[show ssl](#) 302

Preface

This guide describes the commands used to display and configure system security on Cisco IOS XR software. For System Security configuration information and examples, refer to the *Cisco IOS XR System Security Configuration Guide for the Cisco XR 12000 Series Router*.

The preface contains the following sections:

- [Changes to This Document](#), page ix
- [Obtaining Documentation and Submitting a Service Request](#), page ix

Changes to This Document

This table lists the technical changes made to this document since it was first printed.

Table 1: Changes to This Document

Revision	Date	Change Summary
OL-26054-02	June 2012	Republished for Cisco IOS XR Release 4.2.1.
OL-26054-01	December 2011	Initial release of this document.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

Authentication, Authorization, and Accounting Commands

This module describes the commands used to configure authentication, authorization, and accounting (AAA) services.

For detailed information about AAA concepts, configuration tasks, and examples, see the *Configuring AAA Services on Cisco IOS XR Software* configuration module.

aaa accounting

To create a method list for accounting, use the **aaa accounting** command in global configuration mode. To remove a list name from the system, use the **no** form of this command.

aaa accounting {**commands**|**exec**|**network**} {**default**|**list-name**} {**start-stop**|**stop-only**} {**none**|**method**}

no aaa accounting {**commands**|**exec**|**network**} {**default**|**list-name**}

Syntax Description

commands	Enables accounting for EXEC shell commands.
exec	Enables accounting of an EXEC session.
network	Enables accounting for all network-related service requests, such as Internet Key Exchange (IKE) and Point-to-Point Protocol (PPP).
default	Uses the listed accounting methods that follow this keyword as the default list of methods for accounting services.
<i>list-name</i>	Character string used to name the accounting method list.
start-stop	Sends a “start accounting” notice at the beginning of a process and a “stop accounting” notice at the end of a process. The requested user process begins regardless of whether the “start accounting” notice was received by the accounting server.
stop-only	Sends a “stop accounting” notice at the end of the requested user process.
none	Uses no accounting.
<i>method</i>	Method used to enable AAA system accounting. The value is one of the following options: <ul style="list-style-type: none"> • group tacacs+—Uses the list of all TACACS+ servers for accounting. • group radius—Uses the list of all RADIUS servers for accounting. • group named-group—Uses a named subset of TACACS+ or RADIUS servers for accounting, as defined by the aaa group server tacacs+ or aaa group server radius command.

Command Default

AAA accounting is disabled.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.4.0	The network keyword and <i>method</i> argument were added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **aaa accounting** command to create default or named method lists defining specific accounting methods and that can be used on a per-line or per-interface basis. You can specify up to four methods in the method list. The list name can be applied to a line (console, aux, or vty template) to enable accounting on that particular line.

The Cisco IOS XR software supports both TACACS+ and RADIUS methods for accounting. The router reports user activity to the security server in the form of accounting records, which are stored on the security server.

Method lists for accounting define the way accounting is performed, enabling you to designate a particular security protocol that is used on specific lines or interfaces for particular types of accounting services.

For minimal accounting, include the **stop-only** keyword to send a “stop accounting” notice after the requested user process. For more accounting, you can include the **start-stop** keyword, so that TACACS+ or RADIUS sends a “start accounting” notice at the beginning of the requested process and a “stop accounting” notice after the process. The accounting record is stored only on the TACACS+ or RADIUS server.

The requested user process begins regardless of whether the “start accounting” notice was received by the accounting server.

**Note**

This command cannot be used with TACACS or extended TACACS.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to define a default commands accounting method list, where accounting services are provided by a TACACS+ security server, with a stop-only restriction:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa accounting commands default stop-only group tacacs+
```

Related Commands

Command	Description
aaa authorization, on page 14	Creates a method list for authorization.

aaa accounting system default

To enable authentication, authorization, and accounting (AAA) system accounting, use the **aaa accounting system default** command in global configuration mode. To disable system accounting, use the **no** form of this command.

aaa accounting system default {start-stop| stop-only} {none| method}

no aaa accounting system default

Syntax Description

start-stop	Sends a “start accounting” notice during system bootup and a “stop accounting” notice during system shutdown or reload.
stop-only	Sends a “stop accounting” notice during system shutdown or reload.
none	Uses no accounting.
<i>method</i>	Method used to enable AAA system accounting. The value is one of the following options: <ul style="list-style-type: none"> • group tacacs+—Uses the list of all TACACS+ servers for accounting. • group radius—Uses the list of all RADIUS servers for accounting. • group named-group—Uses a named subset of TACACS+ or RADIUS servers for accounting, as defined by the aaa group server tacacs+ or aaa group server radius command.

Command Default

AAA accounting is disabled.

Command Modes

Global configuration mode

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The <i>method</i> argument was added to specify either group tacacs+ , group radius , or group named-group options.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

System accounting does not use named accounting lists; you can define only the default list for system accounting.

The default method list is automatically applied to all interfaces or lines. If no default method list is defined, then no accounting takes place.

You can specify up to four methods in the method list.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to cause a “start accounting” record to be sent to a TACACS+ server when a router initially boots. A “stop accounting” record is also sent when a router is shut down or reloaded.

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa accounting system default start-stop group tacacs+
```

Related Commands

Command	Description
aaa authentication, on page 11	Creates a method list for authentication.
aaa authorization, on page 14	Creates a method list for authorization.

aaa accounting update

To enable periodic interim accounting records to be sent to the accounting server, use the **aaa accounting update** command in global configuration mode. To disable the interim accounting updates, use the **no** form of this command.

aaa accounting update {**newinfo**| **periodic** *minutes*}

no aaa accounting update

Syntax Description

newinfo	(Optional) Sends an interim accounting record to the accounting server whenever there is new accounting information to report relating to the user in question.
periodic <i>minutes</i>	(Optional) Sends an interim accounting record to the accounting server periodically, as defined by the <i>minutes</i> argument, which is an integer that specifies the number of minutes. The range is from 1 to 35791394 minutes.

Command Default

AAA accounting update is disabled.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If the **newinfo** keyword is used, interim accounting records are sent to the accounting server every time there is new accounting information to report. An example of this report would be when IP Control Protocol (IPCP) completes IP address negotiation with the remote peer. The interim accounting record includes the negotiated IP address used by the remote peer.

When used with the **periodic** keyword, interim accounting records are sent periodically as defined by the *minutes* argument. The interim accounting record contains all the accounting information recorded for that user up to the time the accounting record is sent.

When using both the **newinfo** and **periodic** keywords, interim accounting records are sent to the accounting server every time there is new accounting information to report, and accounting records are sent to the accounting server periodically as defined by the *minutes* argument. For example, if you configure the **aaa accounting update** command with the **newinfo** and **periodic** keywords, all users currently logged in continue to generate periodic interim accounting records while new users generate accounting records based on the newinfo algorithm.

**Caution**

Using the **aaa accounting update** command with the **periodic** keyword can cause heavy congestion when many users are logged into the network.

Both **periodic** and **newinfo** keywords are mutually exclusive; therefore, only one keyword can be configured at a time.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to send periodic interim accounting records to the RADIUS server at 30-minute intervals:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa accounting update periodic 30
```

The following example shows how to send interim accounting records to the RADIUS server when there is new accounting information to report:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa accounting update newinfo
```

Related Commands

Command	Description
aaa accounting, on page 4	Creates a method list for accounting.
aaa authorization, on page 14	Creates a method list for authorization.

aaa authentication

To create a method list for authentication, use the **aaa authentication** command in global configuration mode or administration configuration mode. To disable this authentication method, use the **no** form of this command.

aaa authentication {**login**|**ppp**} {**default**|*list-name*|**remote**} *method-list*

no aaa authentication {**login**|**ppp**} {**default**|*list-name*|**remote**} *method-list*

Syntax Description

login	Sets authentication for login.
ppp	Sets authentication for Point-to-Point Protocol.
default	Uses the listed authentication methods that follow this keyword as the default list of methods for authentication.
<i>list-name</i>	Character string used to name the authentication method list.
remote	Uses the listed authentication methods that follow this keyword as the default list of methods for administrative authentication on a remote non-owner secure domain router. The remote keyword is used only with the login keyword and not with the ppp keyword. Note The remote keyword is available only on the administration plane.
<i>method-list</i>	Method used to enable AAA system accounting. The value is one of the following options: <ul style="list-style-type: none"> • group tacacs+—Specifies a method list that uses the list of all configured TACACS+ servers for authentication. • group radius—Specifies a method list that uses the list of all configured RADIUS servers for authentication. • group <i>named-group</i>—Specifies a method list that uses a named subset of TACACS+ or RADIUS servers for authentication, as defined by the aaa group server tacacs+ or aaa group server radius command. • local—Specifies a method list that uses the local username database method for authentication. AAA method rollover happens beyond the local method if username is not defined in the local group. • line—Specifies a method list that uses the line password for authentication.

Command Default

Default behavior applies the local authentication on all ports.

Command Modes

Global configuration

Administration configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The <i>method-list</i> argument was added to specify either group tacacs+ , group radius , group named-group , local , or line options.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **aaa authentication** command to create a series of authentication methods, or method list. You can specify up to four methods in the method list. A *method list* is a named list describing the authentication methods (such as TACACS+ or RADIUS) in sequence. The subsequent methods of authentication are used only if the initial method is not available, not if it fails.

The default method list is applied for all interfaces for authentication, except when a different named method list is explicitly specified—in which case the explicitly specified method list overrides the default list.

For console and vty access, if no authentication is configured, a default of local method is applied.

**Note**

- The **group tacacs+**, **group radius**, and **group group-name** forms of this command refer to a set of previously defined TACACS+ or RADIUS servers.
- Use the **tacacs-server host** or **radius-server host** command to configure the host servers.
- Use the **aaa group server tacacs+** or **aaa group server radius** command to create a named subset of servers.
- The **login** keyword, **remote** keyword, **local** option, and **group** option are available only in administration configuration mode.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to specify the default method list for authentication, and also enable authentication for console in global configuration mode:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa authentication login default group tacacs+
```

The following example shows how to specify the remote method list for authentication, and also enable authentication for console in administration configuration mode:

```
RP/0/0/CPU0:router# admin
RP/0/0/CPU0:router (admin)# configure
RP/0/0/CPU0:router(admin-config)# aaa authentication login remote local group tacacs+
```

Related Commands

Command	Description
aaa accounting, on page 4	Creates a method list for accounting.
aaa authorization, on page 14	Creates a method list for authorization.
aaa group server radius, on page 18	Groups different RADIUS server hosts into distinct lists and distinct methods.
aaa group server tacacs+, on page 20	Groups different TACACS+ server hosts into distinct lists and distinct methods.
login authentication, on page 40	Enables AAA authentication for logins.
tacacs-server host, on page 101	Specifies a TACACS+ host.

aaa authorization

To create a method list for authorization, use the **aaa authorization** command in global configuration mode. To disable authorization for a function, use the **no** form of this command.

aaa authorization {**commands**| **eventmanager**| **exec**| **network**} {**default**| *list-name*} {**none**| **local**| **group** {**tacacs+**| **radius**| *group-name*}}

no aaa authorization {**commands**| **eventmanager**| **exec**| **network**} {**default**| *list-name*}

Syntax Description

commands	Configures authorization for all EXEC shell commands.
eventmanager	Applies an authorization method for authorizing an event manager (fault manager).
exec	Configures authorization for an interactive (EXEC) session.
network	Configures authorization for network services, such as PPP or Internet Key Exchange (IKE).
default	Uses the listed authorization methods that follow this keyword as the default list of methods for authorization.
<i>list-name</i>	Character string used to name the list of authorization methods.
none	Uses no authorization. If you specify none , no subsequent authorization methods is attempted. However, the task ID authorization is always required and cannot be disabled.
local	Uses local authorization. This method of authorization is not available for command authorization.
group tacacs+	Uses the list of all configured TACACS+ servers for authorization.
group radius	Uses the list of all configured RADIUS servers for authorization. This method of authorization is not available for command authorization.
group <i>group-name</i>	Uses a named subset of TACACS+ or RADIUS servers for authorization as defined by the aaa group server tacacs+ or aaa group server radius command.

Command Default

Authorization is disabled for all actions (equivalent to the method **none** keyword).

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.6.0	The eventmanager keyword (fault manager) was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **aaa authorization** command to create method lists defining specific authorization methods that can be used on a per-line or per-interface basis. You can specify up to four methods in the method list.

**Note**

The command authorization mentioned here applies to the one performed by an external AAA server and *not* for task-based authorization.

Method lists for authorization define the ways authorization will be performed and the sequence in which these methods will be performed. A method list is a named list describing the authorization methods (such as TACACS+), in sequence. Method lists enable you to designate one or more security protocols for authorization, thus ensuring a backup system in case the initial method fails. Cisco IOS XR software uses the first method listed to authorize users for specific network services; if that method fails to respond, Cisco IOS XR software selects the next method listed in the method list. This process continues until there is successful communication with a listed authorization method or until all methods defined have been exhausted.

**Note**

Cisco IOS XR software attempts authorization with the next listed method only when there is no response (not a failure) from the previous method. If authorization fails at any point in this cycle—meaning that the security server or local username database responds by denying the user services—the authorization process stops and no other authorization methods are attempted.

The Cisco IOS XR software supports the following methods for authorization:

- **none**—The router does not request authorization information; authorization is not performed over this line or interface.
- **local**—Use the local database for authorization.
- **group tacacs+**—Use the list of all configured TACACS+ servers for authorization.
- **group radius**—Use the list of all configured RADIUS servers for authorization.
- **group group-name**—Uses a named subset of TACACS+ or RADIUS servers for authorization.

Method lists are specific to the type of authorization being requested. Cisco IOS XR software supports four types of AAA authorization:

- **Commands authorization**—Applies to the EXEC mode commands a user issues. Command authorization attempts authorization for all EXEC mode commands.

**Note**

“Command” authorization is distinct from “task-based” authorization, which is based on the task profile established during authentication.

- **EXEC authorization**—Applies authorization for starting an EXEC session.

**Note**

The **exec** keyword is no longer used to authorize the fault manager service. The **eventmanager** keyword (fault manager) is used to authorize the fault manager service. The **exec** keyword is used for EXEC authorization.

- **Network authorization**—Applies authorization for network services, such as IKE.
- **Event manager authorization**—Applies an authorization method for authorizing an event manager (fault manager). RADIUS servers are not allowed to be configured for the event manager (fault manager) authorization. You are allowed to use TACACS+ or locald.

**Note**

The **eventmanager** keyword (fault manager) replaces the **exec** keyword to authorize event managers (fault managers).

When you create a named method list, you are defining a particular list of authorization methods for the indicated authorization type. When defined, method lists must be applied to specific lines or interfaces before any of the defined methods are performed.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to define the network authorization method list named listname1, which specifies that TACACS+ authorization is used:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa authorization commands listname1 group tacacs+
```

Related Commands

Command	Description
aaa accounting , on page 4	Creates a method list for accounting.

aaa default-taskgroup

To specify a task group for both remote TACACS+ authentication and RADIUS authentication, use the **aaa default-taskgroup** command in global configuration mode. To remove this default task group, enter the **no** form of this command.

aaa default-taskgroup *taskgroup-name*
no aaa default-taskgroup

Syntax Description

<i>taskgroup-name</i>	Name of an existing task group.
-----------------------	---------------------------------

Command Default

No default task group is assigned for remote authentication.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **aaa default-taskgroup** command to specify an existing task group for remote TACACS+ authentication.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to specify taskgroup1 as the default task group for remote TACACS+ authentication:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa default-taskgroup taskgroup1
```

aaa group server radius

To group different RADIUS server hosts into distinct lists, use the **aaa group server radius** command in global configuration mode. To remove a group server from the configuration list, enter the **no** form of this command.

aaa group server radius *group-name*

no aaa group server radius *group-name*

Syntax Description

<i>group-name</i>	Character string used to name the group of servers.
-------------------	---

Command Default

This command is not enabled.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **aaa group server radius** command to group existing server hosts, which allows you to select a subset of the configured server hosts and use them for a particular service. A server group is used in conjunction with a global server-host list. The server group lists the IP addresses or hostnames of the selected server hosts.

Server groups can also include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and User Datagram Protocol (UDP) port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific authentication, authorization, and accounting (AAA) service. In other words, this unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service, for example, accounting, the second host entry acts as an automatic switchover backup to the first host entry. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry on the same device for accounting services. The RADIUS host entries are tried in the order in which they are configured in the server group.

All members of a server group must be the same type, that is, RADIUS.

The server group cannot be named radius or tacacs.

This command enters server group configuration mode. You can use the server command to associate a particular RADIUS server with the defined server group.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows the configuration of an AAA group server named radgroup1, which comprises three member servers:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius radgroup1
RP/0/0/CPU0:router(config-sg-radius)# server 10.0.0.5 auth-port 1700 acct-port 1701
RP/0/0/CPU0:router(config-sg-radius)# server 10.0.0.10 auth-port 1702 acct-port 1703
RP/0/0/CPU0:router(config-sg-radius)# server 10.0.0.20 auth-port 1705 acct-port 1706
```

**Note**

If the **auth-port** *port-number* and **acct-port** *port-number* keywords and arguments are not specified, the default value of the *port-number* argument for the **auth-port** keyword is 1645 and the default value of the *port-number* argument for the **acct-port** keyword is 1646.

Related Commands

key (RADIUS), on page 36	Specifies the authentication and encryption key that is used between the router and the RADIUS daemon running on the RADIUS server.
radius source-interface , on page 57	Forces RADIUS to use the IP address of a specified interface or subinterface for all outgoing RADIUS packets.
retransmit (RADIUS), on page 59	Specifies the number of times a RADIUS request is resent to a server if the server is not responding or is responding slowly.
server (RADIUS), on page 63	Associates a RADIUS server with a defined server group.
server-private (RADIUS), on page 67	Configures the IP address of the private RADIUS server for the group server.
timeout (RADIUS), on page 114	Specifies the number of seconds the router waits for the RADIUS server to reply before retransmitting.
vrf (RADIUS), on page 128	Configures the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA RADIUS server group.

aaa group server tacacs+

To group different TACACS+ server hosts into distinct lists, use the **aaa group server tacacs+** command in global configuration mode. To remove a server group from the configuration list, enter the **no** form of this command.

aaa group server tacacs+ *group-name*

no aaa group server tacacs+ *group-name*

Syntax Description

<i>group-name</i>	Character string used to name a group of servers.
-------------------	---

Command Default

This command is not enabled.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The AAA server-group feature introduces a way to group existing server hosts. The feature enables you to select a subset of the configured server hosts and use them for a particular service.

The **aaa group server tacacs+** command enters server group configuration mode. The **server** command associates a particular TACACS+ server with the defined server group.

A *server group* is a list of server hosts of a particular type. The supported server host type is TACACS+ server hosts. A server group is used with a global server host list. The server group lists the IP addresses or hostnames of the selected server hosts.

The server group cannot be named radius or tacacs.

Note

Group name methods refer to a set of previously defined TACACS+ servers. Use the **tacacs-server host** command to configure the host servers.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows the configuration of an AAA group server named tacgroup1, which comprises three member servers:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server tacacs+ tacgroup1
RP/0/0/CPU0:router(config-sg-tacacs)# server 192.168.200.226
RP/0/0/CPU0:router(config-sg-tacacs)# server 192.168.200.227
RP/0/0/CPU0:router(config-sg-tacacs)# server 192.168.200.228
```

Related Commands

Command	Description
aaa accounting, on page 4	Creates a method list for accounting.
aaa authentication, on page 11	Creates a method list for authentication.
aaa authorization, on page 14	Creates a method list for authorization.
server (TACACS+), on page 65	Specifies the host name or IP address of an external TACACS+ server.
tacacs-server host, on page 101	Specifies a TACACS+ host.

accounting (line)

To enable authentication, authorization, and accounting (AAA) accounting services for a specific line or group of lines, use the **accounting** command in line template configuration mode. To disable AAA accounting services, use the **no** form of this command.

accounting {**commands**| **exec**} {**default**| *list-name*}

no accounting {**commands**| **exec**}

Syntax Description

commands	Enables accounting on the selected lines for all EXEC shell commands.
exec	Enables accounting of an EXEC session.
default	The name of the default method list, created with the aaa accounting command.
<i>list-name</i>	Specifies the name of a list of accounting methods to use. The list is created with the aaa accounting command.

Command Default

Accounting is disabled.

Command Modes

Line template configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

After you enable the **aaa accounting** command and define a named accounting method list (or use the default method list) for a particular type of accounting, you must apply the defined lists to the appropriate lines for accounting services to take place. Use the **accounting** command to apply the specified method lists to the selected line or group of lines. If a method list is not specified this way, no accounting is applied to the selected line or group of lines.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to enable command accounting services using the accounting method list named *listname2* on a line template named *configure*:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# line template configure
RP/0/0/CPU0:router(config-line)# accounting commands listname2
```

Related Commands

Command	Description
aaa accounting, on page 4	Creates a method list for accounting.

authorization

To enable authentication, authorization, and accounting (AAA) authorization for a specific line or group of lines, use the **authorization** command in line template configuration mode. To disable authorization, use the **no** form of this command.

authorization {**commands**| **exec**} {**default**| *list-name*}

no authorization {**commands**| **exec**}

Syntax Description

commands	Enables authorization on the selected lines for all commands.
exec	Enables authorization for an interactive (EXEC) session.
default	Applies the default method list, created with the aaa authorization command.
<i>list-name</i>	Specifies the name of a list of authorization methods to use. If no list name is specified, the system uses the default. The list is created with the aaa authorization command.

Command Default

Authorization is not enabled.

Command Modes

Line template configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

After you use the **aaa authorization** command to define a named authorization method list (or use the default method list) for a particular type of authorization, you must apply the defined lists to the appropriate lines for authorization to take place. Use the **authorization** command to apply the specified method lists (or, if none is specified, the default method list) to the selected line or group of lines.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to enable command authorization using the method list named *listname4* on a line template named *configure*:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# line template configure
RP/0/0/CPU0:router(config-line)# authorization commands listname4
```

Related Commands

Command	Description
aaa authorization, on page 14	Creates a method list for authorization.

deadtime (server-group configuration)

To configure the deadtime value at the RADIUS server group level, use the **deadtime** command in server-group configuration mode. To set deadtime to 0, use the **no** form of this command.

deadtime *minutes*

no deadtime

Syntax Description

<i>minutes</i>	Length of time, in minutes, for which a RADIUS server is skipped over by transaction requests, up to a maximum of 1440 (24 hours). The range is from 1 to 1440.
----------------	---

Command Default

Deadtime is set to 0.

Command Modes

Server-group configuration

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The value of the deadtime set in the server groups overrides the deadtime that is configured globally. If the deadtime is omitted from the server group configuration, the value is inherited from the master list. If the server group is not configured, the default value of 0 applies to all servers in the group. If the deadtime is set to 0, no servers are marked dead.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example specifies a one-minute deadtime for RADIUS server group group1 when it has failed to respond to authentication requests for the **deadtime** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# server 1.1.1.1 auth-port 1645 acct-port 1646
```

```
RP/0/0/CPU0:router(config-sg-radius)# server 2.2.2.2 auth-port 2000 acct-port 2001
RP/0/0/CPU0:router(config-sg-radius)# deadtime 1
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different RADIUS server hosts into distinct lists and distinct methods.
radius-server dead-criteria time, on page 44	Forces one or both of the criteria that is used to mark a RADIUS server as dead.
radius-server deadtime , on page 48	Defines the length of time in minutes for a RADIUS server to remain marked dead.

description (AAA)

To create a description of a task group or user group during configuration, use the **description** command in task group configuration or user group configuration mode. To delete a task group description or user group description, use the **no** form of this command.

description *string*

no description

Syntax Description

<i>string</i>	Character string describing the task group or user group.
---------------	---

Command Default

None

Command Modes

Task group configuration
User group configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **description** command inside the task or user group configuration submode to define a description for the task or user group, respectively.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows the creation of a task group description:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# taskgroup alpha
RP/0/0/CPU0:router(config-tg)# description this is a sample taskgroup
```

The following example shows the creation of a user group description:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# usergroup alpha
RP/0/0/CPU0:router(config-ug)# description this is a sample user group
```

Related Commands

Command	Description
taskgroup , on page 112	Accesses task group configuration mode and configures a task group by associating it with a set of task IDs.

group (AAA)

To add a user to a group, use the **group** command in username configuration mode. To remove the user from a group, use the **no** form of this command.

```
group {root-system| root-lr| netadmin| sysadmin| operator| cisco-support| serviceadmin| group-name} no
group {root-system| root-lr| netadmin| sysadmin| operator| cisco-support| serviceadmin| group-name}
```

Syntax Description

root-system	Adds the user to the predefined root-system group. Only users with root-system authority may use this option.
root-lr	Adds the user to the predefined root-lr group. Only users with root-system authority or root-lr authority may use this option.
netadmin	Adds the user to the predefined network administrators group.
sysadmin	Adds the user to the predefined system administrators group.
operator	Adds the user to the predefined operator group.
cisco-support	Adds the user to the predefined Cisco support personnel group.
serviceadmin	Adds the user to the predefined service administrators group.
group-name	Adds the user to a named user group that has already been defined with the usergroup command.

Command Default

None

Command Modes

Username configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The serviceadmin keyword was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The predefined group root-system may be specified only by root-system users while configuring administration.

Use the **group** command in username configuration mode. To access username configuration mode, use the [username, on page 122](#) command in global configuration mode.

If the **group** command is used in administration configuration mode, only root-system and cisco-support keywords can be specified.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to assign the user group operator to the user named user1:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# username user1
RP/0/0/CPU0:router(config-un)# group operator
```

Related Commands

Command	Description
password (AAA), on page 42	Creates a login password for a user.
usergroup, on page 120	Configures a user group and associates it with a set of task groups.
username, on page 122	Accesses username configuration mode, configures a new user with a username, and establishes a password and permissions for that user.

inherit taskgroup

To enable a task group to derive permissions from another task group, use the **inherit taskgroup** command in task group configuration mode.

inherit taskgroup {*taskgroup-name*| **netadmin**| **operator**| **sysadmin**| **cisco-support**| **root-lr**| **root-system**| **serviceadmin**}

Syntax Description

<i>taskgroup-name</i>	Name of the task group from which permissions are inherited.
netadmin	Inherits permissions from the network administrator task group.
operator	Inherits permissions from the operator task group.
sysadmin	Inherits permissions from the system administrator task group.
cisco-support	Inherits permissions from the cisco support task group.
root-lr	Inherits permissions from the root-lr task group.
root-system	Inherits permissions from the root system task group.
serviceadmin	Inherits permissions from the service administrators task group.

Command Default

None

Command Modes

Task group configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The serviceadmin keyword was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **inherit taskgroup** command to inherit the permissions (task IDs) from one task group into another task group. Any changes made to the taskgroup from which they are inherited are reflected immediately in the group from which they are inherited.

Task ID	Task ID	Operations
	aaa	read, write

Examples

In the following example, the permissions of task group tg2 are inherited by task group tg1:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# taskgroup tg1
RP/0/0/CPU0:router(config-tg)# inherit taskgroup tg2
RP/0/0/CPU0:router(config-tg)# end
```

inherit usergroup

To enable a user group to derive characteristics of another user group, use the **inherit usergroup** command in user group configuration mode.

inherit usergroup *usergroup-name*

Syntax Description

<i>usergroup-name</i>	Name of the user group from which permissions are to be inherited.
-----------------------	--

Command Default

None

Command Modes

User group configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Each user group is associated with a set of task groups applicable to the users in that group. A task group is defined by a collection of task IDs. Task groups contain task ID lists for each class of action. The task permissions for a user are derived (at the start of the EXEC or XML session) from the task groups associated with the user groups to which that user belongs.

User groups support inheritance from other user groups. Use the **inherit usergroup** command to copy permissions (task ID attributes) from one user group to another user group. The “destination” user group inherits the properties of the inherited group and forms a union of all task IDs specified in those groups. For example, when user group A inherits user group B, the task map of the user group A is a union of that of A and B. Cyclic inclusions are detected and rejected. User groups cannot inherit properties from predefined groups, such as root-system users, root-sdr users, netadmin users, and so on. Any changes made to the usergroup from which it is inherited are reflected immediately in the group from which it is inherited.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to enable the purchasing user group to inherit properties from the sales user group:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# usergroup purchasing
RP/0/0/CPU0:router(config-ug)# inherit usergroup sales
```

Related Commands

usergroup, on page 120	Configures a user group to be associated with a set of task groups.

key (RADIUS)

To specify the authentication and encryption key that is used between the router and the RADIUS daemon running on the RADIUS server, use the **key (RADIUS)** command in RADIUS server-group private configuration mode.

key {0 *clear-text-key*| 7 *encrypted-key*| *clear-text-key*}

no key {0 *clear-text-key*| 7 *encrypted-key*| *clear-text-key*}

Syntax Description

0 <i>clear-text-key</i>	Specifies an unencrypted (cleartext) shared key.
7 <i>encrypted-key</i>	Specifies an encrypted shared key.
<i>clear-text-key</i>	Specifies an unencrypted (cleartext) user password.

Command Default

For submode **key** commands, the default is to use the **radius-server key** command in global configuration mode, if defined. If the global key is also not defined, the configuration is not complete.

Command Modes

RADIUS server-group private configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to set the encrypted key to anykey:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 auth-port 300
RP/0/0/CPU0:router(config-sg-radius-private)# key anykey
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different RADIUS server hosts into distinct lists.
radius-server key , on page 52	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.
retransmit (RADIUS), on page 59	Specifies the number of times a RADIUS request is resent to a server if the server is not responding or is responding slowly.
server-private (RADIUS), on page 67	Configures the IP address of the private RADIUS server for the group server.
timeout (RADIUS), on page 114	Specifies the number of seconds the router waits for the RADIUS server to reply before retransmitting.

key (TACACS+)

To specify an authentication and encryption key shared between the AAA server and the TACACS+ server, use the **key (TACACS+)** command in TACACS host configuration mode. To disable this feature, use the **no** form of this command.

key {*0 clear-text-key* | *7 encrypted-key* | *auth-key*}

no key {*0 clear-text-key* | *7 encrypted-key* | *auth-key*}

Syntax Description

0 <i>clear-text-key</i>	Specifies an unencrypted (cleartext) shared key.
7 <i>encrypted-key</i>	Specifies an encrypted shared key.
<i>auth-key</i>	Specifies the unencrypted key between the AAA server and the TACACS+ server.

Command Default

None

Command Modes

TACACS host configuration

Command History

Release	Modification
Release 3.6.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The TACACS+ packets are encrypted using the key, and it must match the key used by the TACACS+ daemon. Specifying this key overrides the key set by the **tacacs-server key** command for this server only.

The key is used to encrypt the packets that are going from TACACS+, and it should match with the key configured on the external TACACS+ server so that the packets are decrypted properly. If a mismatch occurs, the result fails.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to set the encrypted key to anykey

```
RP/0/0/CPU0:router(config)# tacacs-server host 209.165.200.226
RP/0/0/CPU0:router(config-tacacs-host)# key anykey
```

Related Commands

Command	Description
tacacs-server host, on page 101	Specifies a TACACS+ host.
tacacs-server key, on page 104	Globally sets the authentication encryption key used for all TACACS+ communications between the router and the TACACS+ daemon.

login authentication

To enable authentication, authorization, and accounting (AAA) authentication for logins, use the **login authentication** command in line template configuration mode. To return to the default authentication settings, use the **no** form of this command.

login authentication {**default**| *list-name*}

no login authentication

Syntax Description

default	Default list of AAA authentication methods, as set by the aaa authentication login command.
<i>list-name</i>	Name of the method list used for authenticating. You specify this list with the aaa authentication login command.

Command Default

This command uses the default set with the **aaa authentication login** command.

Command Modes

Line template configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **login authentication** command is a per-line command used with AAA that specifies the name of a list of AAA authentication methods to try at login.

Caution

If you use a *list-name* value that was not configured with the **aaa authentication login** command, the configuration is rejected.

Entering the **no** form of the **login authentication** command has the same effect as entering the command with the **default** keyword.

Before issuing this command, create a list of authentication processes by using the **aaa authentication login** global configuration command.

Task ID

Task ID	Operations
aaa	read, write
tty-access	read, write

Examples

The following example shows that the default AAA authentication is used for the line template *template1*:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# line template template1
RP/0/0/CPU0:router(config-line)# login authentication default
```

The following example shows that the AAA authentication list called *list1* is used for the line template *template2*:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# line template template2
RP/0/0/CPU0:router(config-line)# login authentication list1
```

Related Commands

Command	Description
aaa authentication, on page 11	Creates a method list for authentication.

password (AAA)

To create a login password for a user, use the **password** command in username configuration mode or line template configuration mode. To remove the password, use the **no** form of this command.

password {[0| 7] *password*}

no password {0| 7] *password*}

Syntax Description

0	(Optional) Specifies that an unencrypted clear-text password follows.
7	Specifies that an encrypted password follows.
<i>password</i>	Specifies the unencrypted password text to be entered by the user to log in, for example, "lab". If encryption is configured, the password is not visible to the user. Can be up to 253 characters in length.

Command Default

The password is in unencrypted clear text.

Command Modes

Username configuration
Line template configuration

Command History

Release	Modification
Release 3.2	This command was supported.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can specify one of two types of passwords: encrypted or clear text.

When an EXEC process is started on a line that has password protection, the process prompts for the password. If the user enters the correct password, the process issues the prompt. The user can try three times to enter a password before the process exits and returns the terminal to the idle state.

Passwords are two-way encrypted and should be used for applications such as PPP that need decryptable passwords that can be decrypted.

**Note**

The **show running-config** command always displays the clear-text login password in encrypted form when the **0** option is used.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to establish the unencrypted password *pwd1* for user. The output from the **show** command displays the password in its encrypted form.

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# username user1
RP/0/0/CPU0:router(config-un)# password 0 pwd1
RP/0/0/CPU0:router(config-un)# commit
RP/0/0/CPU0:router(config-un)# show running-config
Building configuration...
username user1
password 7 141B1309
```

Related Commands

Command	Description
group (AAA), on page 30	Adds a user to a group.
usergroup, on page 120	Accesses user group configuration mode and configures a user group, associating it with a set of task groups.
username, on page 122	Accesses username configuration mode and configures a new user with a username, establishing a password and granting permissions for that user.
line	Enters line template configuration mode for the specified line template. For more information, see the <i>Cisco IOS XR System Management Command Reference</i> .

radius-server dead-criteria time

To specify the minimum amount of time, in seconds, that must elapse from the time that the router last received a valid packet from the RADIUS server to the time the server is marked as dead, use the **radius-server dead-criteria time** command in global configuration mode. To disable the criteria that were set, use the **no** form of this command.

radius-server dead-criteria time *seconds*

no radius-server dead-criteria time *seconds*

Syntax Description

seconds Length of time, in seconds. The range is from 1 to 120 seconds. If the *seconds* argument is not configured, the number of seconds ranges from 10 to 60, depending on the transaction rate of the server.

Note The time criterion must be met for the server to be marked as dead.

Command Default

If the *seconds* argument is not configured, the number of seconds ranges from 10 to 60 seconds, depending on the transaction rate of the server.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Note

If you configure the **radius-server dead-criteria time** command before the **radius-server deadtime** command, the **radius-server dead-criteria time** command may not be enforced.

If a packet has not been received since the router booted and there is a timeout, the time criterion is treated as though it were met.

If the *seconds* argument is not indicated, the time is set to the defaults.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to establish the time for the dead-criteria conditions for a RADIUS server to be marked as dead for the **radius-server dead-criteria time** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server dead-criteria time 5
```

Related Commands

Command	Description
radius-server dead-criteria tries, on page 46	Specifies the number of consecutive timeouts that must occur on the router before the RADIUS server is marked as dead.
radius-server deadtime , on page 48	Defines the length of time, in minutes, for a RADIUS server to remain marked dead.
show radius dead-criteria, on page 86	Displays information for the dead-server detection criteria.

radius-server dead-criteria tries

To specify the number of consecutive timeouts that must occur on the router before the RADIUS server is marked as dead, use the **radius-server dead-criteria tries** command in global configuration mode. To disable the criteria that were set, use the **no** form of this command.

radius-server dead-criteria *tries*

no radius-server dead-criteria *tries*

Syntax Description

<i>tries</i>	Number of timeouts from 1 to 100. If the <i>tries</i> argument is not configured, the number of consecutive timeouts ranges from 10 to 100, depending on the transaction rate of the server and the number of configured retransmissions.
Note	The tries criterion must be met for the server to be marked as dead.

Command Default

If the *tries* argument is not configured, the number of consecutive timeouts ranges from 10 to 100, depending on the transaction rate of the server and the number of configured retransmissions.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If the server performs both authentication and accounting, both types of packet are included in the number. Improperly constructed packets are counted as though they were timeouts. All transmissions, including the initial transmit and all retransmits, are counted.

Note

If you configure the **radius-server dead-criteria tries** command before the **radius-server deadtime** command, the **radius-server dead-criteria tries** command may not be enforced.

If the *tries* argument is not indicated, the number of tries is set to the default.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to establish the number of tries for the dead-criteria conditions for a RADIUS server to be marked as dead for the **radius-server dead-criteria tries** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server dead-criteria tries 4
```

Related Commands

Command	Description

radius-server deadtime , on page 48	Defines the length of time, in minutes, for a RADIUS server to remain marked dead.
show radius dead-criteria , on page 86	Displays information for the dead-server detection criteria.

radius-server deadtime

To improve RADIUS response times when some servers are unavailable and cause the unavailable servers to be skipped immediately, use the **radius-server deadtime** command in global configuration mode. To set deadtime to 0, use the **no** form of this command.

radius-server deadtime *value*

no radius-server deadtime *value*

Syntax Description

<i>value</i>	Length of time, in minutes, for which a RADIUS server is skipped over by transaction requests, up to a maximum of 1440 (24 hours). The range is from 1 to 1440. The default value is 0.
--------------	---

Command Default

Dead time is set to 0.

Command Modes

Global configuration mode

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

A RADIUS server marked as dead is skipped by additional requests for the duration of minutes unless all other servers are marked dead and there is no rollover method.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example specifies five minutes of deadtime for RADIUS servers that fail to respond to authentication requests for the **radius-server deadtime** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server deadtime 5
```

radius-server host

To specify a RADIUS server host, use the **radius-server host** command in global configuration mode. To delete the specified RADIUS host, use the **no** form of this command.

radius-server host *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*]

no radius-server host *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]

Syntax Description

<i>ip-address</i>	IP address of the RADIUS server host.
auth-port <i>port-number</i>	(Optional) Specifies the User Datagram Protocol (UDP) destination port for authentication requests; the host is not used for authentication if set to 0. If unspecified, the port number defaults to 1645.
acct-port <i>port-number</i>	(Optional) Specifies the UDP destination port for accounting requests; the host is not used for accounting if set to 0. If unspecified, the port number defaults to 1646.
timeout <i>seconds</i>	(Optional) The time interval (in seconds) that the router waits for the RADIUS server to reply before retransmitting. This setting overrides the global value of the radius-server timeout command. If no timeout value is specified, the global value is used. Enter a value in the range from 1 to 1000. Default is 5.
retransmit <i>retries</i>	(Optional) The number of times a RADIUS request is re-sent to a server, if that server is not responding or is responding slowly. This setting overrides the global setting of the radius-server retransmit command. If no retransmit value is specified, the global value is used. Enter a value in the range from 1 to 100. Default is 3.
key <i>string</i>	(Optional) Specifies the authentication and encryption key used between the router and the RADIUS server. This key overrides the global setting of the radius-server key command. If no key string is specified, the global value is used. The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius-server host command syntax. This is because the leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks themselves are part of the key.

Command Default

No RADIUS host is specified; use global **radius-server** command values.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can use multiple **radius-server host** commands to specify multiple hosts. The Cisco IOS XR software searches for hosts in the order in which you specify them.

If no host-specific timeout, retransmit, or key values are specified, the global values apply to each host.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to establish the host with IP address 172.29.39.46 as the RADIUS server, use ports 1612 and 1616 as the authorization and accounting ports, set the timeout value to 6, set the retransmit value to 5, and set “rad123” as the encryption key, matching the key on the RADIUS server:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server host 172.29.39.46 auth-port 1612 acct-port 1616
timeout 6 retransmit 5 key rad123
```

To use separate servers for accounting and authentication, use the zero port value as appropriate.

Related Commands

Command	Description
aaa accounting subscriber	Creates a method list for accounting.
aaa authentication subscriber	Creates a method list for authentication.
aaa authorization subscriber	Creates a method list for authorization.
radius-server key , on page 52	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.
radius-server retransmit , on page 54	Specifies how many times Cisco IOS XR software retransmits packets to a server before giving up.
radius-server timeout , on page 56	Sets the interval a router waits for a server host to reply.

radius-server key

To set the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon, use the **radius-server key** command in global configuration mode. To disable the key, use the **no** form of this command.

radius-server key {0 *clear-text-key* | 7 *encrypted-key* | *clear-text-key*}

no radius-server key

Syntax Description

0 <i>clear-text-key</i>	Specifies an unencrypted (cleartext) shared key.
7 <i>encrypted-key</i>	Specifies a encrypted shared key.
<i>clear-text-key</i>	Specifies an unencrypted (cleartext) shared key.

Command Default

The authentication and encryption key is disabled.

Command Modes

Global configuration mode

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The key entered must match the key used on the RADIUS server. All leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks themselves are part of the key.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to set the cleartext key to "samplekey:"

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server key 0 samplekey
```

This example shows how to set the encrypted shared key to "anykey:"

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server key 7 anykey
```

radius-server retransmit

To specify the number of times the Cisco IOS XR software retransmits a packet to a server before giving up, use the **radius-server retransmit** command in global configuration mode. To disable retransmission, use the **no** form of this command.

radius-server retransmit *retries*

no radius-server retransmit

Syntax Description

<i>retries</i>	Maximum number of retransmission attempts. The range is from 1 to 100. Default is 3.
----------------	--

Command Default

The RADIUS servers are retried three times, or until a response is received.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The RADIUS client tries all servers, allowing each one to time out before increasing the retransmit count.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to specify a retransmit counter value of five times:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server retransmit 5
```

Related Commands

Command	Description
radius-server key , on page 52	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon.

radius-server timeout

To set the interval for which a router waits for a server host to reply before timing out, use the **radius-server timeout** command in global configuration mode. To restore the default, use the **no** form of this command.

radius-server timeout *seconds*

no radius-server timeout

Syntax Description

<i>seconds</i>	Number that specifies the timeout interval, in seconds. Range is from 1 to 1000.
----------------	--

Command Default

The default radius-server timeout value is 5 seconds.

Command Modes

Global configuration mode

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **radius-server timeout** command to set the number of seconds a router waits for a server host to reply before timing out.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to change the interval timer to 10 seconds:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# radius-server timeout 10
```

radius source-interface

To force RADIUS to use the IP address of a specified interface or subinterface for all outgoing RADIUS packets, use the **radius source-interface** command in global configuration mode. To prevent only the specified interface from being the default and not from being used for all outgoing RADIUS packets, use the **no** form of this command.

radius source-interface *interface* [**vrf** *vrf_name*]

no radius source-interface *interface*

Syntax Description

<i>interface-name</i>	Name of the interface that RADIUS uses for all of its outgoing packets.
vrf <i>vrf-id</i>	Specifies the name of the assigned VRF.

Command Default

If a specific source interface is not configured, or the interface is down or does not have an IP address configured, the system selects an IP address.

Command Modes

Global configuration mode

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.4.0	The vrf keyword was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **radius source-interface** command to set the IP address of the specified interface or subinterface for all outgoing RADIUS packets. This address is used as long as the interface or subinterface is in the up state. In this way, the RADIUS server can use one IP address entry for every network access client instead of maintaining a list of IP addresses.

The specified interface or subinterface must have an IP address associated with it. If the specified interface or subinterface does not have an IP address or is in the down state, then RADIUS reverts to the default. To avoid this, add an IP address to the interface or subinterface or bring the interface to the up state.

The **radius source-interface** command is especially useful in cases in which the router has many interfaces or subinterfaces and you want to ensure that all RADIUS packets from a particular router have the same IP address.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to make RADIUS use the IP address of subinterface s2 for all outgoing RADIUS packets:

```
RP/0/0/CPU0:router# configure  
RP/0/0/CPU0:router(config)# radius source-interface Loopback 10 vrf wal-mart
```

retransmit (RADIUS)

To specify the number of times a RADIUS request is resent to a server if the server is not responding or is responding slowly, use the **retransmit** command in RADIUS server-group private configuration mode.

retransmit *retries*

no retransmit *retries*

Syntax Description	<i>retries</i>	The <i>retries</i> argument specifies the retransmit value. The range is from 1 to 100. If no retransmit value is specified, the global value is used.
--------------------	----------------	--

Command Default	The default value is 3.
-----------------	-------------------------

Command Modes	RADIUS server-group private configuration
---------------	---

Command History	Release	Modification
	Release 3.4.0	This command was introduced.

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
------------------	---

Task ID	Task ID	Operations
	aaa	read, write

Examples	The following example shows how to set the retransmit value:
----------	--

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 auth-port 300
RP/0/0/CPU0:router(config-sg-radius-private)# retransmit 100
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different RADIUS server hosts into distinct lists.
server-private (RADIUS), on page 67	Configures the IP address of the private RADIUS server for the group server.
timeout (RADIUS), on page 114	Specifies the number of seconds the router waits for the RADIUS server to reply before retransmitting.

secret

To configure an MD5-encrypted secret to be associated with an encrypted username, use the **secret** command in username configuration mode or line template configuration mode. To remove the secure secret, use the **no** form of this command.

secret {[0] *secret-login*| 5 *secret-login*}

no secret {0| 5} *secret-login*

Syntax Description

0	(Optional) Specifies that an unencrypted (clear-text) password follows. The password will be encrypted for storage in the configuration using an MD5 encryption algorithm. Otherwise, the password is not encrypted.
5	Specifies that an encrypted MD5 password (secret) follows.
<i>secret-login</i>	Text string in alphanumeric characters that is stored as the MD5-encrypted password entered by the user in association with the user's login ID. Can be up to 253 characters in length. Note The characters entered must conform to MD5 encryption standards.

Command Default

No password is specified.

Command Modes

Username configuration
Line template configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The <i>password</i> argument was replaced with the <i>secret-login</i> argument.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Cisco IOS XR software allows you to configure Message Digest 5 (MD5) encryption for username logins and passwords. MD5 encryption is a one-way hash function that makes reversal of an encrypted password impossible, providing strong encryption protection. Using MD5 encryption, you cannot retrieve clear-text

passwords. Therefore, MD5 encrypted passwords cannot be used with protocols that require the clear-text password to be retrievable, such as Challenge Handshake Authentication Protocol (CHAP).

You can specify one of two types of secure secret IDs: encrypted (5) or clear text (0). If you do not select either 0 or 5, the clear-text password you enter is not be encrypted.

When an EXEC process is started on a line that has password protection, the process prompts for the secret. If the user enters the correct secret, the process issues the prompt. The user can try entering the secret thrice before the terminal returns to the idle state.

Secrets are one-way encrypted and should be used for login activities that do not require a decryptable secret.

To verify that MD5 password encryption has been enabled, use the **show running-config** command. If the “username name secret 5” line appears in the command output, enhanced password security is enabled.

**Note**

The **show running-config** command does not display the login password in clear text when the 0 option is used to specify an unencrypted password. See the “Examples” section.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to establish the clear-text secret “lab” for the user *user2*:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# username user2
RP/0/0/CPU0:router(config-un)# secret 0 lab
RP/0/0/CPU0:router(config-un)# commit
RP/0/0/CPU0:router(config-un)# show running-config
Building configuration...
username user2
  secret 5 $1$DTmd$q7C6fhzje7Cc7Xzmu2FrX1
!
end
```

server (RADIUS)

To associate a particular RADIUS server with a defined server group, use the **server** command in RADIUS server-group configuration mode. To remove the associated server from the server group, use the **no** form of this command.

server *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]

no server *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]

Syntax Description

<i>ip-address</i>	IP address of the RADIUS server host.
auth-port <i>port-number</i>	(Optional) Specifies the User Datagram Protocol (UDP) destination port for authentication requests. The <i>port-number</i> argument specifies the port number for authentication requests. The host is not used for authentication if this value is set to 0. Default is 1645.
acct-port <i>port-number</i>	(Optional) Specifies the UDP destination port for accounting requests. The <i>port-number</i> argument specifies the port number for accounting requests. The host is not used for accounting services if this value is set to 0. Default is 1646.

Command Default

If no port attributes are defined, the defaults are as follows:

- Authentication port: 1645
- Accounting port: 1646

Command Modes

RADIUS server-group configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **server** command to associate a particular RADIUS server with a defined server group.

There are two different ways in which you can identify a server, depending on the way you want to offer AAA services. You can identify the server simply by using its IP address, or you can identify multiple host instances or entries using the optional **auth-port** and **acct-port** keywords.

When you use the optional keywords, the network access server identifies RADIUS security servers and host instances associated with a group server based on their IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS host entries providing a specific AAA service. If two different host entries on the same RADIUS server are configured for the same service, for example, accounting, the second host entry configured acts as an automatic switchover backup to the first one. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order they are configured.)

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to use two different host entries on the same RADIUS server that are configured for the same services—authentication and accounting. The second host entry configured acts as switchover backup to the first one.

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# server 1.1.1.1 auth-port 1645 acct-port 1646
RP/0/0/CPU0:router(config-sg-radius)# server 2.2.2.2 auth-port 2000 acct-port 2001
```

Related Commands

Command	Description
aaa group server radius, on page 18	Groups different RADIUS server hosts into distinct lists and distinct methods.
deadtime (server-group configuration), on page 26	Configures the deadtime value at the RADIUS server group level.
server-private (RADIUS), on page 67	Configures the IP address of the private RADIUS server for the group server.

server (TACACS+)

To associate a particular TACACS+ server with a defined server group, use the **server** command in TACACS+ server-group configuration mode. To remove the associated server from the server group, use the **no** form of this command.

server {*hostname*|*ip-address*}

no server {*hostname*|*ip-address*}

Syntax Description

<i>hostname</i>	Character string used to name the server host.
<i>ip-address</i>	IP address of the server host.

Command Default

None

Command Modes

TACACS+ server-group configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The server need not be accessible during configuration. Later, you can reference the configured server group from the method lists used to configure authentication, authorization, and accounting (AAA).

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to associate the TACACS+ server with the IP address 192.168.60.15 with the server group tac1:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server tacacs+ tac1
RP/0/0/CPU0:router(config-sg-tacacs+)# server 192.168.60.15
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different TACACS+ server hosts into distinct lists.

server-private (RADIUS)

To configure the IP address of the private RADIUS server for the group server, use the **server-private** command in RADIUS server-group configuration mode. To remove the associated private server from the AAA group server, use the **no** form of this command .

server-private *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*]

no server-private *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*]

Syntax Description

<i>ip-address</i>	IP address of the RADIUS server host.
auth-port <i>port-number</i>	(Optional) Specifies the User Datagram Protocol (UDP) destination port for authentication requests. The <i>port-number</i> argument specifies the port number for authentication requests. The host is not used for authentication if this value is set to 0. The default value is 1645.
acct-port <i>port-number</i>	(Optional) Specifies the UDP destination port for accounting requests. The <i>port-number</i> argument specifies the port number for accounting requests. The host is not used for accounting services if this value is set to 0. The default value is 1646.
timeout <i>seconds</i>	(Optional) Specifies the number of seconds the router waits for the RADIUS server to reply before retransmitting. The setting overrides the global value of the radius-server timeout command. If no timeout is specified, the global value is used. The <i>seconds</i> argument specifies the timeout value in seconds. The range is from 1 to 1000. If no timeout is specified, the global value is used.
retransmit <i>retries</i>	(Optional) Specifies the number of times a RADIUS request is resent to a server if the server is not responding or is responding slowly. The setting overrides the global setting of the radius-server transmit command. The <i>retries</i> argument specifies the retransmit value. The range is from 1 to 100. If no retransmit value is specified, the global value is used.
key <i>string</i>	(Optional) Specifies the authentication and encryption key that is used between the router and the RADIUS daemon running on the RADIUS server. This key overrides the global setting of the radius-server key command. If no key string is specified, the global value is used.

Command Default

If no port attributes are defined, the defaults are as follows:

- Authentication port: 1645
- Accounting port: 1646

Command Modes

RADIUS server-group configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **server-private** command to associate a particular private server with a defined server group. Possible overlapping of IP addresses between VRF instances are permitted. Private servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (for example, default radius server group) can still be referred to by IP addresses and port numbers. Thus, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

Both the **auth-port** and **acct-port** keywords enter RADIUS server-group private configuration mode.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to define the group1 RADIUS group server, to associate private servers with it, and to enter RADIUS server-group private configuration mode:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 timeout 5
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 retransmit 3
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 key coke
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 auth-port 300
RP/0/0/CPU0:router(config-sg-radius-private)# exit
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 timeout 5
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 retransmit 3
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 key coke
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.2.2.2 auth-port 300
RP/0/0/CPU0:router(config-sg-radius-private)#
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different RADIUS server hosts into distinct lists and distinct methods.

Command	Description
radius-server key , on page 52	Sets the authentication and encryption key for all RADIUS communication between the router and the RADIUS daemon.
radius-server retransmit , on page 54	Specifies the number of times the Cisco IOS XR software retransmits a packet to a server before giving up.
radius-server timeout , on page 56	Sets the interval for which a router waits for a server host to reply before timing out.
key (RADIUS) , on page 36	Specifies the authentication and encryption key that is used between the router and the RADIUS daemon running on the RADIUS server.
retransmit (RADIUS) , on page 59	Specifies the number of times a RADIUS request is resent to a server if the server is not responding or is responding slowly.
timeout (RADIUS) , on page 114	Specifies the number of seconds the router waits for the RADIUS server to reply before retransmitting.
vrf (RADIUS) , on page 128	Configures the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA RADIUS server group.

server-private (TACACS+)

To configure the IP address of the private TACACS+ server for the group server, use the **server-private** command in TACACS+ server-group configuration mode. To remove the associated private server from the AAA group server, use the **no** form of this command.

server-private {*hostname*|*ip-address*} [**port** *port-number*] [**timeout** *seconds*] [**key** *string*]

no server-private {*hostname*|*ip-address*}

Syntax Description

<i>hostname</i>	Character string used to name the server host.
<i>ip-address</i>	IP address of the TACACS+ server host.
port <i>port-number</i>	(Optional) Specifies a server port number. This option overrides the default, which is port 49. Valid port numbers range from 1 to 65535.
timeout <i>seconds</i>	(Optional) Specifies, in seconds, a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server. This option overrides the global timeout value set with the tacacs-server timeout command for only this server. The range is from 1 to 1000. The default is 5.
key <i>string</i>	(Optional) Specifies the authentication and encryption key that is used between the router and the TACACS+ daemon running on the TACACS+ server. This key overrides the global setting of the tacacs-server key command. If no key string is specified, the global value is used.

Command Default

The *port-name* argument, if not specified, defaults to the standard port 49.
The *seconds* argument, if not specified, defaults to 5 seconds.

Command Modes

TACACS+ server-group configuration

Command History

Release	Modification
Release 4.1.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **server-private** command to associate a particular private server with a defined server group. Possible overlapping of IP addresses between VRF instances are permitted. Private servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (for example, default tacacs+ server group) can still be referred by IP addresses and port numbers. Therefore, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to define the myserver TACACS+ group server, to associate private servers with it, and to enter TACACS+ server-group private configuration mode:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server tacacs+ myserver
RP/0/0/CPU0:router(config-sg-tacacs+)# server-private 10.1.1.1 timeout 5
RP/0/0/CPU0:router(config-sg-tacacs+)# server-private 10.1.1.1 key a_secret
RP/0/0/CPU0:router(config-sg-tacacs+)# server-private 10.1.1.1 port 51
RP/0/0/CPU0:router(config-sg-tacacs-private)# exit
RP/0/0/CPU0:router(config-sg-tacacs+)# server-private 10.2.2.2 timeout 5
RP/0/0/CPU0:router(config-sg-tacacs+)# server-private 10.2.2.2 key coke
RP/0/0/CPU0:router(config-sg-tacacs+)# server-private 10.2.2.2 port 300
RP/0/0/CPU0:router(config-sg-tacacs-private)#
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different TACACS+ server hosts into distinct lists and distinct methods.
tacacs-server key, on page 104	Sets the authentication encryption key used for all TACACS+ communications between the router and the TACACS+ daemon.
tacacs-server timeout, on page 106	Sets the interval for which a router waits for a server host to reply before timing out.
key (TACACS+), on page 38	Specifies an authentication and encryption key shared between the AAA server and the TACACS+ server.
timeout (TACACS+), on page 116	Specifies a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server.
vrf (TACACS+), on page 130	Configures the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA TACACS+ server group.

show aaa

To display information about an Internet Key Exchange (IKE) Security Protocol group, user group, local user, login traces, or task group; to list all task IDs associated with all IKE groups, user groups, local users, or task groups in the system; or to list all task IDs for a specified IKE group, user group, local user, or task group, use the **show aaa** command in EXEC mode.

show aaa {**ikegroup** *ikegroup-name*| **login trace**| **usergroup** [*usergroup-name*]| **trace**| **userdb** [*username*]| **task supported**| **taskgroup** [**root-lr**| **netadmin**| **operator**| **sysadmin**| **root-system**| **service-admin**| **cisco-support**| **t** *taskgroup-name*]}

Syntax Description

ikegroup	Displays details for all IKE groups.
<i>ikegroup-name</i>	(Optional) IKE group whose details are to be displayed.
login trace	Displays trace data for login subsystem.
usergroup	Displays details for all user groups.
root-lr	(Optional) Usergroup name.
netadmin	(Optional) Usergroup name.
operator	(Optional) Usergroup name.
sysadmin	(Optional) Usergroup name.
root-system	(Optional) Usergroup name.
cisco-support	(Optional) Usergroup name.
<i>usergroup-name</i>	(Optional) Usergroup name.
trace	Displays trace data for AAA subsystem.
userdb	Displays details for all local users and the usergroups to which each user belongs.
<i>username</i>	(Optional) User whose details are to be displayed.
task supported	Displays all AAA task IDs available.
taskgroup	Displays details for all task groups.
	Note For taskgroup keywords, see optional usergroup name keyword list.
<i>taskgroup-name</i>	(Optional) Task group whose details are to be displayed.

Command Default Details for all user groups, or all local users, or all task groups are listed if no argument is entered.

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.
	Release 3.4.0	The ikegroup keyword was added.
	Release 3.5.0	The show task supported command was removed and its topic was added as a keyword for the show aaa command.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show aaa** command to list details for all IKE groups, user groups, local users, AAA task IDs, or task groups in the system. Use the optional *ikegroup-name*, *usergroup-name*, *username*, or *taskgroup-name* argument to display the details for a specified IKE group, user group, user, or task group, respectively.

Task ID	Task ID	Operations
	aaa	read

Examples The following sample output is from the **show aaa** command, using the **ikegroup** keyword:

```
RP/0/0/CPU0:router# show aaa ikegroup
```

```
IKE Group ike-group
  Max-Users = 50
IKE Group ikeuser
  Group-Key = test-password
  Default Domain = cisco.com
IKE Group ike-user
```

The following sample output is from the **show aaa** command, using the **usergroup** command:

```
RP/0/0/CPU0:router# show aaa usergroup operator
```

```
User group 'operator'
  Inherits from task group 'operator'
User group 'operator' has the following combined set
of task IDs (including all inherited groups):
Task:      basic-services : READ    WRITE    EXECUTE DEBUG
Task:      cdp            : READ
Task:      diag           : READ
```

```
Task:          ext-access  : READ          EXECUTE
Task:          logging    : READ
```

The following sample output is from the **show aaa** command, using the **taskgroup** keyword for a task group named **netadmin**:

```
RP/0/0/CPU0:router# show aaa taskgroup netadmin
```

```
Task group 'netadmin'
```

```
Task group 'netadmin' has the following combined set
of task IDs (including all inherited groups):
```

```
Task:          aaa      : READ
Task:          acl      : READ      WRITE      EXECUTE      DEBUG
Task:          admin    : READ
Task:          ancp     : READ      WRITE      EXECUTE      DEBUG
Task:          atm      : READ      WRITE      EXECUTE      DEBUG
Task:          basic-services : READ      WRITE      EXECUTE      DEBUG
Task:          bcdl     : READ
Task:          bfd      : READ      WRITE      EXECUTE      DEBUG
Task:          bgp      : READ      WRITE      EXECUTE      DEBUG
Task:          boot     : READ      WRITE      EXECUTE      DEBUG
Task:          bundle   : READ      WRITE      EXECUTE      DEBUG
Task:          cdp      : READ      WRITE      EXECUTE      DEBUG
Task:          cef      : READ      WRITE      EXECUTE      DEBUG
Task:          cgn      : READ      WRITE      EXECUTE      DEBUG
Task:          config-mgmt : READ      WRITE      EXECUTE      DEBUG
Task:          config-services : READ      WRITE      EXECUTE      DEBUG
Task:          crypto   : READ      WRITE      EXECUTE      DEBUG
Task:          diag     : READ      WRITE      EXECUTE      DEBUG
Task:          drivers  : READ
Task:          dwdm     : READ      WRITE      EXECUTE      DEBUG
Task:          eem      : READ      WRITE      EXECUTE      DEBUG
Task:          eigrp    : READ      WRITE      EXECUTE      DEBUG
Task:          ethernet-services : READ
Task:          ext-access : READ      WRITE      EXECUTE      DEBUG
Task:          fabric   : READ      WRITE      EXECUTE      DEBUG
Task:          fault-mgr : READ      WRITE      EXECUTE      DEBUG
Task:          filesystem : READ      WRITE      EXECUTE      DEBUG
Task:          firewall : READ      WRITE      EXECUTE      DEBUG
Task:          fr        : READ      WRITE      EXECUTE      DEBUG
Task:          hdlc     : READ      WRITE      EXECUTE      DEBUG
Task:          host-services : READ      WRITE      EXECUTE      DEBUG
Task:          hsrp     : READ      WRITE      EXECUTE      DEBUG
Task:          interface : READ      WRITE      EXECUTE      DEBUG
Task:          inventory : READ
Task:          ip-services : READ      WRITE      EXECUTE      DEBUG
Task:          ipv4     : READ      WRITE      EXECUTE      DEBUG
Task:          ipv6     : READ      WRITE      EXECUTE      DEBUG
Task:          isis     : READ      WRITE      EXECUTE      DEBUG
Task:          l2vpn    : READ      WRITE      EXECUTE      DEBUG
Task:          li       : READ      WRITE      EXECUTE      DEBUG
Task:          logging  : READ      WRITE      EXECUTE      DEBUG
Task:          lpts     : READ      WRITE      EXECUTE      DEBUG
Task:          monitor  : READ
Task:          mpls-ldp  : READ      WRITE      EXECUTE      DEBUG
Task:          mpls-static : READ      WRITE      EXECUTE      DEBUG
Task:          mpls-te   : READ      WRITE      EXECUTE      DEBUG
Task:          multicast : READ      WRITE      EXECUTE      DEBUG
Task:          netflow  : READ      WRITE      EXECUTE      DEBUG
Task:          network  : READ      WRITE      EXECUTE      DEBUG
Task:          ospf     : READ      WRITE      EXECUTE      DEBUG
Task:          ouni     : READ      WRITE      EXECUTE      DEBUG
Task:          pkg-mgmt  : READ
Task:          pos-dpt  : READ      WRITE      EXECUTE      DEBUG
Task:          ppp      : READ      WRITE      EXECUTE      DEBUG
Task:          qos      : READ      WRITE      EXECUTE      DEBUG
Task:          rib      : READ      WRITE      EXECUTE      DEBUG
Task:          rip      : READ      WRITE      EXECUTE      DEBUG
Task:          root-lr   : READ
Task:          route-map : READ      WRITE      EXECUTE      DEBUG (reserved)
```

```

Task:      route-policy : READ    WRITE    EXECUTE    DEBUG
Task:      sbc          : READ    WRITE    EXECUTE    DEBUG
Task:      snmp         : READ    WRITE    EXECUTE    DEBUG
Task:      sonet-sdh    : READ    WRITE    EXECUTE    DEBUG
Task:      static       : READ    WRITE    EXECUTE    DEBUG
Task:      sysmgr       : READ
Task:      system      : READ    WRITE    EXECUTE    DEBUG
Task:      transport   : READ    WRITE    EXECUTE    DEBUG
Task:      tty-access   : READ    WRITE    EXECUTE    DEBUG
Task:      tunnel       : READ    WRITE    EXECUTE    DEBUG
Task:      universal    : READ                                (reserved)
Task:      vlan        : READ    WRITE    EXECUTE    DEBUG
Task:      vrrp         : READ    WRITE    EXECUTE    DEBUG

```

The following sample output is from the **show aaa** command, using the **taskgroup** keyword for an operator. The task group operator has the following combined set of task IDs, which includes all inherited groups:

```

Task:      basic-services : READ    WRITE    EXECUTE    DEBUG
Task:      cdp           : READ
Task:      diag          : READ
Task:      ext-access    : READ                                EXECUTE
Task:      logging       : READ

```

The following sample output is from the **show aaa** command, using the **taskgroup** keyword for a root system. The task-group root system has the following combined set of task IDs, which includes all inherited groups:

```

Task:      aaa          : READ    WRITE    EXECUTE    DEBUG
Task:      acl          : READ    WRITE    EXECUTE    DEBUG
Task:      admin        : READ    WRITE    EXECUTE    DEBUG
Task:      atm          : READ    WRITE    EXECUTE    DEBUG
Task:      basic-services : READ    WRITE    EXECUTE    DEBUG
Task:      bcdl         : READ    WRITE    EXECUTE    DEBUG
Task:      bfd          : READ    WRITE    EXECUTE    DEBUG
Task:      bgp          : READ    WRITE    EXECUTE    DEBUG
Task:      boot         : READ    WRITE    EXECUTE    DEBUG
Task:      bundle       : READ    WRITE    EXECUTE    DEBUG
Task:      cdp          : READ    WRITE    EXECUTE    DEBUG
Task:      cef          : READ    WRITE    EXECUTE    DEBUG
Task:      config-mgmt   : READ    WRITE    EXECUTE    DEBUG
Task:      config-services : READ    WRITE    EXECUTE    DEBUG
Task:      crypto       : READ    WRITE    EXECUTE    DEBUG
Task:      diag         : READ    WRITE    EXECUTE    DEBUG

Related Commands

Command	Description
show user, on page 95	Displays task IDs enabled for the currently logged-in user.

show radius

To display information about the RADIUS servers that are configured in the system, use the **show radius** command in EXEC mode.

show radius

Syntax Description

This command has no keywords or arguments.

Command Default

If no radius servers are configured, no output is displayed.

Command Modes

EXEC

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show radius** command to display statistics for each configured RADIUS server.

Examples

The following sample output is for the **show radius** command:

```
RP/0/0/CPU0:router# show radius

Global dead time: 0 minute(s)

Server: 1.1.1.1/1645/1646 is UP
  Timeout: 5 sec, Retransmit limit: 3
  Authentication:
    0 requests, 0 pending, 0 retransmits
    0 accepts, 0 rejects, 0 challenges
    0 timeouts, 0 bad responses, 0 bad authenticators
    0 unknown types, 0 dropped, 0 ms latest rtt
  Accounting:
    0 requests, 0 pending, 0 retransmits
    0 responses, 0 timeouts, 0 bad responses
    0 bad authenticators, 0 unknown types, 0 dropped
    0 ms latest rtt
```

```

Server: 2.2.2.2/1645/1646 is UP
Timeout: 10 sec, Retransmit limit: 3
Authentication:
  0 requests, 0 pending, 0 retransmits
  0 accepts, 0 rejects, 0 challenges
  0 timeouts, 0 bad responses, 0 bad authenticators
  0 unknown types, 0 dropped, 0 ms latest rtt
Accounting:
  0 requests, 0 pending, 0 retransmits
  0 responses, 0 timeouts, 0 bad responses
  0 bad authenticators, 0 unknown types, 0 dropped
  0 ms latest rtt

```

This table describes the significant fields shown in the display.

Table 2: show radius Field Descriptions

Field	Description
Server	Server IP address/UDP destination port for authentication requests/UDP destination port for accounting requests.
Timeout	Number of seconds the router waits for a server host to reply before timing out.
Retransmit limit	Number of times the Cisco IOS XR software searches the list of RADIUS server hosts before giving up.

Related Commands

Command	Description
vrf (RADIUS), on page 128	Configures the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA RADIUS server group.
radius-server retransmit , on page 54	Specifies how many times Cisco IOS XR software searches the list of RADIUS server hosts before giving up.
radius-server timeout , on page 56	Sets the interval for which a router waits for a server host to reply.

show radius accounting

To obtain information and detailed statistics for the RADIUS accounting server and port, use the **show radius accounting** command in EXEC mode.

show radius accounting

Syntax Description

This command has no keywords or arguments.

Command Default

If no RADIUS servers are configured on the router, the output is empty. If the default values are for the counter (for example, request and pending), the values are all zero because the RADIUS server was just defined and not used yet.

Command Modes

EXEC

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Examples

The following sample output is displayed on a per-server basis for the **show radius accounting** command:

```
RP/0/0/CPU0:router# show radius accounting

Server: 12.26.25.61, port: 1813
0 requests, 0 pending, 0 retransmits
0 responses, 0 timeouts, 0 bad responses
0 bad authenticators, 0 unknown types, 0 dropped
0 ms latest rtt

Server: 12.26.49.12, port: 1813
0 requests, 0 pending, 0 retransmits
0 responses, 0 timeouts, 0 bad responses
0 bad authenticators, 0 unknown types, 0 dropped
0 ms latest rtt

Server: 12.38.28.18, port: 29199
```

```
0 requests, 0 pending, 0 retransmits  
0 responses, 0 timeouts, 0 bad responses  
0 bad authenticators, 0 unknown types, 0 dropped  
0 ms latest rtt
```

This table describes the significant fields shown in the display.

aaa accounting, on page 4	Creates a method list for accounting.
aaa authentication, on page 11	Creates a method list for authentication.
show radius accounting, on page 80	Obtains information and detailed statistics for the RADIUS accounting server and port.

show radius client

To obtain general information about the RADIUS client on Cisco IOS XR software, use the **show radius client** command in EXEC mode.

show radius client

Syntax Description

This command has no keywords or arguments.

Command Default

The default value for the counters (for example, an invalid address) is 0. The network access server (NAS) identifier is the hostname that is defined on the router.

Command Modes

EXEC

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **show radius client** command displays the authentication and accounting responses that are received from the invalid RADIUS servers, for example, unknown to the NAS. In addition, the **show radius client** command displays the hostname or NAS identifier for the RADIUS authentication client, accounting client, or both.

Task ID

Task ID	Operations
aaa	read

Examples

The following sample output is for the **show radius client** command:

```
RP/0/0/CPU0:router# show radius client
```

```
Client NAS identifier:                               miniq
Authentication responses from invalid addresses:      0
Accounting responses from invalid addresses:          0
This table describes the significant fields shown in the display.
```

Field	Description
Client NAS identifier	Identifies the NAS-identifier of the RADIUS authentication client.

Related Commands

Command	Description
server (RADIUS), on page 63	Associates a particular RADIUS server with a defined server group.
show radius, on page 78	Displays information about the RADIUS servers that are configured in the system.

show radius dead-criteria

To obtain information about the dead server detection criteria, use the **show radius dead-criteria** command in EXEC mode.

show radius dead-criteria *host ip-addr* [**auth-port** *auth-port*] [**acct-port** *acct-port*]

Syntax Description

host <i>ip-addr</i>	Specifies the name or IP address of the configured RADIUS server.
auth-port <i>auth-port</i>	(Optional) Specifies the authentication port for the RADIUS server. The default value is 1645.
acct-port <i>acct-port</i>	(Optional) Specifies the accounting port for the RADIUS server. The default value is 1646.

Command Default

The default values for time and tries are not fixed to a single value; therefore, they are calculated and fall within a range of 10 to 60 seconds for time and 10 to 100 for tries.

Command Modes

EXEC

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

RP/0/0/CPU0:router# show radius dead-criteria host 12.26.49.12 auth-port 11000 acct-port 11001
```

```
Server: 12.26.49.12/11000/11001
Dead criteria time: 10 sec (computed) tries: 10 (computed)
```

This table describes the significant fields shown in the display.

Table 6: show radius dead-criteria Field Descriptions

Field	Description
Server	Server IP address/UDP destination port for authentication requests/UDP destination port for accounting requests.
Timeout	Number of seconds the router waits for a server host to reply before timing out.
Retransmits	Number of times Cisco IOS XR software searches the list of RADIUS server hosts before giving up.

Related Commands

Command	Description
radius-server dead-criteria time, on page 44	Forces one or both of the criteria that is used to mark a RADIUS server as dead.
radius-server deadtime , on page 48	Defines the length of time in minutes for a RADIUS server to remain marked dead.

show radius server-groups

To display information about the RADIUS server groups that are configured in the system, use the **show radius server-groups** command in EXEC mode.

show radius server-groups [*group-name* [**detail**]]

Syntax Description

<i>group-name</i>	(Optional) Name of the server group. The properties are displayed.
detail	(Optional) Displays properties for all the server groups.

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.4.0	Support was added for the <i>group-name</i> argument and detail keyword.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show radius server-groups** command to display information about each configured RADIUS server group, including the group name, numbers of servers in the group, and a list of servers in the named server group. A global list of all configured RADIUS servers, along with authentication and accounting port numbers, is also displayed.

Task ID

Task ID	Operations
aaa	read

Examples

The inherited global message is displayed if no group level deadtime is defined for this group; otherwise, the group level deadtime value is displayed and this message is omitted. The following sample output is for the **show radius server-groups** command:

```
RP/0/0/CPU0:router# show radius server-groups

Global list of servers
  Contains 2 server(s)
    Server 1.1.1.1/1645/1646
    Server 2.2.2.2/1645/1646

Server group 'radgrp1' has 2 server(s)
  Dead time: 0 minute(s) (inherited from global)
  Contains 2 server(s)
    Server 1.1.1.1/1645/1646
    Server 2.2.2.2/1645/1646
```

```
Server group 'radgrp-priv' has 1 server(s)
  Dead time: 0 minute(s) (inherited from global)
  Contains 1 server(s)
    Server 3.3.3.3/1645/1646 [private]
```

The following sample output shows the properties for all the server groups in group “radgrp1.”

```
RP/0/0/CPU0:router# show radius server-groups radgrp1 detail

Server group 'radgrp1' has 2 server(s)
  VRF default (id 0x60000000)
  Dead time: 0 minute(s) (inherited from global)
  Contains 2 server(s)
    Server 1.1.1.1/1645/1646
  Authentication:
    0 requests, 0 pending, 0 retransmits
    0 accepts, 0 rejects, 0 challenges
    0 timeouts, 0 bad responses, 0 bad authenticators
    0 unknown types, 0 dropped, 0 ms latest rtt
  Accounting:
    0 requests, 0 pending, 0 retransmits
    0 responses, 0 timeouts, 0 bad responses
    0 bad authenticators, 0 unknown types, 0 dropped
    0 ms latest rtt
    Server 2.2.2.2/1645/1646
  Authentication:
    0 requests, 0 pending, 0 retransmits
    0 accepts, 0 rejects, 0 challenges
    0 timeouts, 0 bad responses, 0 bad authenticators
    0 unknown types, 0 dropped, 0 ms latest rtt
  Accounting:
    0 requests, 0 pending, 0 retransmits
    0 responses, 0 timeouts, 0 bad responses
    0 bad authenticators, 0 unknown types, 0 dropped
    0 ms latest rtt
```

The following sample output shows the properties for all the server groups in detail in the group “radgrp-priv.”

```
RP/0/0/CPU0:router# show radius server-groups radgrp-priv detail

Server group 'radgrp-priv' has 1 server(s)
  VRF default (id 0x60000000)
  Dead time: 0 minute(s) (inherited from global)
  Contains 1 server(s)
    Server 3.3.3.3/1645/1646 [private]
  Authentication:
    0 requests, 0 pending, 0 retransmits
    0 accepts, 0 rejects, 0 challenges
    0 timeouts, 0 bad responses, 0 bad authenticators
    0 unknown types, 0 dropped, 0 ms latest rtt
  Accounting:
```

```

0 requests, 0 pending, 0 retransmits
0 responses, 0 timeouts, 0 bad responses
0 bad authenticators, 0 unknown types, 0 dropped
0 ms latest rtt

```

```

Related Commands

Command	Description
show aaa, on page 72	Displays the task maps for selected user groups, local users, or task groups.

single-connection

To multiplex all TACACS+ requests to this server over a single TCP connection, use the **single-connection** command in TACACS host configuration mode. To disable the single TCP connection for all new sessions that use a separate connection, use the **no** form of this command.

single-connection

no single-connection

Syntax Description This command has no keywords or arguments.

Command Default By default, a separate connection is used for each session.

Command Modes TACACS host configuration

Command History	Release	Modification
	Release 3.6.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **single-connection** command allows the TACACS+ server to handle a greater number of TACACS operations than would be possible if multiple TCP connections were used to send requests to a server.

The TACACS+ server that is being used must support single-connection mode for this to be effective; otherwise, the connection between the network access server and the TACACS+ server locks up or you can receive unauthentic errors.

Task ID	Task ID	Operations
	aaa	read, write

Examples The following example shows how to configure a single TCP connection to be made with the TACACS+ server (IP address 209.165.200.226) and all authentication, authorization, accounting requests to use this TCP connection. This works only if the TACACS+ server is also configured in single-connection mode. To configure the TACACS+ server in single connection mode, refer to the respective server manual.

```
RP/0/0/CPU0:router(config)# tacacs-server host 209.165.200.226
RP/0/0/CPU0:router(config-tacacs-host)# single-connection
```

Related Commands

Command	Description
tacacs-server host, on page 101	Specifies a TACACS+ host.

tacacs-server host

To specify a TACACS+ host server, use the **tacacs-server host** command in global configuration mode. To delete the specified name or address, use the **no** form of this command.

tacacs-server host *host-name* [**port** *port-number*] [**timeout** *seconds*] [**key** [**0** | **7**] *auth-key*]
[**single-connection**]

no tacacs-server host *host-name* [*port port-number*]

Syntax Description

<i>host-name</i>	Host or domain name or IP address of the TACACS+ server.
port <i>port-number</i>	(Optional) Specifies a server port number. This option overrides the default, which is port 49. Valid port numbers range from 1 to 65535.
timeout <i>seconds</i>	(Optional) Specifies a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server. This option overrides the global timeout value set with the tacacs-server timeout command for this server only. The valid timeout range is from 1 to 1000 seconds. Default is 5.
key [0 7] <i>auth-key</i>	<p>(Optional) Specifies an authentication and encryption key shared between the AAA server and the TACACS+ server. The TACACS+ packets are encrypted using this key. This key must match the key used by the TACACS+ daemon. Specifying this key overrides the key set by the tacacs-server key command for this server only.</p> <p>(Optional) Entering 0 specifies that an unencrypted (clear-text) key follows.</p> <p>(Optional) Entering 7 specifies that an encrypted key follows.</p> <p>The <i>auth-key</i> argument specifies the unencrypted key between the AAA server and the TACACS+ server.</p>
single-connection	(Optional) Multiplexes all TACACS+ requests to this server over a single TCP connection. By default, a separate connection is used for each session.

Command Default

No TACACS+ host is specified.

The *port-name* argument, if not specified, defaults to the standard port 49.

The *seconds* argument, if not specified, defaults to 5 seconds.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Release	Modification
Release 3.3.0	The show run command was modified to display the default values for both the port keyword and the timeout keyword, if values are not specified.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **key** keyword must be entered last because it uses a line (text with breaks) rather than a string (text only, with no breaks). Any text and line breaks up to the time the user presses Enter can be used as part of the key.

You can use multiple **tacacs-server host** commands to specify additional hosts. Cisco IOS XR software searches for hosts in the order in which you specify them.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to specify a TACACS+ host with the IP address 209.165.200.226:

```
RP/0/0/CPU0:router(config)# tacacs-server host 209.165.200.226
RP/0/0/CPU0:router(config-tacacs-host)#
```

The following example shows that the default values from the **tacacs-server host** command are displayed from the **show run** command:

```
RP/0/0/CPU0:router# show run

Building configuration...
!! Last configuration change at 13:51:56 UTC Mon Nov 14 2005 by lab
!
tacacs-server host 209.165.200.226 port 49
  timeout 5
!
```

The following example shows how to specify that the router consult the TACACS+ server host named host1 on port number 51. The timeout value for requests on this connection is 30 seconds; the encryption key is a_secret.

```
RP/0/0/CPU0:router(config)# tacacs-server host host1 port 51 timeout 30 key a_secret
```

Related Commands

Command	Description
key (TACACS+), on page 38	Specifies an authentication and encryption key shared between the AAA server and the TACACS+ server.
single-connection, on page 99	Multiplexes all TACACS+ requests to this server over a single TCP connection.

Command	Description
tacacs-server key, on page 104	Globally sets the authentication encryption key used for all TACACS+ communications between the router and the TACACS+ daemon.
tacacs-server timeout, on page 106	Globally sets the interval that the router waits for a server host to reply.
timeout (TACACS+), on page 116	Specifies a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server.

tacacs-server key

To set the authentication encryption key used for all TACACS+ communications between the router and the TACACS+ daemon, use the **tacacs-server key** command in global configuration mode. To disable the key, use the **no** form of this command.

tacacs-server key {**0** *clear-text-key*| **7** *encrypted-key*| *auth-key*}

no tacacs-server key {**0** *clear-text-key*| **7** *encrypted-key*| *auth-key*}

Syntax Description

0 <i>clear-text-key</i>	Specifies an unencrypted (cleartext) shared key.
7 <i>encrypted-key</i>	Specifies an encrypted shared key.
<i>auth-key</i>	Specifies the unencrypted key between the AAA server and the TACACS+ server.

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.6.0	The following keywords were added: <ul style="list-style-type: none"> • 0 • 7 • auth-key

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The key name entered must match the key used on the TACACS+ daemon. The key name applies to all servers that have no individual keys specified. All leading spaces are ignored; spaces within and after the key are not. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks themselves are part of the key.

The key name is valid only when the following guidelines are followed:

- The *clear-text-key* argument must be followed by the **0** keyword.
- The *encrypted-key* argument must be followed by the **7** keyword.

The TACACS server key is used only if no key is configured for an individual TACACS server. Keys configured for an individual TACACS server always override this global key configuration.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example sets the authentication and encryption key to key1:

```
RP/0/0/CPU0:router(config)# tacacs-server key key1
```

Related Commands

Command	Description
key (TACACS+), on page 38	Specifies an authentication and encryption key shared between the AAA server and the TACACS+ server.
tacacs-server host, on page 101	Specifies a TACACS+ host.

tacacs-server timeout

To set the interval that the server waits for a server host to reply, use the **tacacs-server timeout** command in global configuration mode. To restore the default, use the **no** form of this command.

tacacs-server timeout *seconds*

no tacacs-server timeout *seconds*

Syntax Description

<i>seconds</i>	Integer that specifies the timeout interval (in seconds) from 1 to 1000.
----------------	--

Command Default

5 seconds

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The TACACS+ server timeout is used only if no timeout is configured for an individual TACACS+ server. Timeout intervals configured for an individual TACACS+ server always override this global timeout configuration.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows the interval timer being changed to 10 seconds:

```
RP/0/0/CPU0:router(config)# tacacs-server timeout 10
```

Related Commands

Command	Description
tacacs-server host , on page 101	Specifies a TACACS+ host.

tacacs source-interface

To specify the source IP address of a selected interface for all outgoing TACACS+ packets, use the **tacacs source-interface** command in global configuration mode. To disable use of the specified interface IP address, use the **no** form of this command.

tacacs source-interface *type path-id* [**vrf** *vrf-id*]

no tacacs source-interface *type path-id*

Syntax Description

<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command in EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
vrf <i>vrf-id</i>	Specifies the name of the assigned VRF.

Command Default

If a specific source interface is not configured, or the interface is down or does not have an IP address configured, the system selects an IP address.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 4.1.0	The vrf keyword was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **tacacs source-interface** command to set the IP address of the specified interface for all outgoing TACACS+ packets. This address is used as long as the interface is in the *up* state. In this way, the TACACS+ server can use one IP address entry associated with the network access client instead of maintaining a list of all IP addresses.

This command is especially useful in cases where the router has many interfaces and you want to ensure that all TACACS+ packets from a particular router have the same IP address.

When the specified interface does not have an IP address or is in a *down* state, TACACS+ behaves as if no source interface configuration is used.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to set the IP address of the specified interface for all outgoing TACACS+ packets:

```
RP/0/0/CPU0:router# configure  
RP/0/0/CPU0:router(config)# tacacs source-interface GigabitEthernet 0/0/0/29 vrf abc
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different server hosts into distinct lists and distinct methods.

task

To add a task ID to a task group, use the **task** command in task group configuration mode. To remove a task ID from a task group, use the **no** form of this command.

task {**read**|**write**|**execute**|**debug**} *taskid-name*

no task {**read**|**write**|**execute**|**debug**} *taskid-name*

Syntax Description

read	Enables read-only privileges for the named task ID.
write	Enables write privileges for the named task ID. The term “write” implies read also.
execute	Enables execute privileges for the named task ID.
debug	Enables debug privileges for the named task ID.
<i>taskid-name</i>	Name of the task ID.

Command Default

No task IDs are assigned to a newly created task group.

Command Modes

Task group configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **task** command in task group configuration mode. To access task group configuration mode, use the **taskgroup** command in global configuration mode.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to enable execute privileges for the config-services task ID and associate that task ID with the task group named taskgroup1:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# taskgroup taskgroup1
RP/0/0/CPU0:router(config-tg)# task execute config-services
```

Related Commands

Command	Description
taskgroup , on page 112	Configures a task group to be associated with a set of task IDs.

taskgroup

To configure a task group to be associated with a set of task IDs, and to enter task group configuration mode, use the **taskgroup** command in global configuration mode. To delete a task group, use the **no** form of this command.

taskgroup *taskgroup-name* [**description** *string*] **task** {**read**|**write**|**execute**|**debug**} *taskid-name* **inherit**
taskgroup *taskgroup-name*]

no taskgroup *taskgroup-name*

Syntax Description

<i>taskgroup-name</i>	Name of a particular task group.
description	(Optional) Enables you to create a description for the named task group.
<i>string</i>	(Optional) Character string used for the task group description.
task	(Optional) Specifies that a task ID is to be associated with the named task group.
read	(Optional) Specifies that the named task ID permits read access only.
write	(Optional) Specifies that the named task ID permits read and write access only.
execute	(Optional) Specifies that the named task ID permits execute access.
debug	(Optional) Specifies that the named task ID permits debug access only.
<i>taskid-name</i>	(Optional) Name of a task: the task ID.
inherit taskgroup	(Optional) Copies permissions from the named task group.
<i>taskgroup-name</i>	(Optional) Name of the task group from which permissions are to be inherited.

Command Default

Five predefined user groups are available by default.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	Support was added to display all task groups in global configuration mode.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task groups are configured with a set of task IDs for each action type. Deleting a task group that is still referenced in the system results in a warning and rejection of the deletion.

From global configuration mode, you can display all the configured task groups. However, you cannot display all the configured task groups in taskgroup configuration mode.

Entering the **taskgroup** command with no keywords or arguments enters task group configuration mode, in which you can use the **description**, **inherit**, **show**, and **task** commands.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example assigns read bgp permission to the task group named alpha:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# taskgroup alpha
RP/0/0/CPU0:router(config-tg)# task read bgp
```

Related Commands

Command	Description
description (AAA), on page 28	Creates a task group description in task configuration mode.
task, on page 110	Adds a task ID to a task group.

timeout (RADIUS)

To specify the number of seconds the router waits for the RADIUS server to reply before retransmitting, use the **timeout** command in RADIUS server-group private configuration mode. To disable this command and return to the default timeout value of 5 seconds, use the **no** form of this command.

timeout *seconds*

no timeout *seconds*

Syntax Description	<i>seconds</i>	Timeout value (in seconds). The range is from 1 to 1000. If no timeout is specified, the global value is used.
--------------------	----------------	--

Command Default	<i>seconds: 5</i>
-----------------	-------------------

Command Modes	RADIUS server-group private configuration
---------------	---

Command History	Release	Modification
	Release 3.4.0	This command was introduced.

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
------------------	---

Task ID	Task ID	Operations
	aaa	read, write

Examples	The following example shows how to set the number of seconds for the timeout value:
----------	---

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# server-private 10.1.1.1 auth-port 300
RP/0/0/CPU0:router(config-sg-radius-private)# timeout 500
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different RADIUS server hosts into distinct lists.
key (RADIUS), on page 36	Specifies the authentication and encryption key that is used between the router and the RADIUS daemon running on the RADIUS server.
radius-server timeout , on page 56	Sets the interval for which a router waits for a server host to reply before timing out.
retransmit (RADIUS), on page 59	Specifies the number of times a RADIUS request is resent to a server if the server is not responding or is responding slowly.
server-private (RADIUS), on page 67	Configures the IP address of the private RADIUS server for the group server.

timeout (TACACS+)

To specify a timeout value that sets the length of time the authentication, authorization, and accounting (AAA) server waits to receive a response from the TACACS+ server, use the **timeout** (TACACS+) command in TACACS host configuration mode. To disable this command and return to the default timeout value of 5 seconds, use the **no** form of this command.

timeout *seconds*

no timeout *seconds*

Syntax Description	<i>seconds</i>	Timeout value (in seconds). The range is from 1 to 1000. If no timeout is specified, the global value is used.

Command History	Release	Modification
	Release 3.6.0	This command was introduced.

Usage Guidelines	<p>To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.</p> <p>The timeout (TACACS+) command overrides the global timeout value set with the tacacs-server timeout command for this server only.</p>
------------------	---

Task ID	Task ID	Operations
	aaa	read, write

Examples	The following example shows how to set the number of seconds for the timeout value:
----------	---

```
RP/0/0/CPU0:router(config)# tacacs-server host 209.165.200.226
RP/0/0/CPU0:router(config-tacacs-host)# timeout 500
```

Related Commands

Command	Description
tacacs-server host, on page 101	Specifies a TACACS+ host.

timeout login response

To set the interval that the server waits for a reply to a login, use the **timeout login response** command in line template configuration mode. To restore the default, use the **no** form of this command.

timeout login response *seconds*

no timeout login response *seconds*

Syntax Description

<i>seconds</i>	Integer that specifies the timeout interval (in seconds) from 0 to 300.
----------------	---

Command Default

seconds: 30

Command Modes

Line template configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **timeout login response** command in line template configuration mode to set the timeout value. This timeout value applies to all terminal lines to which the entered line template is applied. This timeout value can also be applied to line console. After the timeout value has expired, the user is prompted again. The retry is allowed three times.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to change the interval timer to 20 seconds:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# line template alpha
RP/0/0/CPU0:router(config-line)# timeout login response 20
```

Related Commands

Command	Description
login authentication, on page 40	Enables AAA authentication for logging in.

usergroup

To configure a user group and associate it with a set of task groups, and to enter user group configuration mode, use the **usergroup** command in global configuration mode. To delete a user group, or to delete a task-group association with the specified user group, use the **no** form of this command.

usergroup *usergroup-name*

no usergroup *usergroup-name*

Syntax Description

<i>usergroup-name</i>	Name of the user group. The <i>usergroup-name</i> argument can be only one word. Spaces and quotation marks are not allowed.
-----------------------	--

Command Default

Five predefined user groups are available by default.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	Support was added to display all user groups in global configuration mode.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

User groups are configured with the command parameters for a set of users, such as task groups. You can remove specific user groups by using the **no** form of the **usergroup** command. You can remove the user group itself by using the **no** form of the command without giving any parameters. Deleting a user group that is still referenced in the system results in a warning and a rejection of the deletion.

Use the [inherit usergroup](#), on page 34 command to copy permissions from other user groups. The user group is inherited by the parent group and forms a union of all task IDs specified in those groups. Circular inclusions are detected and rejected. User groups cannot inherit properties from predefined groups, such as root-system and owner-sdr.

From global configuration mode, you can display all the configured user groups. However, you cannot display all the configured user groups in usergroup configuration mode.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to add permissions from the user group beta to the user group alpha:

```
RP/0/0/CPU0:router# configure  
RP/0/0/CPU0:router(config)# usergroup alpha  
RP/0/0/CPU0:router(config-ug)# inherit usergroup beta
```

Related Commands

Command	Description
description (AAA), on page 28	Creates a description of a task group during configuration.
inherit usergroup, on page 34	Enables a user group to derive permissions from another user group.
taskgroup, on page 112	Configures a task group to be associated with a set of task IDs.

username

To configure a new user with a username, establish a password, grant permissions for the user, and to enter username configuration mode, use the **username** command in either global configuration or administration configuration mode. To delete a user from the database, use the **no** form of this command.

username *user-name* [**password** {[0]| 7} *password*] **secret** {[0]| 5} *password*] **group** *usergroup-name*]

no username *user-name* [**password** {0| 7} *password*] **secret** {0| 5} *password*] **group** *usergroup-name*]

Syntax Description

<i>user-name</i>	Name of the user. The <i>user-name</i> argument can be only one word. Spaces and quotation marks are not allowed.
password	(Optional) Enables a password to be created for the named user.
0	(Optional) Specifies that an unencrypted (clear-text) password follows. The password will be encrypted for storage in the configuration using a Cisco proprietary encryption algorithm.
7	(Optional) Specifies that an encrypted password follows.
<i>password</i>	(Optional) Specifies the unencrypted password text to be entered by the user to log in, for example, <i>lab</i> . If encryption is configured, the password is not visible to the user. Can be up to 253 characters in length.
secret	(Optional) Enables an MD5-secured password to be created for the named user.
0	(Optional) Specifies that an unencrypted (clear-text) password follows. The password will be encrypted for storage in the configuration using an MD5 encryption algorithm.
5	(Optional) Specifies that an encrypted password follows.
group	(Optional) Enables a named user to be associated with a user group.
<i>usergroup-name</i>	(Optional) Name of a user group as defined with the usergroup command.

Command Default

No usernames are defined in the system.

Command Modes

Global configuration

Administration configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	Support was added to display all user names in global configuration mode.
Release 3.6.0	Having cisco-support privileges as the only group was disallowed.
Release 3.7.0	The command syntax descriptions, usage information, and examples were corrected or enhanced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

**Note**

A user is never allowed to have cisco-support privileges as the only group.

Use the **username** command to identify the user and enter username configuration mode. Password and user group assignments can be made from either global configuration mode or username configuration submode. Permissions (task IDs) are assigned by associating the user with one or more defined user groups.

From global configuration mode, you can display all the configured usernames. However, you cannot display all the configured usernames in username configuration mode.

Each user is identified by a username that is unique across the administrative domain. Each user should be made a member of at least one user group. Deleting a user group may orphan the users associated with that group. The AAA server authenticates orphaned users, but most commands are not authorized.

The **username** command is associated with a particular user for local login authentication by default. Alternatively, a user and password can be configured in the database of the RADIUS server for RADIUS login authentication, or a user and password can be configured in the database of the TACACS+ server for TACACS+ login authentication. For more information, see the description of the [aaa authentication, on page 11](#) command.

The predefined group root-system may be specified only by root-system users while administration is configured.

**Note**

To enable the local networking device to respond to remote Challenge Handshake Authentication Protocol (CHAP) challenges, one **username** command entry must be the same as the hostname entry that has already been assigned to the other networking device.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows the commands available after executing the **username** command in global configuration mode:

```
RP/0/0/CPU0:router# config
RP/0/0/CPU0:router(config)# username user1
RP/0/0/CPU0:router(config-un)# ?
```

clear	Clear the uncommitted configuration
commit	Commit the configuration changes to running
describe	Describe a command without taking real actions
do	Run an exec command
exit	Exit from this submode
group	User group in which this user will be a member of
no	Negate a command or set its defaults
password	Specify the password for the user
pwd	Commands used to reach current submode
root	Exit to the global configuration mode
secret	Specify the secure password for the user
show	Show contents of configuration

```
RP/0/0/CPU0:router(config-un)#
```

The following example shows how to establish the clear-text password *password1* for the user name *user1* in global configuration mode:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# username user1
RP/0/0/CPU0:router(config-un)# password 0 password1
```

The following example shows how to establish an MD5-secured secret for the user *user1* in administration configuration mode:

```
RP/0/0/CPU0:P1(admin-config)# username user1
RP/0/0/CPU0:P1(admin-config-un)# secret 0 lab
RP/0/0/CPU0:P1(admin-config-un)# commit
RP/0/0/CPU0:May 6 13:06:43.205 : config[65723]: %MGBL-CONFIG-6-DB_COMMIT_ADMIN :
Configuration committed by user 'cisco'. Use 'show configuration commit changes 2000000005'
to view the changes.
RP/0/0/CPU0:P1(admin-config-un)# exit
RP/0/0/CPU0:P1(admin-config)# show run username
username user1 secret 5 $1$QB03$3H29k3ZT.0PMQ8GQKXCF0
!
```

Related Commands

Command	Description
aaa authentication, on page 11	Defines a method list for authentication.

Command	Description
group (AAA), on page 30	Adds a user to a group.
password (AAA), on page 42	Creates a login password for a user.
secret, on page 61	Creates a secure login secret for a user.

users group

To associate a user group and its privileges with a line, use the **users group** command in line template configuration mode. To delete a user group association with a line, use the **no** form of this command.

users group {*usergroup-name*| **cisco-support**| **netadmin**| **operator**| **root-lr**| **root-system**| **sysadmin**}

no users group {*usergroup-name*| **cisco-support**| **netadmin**| **operator**| **root-lr**| **root-system**| **serviceadmin**| **sysadmin**}

Syntax Description

<i>usergroup-name</i>	Name of the user group. The <i>usergroup-name</i> argument can be only one word. Spaces and quotation marks are not allowed.
cisco-support	Specifies that users logging in through the line are given Cisco support personnel privileges.
netadmin	Specifies that users logging in through the line are given network administrator privileges.
operator	Specifies that users logging in through the line are given operator privileges.
root-lr	Specifies that users logging in through the line are given root logical router (LR) privileges.
root-system	Specifies that users logging in through the line are given root system privileges.
serviceadmin	Specifies that users logging in through the line are given service administrator group privileges.
sysadmin	Specifies that users logging in through the line are given system administrator privileges.

Command Default

None

Command Modes

Line template configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The serviceadmin keyword was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **users group** command to enable a user group and its privileges to be associated with a line, meaning that users logging in through the line are given the privileges of the particular user group.

Task ID

Task ID	Operations
aaa	read, write

Examples

In the following example, if a vty-pool is created with line template *vtty*, users logging in through vty are given operator privileges:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa authen login vty-authen line
RP/0/0/CPU0:router(config)# commit
RP/0/0/CPU0:router(config)# line template vty
RP/0/0/CPU0:router(config-line)# users group operator
RP/0/0/CPU0:router(config-line)# login authentication
```

vrf (RADIUS)

To configure the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA RADIUS server group, use the **vrf** command in RADIUS server-group configuration mode. To enable server groups to use the global (default) routing table, use the **no** form of this command.

vrf *vrf-name*

no vrf *vrf-name*

Syntax Description

<i>vrf-name</i>	Name assigned to a VRF.
-----------------	-------------------------

Command Default

The default VRF is used.

Command Modes

RADIUS server-group configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **vrf** command to specify a VRF for an AAA RADIUS server group and enable dial-up users to use AAA servers in different routing domains.

Task ID

Task ID	Operations
aaa	read, write

Examples

The following example shows how to use the **vrf** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server radius group1
RP/0/0/CPU0:router(config-sg-radius)# vrf wal-mart
```

Related Commands

Command	Description
aaa group server tacacs+ , on page 20	Groups different RADIUS server hosts into distinct lists and distinct methods.
radius source-interface , on page 57	Forces RADIUS to use the IP address of a specified interface or subinterface for all outgoing RADIUS packets.
server-private (RADIUS) , on page 67	Configures the IP address of the private RADIUS server for the group server.

vrf (TACACS+)

To configure the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an AAA TACACS+ server group, use the **vrf** command in TACACS+ server-group configuration mode. To enable server groups to use the global (default) routing table, use the **no** form of this command.

vrf *vrf-name*

no vrf *vrf-name*

Syntax Description

<i>vrf-name</i>	Name assigned to a VRF.
-----------------	-------------------------

Command Default

The default VRF is used.

Command Modes

TACACS+ server-group configuration

Command History

Release	Modification
Release 4.1.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **vrf** command to specify a VRF for an AAA TACACS+ server group and enable dial-up users to use AAA servers in different routing domains.

Task ID

Task ID	Operations
aaa	read, write

Examples

This example shows how to use the **vrf** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# aaa group server tacacs+ myserver
RP/0/0/CPU0:router(config-sg-tacacs+)# server 9.27.10.6
RP/0/0/CPU0:router(config-sg-tacacs+)# vrf abc
```

Related Commands

Command	Description
aaa group server tacacs+, on page 20	Groups different TACACS+ server hosts into distinct lists and distinct methods.
server (TACACS+), on page 65	Specifies the source IP address of a selected interface for all outgoing TACACS+ packets.
server-private (TACACS+), on page 70	Configures the IP address of the private TACACS+ server for the group server.

IPSec Commands

This module describes the IPSec commands.

Note

The following IPSec commands are available only if the <platform>-k9sec.pie is installed.

- [clear crypto ipsec sa](#), [page 134](#)
- [description \(IPSec profile\)](#), [page 136](#)
- [show crypto ipsec sa](#), [page 137](#)
- [show crypto ipsec statistics](#), [page 141](#)
- [show crypto ipsec summary](#), [page 144](#)
- [show crypto ipsec transform-set](#), [page 146](#)

clear crypto ipsec sa

To delete specific security associations (SAs), or all SAs in the IP Security (IPSec) security associations database (SADB), use the **clear crypto ipsec sa** command in EXEC mode.

clear crypto ipsec sa *{sa-id| all}*

Syntax Description

<i>sa-id</i>	Identifier for the SA. IPSec supports from 1 to 64,500 sessions.
all	Deletes all IPSec SAs in the IPSec SADB.

Command Default

No default behavior or values

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.4.0	The range for the <i>sa-id</i> argument increased to 16500 sessions.
Release 3.6.0	The upper limit for the <i>sa-id</i> argument range was increased to 64,500 sessions.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

SAs are established to secure data flows in IPSec. Use the **clear crypto ipsec sa** command to delete active IPSec sessions or force IPSec to reestablish new SAs. Usually, the establishment of SAs is negotiated between peers through Internet Key Exchange (IKE) on behalf of IPSec.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to remove the SA with ID 100 from the SADB:

```
RP/0/0/CPU0:router# clear crypto ipsec sa 100
```

Related Commands

Command	Description
show crypto ipsec sa , on page 137	Displays the settings used by current SAs.

description (IPSec profile)

To create a description of an IPSec profile, use the **description** command in profile configuration mode. To delete a profile description, use the **no** form of this command.

description *string*

no description

Syntax Description

<i>string</i>	Character string describing the IPSec profile.
---------------	--

Command Default

None

Command Modes

Crypto IPSec profile

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **description** command inside the profile configuration submode to create a description for an IPSec profile.

Task ID

Task ID	Operations
profile configuration	read, write

Examples

The following example shows the creation of a profile description:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ipsec profile newprofile
RP/0/0/CPU0:router(config-newprofile)# description this is a sample profile
```

show crypto ipsec sa

To display security association (SA) information based on the rack/slot/module location, use the **show crypto ipsec sa** command in EXEC mode.

show crypto ipsec sa [*sa-id*] **peer** *ip-address* | **profile** *profile-name* | **detail** | **fvr** *fvr-name* | **ivrf** *ivrf-name* | **location** *node-id*]

Syntax Description

<i>sa-id</i>	(Optional) Identifier for the SA. The range is from 1 to 64500.
peer <i>ip-address</i>	(Optional) IP address used on the remote (PC) side. Invalid IP addresses are not accepted.
profile <i>profile-name</i>	(Optional) Specifies the alphanumeric name for a security profile. The character range is from 1 to 64. Profile names cannot be duplicated.
detail	(Optional) Provides additional dynamic SA information.
fvr <i>fvr-name</i>	(Optional) Specifies that all existing SAs for front door virtual routing and forwarding (FVRF) is the same as the fvr-name.
ivrf <i>ivrf-name</i>	(Optional) Specifies that all existing SAs for inside virtual routing and forwarding (IVRF) is the same as the ivrf-name.
location <i>node-id</i>	(Optional) Specifies that the SAs are configured on a specified location.

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.4.0	The range for the <i>sa-id</i> argument increased to 16500 sessions. Support was added for the following keywords: <ul style="list-style-type: none"> • fvr • ivrf • location
Release 3.6.0	The upper limit for the <i>sa-id</i> argument range was increased to 64,500 sessions.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If no optional argument or keyword is used, all SAs are displayed within a flow. Within a flow, the SAs are listed by protocol (Encapsulating Security Payload [ESP] or Authentication Header [AH]) and direction (inbound or outbound).

The **detail** keyword provides additional information only for SAs that are configured in a software crypto engine. The SAs are configured by using tunnel-ipsec and transport.

Task ID

Task ID	Operations
crypto	read

Examples

The following sample output is from the **show crypto ipsec sa** command:

```
RP/0/0/CPU0:router# show crypto ipsec sa

This table describes the significant fields shown in the display.

Table 10: show crypto ipsec sa Field Descriptions

Field	Description
SA id	Identifier for the SA.
interface	Identifier for the interface.
profile	String of alphanumeric characters that specify the name of a security profile.
local ident	IP address, mask, protocol, and port of the local peer.
remote ident	IP address, mask, protocol and port of the remote peer.
outbound esp sas	Outbound ESP SAs.
inbound esp sas	Inbound ESP SAs.
transform	The transform being used in the SA.
sa lifetime	The lifetime value used in the SA.

The following sample output is from the **show crypto ipsec sa** command for the **profile** keyword for a profile named **pn1**:

```
RP/0/0/CPU0:router# show crypto ipsec sa profile pn1

SA id: 2

show crypto ipsec statistics

To display global statistics for all inside virtual routing and forwarding (IVRF), use the **show crypto ipsec statistics** command in EXEC mode.

show crypto ipsec statistics [*ivrf* [*vrf name*]]

Syntax Description

ivrf <i>vrf name</i>	(Optional) Specifies that all existing SAs whose inside virtual routing and forwarding (IVRF) is the same as the <i>ivrf</i> -name.
-----------------------------	---

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can use the **show crypto ipsec statistics** command with the following results:

- Displays the statistics of all the VRFs that are associated with IPSec.
- Using the **ivrf** keyword, displays the statistics of the default VRF.
- Using the **ivrf** keyword and *vrf name* argument, displays the statistics of the specified VRF.

Task ID

Task ID	Operations
crypto	read

Examples

The following sample output displays the statistics of all the VRFs that are associated to IPSec from the **show crypto ipsec statistics** command:

```
RP/0/0/CPU0:router# show crypto ipsec statistics
VRF: default (VRF ID: 60000000)
```

```

Active Tunnels : 1
Expired Tunnels: 0

pkts tx          :0          pkts rx          :0
bytes tx         :0          bytes rx         :0
pkts encrypt     :0          pkts decrypt    :0
pkts digest      :0          pkts verify     :0
pkts encrpt fail:0          pkts decrpt fail:0
pkts digest fail:0          pkts verify fail:0
pkts replay fail:0
pkts No SA fails:0
pkts sys cap fails:0
pkts tx errors   :0          pkts rx errors   :0

```

This table describes the significant fields shown in the display.

Table 11: show crypto ipsec statistics Field Descriptions

Field	Description
VRF	VRF name and ID.
Active Tunnels	Number of active tunnels associated with the VRF. The VRF is the IVRF for these tunnels.
Expired Tunnels	Number of tunnels that are expired on the VRF. The VRF is the IVRF for these tunnels.
pkts tx	Aggregated number of outgoing packets on all the active tunnels associated to the VRF. The packets are from the trusted network.
bytes tx	Aggregated number of outgoing bytes on all the active tunnels associated to the VRF.
pkts encrypt	Aggregated number of encrypted packets on all the active tunnels associated to the VRF.
pkts digest	Aggregated number of authenticated packets on all the active tunnels associated to the VRF.
pkts encrypt fail	Aggregated number of packets that are dropped due to failing encryption on all the active tunnels associated to the VRF.
pkts digest fail	Aggregated number of packets that are dropped due to failing authentication on all the active tunnels associated to the VRF.
pkts replay fail	Aggregated number of packets that are dropped due to anti-replay check on all the active tunnels associated to the VRF.
pkts No SA fails	Aggregated number of incoming packets that failed because no SA was found in the context of the VRF.

Field	Description
pkts sys cap fails	Aggregated number of packets that failed due to lack of resources in the Cisco IPSec VPN SPA in the context of the VRF.
pkts tx errors	Number of outgoing packets that are dropped for any reason.
pkts rx	Aggregated number of incoming packets on all the active tunnels associated to the VRF. The packets are coming from the untrusted network.
bytes rx	Aggregated number of incoming bytes on all the active tunnels associated to the VRF.
pkts decrypt	Aggregated number of decrypted packets on all the active tunnels associated to the VRF.
pkts verify	Aggregated number of authenticated packets on all the active tunnels associated to the VRF.
pkts decrypt fail	Aggregated number of packets that are dropped due to failing decryption on all the active tunnels associated to the VRF.
pkts verify fail	Aggregated number of packets that are dropped due to failing authentication on all the active tunnels associated to the VRF.
pkts rx errors	Number of incoming packets that are dropped for any reason.

show crypto ipsec summary

To display IP Security (IPSec) summary information, use the **show crypto ipsec summary** command in EXEC mode.

show crypto ipsec summary

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.
	Release 3.5.0	Sample output was modified to display port number to the local peer and remote peer fields.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID	Task ID	Operations
	crypto	read

Examples The following sample output is from the **show crypto ipsec summary** command:

```
RP/0/0/CPU0:router# show crypto ipsec summary
```

```
# * Attached to a transform indicates a bundle
```

```
# Active IPSec Sessions: 1
```

SA	Interface	Local Peer/Port	Remote Peer/Port	FVRF	Profile	Transform	Lifetime
502	service-ipsec100	70.70.70.2/500	60.60.60.2/500	default	ipsec1	esp-3des	esp
3600/100000000							

This table describes the significant fields shown in the display.

Table 12: show crypto ipsec summary Field Descriptions

Field	Description
SA	Identifier for the security association.
Node	Identifier for the node.
Local Peer	IP address of the local peer.
Remote Peer	IP address of the remote peer.
FVRF	The front door virtual routing and forwarding (FVRF) of the SA. If the FVRF is global, the output shows f_vrf as an empty field
Mode	Profile mode type.
Profile	Crypto profile in use.
Transform	Transform in use.
Lifetime	Lifetime value, displayed in seconds followed by kilobytes.

show crypto ipsec transform-set

To display the configured transform sets, use the **show crypto ipsec transform-set** command in EXEC mode.

show crypto ipsec transform-set [*transform-set-name*]

Syntax Description

<i>transform-set-name</i>	(Optional) IPSec transform set with the specified value for the <i>transform-set-name</i> argument are displayed.
---------------------------	---

Command Default

No default values. The default behavior is to print all the available transform-sets.

Command Modes

EXEC

Command History

Release	Modification
Release 3.5.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If no transform is specified, all transforms are displayed.

Task ID

Task ID	Operations
crypto	read

Examples

The following sample output is from the **show crypto ipsec transform-set** command:

```
RP/0/0/CPU0:router# show crypto ipsec transform-set

Transform set combined-des-sha: {esp-des esp-sha-hmac}
Transform set tsfm2: {esp-md5-hmac esp-3des }
      Mode: Transport
Transform set tsfm1: {esp-md5-hmac esp-3des }
      Mode: Tunnel
Transform set ts1: {esp-des  }
      Mode: Tunnel
```

Keychain Management Commands

This module describes the commands used to configure keychain management.

For detailed information about keychain management concepts, configuration tasks, and examples, see the *Implementing Keychain Management on the Cisco IOS XR Software* configuration module in the *Cisco IOS XR System Security Configuration Guide for the Cisco XR 12000 Series Router*.

- [accept-lifetime](#), page 148
- [accept-tolerance](#), page 150
- [cryptographic-algorithm](#), page 152
- [key \(key chain\)](#), page 154
- [key chain \(key chain\)](#), page 156
- [key-string \(keychain\)](#), page 158
- [send-lifetime](#), page 160
- [show key chain](#), page 162

accept-lifetime

To set the time period during which the authentication key on a keychain is received as valid, use the **accept-lifetime** command in key configuration mode. To revert to the default value, use the **no** form of this command.

accept-lifetime *start-time* [**duration** *duration value*| **infinite**| *end-time*]

no accept-lifetime *start-time* [**duration** *duration value*| **infinite**| *end-time*]

Syntax Description

<i>start-time</i>	Start time, in <i>hh:mm:ss day month year</i> format, in which the key becomes valid. The range is from 0:0:0 to 23:59:59. The range for the number of days of the month is from 1 to 31. The range for the years is from 1993 to 2035.
duration <i>duration value</i>	(Optional) Determines the lifetime of the key in seconds. The range is from 1-2147483646.
infinite	(Optional) Specifies that the key never expires after it becomes valid.
<i>end-time</i>	(Optional) Time, in <i>hh:mm:ss day month year</i> format, after which the key expires. The range is from 0:0:0 to 23:59:59.

Command Default

None

Command Modes

Key configuration

Command History

Release	Modification
Release 3.3.0	This command was introduced.
Release 3.6.0	The range values were added for the <i>start-time</i> argument.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows how to use the **accept-lifetime** command:

```
RR/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# key chain isis-keys
RP/0/0/CPU0:router(config-isis-keys)# key 8
RP/0/0/CPU0:router(config-isis-keys-0x8)# accept-lifetime 1:00:00 June 29 2006 infinite
```

Related Commands

Command	Description
key (key chain), on page 154	Creates or modifies a keychain key.
key chain (key chain), on page 156	Creates or modifies a keychain.
key-string (keychain), on page 158	Specifies the text for the key string.
send-lifetime, on page 160	Sends the valid key.
show key chain, on page 162	Displays the keychain.

accept-tolerance

To specify the tolerance or acceptance limit, in seconds, for an accept key that is used by a peer, use the **accept-tolerance** command in keychain configuration mode. To disable this feature, use the **no** form of this command.

accept-tolerance [*value*] **infinite**

no accept-tolerance [*value*] **infinite**

Syntax Description

<i>value</i>	(Optional) Tolerance range, in seconds. The range is from 1 to 8640000.
infinite	(Optional) Specifies that the tolerance specification is infinite. The accept key never expires. The tolerance limit of infinite indicates that an accept key is always acceptable and validated when used by a peer.

Command Default

The default value is 0, which is no tolerance.

Command Modes

Keychain configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you do not configure the **accept-tolerance** command, the tolerance value is set to zero.

Even though the key is outside the active lifetime, the key is deemed acceptable as long as it is within the tolerance limit (for example, either prior to the start of the lifetime, or after the end of the lifetime).

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows how to use the **accept-tolerance** command:

```
RP/0/0/CPU0:router# configure
```

```
RP/0/0/CPU0:router(config)# key chain isis-keys  
RP/0/0/CPU0:router(config-isis-keys)# accept-tolerance infinite
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
key chain (key chain), on page 156	Creates or modifies a keychain.
show key chain, on page 162	Displays the keychain.

cryptographic-algorithm

To specify the choice of the cryptographic algorithm to be applied to the packets using the key string configured for the key ID, use the **cryptographic-algorithm** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

cryptographic-algorithm [HMAC-MD5| HMAC-SHA1-12| HMAC-SHA1-20| MD5| SHA-1]

no cryptographic-algorithm [HMAC-MD5| HMAC-SHA1-12| HMAC-SHA1-20| MD5| SHA-1]

Syntax Description

HMAC-MD5	Configures HMAC-MD5 as a cryptographic algorithm with a digest size of 16 bytes.
HMAC-SHA1-12	Configures HMAC-SHA1-12 as a cryptographic algorithm with a digest size of 12 bytes.
HMAC-SHA1-20	Configures HMAC-SHA1-20 as a cryptographic algorithm with a digest size of 20 bytes.
MD5	Configures MD5 as a cryptographic algorithm with a digest size of 16 bytes.
SHA-1	Configures SHA-1-20 as a cryptographic algorithm with a digest size of 20 bytes.

Command Default

No default behavior or values

Command Modes

Keychain-key configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you do not specify the cryptographic algorithm, MAC computation and API verification would be invalid. These protocols support the following cryptographic algorithms:

- Border Gateway Protocol (BGP) supports only HMAC-MD5 and HMAC-SHA1-12.
- Intermediate System-to-Intermediate System (IS-IS) supports only HMAC-MD5.

- Open Shortest Path First (OSPF) supports only MD5.

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows how to use the **cryptographic-algorithm** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# key chain isis-keys
RP/0/0/CPU0:router(config-isis-keys)# key 8
RP/0/0/CPU0:router(config-isis-keys-0x8)# cryptographic-algorithm HMAC-MD5
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
key chain (key chain), on page 156	Creates or modifies a keychain.
show key chain, on page 162	Displays the keychain.

key (key chain)

To create or modify a keychain key, use the **key** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

key *key-id*

no key *key-id*

Syntax Description	<i>key-id</i> 48-bit integer key identifier of from 0 to 281474976710655.					
Command Default	No default behavior or values					
Command Modes	Keychain-key configuration					
Command History	<table><tr><th>Release</th><th>Modification</th></tr><tr><td>Release 3.3.0</td><td>This command was introduced.</td></tr></table>	Release	Modification	Release 3.3.0	This command was introduced.	
Release	Modification					
Release 3.3.0	This command was introduced.					
Usage Guidelines	<p>To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.</p> <p>For a Border Gateway Protocol (BGP) keychain configuration, the range for the <i>key-id</i> argument must be from 0 to 63. If the range is above the value of 63, the BGP keychain operation is rejected.</p>					
Task ID	<table><tr><th>Task ID</th><th>Operations</th></tr><tr><td>system</td><td>read, write</td></tr></table>	Task ID	Operations	system	read, write	
Task ID	Operations					
system	read, write					

Examples

The following example shows how to use the **key** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# key chain isis-keys
RP/0/0/CPU0:router(config-isis-keys)# key 8
RP/0/0/CPU0:router(config-isis-keys-0x8)#
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
key chain (key chain), on page 156	Creates or modifies a keychain.
key-string (keychain), on page 158	Specifies the text for the key string.
send-lifetime, on page 160	Sends the valid key.
show key chain, on page 162	Displays the keychain.

key chain (key chain)

To create or modify a keychain, use the **key chain** command in global configuration mode. To disable this feature, use the **no** form of this command.

key chain *key-chain-name*

no key chain *key-chain-name*

Syntax Description

<i>key-chain-name</i>	Specifies the name of the keychain. The maximum number of characters is 48.
-----------------------	---

Command Default

No default behavior or values

Command Modes

Global configuration

Command History

Release	Modification
Release 3.3.0	This command was introduced.
Release 3.4.1	The maximum number of characters allowed in the keychain name was changed from 32 to 48.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can configure a keychain for Border Gateway Protocol (BGP) as a neighbor, session group, or neighbor group. BGP can use the keychain to implement a hitless key rollover for authentication.

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows that the name of the keychain isis-keys is for the **key chain** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# key chain isis-keys
RP/0/0/CPU0:router(config-isis-keys)#
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
accept-tolerance, on page 150	Configures a tolerance value to accept keys for the keychain.
key (key chain), on page 154	Creates or modifies a keychain key.
key-string (keychain), on page 158	Specifies the text for the key string.
send-lifetime, on page 160	Sends the valid key.
show key chain, on page 162	Displays the keychain.

key-string (keychain)

To specify the text string for the key, use the **key-string** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

key-string [**clear**| **password**] *key-string-text*

no key-string [**clear**| **password**] *key-string-text*

Syntax Description

clear	Specifies the key string in clear-text form.
password	Specifies the key in encrypted form.
<i>key-string-text</i>	Text string for the key, which is encrypted by the parser process before being saved to the configuration. The text string has the following character limitations: <ul style="list-style-type: none"> • Plain-text key strings—Minimum of 1 character and a maximum of 32. • Encrypted key strings—Minimum of 4 characters and no maximum.

Command Default

The default value is clear.

Command Modes

Keychain-key configuration

Command History

Release	Modification
Release 3.7.2	This command was introduced.

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

For an encrypted password to be valid, the following statements must be true:

- String must contain an even number of characters, with a minimum of four.

- The first two characters in the password string must be decimal numbers and the rest must be hexadecimal.
- The first two digits must not be a number greater than 53.

Either of the following examples would be valid encrypted passwords:

1234abcd

or

50aefd

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows how to use the **keystring** command:

```
RP/0/0/CPU0:router: # configure
RP/0/0/CPU0:router(config) # key chain isis-keys
RP/0/0/CPU0:router(config-isis-keys) # key 8
RP/0/0/CPU0:router(config-isis-keys-0x8) # key-string password 850aefd
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
key (key chain), on page 154	Creates or modifies a keychain key.
key chain (key chain), on page 156	Creates or modifies a keychain.
send-lifetime, on page 160	Sends the valid key.
show key chain, on page 162	Displays the keychain.

send-lifetime

To send the valid key and to authenticate information from the local host to the peer, use the **send-lifetime** command in keychain-key configuration mode. To disable this feature, use the **no** form of this command.

send-lifetime *start-time* [**duration** *duration value*| **infinite**| *end-time*]

no send-lifetime *start-time* [**duration** *duration value*| **infinite**| *end-time*]

Syntax Description

<i>start-time</i>	Start time, in <i>hh:mm:ss day month year</i> format, in which the key becomes valid. The range is from 0:0:0 to 23:59:59. The range for the number of days of the month to start is from 1 to 31. The range for the years is from 1993 to 2035.
duration <i>duration value</i>	(Optional) Determines the lifetime of the key in seconds.
infinite	(Optional) Specifies that the key never expires once it becomes valid.
<i>end-time</i>	(Optional) Time, in <i>hh:mm:ss day month year</i> format, after which the key expires. The range is from 0:0:0 to 23:59:59

Command Default

No default behavior or values

Command Modes

Keychain-key configuration

Command History

Release	Modification
Release 3.3.0	This command was introduced.
Release 3.6.0	The range values were added for the <i>start-time</i> argument.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows how to use the **send-lifetime** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# key chain isis-keys
RP/0/0/CPU0:router(config-isis-keys)# key 8
RP/0/0/CPU0:router(config-isis-keys-0x8)# send-lifetime 1:00:00 June 29 2006 infinite
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
key (key chain), on page 154	Creates or modifies a keychain key.
key chain (key chain), on page 156	Creates or modifies a keychain.
key-string (keychain), on page 158	Specifies the text for the key string.

show key chain

To display the keychain, use the **show key chain** command in EXEC mode.

show key chain *key-chain-name*

Syntax Description

<i>key-chain-name</i>	Names of the keys in the specified keychain. The maximum number of characters is 32.
-----------------------	--

Command Default

No default behavior or values

Command Modes

EXEC

Command History

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Task ID

Task ID	Operations
system	read

Examples

When a secure key storage becomes available, it is desirable for keychain management to alternatively prompt you for a master password and display the key label after decryption. The following example displays only the encrypted key label for the **show key chain** command:

```
RP/0/0/CPU0:router# show key chain isis-keys
Key-chain: isis-keys/ -
accept-tolerance -- infinite
Key 8 -- text "8"
  cryptographic-algorithm -- MD5
  Send lifetime: 01:00:00, 29 Jun 2006 - Always valid [Valid now]
  Accept lifetime: 01:00:00, 29 Jun 2006 - Always valid [Valid now]
```

Related Commands

Command	Description
accept-lifetime, on page 148	Accepts the valid key.
accept-tolerance, on page 150	Configures a tolerance value to accept keys for the keychain.
key (key chain), on page 154	Creates or modifies a keychain key.
key chain (key chain), on page 156	Creates or modifies a keychain.
key-string (keychain), on page 158	Specifies the text for the key string.
send-lifetime, on page 160	Sends the valid key.

 show key chain

Lawful Intercept Commands

This module describes the Cisco IOS XR software commands used to configure lawful intercept (LI).

For detailed information about keychain management concepts, configuration tasks, and examples, see the *Implementing Lawful Intercept on the Cisco IOS XR Software Configuration Module*.

- [lawful-intercept disable](#), page 166

lawful-intercept disable

To disable the lawful intercept feature, use the **lawful-intercept disable** command in global configuration mode. To re-enable the lawful intercept feature, use the **no** form of this command.

lawful-intercept disable

no lawful-intercept disable

Syntax Description This command has no keywords or arguments.

Command Default Lawful intercept feature is enabled by default.

Command Modes Global configuration

Command History	Release	Modification
	Release 3.7.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you disable lawful intercept, all Mediation Devices and associated TAPs will be deleted.

Task ID	Task ID	Operations
	li	read, write

Examples The following example shows the use of the **lawful-intercept disable** command:

```
RP/0/0/CPU0:router(config)# lawful-intercept disable
```

Management Plane Protection Commands

This module describes the commands used to configure management plane protection (MPP).

For detailed information about keychain management concepts, configuration tasks, and examples, see the *Implementing Management Plane Protection on the Cisco IOS XR Software* module in the *Cisco IOS XR System Security Configuration Guide for the Cisco XR 12000 Series Router Software* configuration module.

- [address ipv4 \(MPP\), page 168](#)
- [allow, page 170](#)
- [control-plane, page 173](#)
- [inband, page 174](#)
- [interface \(MPP\), page 176](#)
- [management-plane, page 178](#)
- [out-of-band, page 179](#)
- [show mgmt-plane, page 181](#)
- [vrf \(MPP\), page 183](#)

address ipv4 (MPP)

To configure the peer IPv4 or IPv6 address in which management traffic is allowed on the interface, use the **address ipv4** command in interface peer configuration mode. To remove the IP address that was previously configured on this interface, use the **no** form of this command.

address {**ipv4**|**ipv6**} *peer-ip-address* [*peer-ip-address/length*]
no address {**ipv4**|**ipv6**} *peer-ip-address* [*peer-ip-address/length*]

Syntax Description	<i>peer-ip-address</i>	(Required) Peer IPv4 or IPv6 address in which management traffic is allowed on the interface. This address can effectively be the source address of the management traffic that is coming in on the configured interface.
	<i>peer ip-address/length</i>	(Required) Prefix of the peer IP address and IPv4 or IPv6 format: <ul style="list-style-type: none"> IPv4—<i>A.B.C.D./length</i> IPv6—<i>X.X:X.X</i>

Command Default	If no specific peer is configured, all peers are allowed.
-----------------	---

Command Modes	Interface peer configuration
---------------	------------------------------

Command History	Release	Modification
	Release 3.6.0	This command was introduced.

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
------------------	---

Task ID	Task ID	Operations
	system	read, write

Examples	<p>The following example shows how to configure the peer IPv6 address 33::33 for management traffic:</p> <pre>RP/0/0/CPU0:router# configure RP/0/0/CPU0:router(config)# control-plane</pre>
----------	---

```

RP/0/0/CPU0:router(config-ctrl)# management-plane
RP/0/0/CPU0:router(config-mpp)# inbandout-of-band
RP/0/0/CPU0:router(config-mpp-inbandoutband)# interface GigabitEthernet POS 0/16/10/12
RP/0/0/CPU0:router(config-mpp-inbandoutband-GigabitEthernet0_1_1_POS0_6_0_2)# allow Telnet
TFTP peer
RP/0/0/CPU0:router(config-telnetftp-peer)# address ipv4 10.1.0.0/16ipv6 33::33

```

Related Commands

Command	Description
allow , on page 170	Configures an interface as an inband or out-of-band interface to allow all peer addresses for a specified protocol or all protocols.
control-plane , on page 173	Configures the control plane.
inband , on page 174	Configures an inband interface or protocol.
interface (MPP) , on page 176	Configures a specific inband or out-of-band interface or all inband or out-of-band interfaces.
management-plane , on page 178	Configures management plane protection to allow and disallow protocols.
out-of-band , on page 179	Configures out-of-band interfaces or protocols and enters management plane protection out-of-band configuration mode.
show mgmt-plane , on page 181	Displays the management plane.

allow

To configure an interface as an inband or out-of-band interface to allow all peer addresses for a specified protocol or all protocols, use the **allow** command in management plane protection inband interface configuration mode or management plane protection out-of-band interface configuration. To disallow a protocol on an interface, use the **no** form of this command.

allow {*protocol*| **all**} [**peer**]
no allow {*protocol*| **all**} [**peer**]

Syntax Description

<i>protocol</i>	Interface configured to allow peer-filtering for the following specified protocol's traffic: <ul style="list-style-type: none"> • HTTP(S) • SNMP (also versions) • Secure Shell (v1 and v2) • TFTP • Telnet • XML
all	Configures the interface to allow peer-filtering for all the management traffic that is specified in the list of protocols.
peer	(Optional) Configures the peer address on the interface. Peer refers to the neighboring router interface in which traffic might arrive to the main router.

Command Default

By default, no management protocol is allowed on any interface except the management interfaces.

Command Modes

Management plane protection inband interface configuration

Command History

Release	Modification
Release 3.5.0	This command was introduced.
Release 3.6.0	The following modifications were added: <ul style="list-style-type: none"> • The peer keyword was added to support peer-filtering. • Management plane protection out-of-band interface configuration mode was added.
Release 4.0.0	The XML keyword was added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

If you permit or allow a specific protocol to an interface, traffic is allowed only for that protocol, and all other management traffic is dropped.

After you configure the interface as inband or out-of-band, the specified protocol's traffic, or all protocol traffic, is allowed on the interface. Interfaces that are not configured as inband or out-of-band interfaces, drop the protocol traffic.

The IOS-XR XML API provides a programmatic interface to the router for use by external management applications. This interface provides a mechanism for router configuration and monitoring utilizing XML formatted request and response streams. As one of the management services, XML should be capable of applying MPP. To secure XML MPP data, XML keyword has been added to the command.

Task ID

Task ID	Operations
system	read, write

Examples

The following example shows how to configure all management protocols for all inband interfaces:

```
RR/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# control-plane
RP/0/0/CPU0:router(config-ctrl)# management-plane
RP/0/0/CPU0:router(config-mpp)# inband
RP/0/0/CPU0:router(config-mpp-inband)# interface all
RP/0/0/CPU0:router(config-mpp-inband-all)# allow all
```

The following example shows how to configure peer-filtering for the TFTP protocol for out-of-band interfaces:

```
RR/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# control-plane
RP/0/0/CPU0:router(config-ctrl)# management-plane
RP/0/0/CPU0:router(config-mpp)# out-of-band
RP/0/0/CPU0:router(config-mpp-outband)# interface GigabitEthernet 0/1/1/2
RP/0/0/CPU0:router(config-mpp-outband-GigabitEthernet0_1_1_2)# allow TFTP peer
RP/0/0/CPU0:router(config-tftp-peer)#
```

The following example shows how to configure MPP support on an XML peer in-band interface:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# control-plane
RP/0/0/CPU0:router(config-ctrl)# management-plane
RP/0/0/CPU0:router(config-ctrl-mpp)# inband interface all allow xml peer address ipv4 172.10.10.1
```

To disable all configurations under management plane protection out-of-band configuration mode, use the **no** form of this command.

out-of-band

no out-of-band

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Management plane protection out-of-band configuration

Release	Modification
Release 3.6.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **out-of-band** command to enter management plane protection out-of-band configuration mode.

Out-of-band refers to an interface that allows only management protocol traffic to be forwarded or processed. An *out-of-band management interface* is defined by the network operator to specifically receive network management traffic. The advantage is that forwarding (or customer) traffic cannot interfere with the management of the router.

Task ID	Operations
system	read, write

Examples The following example shows how to enter management plane protection out-of-band configuration mode using the **out-of-band** command:

```
RR/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# control-plane
RP/0/0/CPU0:router(config-ctrl)# management-plane
```

```
RP/0/0/CPU0:router(config-mpp)# out-of-band

EXEC

Command History

Release	Modification
Release 3.5.0	This command was introduced.
Release 3.6.0	The following modifications were added: <ul style="list-style-type: none"> Both inband and out-of-band keywords were added. The vrf keyword was added only for out-of-band VRF configurations. Sample output was updated to display inband and out-of-band interface configurations.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **vrf** keyword is valid only for out-of-band VRF configurations.

Task ID

Task ID	Operations
system	read

Examples

The following sample output displays all the interfaces that are configured as inband or out-of-band interfaces under MPP:

```
RR/0/0/CPU0:router# show mgmt-plane

Management Plane Protection

inband interfaces
-----
interface - GigabitEthernet0_1_1_0
  ssh configured -
    All peers allowed
  telnet configured -
    peer v4 allowed - 10.1.0.0/16
  all configured -
    All peers allowed
interface - GigabitEthernet0_1_1_0
  telnet configured -
    peer v4 allowed - 10.1.0.0/16

interface - all
  all configured -
    All peers allowed

outband interfaces
-----
interface - GigabitEthernet0_1_1_0
  tftp configured -
    peer v6 allowed - 33::33
```

The following sample output displays the Virtual Private Network (VPN) routing and forwarding (VRF) reference of an out-of-band interface:

```
RR/0/0/CPU0:router# show mgmt-plane out-of-band vrf

Management Plane Protection -
  out-of-band VRF - my_out_of_band
```

Related Commands

Command	Description

clear crypto ca certificates

To clear certificates associated with trustpoints that no longer exist in the configuration file, use the **clear crypto ca certificates** command in EXEC mode.

clear crypto ca certificates *trustpoint*

Syntax Description	<i>trustpoint</i>	Trustpoint name.
--------------------	-------------------	------------------

Command Default	None
-----------------	------

Command Modes	EXEC
---------------	------

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines	To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.
------------------	---

If the router is loaded with a new configuration file and certificates in the new configuration file do not have their corresponding trustpoint configuration, use the **clear crypto ca certificates** command to clear the certificates associated with trustpoints that no longer exist in the configuration file.

The **clear crypto ca certificates** command deletes both certification authority (CA) and router certificates from the system.

Task ID	Task ID	Operations
	crypto	execute

Examples	The following example shows how to clear the certificates associated with trustpoints that no longer exist in the configuration file:
----------	---

```
RP/0/0/CPU0:router# clear crypto ca certificates tp_1
```

clear crypto ca crl

To clear all the Certificate Revocation Lists (CRLs) stored on the router, use the **clear crypto ca crl** command in EXEC mode.

clear crypto ca crl

Syntax Description This command has no keywords or arguments.

Command Default No default behavior or values

Command Modes EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **clear crypto ca crl** command to clear all CRLs stored on the router. As a result, the router goes through the certification authorities (CAs) to download new CRLs for incoming certificate validation requests.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to clear all CRLs stored on the router:

```
RP/0/0/CPU0:router# show crypto ca crls

CRL Entry
=====
  Issuer : cn=Certificate Manager,ou=HFR,o=Cisco Systems,l=San Jose,st=CA,c=US
  Last Update : [UTC] Wed Jun  5 02:40:04 2002
  Next Update : [UTC] Wed Jun  5 03:00:04 2002
  CRL Distribution Point :
  ldap://manager.cisco.com/CN=Certificate Manager,O=Cisco Systems

RP/0/0/CPU0:router# clear crypto ca crl
RP/0/0/CPU0:router# show crypto ca crls
```

Related Commands

Command	Description
show crypto ca crls, on page 237	Displays the information about CRLs on the router.

crl optional (trustpoint)

To allow the certificates of other peers to be accepted without trying to obtain the appropriate CRL, use the **crl optional** command in trustpoint configuration mode. To return to the default behavior in which CRL checking is mandatory before your router can accept a certificate, use the **no** form of this command.

crl optional

no crl optional

Syntax Description

This command has no keywords or arguments.

Command Default

The router must have and check the appropriate CRL before accepting the certificate of another IP security peer.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

When your router receives a certificate from a peer, it searches its memory for the appropriate CRL. If the router finds the appropriate CRL, that CRL is used. Otherwise, the router downloads the CRL from either the certificate authority (CA) or from a CRL distribution point (CDP) as designated in the certificate of the peer. Your router will then check the CRL to ensure that the certificate that the peer sent has not been revoked. If the certificate appears on the CRL, your router cannot accept the certificate and will not authenticate the peer. To instruct the router not to download the CRL and treat the certificate as not revoked, use the **crl optional** command.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example declares a CA and permits your router to accept certificates without trying to obtain a CRL. This example also specifies a nonstandard retry period and retry count.

```
RP/0/0/CPU0:router# configure
```

```
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca  
RP/0/0/CPU0:router(config-trustp)# enrollment url http://ca_server  
RP/0/0/CPU0:router(config-trustp)# enrollment retry period 20  
RP/0/0/CPU0:router(config-trustp)# enrollment retry count 100  
RP/0/0/CPU0:router(config-trustp)# crl optional
```

Related Commands

Command	Description
crypto ca trustpoint, on page 200	Configures a trusted point with a selected name.
enrollment retry count, on page 213	Specifies how many times a router resends a certificate request.
enrollment retry period, on page 215	Specifies the wait period between certificate request retries.
enrollment url, on page 219	Specifies the URL of the CA.

crypto ca authenticate

To authenticate the certification authority (CA) by getting the certificate for the CA, use the **crypto ca authenticate** command in EXEC mode.

crypto ca authenticate *ca-name*

Syntax Description

<i>ca-name</i>	Name of the CA Server.
----------------	------------------------

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.6.0	The example output was modified.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **crypto ca authenticate** command is required when you initially configure CA support at your router.

This command authenticates the CA to your router by obtaining the CA certificate, which contains the public key for the CA. For self-signed root CA, because the CA signs its own certificate, you should manually authenticate the CA public key by contacting the CA administrator when you use this command. The certificate fingerprint matching is done out-of-band (for example, phone call, and so forth).

Authenticating a second-level CA requires prior authentication of the root CA.

After the **crypto ca authenticate** command is issued and the CA does not respond by the specified timeout period, you must obtain terminal control again to re-enter the command.

Task ID

Task ID	Operations
crypto	execute

Examples

The CA sends the certificate, and the router prompts the administrator to verify the certificate by checking the certificate fingerprint (a unique identifier). The CA administrator can also display the CA certificate fingerprint, so you should compare what the CA administrator sees to what the router displays on the screen. If the fingerprint on the display matches the fingerprint displayed by the CA administrator, you should accept the certificate as valid.

The following example shows that the router requests the CA certificate:

```
RP/0/0/CPU0:router# crypto ca authenticate msiox
Retrieve Certificate from SFTP server? [yes/no]: yes
Read 860 bytes as CA certificate
  Serial Number   : 06:A5:1B:E6:4F:5D:F7:83:41:11:D5:F9:22:7F:95:23
  Subject:
    Name: CA2

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto ca enroll** command to request certificates from the CA for the Rivest, Shamir, and Adelman (RSA) key pairs for the router defined by the [rsakeypair, on page 225](#) command in trustpoint configuration mode. If no [rsakeypair, on page 225](#) command is configured for the current trustpoint, the default RSA key pair is used for enrollment. This task is also known as enrolling with the CA. Use the **crypto ca cancel-enroll** command to cancel a current enrollment request.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to cancel a current enrollment request from a CA named myca:

```
RP/0/0/CPU0:router# crypto ca cancel-enroll myca
```

Related Commands

crypto ca enroll

To obtain a router certificate from the certification authority (CA), use the **crypto ca enroll** command in EXEC mode.

crypto ca enroll *ca-name*

Syntax Description	
<i>ca-name</i>	Name of the CA Server.

Command Default	None
-----------------	------

Command Modes	EXEC
---------------	------

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto ca enroll** command to request certificates from the CA for the Rivest, Shamir, and Adelman (RSA) key pairs for the router defined by the [rsakeypair, on page 225](#) command in trustpoint configuration mode. If no [rsakeypair, on page 225](#) command is configured for the current trustpoint, the default RSA key pair is used for enrollment. This task is also known as enrolling with the CA. (Enrolling and obtaining certificates are two separate events, but they both occur when the **crypto ca enroll** command is issued.) When using manual enrollment, these two operations occur separately.

The router needs a signed certificate from the CA for each of the RSA key pairs on the router; if you previously generated general-purpose keys, this command obtains the one certificate corresponding to the one general-purpose RSA key pair. If you previously generated special-usage keys, this command obtains two certificates corresponding to each of the special-usage RSA key pairs.

If you already have a certificate for your keys, you are unable to configure this command; instead, you are prompted to remove the existing certificate first. (You can remove existing certificates by removing the trustpoint configuration with the **no crypto ca trustpoint** command.)

The **crypto ca enroll** command is not saved in the router configuration.

Task ID	Task ID	Operations
	crypto	execute

Examples

The following sample output is from the **crypto ca enroll** command:

```
RP/0/0/CPU0:router# crypto ca enroll msiox
% Start certificate enrollment...
% Create a challenge password. You will need to verbally provide this password to the
  CA Administrator in order to revoke your certificate.
% For security reasons you password will not be saved in the configuration.
% Please make a note of it.
%Password
re-enter Password:
  Fingerprint: 4F35ADC9 2791997A CE211437 AFC66CF7
RP/0/0/CPU0:May 29 18:49:15.572 : pki_cmd: %PKI-6-LOG_INFO : certificate request pending
RP/0/0/CPU0:May 29 18:52:17.705 : pki_get_cert: %PKI-6-LOG_INFO : certificate is granted
```

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.6.0	The example was modified to include the sftp-password command and sftp-username command.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto ca trustpoint** command to declare a CA.

This command allows you to configure a trusted point with a selected name so that your router can verify certificates issued to peers. Your router need not enroll with the CA that issued the certificates to the peers.

The **crypto ca trustpoint** command enters trustpoint configuration mode, in which you can specify characteristics for the CA with the following commands:

- [crl optional \(trustpoint\), on page 190](#) command—The certificates of other peers are accepted without trying to obtain the appropriate CRL.
- [enrollment retry count, on page 213](#) command—The number of certificate request retries your router sends before giving up. Optional.
- [enrollment retry period, on page 215](#) command—(Optional)—The time the router waits between sending certificate request retries.
- [enrollment terminal, on page 217](#) command—When you do not have a network connection between the router and certification authority (CA), manually cut-and-paste certificate requests and certificates.

- [enrollment url, on page 219](#) command—(Optional)—The URL of the CA.
- [ip-address \(trustpoint\), on page 221](#) command—A dotted IP address that is included as an unstructured address in the certificate request.
- [query url, on page 223](#) command—The directory server URL in which the Certificate Revocation List (CRL) is published. Only a string that begins with “ldap://” is accepted. Required only if your CA supports Lightweight Directory Access Protocol (LDAP).
- [rsakeypair, on page 225](#) command—The named Rivest, Shamir, and Adelman (RSA) key pair for this trustpoint.
- [serial-number \(trustpoint\), on page 227](#) command—Router serial number in the certificate request.
- [sftp-password \(trustpoint\), on page 229](#) command—FTP secure password.
- [sftp-username \(trustpoint\), on page 231](#) command—FTP secure username.
- [subject-name \(trustpoint\), on page 233](#) command—Subject name in the certificate request.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to use the **crypto ca trustpoint** command to create a trustpoint:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint msiox
RP/0/0/CPU0:router(config-trustp)# sftp-password xxxxxx
RP/0/0/CPU0:router(config-trustp)# sftp-username tmordeko
RP/0/0/CPU0:router(config-trustp)# enrollment url
sftp://192.168..254.254/tftpboot/tmordeko/CAcert
RP/0/0/CPU0:router(config-trustp)# rsakeypair label-2
```

Related Commands

Command	Description

crypto key generate dsa

To generate Digital Signature Algorithm (DSA) key pairs, use the **crypto key generate dsa** command in EXEC mode.

crypto key generate dsa

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto key generate dsa** command to generate DSA key pairs for your router.

DSA keys are generated in pairs—one public DSA key and one private DSA key.

If your router already has DSA keys when you issue this command, you are warned and prompted to replace the existing keys with new keys.

To remove the DSA key generated, use the **crypto key zeroize dsa** command.

Task ID	Task ID	Operations
	crypto	execute

Examples The following example shows how to generate a 512-bit DSA key:

```
RP/0/0/CPU0:router# crypto key generate dsa
The name for the keys will be: the_default
Choose the size of your DSA key modulus. Modulus size can be 512, 768, or 1024 bits.
Choosing a key modulus
How many bits in the modulus [1024]: 512
Generating DSA keys...
Done w/ crypto generate keypair
[OK]
```

Related Commands

Command	Description
crypto key zeroize dsa, on page 208	Deletes a DSA key pair from your router.
show crypto key mypubkey dsa, on page 238	Displays the DSA public keys for your router.

crypto key generate rsa

To generate a Rivest, Shamir, and Adelman (RSA) key pair, use the **crypto key generate rsa** command in EXEC mode.

crypto key generate rsa [**usage-keys**| **general-keys**] [*keypair-label*]

Syntax Description

usage-keys	(Optional) Generates separate RSA key pairs for signing and encryption.
general-keys	(Optional) Generates a general-purpose RSA key pair for signing and encryption.
<i>keypair-label</i>	(Optional) RSA key pair label that names the RSA key pairs.

Command Default

RSA key pairs do not exist. If the **usage-keys** keyword is not used, general-purpose keys are generated. If no RSA label is specified, the key is generated as the default RSA key.

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto key generate rsa** command to generate RSA key pairs for your router.

RSA keys are generated in pairs—one public RSA key and one private RSA key.

If your router already has RSA keys when you issue this command, you are warned and prompted to replace the existing keys with new keys. The keys generated by this command are saved in the secure NVRAM (which is not displayed to the user or backed up to another device).

To remove an RSA key, use the **crypto key zeroize rsa** command.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to generate an RSA key pair:

```
RP/0/0/CPU0:router# crypto key generate rsa
```

The name for the keys will be: the_default

Choose the size of the key modulus in the range of 360 to 2048 for your General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.

How many bits in the modulus[1024]: <return>

```
RP/0/0/CPU0:router#
```

Related Commands

Command	Description
crypto key zeroize rsa, on page 210	Deletes the RSA key pair for your router.
show crypto key mypubkey rsa, on page 240	Displays the RSA public keys for your router.

crypto key import authentication rsa

To import a public key using the Rivest, Shamir, and Adelman (RSA) method, use the **crypto key import authentication rsa** command in EXEC mode.

crypto key import authentication rsa

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.9.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

First, you must generate an RSA public-private key pair on a unix client using any key generation mechanism, like ssh-keygen. The key size range is between 512 bits and 2048 bits.

Then, you must convert public key to base64 encoded (binary) format to import it correctly into the box. The number of keys that can be stored in the nvram box depends on the individual key size. This size is a variable number defined by the user.

Once the public key is generated, the key must be placed on the router where you wish to enable RSA based authentication.

Task ID	Task ID	Operations
	crypto	execute

Examples The following example displays how to import a public key:

```
RP/0/0/CPU0:k2#crypto key import authentication rsa
```

crypto key zeroize dsa

To delete the Digital Signature Algorithm (DSA) key pair from your router, use the **crypto key zeroize dsa** command in EXEC mode.

crypto key zeroize dsa

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto key zeroize dsa** command to delete the DSA key pair that was previously generated by your router.

Task ID	Task ID	Operations
	crypto	execute

Examples The following example shows how to delete DSA keys from your router:

```
RP/0/0/CPU0:router# crypto key zeroize dsa
% Keys to be removed are named the default
Do you really want to remove these keys? [yes/no]: yes
```

crypto key zeroize rsa

To delete all Rivest, Shamir, and Adelman (RSA) keys from the router, use the **crypto key zeroize rsa** command in EXEC mode.

crypto key zeroize rsa [*keypair-label*]

Syntax Description

keypair-label

(Optional) Names the RSA key pair to be removed.

Command Default

If the key pair label is not specified, the default RSA key pair is removed.

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **crypto key zeroize rsa** command to delete all RSA keys that were previously generated by the router. After issuing this command, you must perform two additional tasks:

- Ask the certification authority (CA) administrator to revoke the certificates for the router at the CA; you must supply the challenge password you created when you originally obtained the router certificates with the [crypto ca enroll](#), on page 196 command CA.
- Manually remove the certificates from the configuration using the **clear crypto ca certificates** command.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to delete the general-purpose RSA key pair that was previously generated:

```
RP/0/0/CPU0:router# crypto key zeroize rsa key1
% Keys to be removed are named key1
Do you really want to remove these keys? [yes/no]: yes
```

Related Commands

Command	Description
clear crypto ca certificates, on page 187	Clears certificates associated with trustpoints that no longer exist in the configuration file.
crypto ca enroll, on page 196	Obtains a router certificate from the CA.

show crypto key mypubkey rsa, on page 240	Displays the RSA public keys for your router.

description (trustpoint)

To create a description of a trustpoint, use the **description** command in trustpoint configuration mode. To delete a trustpoint description, use the **no** form of this command.

description *string*

no description

Syntax Description

<i>string</i>	Character string describing the trustpoint.
---------------	---

Command Default

The default description is blank.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **description** command in the trustpoint configuration mode to create a description for a trustpoint.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to create a trustpoint description:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/0/CPU0:router(config-trustp)# description this is the primary trustpoint
```

enrollment retry count

To specify the number of times a router resends a certificate request to a certification authority (CA), use the **enrollment retry count** command in trustpoint configuration mode. To reset the retry count to the default, use the **no** form of this command.

enrollment retry count *number*

no enrollment retry count *number*

Syntax Description

<i>number</i>	Number of times the router resends a certificate request when the router does not receive a certificate from the previous request. The range is from 1 to 100.
---------------	--

Command Default

If no retry count is specified, the default value is 10.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

After requesting a certificate, the router waits to receive a certificate from the CA. If the router does not receive a certificate within a specified time (the retry period), the router sends another certificate request. The router continues to send requests until it receives a valid certificate, the CA returns an enrollment error, or the configured number of retries (the retry count) is exceeded.

To reset the retry count to the default of 10, use the **no** form of this command. Setting the retry count to 0 indicates an infinite number of retries. The router sends the CA certificate requests until a valid certificate is received (there is no limit to the number of retries).

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to declare a CA, change the retry period to 10 minutes, and change the retry count to 60 retries. The router resends the certificate request every 10 minutes until receipt of the certificate

or approximately 10 hours pass since the original request was sent, whichever occurs first (10 minutes x 60 tries = 600 minutes = 10 hours).

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/0/CPU0:router(config-trustp)# enrollment url http://ca_server
RP/0/0/CPU0:router(config-trustp)# enrollment retry period 10
RP/0/0/CPU0:router(config-trustp)# enrollment retry count 60
```

Related Commands

Command	Description
crl optional (trustpoint) , on page 190	Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL.
crypto ca trustpoint , on page 200	Configures a trusted point with a selected name.
enrollment retry period , on page 215	Specifies the wait period between certificate request retries.
enrollment url , on page 219	Specifies the certification authority (CA) location by naming the CA URL.

enrollment retry period

To specify the wait period between certificate request retries, use the **enrollment retry period** command in trustpoint configuration mode. To reset the retry period to the default of 1 minute, use the **no** form of this command.

enrollment retry period *minutes*

no enrollment retry period *minutes*

Syntax Description

<i>minutes</i>	Period (in minutes) between certificate requests issued to a certification authority (CA) from the router. The range is from 1 to 60 minutes.
----------------	---

Command Default

minutes: 1

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

After requesting a certificate, the router waits to receive a certificate from the CA. If the router does not receive a certificate within a specified time (the retry period), the router sends another certificate request. The router continues to send requests until it receives a valid certificate, the CA returns an enrollment error, or the configured number of retries (the retry count) is exceeded.

The router sends the CA another certificate request every minute until a valid certificate is received. (By default, the router sends ten requests, but you can change the number of permitted retries with the **enrollment retry count** command.)

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to declare a CA and change the retry period to 5 minutes:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/0/CPU0:router(config-trustp)# enrollment retry period 5
```

enrollment terminal

To specify manual cut-and-paste certificate enrollment, use the **enrollment terminal** command in trustpoint configuration mode. To delete a current enrollment request, use the **no** form of this command.

enrollment terminal

no enrollment terminal

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Trustpoint configuration

Command History	Release	Modification
	Release 3.4.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

You can manually cut and paste certificate requests and certificates when you do not have a network connection between the router and certification authority (CA). When the **enrollment terminal** command is enabled, the router displays the certificate request on the console terminal, which allows you to enter the issued certificate on the terminal.

Task ID	Task ID	Operations
	crypto	read, write

Examples The following example shows how to manually specify certificate enrollment through cut-and-paste. In this example, the CA trustpoint is myca.

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/0/CPU0:router(config-trustp)# enrollment terminal
```

Related Commands

Command	Description
crypto ca trustpoint, on page 200	Configures a trusted point with a selected name.

enrollment url

To specify the certification authority (CA) location by naming the CA URL, use the **enrollment url** command in trustpoint configuration mode. To remove the CA URL from the configuration, use the **no** form of this command.

enrollment url *CA-URL*

no enrollment url *CA-URL*

Syntax Description

<i>CA-URL</i>	URL of the CA server. The URL string must start with http://CA_name, where CA_name is the host Domain Name System (DNS) name or IP address of the CA (for example, http://ca-server). If the CA cgi-bin script location is not /cgi-bin/pkiclient.exe at the CA (the default CA cgi-bin script location), you must also include the nonstandard script location in the URL, in the form of http://CA-name/script-location, where script-location is the full path to the CA scripts.
---------------	---

Command Default

None

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.4.0	Both SFTP and TFTP enrollment methods were added.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **enrollment url** command to specify the CA URL. This command is required when you declare a CA with the **crypto ca trustpoint** command. The URL must include the CA script location if the CA scripts are not loaded into the default cgi-bin script location. The CA administrator should be able to tell you where the CA scripts are located.

This table lists the available enrollment methods.

Table 13: Certificate Enrollment Methods

Enrollment Method	Description
SFTP	Enroll through SFTP: file system

Enrollment Method	Description
TFTP ¹	Enroll through TFTP: file system

¹ If you are using TFTP for enrollment, the URL must be in the form `tftp://certserver/file_specification`. (The file specification is optional.)

TFTP enrollment sends the enrollment request and retrieves the certificate of the CA and the certificate of the router. If the file specification is included in the URL, the router appends an extension to the file specification.

To change the CA URL, repeat the **enrollment url** command to overwrite the previous URL.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows the absolute minimum configuration required to declare a CA:

```
RP/0/0/CPU0:router# configure RP/0/0/CPU0:router(config)#
crypto ca trustpoint myca RP/0/0/CPU0:router(config-trustp)#
enrollment url http://ca.domain.com/certsrv/mscep/mscep.dll
```

Related Commands

Command	Description
crl optional (trustpoint), on page 190	Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL.
crypto ca trustpoint, on page 200	Configures a trusted point with a selected name.
ip-address (trustpoint), on page 221	Specifies a dotted IP address that is included as an unstructured address in the certificate request.

ip-address (trustpoint)

To specify a dotted IP address that is included as an unstructured address in the certificate request, use the **ip-address** command in trustpoint configuration mode. To restore the default behavior, use the **no** form of this command.

ip-address {*ip-address*| **none**}

no ip-address {*ip-address*| **none**}

Syntax Description

<i>ip-address</i>	Dotted IP address that is included in the certificate request.
none	Specifies that an IP address is not included in the certificate request.

Command Default

You are prompted for the IP address during certificate enrollment.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ip-address** command to include the IP address of the specified interface in the certificate request or to specify that an IP address should not be included in the certificate request.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to include the IP address of the Ethernet-0 interface in the certificate request for the trustpoint frog:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint frog
RP/0/0/CPU0:router(config-trustp)# enrollment url http://frog.phoobin.com
```

```
RP/0/0/CPU0:router(config-trustp)# subject-name OU=Spiral Dept., O=tiedye.com
```

```
RP/0/0/CPU0:router(config-trustp)# ip-address 172.19.72.120
```

The following example shows that an IP address is not to be included in the certificate request:

```
RP/0/0/CPU0:router# configure
```

```
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca
```

```
RP/0/0/CPU0:router(config-trustp)# enrollment url http://10.3.0.7:80
```

```
RP/0/0/CPU0:router(config-trustp)# subject-name CN=subject1, OU=PKI, O=Cisco Systems, C=US
```

```
RP/0/0/CPU0:router(config-trustp)# ip-address none
```

Related Commands

Command	Description
crl optional (trustpoint) , on page 190	Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL.
crypto ca trustpoint , on page 200	Configures a trusted point with a selected name.
enrollment url , on page 219	Specifies the certification authority (CA) location by naming the CA URL.
serial-number (trustpoint) , on page 227	Specifies whether the router serial number should be included in the certificate request.
subject-name (trustpoint) , on page 233	Specifies the subject name in the certificate request.

query url

To specify Lightweight Directory Access Protocol (LDAP) protocol support, use the **query url** command in trustpoint configuration mode. To remove the query URL from the configuration, use the **no** form of this command.

query url *LDAP-URL*

no query url *LDAP-URL*

Syntax Description

<i>LDAP-URL</i>	URL of the LDAP server (for example, ldap://another-server). This URL must be in the form of ldap://server-name where server-name is the host Domain Name System (DNS) name or IP address of the LDAP server.
-----------------	--

Command Default

The URL provided in the router certificate's CRLDistributionPoint extension is used.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

LDAP is a query protocol used when the router retrieves the Certificate Revocation List (CRL). The certification authority (CA) administrator should be able to tell you whether the CA supports LDAP; if the CA supports LDAP, the CA administrator can tell you the LDAP location where certificates and certificate revocation lists should be retrieved.

To change the query URL, repeat the **query url** command to overwrite the previous URL.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows the configuration required to declare a CA when the CA supports LDAP:

```
RP/0/0/CPU0:router# configure  
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca  
RP/0/0/CPU0:router(config-trustp)# query url ldap://my-ldap.domain.com
```

Related Commands

Command	Description
crypto ca trustpoint, on page 200	Configures a trusted point with a selected name.

rsakeypair

To specify a named Rivest, Shamir, and Adelman (RSA) key pair for this trustpoint, use the **rsakeypair** command in trustpoint configuration mode. To reset the RSA key pair to the default, use the **no** form of this command.

rsakeypair *keypair-label*

no rsakeypair *keypair-label*

Syntax Description

<i>keypair-label</i>	RSA key pair label that names the RSA key pairs.
----------------------	--

Command Default

If the RSA key pair is not specified, the default RSA key is used for this trustpoint.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **rsakeypair** command to specify a named RSA key pair generated using the **crypto key generate rsa** command for this trustpoint.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to specify the named RSA key pair key1 for the trustpoint myca:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint myca
RP/0/0/CPU0:router(config-trustp)# rsakeypair key1
```

Related Commands

Command	Description
crypto key generate rsa, on page 205	Generates RSA key pairs.

serial-number (trustpoint)

To specify whether the router serial number should be included in the certificate request, use the **serial-number** command in trustpoint configuration mode. To restore the default behavior, use the **no** form of this command.

serial-number [none]

no serial-number

Syntax Description

none	(Optional) Specifies that a serial number is not included in the certificate request.
------	---

Command Default

You are prompted for the serial number during certificate enrollment.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Before you can use the **serial-number** command, you must enable the **crypto ca trustpoint** command, which declares the certification authority (CA) that your router should use and enters trustpoint configuration mode.

Use this command to specify the router serial number in the certificate request, or use the **none** keyword to specify that a serial number should not be included in the certificate request.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to omit a serial number from the root certificate request:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint root
RP/0/0/CPU0:router(config-trustp)# enrollment url http://10.3.0.7:80
RP/0/0/CPU0:router(config-trustp)# ip-address none
RP/0/0/CPU0:router(config-trustp)# serial-number none
RP/0/0/CPU0:router(config-trustp)# subject-name ON=Jack, OU=PKI, O=Cisco Systems, C=US
```

Related Commands

Command	Description
crl optional (trustpoint), on page 190	Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL.
crypto ca trustpoint, on page 200	Configures a trusted point with a selected name.
enrollment url, on page 219	Specifies the certification authority (CA) location by naming the CA URL.
ip-address (trustpoint), on page 221	Specifies a dotted IP address that is included as an unstructured address in the certificate request.
subject-name (trustpoint), on page 233	Specifies the subject name in the certificate request.

sftp-password (trustpoint)

To secure the FTP password, use the **sftp-password** command in trustpoint configuration mode. To disable this feature, use the **no** form of this command.

sftp-password {*clear text*| **clear text**| **password** *encrypted string*}

no sftp-password {*clear text*| **clear text**| **password** *encrypted string*}

Syntax Description

<i>clear text</i>	Clear text password and is encrypted only for display purposes.
password <i>encrypted string</i>	Enters the password in an encrypted form.

Command Default

The *clear text* argument is the default behavior.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.6.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Passwords are stored in encrypted form and not as plain text. The command-line interface (CLI) contains the provisioning (for example, clear and encrypted) to specify the password input.

The username and password are required as part of the SFTP protocol. If you specify the URL that begins with the prefix (sftp://), you must configure the parameters for the **sftp-password** command under the trustpoint. Otherwise, the certificate from the SFTP server, which is used for manual certificate enrollment, cannot be retrieved.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to secure the FTP password in an encrypted form:

```
RP/0/0/CPU0:router# configure
```

```
RP/0/0/CPU0:router(config)# crypto ca trustpoint msiox  
RP/0/0/CPU0:router(config-trustp)# sftp-password password xxxxxx
```

Related Commands

Command	Description
crypto ca trustpoint , on page 200	Configures a trusted point with a selected name.
sftp-username (trustpoint) , on page 231	Secures the FTP username.

sftp-username (trustpoint)

To secure the FTP username, use the **sftp-username** command in trustpoint configuration mode. To disable this feature, use the **no** form of this command.

sftp-username *username*

no sftp-username *username*

Syntax Description

<i>username</i>	Name of the user.
-----------------	-------------------

Command Default

None

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.6.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The **sftp-username** command is used only if the URL has (sftp://) in the prefix. If (sftp://) is not specified in the prefix, the manual certificate enrollment using SFTP fails.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to secure the FTP username:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint msiox
RP/0/0/CPU0:router(config-trustp)# sftp-username tmordeko
```

Related Commands

Command	Description
crypto ca trustpoint , on page 200	Configures a trusted point with a selected name.
sftp-password (trustpoint) , on page 229	Secures the FTP password.

subject-name (trustpoint)

To specify the subject name in the certificate request, use the **subject-name** command in trustpoint configuration mode. To clear any subject name from the configuration, use the **no** form of this command.

subject-name *x.500-name*

no subject-name *x.500-name*

Syntax Description

x.500-name

(Optional) Specifies the subject name used in the certificate request.

Command Default

If the *x.500-name* argument is not specified, the fully qualified domain name (FQDN), which is the default subject name, is used.

Command Modes

Trustpoint configuration

Command History

Release	Modification
Release 3.4.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Before you can use the **subject-name** command, you must enable the **crypto ca trustpoint** command, which declares the certification authority (CA) that your router should use and enters trustpoint configuration mode.

The **subject-name** command is an attribute that can be set for automatic enrollment; thus, issuing this command prevents you from being prompted for a subject name during enrollment.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to specify the subject name for the frog certificate:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# crypto ca trustpoint frog
RP/0/0/CPU0:router(config-trustp)# enrollment url http://frog.phoobin.com
RP/0/0/CPU0:router(config-trustp)# subject-name OU=Spiral Dept., O=tiedye.com
RP/0/0/CPU0:router(config-trustp)# ip-address 172.19.72.120
```

Related Commands

Command	Description
crl optional (trustpoint), on page 190	Allows the certificates of other peers to be accepted without trying to obtain the appropriate CRL.
crypto ca trustpoint, on page 200	Configures a trusted point with a selected name.
enrollment url, on page 219	Specifies the certification authority (CA) location by naming the CA URL.
ip-address (trustpoint), on page 221	Specifies a dotted IP address that is included as an unstructured address in the certificate request.
serial-number (trustpoint), on page 227	Specifies whether the router serial number should be included in the certificate request.

show crypto ca certificates

To display information about your certificate and the certification authority (CA) certificate, use the **show crypto ca certificates** command in EXEC mode.

show crypto ca certificates

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.
	Release 3.6.0	The example output was modified.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show crypto ca certificates** command to display information about the following certificates:

- Your certificate, if you have requested one from the CA (see the **crypto ca enroll** command).
- CA certificate, if you have received the certificate (see the **crypto ca authenticate** command).

Task ID	Task ID	Operations
	crypto	read

Software Authentication Manager Commands

This module describes the Cisco IOS XR software commands used to configure Software Authentication Manager (SAM).

For detailed information about SAM concepts, configuration tasks, and examples, see the *Configuring Software Authentication Manager on the Cisco IOS XR Software* module in the *Cisco IOS XR System Security Configuration Guide for the Cisco XR 12000 Series Router Software* configuration module.

- [sam add certificate, page 244](#)
- [sam delete certificate, page 246](#)
- [sam prompt-interval, page 248](#)
- [sam verify, page 250](#)
- [show sam certificate, page 252](#)
- [show sam srl, page 256](#)
- [show sam log, page 259](#)
- [show sam package, page 261](#)
- [show sam sysinfo, page 264](#)

sam add certificate

To add a new certificate to the certificate table, use the **sam add certificate** command in EXEC mode.

sam add certificate *filepath location* {**trust**| **untrust**}

Syntax Description	<i>filepath</i>	Absolute path to the source location of the certificate.
	<i>location</i>	Storage site of the certificate. Use one of the following: root , mem , disk0 , disk1 , or other flash device name on router .
	trust	Adds the certificate to the certificate table without validation by the Software Authentication Manager (SAM). To add a root certificate, you must use the trust keyword. Adding a root certificate with the untrust keyword is not allowed.
	untrust	Adds the certificate to the certificate table after the SAM has validated it. Adding a root certificate with the untrust keyword is not allowed. To add a root certificate, you must use the trust keyword.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

For security reasons, the **sam add certificate** command can be issued only from the console or auxiliary port of the networking device; the command cannot be issued from a Telnet connection to any other interface on the networking device.

The certificate must be copied to the network device before it can be added to the certificate table. If the certificate is already present in the certificate table, the SAM rejects the attempt to add it.

When adding root certificates, follow these guidelines:

- Only the certificate authority (CA) root certificate can be added to the root location.
- To add a root certificate, you must use the **trust** keyword. Adding the root certificate with the **untrust** keyword is not allowed.

Use of the **trust** keyword assumes that you received the new certificate from a source that you trust, and therefore have enough confidence in its authenticity to bypass validation by the SAM. One example of acquiring a certificate from a trusted source is downloading it from a CA server (such as Cisco.com) that requires user authentication. Another example is acquiring the certificate from a person or entity that you can verify, such as by checking the identification badge for a person. If you bypass the validation protection offered by the SAM, you must verify the identity and integrity of the certificate by some other valid process.

Certificates added to the memory (**mem**) location validate software installed in memory. Certificates added to the **disk0** or **disk1** location validate software installed on those devices, respectively.

**Note**

If the **sam add certificate** command fails with a message indicating that the certificate has expired, the networking device clock may have been set incorrectly. Use the **show clock** command to determine if the clock is set correctly.

Task ID

Task ID	Operations
crypto	execute

Examples

The following example shows how to add the certificate found at /bootflash/ca.bin to the certificate table in the root location without first validating the certificate:

```
RP/0/0/CPU0:router# sam add certificate /bootflash/ca.bin root trust
```

```
SAM: Successful adding certificate /bootflash/ca.bin
```

The following example shows how to add the certificate found at /bootflash/css.bin to the certificate table in the memory (**mem**) location after validating the certificate:

```
RP/0/0/CPU0:router# sam add certificate /bootflash/css.bin mem untrust
```

```
SAM: Successful adding certificate /bootflash/css.bin
```

Related Commands

Command	Description
sam delete certificate, on page 246	Deletes a certificate from the certificate table.
show sam certificate, on page 252	Displays records in the certificate table, including the location of the certificates.
show clock	Displays networking device clock information. For more information, see <i>Cisco IOS XR System Management Command Reference for the Cisco XR 12000 Series Router</i> .

sam delete certificate

To delete a certificate from the certificate table, use the **sam delete certificate** command in EXEC mode.

sam delete certificate *location certificate-index*

Syntax Description	<i>location</i>	Storage site of the certificate. Use one of the following: root , mem , disk0 , disk1 , or other flash device name on the router .
	<i>certificate-index</i>	Number in the range from 1 to 65000.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

For security reasons, the **sam delete certificate** command can be issued only from the console port of the networking device; the command cannot be issued from a Telnet connection to any other interface on the networking device.

Use the **show sam certificate summary** command to display certificates by their index numbers.

Because the certificate authority (CA) certificate must not be unknowingly deleted, the Software Authentication Manager (SAM) prompts the user for confirmation when an attempt is made to delete the CA certificate.

If a certificate stored on the system is no longer valid (for example, if the certificate has expired), you can use the **sam delete certificate** command to remove the certificate from the list.

Task ID	Task ID	Operations
	crypto	execute

Examples

The following example shows how to delete the certificate identified by the index number 2 from the memory location:

```
RP/0/0/CPU0:router# sam delete certificate mem 2
```

```
SAM: Successful deleting certificate index 2
```

The following example shows how to cancel the deletion of the certificate identified by the index number 1 from the root location:

```
RP/0/0/CPU0:router# sam delete certificate root 1
```

```
Do you really want to delete the root CA certificate (Y/N): N
```

```
SAM: Delete certificate (index 1) canceled
```

The following example shows how to delete the certificate identified by the index number 1 from the root location:

```
RP/0/0/CPU0:router# sam delete certificate root 1
```

```
Do you really want to delete the root CA certificate (Y/N): Y
```

```
SAM: Successful deleting certificate index 1
```

Related Commands

Command	Description
sam add certificate, on page 244	Adds a new certificate to the certificate table.
show sam certificate, on page 252	Displays records in the certificate table, including the location of the certificates stored.

sam prompt-interval

To set the interval that the Software Authentication Manager (SAM) waits after prompting the user for input when it detects an abnormal condition at boot time and to determine how the SAM responds when it does not receive user input within the specified interval, use the **sam promptinterval** command in global configuration mode. To reset the prompt interval and response to their default values, use the **no** form of this command.

sam promptinterval *time-interval* {**proceed**|**terminate**}

no sam promptinterval *time-interval* {**proceed**|**terminate**}

Syntax Description

<i>time-interval</i>	Prompt time, in the range from 0 to 300 seconds.
proceed	Causes the SAM to respond as if it had received a “yes” when the prompt interval expires.
terminate	Causes the SAM to respond as if it had received a “no” when the prompt interval expires.

Command Default

The default response is for the SAM to wait 10 seconds and then terminate the authentication task.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **sam prompt-interval** command to control the action taken when the system detects an exception condition, such as an expired certificate during initialization of the SAM at boot time. The following message appears when the software detects the abnormal condition of a certificate authority (CA) certificate expired:

```
SAM detects expired CA certificate. Continue at risk (Y/N):
```

The SAM waits at the prompt until you respond or the time interval controlled by the **sam prompt-interval** command expires, whichever is the earlier event. If you respond “N” to the prompt, the boot process is allowed to complete, but no packages can be installed.

The following message appears when the software detects the abnormal condition of a Code Signing Server (CSS) certificate expired:

```
SAM detects CA certificate (Code Signing Server Certificate Authority) has expired. The
validity period is Oct 17, 2000 01:46:24 UTC - Oct 17, 2015 01:51:47 UTC. Continue at risk?
(Y/N) [Default:N w/in 10]:
```

If you do not respond to the prompt, the SAM waits for the specified interval to expire, and then it takes the action specified in the **sam prompt-interval** command (either the **proceed** or **terminate** keyword).

If you enter the command with the **proceed** keyword, the SAM waits for the specified interval to expire, and then it proceeds as if you had given a “yes” response to the prompt.

If you enter the command with the **terminate** keyword, the SAM waits for the specified interval to expire, and then it proceeds as if you had given a “no” response to the prompt. This use of the command keeps the system from waiting indefinitely when the system console is unattended.

Note

After the software has booted up, the *time-interval* argument set using this command has no effect. This value applies at boot time only.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to tell the SAM to wait 30 seconds for a user response to a prompt and then terminate the requested SAM processing task:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# sam promptinterval 30 terminate
```

Related Commands

Command	Description
show sam sysinfo , on page 264	Displays the current status information for the SAM.

sam verify

To use the Message Digest 5 (MD5) hash algorithm to verify the integrity of the software component on a flash memory card and ensure that it has not been tampered with during transit, use the **sam verify** command in EXEC mode.

sam verify {*location*|*file-system*} {**MD5**|**SHA** [*digest*]}

Syntax Description

<i>location</i>	Name of the flash memory card slot, either disk0 or disk1.
<i>file-system</i>	Absolute path to the file to be verified.
MD5	Specifies a one-way hashing algorithm to generate a 128-bit hash (or message digest) of the specified software component.
SHA	Specifies the Secure Hash Algorithm, a hashing algorithm that takes a message of less than 264 bits in length and produces a 160-bit message digest. The large message digest provides security against brute-force collision and inversion attacks.
<i>digest</i>	(Optional) Message digest generated by the hashing algorithm, to be compared in determining the integrity of the software component.

Command Default

None

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **sam verify** command to generate a message digest for a given device. The message digest is useful for determining whether software on a flash memory card has been tampered with during transit. The command generates a hash code that can be used to compare the integrity of the software between the time it was shipped and the time you received it.

For example, if you are given a flash memory card with preinstalled software and a previously generated MD5 message digest, you can verify the integrity of the software using the **sam verify** command:

```

sam verify device MD5 digest

```

The *device* argument specifies the flash device. The *digest* argument specifies the message digest supplied by the originator of the software.

If the message digest matches the message digest generated by the **sam verify** command, the software component is valid.

**Note**

You should calculate the hash code on the contents of the flash memory code at the destination networking device using a different set of files from the one loaded on the flash memory card. It is possible for an unauthorized person to use the same software version to produce the desired (matching) hash code and thereby disguise that someone has tampered with the new software.

Task ID

Task ID	Operations
crypto	execute

Examples

The example shows a third **sam verify** command, issued with a mismatched message digest, to show the Software Authentication Manager (SAM) response to a mismatch. The following example shows how to use MD5 to generate a message digest on the entire file system on the flash memory card in slot 0 and then use that message digest as input to perform the digest comparison:

```
RP/0/0/CPU0:router# sam verify disk0: MD5
```

```
Total file count in disk0: = 813
082183cb6e65a44fd7ca95fe8e93def6
```

```
RP/0/0/CPU0:router# sam verify disk0: MD5 082183cb6e65a44fd7ca95fe8e93def6
```

```
Total file count in disk0: = 813
Same digest values
```

```
RP/0/0/CPU0:router# sam verify disk0: MD5 3216c9282d97ee7a40b78a4e401158bd
```

```
Total file count in disk0: = 813
Different digest values
```

The following example shows how to use MD5 to generate a message digest and then uses that message digest as input to perform the digest comparison:

```
RP/0/0/CPU0:router# sam verify disk0: /crl_revoked.bin MD5
```

```
38243ffbbe6cdb7a12fa9fa6452956ac
```

```
RP/0/0/CPU0:router# sam verify disk0: /crl_revoked.bin MD5 38243ffbbe6cdb7a12fa9fa6452956ac
```

```
Same digest values
```

show sam certificate

To display records in the certificate table, use the **show sam certificate** command in EXEC mode.

Syntax Description

<i>detail</i>	Displays all the attributes for the selected table entry (specified by the <i>certificate-index</i> argument).
<i>location</i>	Specifies the certificates stored in a specific location. Use one of the following: root , mem , disk0 , disk1 , or other flash device on router .
<i>certificate-index</i>	Index number for the entry, in the range from 1 to 65000.
<i>brief</i>	Displays selected attributes for entries in the table.
<i>all</i>	Displays selected attributes for all the entries in the table.
<i>location</i>	Displays selected attributes for only the certificates stored in a specific location. Use one of the following: root , mem , disk0 , disk1 , or other flash device on router .

Command Default

None

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.3.0	The summary keyword was replaced with the brief keyword.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show sam certificate** command when you want to display all the certificates stored in the system. Attributes are certificate number, certificate flag, serial number, subject name, issued by, version, issuing algorithm, not-before and not-after dates, public key, and signature.

To get the certificate number, use the *certificate-index* argument. When used with the **brief** keyword, the **all** keyword displays selected attributes for all the entries in the table.

When used with the **brief** keyword, the *location* argument displays selected attributes for only the certificates stored in a specific location. Use one of the following: **root**, **mem**, **disk0**, **disk1**, or **other flash device on router**.

Task ID

Task ID	Operations
none	—

Examples

In the example, the root location has one certificate, and disk0 has one certificate. The following sample output is from the **show sam certificate** command:

```
RP/0/0/CPU0:router# show sam certificate
```

```
summary

This table describes the significant fields shown in the display.

Table 15: show sam certificate detail mem 1 Field Descriptions

Field	Descriptions
Certificate Location	Location of the certificate; one of the following: root , mem , disk0 , or disk1 .
Certificate Index	Index number that the SAM automatically assigns to the certificate.
Certificate Flag	One of the following: TRUSTED, VALIDATED, EXPIRED, or REVOKED.
Serial Number	Unique serial number of the certificate, assigned by its issuer.
Subject Name	Name of the entity for which the certificate is issued.
Issued By	Name of the entity that issued the certificate.
Version	The X.509 version of the certificate. The version can be 1 (X.509v1), 2 (X.509v2), or 3 (X.509v3).
Issuing Algorithm	Hash and public key algorithm that the issuer uses to sign the certificate.
Public Key	Subject public key for the certificate.
Certificate signature	Encrypted hash value (or signature) of the certificate. The hash value of the certificate is encrypted using the private key of the issuer.

show sam crl

To display the records in the certificate revocation list (CRL) table, use the **show sam crl** command in EXEC mode.

show sam crl {**summary**|**detail** *crl-index*}

Syntax Description

summary	Displays selected attributes for all entries in the table.
detail	Displays all the attributes for the selected table entry (specified by the <i>crl-index</i> argument).
<i>crl-index</i>	Index number for the entry, in the range from 1 to 65000.

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show sam crl** command when you want to display all the revoked certificates currently stored on the system. Attributes are CRL index number, issuer, and update information.

To get the CRL index number, use the **summary** keyword.

Task ID

Task ID	Operations
crypto	read

Examples

The following sample output is from the **show sam crl** command for the **summary** keyword:

```
RP/0/0/CPU0:router# show sam crl summary
----- SUMMARY OF CRLs -----
```

```

CRL Index          :1
Issuer:CN = Code Sign Server Certificate Manager, OU = Cisco HFR mc , O =
Cisco,
    L = San Jose, ST = CA, C = US, EA =<16> iosmx-css-cert@cisco.com
Including updates of:
                        Sep 09, 2002 03:50:41 GMT

```

This table describes the significant fields shown in the display.

Table 16: show sam crl summary Field Descriptions

Field	Description
CRL Index	Index number for the entry, in the range from 1 to 65000. The index is kept in the certificate revocation list table.
Issuer	Certificate authority (CA) that issued this CRL.
Including updates of	Versions of CRLs from this CA that are included in the CRL table.

The following sample output is from the **show sam crl** command for the **detail** keyword:

```

RP/0/RP0/CPU0:router# show sam crl detail 1
-----
CRL Index          :1
-----
----- CERTIFICATE REVOCATION LIST (CRL) -----
Issuer:CN = Code Sign Server Certificate Manager, OU = Cisco HFR mc , O = Cisco,
    L = San Jose, ST = CA, C = US, EA =<16> iosmx-css-cert@cisco.com
Including updates of:
                        Sep 09, 2002 03:50:41 GMT
Revoked certificates include:
    Serial #:61:2C:5C:83:00:00:00:00:44, revoked on Nov 03, 2002 00:59:02 GMT
    Serial #:21:2C:48:83:00:00:00:00:59, revoked on Nov 06, 2002 19:32:51 GMT
-----

```

This table describes the significant fields shown in the display.

Table 17: show sam crl detail Field Descriptions

Field	Descriptions
CRL Index	Index number for the entry, in the range from 1 to 65000. The index is kept in the certificate revocation list table.
Issuer	CA that issued this CRL.
Including updates of	Versions of CRLs from this CA that are included in the CRL table.

show sam crl

Field	Descriptions
Revoked certificates include	List of certificates that have been revoked, including the certificate serial number and the date and time the certificate was revoked.

show sam log

To display the contents of the Software Authentication Manager (SAM) log file, use the **show sam log** command in EXEC mode.

show sam log [*lines-number*]

Syntax Description

<i>lines-number</i>	(Optional) Number of lines of the SAM log file to display, in the range from 0 to 200, where 0 displays all lines in the log file and 200 displays the most recent 200 lines (or as many lines as there are in the log file if there are fewer than 200 lines).
---------------------	---

Command Default

The **show sam log** command without a *lines-number* argument displays all the lines in the log file.

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The SAM log file records changes to the SAM tables, including any expired or revoked certificates, table digest mismatches, and SAM server restarts.

Task ID

Task ID	Operations
crypto	read

Examples

The following sample output is from the **show sam log** command:

```
RP/0/0/CPU0:router# show sam log

06/16/02 12:03:44 UTC Added certificate in table root/1 CN = Certificate Manage, 0x01
06/16/02 12:03:45 UTC SAM server restarted through router reboot
06/16/02 12:03:47 UTC Added CRL in table CN = Certificate Manage, updated at Nov 10, 2001
04:11:42 GMT
06/16/02 12:03:48 UTC Added certificate in table mem:/1 CN = Certificate Manage, 0x1e
06/16/02 12:16:16 UTC SAM server restarted through router reboot
06/16/02 12:25:02 UTC SAM server restarted through router reboot
```

show sam log

```
06/16/02 12:25:04 UTC Added certificate in table mem:/1 CN = Certificate Manage, 0x1e
06/16/02 12:39:30 UTC SAM server restarted through router reboot
06/16/02 12:39:30 UTC SAM server restarted through router reboot
06/16/02 12:40:57 UTC Added certificate in table mem/1 CN = Certificate Manage, 0x1e
```

33 entries shown

Each line of output shows a particular logged event such as a table change, expired or revoked certificates, table digest mismatches, or SAM server restarts.

show sam package

To display information about the certificate used to authenticate the software for a particular package installed on the networking device, use the **show sam package** command in EXEC mode.

show sam package *package-name*

Syntax Description

<i>package-name</i>	Location of the software package, including the memory device (disk0: , disk1: , mem: , and so on) and the file system path to the file. Use the show install all command to display the Install Manager package name and location information.
---------------------	--

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show install all** command to display the installed location and name of the software package—for example, `mem:ena-base-0.0.0` or `disk1:crypto-exp-lib-0.4.0`—and then use the **show sam package** command to display information about the certificate used to authenticate that installed package. The **show sam package** command displays the same information as the **show sam certificate** command for the **detail** keyword.

Task ID

Task ID	Operations

```

This table describes the significant fields shown in the display.

Table 18: show sam package Field Descriptions

Field	Description
Certificate Location	Location of the certificate; one of the following: root , mem , disk0 , or disk1 .
Certificate Index	Index number that the Software Authentication Manager (SAM) automatically assigns to the certificate.
Certificate Flag	One of the following: TRUSTED, VALIDATED, EXPIRED, or REVOKED.

Field	Description
Serial Number	Unique serial number of the certificate, assigned by its issuer.
Subject Name	Name of the entity for which the certificate is issued.
Issued By	Name of the entity that issued the certificate.
Version	X.509 version of the certificate. The version can be 1 (X.509v1), 2 (X.509v2), or 3 (X.509v3).
Issuing Algorithm	Hash and public key algorithm that the issuer uses to sign the certificate.
Public Key	Subject public key for the certificate.
Certificate signature	Encrypted hash value (or signature) of the certificate. The hash value of the certificate is encrypted using the private key of the issuer.

Related Commands

Command	Description
show install	Displays the installed location and name of the software package. You can use the all keyword to display the active packages from all locations. For more information, see <i>Cisco IOS XR System Management Command Reference for the Cisco XR 12000 Series Router</i> .
show sam certificate, on page 252	Displays records in the SAM certificate table.

show sam sysinfo

To display current configuration settings for the Software Authentication Manager (SAM), use the **show sam sysinfo** command in EXEC mode.

show sam sysinfo

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show sam sysinfo** command to determine the configuration settings of the SAM.

The display shows the status of the SAM, current prompt interval setting, and current prompt default response.

Task ID	Task ID	Operations
	crypto	read

Examples The following sample output is from the **show sam sysinfo** command:

```
RP/0/RP0/CPU0:router# show sam sysinfo

Software Authentication Manager System Information
=====
Status                : running
Prompt Interval       : 10 sec
Prompt Default Response : NO
This table describes the significant fields shown in the display.
```

Table 19: show sam sysinfo Field Descriptions

Field	Description
Status	<p>One of the following: running or not running.</p> <p>If the SAM is not running, the System Manager should detect that state and attempt to restart the SAM. If problems prevent the System Manager from restarting the SAM after a predefined number of repeated attempts, the SAM will not be restarted. In such a case, you should contact Cisco Technical Assistance Center (TAC) personnel.</p>
Prompt Interval	<p>Current setting for the prompt interval. The interval can be set in the range from 0 to 300 seconds. The value shown in the sample output (10 seconds) is the default.</p>
Prompt Default Response	<p>Current setting that specifies the action taken by the SAM if the prompt interval expires before the user responds to the prompt. If the user does not respond to the prompt, the SAM waits for the specified interval to expire and then takes the action specified in the sam prompt-interval command (either proceed keyword or terminate keyword).</p> <p>Entering the sam promptinterval command with the proceed keyword causes the show sam sysinfo command to display “Yes,” meaning that the default action taken by the SAM is to wait for the prompt interval to expire and then respond as if it had received a “yes” from the user.</p> <p>Entering the sam promptinterval command with the terminate keyword causes the show sam sysinfo command to display “No,” meaning that the default action taken by the SAM is to wait for the prompt interval to expire and then respond as if it had received a “no” from the user.</p>

Related Commands

Command	Description
sam prompt-interval , on page 248	Sets the interval that the SAM waits after prompting the user for input when it detects an abnormal condition and determines how the SAM responds when it does not receive user input within the specified interval.

`show sam sysinfo`

Secure Shell Commands

This module describes the Cisco IOS XR software commands used to configure Secure Shell (SSH).

For detailed information about SSH concepts, configuration tasks, and examples, see the *Implementing Secure Shell on the Cisco IOS XR Software module* in the *Cisco IOS XR System Security Configuration Guide for the Cisco XR 12000 Series Router*.

clear ssh

To terminate an incoming or outgoing Secure Shell (SSH) connection, use the **clear ssh** command in EXEC mode.

clear ssh *{session-id| outgoing session-id}*

Syntax Description

<i>session-id</i>	Session ID number of an incoming connection as displayed in the show ssh command output. Range is from 0 to 1024.
outgoing <i>session-id</i>	Specifies the session ID number of an outgoing connection as displayed in the show ssh command output. Range is from 1 to 10.

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **clear ssh** command to disconnect incoming or outgoing SSH connections. Incoming connections are managed by the SSH server running on the local networking device. Outgoing connections are initiated from the local networking device.

To display the session ID for a connection, use the **show ssh** command.

Task ID

Task ID	Operations
crypto	execute

Examples

In the following example, the **show ssh** command is used to display all incoming and outgoing connections to the router. The **clear ssh** command is then used to terminate the incoming session with the ID number 0.

```
RP/0/0/CPU0:router# show ssh
```

```
SSH version: Cisco-2.0
session      pty  location  state      userid      host        ver
-----
Incoming sessions
0            vty0  0/33/1  SESSION_OPEN  cisco  172.19.72.182  v2
1            vty1  0/33/1  SESSION_OPEN  cisco  172.18.0.5     v2
2            vty2  0/33/1  SESSION_OPEN  cisco  172.20.10.3    v1
3            vty3  0/33/1  SESSION_OPEN  cisco  3333::50       v2

Outgoing sessions
1            0/33/1  SESSION_OPEN  cisco  172.19.72.182  v2
2            0/33/1  SESSION_OPEN  cisco  3333::50       v2

RP/0/0/CPU0:router# clear ssh 0
```

Related Commands

Command	Description
show ssh , on page 277	Displays the incoming and outgoing connections to the router.

sftp

To start the secure FTP (SFTP) client, use the **sftp** command in EXEC mode.

sftp [*username @ host : remote-filename* **e**] *source-filename dest-filename* [**source-interface** *type interface-path-id*] [**vrf** *vrf-name*]

Syntax Description

<i>username</i>	(Optional) Name of the user performing the file transfer. The at symbol (@) following the username is required.
<i>hostname:remote-filename</i>	(Optional) Name of the Secure Shell File Transfer Protocol (SFTP) server. The colon (:) following the hostname is required.
<i>source-filename</i>	SFTP source, including the path.
<i>dest-filename</i>	SFTP destination, including the path.
source-interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command in EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
vrf <i>vrf-name</i>	Specifies the name of the VRF associated with the source interface.

Command Default

If no *username* argument is provided, the login name on the router is used. If no *hostname* argument is provided, the file is considered local.

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.8.0	The srcfile keyword was removed and was replaced by an argument for this same purpose. Support was added for the vrf and the source-interface keywords.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

SFTP provides for the secure (and authenticated) copying of files between a router and a remote host. Like the **copy** command, the **sftp** command can be invoked only in EXEC mode.

If a username is not provided, the login name on the router is used as the default. If a host name is not provided, the file is considered local.

If the source interface is specified in the **sftp** command, the **sftp** interface takes precedence over the interface specified in the **ssh client source-interface** command.

When the file destination is a local path, all of the source files should be on remote hosts, and vice versa.

When multiple source files exist, the destination should be a preexisting directory. Otherwise, the destination can be either a directory name or destination filename. The file source cannot be a directory name.

If you download files from different remote hosts, that is, the source points to different remote hosts, the SFTP client spawns SSH instances for each host, which may result in multiple prompts for user authentication.

Task ID

Task ID	Operations
crypto	execute
basic-services	execute

Examples

In the following example, user *abc* is downloading the file *ssh.diff* from the SFTP server *ena-view1* to *disk0*:

```
RP/0/0/CPU0:router# sftp abc@ena-view1:ssh.diff disk0
```

In the following example, user *abc* is uploading multiple files from *disk 0:/sam_** to */users/abc/* on a remote SFTP server called *ena-view1*:

```
RP/0/0/CPU0:router# sftp disk0:/sam_* abc@ena-view1:/users/abc/
```

In the following example, user *admin* is downloading the file *run* from *disk0a:* to *disk0:/v6copy* on a local SFTP server using an IPv6 address:

```
RP/0/0/CPU0:router#sftp admin@[2:2:2::2]:disk0a:/run disk0:/V6copy
Connecting to 2:2:2::2...
Password:
```

```
disk0a:/run
  Transferred 308413 Bytes
  308413 bytes copied in 0 sec (338172)bytes/sec
```

```
RP/0/0/CPU0:router#dir disk0:/V6copy
```

```
Directory of disk0:
```

```
70144      -rwx  308413      Sun Oct 16 23:06:52 2011  V6copy
```

```
2102657024 bytes total (1537638400 bytes free)
```

In the following example, user *admin* is uploading the file *v6copy* from *disk0:* to *disk0a:/v6back* on a local SFTP server using an IPv6 address:

```
RP/0/0/CPU0:router#sftp disk0:/V6copy admin@[2:2:2::2]:disk0a:/v6back
Connecting to 2:2:2::2...
Password:

/disk0:/V6copy
  Transferred 308413 Bytes
  308413 bytes copied in 0 sec (421329)bytes/sec
```

```
RP/0/0/CPU0:router#dir disk0a:/v6back
```

```
Directory of disk0a:
```

```
66016      -rwx  308413      Sun Oct 16 23:07:28 2011  v6back
```

```
2102788096 bytes total (2098987008 bytes free)
```

In the following example, user *admin* is downloading the file *sampfile* from *disk0:* to *disk0a:/sampfile_v4* on a local SFTP server using an IPv4 address:

```
RP/0/0/CPU0:router#sftp admin@2.2.2.2:disk0:/sampfile disk0a:/sampfile_v4
Connecting to 2.2.2.2...
Password:
```

```
disk0:/sampfile
  Transferred 986 Bytes
  986 bytes copied in 0 sec (493000)bytes/sec
```

```
RP/0/0/CPU0:router#dir disk0a:/sampfile_v4
```

```
Directory of disk0a:
```

```
131520      -rwx   986      Tue Oct 18 05:37:00 2011  sampfile_v4
```

```
502710272 bytes total (502001664 bytes free)
```

In the following example, user *admin* is uploading the file *sampfile_v4* from *disk0a:* to *disk0:/sampfile_back* on a local SFTP server using an IPv4 address:

```
RP/0/0/CPU0:router#sftp disk0a:/sampfile_v4 admin@2.2.2.2:disk0:/sampfile_back
Connecting to 2.2.2.2...
Password:
```

```
disk0a:/sampfile_v4
  Transferred 986 Bytes
  986 bytes copied in 0 sec (564000)bytes/sec
```

```
RP/0/0/CPU0:router#dir disk0:/sampfile_back
```

```
Directory of disk0:
```

```
121765      -rwx   986      Tue Oct 18 05:39:00 2011  sampfile_back
```

```
524501272 bytes total (512507614 bytes free)
```

Related Commands

Command	Description
ssh client source-interface , on page 286	Specifies the source IP address of a selected interface for all outgoing SSH connections.
ssh client vrf , on page 288	Configures a new VRF for use by the SSH client.

sftp (Interactive Mode)

To enable users to start the secure FTP (SFTP) client, use the **sftp** command in EXEC mode.

sftp [*username @ host : remote-filename* **e**] [**source-interface** *type interface-path-id*] [**vrf** *vrf-name*]

Syntax Description

<i>username</i>	(Optional) Name of the user performing the file transfer. The at symbol (@) following the username is required.
<i>hostname:remote-filename</i>	(Optional) Name of the Secure Shell File Transfer Protocol (SFTP) server. The colon (:) following the hostname is required.
source-interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command in EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.
vrf <i>vrf-name</i>	Specifies the name of the VRF associated with the source interface.

Command Default

If no *username* argument is provided, the login name on the router is used. If no *hostname* argument is provided, the file is considered local.

Command Modes

EXEC

Command History

Release	Modification
Release 3.9.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The SFTP client, in the interactive mode, creates a secure SSH channel where the user can enter any supported command. When a user starts the SFTP client in an interactive mode, the SFTP client process creates a secure SSH channel and opens an editor where user can enter any supported command.

More than one request can be sent to the SFTP server to execute the commands. While there is no limit on the number of 'non-acknowledged' or outstanding requests to the server, the server might buffer or queue these requests for convenience. Therefore, there might be a logical sequence to the order of requests.

The following unix based commands are supported in the interactive mode:

- **bye**
- **cd** *<path>*
- **chmod** *<mode>* *<path>*
- **exit**
- **get** *<remote-path>* [*local-path*]
- **help**
- **ls** [*-alt*] [*path*]
- **mkdir** *<path>*
- **put** *<local-path>* [*remote-path*]
- **pwd**
- **quit**
- **rename** *<old-path>* *<new-path>*
- **rmdir** *<path>*
- **rm** *<path>*

The following commands are not supported:

- **lcd**, **lls**, **lpwd**, **lumask**, **lmkdir**
- **ln**, **symlink**
- **chgrp**, **chown**
- **!**, **!command**
- **?**
- **mget**, **mput**

Command	Description
show sessions	Displays information about open Telnet or rlogin connections. For more information, see the <i>Cisco IOS XR System Management Command Reference for the Cisco XR 12000 Series Router</i>
show ssh session details, on page 279	Displays the details for all the incoming and outgoing SSHv2 connections, to the router.

show ssh session details

To display the details for all incoming and outgoing Secure Shell Version 2 (SSHv2) connections, use the **show ssh session details** command in EXEC mode.

show ssh session details

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes EXEC

Command History	Release	Modification
	Release 3.2	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **show ssh session details** command to display a detailed report of the SSHv2 connections to or from the router, including the cipher chosen for the specific session.

Task ID	Task ID	Operations
	crypto	read

Examples The following is sample output from the **show ssh session details** command to display the details for all the incoming and outgoing SSHv2 connections:

```
RP/0/0/CPU0:router# show ssh session details

SSH version: Cisco-2.0
session      key-exchange  pubkey  incipher  outcipher  inmac    outmac
-----
Incoming Session
0            diffie-hellman ssh-dss  3des-cbc  3des-cbc  hmac-md5  hmac-md5

Outgoing connection
1            diffie-hellman ssh-dss  3des-cbc  3des-cbc  hmac-md5  hmac-md5
```

This table describes the significant fields shown in the display.

Table 21: show ssh session details Field Descriptions

Field	Description
session	Session identifier for the incoming and outgoing SSH connections.
key-exchange	Key exchange algorithm chosen by both peers to authenticate each other.
pubkey	Public key algorithm chosen for key exchange.
incipher	Encryption cipher chosen for the Rx traffic.
outcipher	Encryption cipher chosen for the Tx traffic.
inmac	Authentication (message digest) algorithm chosen for the Rx traffic.
outmac	Authentication (message digest) algorithm chosen for the Tx traffic.

Command	Description
show sessions	Displays information about open Telnet or rlogin connections.
show ssh, on page 277	Displays all the incoming and outgoing connections to the router.

ssh

To start the Secure Shell (SSH) client connection and enable an outbound connection to an SSH server, use the **ssh** command in EXEC mode.

ssh [**vrf** *vrf-name*] {**ipv4-address**| **ipv6-address**| **hostname**} [**username** *user-id*] [**cipher** **aes** {**128-cbc**| **192-cbc**| **256-cbc**}][**source-interface** *type interface-path-id*][**command***command-name*]

Syntax Description

vrf <i>vrf-name</i>	Specifies the name of the VRF associated with this connection.
<i>ipv4-address</i>	IPv4 address in A:B:C:D format.
<i>ipv6-address</i>	IPv6 address in X:X::X format.
<i>hostname</i>	Hostname of the remote node. If the hostname has both IPv4 and IPv6 addresses, the IPv6 address is used.
username <i>user-id</i>	(Optional) Specifies the username to use when logging in on the remote networking device running the SSH server. If no user ID is specified, the default is the current user ID.
cipher aes	(Optional) Specifies Advanced Encryption Standard (AES) as the cipher for the SSH client connection. Note If there is no specification of a particular cipher by the administrator, the client proposes 3DES as the default to ensure compatibility.
128-CBC	128-bit keys in CBC mode.
192-CBC	192-bit keys in CBC mode.
256-CBC	256-bit keys in CBC mode.
source interface	(Optional) Specifies the source IP address of a selected interface for all outgoing SSH connections.
<i>type</i>	Interface type. For more information, use the question mark (?)online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command in EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark(?)online help function.
command	(Optional) Specifies a remote command. Adding this keyword prompts the SSHv2 server to parse and execute the ssh command in non-interactive mode instead of initiating the interactive session.

Command Default

3DES cipher
None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.8.0	Support was added for the following: <ul style="list-style-type: none"> • Association of a specific VRF for the client connection was added. • Advanced Encryption Standard (AES) cipher with three bit lengths.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ssh** command to make an outbound client connection. The SSH client tries to make an SSHv2 connection to the remote peer. If the remote peer supports only the SSHv1 server, it internally spawns an SSHv1 connection to the remote server. The process of the remote peer version detection and spawning the appropriate client connection is transparent to the user.

If a VRF is specified in the **ssh** command, the **ssh** interface takes precedence over the interface specified in the **ssh client source-interface** [ssh client source-interface](#), [on page 286](#) command.

When you configure the **cipher aes** keyword, an SSH client makes a proposal, including one or more of the key sizes you specified, as part of its request to the SSH server. The SSH server chooses the best possible cipher, based both on which ciphers that server supports and on the client proposal.

**Note**

AES encryption algorithm is not supported on the SSHv1 server and client. Any requests for an AES cipher sent by an SSHv2 client to an SSHv1 server are ignored, with the server using 3DES instead.

A VRF is required to run SSH, although this may be either the default VRF or a VRF specified by the user. If no VRF is specified while configuring the [ssh client source-interface](#), [on page 286](#) or [ssh client knownhost](#), [on page 284](#) commands, the default VRF is assumed.

Use the **command** keyword to enable the SSHv2 server to parse and execute the **ssh** command in non-interactive mode instead of initiating an interactive session.

Task ID

Task ID	Operations
crypto	execute
basic-services	execute

Examples

The following sample output is from the **ssh** command to enable an outbound SSH client connection:

```
RP/0/0/CPU0:router# sshvrf green username userabc
```

```
Password:
```

```
Remote-host>
```

Related Commands

Command	Description
show ssh, on page 277	Displays all the incoming and outgoing connections to the router.

ssh client knownhost

To authenticate a server public key (pubkey), use the **ssh client knownhost** command in global configuration mode. To disable authentication of a server pubkey, use the **no** form of this command.

ssh client knownhost device:/filename

no ssh client knownhost device:/filename

Syntax Description

device:/filename

Complete path of the filename (for example, slot0:/server_pubkey). The colon (:) and slash (/) are required.

Command Default

None

Command Modes

Global configuration

Command History

Release

Modification

Release 3.2

This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

The *server pubkey* is a cryptographic system that uses two keys at the client end—a public key known to everyone and a private, or secret, key known only to the owner of the keys. In the absence of certificates, the server pubkey is transported to the client through an out-of-band secure channel. The client stores this pubkey in its local database and compares this key against the key supplied by the server during the early stage of key negotiation for a session-building handshake. If the key is not matched or no key is found in the local database of the client, users are prompted to either accept or reject the session.

The operative assumption is that the first time the server pubkey is retrieved through an out-of-band secure channel, it is stored in the local database. This process is identical to the current model adapted by Secure Shell (SSH) implementations in the UNIX environment.

Task ID

Task ID

Operations

crypto

read, write

Examples

The following sample output is from the **ssh client knownhost** command:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh client knownhost disk0:/ssh.knownhost
RP/0/0/CPU0:router(config)# commit
RP/0/0/CPU0:router# ssh host1 username user1234
Host key not found from the list of known hosts.
Are you sure you want to continue connecting (yes/no)? yes
Password:
RP/0/0/CPU0:host1# exit
RP/0/0/CPU0:router# ssh host1 username user1234
```

ssh client source-interface

To specify the source IP address of a selected interface for all outgoing Secure Shell (SSH) connections, use the **ssh client source-interface** command in global configuration mode. To disable use of the specified interface IP address, use the **no** form of this command.

ssh client source-interface *type interface-path-id*

no ssh client source-interface *type interface-path-id*

Syntax Description

<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-path-id</i>	Physical interface or virtual interface. Note Use the show interfaces command in EXEC mode to see a list of all interfaces currently configured on the router. For more information about the syntax for the router, use the question mark (?) online help function.

Command Default

No source interface is used.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ssh client source-interface** command to set the IP address of the specified interface for all outgoing SSH connections. If this command is not configured, TCP chooses the source IP address when the socket is connected, based on the outgoing interface used—which in turn is based on the route required to reach the server. This command applies to outbound shell over SSH as well as Secure Shell File Transfer Protocol (SFTP) sessions, which use the ssh client as a transport.

The source-interface configuration affects connections only to the remote host in the same address family. The system database (Sysdb) verifies that the interface specified in the command has a corresponding IP address (in the same family) configured.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to set the IP address of the Management Ethernet interface for all outgoing SSH connections:

```
RP/0/0/CPU0:router# configure  
RP/0/0/CPU0:router(config)# ssh client source-interface MgmtEth 0/0/CPU0/0
```

ssh client vrf

To configure a new VRF for use by the SSH client, use the **ssh client vrf** command in global configuration mode. To remove the specified VRF, use the **no** form of this command.

ssh client vrf *vrf-name*

no ssh client vrf *vrf-name*

Syntax Description

<i>vrf-name</i>	Specifies the name of the VRF to be used by the SSH client.
-----------------	---

Command Default

None

Command Modes

Global configuration

Command History

Release	Modification
Release 3.8.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

An SSH client can have only one VRF.

If a specific VRF is not configured for the SSH client, the default VRF is assumed when applying other SSH client-related commands, such as [ssh client knownhost](#), on page 284 or [ssh client source-interface](#), on page 286.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows the SSH client being configured to start with the specified VRF:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh client vrf green
```

Related Commands

Command	Description
ssh client dscp <value from 0 - 63>	SSH Client supports setting DSCP value in the outgoing packets. If not configured, the default DSCP value set in packets is 16 (for both client and server).

ssh server

To bring up the Secure Shell (SSH) server and to configure one or more VRFs for its use, use the **ssh server** command in global configuration mode. To stop the SSH server from receiving any further connections for the specified VRF, use the **no** form of this command.

ssh server [**vrf** *vrf-name*] **v2**

no ssh server [**vrf** *vrf-name*] **v2**

Syntax Description

vrf <i>vrf-name</i>	Specifies the name of the VRF to be used by the SSH server. The maximum VRF length is 32 characters.
Note	If no VRF is specified, the default VRF is assumed.
v2	Forces the SSH server version to be only 2.

Command Default

The default SSH server version is 2 (SSHv2), which falls back to 1 (SSHv1) if the incoming SSH client connection is set to SSHv1.

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.
Release 3.8.0	The vrf keyword was supported.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

An SSH server must be configured at minimum for one VRF. If you delete all configured VRFs, including the default, the SSH server process stops. If you do not configure a specific VRF for the SSH client when applying other commands, such as **ssh client knownhost** or **ssh client source-interface**, the default VRF is assumed.

The SSH server listens for an incoming client connection on port 22. This server handles both Secure Shell Version 1 (SSHv1) and SSHv2 incoming client connections for both IPv4 and IPv6 address families. To accept only Secure Shell Version 2 connections, use the [ssh server v2, on page 298](#) command.

To verify that the SSH server is up and running, use the **show process sshd** command.

Task ID

Task ID	Operations
crypto	read, write

Examples

In the following example, the SSH server is brought up to receive connections for VRF “green”:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh server vrf green
```

Related Commands

Command	Description
show processes	Displays information about the SSH server. For more information, see the <i>Cisco IOS XR System Management Command Reference for the Cisco XR 12000 Series Router</i> .
ssh server v2, on page 298	Forces the SSH server version to be only 2 (SSHv2).
ssh server dscp <value from 0 - 63>	SSH server supports setting DSCP value in the outgoing packets. If not configured, the default DSCP value set in packets is 16 (for both client and server).

ssh server logging

To enable SSH server logging, use the **ssh server logging** command in global configuration mode. To discontinue SSH server logging, use the **no** form of this command.

ssh server logging

no ssh server logging

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Global configuration

Command History	Release	Modification
	Release 3.8.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Once you configure the logging, the following messages are displayed:

- Warning: The requested term-type is not supported
- SSH v2 connection from %s succeeded (*user:%s, cipher:%s, mac:%s, pty:%s*)

The warning message appears if you try to connect using an unsupported terminal type. Routers running the Cisco IOS XR software support only the vt100 terminal type.

The second message confirms a successful login.

Task ID	Task ID	Operations
	crypto	read, write

Examples The following example shows the initiation of an SSH server logging:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh server logging
```

Related Commands

Command	Description
ssh server , on page 290	Initiates the SSH server.

ssh server rate-limit

To limit the number of incoming Secure Shell (SSH) connection requests allowed per minute, use the **ssh server rate-limit** command in global configuration mode. To return to the default value, use the **no** form of this command.

ssh server rate-limit *rate-limit*

no ssh server rate-limit

Syntax Description

<i>rate-limit</i>	Number of incoming SSH connection requests allowed per minute. Range is from 1 to 120.
-------------------	--

Command Default

rate-limit: 60 connection requests per minute

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Command History

Release	Modification
Release 2.0	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ssh server rate-limit** command to limit the incoming SSH connection requests to the configured rate. Any connection request beyond the rate limit is rejected by the SSH server. Changing the rate limit does not affect established SSH sessions.

If, for example, the *rate-limit* argument is set to 30, then 30 requests are allowed per minute, or more precisely, a two-second interval between connections is enforced.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to set the limit of incoming SSH connection requests to 20 per minute:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh server rate-limit 20
```

ssh server session-limit

To configure the number of allowable concurrent incoming Secure Shell (SSH) sessions, use the **ssh server session-limit** command in global configuration mode. To return to the default value, use the **no** form of this command.

ssh server session-limit *sessions*

no ssh server session-limit

Syntax Description

<i>sessions</i>	Number of incoming SSH sessions allowed across the router. The range is from 1 to 1024.
-----------------	---

Command Default

sessions: 64 per router

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ssh server session-limit** command to configure the limit of allowable concurrent incoming SSH connections. Outgoing connections are not part of the limit.

Task ID

Task ID	Operations
crypto	read, write

Examples

The following example shows how to set the limit of incoming SSH connections to 50:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh server session-limit 50
```

Related Commands

Command	Description
show processes	Displays information about the SSH server. For more information, see <i>Cisco IOS XR System Management Command Reference for the Cisco XR 12000 Series Router</i> .

ssh server v2

To force the SSH server version to be only 2 (SSHv2), use the **ssh server v2** command in global configuration mode. To bring down an SSH server for SSHv2, use the **no** form of this command.

ssh server v2

no ssh server v2

Syntax Description This command has no keywords or arguments.

Command Default None

Command Modes Global configuration

Release	Modification
Release 3.3.0	This command was introduced.

Usage Guidelines To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Only SSHv2 client connections are allowed.

Task ID	Operations
crypto	read, write

Examples The following example shows how to initiate the SSH server version to be only SSHv2:

```
RP/0/0/CPU0:router#configure
RP/0/0/CPU0:router(config)# ssh server v2
```

Command	Description
ssh server , on page 290	Initiates the SSH server.

ssh timeout

To configure the timeout value for authentication, authorization, and accounting (AAA) user authentication, use the **ssh timeout** command in global configuration mode. To set the timeout value to the default time, use the **no** form of this command.

ssh timeout *seconds*

no ssh timeout *seconds*

Syntax Description

<i>seconds</i>	Time period (in seconds) for user authentication. The range is from 5 to 120.
----------------	---

Command Default

seconds: 30

Command Modes

Global configuration

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **ssh timeout** command to configure the timeout value for user authentication to AAA. If the user fails to authenticate itself within the configured time to AAA, the connection is aborted. If no value is configured, the default value of 30 seconds is used.

Task ID

Task ID	Operations
crypto	read, write

Examples

In the following example, the timeout value for AAA user authentication is set to 60 seconds:

```
RP/0/0/CPU0:router# configure
RP/0/0/CPU0:router(config)# ssh timeout 60
```

Secure Socket Layer Protocol Commands

This module describes the commands used to configure the Secure Socket Layer (SSL) protocol.

For detailed information about SSL concepts, configuration tasks, and examples, see the *Implementing Secure Socket Layer on the Cisco IOS XR Software* module in the *Cisco IOS XR System Security Configuration Guide for the Cisco XR 12000 Series Router*.

- [show ssl](#), page 302

show ssl

To display active Secure Socket Layer (SSL) sessions, use the **show ssl** command in EXEC mode.

show ssl [*process-id*]

Syntax Description

<i>process-id</i>	(Optional) Process ID (PID) of the SSL application. The range is from 1 to 1000000000.
-------------------	--

Command Default

None

Command Modes

EXEC

Command History

Release	Modification
Release 3.2	This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

To display a specific process, enter the process ID number. To get a specific process ID number, enter **run pidin** from the command line or from a shell.

The absence of any argument produces a display that shows all processes that are running SSL.

Task ID

Task ID	Operations
crypto	read

Examples

The following sample output is from the **show ssl** command:

```
RP/0/0/CPU0:router# show ssl
```

PID	Method	Type	Peer	Port	Cipher-Suite
1261711	sslsv3	Server	172.16.0.5	1296	DES-CBC3-SHA

This table describes the fields shown in the display.

Table 22: show ssl Field Descriptions

Field	Description
PID	Process ID of the SSL application.
Method	Protocol version (sslv2, sslv3, sslv23, or tlsv1).
Type	SSL client or server.
Peer	IP address of the SSL peer.
Port	Port number on which the SSL traffic is sent.
Cipher-Suite	Exact cipher suite chosen for the SSL traffic. The first portion indicates the encryption, the second portion the hash or integrity method. In the sample display, the encryption is Triple DES and the Integrity (message digest algorithm) is SHA.

Related Commands

Command	Description
run pidin	Displays the process ID for all processes that are running.
