP/0/RP0/CPU0:router(cc RP/0/RP0/CPU0:router(cc RP/0/RP0/CPU0:router(cc	-

RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#purge-time 30
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)#refresh-time 30

response-time (rpki-server)

To configure the time BGP waits for a response from the RPKI cache-server after sending a serial or reset query, use the **response-time** command in rpki-server configuration mode. To remove the response-time configuration, use the **no** form of this command.

response-time {*time-in-seconds*| **off**}

no response-time {*time-in-seconds*| **off**}

Syntax Description	off	Specifies to wait indefinitely for a response from the RPKI cache.
	time-in-seconds	Specifies the response-time in seconds. Range is 30 to 3600 seconds.
Command Default	Response-time is not set.	
Command Modes	RPKI server configuration

remote-as (BGP)

To create a Border Gateway Protocol (BGP) neighbor and begin the exchange of routing information, use the **remote-as** command in an appropriate configuration mode. To delete the entry for the BGP neighbor, use the **no** form of this command.

remote-as as-number

no remote-as [as-number]

Syntax Description	as-number	Autonomous system (AS) to which the neighbor belongs.
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
• Range for 4-byte Autonomous system numbers (ASNs) is asdot forma 65535.65535.		• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.

Command Default No BGP neighbors exist.

Command ModesNeighbor configurationVRF neighbor configurationNeighbor group configurationSession group configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **remote-as** command to create a neighbor and assign it a remote autonomous system number. A neighbor must have a remote autonomous system number before any other commands can be configured for it. Removing the remote autonomous system from a neighbor causes the neighbor to be deleted. You cannot remove the autonomous system number if the neighbor has other configuration.

We recommend that you use the **no neighbor** command rather than the **no remote-as** command to delete a neighbor.

A neighbor specified with a remote autonomous system number that matches the autonomous system number specified in the **router bgp** command identifies the neighbor as internal to the local autonomous system. Otherwise, the neighbor is considered external.

Configuration of the **remote-as** command for a neighbor group or session group using the **neighbor-group** command or **session-group** command causes all neighbors using the group to inherit the characteristics configured with the command. Configuring the command directly for the neighbor overrides the value inherited from the group.

In the neighbor configuration submode, configuring use of a session group or neighbor group for which **remote-as** is configured creates a neighbor and assigns it an autonomous system number if the neighbor has not already been created.

Note

Do not combine **remote-as** commands and **no use neighbor-group** commands, or **remote-as** commands and **no use session-group** commands, in the same configuration commit.

Task ID

Task ID	Operations
bgp	read, write

Examples

The following example shows how to assign autonomous system numbers on two neighbors, neighbor 10.0.0.1, (internal) and neighbor 192.168.0.1 (external), setting up a peering session that shares routing information between this router and each of these neighbors:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# session-group group2
RP/0/RP0/CPU0:router(config-bgp-sngrp)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-sngrp)#exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr)#use session-group group2

The following example shows how to configure a session group called group2 with an autonomous system number 1. Neighbor 10.0.0.1 is created when it inherits the autonomous system number 1 from session group group2.

RP/0/RP0/CPU0:router(config) #router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# session-group group2
RP/0/RP0/CPU0:router(config-bgp-sngrp)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.0.0.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group group2

Command	Description
neighbor (BGP), on page 186	Enters neighbor configuration mode for configuring BGP routing sessions.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
router bgp, on page 245	Configures the BGP routing process.
session-group, on page 254	Creates a session group and enters session group configuration mode.
use, on page 489	Inherits characteristics from a neighbor group, session group, or address family group.

remove-private-as

To remove private autonomous system numbers from autonomous system paths when generating updates to external neighbors, use the **remove-private-as** command in an appropriate configuration mode. To place the router in the default state in which it does not remove private autonomous system numbers, use the **no** form of this command.

remove-private-as [inheritance-disable] [entire-aspath] no remove-private-as [inheritance-disable] [entire-aspath]

Syntax Description	inheritance-disable	(Optional) Permits the feature to be disabled from a neighbor group or address family group instead of being inherited.	
	entire-aspath	(Optional) Removes the entire private autonomous system numbers from an autonomous system path only if all ASes in the path are private.	

numbers are not removed from updates sent to external neighbors.

Command Modes

IPv4 address family group configuration

- IPv6 address family group configuration
 - VPNv4 address family group configuration
- IPv4 neighbor address family configuration
- VPNv4 neighbor address family configuration
- VRF IPv4 neighbor address family configuration
- IPv4 neighbor group address family configuration
- IPv6 neighbor group address family configuration
 - VPNv4 neighbor group address family configuration
- VPNv6 address family group configuration
- VPNv6 neighbor address family configuration
- VRF IPv6 neighbor address family configuration
- VPNv6 neighbor group address family configuration

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines To use this

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This feature is available for external BGP (eBGP) neighbors only.

When an update is passed to the external neighbor, the software drops any leading autonomous system sequence in the autonomous system path if the sequence contains only private autonomous system numbers and does not contain the autonomous system number of the neighbor.

If this command is used in a BGP confederation, the element following the confederation portion of the autonomous system path, if a sequence, is considered the leading sequence.

The private autonomous system values range from 64512 to 65535.

If this command is configured for a neighbor group or address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Use the **entire-aspath** to removes the entire private autonomous system numbers from an autonomous system path only if all ASes in the path are private.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows a configuration that removes the private autonomous system number from the IP Version 4 (IPv4) unicast updates sent to 172.20.1.1:

```
RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# remove-private-as
```

The following example shows how to disable the remove private autonomous system number feature for neighbor 172.20.1.1, preventing this feature from being automatically inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# remove-private-as
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp-nbr# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# remove-private-as inheritance-disable
```

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **route-policy** command to specify a routing policy for an inbound or outbound route. The policy can be used to filter routes or modify route attributes. The **route-policy** command is used to define a policy.

Note

Configuring a large number of uniquely named outbound neighbor policies can adversely affect performance. This is true even if the uniquely named route policies are functionally identical. The user is discouraged from configuring multiple functionally identical route policies for use with this command. For example, if Policy A and Policy B are identical but named for different neighbors, the two policies should be configured as a single policy.

If the **route-policy** command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID Operations bgp read, write

Examples

The following example shows how to apply the In-Ipv4 policy to inbound IP Version 4 (IPv4) unicast routes from neighbor 172.20.1.1:

```
RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# route-policy In-Ipv4 in
```

Command	Description
af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
route-policy (RPL)	Defines a route policy and enters route-policy configuration mode.

route-reflector-client

To configure the router as a Border Gateway Protocol (BGP) route reflector and configure the specified neighbor as its client, use the **route-reflector-client** command in an appropriate configuration mode. To disable configuring the neighbor as a client, use the **no** form of this command.

route-reflector-client [inheritance-disable]

no route-reflector-client [inheritance-disable]

Syntax Description	inheritance-disable	(Optional) Allows the configuration inherited from a neighbor group or address family group to be overridden.
Command Default	The neighbor is not treated as	a route reflector client.
Command Modes	IPv4 address family group con	nfiguration

	VPNv6 address family group	configuration
	VPNv6 neighbor address fam	ily group configuration
	VPNv6 neighbor group addre	ss family configuration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		st be in a user group associated with a task group that includes appropriate task tent is preventing you from using a command, contact your AAA administrator

This command is restricted to internal BGP (iBGP) neighbors only.

Use the **route-reflector-client** command to configure the local router as the route reflector and the specified neighbor as one of its clients. All neighbors configured with this command are members of the client group, and the remaining iBGP peers are members of the nonclient group for the local route reflector.

By default, all iBGP speakers in an autonomous system must be fully meshed with each other, and neighbors do not readvertise iBGP learned routes to other iBGP neighbors.

With route reflection, all iBGP speakers need not be fully meshed. An iBGP speaker, the route reflector, passes learned iBGP routes to some number of iBGP client neighbors. Learned iBGP routes eliminate the need for each router running BGP to communicate with every other device running BGP in the autonomous system.

The local router is a route reflector as long as it has at least one route reflector client.

If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows neighbor at 172.20.1.1 configured as a route reflector client for IP Version 4 (IPv4) unicast routes:

RP/0/RP0/CPU0:router(config)# router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 140
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# route-reflector-client

The following example disables the route-reflector client for neighbor 172.20.1.1, preventing this feature from being automatically inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp) # af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # route-reflector-client
RP/0/RP0/CPU0:router(config-bgp-afgrp) #exit
RP/0/RP0/CPU0:router(config-bgp-nbr) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 140
RP/0/RP0/CPU0:router(config-bgp-nbr) # address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # route-reflector-client inheritance-disable
```

Command	Description
af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
bgp cluster-id, on page 69	Configures the cluster ID if the BGP cluster has more than one route reflector.

Command	Description
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.

router bgp

To configure the Border Gateway Protocol (BGP) routing process, use the **router bgp** command in XR Config mode. To remove all BGP configurations and terminate the BGP routing process, use the **no** form of this command.

router bgp as-number [instance instance-name]

no router bgp [as-number]

Syntax Description	as-number	Number that identifies the autonomous system (AS) in which the router resides.
		• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
		• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
		• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
	instance instance-name	Specifies an instance and instance name. The maximum length for the instance name is 32 characters.
		The router bgp instance <i>instance-name</i> command replaced the distributed speaker command.
Command Default	No BGP routing pr	rocess is enabled.
Command Default Command Modes Command History	No BGP routing pr XR Config Release	rocess is enabled. Modification
Command Modes	XR Config

send-buffer-size

To set the size of the send buffers for a Border Gateway Protocol (BGP) neighbor, use the **send-buffer-size** command in an appropriate configuration mode. To set the size of the send buffers to the default values, use the **no** form of this command.

send-buffer-size socket-size [bgp-size]

no send-buffer-size [socket-size] [bgp-size]

Syntax Description	socket-size	Size, in bytes, of the send-side socket buffer. Range is 4096 to 131072.
	bgp-size	(Optional) Size, in bytes, of the BGP process send buffer. Range is 4096 to 131072.
Command Default	socket-size : 10240 by	rtes
	<i>bgp-size</i> : 4096 bytes	huffer size command to change the defaults
	Ose the socket send-	buffer-size command to change the defaults.
Command Modes	Neighbor configuration	on
	VRF neighbor configu	uration
	Neighbor group config	guration
	Session group configu	iration
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator
	Using larger buffers c	size command to increase the buffer size employed when sending updates to a neighbor. an improve convergence time because the software can process more packets ever, allocating larger buffers uses more memory on the router.

Increasing the socket buffer size uses more memory only when more messages are waiting to be processed by the software. In contrast, increasing the BGP buffer size uses more memory indefinitely. If this command is configured for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID

Task ID	Operations
bgp	read, write

Examples

The following example shows how to set the send buffer sizes for neighbor 172.20.1.1 to be 8192 bytes for both the socket buffer and the BGP buffer:

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# send-buffer-size 8192 8192
```

Command	Description
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
receive-buffer-size, on page 220	Sets the size of the receive buffers for a BGP neighbor.
session-group, on page 254	Creates a session group and enters session group configuration mode.
socket send-buffer-size, on page 459	Sets the size of the send buffers for all BGP neighbors.

send-community-ebgp

To specify that community attributes should be sent to an external Border Gateway Protocol (eBGP) neighbor, use the **send-community-ebgp** command in an appropriate configuration mode. To disable sending community attributes to an eBGP neighbor, use the **no** form of this command.

send-community-ebgp [inheritance-disable]

no send-community-ebgp [inheritance-disable]

Syntax Description	inheritance-disable	(Optional) Allows configuration inherited from a neighbor group or address family group to be overridden.	
Command Default	Community (COMM) attrib	utes are NOT sent to eBGP peers (including PE-CE peers).	
Command Modes	IPv4 address family group configuration		
	IPv6 address family group configuration		
	IPv4 neighbor address family configuration		
	VRF IPv4 neighbor address family configuration		
	VPNv4 neighbor address family configuration		
	IPv4 neighbor group address family configuration		
	IPv6 neighbor group address family configuration		
	VRF IPv6 neighbor address family configuration		
	VPNv6 neighbor address family configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	Use the send-community-ebgp command to control whether community attributes are sent to eBGP neighbors. This command cannot be configured for iBGP neighbors as community attributes are always sent to iBGP neighbors.		
	When IOS XR BGP updates community attributes for eBGP VPN peers (VPNv4 or VPNv6), there is no need to configure the send-community-ebgp command separately. The community attributes are updated by default.		

If this command is configured for a neighbor group or address family group, all neighbors using the group inherit the configuration. Configuring the command specifically for a neighbor overrides inherited values.

Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The following example shows for IP Version 4 (IPv4) multi-	s how to disable the router that sends community attributes to neighbor 172.20.1.1 cast routes:	
	<pre>RP/0/RP0/CPU0:router(config)#router bgp 140 RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-community-ebgp</pre>		
	The following example shows how to disable the delivery of community attributes to neighbor 172.20.1.1, preventing this feature from being inherited from address family group group1:		
	RP/0/RP0/CPU0:router(con RP/0/RP0/CPU0:router(con	fig-bgp)# af-group group1 address-family ipv4 multicast fig-bgp-afgrp)# send-community-ebgp	

RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast

RP/0/RP0/CPU0:router(config-bgp-nbr-af)# use af-group group1

RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-community-ebgp inheritance-disable

Command	Description
af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
send-extended-community-ebgp, on page 252	Specifies that extended community attributes are sent to eBGP neighbors.

send-extended-community-ebgp

To specify that extended community attributes should be sent to external Border Gateway Protocol (eBGP) neighbors, use the **send-extended-community-ebgp** command in an appropriate configuration mode. To disable sending extended community attributes to eBGP neighbors, use the **no** form of this command.

send-extended-community-ebgp [inheritance-disable]

no send-extended-community-ebgp [inheritance-disable]

Syntax Description	inheritance-disable	(Optional) Allows configurations inherited from a neighbor group or address family group to be overridden.	
Command Default	Extended community (EXT	COMM) attributes are NOT sent to eBGP peers (including PE-CE peers).	
Command Modes	IPv4 address family group c	configuration	
	IPv6 address family group c	-	
	IPv4 neighbor address family configuration		
	VRF IPv4 neighbor address family configuration		
	VPNv4 neighbor address family configuration		
	IPv4 neighbor group address family configuration		
	IPv6 neighbor group address family configuration		
	VRF IPv6 neighbor address family configuration		
	VPNv6 neighbor address fa	mily configuration	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		nust be in a user group associated with a task group that includes appropriate tag ment is preventing you from using a command, contact your AAA administrat	

Use the **send-extended-community-ebgp** command to control whether extended community attributes are sent to eBGP neighbors. This command cannot be used for iBGP neighbors as extended community attributes are always sent to iBGP neighbors.

When IOS XR BGP updates community attributes for eBGP VPN peers (VPNv4 or VPNv6), there is no need to configure the **send-extended-community-ebgp** command separately. The community attributes are updated by default.

If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to configure the router to send extended community attributes to neighbor 172.20.1.1 for IP Version 4 (IPv4) multicast routes:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-extended-community-ebgp
```

The following example shows how to disable the delivery of extended community attributes to neighbor 172.20.1.1, preventing this feature from being automatically inherited from address family group group1:

```
RP/0/RP0/CPU0:router(config) # router bgp 140
RP/0/RP0/CPU0:router(config-bgp)# af-group group1 address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# send-extended-community-ebgp
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 172.20.1.1
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# send-extended-community-ebgp inheritance-disable
```

Related Commands

Command	Description
af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
send-community-ebgp, on page 250	Specifies that community attributes should be sent to an eBGP neighbor.

session-group

To create a session group and enter session group configuration mode, use the **session-group** command in router configuration mode. To remove a session group and delete all configurations associated with it, use the **no** form of this command.

session-group name

no session-group name

Syntax Description	name	Name of the session group.
Command Default	No session groups are created	d
Command Modes	Router configuration	. .
Command History	Release 5.0.0	Modification This command was introduced.
Usage Guidelines		ust be in a user group associated with a task group that includes appropriate task ment is preventing you from using a command, contact your AAA administrator
		mand to create a session group from which neighbors can inherit configuration ndent. That is, session groups cannot have address family-specific configuration.

This command enters the session group configuration mode in which configuration for a session group is entered.

Many commands can be configured in both session group configuration mode and neighbor configuration mode.

Use of session groups saves time and reduces the router configuration size. Because the configuration of a session group can be inherited by any number of neighbors, use of the group can eliminate the need to copy long or complex configurations on each of a large number of neighbors. A neighbor can inherit all configuration from a session group simply by configuring the **use** command. Specific inherited session group configuration commands can be overridden for a specific neighbor by explicitly configuring the command for the specific neighbor.

The **no** form of this command causes all of the configuration for the session group to be removed. You cannot use the **no** form of this command if removing the group would leave one or more neighbors without a configured remote autonomous system number.

Task ID	Task ID	Operations
	bgp	read, write
Examples	10.0.0.2. Because group1 is	ws a session group called group1 that is used by two neighbors, 10.0.0.1 and a session group, it contains only address family-independent configuration. And

session-open-mode

To establish a Border Gateway Protocol (BGP) session with a specific TCP open mode, use the **session-open-mode** command in an appropriate configuration mode. To restore the default state, use the **no** form of this command.

session-open-mode {active-only| both| passive-only}

no session-open-mode [active-only| both| passive-only]

Syntax Descriptionactive-onlyEnsures that the BGP session can be established only when the request is initiated by
the local end (active-open request) and all passive-open requests (from the other end)
are rejected by the local BGP.bothAllows BGP sessions to be established from both incoming or outgoing TCP connection
requests, with one being rejected in the event of a request collision.passive-onlyEnsures that the local BGP does not initiate any TCP open requests and the session
can be established only when the request comes from the remote end.

Command Default	The default is bot	h.

Command Modes Neighbor configuration VRF neighbor configuration

Neighbor group configuration

Session group configuration

Command History

ReleaseModificationRelease 5.0.0This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

BGP, by default, tries to initiate an active TCP connection whenever a new neighbor is configured. A remote neighbor may also initiate the TCP connection before the local BGP can initiate the connection. This initiation of a TCP connection by a remote neighbor is considered a passive-open request and it is accepted by the local BGP. This default behavior can be modified using the **session-open-mode** command.

Note

The BGP connection is not opened and, as a result the BGP session, is not established if both the peering neighbors use the same nondefault TCP session open mode—active-only or passive-only. If both ends are configured with active-only, each neighbor rejects the TCP open request from the other end. One neighbor must be configured as passive-only or both. Similarly, if both neighbors are configured with passive-only, neither neighbor initiates the TCP open request and the BGP session is not established. Again, one neighbor must be configured as active-only or both. There is one exception. A connection open request from a neighbor that is configured with the TCP session open mode to be passive-only is processed to detect whether there is a connection collision before the request is rejected. This exception enables the local BGP to reset the session if the remote neighbor goes down and it is not detected by the local router.

Use the **session-open-mode** command when it may be necessary to preconfigure a neighbor that does not exist. Ensure that BGP does not spend any time actively trying to set up a TCP session with the neighbor. A BGP session does not come up between two neighbors, both of which configure the same nondefault value (**active-only** or **passive-only** keyword) for this command.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to enable a BGP session on router bgp 1:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# neighbor 45.67.89.01
RP/0/RP0/CPU0:router(config-bgp-nbr)# session-open-mode active-only

show bgp

To display entries in the Border Gateway Protocol (BGP) routing table, use the **show bgp** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast| all| tunnel| mdt}| ipv6 {unicast| multicast| all| labeled-unicast}| all {unicast| multicast| all| labeled-unicast| mdt| tunnel}| vpnv4 unicast [rd rd-address]] vrf {vrf-name| all} [ipv4 {unicast| labeled-unicast}| ipv6 unicast]| vpnv6 unicast [rd rd-address]] [ip-address [{mask| /prefix-length} [longer-prefixes| unknown-attributes| bestpath-compare]]] [standby] [detail]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	tunnel	(Optional) Specifies tunnel address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.

	ip-address	(Optional) Network address, entered to display a particular network in the BGP routing table. If the network address is omitted, then all networks in the BGP routing table are displayed. If the network mask and prefix length is omitted, then the software displays the longest matching prefix for the network address.
	mask	(Optional) Network mask of the BGP route to match.
	/ prefix-length	(Optional) Prefix length of the BGP route to match. A slash (/) must precede the decimal value.
	longer-prefixes	(Optional) Displays a route with the specified prefix length and more-specific routes if available. The longer-prefixes keyword is available when the <i>ip-address</i> and <i>mask</i> or <i>/prefix-length</i> arguments are specified.
	unknown-attributes	(Optional) Includes unknown, transitive attributes. The unknown-attributes keyword is available when the <i>ip-address</i> and <i>mask</i> or <i>/prefix-length</i> arguments are specified.
	bestpath-compare	(Optional) Displays route and best-path comparison information. The bestpath-compare keyword is available when the <i>ip-address</i> and <i>mask</i> or <i>/prefix-length</i> arguments are specified.
	standby	(Optional) Displays information about the standby card.
	detail	(Optional) Displays the prefix details.
Command Default	-	baddress family is specified, the default address family and subaddress family fault-afi and set default-safi commands are used.
Command Modes	XR EXEC	

Command History Release Modification Release 5.0.0 This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **set default-afi** command is used to specify the default address family for the sessions and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for an address family or a subaddress family, each matching routing table is examined in turn.

Running the **show bgp** command immediately after configuring a large and complex route policy may result in timeout of the system database shown through an error message (SYSDB-SYSDB-6-TIMEOUT_EDM). It is recommended, that the show command be run, after the new route policy takes effect.

Use the **show bgp** *ip-address* { $mask \mid / prefix-length$ } command to display detailed information for a specific route. If the mask and prefix length are omitted, the details of the longest matching prefix for the IP address are displayed.

Use the **show bgp** command to display all routes in the specified BGP routing table. Use the **show bgp** *ip-address* { *mask* | */ prefix-length* } **longer-prefixes** command to display those routes more specific than a particular prefix.

Use the **unknown-attributes** keyword to display details of any transitive attributes associated with a route that are not understood by the local system.

This table describes the significant fields shown in the display.

Table 3: show	' bgp	Field	Descri	iptions
---------------	-------	-------	--------	---------

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) in asdot format is 1.0 to 65535.65535.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP table state	State of the BGP database.
Table ID	BGP database identifier.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between BGP scans for the specified address family and subaddress family.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit discriminator (MED) metric.

Field	Description
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the path origin code.

The following is sample output from the show bgp command with the network specified:

This table describes the significant fields shown in the display.

Table 4: show bgp prefix length Field Descriptions

Field	Description
BGP router table entry	Network that is being displayed.
Versions	List of the network versions in each BGP process.
Process	Name of the BGP process.
bRIB/RIB	Version of the network for sending to the RIB. You can compare this version with the bRIB/RIB version for the process (at the top of show bgp summary) to verify whether the network has been sent to the RIB.

Field	Description
SendTblVer	Version of the network for advertising to neighbors. This can be compared with the neighbor version to determine whether the network has been advertised to a particular neighbor.
Paths	List of paths for the network (that is, routes to reach the network). The number of paths and the index of the best path are given.
not advertised to any peer	Best path was received with a NO_ADVERTISE community and is not advertised to any neighbor.
not advertised to EBGP peer	Best path was received with a NO_EXPORT community and is not advertised to any eBGP neighbor.
not advertised outside local AS	Best path was received with a LOCAL_AS community and is not advertised to peers outside the local AS.
Advertisements of this net are suppressed by an aggregate	Network is a more-specific prefix of a configured aggregate and has been suppressed. It is not advertised to any neighbors unless they have an unsuppress-map configured.
Advertised to update-groups	List of update-groups to which the net has been advertised. Update-groups that have only one peer are not listed here.
Advertised to peers	List of neighbors to which the net has been advertised to. Neighbors that are in one of the update-groups listed above are not listed separately. Only neighbors that are in unique update-groups are listed.
Received by speaker 0	BGP process where the path originated. This is always "speaker 0" for standalone mode. It will be the speaker-id when BGP is in distributed mode.
AS Path	Autonomous system (AS) path that was received for the path. If the AS path is empty, then "Local" is displayed. This is the case for paths that are locally generated on this router or on a neighboring router within the same AS.
aggregated by	If the path is an aggregate, the router-id of the router that performed the aggregation.
suppressed due to dampening	Path has been suppressed due to the configured path dampening.

Field	Description
history entry	Path is withdrawn, but a copy is kept to store the dampening information.
Received from a RR-client	Path was received from a route reflector client.
received-only	If soft reconfiguration inbound is configured, the path was received but dropped by inbound policy, or was accepted and modified. In either event, the received-only value is a copy of the original, unmodified path.
received & used	If soft reconfiguration inbound is configured, the path was received and accepted by inbound policy, but not modified.
stale	Neighbor from which the path was received is down, and the path is kept and marked as stale to support graceful restart.
<nexthop> from <neighbor> (<router-id>)</router-id></neighbor></nexthop>	Next hop for the path. If the next hop is known by a mechanism outside BGP (for example, for redistributed paths), then 0.0.0.0 is displayed. After the next hop, the neighbor from whom the path was received is displayed, along with the neighbor's router-id. If the path was locally generated (for example, an aggregate or redistributed path), then 0.0.0.0 is displayed for the neighbor address.
Origin	IGP: the path originated from an IGP.
	EGP: the path originated from an EGP.
	incomplete: the origin of the path is unknown.
metric	MED value of the path.
localpref	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
weight	Locally assigned weight (if not 0) of the path. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
valid	Path is valid and can be considered in the best-path calculation.
redistributed	Path is redistributed through a redistribute command.

Field	Description
aggregated	Path is a locally generated aggregate created due to an aggregate-address command.
local	Path is a local network source due to a network command.
internal	Path was received from an iBGP neighbor.
external	Path was received from an eBGP neighbor.
atomic-aggregate	Path was received with the atomic-aggregate flag set. Some path information has been removed through aggregation.
best	Path is the best path for the network and is used for routing and advertised to peers.
multipath	Path is a multipath and is installed into the RIB along with the best path.
Community	List of communities attached to the path.
Extended community	List of extended communities attached to the path.
Originator	Originator of the path within the AS Cluster list if the path is reflected.
AS Cluster list	List of RR clusters the path has passed through if the path is reflected
Dampinfo	Penalty and reuse information if the path is dampened.
penalty	Current penalty for the path.
flapped	Number of times the path has flapped and the time since the first flap.
reuse in	Time until the path is re-used (undampened).
half life	Configured half-life for the path.
suppress value	Penalty at which the path is suppressed.
reuse value	Penalty at which the path is re-used.
Maximum suppress time	Maximum length of time for which the path can be suppressed.

The following is sample output from the **show bgp** command with the *ip-address/prefix-length* **detail** options:

```
RP/0/RP0/CPU0:router# show bgp 51.0.0.0/24 detail

```

The **show bgp** command output displays 'import suspect' when potential import oscillation has been detected for the prefix. Import of such a prefix is not affected. However, import of the prefix can be dampened in future if the oscillation continues. If the oscillation stops during the next import run, the prefix will no longer be marked 'import supect'.

This is sample output from **show bgp vpnv4 unicast rd prefix/length** command that displays Accept Own prefix information:

```

```

This table describes the significant fields shown in the display:

Field	Description
accept-own-self	The Accept Own path in the customer VRF contains the "accept-own-self" keyword/flag.
accept-own	The Accept Own path contains the "accept-own" keyword/flag.
Community:accept-own	List of communities attached to the path: accept-own.
Extended community	List of extended communities attached to the path.
Cluster list	Router ID or cluster ID of all route reflectors through which the route has passed.

The output of **show bgp {vpnv4 | vpnv6} unicast rd** command may display the optional BGP attribute not-in-vrf. If a path in a VPNvX net is marked as not-in-vrf, it may be due to any of the following conditions:

- The RD of the VPNvX net is not the same as any of the RDs configured for VRFs on the router.
- The RD of the VPNvX net is the same as the RD configured for a specific VRF on the router, but the path is not imported to the specified VRF. For example, the route-targets attached to the path do not match any of the **import route-target** [as-number:nn | ip-address:nn] configured for VRF, vrf 1.

If the not-in-vrf net is set, it indicates that the path does not belong to the VRF.

ted Commands	Command	Description	
	aggregate-address, on page 27	Creates an aggregate entry in a BGP routing table.	
	bgp default local-preference, on page 77	Changes the default local preference value.	
	network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.	
	route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.	
	set default-afi	Sets the default Address Family Identifier (AFI) for the current session.	
	set default-safi	Sets the default subaddress Family Identifier (SAFI) for the current session.	
	show bgp cidr-only, on page 299	Displays routes with nonnatural netmasks.	
	show bgp community, on page 303	Displays routes belonging to the specified communities.	

Relat

Command	Description
show bgp inconsistent-as, on page 322	Displays networks with inconsistent origin autonomous system.
show bgp regexp, on page 406	Displays routes matching an AS path regular expression.
show bgp route-policy, on page 411	Displays networks that match a route policy.
show bgp summary, on page 422	Displays the status of all BGP connections.
show bgp truncated-communities, on page 434	Displays networks with community lists truncated by policy.

show bgp update out

To display address-family level update generation information, use the **show bgp update out** command in XR EXEC mode.

show bgp [vrf vrf-name] [afi safi] update out [brief] detail]

Syntax Description	vrf vrf-name	(Optional) Displays non-default VRF.

show bgp advertised

To display advertisements for neighbors or a single neighbor, use the **show bgp advertised**command in XR EXEC mode.

show bgp [ipv4 { all| labeled-unicast| mdt| multicast| tunnel| unicast}] advertised [neighbor ip-address]
[standby] [summary]

show bgp [ipv6 { all| labeled-unicast| multicast| unicast}] advertised [neighbor ip-address] [standby]
[summary]

show bgp [all { all | labeled-unicast | multicast| tunnel | unicast }] advertised [neighbor ip-address]
[standby] [summary]

show bgp [vpnv4 unicast [rd rd-address]] advertised [neighbor ip-address] [standby] [summary]

show bgp [vpnv6 unicast [rd rd-address]] advertised [neighbor ip-address] [standby] [summary]

show bgp [vrf {vrf-name| all} [ipv4 | {labeled-unicast | unicast}| ipv6 unicast]] advertised [neighbor
ip-address] [standby] [summary]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.

	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	neighbor	(Optional) Previews advertisements for a single neighbor. If the neighbor keyword is omitted, then the advertisements for all neighbors are displayed.
	ip-address	(Optional) IP address of the neighbor.
	standby	(Optional) Displays information about the standby card.
	summary	(Optional) Displays a summary of advertisements.
Command Default	specified using the set defa	address family is specified, the default address family and subaddress family ault-afi and set default-safi commands are used.
	•	
Command Modes	specified using the set def	ault-afi and set default-safi commands are used.
Command Modes	specified using the set defa XR EXEC Release Release 5.0.0 To use this command, you	ault-afi and set default-safi commands are used. Modification

BGP contains a separate routing table for each address family and subaddress family combination that is configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp advertised** command to display the routes that have been advertised to peers or a specific peer. To preview advertisements that would be sent to a peer under a particular policy, even if the corresponding update messages have not been generated yet, use the **show bgp policy** command.

Note

When you issue the **show bgp advertised** command, a route is not displayed in the output unless an advertisement for that route has already been sent (and not withdrawn). If an advertisement for the route has not yet been sent, the route is not displayed.

Use the **summary** keyword to display a summary of the advertised routes. If you do not specify the **summary** keyword, the software displays detailed information about the advertised routes.

Note

The **show bgp advertised** command does not display the application of any outbound policy in the route details it displays. Consequently, this command provides only an indication of whether a particular route has been advertised, rather than details of which attributes were advertised. Use the **show bgp policy sent-advertisements** command to display the attributes that are advertised.

Examples

Task ID

The following is sample output from the **show bgp advertised** command in XR EXEC mode:

RP/0/RP0/CPU0:router# show bgp advertised neighbor 10.0.101.4 summary

Network	Next Hop	From	AS Path
1.1.1.0/24	10.0.101.1	10.0.101.1	2 3 222 333 444 555 i
1.1.2.0/24	10.0.101.1	10.0.101.1	34567i
1.1.3.0/24	10.0.101.1	10.0.101.1	77 88 33 44 55 99 99 99 i
1.1.4.0/24	10.0.101.1	10.0.101.1	25678i
1.1.7.0/24	10.0.101.1	10.0.101.1	3 5 i
1.1.8.0/24	10.0.101.1	10.0.101.1	77 88 99 99 99 i

This table describes the significant fields shown in the display.

Table 6: show bgp advertised neighbor summary Field Descriptions

Field	Description
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
From	IP address of the peer that advertised this route.

Field	Description
AS Path	AS path of the peer that advertised this route.
Local	Indicates the route originated on the local system.
Local Aggregate	Indicates the route is an aggregate created on the local system.
Advertised to	Indicates the peer to which this entry was advertised. This field is used in the output when displaying a summary of the advertisements to all neighbors.

The following is sample output from the **show bgp advertised** command for detailed advertisement information:

```
RP/0/RP0/CPU0:router# show bgp advertised neighbor 172.72.77.1
172.16.0.0/24 is advertised to 172.72.77.1
  Path info:
    neighbor: Local
                                neighbor router id: 172.74.84.1
    valid redistributed best
 Attributes after inbound policy was applied:
 next hop: 0.0.0.0
    MET ORG AS
    origin: incomplete metric: 0
    aspath:
10.52.0.0/16 is advertised to 172.72.77.1
  Path info:
   neighbor: Local Aggregate neighbor router id: 172.74.84.1 valid aggregated best
 Attributes after inbound policy was applied:
 next hop: 0.0.0.0
    ORG AGG ATOM
    origin: IGP aggregator: 172.74.84.1 (1)
    aspath:
```

This table describes the significant fields shown in the display.

Field	Description
is advertised to	IP address of the peer to which this route has been advertised. If the route has been advertised to multiple peers, the information is shown separately for each peer.
neighbor	IP address of the peer that advertised this route, or one of the following:
	Local—Route originated on the local system.
	Local Aggregate—Route is an aggregate created on the local system.

Field	Description
neighbor router id	BGP identifier for the peer, or the local system if the route originated on the local system.
Not advertised to any peer	Indicates the no-advertise well-known community is associated with this route. Routes with this community are not advertised to any BGP peers.
Not advertised to any EBGP peer	Indicates the no-export well-known community is associated with this route. Routes with this community are not advertised to external BGP peers, even if those external peers are part of the same confederation as the local router.
Not advertised outside the local AS	Indicates the local-AS well-known community is associated with this route. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
(Received from a RR-client)	Path was received from a route reflector client.
(received-only)	This path is not used for routing purposes. It is used to support soft reconfiguration, and records the path attributes before inbound policy was applied to a path received from a peer. A path marked "received-only" indicates that either the path was dropped by inbound policy, or the path information was modified by inbound policy and a separate copy of the modified path is used for routing.
(received & used)	Indicates that the path is used both for soft reconfiguration and routing purposes. A path marked "received and used," implies the path information was not modified by inbound policy.
valid	Path is valid.
redistributed	Path is locally sourced through redistribution.
aggregated	Path is locally sourced through aggregation.
local	Path is locally sourced through the network command.
confed	Path was received from a confederation peer.
best	Path is selected as best.
multipath	Path is one of multiple paths selected for load-sharing purposes.

Field	Description	
dampinfo	Indicates dampening information:	
	Penalty—Current penalty for this path.	
	Flapped—Number of times the route has flapped.	
	In—Time (hours:minutes:seconds) since the router noticed the first flap.	
	Reuse in—Time (hours:minutes:seconds) after which the path is made available. This field is displayed only if the path is currently suppressed.	
Attributes after inbound policy was applied	Displays attributes associated with the received route, after any inbound policy has been applied.	
	AGG—Aggregator attribute is present.	
	AS—AS path attribute is present.	
	ATOM—Atomic aggregate attribute is present.	
	COMM—Communities attribute is present.	
	EXTCOMM—Extended communities attribute is present.	
	LOCAL—Local preference attribute is present.	
	MET—Multi Exit Discriminator (MED) attribute is present.	
	next hop—IP address of the next system used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.	
	ORG—Origin attribute is present.	
origin	Origin of the path:	
	IGP—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.	
	EGP—Path originated from an Exterior Gateway Protocol.	
	incomplete—Origin of the path is not clear. For example, a route that is redistributed into BGP from an IGP.	
neighbor as	First autonomous system (AS) number in the AS path.	
aggregator	Indicates that the path was received with the aggregator attribute. The autonomous system number and router-id of the system that performed the aggregation are shown.	

Field	Description
metric	Value of the interautonomous system metric, otherwise known as the MED metric.
localpref	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system
aspath	AS path associated with the route.
community	Community attributes associated with the path. Community values are displayed in AA:NN format, except for the following well-known communities: Local-AS—Community with value 4294967043 or hex 0xFFFFF03. Routes with this community value are not advertised outside the local autonomous system or confederation boundary. no-advertise—Community with value 4294967042 or hex 0xFFFFF02. Routes with this community value are not advertised to any BGP peers. no-export—Community with value 4294967041 or hex 0xFFFFF01. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation with the local router.
Extended community	Extended community attributes associated with the path. For known extended community types, the following codes may be displayed: RT—Route target community SoO—Site of Origin community LB—Link Bandwidth community
Originator	Router ID of the originating router when route reflection is used.
Cluster lists	Router ID or cluster ID of all route reflectors through which the route has passed.

Related Commands

Command	Description
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.

Command	Description
set default-safi	Sets the default subaddress Family Identifier (SAFI) for the current session.
route-policy (BGP), on page 240	Applies a route policy to incoming and outgoing routes.
rd, on page 218	Filters routes using a prefix list.
show bgp policy, on page 374	Displays information about BGP advertisements under a proposed policy.
show bgp policy, on page 374 sent-advertisements	Previews advertisements to peers, including details of advertised attributes.

show bgp af-group

To display information about Border Gateway Protocol (BGP) configuration for address family groups, use the **show bgp af-group** command in XR EXEC mode.

show bgp af-group group-name {configuration [defaults] [nvgen]| inheritance| users}

group-name	Name of the address family group to display.	
configuration	(Optional) Displays the effective configuration for the af-group, including any settings that have been inherited from af-groups used by this af-group.	
defaults	(Optional) Displays all configuration settings, including any default settings.	
nvgen	(Optional) Displays output in the format of show running-config output.	
	If the defaults keyword is also specified, the output is not suitable for cutting and pasting into a configuration session.	
inheritance	Displays the af-groups from which this af-group inherits configuration settings.	
users	Displays the neighbors, neighbor groups, and af-groups that inherit configuration from this af-group.	
	configuration defaults nvgen inheritance	

Command Default No default behavior or value

Command Modes XR EXEC

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

S To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show bgp af-group** command with the *group-name* **configuration** argument and keyword to display the effective configuration of an af-group, taking into account any configuration that may be inherited from other af-groups through the **use af-group** command. The source of each command is shown.

If the **defaults** keyword is specified, all configuration for the af-group, including default values, is shown. Default configuration is identified in the show output. Use the **nvgen** keyword to display configuration

formatted in the style of the **show running-config** command. This output is suitable for cutting and pasting into configuration sessions.

Use the **show bgp af-group** command with the *group-name* **inheritance** argument and keyword to display the address family groups from which the specified af-group inherits configuration.

Use the **show bgp af-group** command with the *group-name* **users** argument and keyword to display the neighbors, neighbor groups, and af-groups that inherit configuration from the specified af-group.

Examples

The following af-group configuration is used in the examples:

```
af-group group3 address-family ipv4 unicast
remove-private-AS
soft-reconfiguration inbound
!
af-group group1 address-family ipv4 unicast
use af-group group2
maximum-prefix 2500 75 warning-only
default-originate
soft-reconfiguration inbound disable
!
af-group group2 address-family ipv4 unicast
use af-group group3
send-community-ebgp
send-extended-community-ebgp
capability orf prefix both
```

The following is sample output from the **show bgp af-group** command with the **configuration** keyword in XR EXEC mode. The source of each command is shown in the right column. For example, **default-originate** is configured directly on **af-group group1**, and the **remove-private-AS** command is inherited from af-group group2, which in turn inherits it from af-group group3.

```
RP/0/RP0/CPU0:router# show bgp af-group group1 configuration
```

af-group group1 address-family ipv4 unicast	
capability orf prefix both	[a:group2]
default-originate	[]
maximum-prefix 2500 75 warning-only	[]
remove-private-AS	[a:group2 a:group3]
send-community	[a:group2]
send-extended-community	[a:group2

The following is sample output from the **show bgp af-group** command with the **users** keyword:

RP/0/RP0/CPU0:router# show bgp af-group group2 users

IPv4 Unicast: a:group1

The following is sample output from the **show bgp af-group** command with the **inheritance** keyword. This example shows that the specified af-group group1 directly uses the group2 af-group, which in turn uses the group3 af-group:

```
RP/0/RSP0RP0/CPU0:router# show bgp af-group group1 inheritance
```

IPv4 Unicast: a:group2 a:group3

Table 8: show bgp af-group Field Descriptions, on page 293 describes the significant fields shown in the display.

This table describes the significant fields shown in the display.

Table 8: show bgp af-group Field Descriptions

Field	Description
[]	Configures the command directly on the specified address family group.
a:	Indicates the name that follows is an address family group.
n:	Indicates the name that follows is a neighbor group.
[dflt]	Indicates the setting is not explicitly configured or inherited, and the default value for the setting is used. This field may be shown when the defaults keyword is specified.
<not set=""></not>	Indicates that the configuration is disabled by default. This field may be shown when the defaults keyword is specified.

Related Commands

Command	Description
af-group, on page 25	Configures a BGP address family group.
show bgp neighbors, on page 335	Displays information about BGP neighbors, including configuration inherited from neighbor groups, session groups, and address family groups.
show bgp neighbor-group, on page 331	Displays information about configuration for neighbor groups.
use, on page 489 af-group	Configures an af-group to inherit the configuration of a specified af-group.

show bgp attribute-key

To display all existing attribute keys, use the show bgp attribute-keycommand in XR EXEC mode.

show bgp {ipv4| ipv6| all| vpnv4 unicast| vrf| vpnv6 unicast} attribute-key [standby]

ipv4	(Optional) Specifies IP Version 4 address prefixes.
unicast	(Optional) Specifies unicast address prefixes.
multicast	(Optional) Specifies multicast address prefixes.
labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
all	(Optional) For address family, specifies prefixes for all address families.
tunnel	(Optional) Specifies tunnel address prefixes.
mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
all	(Optional) For subaddress family, specifies prefixes for all subaddress families.
ipv6	(Optional) Specifies IP Version 6 address prefixes.
vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) Name of a VRF.
all	(Optional) For VRF, specifies all VRFs.
ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
standby	(Optional) Displays information about the standby card.
	unicast multicast labeled-unicast all tunnel mdt all ipv6 vpnv4 unicast vrf vrf-name all ipv4 { unicast labeled-unicast } ipv6 unicast vrf-name all

Command Default

If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

This table describes the significant fields shown in the display.

Table 9: show bgp	attribute-key	y Field Descrip	ntions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
BGP scan interval	Interval (in seconds) between scans.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	e—Entry originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
AttrKey	Key associated with the route attribute.
Processed <i>n</i> prefixes, <i>n</i> paths	Number of prefixes and number of paths processed for the table.

Related Commands

Command	Description
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.

show bgp cidr-only

To display routes with nonnatural network masks, also known as classless interdomain routing (CIDR) routes, use the **show bgp cidr-only** command in XR EXEC mode.

show bgp [ipv4| vrf] cidr-only [standby]

Syntax Description	·	
	ipv4	(Optional) Specifies the IP Version 4 address family.
	unicast	(Optional) Specifies the unicast address family.
	multicast	(Optional) Specifies the multicast address family.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress family, specifies all subaddress families.
	tunnel	(Optional) Specifies the tunnel address family.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	standby	(Optional) Displays information about the standby card.
Command Default	specified using the set default-af	s family is specified, the default address family and subaddress family i and set default-safi commands are used. This command is applicable ult address family is not IPv4, then the ipv4 keyword must be used.
Command Modes	XR EXEC	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

Border Gateway Protocol (BGP) contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for subaddress family, all subaddress family routing tables are examined.

The **show bgp cidr-only** command applies only for IPv4 prefixes. If the **ipv4** keyword is not specified and the default address family is not IPv4, the command is not available.

Use the **show bgp cidr-only** command to display CIDR routes. Routes that have their correct class (class A, B, or C) prefix length are not displayed.

bgp	read

Examples

Task ID

The following is sample output from the **show bgp cidr-only** command in XR EXEC mode:

RP/0/RP0/CPU0:router# show bg	p cidr-only			
BGP router identifier 172.20. BGP main routing table versio		number 1820		
Dampening enabled				
BGP scan interval 60 secs				
Status codes: s suppressed, d i - internal, S	- ·	tory, * val:	id, > best	5
Origin codes: i - IGP, e - EG	P, ? - incomple	ete		
Network Next Hop	Metri	c LocPrf	Weight	Path
*> 192.0.0.0/8 192.168.7	2.24 0	1878	?	
*> 192.168.0.0/16 192.168.7	2.30 0	108	?	

This table describes the significant fields shown in the display.

Table 10: show bgp cidr-only Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.

Field	Description
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	e—Entry originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.

Field	Description
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Related Commands

Command	Description
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp, on page 258	Displays BGP routes.

show bgp community

To display routes that have the specified Border Gateway Protocol (BGP) communities, use the **show bgp community** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast | all| tunnel| mdt}] community-list
[exact-match]

show bgp [ipv6 {unicast| multicast| labeled-unicast | all}] community community-list [exact-match]

show bgp [all {unicast| multicast| labeled-unicast | all| tunnel}] community community-list [exact-match]

show bgp [vpnv4 unicast [rd rd-address]] community community-list [exact-match]

show bgp [vrf {vrf-name| all} [ipv4 | {unicast| labeled-unicast}| ipv6 unicast]] community-list
[exact-match]

show bgp [vpnv6 unicast [rd rd-address]] community community-list [exact-match]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.

vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.		
community	Specifies that only routes with communities specified by <i>community-list</i> is displayed.		
community-list	Between one and seven communities. Each community can be a number in the range from 1 to 4294967295, a community specified in AA:NN format, or one of the following well-known communities:		
	local-AS —Well-known community with value 4294967043 or hex 0xFFFFF02 Routes with this community value are not advertised outside the local autonomou system or confederation boundary.		
	no-advertise —Well-known community with value 4294967042 or hex 0xFFFFFF02. Routes with this community value are not advertised to any BG peers.		
	no-export —Well-known community with value 4294967041 or hex 0xFFFFFF01. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation as the local router.		
	internet —Well-known community whose value is not defined in BGP RFC. IOS XR BGP uses a value of 0 for the internet community. Routes with this community are advertised to all peers without any restrictions.		
	For the AA:NN format:		
	AA—Range is 0 to 65535.		
	NN—Range is 1 to 4294967295.		
	Up to seven community numbers can be specified.		
exact-match	(Optional) Displays those routes that have communities exactly matching the specified communities.		

Command Default specified using the set default-afi and set default-safi commands are used.

Command Modes XR EXEC

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or the subaddress family, each matching routing table is examined in turn.

If more than seven communities are required, it is necessary to configure a route policy and use the show bgp route-policy, on page 411 command.

Use the **exact-match** keyword to display only those routes with a set of communities exactly matching the list of specified communities. If you omit the **exact-match** keyword, those routes containing at least the specified communities are displayed.

Task ID	Task ID	Operations
	bgp	read

Examples

The following is sample output from the **show bgp community** command in XR EXEC mode:

RP/0/RP0/CPU0:router# show bgp community 1820:1 exact-match

BGP router identifier 172.20.1.1, local BGP main routing table version 55 Dampening enabled	l AS number 1820
BGP scan interval 60 secs	
Status codes: s suppressed, d damped, h	n history, * valid, > best
i - internal, S stale	
Origin codes: i - IGP, e - EGP, ? - inc	complete
Network Next Hop	Metric LocPrf Weight Path
* 10.13.0.0/16 192.168.40.24	0 1878 704 701 200 ?
* 10.16.0.0/16 192.168.40.24	0 1878 704 701 i

This table describes the significant fields shown in the display.

Table 11: show bgp community Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.

Field	Description
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.

Field	Description
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Related Commands

Command	Description
aggregate-address, on page 27	Creates an aggregate entry in a BGP routing table.
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp, on page 258	Displays BGP routes.

show bgp convergence

To display whether a specific address family has reached convergence, use the **show bgp convergence** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast | all| tunnel| mdt}] convergence show bgp [ipv6 {unicast| multicast| labeled-unicast| all}] convergence show bgp [all {unicast| multicast| labeled-unicast | all| mdt| tunnel}] convergence show bgp [vpnv4 unicast] convergence show bgp [vpnv4 unicast] convergence

Syntax Description	ipv4	(Optional) Specifies the IP Version 4 address family.
	unicast	(Optional) Specifies the unicast address family.
	multicast	(Optional) Specifies the multicast address family.
	labeled-unicast	(Optional) Specifies unicast address prefixes.
	all	(Optional) For subaddress family, specifies all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies the IP Version 6 address family.
	all	(Optional) For address family, specifies all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
Command Default	5	ubaddress family is specified, the default address family and subaddress family
	1 0	efault-afi and set default-safi commands are used.
Command Modes	XR EXEC	lefault-afi and set default-safi commands are used.
Command Modes Command History		Modification

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

Border Gateway Protocol (BGP) contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp convergence** command to see if there is any pending work for BGP to perform. The software checks the following conditions to determine whether the specified address family has converged. If all the conditions are true, the address family is considered converged.

- All received updates have been processed and best routes selected.
- All selected routes have been installed in the global Routing Information Base (RIB).
- All selected routes have been advertised to peers, including any peers that are not established (unless those peers have been administratively shut down). See the **shutdown (BGP)** command for more information about administrative shutdown.

While testing that all selected routes have been advertised to peers, the **show bgp convergence**command checks the size of the write queue for each neighbor. Because this queue is shared by all address families, there is a small possibility that the command indicates the address family has not converged when, in fact, it has converged. This could happen if the neighbor write queue contained messages from some other address family.

If the specified address family has not converged, the **show bgp convergence** command output does not indicate the amount of work that is pending. To display this information, use the**show bgp summary** command.

Task ID	Task ID	Operations	
	bgp	read	

Examples

The following shows the result of using the **show bgp convergence** command for an address family that has converged:

RP/0/RP0/CPU0:router# show bgp convergence

Converged. All received routes in RIB, all neighbors updated. All neighbors have empty write queues.

The following shows the result of using the **show bgp convergence** command for an address family that has not converged:

RP/0/RP0/CPU0:router# show bgp convergence

Not converged. Received routes may not be entered in RIB. One or more neighbors may need updating.

This table describes the significant fields shown in the display.

Table 12: show bgp convergence Field Descriptions

Field	Description
Converged/Not converged	Specifies whether or not all routes have been installed in the RIB and updates have been generated and sent to all neighbors.
[All] Received routes	For convergence, all routes must have been installed into the RIB and all updates must have been generated. For non-convergence, some routes may not be installed in the RIB, or some routes that have been withdrawn have not yet been removed from the RIB, or some routes that are up to date in the RIB have not been advertised to all neighbors.
[All One or more] neighbors	Specifies the status of neighbor updating.

Related Commands

Command	Description
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp summary, on page 422	Displays the status of BGP peer connections.
shutdown (BGP), on page 452	Disables a neighbor without removing all of its configuration.

show bgp dampened-paths

To display Border Gateway Protocol (BGP) dampened routes, use the **show bgp dampened-paths** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast | all}] dampened-paths [standby]
show bgp [ipv6 {unicast| multicast| labeled-unicast| all}] dampened-paths [standby]
show bgp [all {unicast| multicast| labeled-unicast | all| tunnel}] dampened-paths [standby]

show bgp [vrf {vrf-name| all} [ipv4 | {unicast| labeled-unicast}| ipv6 unicast]] dampened-paths
show bgp [vpnv6 unicast [rd rd-address]] dampened-paths [standby]

ipv4	(Optional) Specifies IP Version 4 address prefixes.
unicast	(Optional) Specifies unicast address prefixes.
multicast	(Optional) Specifies multicast address prefixes.
labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
ipv6	(Optional) Specifies IP Version 6 address prefixes.
all	(Optional) For address family, specifies prefixes for all address families.
vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
rd rd-address	(Optional) Displays routes with a specific route distinguisher.
vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) Name of a VRF.
all	(Optional) For VRF, specifies all VRFs.
ipv4 {unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
standby	(Optional) Displays information about the standby card.

Table 13: show bgp dampened-paths Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.

Field	Description
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
From	Neighbor from which the route was received.
Reuse	Time (in hours:minutes:seconds) after which the path is made available.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Related Commands

Command	Description
aggregate-address, on page 27	Creates an aggregate entry in a BGP routing table.
bgp dampening, on page 75	Enables BGP route dampening or changes various BGP route dampening factors.
clear bgp dampening, on page 120	Clears BGP route dampening information and unsuppresses the suppressed routes.
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp flap-statistics, on page 316	Displays BGP routes that have flapped.
show bgp neighbors, on page 335	Displays information about the TCP and BGP connections to neighbors.

show bgp flap-statistics

To display information about Border Gateway Protocol (BGP) paths that have flapped, use the **show bgp flap-statistics** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast | all}] flap-statistics [regexp
regular-expression|route-policy route-policy-name |cidr-only |{ip-address| {mask| /prefix-length}}]
[longer-prefixes] [detail] [standby]

show bgp [ipv6 {unicast| multicast| labeled-unicast| all}] flap-statistics [regexp
regular-expression|route-policy route-policy-name |cidr-only |{ip-address| {mask| /prefix-length}}]
[longer-prefixes] [detail] [standby]

show bgp [all {unicast| multicast| labeled-unicast | all}] flap-statistics [regexp
regular-expression|route-policy route-policy-name |cidr-only |{ip-address| {mask| /prefix-length}}]
[longer-prefixes] [detail] [standby]

show bgp [**vpnv4 unicast** [**rd** *rd-address*]] **flap-statistics** [**regexp** *regular-expression*|**route-policy** *route-policy-name* |**cidr-only** |{*ip-address*| {*mask*| /*prefix-length*}}] [**longer-prefixes**] [**detail**] [**standby**]

show bgp [vrf {vrf-name| all} [ipv4 | {unicast| labeled-unicast}| ipv6 unicast]] flap-statistics [regexp regular-expression|route-policy route-policy-name |cidr-only |{ip-address| {mask| /prefix-length}}] [longer-prefixes] [detail] [standby]

show bgp [**vpnv6 unicast** [**rd** *rd*-*address*]] **flap-statistics** [**regexp** *regular-expression*|**route-policy** *route-policy-name* |**cidr-only** |{*ip-address*| {*mask*| */prefix-length*}}] [**longer-prefixes**] [**detail**]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.

ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
regexp regular-expression	(Optional) Displays flap statistics for all paths that match the regular expression.
route-policy route-policy-name	(Optional) Displays flap statistics for a route policy.
cidr-only	(Optional) Displays only routes whose prefix length does not match the classful prefix length for that network. The cidr-only keyword can be specified only if the address family is IPv4.
ip-address	(Optional) Flap statistics for a network address only.
mask	(Optional) Network mask applied to the <i>ip-address</i> argument.
/ prefix-length	(Optional) Length of the IP address prefix. A decimal value that indicates how many of the high-order contiguous bits of the address compose the prefix (the network portion of the address). A slash (/) must precede the decimal value.
longer-prefixes	(Optional) Displays flap statistics for the specified prefix and more-specific prefixes. The longer-prefixes keyword is available when the <i>ip-address</i> and <i>mask</i> or <i>/prefix-length</i> arguments are specified.
detail	(Optional) Displays dampening parameters for the path. The detail keyword cannot be specified if the longer-prefixes keyword is specified. The detail keyword is available when the <i>ip-address</i> argument or <i>ip-address</i> and <i>mask</i> or <i>/prefix-length</i> arguments are specified.

Command History

Release S.0.0

This command was introduced.

Modification

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Flap statistics are maintained only for paths if dampening is enabled using the **bgp dampening** command. If dampening is not enabled, the **show bgp flap-statistics** command does not display any paths.

If no arguments or keywords are specified, the software displays flap statistics for all paths for the specified address family. You can use the **regexp**, **filter-list**, **cidr-only**, and **longer-prefixes** options to limit the set of paths displayed.

If you specify a network address without a mask or prefix length, the longest matching prefix for the network address is displayed. When displaying flap statistics for a single route, use the **detail** keyword to display dampening parameters for the route.

This table describes the significant fields shown in the display.

Table 14: show bgp flap-statistics Field Descriptions

Field	Description
BGP route identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.

Field	Description
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network that is dampened.
From	IP address of the peer that advertised this route.
Flaps	Number of times the route has flapped.
Duration	Time (in hours:minutes:seconds) since the first flap.
Reuse	Time (in hours:minutes:seconds) after which the path is made available.
Path	Autonomous system path of the route that is being dampened.
Half life	Half-life value used when dampening this route. The half-life is the amount of time that must elapse to reduce the reuse penalty by half. The half-life value is specified using the bgp dampening command.
Suppress	Suppress value used to dampen this route. The suppress value is the value that the penalty must exceed for the route to be suppressed. The suppress value can be configured using the bgp dampening command.
Reuse penalty	Reuse penalty used to dampen this route. The penalty must fall below the reuse penalty for the route to be unsuppressed. The reuse penalty can be configured using the bgp dampening command.
Max supp. time	Maximum length of time that the route may be suppressed due to dampening. The maximum suppress time can be configured using the bgp dampening command.

Related Commands

Command	Description
bgp dampening, on page 75	Enables BGP route dampening or changes various BGP route dampening factors.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp dampened-paths, on page 311	Displays the BGP dampened routes.
show bgp neighbors, on page 335	Displays information about BGP neighbors.

show bgp inconsistent-as

To display Border Gateway Protocol (BGP) routes originated from more than one autonomous system, use the show bgp inconsistent-as command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast | all| tunnel| mdt}] inconsistent-as [standby] show bgp [ipv6 {unicast| multicast| labeled-unicast| all}] inconsistent-as [standby] show bgp [all {unicast| multicast| labeled-unicast | all| tunnel| mdt}] inconsistent-as [standby] show bgp vpnv4 unicast [rd rd-address] inconsistent-as [standby] show bgp [vrf {vrf-name| all} [ipv4 | {unicast| labeled-unicast}| ipv6 unicast]] inconsistent-as [standby] show bgp [vpnv6 unicast [rd rd-address]] inconsistent-as [standby]

tax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.

Synta

standby (Optional) Displays information about the standby card.

 Command Default
 If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.

 Command Modes
 XR EXEC

 Command History
 Release
 Modification

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

This command was introduced.

Note

Release 5.0.0

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or for the subaddress family, each matching routing table is examined in turn.

Use the **show bgp inconsistent-as**command to search through all prefixes in the specified BGP routing table and display the paths for any prefix that has inconsistent originating autonomous system numbers. The originating autonomous system is the last autonomous system number displayed in the path field and should be the same for all paths.

If a prefix has one or more paths originating from different autonomous systems, all paths for that prefix are displayed.

This table describes the significant fields shown in the display.

Table 15: show bgp inconsistent-as Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.

Field	Description
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Related Commands

Command	Description
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default -safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.

show bgp labels

To display Border Gateway Protocol (BGP) routes and their incoming and outgoing labels, use the **show bgp labels**command in XR EXEC mode.

show bgp labels

Syntax Description

ipv4	(Optional) Specifies IP Version 4 address prefixes.
unicast	(Optional) Specifies unicast address prefixes.
multicast	(Optional) Specifies multicast address prefixes.
labeled-unicast	(Optional) Specifies labeled-unicast address prefixes.
all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
ipv6	(Optional) Specifies IP Version 6 address prefixes.
vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
rd rd-address	(Optional) Displays routes with a specific route distinguisher.
vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) Name of a VRF.
all	(Optional) For VRF, specifies all VRFs.
<pre>ipv4 {unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
standby	(Optional) Displays information about the standby card.

Command Default

If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Table 16: show bgp	labels Field Descriptions	

Field	Description
BGP Route Distinguisher	BGP route distinguisher.
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP table state	State of the BGP routing table.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
Rcvd Label	Received label.
Local Label	Local label.

Related Commands

Command	Description
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default subaddress Family Identifier (SAFI) for the current session.

show bgp neighbor-group

To display information about the Border Gateway Protocol (BGP) configuration for neighbor groups, use the **show bgp neighbor-group** command in XR EXEC mode.

show bgp neighbor-group group-name {configuration [defaults] [nvgen]| inheritance| users}

Syntax Description		
yntax Deseription	group-name	Name of the address family group to display.
	configuration	(Optional) Displays the effective configuration for the neighbor group, including any configuration inherited by this neighbor group.
	defaults	(Optional) Displays all configuration, including default configuration.
	nvgen	(Optional) Displays output in show running-config command output.
		If the defaults keyword is also specified, the output is not suitable for cutting and pasting into a configuration session.
	inheritance	Displays the af-groups, session groups, and neighbor groups from which this neighbor group inherits configuration.
	users	Displays the neighbors and neighbor groups that inherit configuration from this neighbor group.
Command Modes	XR EXEC	
ommand History	Release	Modification
Command History	Release 5.0.0	Modification This command was introduced.

each configured command is also displayed.

Use the **defaults** keyword to display all configuration for the neighbor group, including default configuration. The command output identifies default onfiguration. Use the **nvgen** keyword to display configuration in the output form of **show running-config** command. Output in this form is suitable for cutting and pasting into a configuration session.

Theshow bgp neighbor-group command with the *group-name* inheritance argument and keyword displays the session groups, address family groups, and neighbor groups from which the specified neighbor group inherits configuration.

The **show bgp neighbor-group** group-name command displays the neighbors and neighbor groups that inherit configuration from the specified neighbor group.

Task ID	Task ID	Operations
	bgp	read

Examples

The examples use the following configuration:

```
af-group group3 address-family ipv4 unicast
 remove-private-AS
 soft-reconfiguration inbound
!
af-group group2 address-family ipv4 unicast
 use af-group group3
 send-community-ebap
 send-extended-community-ebgp
 capability orf prefix both
session-group group3
 dmzlink-bw
1
neighbor-group group3
 use session-group group3
 timers 30 90
1
neighbor-group group1
 remote-as 1982
 use neighbor-group group2
 address-family ipv4 unicast
 1
1
neighbor-group group2
 use neighbor-group group3
 address-family ipv4 unicast
  use af-group group2
  weight 100
```

The following is sample output from the **show bgp neighbor-group** command with the **configuration** keyword:

RP/0/RP0/CPU0:router# show bgp neighbor-group group1 configuration

```
neighbor-group group1
remote-as 1982
                                   []
                                   [n:group2 n:group3]
 timers 30 90
dmzlink-bw
                                   [n:group2 n:group3 s:group3]
 address-family ipv4 unicast
                                  []
 capability orf prefix both
                                  [n:group2 a:group2]
                                  [n:group2 a:group2 a:group3]
 remove-private-AS
  send-community-ebgp
                                   [n:group2 a:group2]
  send-extended-community-ebgp
                                  [n:group2 a:group2]
```

```
soft-reconfiguration inbound [n:group2 a:group3]
weight 100 [n:group2]
```

The configuration source is shown to the right of each command. In the output, the **remote-as** command is configured directly on neighbor group group1, and the **send-community-ebgp** command is inherited from neighbor group group2, which in turn inherits the setting from af-group group2.

The following is sample output from the **show bgp neighbor-group** command with the **users** keyword. This output shows that the group1 neighbor group inherits session (address family-independent configuration parameters) from the group2 neighbor group. The group1 neighbor group also inherits IPv4 unicast configuration parameters from the group2 neighbor group:

```
RP/0/RP0/CPU0:router# show bgp neighbor-group group2 users
```

Session: n:group1 IPv4 Unicast: n:group1

The following is sample output from the **show bgp neighbor-group** command with the **inheritance** keyword. This output shows that the specified neighbor group group1 inherits session (address family-independent configuration) from neighbor group group2, which inherits its own session from neighbor group group3. Neighbor group group3 inherited its session from session group group3. It also shows that the group1 neighbor-group inherits IPv4 unicast configuration parameters from the group2 neighbor group, which in turn inherits them from the group2 af-group, which itself inherits them from the group3 af-group:

RP/0/RP0/CPU0:router# show bgp neighbor-group group1 inheritance

Session: n:group2 n:group3 s:group3 IPv4 Unicast: n:group2 a:group3

This table describes the significant fields shown in the display.

Field	Description
[]	Configures the command directly on the specified address family group.
S:	Indicates the name that follows is a session group.
a:	Indicates the name that follows is an address family group.
n:	Indicates the name that follows is a neighbor group.
[dflt]	Indicates the setting is not explicitly configured or inherited, and the default value for the setting is used. This field may be shown when the defaults keyword is specified.
<not set=""></not>	Indicates that the default is for the setting to be disabled. This field may be shown when the defaults keyword is specified.

Table 17: show bgp neighbor-group Field Descriptions

Related Commands

Command	Description
af-group, on page 25	Configures a BGP address family group.
session-group, on page 254	Creates a session group and enters session group configuration mode.
show bgp af-group, on page 291	Displays information about configuration for address family groups.
show bgp neighbors, on page 335	Displays information about BGP neighbors, including configuration inherited from neighbor groups, session groups, and address family groups.
show bgp session-group, on page 416	Displays information about the BGP configuration for session groups.
show running-config	Displays the contents of the currently running configuration or a subset of that configuration.
use, on page 489	Inherits configuration from a neighbor group, a session group, or an address family group.

show bgp neighbors

To display information about Border Gateway Protocol (BGP) connections to neighbors, use the **show bgp neighbors** command in XR EXEC mode.

show bgp neighbors [performance-statistics| missing-eor] [standby]

show bgp neighbors *ip-address*[advertised-routes| dampened-routes| flap-statistics| performance-statistics| received | {prefix-filter| routes}| routes] [standby]

show bgp neighbors *ip-address* [configuration| [defaults] | nvgen| inheritance][standby]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	performance-statistics	(Optional) Displays performance statistics relative to work done by the BGP process for this neighbor.

	missing-eor	(Optional) Displays neighbors that did not send end-of-rib (EoR) notification in read-only mode.	
	ip-address	(Optional) IP address of the BGP-speaking neighbor. If you omit this argument, all neighbors are displayed.	
	advertised-routes	(Optional) Displays all routes the router advertised to the neighbor.	
	dampened-routes	(Optional) Displays the dampened routes that are learned from the neighbor	
	flap-statistics	(Optional) Displays flap statistics of the routes learned from the neighbor.	
	received { prefix-filter routes }	(Optional) Displays information received from the BGP neighbor. The options are:	
		prefix-filter— Displays the prefix list filter.	
		routes—Displays routes from the neighbor before inbound policy	
	routes	(Optional) Displays routes learned from the neighbor.	
	configuration	(Optional) Displays the effective configuration for the neighbor, including any settings that have been inherited from session groups, neighbor groups or af-groups used by this neighbor.	
	defaults	(Optional) Displays all configuration settings, including any default settings	
	nvgen	(Optional) Displays output in the show running-config command output	
	inheritance	(Optional) Displays the session groups, neighbor groups, and af-groups from which this neighbor inherits configuration settings.	
standby	standby	(Optional) Displays information about the standby card.	
Command Default	If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.		
Command Modes	XR EXEC		
Command History	Release	Modification	

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note	

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify which routing table should be examined. If the **all** keyword is specified for address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp neighbors** command to display detailed information about all neighbors or a specific neighbor. Use the **performance-statistics** keyword to display information about the work related to specific neighbors done by the BGP process.

Use the **show bgp neighbors** command with the *ip-address* **received prefix-filter** argument and keyword to display the Outbound Route Filter (ORF) received from a neighbor.

Use the **advertised-routes** keyword to display a summary of the routes advertised to the specified neighbor.

Use the **dampened-routes** keyword to display routes received from the specified neighbor that have been suppressed due to dampening. For more details, see the **show bgp dampened-paths** command.

To display information about flapping routes received from a neighbor, use the **flap-statistics** keyword. For more details, see the **show bgp flap-statistics** command.

To display the routes received from a neighbor, use the **routes** keyword. For more details, see the **show bgp** command.

Use the **show bgp neighbor** command with the *ip-address* **configuration** argument and keyword to display the effective configuration of a neighbor, including configuration inherited from session groups, neighbor groups, or af-groups through application of the **use** command. Use the **defaults** keyword to display the value of all configurations for the neighbor, including default configuration. Use the **nvgen** keyword to display configuration output format of the **show running-config** command. Output in this format is suitable for cutting and pasting into a configuration session. Use the **show bgp neighbors** command with the *ip-address* **inheritance** argument and keyword to display the session groups, neighbor groups, and af-groups from which the specified neighbor inherits configuration.

Examples	The following is sample o	utput from the show bgp neighbors command:	
	BGP neighbor is 10.0.1 Description: routem r Remote router ID 10.0	0.101.1 Shed, up for 00:00:56	

BGP neighbor is 1.1.1.2 Remote AS 300, local AS 100, external link Remote router ID 0.0.0.0 BGP state = Idle (LC/FIB for the neighbor in reloading) Last read 00:00:00, Last read before reset 00:05:12 Hold time is 180, keepalive interval is 60 seconds Configured hold time: 180, keepalive: 60, min acceptable hold time: 3 BFD enabled (session initializing) Last read 00:00:55, hold time is 180, keepalive interval is 60 seconds DMZ-link bandwidth is 1000 Mb/s Neighbor capabilities: Route refresh: advertised 4-byte AS: advertised and received Address family IPv4 Unicast: advertised and received Address family IPv4 Multicast: advertised and received Received 119 messages, 0 notifications, 0 in queue Sent 119 messages, 22 notifications, 0 in queue Minimum time between advertisement runs is 60 seconds For Address Family: IPv4 Unicast BGP neighbor version 137 Update group: 1.3 Community attribute sent to this neighbor AF-dependant capabilities: Outbound Route Filter (ORF) type (128) Prefix-list: Send-mode: advertised Receive-mode: advertised Route refresh request: received 0, sent 0 Policy for incoming advertisements is pass-all Policy for outgoing advertisements is pass-all 5 accepted prefixes, 5 are bestpaths Prefix advertised 3, suppressed 0, withdrawn 0, maximum limit 1000000 Threshold for warning message 75% For Address Family: IPv4 Multicast BGP neighbor version 23 Update group: 1.2 Route refresh request: received 0, sent 0 Policy for incoming advertisements is pass-all Policy for outgoing advertisements is pass-all 2 accepted prefixes, 2 are bestpaths Prefix advertised 0, suppressed 0, withdrawn 0, maximum limit 131072 Threshold for warning message 75% Connections established 9; dropped 8 Last reset 00:02:10, due to User clear requested (CEASE notification sent - administrative reset) Time since last notification sent to neighbor: 00:02:10 Error Code: administrative reset Notification data sent: None

This table describes the significant fields shown in the display.

Table 18: show bgp neighbors Field Descriptions

Field	Description
BGP neighbor	IP address of the BGP neighbor and its autonomous system number. If the neighbor is in the same autonomous system as the router, then the link between them is internal; otherwise, it is considered external.
Description	Neighbor specific description.

Field	Description
remote AS	• Number of the autonomous system to which the neighbor belongs.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
local AS	Autonomous system number of the local system.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
internal link	Neighbor is an internal BGP peer.
external link	Neighbor is an external BGP peer.
Administratively shut down	Neighbor connection is disabled using the shutdown command.
remote router ID	Router ID (an IP address) of the neighbor.
Neighbor under common administration	Neighbor is internal or a confederation peer.
BGP state	Internal state of this BGP connection.
BFD enabled	Status of bidirectional forwarding detection.
TCP open mode	TCP mode used in establishing the BGP session. The following valid TCP mode are supported:
	• default—Accept active/passive connections
	passive-only—Accept only passive connections
	• active-only—Accept only active connections initiated by the router
Last read	Time since BGP last read a message from this neighbor.

Field	Description
hold time	Hold time (in seconds) used on the connection with this neighbor.
keepalive interval	Interval for sending keepalives to this neighbor.
DMZ-link bandwidth	DMZ link bandwidth for this neighbor.
Neighbor capabilities	BGP capabilities advertised and received from this neighbor. The following valid BGP capabilities are supported:
	• Multi-protocol
	• Route refresh
	• Graceful restart
	• Outbound Route Filter (ORF) type (128) Prefix
Route refresh	Indicates that the neighbor supports dynamic soft reset using the route refresh capability.
4-byte AS	Indicates that the neighbor supports the 4-byte AS capability.
Address family	Indicates that the local system supports the displayed address family capability. If "received" is displayed, the neighbor also supports the displayed address family.
Received	Number of messages received from this neighbor, the number of notification messages received and processed from this neighbor, and the number of messages that have been received, but not yet processed.
Sent	Number of messages sent to this neighbor, the number of notification messages generated to be sent to this neighbor, and the number of messages queued to be sent to this neighbor.
Minimum time between advertisement runs	Advertisement interval (in seconds) for this neighbor.
For Address Family	Information that follows is specific to the displayed address family.
BGP neighbor version	Last version of the BGP database that was sent to the neighbor for the specified address family.
Update group	Update group to which the neighbor belongs.

Field	Description
Route reflector client	Indicates that the local system is acting as a route reflector for this neighbor.
Inbound soft reconfiguration allowed	Indicates that soft reconfiguration is enabled for routes received from this neighbor.
	Note If the neighbor has route refresh capability, then soft configuration received-only routes are not stored by the local system unless "override route refresh" is displayed.
eBGP neighbor with no inbound or outbound policy: defaults to drop	Indicates that the neighbor does not have an inbound or outbound policy configured using the route-policy (BGP) command. Hence, no routes are accepted from or advertised to this neighbor.
Private AS number removed from updates to this neighbor	Indicates that remove-private-AS is configured on the specified address family for this neighbor.
NEXT_HOP is always this router	Indicates that next-hop-self is configured on the specified address family for this neighbor.
Community attribute sent to this neighbor	Indicates that send-community-ebgp is configured on the specified address family for this neighbor.
Extended community attribute sent to this neighbor	Indicates that send-extended-community-ebgp is configured on the specified address family for this neighbor.
Default information originate	Indicates that default-originate is configured on the specified address family for this neighbor, together with the policy used, if one was specified in the default-originate configuration. An indication of whether the default route has been advertised to the neighbor is also shown.
AF-dependant capabilities	BGP capabilities that are specific to a particular address family. The following valid AF-dependent BGP capabilities are supported:
	• route refresh capability
	route refresh capability OLD value

Field	Description
Outbound Route Filter	Neighbor has the Outbound Route Filter (ORF) capability for the specified address family. Details of the capabilities supported are also shown:
	Send-mode—"advertised" is shown if the local system can send an outbound route filter to the neighbor. "received" is shown if the neighbor can send an outbound route filter to the local system.
	Receive-mode—"advertised" is shown if the local system can receive an outbound route filter from the neighbor. "received" is shown if the neighbor can receive an outbound route filter from the local system.
Graceful Restart Capability	Indicates whether graceful restart capability has been advertised to and received from the neighbor for the specified address family.
Neighbor preserved the forwarding state during latest restart	Indicates that when the neighbor connection was last established, the neighbor indicated that it preserved its forwarding state for the specified address family.
Local restart time	Restart time (in seconds) advertised to this neighbor.
RIB purge time	RIB purge time (in seconds) used for graceful restarts.
Maximum stalepath time	Maximum time (in seconds) a path received from this neighbor may be marked as stale if the neighbor restarts.
Remote Restart time	Restart time received from this neighbor.
Route refresh request	Number of route refresh requests sent and received from this neighbor.
Outbound Route Filter (ORF)	"sent" indicates that an outbound route filter has been sent to this neighbor. "received" indicates that an outbound route filter has been received from this neighbor.
	Note A received outbound route filter may be displayed using the show bgp neighbors command with the received prefix-filter keywords.
First update is deferred until ORF or ROUTE-REFRESH is received	If the local system advertised the receive capability and the neighbor has advertised send capability, no updates are generated until specifically asked by the neighbor (using a ROUTE-REFRESH or ORF with immediate request).

Field	Description
Scheduled to send the Prefix-list filter	Indicates the local system is due to send an outbound route filter request in order to receive updates from the neighbor.
Inbound path policy	Indicates if an inbound path policy is configured.
Outbound path policy	Indicates if an outbound path policy is configured.
Incoming update prefix filter list	Indicates a prefix list is configured to filter inbound updates from the neighbor.
Default weight	Default weight for routes received from the neighbor.
Policy for incoming advertisements	Indicates a route policy is configured to be applied to inbound updates from the neighbor.
Policy for outgoing advertisements	Indicates a route policy is configured to be applied to outbound updates to the neighbor.
Туре	Indicates whether the condition map selects routes that should be advertised, or routes that should not be advertised:
	Exist—Routes advertised if permitted by the condition route map.
	Non-exist—Routes advertised if denied by the condition route map.
accepted prefixes	Number of prefixes accepted.
Prefix advertised	Number of prefixes advertised to the neighbor during the lifetime of the current connection with the neighbor.
suppressed	Number of prefix updates that were suppressed because no transitive attributes changed from one best path to the next.
	Note Update suppression occurs only for external BGP neighbors.
withdrawn	Number of prefixes withdrawn from the neighbor during the lifetime of the current connection with the neighbor.
maximum limit	Maximum number of prefixes that may be received from the neighbor. If "(warning-only)" is displayed, a warning message is generated when the limit is exceeded, otherwise the neighbor connection is shut down when the limit is exceeded.

Field	Description
Threshold for warning message	Percentage of maximum prefix limit for the neighbor at which a warning message is generated.
Connections established	Number of times the router has established a BGP peering session with the neighbor.
dropped	Number of times that a good connection has failed or been taken down.
Last reset due to	Reason that the connection with the neighbor was last reset.
Time since last notification sent to neighbor	Amount of time since a notification message was last sent to the neighbor.
Error Code	Type of notification that was sent. The notification data, if any, is also displayed.
Time since last notification received from neighbor	Amount of time since a notification message was last received from the neighbor.
Error Code	Type of notification that was received. The notification data received, if any, is also displayed
External BGP neighbor may be up to <n> hops away</n>	Indicates ebgp-multihop is configured for the neighbor.
External BGP neighbor not directly connected	Indicates that the neighbor is not directly attached to the local system.
Notification data sent:	Data providing more details on the error along with the error notification sent to the neighbor.

The following is sample output from the **show bgp neighbors** command with the **advertised-routes** keyword:

RP/0/RP0/CPU0:router# show bgp neighbors 172.20.16.178 routes

```
BGP router identifier 172.20.16.181, local AS number 1

```

This table describes the significant fields shown in the display.

Table 19: show bgp neighbors routes Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.

Field	Description
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

The following is sample output from the **show bgp neighbors** command with the **dampened-routes** keyword:

RP/0/RP0/CPU0:router# show bgp neighbors 10.0.101.1 flap-statistics

```
BGP router identifier 10.0.0.5, local AS number 1
BGP main routing table version 48

This table describes the significant fields shown in the display.

Table 20: show bgp	neighbors	dampened-routes	Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
From	Neighbor from which the route was received.
Reuse	Time (in hours:minutes:seconds) after which the path is made available.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

The following is sample output from the **show bgp neighbors** command with the **flap-statistics** keyword:

RP/0/RP0/CPU0:router# show bgp neighbors 10.0.101.2 performance-statistics

```
BGP neighbor is 10.0.101.2, remote AS 1
Read 3023 messages (58639 bytes) in 3019 calls (time spent: 1.312 secs)
Read throttled 0 times
Processed 3023 inbound messages (time spent: 0.198 secs)
Wrote 58410 bytes in 6062 calls (time spent: 3.041 secs)
Processing write list: wrote 0 messages in 0 calls (time spent: 0.000 secs)
Processing write queue: wrote 3040 messages in 3040 calls (time spent: 0.055 secs)
Received 3023 messages, 0 notifications, 0 in queue
Sent 3040 messages, 0 notifications, 0 in queue
```

This table describes the significant fields shown in the display.

Table 21: show bgp neighbors flap-statistics Field Descriptions

Field	Description
BGP route identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between when the BGP process scans for the specified address family and subaddress family.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
From	IP address of the peer that advertised this route.
Flaps	Number of times the route has flapped.
Duration	Time (in hours:minutes:seconds) since the router noticed the first flap.
Reuse	Time (in hours:minutes:seconds) after which the path is made available.
Path	Autonomous system path to reach the destination network.

The following is sample output from the **show bgp neighbors** command with the **performance-statistics** keyword:

```
RP/0/RP0/CPU0:router# show bgp neighbors 10.0.101.2 performance-statistics
BGP neighbor is 10.0.101.2, remote AS 1
Read 3023 messages (58639 bytes) in 3019 calls (time spent: 1.312 secs)
Read throttled 0 times
Processed 3023 inbound messages (time spent: 0.198 secs)
Wrote 58410 bytes in 6062 calls (time spent: 3.041 secs)
Processing write list: wrote 0 messages in 0 calls (time spent: 0.000 secs)
Processing write queue: wrote 3040 messages in 3040 calls (time spent: 0.055 secs)
Received 3023 messages, 0 notifications, 0 in queue
Sent 3040 messages, 0 notifications, 0 in queue
```

This table describes the significant fields shown in the display.

Table 22: show bgp neighbors performance-statistics Field Descriptions

Field	Description
Read	Indicates the number of messages received from the neighbor, the total size of received messages, the number of read operations performed, and the real time spent (in seconds) by the process performing read operations for this neighbor.
Read throttled	Number of times that reading from the TCP connection to this neighbor has been throttled. Throttling is due to a backlog of messages that have been read but not processed.
inbound messages	Number of read messages that have been processed, and the real time spent processing inbound messages for this neighbor.
Wrote	Amount of data that has been sent to this neighbor, number of write operations performed, and the real time spent by the process performing write operations for this neighbor.
Processing write list	Number of messages written from the write list to this neighbor, number of times the write list has been processed, and real time spent processing the write list.
	Note Write lists typically contain only update messages.
Processing write queue	Number of messages written from the write queue to this neighbor, number of times the write queue has been processed, and real time spent processing the write queue.

Field	Description
Received	Number of messages received from this neighbor, number of notification messages received and processed from this neighbor, and number of messages that have been received, but not yet processed.
Sent	Number of messages sent to this neighbor, number of notification messages generated to be sent to this neighbor, and number of messages queued to be sent to this neighbor.

The following is sample output from the show bgp neighbors command with the configuration keyword:

RP/0/RP0/CPU0:router# show bgp neighbors 10.0.101.1 configuration

```
neighbor 10.0.101.1
remote-as 2 []
bfd fast-detect []
address-family ipv4 unicast []
policy pass-all in []
policy pass-all out []
policy pass-all in []
policy pass-all in []
policy pass-all out []
```

This table describes the significant fields shown in the display.

Table 23: show bgp neighbors configuration Field Descriptions

Field	Description
neighbor	IP address configuration of the neighbor.
remote-as	Remote autonomous system configured on the neighbor.
bfd fast-detect	BFD parameter configured on the neighbor.
address-family	Address family and subsequent address family configured on the router.
route-policy pass-all in	Route policy configured for inbound updates.
route-policy pass-all out	Route policy configured for outbound updates.

The following sample output shows sample output from **show bgp neighbors** command with additional paths send and receive capabilities advertised to neighbors:

```
BGP neighbor is 80.0.0.30
Remote AS 100, local AS 100, internal link
Remote router ID 33.33.33.33
```

Related Commands

Command	Description
clear bgp, on page 116	Resets a BGP connection or session.
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp, on page 258	Displays entries in the BGP routing table.
show bgp dampened-paths, on page 311	Displays BGP dampened routes.
show bgp flap-statistics, on page 316	Displays BGP routes that have flapped.
show bgp neighbor-group, on page 331	Displays information about the BGP configuration for neighbor groups.
shutdown (BGP), on page 452	Disables a neighbor without removing all of its configuration.

show bgp neighbors nsr

To display Border Gateway Protocol (BGP) nonstop routing (NSR) information across neighbors, use the **show bgp neighbors nsr** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| all}| ipv6 {unicast| multicast| all}| vpnv4 unicast| vpnv6 unicast| vrf {all| vrf_name}] neighbors nsr [standby]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf_name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	standby	(Optional) Displays information about the standby card.
Command Default	No default behavior or values.	
Command Modes	XR EXEC	
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		be in a user group associated with a task group that includes appropriate task nt is preventing you from using a command, contact your AAA administrator

Task ID Operations bgp read

Examples

The following is sample output from the show bgp neighbors nsr command with the standby keyword:

RP/0/RP0/CPU0:router# show bgp neighbors nsr standby

```
BGP neighbor is 2.2.2.2
BGP state = Established, up for 5d04h
NSR state = NSR Ready
Outstanding Postits: 0
BGP neighbor is 10.0.101.5
BGP state = Established, up for 05:19:00
NSR state = NSR Ready
Outstanding Postits: 0
BGP neighbor is 10.1.0.5
BGP state = Established, up for 5d04h
NSR state = NSR Ready
Outstanding Postits: 0
```

This table describes the significant fields shown in the display.

Table 24: show bgp neighbors nsr Field Descriptions

Field	Description
BGP state	Displays BGP neighbor peering state.
NSR state	Displays BGP neighbor NSR state.
Outstanding Postits	Displays the postit counters of pending events.

Related Commands

Command	Description	
nsr (BGP), on page 203	Activates the Border Gateway Protocol (BGP) nonstop routing (NSR).	
show bgp summary nsr, on page 427	Displays the Border Gateway Protocol (BGP) nonstop routing (NSR) information.	
show bgp summary, on page 422	Displays the status of all Border Gateway Protocol (BGP) connections.	

show bgp nexthops

To display statistical information about the Border Gateway Protocol (BGP) next hops, use the **show bgp nexthops** command in XR EXEC mode.

show bgp nexthops [statistics] [speaker speaker-id] [standby]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled-unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	statistics	(Optional) Specifies nexthop statistics.
	speaker speaker-id	(Optional) Specifies a speaker process ID.
	standby	(Optional) Displays information about the standby card.

Command Default	No default behavior or value			
Command Modes	XR EXEC			
Command History	Release	Modification		
	Release 5.0.0	This command was introduced.		
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.			
	The show bgp nexthops command displays statistical information about next-hop notifications, the time spent processing the notifications, and details about each next-hop that has been registered with the Routing Information Base (RIB).			
	Use the vrf <i>vrf</i> -name keyword and argument to display only the next-hops present in the specified VPN routing and forwarding (VRF) instance.			
	The next-hop information is displayed for all active speaker processes in distributed mode. Each speaker displays a set of next-hops that belongs to the prefixes received by the speaker and next hops that belong to best paths that were received by other speaker processes. Use the speaker <i>speaker-id</i> keyword and argument to display information for only the specified speaker process.			
Task ID	Task ID	Operations

This table describes the significant fields shown in the display.

Field	Description
VRF	Name of the VRF.
Total Nexthop Processing Time Spent	Time spent processing trigger delays for critical and noncritical events for the VRF or address family. The time is specified in seconds.
Maximum Nexthop Processing	Time that has passed since the nexthop notification was received that resulted in spending the maximum amount of processing time for all notifications.
Last Notification Processing	Time that has passed since the last nexthop notification was received.
IPv4 Unicast is active.	VRF specified output that indicates the IPv4 unicast address family is active within the VRF.
Nexthop Count	Number of next hops for the VRF or address family.
Critical Trigger Delay	Configured critical trigger delay.
Non-critical Trigger Delay	Configured noncritical trigger delay.
Total Critical Notifications Received	Number of critical notifications received.
Total Non-critical Notifications Received	Number of noncritical notifications received.
Bestpaths Deleted After Last Walk	Number of best paths deleted due to the last notification.
Bestpaths Changed After Last Walk	Number of best paths modified due to the last notification.
Next Hop	IP address of the next hop.
Status	Status of the next hop.
Metric	IGP metric of the next hop.
Notf	Number of critical and noncritical notifications received.
LastRIBEvent	When the last notification was received from the RIB.
RefCount	The number of neighbors or prefixes that refer to the next hop in address family/all format.
Address Family	Name of the address family.

Table 25: show bgp vrf all nexthops Field Descriptions

Related Commands

Command	Description
bgp redistribute-internal, on page 98	Specifies the delay for triggering BGP next-hop calculations.

show bgp nsr

To display Border Gateway Protocol (BGP) nonstop routing (NSR) information, use the **show bgp nsr** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast| all| tunnel| mdt}| ipv6 {unicast| multicast| all| labeled-unicast}| all {unicast| multicast| all| labeled-unicast| mdt| tunnel}| vpnv4 unicast| vrf {vrf-name| all} [ipv4 {unicast| labeled-unicast}| ipv6 unicast]| vpvn6 unicast] nsr [standby]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	standby	Displays information about the standby card.

	5	ess family is specified, the default address family and subaddress family afi and set default-safi commands are used.

Command	Description
nsr (BGP), on page 203	Activates Border Gateway Protocol (BGP) nonstop routing (NSR).

show bgp paths

To display all the Border Gateway Protocol (BGP) paths in the database, use the **show bgp paths** command in XR EXEC mode.

show bgp paths [detail] [debug] [regexp regular-expression]

Syntax Description	detail	(Optional) Displays detailed attribute information.	
	debug	(Optional) Displays attribute process ID, hash bucket, and hash chain ID attribute information.	
	regexp regular-expression	(Optional) Specifies an autonomous system path that matches the regular expression.	
Command Default	No default behavior or values

Spk 0	MET ORG AS	3	0234i

This table describes the significant fields shown in the display.

Table 26: show bgp paths Field Descriptions

Field	Description
Proc	ID of the process in which the path is stored. This is always "Spk 0."
Attributes	Attributes that are present. The following may appear:
	MET —Multi Exit Discriminator (MED) attribute is present.
	ORG—Origin attribute is present.
	AS—AS path attribute is present.
	LOCAL—Local preference attribute is present.
	AGG—Aggregator attribute is present.
	COMM—Communities attribute is present.
	ATOM—Atomic aggregate attribute is present.
	EXTCOMM—Extended communities attribute is present.

Field	Description
NeighborAS	Autonomous system number of the neighbor, or 0, if the path information originated locally.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Refcount	Number of routes using a path.
Metric	Value of the interautonomous system metric, otherwise known as the MED metric.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.

show bgp policy

To display information about Border Gateway Protocol (BGP) advertisements under a proposed policy, use the **show bgp policy** command in XR EXEC mode.

show bgp policy

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	neighbor	(Optional) Previews advertisements for a single neighbor.
	ip-address	(Optional) IP address of a single neighbor.
	sent-advertisements	(Optional) Displays the routes that have been advertised to neighbors. If a route has not yet been advertised to the neighbor, it is not shown.

	route-policy	(Optional) Displays advertisements for an output route policy.
	route-policy-name	(Optional) Name of the route policy.
	standby	(Optional) Displays information about the standby card.
	summary	(Optional) Displays a summary of the BGP advertisements.
Command Default	Advertisements for all neighbors are displayed if the neighbor <i>ip-address</i> keyword and argument are no specified. If no address family or subaddress family is specified, the default address family and subaddress family specified using the set default-afi and set default-safi commands are used.

The following is sample output from the **show bgp policy** command with the **summary** keyword in XR EXEC mode:

RP/0/RP0/CPU0:router# show bgp policy summary

Network	Next Hop	From	Advertised to 10.0.101.2 10.0.101.3
172.16.1.0/24	10.0.101.1	10.0.101.1	
172.17.0.0/16	0.0.0.0	Local	10.0.101.1 10.0.101.2 10.0.101.3

This table describes the significant fields shown in the display.

Table 27: show bgp policy summary Field Descriptions

Field	Description
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
From	IP address of the peer that advertised this route.
Local	Indicates the route originated on the local system.
Local Aggregate	Indicates the route is an aggregate created on the local system.
Advertised to	Indicates the neighbors to which this route was advertised.

The following is sample output from the **show bgp policy** command in XR EXEC mode:

```
RP/0/RP0/CPU0:router# show bgp policy
```

This table describes the significant fields shown in the display.

Field	Description
Is advertised to	IP address of the peer to which this route is advertised. If the route is advertised to multiple peers, information is shown separately for each peer.
neighbor	IP address of the peer that advertised this route, or one of the following:
	Local—Route originated on the local system.
	Local Aggregate—Route is an aggregate created on the local system.
neighbor router id	BGP identifier for the peer, or the local system if the route originated on the local system.
Not advertised to any peer	Indicates the no-advertise well-known community is associated with this route. Routes with this community are not advertised to any BGP peers.
Not advertised to any EBGP peer	Indicates the no-export well-known community is associated with this route. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation as the local router.
Not advertised outside the local AS	Indicates the local-AS well-known community is associated with this route. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
(Received from a RR-client)	Path was received from a route reflector client.
(received-only)	Path is not used for routing purposes. It is used to support soft reconfiguration, and records the path attributes before inbound policy was applied to a path received from a peer. A path marked "received-only" indicates that either the path was dropped by inbound policy, or that a copy of path information was created and then modified for routing use.
(received & used)	Indicates that the path is used both for soft reconfiguration and routing purposes. A path marked "(received & used)", implies the path information was not modified by inbound policy.
valid	Path is valid.
redistributed	Path is locally sourced through redistribution.

Table 28: show bgp policy Field Descriptions

Field	Description
aggregated	Path is locally sourced through aggregation.
local	Path is locally sourced through the network command.
confed	Path was received from a confederation peer.
best	Path is selected as best.
multipath	Path is one of multiple paths selected for load-sharing purposes.
dampinfo	Indicates dampening information:
	Penalty—Current penalty for this path.
	Flapped—Number of times the route has flapped.
	In—Time (hours:minutes:seconds) since the network first flapped.
	Reuse in—Time (hours:minutes:seconds) after which the path is available. This field is displayed only if the path is currently suppressed.
Attributes after inbound policy was applied	Displays attributes associated with the received route, after any inbound policy has been applied.
	AGG—Aggregator attribute is present.
	AS—AS path attribute is present.
	ATOM—Atomic aggregate attribute is present.
	COMM—Communities attribute is present.
	EXTCOMM—Extended communities attribute is present.
	LOCAL—Local preference attribute is present.
	MET—Multi Exit Discriminator (MED) attribute is present.
	next hop—IP address of the next system used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
	ORG—Origin attribute is present.

Field	Description
origin	Origin of the path:
	IGP—Path originated from an Interior Gateway Protocol (IGP) and was sourced by BGP using a network or aggregate-address command.
	EGP—Path originated from an Exterior Gateway Protocol.
	incomplete—Origin of the path is not clear; in example, a route that is redistributed into BGP from an IGP.
neighbor as	First autonomous system (AS) number in the AS path.
aggregator	Indicates that the path was received with the aggregator attribute. The AS number and router-id of the system that performed the aggregation are shown.
metric	Value of the interautonomous system metric, otherwise known as the MED metric.
localpref	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system
aspath	AS path associated with the route.
community	Community attributes associated with the path. Community values are displayed in AA:NN format, except for the following well-known communities:
	Local-AS—Community with value 4294967043 or hex 0xFFFFF03. Routes with this community value are not advertised outside the local autonomous system or confederation boundary.
	no-advertise—Community with value 4294967042 or hex 0xFFFFF02. Routes with this community value are not advertised to any BGP peers.
	no-export—Community with value 4294967041 or hex 0xFFFFF01. Routes with this community are not advertised to external BGP peers, even if those peers are in the same confederation as the local router.

Field	Description
Extended community	Extended community attributes associated with the path. For known extended community types, the following codes may be displayed:
	RT—Route target community
	SoO—Site of Origin community
	LB—Link Bandwidth community
Originator	Router ID of the originating router when route reflection is used.
Cluster lists	Router ID or cluster ID of all route reflectors through which the route has passed.
Attributes after outbound policy was applied	Displays attributes associated with the received route, after any outbound policy has been applied.
	AGG—Aggregator attribute is present.
	AS—AS path attribute is present.
	ATOM—Atomic aggregate attribute is present.
	COMM—Communities attribute is present.
	EXTCOMM—Extended communities attribute is present.
	LOCAL—Local preference attribute is present.
	MET—Multi Exit Discriminator (MED) attribute is present.
	next hop—IP address of the next system used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
	ORG—Origin attribute is present.

Related Commands

Command	Description
route-policy (BGP), on page 240	Applies an inbound or outbound routing policy to a neighbor.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.

Command	Description
show bgp advertised, on page 283	Displays routes advertised to neighbors.
show bgp neighbors, on page 335	Displays information about the TCP and BGP connections to neighbors.
show bgp route-policy, on page 411	Displays BGP information about networks that match an outbound route policy.

show bgp process

To display Border Gateway Protocol (BGP) process information, use the **show bgp process** command in XR EXEC mode.

show bgp [ipv4| {unicast| multicast| labeled-unicast| all| tunnel| mdt}| ipv6| {unicast| multicast| all| labeled-unicast}| all| {unicast| multicast| all| labeled-unicast| mdt| tunnel}| vpnv4 unicast| vpvn6 unicast] process [performance-statistics] [detail] [standby]

Cuntary Description		
Syntax Description	ipv4	(Optional) Specifies IP Version 4.
	unicast	(Optional) Specifies the unicast subaddress family.
	multicast	(Optional) Specifies the multicast subaddress family.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	performance- statistics	(Optional) Displays performance statistics relative to the work done by the specified process.
	detail	(Optional) Specifies detailed process information.
	standby	(Optional) Displays information about the standby card.

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC

This table describes the significant fields shown in the display.

Table 29: show bgp process Field Descriptions

Field	Description
BGP is operating in	Indicates BGP is operating in standalone mode. This is the only supported mode.
Autonomous System	Autonomous system number for the local system.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Router ID	BGP identifier assigned to the local system. If this is explicitly configured using the bgp router-id command, "manually configured" is displayed. If the router ID is not manually configured, it is determined from a global router ID. If no global ID is available, the router ID is shown as 0.0.0.0.
Confederation ID	Confederation identifier for the local system.
Cluster ID	Cluster identifier for the local system. If this is manually configured using the bgp cluster-id command, "manually configured" is displayed.
Default metric	Default metric. This is controlled by the default-metric command.
Fast external fallover enabled	Indicates whether fast external fallover is enabled. This is controlled by the bgp fast-external-fallover disable command.
Neighbor logging enabled	Indicates whether logging of peer connection up and down transitions is enabled. This is controlled by the bgp log neighbor changes disable command.

Field	Description
Enforce first AS enabled	Indicates that strict checking of the first AS number in paths received from external BGP peers is enabled. This is controlled by the bgp enforce-first-as disable command.
iBGP to IGP redistribution	Indicates internal redistribution is enabled using the bgp redistribution-internal command.
Treating missing MED as worst	Indicates missing Multi Exit Discriminator (MED) metric values are treated as worst in the route selection algorithm. This is controlled by the bgp bestpath med missing-as-worst command.
Always compare MED is enabled	Indicates that the MED is always used during the route selection algorithm, even when paths are received from external BGP neighbors in different autonomous systems. This is controlled by the bgp bestpath med always command.
AS Path ignore is enabled	Indicates that the AS path length is ignored by the route selection algorithm. This is controlled by the bgp bestpath as-path ignore command.
Comparing MED from confederation peers	Indicates that the MED values are used in the route selection algorithm when comparing routes received from confederation peers. This is controlled by the bgp bestpath med confed command.
Comparing router ID for eBGP paths	Indicates that the router ID is used as a tiebreaker by the route selection algorithm when comparing identical routes received from different external BGP neighbors. This is controlled by the bgp bestpath compare-routerid command.
Default local preference	Default local preference value used for BGP routes. This is controlled by the bgp default local-preference command.
Default keepalive	Default keepalive interval. This is controlled by the timers bgp command.

Field	Description
Graceful restart enabled	Indicates that the graceful restart capability is enabled. The configuration commands affecting graceful restart behavior are:
	• bgp graceful-restart
	• bgp graceful-restart purge-time
	• bgp graceful-restart stalepath-time
	• bgp graceful-restart restart-time
	• bgp graceful-restart graceful-reset
Update delay	Maximum time that a BGP process stays in read-only mode.
Generic scan interval	Interval (in seconds) between BGP scans for address family-independent tasks. This is controlled by the bgp scan-time command.
Dampening	Indicates whether dampening is enabled for the specified address family. This is controlled by the dampening command.
Client reflection	Indicates whether client-to-client route reflection is enabled for the specified address family. This is controlled by the bgp client-to-client reflection disable command.
Scan interval	Interval (in seconds) between BGP scans for the given address family. This is controlled by the bgp scan-time command in address family configuration mode.
Main Table Version	Last version of the BGP database that was installed into the main routing table.
IGP notification	Indicates whether Interior Gateway Protocols (IGP) have been notified of BGP convergence for the specified address family.
Node	Node on which the process is executing.
Process	Type of BGP process.
Speaker	Speaker process. A speaker process is responsible for receiving, processing, and sending BGP messages to configured neighbors.

Field	Description
Nbrs	Number of neighbors for which the process is responsible.
Estab	Number of neighbors that have connections in the established state for this process.
Rst	Number of times this process was restarted.
Upd-Revd	Number of update messages received by the process.
Upd-Sent	Number of update messages sent by the process.
Nfn-Rcvd	Number of notification messages received by the process.
Nfn-Sent	Number of notification messages sent by the process.

The following is sample output from the **show bgp process** command with the **detail** keyword:

Table 30: show bgp process detail Field Descriptions

Field	Description	
BGP is operating in	Indicates whether BGP is operating in standalone mode.	
Autonomous System	Autonomous system number for the local system.	
Router ID	BGP identifier assigned to the local system. If this is explicitly configured using the bgp router-id command, "manually configured" is displayed. If the router ID is not manually configured, it is determined from a global router ID. If the global ID is not available, the router ID is shown as 0.0.0.0.	
Confederation ID	Confederation identifier for the local system.	
Cluster ID	Cluster identifier for the local system. If this is manually configured using the bgp cluster-id command, "manually configured" is displayed.	
Default metric	Default metric.	
Fast external fallover enabled	Indicates whether fast external fallover is enabled.	
Neighbor logging enabled	Indicates whether logging of peer connection up and down transitions is enabled.	
Enforce first AS enabled	Indicates that strict checking of the first autonomou system (AS) number in paths received from externa BGP peers is enabled.	
iBGP to IGP redistribution	Indicates internal redistribution is enabled using the bgp redistribution-internal command.	
Treating missing MED as worst	Indicates missing MED metric values are treated as worst in the route selection algorithm. This is controlled by the bgp bestpath med missing-as-worst command.	

Field	Description	
Always compare MED is enabled	Indicates that the MED is always used during the route selection algorithm, even when paths are received from external BGP neighbors in different autonomous systems. This is controlled by the bgp bestpath med always command.	
AS Path ignore is enabled	Indicates that the AS path length is ignored by the route selection algorithm. This is controlled by the bgp bestpath as-path ignore command.	
Comparing MED from confederation peers	Indicates that the MED values are used in the route selection algorithm when comparing routes received from confederation peers. This is controlled by the bgp bestpath med confed command.	
Comparing router ID for eBGP paths	Indicates that the router ID is used as a tiebreaker by the route selection algorithm when comparing identical routes received from different external BGP neighbors. This is controlled by the bgp bestpath compare-routerid command.	
Default local preference	Default local preference value used for BGP routes.	
Default keepalive	Default keepalive interval. This is controlled by the timers bgp command.	
Graceful restart enabled	Indicates that the graceful restart capability is enabled. The configuration commands affecting graceful restart behavior are:	
	• bgp graceful-restart	
	• bgp graceful-restart purge-time	
	• bgp graceful-restart stalepath-time	
	• bgp graceful-restart restart-time	
	• bgp graceful-restart graceful-reset	
Update delay	Maximum time that a BGP process stays in read-only mode.	
Generic scan interval	Interval (in seconds) between BGP scans for address family-independent tasks. This is controlled by the bgp scan-time command.	
BGP Speaker Process	Speaker process responsible for receiving, processing and sending BGP messages.	

Field	Description
Node	Node on which the specified process is executing.
Neighbors	Number of neighbors for which the specified process is responsible.
established	Number of neighbors that have connections in the established state for the specified process.
Updates	Number of update messages sent and received by the specified process.
Notifications	Number of notification messages sent and received by the specified process.
Attributes	Number of unique sets of attribute information stored in the specified process and the amount of memory used by the attribute information.
AS Paths	Number of unique autonomous system paths stored in the specified process and the amount of memory used by the AS path information.
Communities	Number of unique sets of community information stored in the specified process and the amount of memory used by them.
Extended communities	Number of unique sets of extended community information stored in the specified process and the amount of memory used by them.
Route Reflector Entries	Number of unique sets of route reflector information stored in the specified process and the amount of memory used by them.
Nexthop Entries	Number of entries and memory usage for cached next- hop information.
Update messages queued	Total number of update messages queued to be sent across all neighbors for which the specified process is responsible.
Address family	Specified address family.
Dampening	Indicates whether dampening is enabled for the specified address family.

Field	Description
Client reflection	Indicates whether client-to-client route reflection is enabled for the specified address family. This is controlled by the bgp client-to-client reflection disable command.
Scan interval	Interval (in seconds) between BGP scans for the given address family. This is controlled by the bgp scan-time command.
Main Table Version	Last version of the local BGP database for the specified address family that was injected into the main routing table.
IGP notification	Indicates whether IGPs have been notified of BGP convergence for the specified address family.
RIB has converged	Indicates whether the main routing table version has converged and the version at which it converged.
State	BGP system state for the specified address family and process. This may be one of the following:
	read-only mode—Initial set of updates is being recovered. In this mode, route selection is not performed, routes are not installed in the global RIB, and updates are not advertised to peers.
	best-path calculation mode—Route selection is being performed for the routes that were received while in read-only mode.
	import mode—Routes are imported from one VRF to another VRF once the best paths are calculated. This mode is supported in VPNv4 unicast address family mode.
	RIB update mode—Routes that were selected in best-path calculation mode are being installed in the global RIB.
	label allocation mode: Labels are allocated for the received prefixes based on the requirement.
	normal mode—Best paths are sent to the peers for routes that exist in the RIB. The route selection, import processing, RIB updates, and label allocation are performed as new updates are received.
BGP Table Version	Last version used in the BGP database for received routes.

Field	Description
Attribute download	Indicates whether the RIB attribute download is enabled.
Network Entries	Number of sets of prefix information held in the specified BGP process for the specified address family.
Soft Reconfig Entries	Number of sets of prefix information that are present only for the purpose of supporting soft reconfiguration.
Dampened Paths	Number of routes that are suppressed due to dampening for the specified address family.
History Paths	Number of routes that are currently withdrawn, but are being maintained to preserve dampening information.
Prefixes (Allocated/Freed)	Number of sets of prefix information for the specified address family that have been allocated and freed during the lifetime of the process.
Paths (Allocated/Freed)	Number of sets of route information for the specified address family that have been allocated and freed during the lifetime of the process.
Prefixes (Number/Memory Used)	Number of sets of prefix information currently allocated for the specified address family, and the amount of memory used by them.
Paths (Number/Memory Used)	Number of sets of route information currently allocated for the specified address family, and the amount of memory used by them.

The following is sample output from the **show bgp process** command with the **performance-statistics** keyword:

RP/0/RP0/CPU0:router# show bgp process performance-statistics detail

This table describes the significant fields shown in the display.

Table 31: show bgp process performance-statistics Field Descriptions
Table 51. Show byp process performance-statistics rieu Descriptions

Field	Description
BGP is operating in	Indicates whether BGP is operating in standalone mode.
Autonomous system	Autonomous system number for the local system.
Router ID	BGP identifier assigned to the local system. If this is explicitly configured using the bgp router-id command, "manually configured" is displayed. If the router ID is not manually configured, it is determined from a global router ID. If the global ID is not available, the router ID is shown as 0.0.0.0.
Confederation ID	Confederation identifier for the local system.

Field	Description	
Cluster ID	The cluster identifier for the local system. If this is manually configured using the bgp cluster-id command, "manually configured" is displayed.	
Default metric	Default metric.	
Fast external fallover enabled	Indicates whether fast external fallover is enabled.	
Neighbor logging enabled	Indicates whether logging of peer connection up and down transitions is enabled. This is controlled by the bgp log neighbor changes disable command.	
Enforce first AS enabled	Indicates that strict checking of the first AS number in paths received from external BGP peers is enabled.	
iBGP to IGP redistribution	Indicates internal redistribution is enabled using the bgp redistribution-internal command.	
Treating missing MED as worst	Indicates missing MED metric values are treated as worst in the route selection algorithm. This is controlled using the bgp bestpath med missing-as-worst command.	
Always compare MED is enabled	Indicates that the MED is always used during the route selection algorithm, even when paths are received from external BGP neighbors in different autonomous systems. This setting is controlled by the bgp bestpath med always command.	
AS Path ignore is enabled	Indicates that the AS path length is ignored by the route selection algorithm. This is controlled by the bgp bestpath as-path ignore command.	
Comparing MED from confederation peers	Indicates that the MED values are used in the route selection algorithm when comparing routes received from confederation peers. This is controlled by the bgp bestpath med confed command.	
Comparing router ID for eBGP paths	Indicates that the router ID is used as a tiebreaker by the route selection algorithm when comparing identical routes received from different external BGP neighbors. This is controlled by the bgp bestpath compare-routerid command.	
Default local preference	Default local preference value used for BGP routes.	
Default keepalive	Default keepalive interval. This setting is controlled by the timers bgp command.	

Field	Description
Graceful restart enabled	Indicates that the graceful restart capability is enabled. The configuration commands affecting graceful restart behavior are: bgp graceful-restart , bgp graceful-restart purge-time , bgp graceful-restart stalepath-time , bgp graceful-restart restart-time , and bgp graceful-restart graceful-reset .
Update delay	Maximum time that a BGP process stays in read-only mode.
Generic scan interval	Interval (in seconds) between BGP scans for address family-independent tasks. This setting is controlled by the bgp scan-time command in router configuration mode.
Address family	Specified address family.
Dampening	Indicates whether dampening is enabled for the specified address family.
Client reflection	Indicates whether client-to-client route reflection is enabled for the specified address family. This is controlled by the bgp client-to-client reflection disable command.
Scan interval	Interval (in seconds) between BGP scans for the given address family. This is controlled by the bgp scan-time command.
Main Table Version	Last version of the local BGP database for the specified address family that was injected into the main routing table.
IGP notification	Indicates whether IGPs have been notified of BGP convergence for the specified address family.
Node	Node on which the process is executing.
Process	BGP process.
Speaker	Speaker process. The speaker process is responsible for receiving, processing and sending BGP messages.
Read	Real time (in seconds) spent reading messages from peers by this process.
Write	Real time (in seconds) spent writing messages to peers by this process.

Field	Description
Inbound	The real time (in seconds) spent processing messages read from peers by this process.
Config	Real time (in seconds) spent processing configuration commands by this process.
Data	Real time (in seconds) spent providing operational data by this process.
Conv	Indicates whether the process has converged after the initial update.
Nbr Estab	Time stamp (in seconds) recording the time when the first neighbor became established.
Bestpath	Time stamp (in seconds) recording the time the best-path calculation mode was entered.
RIB Inst	Time stamp (in seconds) recording the time RIB update mode was entered.
Read/Write	Time stamp (in seconds) recording the time normal mode was entered.
Last Upd	Time stamp (in seconds) recording the time the last update was sent to a neighbor.
Address Family IPv4 Unicast converged in <i>n</i> seconds	Indicates that BGP has reached initial convergence for the IPv4 unicast address family. The time taken for convergence is shown.
Address Family IPv6 Multicast converged in <i>n</i> seconds	Indicates that BGP has reached initial convergence for the IPv6 multicast address family. The time taken for convergence is shown.

The following is sample output from the **show bgp process** command with the **performance-statistics** and **detail** keywords:

This table describes the significant fields shown in the display.

Table 32: show bgp process performance-statistics detail Field Descriptions

Field	Description
Process	The specified process.
Location	Node in which the specified process is executing.
Neighbors	Number of neighbors for which the specified process is responsible.
established	Number of neighbors that have connections in the established state for the specified process.
Updates	Number of update messages sent and received by the specified process.
Notifications	Number of notification messages sent and received by the specified process.

Field	Description
Attributes	Number of unique sets of attribute information stored in the specified process and the amount of memory used by the attribute information.
AS Paths	Number of unique autonomous system paths stored in the specified process, and the amount of memory used by the AS path information.
Communities	Number of unique sets of community information stored in the specified process and the amount of memory used by them.
Extended communities	Number of unique sets of extended community information stored in the specified process and the amount of memory used by them.
Route Reflector Entries	Number of unique sets of route reflector information stored in the specified process and the amount of memory used by them.
Route-map Cache Entries	Number of entries and memory usage for cached results for applying a route map.
Filter-list Cache Entries	Number of entries and memory usage for cached results for applying an AS path filter list.
Next Hop Cache Entries	Number of entries and memory usage for cached next-hop information.
Update messages queued	Number of update messages queued to be sent across all neighbors for which the specified process is responsible.
Read	Indicates the number of messages read by the process, the total size of read messages, the number of read operations performed, and the real time spent by the process performing read operations.
Read throttled	Number of times that reading from TCP has been throttled due to a backlog of messages read but not processed.
inbound messages	Number of read messages that have been processed and the real time spent processing inbound messages.
Wrote	Amount of data that has been written by the process, the number of write operations performed, and the real time spent by the process performing write operations.

Field	Description	
Processing write list	Number of messages written from write lists, the number of times the write list has been processed, and the real time spent processing the write list.	
	Note Write lists typically contain only update messages.	
Processing write queue	Number of messages written from write queues, number of times the write queue has been processed, and the real time spent processing the write queue.	
Socket setup	Number of socket setup operations performed and the real time spent during socket setup operations.	
Configuration	Number of configuration requests received by the process and the real time spent processing configuration requests.	
Operational data	Number of requests for operational data (for show commands) received by the process and the real time spent processing operation data requests	
State	BGP system state for the specified address family and process. This may be one of the following:	
	read-only mode—Initial set of updates is being recovered. In this mode, route selection is not performed, routes are not installed in the global RIB, and updates are not advertised to peers.	
	best-path calculation mode—Route selection is being performed for the routes that were received while in read-only mode.	
	import mode—Routes are imported from one VRF to another VRF once the best paths are calculated. This mode is supported in VPNv4 unicast address family mode.	
	RIB update mode—Routes that were selected in best-path calculation mode are being installed in the global RIB.	
	label allocation mode: Labels are allocated for the received prefixes based on the requirement.	
	normal mode—Best paths are sent to the peers for routes that exist in the RIB. The route selection, import processing, RIB updates, and label allocation are performed as new updates are received.	
BGP Table Version	Last version used in the BGP database for received routes.	

Field	Description	
Network Entries	Number of sets of prefix information held in the specified BGP process for the specified address family.	
Soft Reconfig Entries	Number of sets of prefix information that are present only for the purpose of supporting soft reconfiguration.	
Dampened Paths	Number of routes that are suppressed due to dampening for the specified address family.	
History Paths	Number of routes that are currently withdrawn, but are being maintained to preserve dampening information.	
Prefixes (Allocated/Freed)	Number of sets of prefix information for the specified address family that have been allocated and freed during the lifetime of the process.	
Paths (Allocated/Freed)	Number of sets of route information for the specified address family that have been allocated and freed during the lifetime of the process.	
Prefixes (Number/Memory Used)	Number of sets of prefix information currently allocated for the specified address family and amon of memory used by them.	
Paths (Number/Memory Used)	Number of sets of route information currently allocated for the specified address family and amon of memory used by them.	
Updates generated	Number of prefixes for which updates have been generated, the number of messages used to advertis the updates, the number of update generation runs performed, and the real time spent generating update for the specified address family.	
Scanner	Number of times the scanner has run for the specified address family and real time spent in scanner processing.	
RIB Update	Number of global routing information base update runs performed for the specified address family, number of prefixes installed, withdrawn, or modified in the global RIB during these runs, and real time spent performing these runs.	
Process has converged	Indicates whether the process has reached initial convergence for the specified address family.	

Field	Description
First neighbor established	Time stamp (in seconds) recording the time the first neighbor in the process was established.
Entered DO_BESTPATH mode	Time stamp (in seconds) recording the time best-path calculation mode was entered.
Entered DO_RIBUPD mode	Time stamp (in seconds) recording the time RIB update mode was entered.
Entered Normal mode	Time stamp (in seconds) recording the time normal mode was entered.
Last UPDATE sent	Time stamp (in seconds) recording the time the last update was sent to a neighbor.

show bgp regexp

To display routes matching the autonomous system path regular expression, use the**show bgp regexp** command in XR EXEC mode.

show bgp regexp regular-expression

Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	regular-expression	Regular expression to match the BGP autonomous system paths.

Command Default

If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC

Command History

Release 5.0.0

Release

 Modification

 This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each configured address family and subaddress family combination. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined in turn.

Use the **show bgp regexp** command to display all routes in the specified BGP table whose autonomous system path is matched by the specified regular expression.

Note

If the regular expression contains spaces and parentheses, it must be specified and surrounded by quotation marks.

Examples

The following is sample output from the **show bgp regexp** command:

```
RP/0/RP0/CPU0:router# show bgp regexp "^3 "
```

*>i172.20.17.121	10.0.101.2	100	0 3 2000 3000 i
*>i10.0.0.0	10.0.101.2	100	0 3 100 1000 i
*>i172.5.23.0/24	10.0.101.2	100	0 3 4 60 4378 i

This table describes the significant fields shown in the display.

Table 33: show bgp regexp Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.

Field	Description
Origin codes	Origin of the path. The origin code is placed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP address of a network entity.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Related Commands

Command	Description
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp, on page 258	Displays entries in the BGP routing table.
show bgp route-policy, on page 411	Displays BGP information about networks that match an outbound route policy.

show bgp route-policy

To display Border Gateway Protocol (BGP) information about networks that match an outbound route policy, use the **show bgp route-policy** command in XR EXEC mode.

show bgp route-policy route-policy-name [standby]

Syntax Description		
Syntax Description	ipv4	(Optional) Specifies IP Version 4 address prefixes.
	unicast	(Optional) Specifies unicast address prefixes.
	multicast	(Optional) Specifies multicast address prefixes.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	іруб	(Optional) Specifies IP Version 6 address prefixes.
	all	(Optional) For address family, specifies prefixes for all address families.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	route-policy-name	Name of a route policy.
	standby	(Optional) Displays information about the standby card.

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined.

A route policy must be configured to use this command. When the **show bgp route-policy** command is entered, routes in the specified BGP table are compared with the specified route policy, and all routes passed by the route policy are displayed.

If a pass clause is encountered while the route policy is being applied to the route and the route policy processing completes without hitting a drop clause, the route is displayed. The route is not displayed if a drop clause is encountered, if the route policy processing completes without hitting a pass clause, or if the specified route policy does not exist.

The information displayed does not reflect modifications the policy might make to the route. To display such modifications, use the **show bgp policy** command.

Task ID	Task ID	Operations
	bgp	read

Examples The following is sample output from the **show bgp route-policy** command in XR EXEC mode:

```
RP/0/RP0/CPU0:router# show bgp route-policy p1
```

This table describes the significant fields shown in the display.

Table 34: show bgp route-policy Field Descriptions

Field	Description
BGP router identifier	BGP identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit discriminator (MED) metric.

Field	Description
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Related Commands

Command	Description
aggregate-address, on page 27	Configures an aggregate entry in a BGP routing table.
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor
route-policy	Configures a route policy.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp policy, on page 374	Displays advertisements under a proposed policy.

show bgp session-group

To display information about the Border Gateway Protocol (BGP) configuration for session groups, use the **show bgp session-group** command in XR EXEC mode.

show bgp session-group group-name {configuration [defaults] [nvgen]| inheritance| users}

Syntax Description		Name of the session family group to display.							
	group-name	Name of the session family group to display.							
	configuration	(Optional) Displays the effective configuration for the session group, including any inherited configuration.							
	defaults	(Optional) Displays all configuration, including default configuration.							
	nvgen (Optional) Displays output in the form of the show running-config								
		If the defaults keyword also is specified, the output is not suitable for cutting and pasting into a configuration session.							
	inheritance	(Optional) Displays the session groups from which this session group inherits configuration.							
	users	(Optional) Display the session groups, neighbor groups, and neighbors that inherit configuration from this session group.							
Command Default Command Modes	No default behavior o	or value							
Command History	Release	Modification							
	Release 5.0.0	This command was introduced.							
Usage Guidelines		, you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator							
	Use the show bgp session-group command with the <i>group-name</i> configuration argument and keyword to display the effective configuration of a session group, including any configuration inherited from other session groups through application of the use command. The source for each configured command is also displayed.								

Use the **defaults** keyword to display the value of all configuration, including default configuration. Use the **nvgen** keyword to display configuration in the form of the **show running-config** command output. Output in this form is suitable for cutting and pasting into a configuration session.

Use the **show bgp session-group** command with the *group-name* **inheritance** argument and keyword to display the session groups from which the specified session group inherits configuration.

Use the **show bgp session-group** command with the *group-name* **users** argument and keyword to display the neighbors, neighbor groups, and session groups that inherit configuration from the specified session group.

Task ID	Task ID	Operations		
	bgp	read		

Examples

For the example shown here, the following configuration is used:

```
session-group group3
advertisement-interval 5
dmzlink-bw
!
session-group group1
use session-group group2
update-source Loopback0
!
session-group group2
use session-group group3
ebgp-multihop 2
```

The following example shows the **show bgp session-group** command with the **configuration** keyword:

RP/0/RP0/CPU0:router# show bgp session-group group1 configuration

```
session-group group1
advertisement-interval 5[s:group2 s:group3]
ebgp-multihop 2 [s:group2]
update-source Loopback0 []
dmzlink-bandwidth [s:group2 s:group3]
```

The source of each command is shown to the right of the command. For example, **update-source** is configured directly on session group group1. The **dmzlink-bandwidth** command is inherited from session group group2, which in turn inherits it from session group group3.

The following example shows the **show bgp session-group** command with the **users** keyword:

RP/0/RP0/CPU0:router# show bgp session-group group2 users

IPv4 Unicast:a:group1 The following example shows the **show bgp session-group** command with the **inheritance** keyword.

RP/0/RP0/CPU0:router# show bgp session-group group1 inheritance

Session:s:group2 s:group3

The command output shows that the session group group1 directly uses the group2 session group. The group2 session group uses the group3 session group.

This table describes the significant fields shown in the display.

Field	Description
[]	Configures the command directly on the specified session group.
s:	Indicates the name that follows is a session group.
a:	Indicates the name that follows is an address family group.
n:	Indicates the name that follows is a neighbor group.
[dflt]	Indicates the command is not explicitly configured or inherited, and the default value for the command is used. This field may be shown when the defaults keyword is specified.
<not set=""></not>	Indicates that the default is for the command to be disabled. This field may be shown when the defaults keyword is specified.

	multicast	(Optional) Specifies multicast address prefixes.					
	ipv6	(Optional) Specifies IP Version 6 address prefixes.					
	all	(Optional) For address family, specifies prefixes for all address families.					
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.					
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.					
	vrf-name	(Optional) Name of a VRF.					
	all	(Optional) For VRF, specifies all VRFs.					
	<pre>ipv4 { unicast labeled-unicast }</pre>	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.					
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.					
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.					
	standby	(Optional) Displays information about the standby card.					

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC

Command History Release		Modification		
	Release 5.0.0	This command was introduced.		

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

Use the **show bgp summary** command to display a summary of the neighbors for which the specified address family and subaddress family are enabled. If the neighbor does not have the specified address family and subaddress family enabled, it is not included in the output of the **show** command. If the **all** keyword is specified for the address family or subaddress family, a summary for each combination of address family and subaddress family is displayed in turn.

The table versions shown in the output (RcvTblVer, bRIB/RIB, SendTblVer, and TblVer) are specific to the specified address family and subaddress family. All other information is global.

The table versions provide an indication of whether BGP is up to date with all work for the specified address family and subaddress family.

- bRIB/RIB < RecvTblVer—Some received routes have not yet been considered for installation in the global routing table.
- TblVer < SendTblVer—Some received routes have been installed in the global routing table but have not yet been considered for advertisement to this neighbor.

This table describes the significant fields shown in the display.

Table 37: show bgp summary Field Descriptions

Field	Description
BGP router identifier	IP address of the router.
local AS number	Autonomous system number set by the router bgp, on page 245 command.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP table state	State of the BGP database.
Table ID	BGP database identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
BGP is operating in	Specifies BGP is operating in standalone mode.
Process	BGP process.
RecvTblVer	Last version used in the BGP database for received routes.
bRIB/RIB	Last version of the local BGP database that was injected into the main routing table.
LabelVer	Label version used in the BGP database for label allocation.
ImportVer	Last version of the local BGP database for importing routes.
SendTblVer	Latest version of the local BGP database that is ready to be advertised to neighbors.
Some configured eBGP neighbors do not have any policy	Some external neighbors exist that do not have both an inbound and outbound policy configured for every address family, using the route-policy (BGP) command. In this case, no prefixes are accepted and advertised to those neighbors.
Neighbor	IP address of a neighbor.
Spr	Speaker process that is responsible for the neighbor. Always 0.
AS	Autonomous system.
MsgRcvd	Number of BGP messages received from a neighbor.
MsgSent	Number of BGP messages sent to a neighbor.
TblVer	Last version of the BGP database that was sent to a neighbor.
InQ	Number of messages from a neighbor waiting to be processed.
OutQ	Number of messages waiting to be sent to a neighbor.
Up/Down	Length of time in (hh:mm:ss) that the BGP session has been in Established state, or the time since the session left Established state, if it is not established.

Field	Description
St/PfxRcd	If the BGP session is not established, the current state of the session. If the session is established, the number of prefixes the router has received from the neighbor.
	If the number of prefixes received exceeds the maximum allowed (as set by the maximum-prefix command), "(PfxRcd)" appears.
	If the connection has been shut down using the shutdown command, "(Admin)" appears.
	If the neighbor is external and it does not have an inbound and outbound policy configured for every address family, an exclamation mark (!) is inserted at the end of the state when using the route-policy (BGP) command.
	If the connection has been shut down due to out of memory (OOM), "(OOM)" appears.

Related Commands

Command	Description
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.

show bgp summary nsr

To display the summary of Border Gateway Protocol (BGP) neighbor state and nonstop routing (NSR) state information, use the **show bgp summary** nsr command in XR EXEC mode.

show bgp summary [ipv4 {unicast| multicast| labeled-unicast| all| tunnel| mdt}| ipv6 {unicast| multicast| all| labeled-unicast| all| labeled-unicast| mdt| tunnel}| vpnv4 unicast| vrf {vrf-name| all} [ipv4 {unicast| labeled-unicast}| ipv6 unicast]| vpvn6 unicast] nsr [standby]

Syntax Description		(Ontional) Specifica ID Varian 1 address profives					
-,	ipv4	(Optional) Specifies IP Version 4 address prefixes.					
	unicast	(Optional) Specifies unicast address prefixes.					
	multicast	(Optional) Specifies multicast address prefixes.					
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.					
	all	(Optional) For subaddress families, specifies prefixes for all subaddress families.					
	tunnel	(Optional) Specifies tunnel address prefixes.					
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.					
	multicast	(Optional) Specifies multicast address prefixes.					
	ipv6	(Optional) Specifies IP Version 6 address prefixes.					
	all	(Optional) For address family, specifies prefixes for all address families.					
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.					
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.					
	vrf-name	(Optional) Name of a VRF.					
	all	(Optional) For VRF, specifies all VRFs.					
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.					
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.					
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.					
	standby	Displays information about the standby card.					

Command Default	efault If no address family or subaddress family is specified, the default address family and subaddress f specified using the set default-afi and set default-safi commands are used.					ress family

Table 38: show bgp summary nsr Field Descriptions

Field	Description
BGP router identifier	IP address of the router.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
Non-stop routing	State of the Nonstop routing.
BGP table state	State of the BGP database.
Table ID	BGP database identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
BGP is operating in	Specifies BGP is operating in standalone mode.

Field	Description
Entered mode	The successive transition of various states of TCP and BGP, leading to the NSR ready state.
	Note This is used for monitoring and debugging purposes.
SyncVer	The version which has synced to standby for this neighbor.
AckVer	The version which the neighbor has acknowledge.
NBRState	State of the BGP neighbor.
NSRState	Neighbor NSR state.

Related Commands

Command	Description
nsr (BGP), on page 203	Activates Border Gateway Protocol (BGP) nonstop routing (NSR)
show bgp nsr, on page 367	Displays Border Gateway Protocol (BGP) nonstop routing (NSR) information.

show bgp table

To display neighbors in the global table, use the show bgp table command in XR EXEC mode.

show bgp table [ipv4 {unicast| multicast| tunnel| mdt}| ipv6 {unicast| multicast}| vpnv4 unicast| vpnv6 unicast]

Syntax Description	ipv4 unicast	(Optional) Specifies IP Version 4 (IPv4) unicast neighbors.
	ipv4 multicast	(Optional) Specifies IPv4 multicast neighbors.
	ipv4 tunnel	(Optional) Specifies IPv4 tunnel neighbors.
	ipv4 mdt	(Optional) Specifies IPv4 multicast distribution tree (MDT) neighbors.
	ipv6 unicast	(Optional) Specifies IP Version 6 (IPv6) unicast neighbors.
	ipv6 multicast	(Optional) Specifies IPv6 multicast neighbors.
	vpnv4 unicast	(Optional) Specifies VPN Version 4 (VPNv4) unicast neighbors.
	vpnv6 unicast	(Optional) Specifies VPN Version 6 (VPNv6) unicast neighbors.

Command Default No default behavior or value

Command Modes XR EXEC

Command History

Release	Modification
Release 5.0.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **show bgp table** command provides information about the BGP neighbors based on the global address family and independent of VRFs. Use the **show bgp table** command to get information about all BGP neighbors in different address families.

Task ID Examples	Task ID			Operat	ions

Table 39: show bgp table Field Descriptions

Field	Description
Neighbor	IP address of a neighbor.
VRF	The VRF which each neighbor belongs to; either the default VRF or a specified VRF.
Spk	Speaker process that is responsible for the neighbor. Always 0.
AS	Autonomous system.
TblVer	Last version of the BGP database that was sent to a neighbor.
InQ	Number of messages from a neighbor waiting to be processed.

Field	Description
OutQ	Number of messages waiting to be sent to a neighbor.
St/PfxRcd	If the BGP session is not established, the current state of the session. If the session is established, the number of prefixes the router has received from the neighbor.
	If the number of prefixes received exceeds the maximum allowed (as set by the maximum-prefix command), "(PfxRcd)" appears.
	If the connection has been shut down using the shutdown command, "(Admin)" appears.
	If the neighbor is external and it does not have an inbound and outbound policy configured for every address family, an exclamation mark (!) is inserted at the end of the state when using the route-policy (BGP) command.
	If the connection has been shut down due to out of memory (OOM), "(OOM)" appears.

Command	Description
show bgp neighbor-group, on page 331	Displays information about the Border Gateway Protocol (BGP) configuration for neighbor groups.
show bgp neighbors, on page 335	Displays information about Border Gateway Protocol (BGP) connections to neighbors.
show bgp summary, on page 422	Displays the status of all Border Gateway Protocol (BGP) connections.

show bgp truncated-communities

To display routes in the Border Gateway Protocol (BGP) routing table for which inbound policy or aggregation has exceeded the maximum number of communities that may be attached, use the **show bgp truncated-communities** command in XR EXEC mode.

show bgptruncated-communities standby

ipv4	(Optional) Specifies IP Version 4 address prefixes.
unicast	(Optional) Specifies unicast address prefixes.
multicast	(Optional) Specifies multicast address prefixes.
labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
all	(Optional) For subaddress families, specifies prefixes for all subaddress families.
tunnel	(Optional) Specifies tunnel address prefixes.
mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
multicast	(Optional) Specifies multicast address prefixes.
ipv6	(Optional) Specifies IP Version 6 address prefixes.
all	(Optional) For address family, specifies prefixes for all address families.
vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
rd rd-address	(Optional) Displays routes with a specific route distinguisher.
vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
vrf-name	(Optional) Name of a VRF.
all	(Optional) For VRF, specifies all VRFs.
ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
vpvn6 unicast	(Optional) Specifies VPNv6 unicast address families.
standby	(Optional) Displays information about the standby card.
	unicast multicast labeled-unicast all tunnel mdt multicast ipv6 all vpnv4 unicast rd rd-address vrf vrf-name all ipv4 { unicast labeled-unicast } ipv6 unicast vpvn6 unicast

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC

and History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

Comma

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

BGP contains a separate routing table for each address family and subaddress family combination that has been configured. The address family and subaddress family options specify the routing table to be examined. If the **all** keyword is specified for the address family or subaddress family, each matching routing table is examined.

Use the **show bgp truncated-communities** command to display those routes in the specified BGP routing table in which the buffers used to store communities or extended communities have overflowed. An overflow occurs if an attempt is made to associate more communities or extended communities with the route than fits in a BGP update message. This can happen due to modification of communities or extended communities during aggregration or when inbound policy is applied.

Task ID	Task ID	Operations
	bgp	read

Examples

The following is sample output from the **show bgp truncated-communities** command:

RP/0/RP0/CPU0:router# show bgp truncated-communities

BGP router identifier 172.20.1.1, local AS number 1820 BGP main routing table version 3042 BGP scan interval 60 secs

This table describes the significant fields shown in the display.

Table 40: show bgp truncated-communities Field Descriptions

Field	Description
BGP router identifier	BGP Identifier for the local system.
local AS number	Autonomous system number for the local system.
BGP main routing table version	Last version of the BGP database that was installed into the main routing table.
Dampening enabled	Displayed if dampening is enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.
Status codes	Status of the table entry. The status is displayed as a three-character field at the beginning of each line in the table. The first character may be (in order of precedence):
	S—Path is stale, indicating that a graceful restart is in progress with the peer from which the route was learned.
	s—Path is more specific than a locally sourced aggregate route and has been suppressed.
	*—Path is valid.
	The second character may be (in order of precedence):
	>—Path is the best path to use for that network.
	d—Path is dampened.
	h—Path is a history entry, representing a route that is currently withdrawn, but that is being maintained to preserve dampening information. Such routes should never be marked as valid.
	The third character may be:
	i—Path was learned by an internal BGP (iBGP) session.

Field	Description
Origin codes	Origin of the path. The origin code is displayed at the end of each line in the table. It can be one of the following values:
	i—Path originated from an Interior Gateway Protocol (IGP) and was advertised with a network or aggregate-address command.
	e—Path originated from an Exterior Gateway Protocol (EGP).
	?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.
Network	IP prefix and prefix length for a network.
Next Hop	IP address of the next system that is used when a packet is forwarded to the destination network. An entry of 0.0.0.0 indicates that the router has a non-BGP route to this network.
Metric	Value of the interautonomous system metric, otherwise known as the Multi Exit Discriminator (MED) metric.
LocPrf	Local preference value. This is used to determine the preferred exit point from the local autonomous system. It is propagated throughout the local autonomous system.
Weight	Path weight. Weight is used in choosing the preferred path to a route. It is not advertised to any neighbor.
Path	Autonomous system path to the destination network. At the end of the path is the origin code for the path.

Command	Description
aggregate-address, on page 27	Creates an aggregate entry in a BGP routing table.
network (BGP), on page 190	Specifies a local network that the BGP routing process should originate and advertise to its neighbors.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.

Command	Description
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp, on page 258	Displays entries in the BGP routing table.

show bgp update-group

To display Border Gateway Protocol (BGP) information for update groups, use the **show bgp update-group** command in XR EXEC mode.

show bgp [ipv4 {unicast| multicast| labeled-unicast| all| tunnel| mdt}| ipv6 {unicast| multicast| all| labeled-unicast}| all {unicast| multicast| all| labeled-unicast| mdt| tunnel}| vpnv4 unicast| vrf {vrf-name| all} [ipv4 {unicast| labeled-unicast}| ipv6 unicast]| vpnv6 unicast] update-group [neighbor ip-address| process-id.index [summary| performance-statistics]] [standby]

Syntax Description	ipv4	(Optional) Specifies IP Version 4 update groups.
	unicast	(Optional) Specifies unicast update groups.
	multicast	(Optional) Specifies multicast update groups.
	labeled-unicast	(Optional) Specifies labeled unicast address prefixes.
	all	(Optional) Displays both unicast and multicast update groups.
	tunnel	(Optional) Specifies tunnel address prefixes.
	mdt	(Optional) Specifies multicast distribution tree (MDT) address prefixes.
	ipv6	(Optional) Specifies IP Version 6 update groups.
	all	(Optional) Displays both IP Version 4 and IP Version 6 update groups.
	vpnv4 unicast	(Optional) Specifies VPNv4 unicast address families.
	rd rd-address	(Optional) Displays routes with a specific route distinguisher.
	vrf	(Optional) Specifies VPN routing and forwarding (VRF) instance.
	vrf-name	(Optional) Name of a VRF.
	all	(Optional) For VRF, specifies all VRFs.
	ipv4 { unicast labeled-unicast }	(Optional) For VRF, specifies IPv4 unicast or labeled-unicast address families.
	ipv6 unicast	(Optional) For VRF, specifies IPv6 unicast address families.
	vpnv6 unicast	(Optional) Specifies VPNv6 unicast address families.
	neighbor ip-address	(Optional) Specifies information on an update group for a specific neighbor.

(Optional) Update group index. Process ID range is 0 to 254. Index range is 0 to 4294967295.	
The <i>process id.index</i> argument is specified as follows: process ID (dot) index. In standalone mode, the process ID is always 0.	
(Optional) Specifies summary of update group members.	
(Optional) Specifies performance information about the updates generated for the update group.	
(Optional) Displays information about the standby card.	
-	

Command Default If no address family or subaddress family is specified, the default address family and subaddress family specified using the **set default-afi** and **set default-safi** commands are used.

Command Modes XR EXEC

Command History	Release	Modification
	Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

The **set default-afi** command is used to specify the default address family for the session, and the **set default-safi** command is used to specify the default subaddress family for the session. See the *System Management Command Reference for Cisco NCS 6000 Series Routers* for detailed information and syntax for the **set default-afi** and **set default-safi** commands. If you do not specify a default address family, the default address family is IPv4. If you do not specify a default subaddress family, the default subaddress family is unicast.

Every BGP neighbor is automatically assigned to an update group for each address family that is enabled on the neighbor. Neighbors that have similar outbound policy, such that they are sent the same updates, are placed in the same update group.

Use the **show bgp update-group** command to display the update groups and a list of the neighbors that belong to the update group.

Use the **show bgp update-group neighbor** command to display details about the update group to which a neighbor belongs for the specified address family.

Use the **summary** keyword to display a summary of the neighbors belonging to the specified update group. The display format is the same as for the show bgp summary, on page 422 command.

Use the **performance-statistics** keyword to display information about the number of prefixes processed and the time taken to generate updates for the specified update group.

Note

Update group indexes are not necessarily persistent over a process restart. If a BGP process restarts, the index of the update group to which a particular neighbor is assigned may be different, though the set of neighbors belonging to the update group is the same.

bgp	read

Examples

The following is sample output from the **show bgp update-group** command:

RP/0/RP0/CPU0:router# show bgp update-group

```
Update group for IPv4 Unicast, index 0.1:
Attributes:
Internal
Common admin
Send communities
Send extended communities
Minimum advertisement interval: 300
Update group desynchronized: 0
Sub-groups merged: 0
Messages formatted: 0, replicated: 0
Neighbors not in any sub-group:
10.0.101.1
```

This table describes the significant fields shown in the display.

Table 41: show bgp update-group Field Descriptions

Field	Description
Update group for	Address family to which updates in this update group apply.
index	Update group index.
Attributes	Attributes common to all members of the update group.
Unsuppress map	Unsuppress route map used to selectively unsuppress more specific routes of locally generated aggregates for members of this update group.
Outbound policy	Route policy applied to outbound updates generated for members of this update group.
Internal	Members of the update group are internal peers.

Field	Description
ORF Receive enabled	Members of this update group are capable of receiving an outbound route filter.
Route Reflector Client	Local system is acting as a route reflector for members of this update group.
Remove private AS numbers	Members of this update group have private AS numbers stripped from outbound updates.
Next-hop-self enabled	Next- Next hop for members of the update group is set to the local router.
Directly connected IPv6 EBGP	Members of this update group are directly connected external BGP IPv6-based peers.
Configured Local AS	Local autonomous system (AS) used for members of this update group.
Common admin	Peers in this update group are under common administration (internal or confederation peers).
Send communities	Communities are sent to neighbors in this update group.
Send extended communities	Extended communities is sent to neighbors in this update group.
Minimum advertisement interval	Minimum advertisement interval for members of this update group.
replicated	Number of update messages replicated for this update group.
Messages formatted	Number of update messages generated for this update group.
Neighbors in this update group	List of neighbors that use this update group for the given address family.
Update group desynchronized	Number of times an update group has been split to accommodate the slower peer. This option is disabled.
Sub-groups merged	Number of times an update group has been split and merged.
Neighbors not in any sub-group	BGP neighbor that does not belong to any subgroup.

The following is sample output from the **show bgp update-group** command with the **ipv4**, **unicast**, and **summary** keywords and the *process id.index* argument:

RP/0/RP0/CPU0:router# show bgp ipv4 unicast update-group 0.1 summary

BGP router identifier 10.140.140.1, local AS number 1.1 BGP generic scan interval 60 secs BGP table state: Active Table ID: 0xe0000000 BGP main routing table version 1 BGP scan interval 60 secs BGP is operating in STANDALONE mode. Process RecvTblVer bRIB/RIB LabelVer ImportVer SendTblVer Speaker 1 0 1 1 0 Neighbor Spr AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down St/PfxRcd 172.25.11.8 0 1 0 0 0 0 0 00:00:00 Idle

This table describes the significant fields shown in the display.

Table 42: show bgp ipv4 unicast update-group Field Descriptions

Field	Description
BGP router identifier	IP address of the router.
local AS number	Autonomous system number set by the router bgp, on page 245 command.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
BGP generic scan interval	Interval (in seconds) between scans of the BGP table by a generic scanner.
BGP table state	State of the BGP database.
Table ID	BGP database identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
Dampening enabled	Displayed if dampening has been enabled for the routes in this BGP routing table.
BGP scan interval	Interval (in seconds) between scans of the BGP table specified by the address family and subaddress family.

Field	Description
BGP is operating in	BGP is operating in standalone mode.
Process	BGP process.
RecvTblVer	Last version used in the BGP database for received routes.
bRIB/RIB	Last version of the local BGP database that was injected into the main routing table.
LabelVer	Label version used in the BGP database for label allocation.
ImportVer	Last version of the local BGP database for importing routes.
SendTblVer	Latest version of the local BGP database that is ready to be advertised to neighbors.
Some configured eBGP neighbors do not have any policy	Some external neighbors that exist do not have both an inbound and outbound policy configured for every address family, using the route-policy (BGP) command. In this case, no prefixes are accepted or advertised to those neighbors.
Neighbor	IP address of a neighbor.
Spr	Speaker process that is responsible for the neighbor. Always 0.
AS	Autonomous system.
MsgRcvd	Number of BGP messages received from a neighbor.
MsgSent	Number of BGP messages sent to a neighbor.
TblVer	Last version of the BGP database that was sent to a neighbor.
InQ	Number of messages from a neighbor waiting to be processed.
OutQ	Number of messages waiting to be sent to a neighbor.
Up/Down	Length of time (in hh:mm:s) that the BGP session has been in Established state, or the time since the session left Established state, if it is not established.

Field	Description
St/PfxRcd	If the BGP session is not established, the current state of the session. If the session is established, the number of prefixes the router has received from the neighbor.
	If the number of prefixes received exceeds the maximum allowed (as set by the maximum-prefix command), "(PfxRcd)" appears.
	If the connection has been shut down using the shutdown command, "(Admin)" appears.
	If the neighbor is external and it does not have an inbound and outbound policy configured for every address family, an exclamation mark (!) is inserted at the end of the state when using the route-policy (BGP) command.

Command	Description
maximum-prefix (BGP), on page 179	Limits the number of prefixes that can be received from a neighbor.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.
set default-afi	Sets the default Address Family Identifier (AFI) for the current session.
set default-safi	Sets the default Subaddress Family Identifier (SAFI) for the current session.
show bgp summary, on page 422	Displays the status of all BGP connections.
shutdown (BGP), on page 452	Disables a neighbor without removing its configuration.

show bgp vrf imported-routes

To display Border Gateway Protocol (BGP) information for routes imported into specified VPN routing and forwarding (VRF) instances, use the **show bgp vrf imported-routes** command in XR EXEC mode.

show bgp vrf{vrf| vrf-name} imported-routes

Contra Description			
Syntax Description	vrf-name	Displays imported routes for a specific VRF.	
	all	Displays imported routes for all VRFs.	
	ipv4 { unicast labeled-unicast }	(Optional) Specifies IP Version 4 unicast or labeled-unicast imported routes.	
	ipv6 unicast	(Optional) Specifies IP Version 6 unicast imported routes.	
	vrf source-vrf-name	(Optional) Displays routes imported from the specified source VRF.	
	neighbor neighbor-address	(Optional) Displays preview advertisements for a specified neighbor.	
	standby	(Optional) Displays information about the standby card.	
Command Default Command Modes Command History	No default behavior or values XR EXEC		
Command History	Release	Modification	
Usage Guidelines	IDs. If the user group assignment is profor assistance.	This command was introduced. A user group associated with a task group that includes appropriate task eventing you from using a command, contact your AAA administrator tes command to display all paths imported into a specified VRF from	
	the default VRF. Use the neighbor <i>neighbor-address</i> keyword and argument to display all imported paths and which paths were learned from the specified neighbor. Use the vrf <i>source-vrf-name</i> keyword and		

argument to display all imported routes that belong to the specified source VRF. The neighbor

neighbor-address and vrf source-vrf-name cannot coexist.

Examples

The following is sample output from the **show bgp vrf imported-routes** command:

RP/0/RP0/CPU0:router# show bgp vrf vrf-1 ipv6 unicast imported-routes

BGP VRF one, state: Active BGP BGP Route Distinguisher: 100:222 VRF ID: 0x6000001 BGP router identifier 10.2.0.1, local AS number 100 BGP table state: Active Table ID: 0xe0800001 BGP main routing table version 41534 Status codes: s suppressed, d damped, h history, * valid, > best i - internal, S stale Origin codes: i - IGP, e - EGP, ? - incomplete Network Neighbor Route Distinguisher Source VRF *>i1234:1052::/32 10.1.0.1 default 100:111 *>i2008:1:1:1::/112 10.1.0.1 100:111 default *>i2008:111:1:1:1/128 10.1.0.1 100:111 default

Processed 3 prefixes, 3 paths

This table describes the significant fields shown in the display.

Table 43: show bgp vrf imported-routes Field Descriptions

Field	Description
BGP VRF	VRF name.
state	State of the VRF.
BGP Route Distinguisher:	Unique identifier for the BGP routing instance.
VRF Id	VRF identifier.
BGP router identifier	IP address of the router.
local AS number	Autonomous system number set by the router bgp, on page 245 command.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.

Field	Description
BGP table state	State of the BGP database.
Table ID	Table identifier.
BGP main routing table version	Last version of the BGP database that was injected into the main routing table.
Network	Network address.
Neighbor	IP address of a neighbor.
Route Distinguisher	Unique identifier for the routing instance.
Source VRF	Source VRF for the imported route.

show protocols (BGP)

To display information about the Border Gateway Protocol (BGP) instances running on the router, use the **show protocols** command in XR EXEC mode and specify either the **bgp** or **all** keyword.

show protocols [ipv4| ipv6| afi-all] [all| protocol]

Syntax Description	ipv4	(Optional) Specifies the IP Version 4 address family.
	ipv6	(Optional) Specifies the IP Version 6 address family.
	afi-all	(Optional) Specifies all address families.
	all	(Optional) Specifies all protocols for a given address family.
	protocol	(Optional) Specifies a routing protocol.
		For the IPv4 address family, the options are bgp , isis, rip, eigrp, and ospf.
		For the IPv6 address family, the options are bgp , $eigrp$, $isis$, and $ospfv3$.
Command Default	Default is IPv4.

Examples

The following example shows the display for the **show protocols** command using the **bgp** keyword:

```
RP/0/RP0/CPU0:router# show protocols bgp
Routing Protocol "BGP 40"
Address Family IPv4 Unicast:
   Distance: external 20 internal 200 local 200
   Sourced Networks:
    10.100.0.0/16 backdoor
    10.100.1.0/24
   10.100.2.0/24
Routing Information Sources:
   Neighbor State/Last update received
   10.5.0.2 Idle
   10.9.0.3 Idle
```

This table describes the significant fields shown in the display.

Table 44: show protocols (BGP) Field Descriptions	

Field	Description
Routing Protocol:	Identifies BGP as the running protocol and displays the BGP AS number.
	• Range for 2-byte Autonomous system numbers (ASNs) is 1 to 65535.
	• Range for 4-byte Autonomous system numbers (ASNs) in asplain format is 1 to 4294967295.
	• Range for 4-byte Autonomous system numbers (ASNs) is asdot format is 1.0 to 65535.65535.
Address Family	Specifies the address family. This can be IPv4 Unicast, IPv4 Multicast, or IPv6 Unicast.
Distance: external	Specifies the distance BGP sets when installing eBGP routes into the RIB. eBGP routes are routes received from eBGP peers. The RIB uses the distance as a tiebreaker when several protocols install a route for the same prefix.
Distance: internal	Specifies the distance BGP sets for routes received from iBGP peers.
Distance: local	Specifies the distance BGP sets for locally generated aggregates and backdoor routes.

Field	Description
Sourced Networks	List of locally sourced networks. These are networks sourced using the network command.
Routing information Sources	List of configured BGP neighbors.
Neighbor	Address of a BGP neighbor.
State/Last update received	State of each neighbor and the time since the last update was received from the neighbor if it is established.

shutdown (BGP)

To disable a neighbor without removing its configuration, use the **shutdown** command in an appropriate configuration mode. To re-enable the neighbor and reestablish a Border Gateway Protocol (BGP) session, use the **no** form of this command.

shutdown [inheritance-disable]

no shutdown [inheritance-disable]

Syntax Description	inheritance-disable	(Optional) Overrides the value of a shutdown command inherited from a neighbor group or session group.
Command Default	Neighbors are not shutdown.

	VPNv6 neighbor group address family configuration		
Command History	Release	Modification	

Release 5.0.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To filter or modify some of the updates received from a neighbor, you configure an inbound policy using the **route-policy (BGP)** command. Configuring soft reconfiguration inbound causes the software to store the original unmodified route beside a route that is modified or filtered. This allows a "soft clear" to be performed after the inbound policy is changed. To perform a soft clear, use the **clear bgp soft** command with the **in** keyword specified. The unmodified routes are then passed through the new policy and installed in the BGP table.

If an address family group, neighbor group, or session group is configured, the configuration inside these configuration groups will not be effective unless it is applied directly or indirectly to one or more neighbors.

The bgp auto-policy-soft-reset is enabled by default. A soft clear is done automatically when the inbound policy configured with the **route-policy** (BGP) command is changed. This behavior can be changed by disabling the auto-policy-soft-reset using the **bgp auto-policy-soft-reset disable** command.

If the neighbor supports the route refresh capability, then the original routes are not stored because they can be retrieved from the neighbor through a route refresh request. However, if the **always** keyword is specified, the original routes are stored even when the neighbor supports the route refresh capability.

If the **soft-reconfiguration inbound** command is not configured and the neighbor does not support the route refresh capability, then an inbound soft clear is not possible. In that case, the only way to rerun the inbound policy is to use the **clear bgp** *ip-address* command to reset the neighbor BGP session.

Note

If there is an existing BGP session with a neighbor that does not support the route refresh capability, the session is terminated and a new one is initiated.

Note The extra routes stored as a result of configuring this command use more memory on the router.

If you configure this command for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

```

 Task ID
 Operations

 bgp
 read, write

Examples

The following example shows inbound soft reconfiguration enabled for IP Version 4 (IPv4) unicast routes received from neighbor 10.108.1.1. The software stores all routes received in their unmodified form so that when an inbound soft clear is performed later, the stored information can then be used to generate a new set of modified routes.

RP/0/RP0/CPU0:router(config) # router bgp 100 RP/0/RP0/CPU0:router(config-bgp)# neighbor 10.108.1.1 RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 100 RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 unicast RP/0/RP0/CPU0:router(config-bgp-nbr-af)# soft-reconfiguration inbound RP/0/RP0/CPU0:router(config-bgp-nbr-af)# exit

The following example shows inbound soft reconfiguration disabled for neighbor 10.108.1.1, preventing this feature from being automatically inherited by address family group group1:

```
RP/0/RP0/CPU0:router(config) # router bgp 100
RP/0/RP0/CPU0:router(config-bgp) # af-group group1 address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-afgrp) # soft-reconfiguration inbound
RP/0/RP0/CPU0:router(config-bgp-afgrp) # exit
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 100
RP/0/RP0/CPU0:router(config-bgp-nbr) # address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # use af-group group1
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # soft-reconfiguration inbound inheritance-disable
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # exit
```

Command	Description
af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
bgp auto-policy-soft-reset disable, on page 53	Disables an automatic soft reset of BGP peers when the configured inbound route policy is modified.
clear bgp, on page 116	Resets a BGP connection using a soft or hard reset.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
rd, on page 218	Applies a prefix list to filter updates received from a neighbor.
route-policy (BGP), on page 240	Applies a routing policy to updates advertised to or received from a BGP neighbor.

speaker-id

To allocate a speaker process to a neighbor, use the **speaker-id** command in the appropriate configuration mode. To remove the speaker process from a neighbor, use the **no** form of this command.

	speaker-id <i>id</i> no speaker-id [<i>id</i>]		
Syntax Description	id	ID of the speaker process. Range is 1 to 15.	
Command Default	Default is 0.		
Command Modes	Session group config	uration	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines		, you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator	
Task ID	Task ID	Operations	
	bgp	read, write	
Examples	The following example shows how to allocate speaker process 3 to neighbor 192.168.40.24: RP/0/RP0/CPU0:router(config) # router bgp 109		
	RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24 RP/0/RP0/CPU0:router(config-bgp-nbr)# speaker-id 3		

table-policy

To apply a routing policy to routes being installed into the routing table, use the **table-policy** command in an appropriate configuration mode. To disable applying a routing policy when installing routes into the routing table, use the **no** form of this command.

table-policy policy-name

no table-policy [policy-name]

Syntax Description	policy-name	Name of the routing policy to apply.
Command Default	No policy is applied whe	on routes are installed into the routing table.
Command Modes	IPv4 address family conf	iguration
	IPv6 address family conf	iguration
Command History	Release	Modification
	Release 5.0.1	This command was introduced.
Usage Guidelines		u must be in a user group associated with a task group that includes appropriate task ignment is preventing you from using a command, contact your AAA administrator
Note	feature can be useful in co	ers with the ability to drop routes from the RIB based on match criteria. This ertain applications and should be used with caution as it can easily create a routing advertises routes to neighbors that BGP does not install in its global routing table
		mmand to modify route attributes as the routes are installed into the routing table by 1 (BGP). Commonly, it is used to set the traffic index attribute.
Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to apply the set-traffic-index policy to IPv4 unicast routes being installed into the routing table:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-af)# table-policy set-traffic-index

Command	Description
route-policy (RPL)	Defines a route policy and enters route policy configuration mode.

timers (BGP)

To set the timers for a specific Border Gateway Protocol (BGP) neighbor, use the **timers** command in an appropriate configuration mode. To set the timers to the default values, use the **no** form of this command.

timers keepalive hold-time

no timers [keepalive hold-time]

Syntax Description	keepalive	Frequency (in seconds) with which the software sends keepalive messages to a neighbor. Range is 0 to 65535.	
	hold-time	Interval (in seconds) after not receiving a keepalive message from the neighbor that the software terminates the BGP session for the neighbor. Values are 0 or a number in the range from 3 to 65535.	
Command Default	<i>keepalive</i> : 60 sec <i>hold-time</i> : 180 se		
	Use the timers bgp command to override the default values.		
Command Modes	Neighbor configu	ration	
	VRF neighbor configuration		
	Neighbor group configuration		
	Session group configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	
Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.		
	The timers actually used in connection with the neighbor may not be the same as those configured with this command. The actual timers are negotiated with the neighbor when establishing the session. The negotiated hold time is the minimum of the configured time and the hold time received from the neighbor. If the negotiated hold time is 0, keepalives are disabled.		
		alue for the keepalive must not exceed one-third of the negotiated hold time. If it does, a of the negotiated hold time is used.	

If this command is configured for a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

In cases where mechanisms such as Bi-directional Forwarding Detection (BFD), BGP fast-external-failover or Next-hop Tracking cannot be employed to detect and react to changes in the network in a faster manner, BGP Keepalive and Hold-timer values can be configured to use smaller values than the default (60 and 180 seconds respectively). When using aggressive values, consider the router's profile and scale, particularly in respect to the number of BGP neighbours that will be using sessions with the non-default timers.

Sessions using very aggressive values will be more susceptible to flap during events that cause the Route-Processor's CPU utilization levels to increase. Such events include component OIR, Route-Processor Failover, network instability, excessive churn in routing protocols etc. It is therefore recommended that the desired scale and profile of the router be tested with the non-default timer values, subjecting the router to CPU-intensive events in order to determine the timer threshold values that are appropriate for the router before configuring the values in an operational network.

The BGP Non-Stop Routing (NSR) is able to sustain sessions with more aggressive timer values than BGP Graceful Restart (GR) since in the event of a Route-Processor Failover, Graceful Restart (GR) requires the re-establishment of the TCP session over which the BGP session takes place. When using Non-Stop Routing (NSR), both the underlying TCP session and BGP session are maintained during Route-Processor failover.

Task ID	Task ID	Operations
	bgp	read, write

Examples The following example shows how to change the keepalive timer to 70 seconds and the hold-time timer to 210 seconds for the BGP peer 192.168.40.24:

RP/0/RP0/CPU0:router(config)# router bgp 109
RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.40.24
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# timers 70 210

Command	Description
af-group, on page 25	Creates an address family group for BGP neighbors and enters address family group configuration mode.
neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
session-group, on page 254	Creates a session group and enters session group configuration mode.
timers bgp, on page 469	Adjusts BGP network timers for all BGP neighbors.

timers bgp

To change the default timer values for Border Gateway Protocol (BGP) neighbors, use the **timers bgp** command in an appropriate configuration mode. To set the default timers to the default values, use the **no** form of this command.

timers bgp keepalive hold-time

no timers bgp [keepalive hold-time]

Syntax Description	keepalive	Frequency (in seconds) with which the software sends keepalive messages to a neighbor. Range is 0 to 65535.
	hold-time	Interval (in seconds) after not receiving a keepalive message from the neighbor that the software terminates the BGP session for the neighbor. Values are 0 or a number in the range from 3 to 65535.
Command Default	<i>keepalive</i> : 60 seco	
	hold-time : 180 sec	conas
Command Modes	Router configuration	on
	VRF configuration	1
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		and, you must be in a user group associated with a task group that includes appropriate task oup assignment is preventing you from using a command, contact your AAA administrator
		gp command to adjust the default timer times used by all BGP neighbors. The values car particular neighbors using the timers command in the neighbor configuration mode.
		y used in connection with the neighbor may not be the same as those configured with this ual timers are negotiated with the neighbor when establishing the session. The negotiated
	hold time is the mir	nimum of the configured time and the hold time received from the neighbor. If the negotiated palives are disabled.

In cases where mechanisms such as Bi-directional Forwarding Detection (BFD), BGP fast-external-failover or Next-hop Tracking cannot be employed to detect and react to changes in the network in a faster manner, BGP Keepalive and Hold-timer values can be configured to use smaller values than the default (60 and 180 seconds respectively). When using aggressive values, consider the router's profile and scale, particularly in respect to the number of BGP neighbors that will be using sessions with the non-default timers.

Sessions using very aggressive values will be more susceptible to flap during events that cause the Route-Processor's CPU utilization levels to increase. Such events include component OIR, Route-Processor Failover, network instability, excessive churn in routing protocols etc. It is therefore recommended that the desired scale and profile of the router be tested with the non-default timer values, subjecting the router to CPU-intensive events in order to determine the timer threshold values that are appropriate for the router before configuring the values in an operational network.

The BGP Non-Stop Routing (NSR) is able to sustain sessions with more aggressive timer values than BGP Graceful Restart (GR) since in the event of a Route-Processor Failover, Graceful Restart (GR) requires the re-establishment of the TCP session over which the BGP session takes place. When using Non-Stop Routing (NSR), both the underlying TCP session and BGP session are maintained during Route-Processor failover.

Task ID	Task ID	Operations
	bgp	read, write

Examples

The following example shows how to configure a default keepalive time of 30 seconds and a default hold time of 90 seconds:

RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# timers bgp 30 90

Related Commands	Command	Description
	timers (BGP), on page 467	Adjusts BGP network timers for a BGP neighbor.

transport (rpki-server)

To choose a transport mechanism for the RPKI cache-server configuration, establish and manage transport connections, and send or receive byte streams from the network, use the **transport** command in rpki-server configuration mode. To disable the transport connection, use the **no** form of this command.

transport {ssh| tcp} port port-number

no transport {ssh| tcp} port port-number

Syntax Description	port	Specifies to choose a port number for the RPKI cache transport.
	port-number	Specifies the port number for the RPKI cache transport. Range is 1 to 65535.
Command Default	Transport mechanism	is disabled.
Command Modes	RPKI server configura	ation
Command History	Release	Modification
	Release 5.0.0	This command was introduced.
Usage Guidelines		you must be in a user group associated with a task group that includes appropriate task assignment is preventing you from using a command, contact your AAA administrator
	The transport can be se router and RPKI cache	et to either TCP or SSH. An SSH transport session is the recommended transport between e for security reasons.
	port 980, another can	(TCP or SSH) can be configured on a per-RPKI-server basis: once server can be TCP be SSH port 22, for example. This can be changed by configuration. Changing the cause the cache session to flap (cleanup its existing transport related data and initialize ted data).
Task ID	Task ID	Operation
	bgp	read, write

Examples This example shows how to configure SSH as the transport mechanism and to use port 1 for SSH communication:

RP/0/RP0/CPU0:router#configure
RP/0/RP0/CPU0:router(config)#router bgp 100
RP/0/RP0/CPU0:router(config-bgp)#rpki server 172.168.35.40
RP/0/RP0/CPU0:router(config-bgp-rpki-cache)# transport ssh port 1

ttl-security

To configure a router to check the time-to-live (TTL) field in incoming IP packets for the specified external Border Gateway Protocol (eBGP) peer, use the **ttl-security** command in an appropriate configuration mode. To disable TTL verification, use the **no** form of this command. ttl-security [inheritance-disable] no ttl-security [inheritance-disable] **Syntax Description** inheritance-disable (Optional) Prevents the ttl-security command from being inherited from a session group or neighbor group. **Command Default** TTL verification is not enabled for eBGP peers. **Command Modes** Neighbor configuration VRF neighbor configuration Neighbor group configuration Session group configuration **Command History** Release Modification Release 5.0.0 This command was introduced. **Usage Guidelines** To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. Use the **ttl-security** command to enable a lightweight security mechanism to protect eBGP peering sessions from CPU utilization-based and other resource exhaustion-based attacks. These types of attacks are typically brute-force Denial of Service (DoS) attacks that attempt to disable the network by flooding devices in the network with IP packets that contain forged source and destination IP addresses in the packet headers. This command leverages existing behavior in IP packets. For a given IP packet, the TTL count of the packet always is equal to or less than the TTL count when the packet originated, a behavior that is considered impossible to circumvent. Therefore, a packet received with a TTL count equal to the maximum TTL value of 255 can be sent only by a directly adjacent peer. When the **ttl-security** command is configured for an eBGP neighbor that is directly adjacent, the router accepts only IP packets with a TTL count that is equal to the maximum TTL value. The ttl-security command secures the eBGP session in the incoming direction only. In the outbound direction, it causes packets to be sent only with the maximum TTL value so that the BGP neighbor can also verify the

TTL value of incoming packets. When this command is enabled, BGP establishes or maintains a session only if the TTL value in the IP packet header is equal to the maximum TTL value. If the value is less than the maximum TTL value, the packet is discarded and an Internet Control Message Protocol (ICMP) message is not generated. This behavior is designed because a response to a forged packet is not necessary.

Note

The **ttl-security** command must be configured on each participating router. Failure to configure this command on both ends of the BGP session results in the session progressing as far as the OpenSent or OpenConfirm state, remaining there until the hold time expires.

The following restrictions apply to the configuration of this command:

- The **ttl-security** command should not be configured for a peer that is already configured with the **neighbor ebgp-multihop** command. The simultaneous configuration of these commands is permitted; however, the **ttl-security** command overrides the **ebgp-multihop** command.
- This command is not supported for internal BGP (iBGP) peers.
- This command is not effective against attacks from a directly adjacent peer that has been compromised.

If you configure this command for a neighbor group or session group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

Note

If the **ttl-security** command is configured on a neighbor to which the router has an established connection or the router is in the process of establishing a connection, the session must be cleared using the **clear bgp** command.

Task IDOperationsbgpread, write

Examples

Task ID

The following example shows how to enable TTL security for eBGP neighbor 192.168.223.7:

```
RP/0/RP0/CPU0:router(config) # router bgp 65534
RP/0/RP0/CPU0:router(config-bgp) # neighbor 192.168.223.7
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 65507
RP/0/RP0/CPU0:router(config-bgp-nbr) # ttl-security
```

The following example shows how to enable TTL security for multiple eBGP neighbors using a session group:

RP/0/RP0/CPU0:router(config) # router bgp 65534 RP/0/RP0/CPU0:router(config-bgp) # session-group ebgp-nbrs RP/0/RP0/CPU0:router(config-bgp-sngrp) # ttl-security RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 65501 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group ebgp-nbrs RP/0/RP0/CPU0:router(config-bgp-nbr) # exit RP/0/RP0/CPU0:router(config-bgp-nbr) # exit RP/0/RP0/CPU0:router(config-bgp-nbr) # exit RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 65502 RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group ebgp-nbrs

```
RP/0/RP0/CPU0:router(config-bgp-nbr)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor 192.168.223.3
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 65503
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group ebgp-nbrs
RP/0/RP0/CPU0:router(config-bgp-nbr)# exit
```

neighbor-group, on page 188	Creates a neighbor group and enters neighbor group configuration mode.
session-group, on page 254	Creates a session group and enters session group configuration mode.

use

To inherit configuration from a neighbor group, session group, or address family group, use the **use** command in an appropriate configuration mode. To discontinue inheritance from a group, use the **no** form of this command.

use {af-group group-name| neighbor-group group-name| session-group group-name }
no use {af-group [group-name]| neighbor-group [group-name]| session-group [group-name]}

Syntax Description	af-group	Specifies an address family group.	
-,	ai-group	Specifies an address family group.	
	group-name	Name of the neighbor group, session group, or address family group from which you want to inherit configuration.	
	neighbor-group	Specifies a neighbor group.	
	session-group	Specifies a session group.	
Command Default	Inheritance of group characte	eristics does not occur.	
Command Modes	For use af-group version:		
	Address family group configuration		
	Neighbor address family configuration		
	Neighbor group address family configuration		
	For use neighbor-group version:		
	Neighbor group configuration		
	Neighbor configuration		
	VRF neighbor configuration		
	For use session-group version:		
	Neighbor group configuration		
	Neighbor configuration		
	VRF neighbor configuration		
	Session-group configuration		
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	

Usage Guidelines

use

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **use** command configures inheritance of configuration from an address family group, neighbor group, or session group, which means that any configuration for the group also takes effect for the user of the group.

The configuration inherited depends on the type of group that is specified. The group types are described in the following sections:

Address Family Group

An address family group can specify a configuration for only a single address family. The address family specified when the address family group was defined (through the **af-group** command) must match the address family from which the group is used.

Neighbor Group

A neighbor group (like a neighbor) can have address family-independent configuration and address family-specific configuration. All of these configurations could be inherited.

Session Group

A session group can have only address family-independent configuration and thus only address family-independent configuration is inherited from it.

The following rules govern inheritance to resolve possible conflicting configuration:

- 1 If a command is configured directly on the neighbor that is using group configuration, the command overrides the value that would be normally inherited from the group.
- 2 If the neighbor is configured to use a session group (for address family-independent configuration) or an address family group (for address family-specific configuration) and the command is configured for the session group or address family group, that configuration is used.
- 3 The neighbor group configuration is used:
 - If the command is not configured directly on the neighbor and the neighbor is not using a session group (for address family-independent configuration) or an af-group (for address family-specific configuration).
 - The neighbor is using a neighbor group and the command is configured on the neighbor group.

Typically, all configuration for a neighbor group is inherited, but some characteristics may be masked by a session group or address family group. For an example of this configuration, see the "Examples" section.

If the neighbor is using both a session group and a neighbor group and a specific command is configured for the neighbor group but not for the session group, then the configuration for the neighbor group does not take effect. The session group "hides" all address family-independent configuration on the neighbor group and prevents it from being inherited. Similarly, the use of an address family group hides any address family-specific configuration that may otherwise be inherited from a neighbor group for that address family.

In addition to neighbors using groups, it is possible to build a hierarchy by having groups use other groups. The following hierarchical groups are permitted:

- Session groups may use other session groups.
- Address family groups may use other address family groups.

- Neighbor groups may use other neighbor groups.
- Neighbor groups may use session groups and address family groups.

```
Note
```

Within the Cisco IOS XR system configuration architecture, do not combine the **remote-as** command and the **no use neighbor-group** command in the same commit, or the **remote-as** command and the **no use session-group** command in the same commit.

Task ID

Task ID	Operations
bgp	read, write

Examples

The following example shows how to define a session group session1 and configure neighbor 172.168.40.24 to use session1. As a result, the session1 configuration takes effect on the neighbor also.

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # session-group session1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # advertisement-interval 40
RP/0/RP0/CPU0:router(config-bgp-sngrp) # timers 30 90
RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.168.40.24
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session1
RP/0/RP0/CPU0:router(config-bgp-nbr) # exit
```

The following example is similar to the previous example, but in this case the **timers** command on the session group does not take effect on the neighbor because it is overridden by a **timers** command directly configured for the neighbor.

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # session-group session1
RP/0/RP0/CPU0:router(config-bgp-sngrp) # advertisement-interval 40
RP/0/RP0/CPU0:router(config-bgp-sngrp) # timers 30 90
RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit
RP/0/RP0/CPU0:router(config-bgp-sngrp) # exit
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbr) # use session-group session1
RP/0/RP0/CPU0:router(config-bgp-nbr) # timers 60 180
RP/0/RP0/CPU0:router(config-bgp-nbr) # exit
```

The following example shows an address family group, family1, for IPv4 multicast and a neighbor group, neighbor1, that have IPv4 unicast and IPv4 multicast enabled. In this case, the neighbor inherits IPv4 unicast (and address family-independent) configuration from the neighbor group, but inherits IPv4 multicast configuration from the address family group. In this example, the neighbor group also has a remote autonomous system configured, so there is no need to configure a remote autonomous system for the neighbor because it inherits the remote autonomous system from the neighbor group:

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# af-group family1 address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-afgrp)# route-policy mcast-in in
RP/0/RP0/CPU0:router(config-bgp-afgrp)# exit
RP/0/RP0/CPU0:router(config-bgp)# neighbor-group neighbor1
```

```
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# remote-as 2
RP/0/RP0/CPU0:router(config-bgp-nbrgrp)# address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 in
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 in
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 in
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# route-policy policy1 out
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bgp-nbrgrp-af)# exit
RP/0/RP0/CPU0:router(config-bgp-nbr)# use neighbor-group neighbor1
RP/0/RP0/CPU0:router(config-bgp-nbr)# address-family ipv4 multicast
RP/0/RP0/CPU0:router(config-bgp-nbr)# use neighbor-group neighbor1
RP/0/RP0/CPU0:router(config-bgp-nbr)# use af-group family1
RP/0/RP0/CPU0:router(config-bgp-nbr-af)# exit
```

In the previous example, the neighbor uses the policy1 route policy for inbound and outbound IPv4 unicast routes, but uses the meast-in route policy for inbound IPv4 multicast routes and no policy for outbound IPv4 multicast routes.

The following example shows a neighbor inheriting configuration from a session group that likewise inherits configuration from another session group. The configuration from both session groups take effect on the neighbor:

```
RP/0/RP0/CPU0:router(config)# router bgp 1
RP/0/RP0/CPU0:router(config-bgp)# session-group session1
RP/0/RP0/CPU0:router(config-bgp-sngrp)# advertisement-interval 40
RP/0/RP0/CPU0:router(config-bgp)# session-group session2
RP/0/RP0/CPU0:router(config-bgp-sngrp)# use session-group session1
RP/0/RP0/CPU0:router(config-bgp-sngrp)# update-source Loopback0
RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit
RP/0/RP0/CPU0:router(config-bgp-sngrp)# exit
RP/0/RP0/CPU0:router(config-bgp-nbr)# remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group session2
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group session2
RP/0/RP0/CPU0:router(config-bgp-nbr)# use session-group session2
```

	VPNv6 address family group configuration		
	VPNv6 neighbor address family configuration		
	VRF IPv6 neighbor address family configuration		
	VPNv6 neighbor group add	dress family configuration	
Command History	Release	Modification	
	Release 5.0.0	This command was introduced.	

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The weight of a route is a Cisco-specific attribute. It is used in the best-path selection process (as the strongest tie-breaker). See the *Implementing BGP on* module of the *Routing Configuration Guide for Cisco NCS 6000 Series Routers* for information on best path. If there are two BGP routes with the same network layer reachability information (NLRI), the route with the higher weight is always chosen no matter what the value of other BGP attributes. Weight only has significance on the local router. Weight is assigned locally to the router, is a value that only makes sense to the specific router, is not propagated or carried through any route updates, and never is sent between BGP peers (even within the same AS).

Note

If an address family group, neighbor group, or session group is configured, the configuration inside these configuration groups will not be effective unless it is applied directly or indirectly to one or more neighbors.

The weight assigned to individual routes can be further manipulated in the inbound route policy of a neighbor using the **set weight** command. The **set weight** command sets the weight directly. If you have particular neighbors that you want to prefer for most of your outbound traffic, you can assign a higher weight to all routes learned from that neighbor.

The weight assigned to individual routes may be modified by using an inbound routing policy.

Note

For weight changes to take effect, you may need to use the clear bgp soft, on page 136 command.

If this command configures a neighbor group or neighbor address family group, all neighbors using the group inherit the configuration. Values of commands configured specifically for a neighbor override inherited values.

```
Task ID
```

Task ID	Operations
bgp	read, write

Examples

The following example shows how to assign a weight of 50 to all IP Version 4 (IPv4) unicast routes learned through 172.20.16.6:

```
RP/0/RP0/CPU0:router(config) # router bgp 1
RP/0/RP0/CPU0:router(config-bgp) # neighbor 172.20.16.6
RP/0/RP0/CPU0:router(config-bgp-nbr) # remote-as 1
RP/0/RP0/CPU0:router(config-bgp-nbr) # address-family ipv4 unicast
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # weight 50
RP/0/RP0/CPU0:router(config-bgp-nbr-af) # weight 50
```
