

## **same-security-traffic through show asdm sessions Commands**

---

# same-security-traffic

To permit communication between interfaces with equal security levels, use the **same-security-traffic** command in global configuration mode. To disable the same-security interfaces, use the **no** forms of this command.

**same-security-traffic permit {inter-interface | intra-interface}**

**no same-security-traffic permit {inter-interface | intra-interface}**

## Syntax Description

<b>inter-interface</b>	Permits communication between different interfaces that have the same security level.
<b>intra-interface</b>	Permits communication in and out of the same interface when traffic is IPSec protected.

## Defaults

This command has no default settings.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global configuration	•	•	•	•	—

## Command History

Release	Modification
7.0(1)(1)	This command was introduced.

## Usage Guidelines

Allowing communication between same security interfaces provides the following benefits:

- You can configure more than 101 communicating interfaces. If you use different levels for each interface, you can configure only one interface per level (0 to 100).
- You can allow traffic to flow freely between all same security interfaces without access lists.

You can also redirect incoming client VPN traffic back out through the same interface unencrypted as well as encrypted. If you send VPN traffic back out through the same interface unencrypted, you must enable NAT for the interface so that publicly routable addresses replace your private ip addresses (unless you already use public ip addresses in your local ip address pool). The following example commands apply an interface PAT rule to traffic sourced from the client ip pool:

```
hostname(config)# ip local pool clientpool 192.168.0.10-192.168.0.100
hostname(config)# global (outside) 1 interface
hostname(config)# nat (outside) 1 192.168.0.0 255.255.255.0
```

When the security appliance sends encrypted VPN traffic back out this same interface, however, NAT is optional. To apply NAT to all outgoing traffic, implement only the commands above. To exempt the VPN-to-VPN traffic from NAT, add commands (to the example above) that implement NAT exemption for VPN-to-VPN traffic, such as:

```
hostname(config)# access-list nonat permit ip 192.168.0.0 255.255.255.0 192.168.0.0
255.255.255.0
hostname(config)# nat (outside) 0 access-list nonat
```

See the **nat** command for more information.

### Examples

The following example shows how to enable the same-security interface communication:

```
hostname(config)# same-security-traffic permit inter-interface
```

### Related Commands

Command	Description
<b>show running-config same-security-traffic</b>	Displays the <b>same-security-traffic</b> configuration.

# sasl-mechanism

To specify a SASL (Simple Authentication and Security Layer) mechanism for authenticating an LDAP client to an LDAP server, use the **sasl-mechanism** command in aaa-server host configuration mode. The SASL authentication mechanism options are **digest-md5** and **kerberos**.

To disable an authentication mechanism, use the **no** form of this command.

**sasl-mechanism** { **digest-md5** | **kerberos** *server-group-name* }

**no sasl-mechanism** { **digest-md5** | **kerberos** *server-group-name* }

## Note

Because the security appliance serves as a client proxy to the LDAP server for VPN users, the LDAP client referred to here is the security appliance.

## Syntax Description

<b>digest-md5</b>	The security appliance responds with an MD5 value computed from the username and password.
<b>kerberos</b>	The security appliance responds by sending the username and realm using the GSSAPI (Generic Security Services Application Programming Interface) Kerberos mechanism.
<i>server-group-name</i>	Specifies the Kerberos aaa-server group, up to 64 characters.

## Defaults

No default behavior or values. The security appliance passes the authentication parameters to the LDAP server in plain text.

## Note

We recommend that you secure LDAP communications with SSL using the **ldap-over-ssl** command if you have not configured SASL.

## Command Modes

The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
aaa-server host configuration	•	•	•	•	—

## Command History

Release	Modification
7.1(1)	This command was introduced.

## Usage Guidelines

Use this command to specify security appliance authentication to an LDAP server using SASL mechanisms.

Both the security appliance and the LDAP server can support multiple SASL authentication mechanisms. When negotiating SASL authentication, the security appliance retrieves the list of SASL mechanisms configured on the server and sets the authentication mechanism to the strongest mechanism configured on both the security appliance and the server. The Kerberos mechanism is stronger than the Digest-MD5 mechanism. To illustrate, if both the LDAP server and the security appliance support both mechanisms, the security appliance selects Kerberos, the stronger of the mechanisms.

When disabling the SASL mechanisms, you must enter a separate **no** command for each mechanism you want to disable because they are configured independently. Mechanisms that you do not specifically disable remain in effect. For example, you must enter both of the following commands to disable both SASL mechanisms:

```
no sasl-mechanism digest-md5
```

```
no sasl-mechanism kerberos <server-group-name>
```

### Examples

The following examples, entered in aaa-server host configuration mode, enable the SASL mechanisms for authentication to an LDAP server named `ldapsvr1` with an IP address of `10.10.0.1`. This example enables the SASL digest-md5 authentication mechanism:

```
hostname(config)# aaa-server ldapsvr1 protocol ldap
hostname(config-aaa-server-group)# aaa-server ldapsvr1 host 10.10.0.1
hostname(config-aaa-server-host)# sasl-mechanism digest-md5
hostname(config-aaa-server-host)#
```

The following example enables the SASL Kerberos authentication mechanism and specifies `kerb-svr1` as the Kerberos AAA server:

```
hostname(config)# aaa-server ldapsvr1 protocol ldap
hostname(config-aaa-server-group)# aaa-server ldapsvr1 host 10.10.0.1
hostname(config-aaa-server-host)# sasl-mechanism kerberos kerbsvr1
hostname(config-aaa-server-host)#
```

### Related Commands

Command	Description
<b>ldap-over-ssl</b>	Specifies that SSL secures the LDAP client-server connection.
<b>server-type</b>	Specifies the LDAP server vendor as either Microsoft or Sun.
<b>ldap attribute-map (global configuration mode)</b>	Creates and names an LDAP attribute map for mapping user-defined attribute names to Cisco LDAP attribute names.

# secondary

To give the secondary unit higher priority in a failover group, use the **secondary** command in failover group configuration mode. To restore the default, use the **no** form of this command.

**secondary**

**no secondary**

## Syntax Description

This command has no arguments or keywords.

## Defaults

If **primary** or **secondary** is not specified for a failover group, the failover group defaults to **primary**.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Failover group configuration	•	•	—	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

Assigning a primary or secondary priority to a failover group specifies which unit the failover group becomes active on when both units boot simultaneously (within a unit polltime). If one unit boots before the other, then both failover groups become active on that unit. When the other unit comes online, any failover groups that have the second unit as a priority do not become active on the second unit unless the failover group is configured with the **preempt** command or is manually forced to the other unit with the **no failover active** command.

## Examples

The following example configures failover group 1 with the primary unit as the higher priority and failover group 2 with the secondary unit as the higher priority. Both failover groups are configured with the **preempt** command, so the groups will automatically become active on their preferred unit as the units become available.

```
hostname(config)# failover group 1
hostname(config-fover-group)# primary
hostname(config-fover-group)# preempt 100
hostname(config-fover-group)# exit
hostname(config)# failover group 2
hostname(config-fover-group)# secondary
hostname(config-fover-group)# preempt 100
hostname(config-fover-group)# mac-address e1 0000.a000.a011 0000.a000.a012
hostname(config-fover-group)# exit
```

```
hostname(config)#
```

**Related Commands**

Command	Description
<b>failover group</b>	Defines a failover group for Active/Active failover.
<b>preempt</b>	Forces the failover group to become active on its preferred unit when the unit becomes available.
<b>primary</b>	Gives the primary unit a higher priority than the secondary unit.

# secondary-color

To set a secondary color for the WebVPN login, home page, and file access page, use the **secondary-color** command in webvpn mode. To remove a color from the configuration and reset the default, use the **no** form of this command.

**secondary-color** *[color]*

**no secondary-color**

## Syntax Description

color	(Optional) Specifies the color. You can use a comma separated RGB value, an HTML color value, or the name of the color if recognized in HTML. <ul style="list-style-type: none"> <li>RGB format is 0,0,0, a range of decimal numbers from 0 to 255 for each color (red, green, blue); the comma separated entry indicates the level of intensity of each color to combine with the others.</li> <li>HTML format is #000000, six digits in hexadecimal format; the first and second represent red, the third and fourth green, and the fifth and sixth represent blue.</li> <li>Name length maximum is 32 characters</li> </ul>
-------	--

## Defaults

The default secondary color is HTML #CCCCFF, a lavender shade.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Webvpn	•	•	—	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

The number of RGB values recommended for use is 216, many fewer than the mathematical possibilities. Many displays can handle only 256 colors, and 40 of those look differently on MACs and PCs. For best results, check published RGB tables. To find RGB tables online, enter RGB in a search engine.

## Examples

The following example shows how to set an HTML color value of #5F9EAO, which is a teal shade:

```
hostname(config)# webvpn
hostname(config-webvpn)# secondary-color #5F9EAO
```

**Related Commands**

Command	Description
<b>title-color</b>	Sets a color for the WebVPN title bar on the login, home page, and file access page

## secondary-text-color

To set the secondary text color for the WebVPN login, home page and file access page, use the **secondary-text-color** command in webvpn mode. To remove the color from the configuration and reset the default, use the **no** form of this command.

**secondary-text-color** [*black* | *white*]

**no secondary-text-color**

### Syntax Description

auto	Chooses black or white based on the settings for the text-color command. That is, if the primary color is black, this value is white.
black	The default secondary text color is black.
white	You can change the text color to white.

### Defaults

The default secondary text color is black.

### Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Webvpn	•	—	•	—	—

### Command History

Release	Modification
7.0(1)	This command was introduced.

### Examples

The following example shows how to set the secondary text color to white:

```
hostname(config)# webvpn
hostname(config-webvpn)# secondary-text-color white
```

### Related Commands

Command	Description
<b>text-color</b>	Sets a color for text in the WebVPN title bar on the login, home page and file access page

# secure-unit-authentication

To enable secure unit authentication, use the **secure-unit-authentication enable** command in group-policy configuration mode. To disable secure unit authentication, use the **secure-unit-authentication disable** command. To remove the secure unit authentication attribute from the running configuration, use the **no** form of this command. This option allows inheritance of a value for secure unit authentication from another group policy.

Secure unit authentication provides additional security by requiring VPN hardware clients to authenticate with a username and password each time the client initiates a tunnel. With this feature enabled, the hardware client does not have a saved username and password.

## Note

With this feature enabled, to bring up a VPN tunnel, a user must be present to enter the username and password.

**secure-unit-authentication {enable | disable}**

**no secure-unit-authentication**

## Syntax Description

<b>disable</b>	Disables secure unit authentication.
<b>enable</b>	Enables secure unit authentication.

## Defaults

Secure unit authentication is disabled.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Group policy	•	—	•	—	—

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

Secure unit authentication requires that you have an authentication server group configured for the tunnel group the hardware client(s) use.

If you require secure unit authentication on the primary security appliance, be sure to configure it on any backup servers as well.

---

**Examples**

The following example shows how to enable secure unit authentication for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# secure-unit-authentication enable
```

---

**Related Commands**

Command	Description
<b>ip-phone-bypass</b>	Lets IP phones connect without undergoing user authentication. Secure unit authentication remains in effect.
<b>leap-bypass</b>	Lets LEAP packets from wireless devices behind a VPN hardware client travel across a VPN tunnel prior to user authentication, when enabled. This lets workstations using Cisco wireless access point devices establish LEAP authentication. Then they authenticate again per user authentication.
<b>user-authentication</b>	Requires users behind a hardware client to identify themselves to the security appliance before connecting.

# security-level

To set the security level of an interface, use the **security-level** command in interface configuration mode. To set the security level to the default, use the **no** form of this command. The security level protects higher security networks from lower security networks by imposing additional protection between the two.

**security-level** *number*

**no security-level**

## Syntax Description

*number* An integer between 0 (lowest) and 100 (highest).

## Defaults

By default, the security level is 0.

If you name an interface “inside” and you do not set the security level explicitly, then the security appliance sets the security level to 100 (see the **nameif** command). You can change this level if desired.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface configuration	•	•	•	•	—

## Command History

Release	Modification
7.0(1)	This command was moved from a keyword of the <b>nameif</b> command to an interface configuration mode command.

## Usage Guidelines

The level controls the following behavior:

- Network access—By default, there is an implicit permit from a higher security interface to a lower security interface (outbound). Hosts on the higher security interface can access any host on a lower security interface. You can limit access by applying an access list to the interface.

For same security interfaces, there is an implicit permit for interfaces to access other interfaces on the same security level or lower.

- Inspection engines—Some inspection engines are dependent on the security level. For same security interfaces, inspection engines apply to traffic in either direction.
  - NetBIOS inspection engine—Applied only for outbound connections.
  - OraServ inspection engine—If a control connection for the OraServ port exists between a pair of hosts, then only an inbound data connection is permitted through the security appliance.

- Filtering—HTTP(S) and FTP filtering applies only for outbound connections (from a higher level to a lower level).

For same security interfaces, you can filter traffic in either direction.

- NAT control—When you enable NAT control, you must configure NAT for hosts on a higher security interface (inside) when they access hosts on a lower security interface (outside).

Without NAT control, or for same security interfaces, you can choose to use NAT between any interface, or you can choose not to use NAT. Keep in mind that configuring NAT for an outside interface might require a special keyword.

- **established** command—This command allows return connections from a lower security host to a higher security host if there is already an established connection from the higher level host to the lower level host.

For same security interfaces, you can configure **established** commands for both directions.

Normally, interfaces on the same security level cannot communicate. If you want interfaces on the same security level to communicate, see the **same-security-traffic** command. You might want to assign two interfaces to the same level and allow them to communicate if you want to create more than 101 communicating interfaces, or you want protection features to be applied equally for traffic between two interfaces; for example, you have two departments that are equally secure.

If you change the security level of an interface, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

## Examples

The following example configures the security levels for two interfaces to be 100 and 0:

```
hostname(config)# interface gigabitethernet0/0
hostname(config-if)# nameif inside
hostname(config-if)# security-level 100
hostname(config-if)# ip address 10.1.1.1 255.255.255.0
hostname(config-if)# no shutdown
hostname(config-if)# interface gigabitethernet0/1
hostname(config-if)# nameif outside
hostname(config-if)# security-level 0
hostname(config-if)# ip address 10.1.2.1 255.255.255.0
hostname(config-if)# no shutdown
```

## Related Commands

Command	Description
<b>clear local-host</b>	Resets all connections.
<b>interface</b>	Configures an interface and enters interface configuration mode.
<b>nameif</b>	Sets the interface name.
<b>vlan</b>	Assigns a VLAN ID to a subinterface.

# serial-number

To include the security appliance serial number in the certificate during enrollment, use the **serial-number** command in crypto ca trustpoint configuration mode. To restore the default setting, use the **no** form of the command.

**serial-number**

**no serial-number**

## Syntax Description

This command has no arguments or keywords.

## Defaults

The default setting is to not include the serial number.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Crypto ca trustpoint configuration	•	•	•	•	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Examples

The following example enters crypto ca trustpoint configuration mode for trustpoint central, and includes the security appliance serial number in the enrollment request for trustpoint central:

```
hostname(config)# crypto ca trustpoint central
hostname(ca-trustpoint)# serial-number
hostname(ca-trustpoint)#
```

## Related Commands

Command	Description
<a href="#">crypto ca trustpoint</a>	Enters trustpoint configuration mode.

# server

To specify a default e-mail proxy server, use the **server** command in the applicable e-mail proxy mode. To remove the attribute from the configuration, use the **no** version of this command. The security appliance sends requests to the default e-mail server when the user connects to the e-mail proxy without specifying a server. If you do not configure a default server, and a user does not specify a server, the security appliance returns an error.

**server** {*ipaddr or hostname*}

**no server**

## Syntax Description

hostname	The DNS name of the default e-mail proxy server.
ipaddr	The IP address of the default e-mail proxy server.

## Defaults

There is no default e-mail proxy server by default.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Pop3s	•	•	—	—	•
Imap4s	•	•	—	—	•
Smtps	•	•	—	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Examples

The following example shows how to set a default POP3S e-mail server with an IP address. of 10.1.1.7:

```
hostname(config)# pop3s
hostname(config-pop3s)# server 10.1.1.7
```

# server-port

To configure a AAA server port for a host, use the **server-port** command in AAA-server host mode. To remove the designated server port, use the **no** form of this command:

**server-port** *port-number*

**no server-port**

## Syntax Description

*port-number* A port number in the range 0 through 65535.

## Defaults

The default server ports are as follows:

- SDI—5500
- LDAP—389
- Kerberos—88
- NT—139
- TACACS+—49

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
AAA-server group	•	•	•	•	—

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Examples

The following example configures an SDI AAA server named “srvgrp1” to use server port number 8888:

```
hostname(config)# aaa-server srvgrp1 protocol sdi
hostname(config-aaa-server-group)# aaa-server srvgrp1 host 192.168.10.10
hostname(config-aaa-server-host)# server-port 8888
hostname(config-aaa-server-host)#
```

## Related Commands

Command	Description
<b>aaa-server host</b>	Configures host-specific AAA server parameters.

<b>clear configure aaa-server</b>	Removes all AAA-server configuration.
<b>show running-config aaa-server</b>	Displays AAA server statistics for all AAA servers, for a particular server group, for a particular server within a particular group, or for a particular protocol

# server-separator

To specify a character as a delimiter between the e-mail and VPN server names, use **server-separator** command in the applicable e-mail proxy mode. To revert to the default, “:”, use the no form of this command.

**server-separator** {*symbol*}

**no server-separator**

## Syntax Description

symbol	The character that separates the e-mail and VPN server names. Choices are “@,” (at) “ ” (pipe), “:” (colon), “#” (hash), “,” (comma), and “;” (semi-colon).
--------	---

## Defaults

The default is “@” (at).

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Pop3s	•	—	•	—	—
Imap4s	•	—	•	—	—
Smtps	•	—	•	—	—

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

The server separator must be different from the name separator.

## Examples

The following example shows how to set a pipe (|) as the server separator for IMAP4S:

```
hostname(config)# imap4s
hostname(config-imap4s)# server-separator |
```

## Related Commands

Command	Description
<b>name-separator</b>	Separates the e-mail and VPN usernames and passwords.

# server-type

To manually configure the LDAP server model, use the **server-type** command in aaa-server host configuration mode. The security appliance supports the following server models:

- Microsoft Active Directory
- Sun Microsystems JAVA System Directory Server, formerly named the Sun ONE Directory Server.

To disable this command, use the **no** form of this command.

**server-type** { **auto-detect** | **microsoft** | **sun** }

**no server-type** { **auto-detect** | **microsoft** | **sun** }

## Syntax Description

<b>auto-detect</b>	Specifies that the security appliance determines the LDAP server type through auto-detection.
<b>microsoft</b>	Specifies that the LDAP server is a Microsoft Active Directory.
<b>sun</b>	Specifies that the LDAP server is a Sun Microsystems JAVA System Directory Server.

## Defaults

By default, auto-detection attempts to determine the server type.

## Command Modes

The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
aaa-server host configuration	•	•	•	•	—

## Command History

Release	Modification
7.1(1)	This command was introduced.

## Usage Guidelines

The security appliance supports LDAP version 3 and is compatible with any LDAP v3 or v2 directory server. However, it supports *password management* features only on the Sun Microsystems JAVA System Directory Server and the Microsoft Active Directory. For example, the security appliance supports automated reset of an expired password without manual intervention by a system administrator with either a Sun or Microsoft LDAP server. With any other type of LDAP server, such as a Novell or OpenLDAP server, it supports all LDAP functions except for password management. Thus, if someone tries to log in to a security appliance using one of these other servers for authentication and their password has expired, the security appliance drops the connection and a manual password reset is required.

**Note**

- Sun—The DN configured on the security appliance to access a Sun directory server must be able to access the default password policy on that server. We recommend using the directory administrator, or a user with directory administrator privileges, as the DN. Alternatively, you can place an ACI on the default password policy.
- Microsoft—You must configure LDAP over SSL to enable password management with Microsoft Active Directory. For more information, see the **ldap-over-ssl** command.

By default, the security appliance auto-detects whether it is connected to a Microsoft or a Sun LDAP directory server. However, if auto-detection fails to determine the LDAP server type and if you know the server is either a Microsoft or Sun server, you can use the **server-type** command to manually configure the server as either a Microsoft or a Sun Microsystems LDAP server.

**Examples**

The following example, entered in aaa-server host configuration mode, configures the server type for the LDAP server ldapsvr1 at IP address 10.10.0.1. The first example configures a Sun Microsystems LDAP server.

```
hostname(config)# aaa-server ldapsvr1 protocol ldap
hostname(config-aaa-server-group)# aaa-server ldapsvr1 host 10.10.0.1
hostname(config-aaa-server-host)# server-type sun
hostname(config-aaa-server-host)#
```

The following example specifies that the security appliance use auto-detection to determine the server type:

```
hostname(config)# aaa-server ldapsvr1 protocol LDAP
hostname(config-aaa-server-group)# aaa-server ldapsvr1 host 10.10.0.1
hostname(config-aaa-server-host)# server-type auto-detect
hostname(config-aaa-server-host)#
```

**Related Commands**

Command	Description
<b>ldap-over-ssl</b>	Specifies that SSL secures the LDAP client-server connection.
<b>sasl-mechanism</b>	Configures SASL authentication between the LDAP client and server.
<b>ldap attribute-map (global configuration mode)</b>	Creates and names an LDAP attribute map for mapping user-defined attribute names to Cisco LDAP attribute names.

# service

To enable resets for denied TCP connections, use the **service** command in global configuration mode. To disable resets, use the **no** form of this command.

```
service { resetinbound [interface interface_name] | resetoutbound [interface interface_name] | resetoutside }
```

```
no service { resetinbound [interface interface_name] | resetoutbound [interface interface_name] | resetoutside }
```

## Syntax Description

<b>interface</b> <i>interface_name</i>	Enables or disables resets for the specified interface.
<b>resetinbound</b>	Sends TCP resets for all inbound TCP sessions that attempt to transit the security appliance and are denied by the security appliance based on access lists or AAA settings. Traffic between same security level interfaces is also affected. When this option is not enabled, the security appliance silently discards denied packets. If you do not specify an interface, then this setting applies to all interfaces.
<b>resetoutbound</b>	Sends TCP resets for all outbound TCP sessions that attempt to transit the security appliance and are denied by the security appliance based on access lists or AAA settings. Traffic between same security level interfaces is also affected. When this option is not enabled, the security appliance silently discards denied packets. This option is enabled by default. You might want to disable outbound resets to reduce the CPU load during traffic storms, for example.
<b>resetoutside</b>	Enables resets for TCP packets that terminate at the least secure interface and are denied by the security appliance based on access lists or AAA settings. When this option is not enabled, the security appliance silently discards the packets of denied packets. We recommend that you use the <b>resetoutside</b> keyword with interface PAT. This keyword allows the security appliance to terminate the IDENT from an external SMTP or FTP server. Actively resetting these connections avoids the 30-second timeout delay.

## Defaults

By default, **service resetoutbound** is enabled for all interfaces.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global configuration	•	•	•	•	—

## Command History

Release	Modification
7.1(1)	The <b>interface</b> keyword and the <b>resetoutbound</b> command were added.

### Usage Guidelines

You might want to explicitly send resets for inbound traffic if you need to reset identity request (IDENT) connections. When you send a TCP RST (reset flag in the TCP header) to the denied host, the RST stops the incoming IDENT process so that you do not have to wait for IDENT to time out. Waiting for IDENT to time out can cause traffic to slow because outside hosts keep retransmitting the SYN until the IDENT times out, so the **service resetinbound** command might improve performance.

### Examples

The following example disables outbound resets for all interfaces except for the inside interface:

```
hostname(config)# no service resetoutbound
hostname(config)# service resetoutbound interface inside
```

The following example enables inbound resets for all interfaces except for the DMZ interface:

```
hostname(config)# service resetinbound
hostname(config)# no service resetinbound interface dmz
```

The following example enables resets for connections that terminate on the outside interface:

```
hostname(config)# service resetoutside
```

### Related Commands

Command	Description
<b>show running-config</b> <b>service</b>	Displays the service configuration.

# service password-recovery

To enable password recovery, use the **service password-recovery** command in global configuration mode. To disable password recovery, use the **no** form of this command. Password recovery is enabled by default, but you might want to disable it to ensure that unauthorized users cannot use the password recovery mechanism to compromise the security appliance.

**service password-recovery**

**no service password-recovery**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Password recovery is enabled by default.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global configuration	•	•	•	—	•

Release	Modification
7.0(1)	This command was introduced.

**Usage Guidelines** On the ASA 5500 series adaptive security appliance, if you forget the passwords, you can boot the security appliance into ROMMON by pressing the **Escape** key on the terminal keyboard when prompted during startup. Then set the security appliance to ignore the startup configuration by changing the configuration register (see the **config-register** command). For example if your configuration register is the default 0x1, then change the value to 0x41 by entering the **confreg 0x41** command. After reloading the security appliance, it loads a default configuration, and you can enter privileged EXEC mode using the default passwords. Then load the startup configuration by copying it to the running configuration and reset the passwords. Finally, set the security appliance to boot as before by setting the configuration register to the original setting. For example, enter the **config-register 0x1** command in global configuration mode.

On the PIX 500 series security appliance, boot the security appliance into monitor mode by pressing the **Escape** key on the terminal keyboard when prompted during startup. Then download the PIX password tool to the security appliance, which erases all passwords and **aaa authentication** commands.

On the ASA 5500 series adaptive security appliance, the **no service password-recovery** command prevents a user from entering ROMMON with the configuration intact. When a user enters ROMMON, the security appliance prompts the user to erase all Flash file systems. The user cannot enter ROMMON without first performing this erasure. If a user chooses not to erase the Flash file system, the security appliance reloads. Because password recovery depends on using ROMMON and maintaining the

existing configuration, this erasure prevents you from recovering a password. However, disabling password recovery prevents unauthorized users from viewing the configuration or inserting different passwords. In this case, to recover the system to an operating state, load a new image and a backup configuration file, if available. The **service password-recovery** command appears in the configuration file for informational purposes only; when you enter the command at the CLI prompt, the setting is saved in NVRAM. The only way to change the setting is to enter the command at the CLI prompt. Loading a new configuration with a different version of the command does not change the setting. If you disable password recovery when the security appliance is configured to ignore the startup configuration at startup (in preparation for password recovery), then the security appliance changes the setting to boot the startup configuration as usual. If you use failover, and the standby unit is configured to ignore the startup configuration, then the same change is made to the configuration register when the **no service password recovery** command replicates to the standby unit.

On the PIX 500 series security appliance, the **no service password-recovery** command forces the PIX password tool to prompt the user to erase all Flash file systems. The user cannot use the PIX password tool without first performing this erasure. If a user chooses not to erase the Flash file system, the security appliance reloads. Because password recovery depends on maintaining the existing configuration, this erasure prevents you from recovering a password. However, disabling password recovery prevents unauthorized users from viewing the configuration or inserting different passwords. In this case, to recover the system to an operating state, load a new image and a backup configuration file, if available.

## Examples

The following example disables password recovery for the ASA 5500 series adaptive security appliance:

```
hostname(config)# no service password-recovery
WARNING: Executing "no service password-recovery" has disabled the password recovery
mechanism and disabled access to ROMMON. The only means of recovering from lost or
forgotten passwords will be for ROMMON to erase all file systems including configuration
files and images. You should make a backup of your configuration and have a mechanism to
restore images from the ROMMON command line.
```

The following example disables password recovery for the PIX 500 series security appliance:

```
hostname(config)# no service password-recovery
WARNING: Saving "no service password-recovery" in the startup-config will disable password
recovery via the npdisk application. The only means of recovering from lost or forgotten
passwords will be for npdisk to erase all file systems including configuration files and
images. You should make a backup of your configuration and have a mechanism to restore
images from the Monitor Mode command line.
```

The following example for the ASA 5500 series adaptive security appliance shows when to enter ROMMON at startup and how to complete a password recovery operation.

```
Use BREAK or ESC to interrupt boot.
Use SPACE to begin boot immediately.
Boot interrupted.
```

```
Use ? for help.
rommon #0> confreg
```

```
Current Configuration Register: 0x00000001
Configuration Summary:
  boot default image from Flash
```

```
Do you wish to change this configuration? y/n [n]: n
```

```
rommon #1> confreg 0x41
```

```
Update Config Register (0x41) in NVRAM...
```

```

rommon #2> boot
Launching BootLoader...
Boot configuration file contains 1 entry.

Loading disk0:/ASA_7.0.bin... Booting...

## Related Commands

Command	Description
<b>config-register</b>	Sets the security appliance to ignore the startup configuration when it reloads.
<b>enable password</b>	Sets the enable password.
<b>password</b>	Sets the login password.

# service-policy

To activate a policy map globally on all interfaces or on a targeted interface, use the **service-policy** command in privileged EXEC mode. To disable, use the **no** form of this command. Use the **service-policy** command to enable a set of policies on an interface. In general, a **service-policy** command can be applied to any interface that can be defined by the **nameif** command.

**service-policy** *policymap\_name* [ **global** | **interface** *intf* ]

**no service-policy** *policymap\_name* [ **global** | **interface** *intf* ]

## Syntax Description

<i>policymap_name</i>	A unique alphanumeric policy map identifier.
<b>global</b>	Applies the policy map to all interfaces.
<b>interface</b>	Applies the policy map to a specific interface
<i>intf</i>	The interface name defined in the <b>nameif</b> command.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	—

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

If an interface name is specified, the policy-map only applies to the interface. The interface name is defined in the **nameif** command, and an interface policy-map overrides a global policy-map. Only one policy-map is allowed per interface.

Only one global policy is allowed.

## Examples

The following example shows the syntax of the **service-policy** command:

```
hostname(config)# service-policy outside_security_map outside
hostname(config)#
```

## Related Commands

Command	Description
<b>show service-policy</b>	Displays the service policy.
<b>show running-config service-policy</b>	Displays the service policies configured in the running configuration.
<b>clear service-policy</b>	Clears service policy statistics.
<b>clear configure service-policy</b>	Clears service policy configurations.

# session

To establish a Telnet session to an intelligent SSM, such as an AIP SSM or a CSC SSM, use the **session** command in privileged EXEC mode.

**session** *slot* [**do** | **ip**]

## Syntax Description

<b>do</b>	Executes a command on the SSM specified by the <i>slot</i> argument. Do not use the <b>do</b> keyword unless you are advised to do so by Cisco TAC.
<b>ip</b>	Configures logging IP addresses for the SSM specified by the <i>slot</i> argument. Do not use the <b>ip</b> keyword unless you are advised to do so by Cisco TAC.
<i>slot</i>	Specifies the SSM slot number, which is always 1.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Privileged EXEC	•	•	•	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.
7.1(1)	The <b>do</b> and <b>ip</b> keywords were added. These keywords are for use only when advised to do so by Cisco TAC.

## Usage Guidelines

This command is only available when the SSM is in the Up state. See the **show module** command for state information.

To end a session, enter **exit** or **Ctrl-Shift-6** then the **X** key.

## Examples

The following example sessions to an SSM in slot 1:

```
hostname# session 1
Opening command session with slot 1.
Connected to slot 1. Escape character sequence is 'CTRL-^X'.
```

## Related Commands

Command	Description
<b>debug session-command</b>	Shows debug messages for sessions.

## set connection

To specify connection values within a policy-map for a traffic class, use the **set connection** command in class mode. Use this command to specify the maximum number of simultaneous connections and to specify whether TCP sequence number randomization is enabled. To remove these specifications, thereby allowing unlimited connections, use the **no** form of this command.

```
set connection {conn-max n | embryonic-conn-max n | per-client-embryonic-max n |  
per-client-max n | random-sequence-number {enable | disable}} . . .
```

```
no set connection {conn-max n | embryonic-conn-max n | per-client-embryonic-max n |  
per-client-max n | random-sequence-number {enable | disable}} . . .
```

Syntax Description	
<b>conn-max</b> <i>n</i>	(Optional) The maximum number of simultaneous TCP and/or UDP connections that are allowed.
<b>disable</b>	Turns off TCP sequence number randomization.
<b>enable</b>	Turns on TCP sequence number randomization.
<b>embryonic-conn-max</b> <i>n</i>	(Optional) The maximum number of simultaneous embryonic connections allowed.
<b>per-client-embryonic-max</b> <i>n</i>	(Optional) The maximum number of simultaneous embryonic connections allowed.
<b>per-client-max</b> <i>n</i>	(Optional) The maximum number of simultaneous connections allowed per client.
<b>random-sequence-number</b>	<p>(Optional) Enable or disable TCP sequence number randomization. Each TCP connection has two ISNs: one generated by the client and one generated by the server. The security appliance randomizes the ISN of the TCP SYN passing in both the inbound and outbound directions.</p> <p>Randomizing the ISN of the protected host prevents an attacker from predefining the next ISN for a new connection and potentially hijacking the new session.</p> <p>TCP initial sequence number randomization can be disabled if required. For example:</p> <ul style="list-style-type: none"> <li>• If another in-line firewall is also randomizing the initial sequence numbers, there is no need for both firewalls to be performing this action, even though this action does not affect the traffic.</li> <li>• If you use eBGP multi-hop through the security appliance, and the eBGP peers are using MD5. Randomization breaks the MD5 checksum.</li> <li>• You use a WAAS device that requires the security appliance not to randomize the sequence numbers of connections.</li> </ul>

### Defaults

For the **conn-max**, **embryonic-conn-max**, **per-client-embryonic-max**, and **per-client-max** parameters, the default value of *n* is 0, which allows unlimited connections.

Sequence number randomization is enabled by default.

**Command Modes**

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Class	•	•	—	—	•

**Command History**

Release	Modification
7.0(1)	This command was introduced.
7.1(1)	The <b>per-client-embryonic-max</b> and <b>per-client-max</b> keywords were added.

**Usage Guidelines**

While the **conn-max**, **embryonic-conn-max**, **per-client-embryonic-max**, **per-client-max**, **random-sequence-number** keywords are all optional, you must specify at least one of them.

You can enter this command with multiple parameters or you can enter each parameter as a separate command. The security appliance combines the commands into one line in the running configuration. For example, if you entered the following two commands in Class configuration mode:

```
hostname(config-pmap-c)# set connection conn-max 600
hostname(config-pmap-c)# set connection embryonic-conn-max 50
```

the output of the **show running-config policy-map** command would display the result of the two commands in a single, combined command:

```
set connection conn-max 600 embryonic-conn-max 50
```

The **set connection** command parameters (**conn-max**, **embryonic-conn-max**, **per-client-embryonic-max**, **per-client-max**, **random-sequence-number**) can co-exist with any **nat** or **static** command; that is, you can configure connection parameters either through the **nat/static** commands using **max-conn**, **emb\_limit**, or **norandomseq** parameters, or through the MPC **set connection** command using **conn-max**, **embryonic-conn-max**, **per-client-embryonic-max**, **per-client-max** or **random-sequence-number** parameters. A mixed configuration is not recommended, but if one exists, it behaves in the following ways:

- When a traffic class is subject to a connection limit or embryonic connection limit from both the MPC **set connection** command and the **nat/static** command, then whichever limit is reached, that limit is applied.
- When a TCP traffic class is configured to have sequence number randomization disabled by either the MPC **set connection** command or the **nat/static** command, then sequence number randomization is disabled.

The **per-client-embryonic-max** and **per-client-max** parameters limit the maximum number of connections that a client can open. If particular clients use more network resources simultaneously than is desired, you can use these parameters to limit the number of connections that the security appliance will allow specific clients. DoS attacks seek to disrupt networks by overwhelming the capacity of key hosts with connections or requests for connections. You can use the **per-client-embryonic-max** and **per-client-max** parameters to thwart DoS attacks. After you configure a per-client maximum that can be supported by hosts likely to be attacked, malicious clients will be unable to overwhelm hosts on protected networks.

**Examples**

The following is an example of the use of the **set connection** command configure the maximum number of simultaneous connections as 256 and to disable TCP sequence number randomization:

```
hostname(config)# policy-map localpolicy1
hostname(config-pmap)# class local_server
hostname(config-pmap-c)# set connection conn-max 256 random-sequence-number disable
hostname(config-pmap-c)#
```

The following is an example of the use of the **set connection** command in a service policy that diverts traffic to a Cisco Content Security and Control (CSC) SSM. The **set connection** command restricts each client whose traffic the CSC SSM scans to a maximum of five connections.

```
hostname(config)# policy-map csc_policy
hostname(config-pmap)# class local_server
hostname(config-pmap-c)# set connection per-client-max 5
hostname(config-pmap-c)# csc fail-close
hostname(config-pmap-c)#
```

**Related Commands**

Command	Description
<b>class</b>	Specifies a class-map to use for traffic classification.
<b>clear configure policy-map</b>	Removes all policy-map configuration, except that if a policy-map is in use in a service-policy command, that policy-map is not removed.
<b>policy-map</b>	Configures a policy; that is, an association of a traffic class and one or more actions.
<b>show running-config policy-map</b>	Displays all current policy-map configurations.
<b>show service-policy</b>	Displays service policy configuration. Use the <b>set connection</b> keyword to view policies that include the <b>set connection</b> command.

# set connection advanced-options

To specify advanced TCP connection options within a policy-map for a traffic class, use the **set connection advanced-options** command in class mode. To remove advanced TCP connection options for a traffic class within a policy map, use the **no** form of this command.

**set connection advanced-options** *tcp-mapname*

**no set connection advanced-options** *tcp-mapname*

## Syntax Description

<i>tcp-mapname</i>	Name of a TCP map in which advanced TCP connection options are configured.
--------------------	--

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Class	•	•	—	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

You must have configured the **policy-map** command and the **class** command, as well as the TCP map name, before issuing this command. See the description of the **tcp-map** command for detailed information.

## Examples

The following example shows the use of the **set connection advanced-options** command to specify the use of a TCP map named localmap:

```
hostname(config)# access-list http-server permit tcp any host 10.1.1.1
hostname(config)# class-map http-server
hostname(config-cmap)# match access-list http-server
hostname(config-cmap)# exit
hostname(config)# tcp-map localmap
hostname(config)# policy-map global_policy global
hostname(config-pmap)# description This policy map defines a policy concerning connection
to http server.
hostname(config-pmap)# class http-server
hostname(config-pmap-c)# set connection advanced-options localmap
hostname(config-pmap-c)#
```

**Related Commands**

Command	Description
<b>class</b>	Specifies a class-map to use for traffic classification.
<b>class-map</b>	Configures a traffic class by issuing at most one (with the exception of tunnel-group and default-inspection-traffic) match command, specifying match criteria, in the class-map mode.
<b>clear configure policy-map</b>	Remove all policy-map configuration, except that if a policy-map is in use in a service-policy command, that policy-map is not removed.
<b>policy-map</b>	Configures a policy; that is, an association of a traffic class and one or more actions.
<b>show running-config policy-map</b>	Display all current policy-map configurations.

# set connection timeout

To configure the timeout period, after which an idle TCP connection is disconnected, use the **set connection timeout** command in class mode. To remove the timeout, use the **no** form of this command.

**set connection timeout tcp** *hh[:mm[:ss]]* [**reset**]

**no set connection timeout tcp**

**set connection timeout embryonic** *hh[:mm[:ss]]*

**no set connection timeout embryonic**

**set connection timeout half-closed** *hh[:mm[:ss]]*

**no set connection timeout half-closed**

## Syntax Description

<b>embryonic</b> <i>hh[:mm[:ss]]</i>	Timeout period after which a TCP embryonic (half-opened) connection is closed.
<b>half-closed</b> <i>hh[:mm[:ss]]</i>	The timeout period until a TCP half-closed connection is freed.
<b>reset</b>	Sends a TCP RST packet to both end systems after TCP idle connections are removed.
<b>tcp</b> <i>hh[:mm[:ss]]</i>	The idle time after which an established connection closes.

## Defaults

The default **embryonic** connection timeout value is 30 seconds.

The default **half-closed** connection timeout value is 10 minutes.

The default **tcp** connection timeout value is 1 hour.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Class	•	•	—	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

**Usage Guidelines**

You must have configured the **policy-map** command and the **class** command before issuing this command.

A TCP connection for which a three-way handshake is not complete is an *embryonic* connection. For the **embryonic** connection timeout value, use **0:0:0** to specify that the connection never times out. Otherwise, the timeout duration must be at least 5 seconds.

When the TCP connection is in the closing state, use the half-closed parameter to configure the length of time until the connection is freed. Use **0:0:0** to specify that the connection never times out. The minimum timeout duration is 5 minutes.

The **tcp** inactive connection timeout configures the period after which an idle TCP connection in the established state is disconnected. Use **0:0:0** to specify that the connection never times out. The minimum timeout duration is 5 minutes.

The **reset** keyword is used to send a TCP RST packet to both end systems once an idle TCP connection has timed out. Some applications require a TCP RST after a timeout to perform properly.

**Examples**

The following is an example of a **set connection timeout** command that specifies an embryonic connection **timeout** of two minutes:

```
hostname(config)# access-list http-server permit tcp any host 10.1.1.1
hostname(config)# class-map http-server
hostname(config-cmap)# match access-list http-server
hostname(config-cmap)# exit
hostname(config)# policy-map global_policy global
hostname(config-pmap)# description This policy map defines a policy concerning connection
to http server.
hostname(config-pmap)# class http-server
hostname(config-pmap-c)# set connection timeout embryonic 00:2:00
hostname(config-pmap-c)#
```

**Related Commands**

Command	Description
<b>class</b>	Specifies a class-map to use for traffic classification.
<b>clear configure policy-map</b>	Remove all policy-map configuration, except that if a policy-map is in use in a service-policy command, that policy-map is not removed.
<b>policy-map</b>	Configures a policy; that is, an association of a traffic class and one or more actions.
<b>set connection</b>	Configure connection values.
<b>show running-config policy-map</b>	Display all current policy-map configurations.

# set metric

To set the metric value for a routing protocol, use the **set metric** command in route-map configuration mode. To return to the default metric value, use the **no** form of this command.

**set metric** *value*

**no set metric** *value*

## Syntax Description

*value* Metric value.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Route-map configuration	•	—	•	—	—

## Command History

Release	Modification
Preexisting	This command was preexisting.

## Usage Guidelines

The **no set metric value** command allows you to return to the default metric value. In this context, the *value* is an integer from 0 to 4294967295.

## Examples

The following example shows how to configure a route map for OSPF routing:

```
hostname(config)# route-map maptag1 permit 8
hostname(config-route-map)# set metric 5
hostname(config-route-map)# match metric 5
hostname(config-route-map)# show route-map
route-map maptag1 permit 8
set metric 5
match metric 5
hostname(config-route-map)# exit
hostname(config)#
```

## Related Commands

Command	Description
<b>match interface</b>	Distributes any routes that have their next hop out one of the interfaces specified,
<b>match ip next-hop</b>	Distributes any routes that have a next-hop router address that is passed by one of the access lists specified.
<b>route-map</b>	Defines the conditions for redistributing routes from one routing protocol into another.

# set metric-type

To specify the type of OSPF metric routes, use the **set metric-type** command in route-map configuration mode. To return to the default setting, use the **no** form of this command.

**set metric-type {type-1 | type-2}**

**no set metric-type**

## Syntax Description

<b>type-1</b>	Specifies the type of OSPF metric routes that are external to a specified autonomous system.
<b>type-2</b>	Specifies the type of OSPF metric routes that are external to a specified autonomous system.

## Defaults

The default is **type-2**.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Route-map configuration	•	—	•	—	—

## Command History

Release	Modification
Preexisting	This command was preexisting.

## Examples

The following example shows how to configure a route map for OSPF routing:

```
hostname(config)# route-map maptag1 permit 8
hostname(config-route-map)# set metric 5
hostname(config-route-map)# match metric 5
hostname(config-route-map)# set metric-type type-2
hostname(config-route-map)# show route-map
route-map maptag1 permit 8
  set metric 5
  set metric-type type-2
  match metric 5
hostname(config-route-map)# exit
hostname(config)#
```

## Related Commands

Command	Description
<b>match interface</b>	Distributes any routes that have their next hop out one of the interfaces specified,
<b>route-map</b>	Defines the conditions for redistributing routes from one routing protocol into another.
<b>set metric</b>	Specifies the metric value in the destination routing protocol for a route map.

# setup

To configure a minimal configuration for the security appliance using interactive prompts, enter the **setup** command in global configuration mode. This configuration provides connectivity to use ASDM. See also the **configure factory-default** command to restore the default configuration.

## setup

### Syntax Description

This command has no arguments or keywords.

### Defaults

No default behavior or values.

### Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Global configuration	•	•	•	•	•

### Command History

Release	Modification
Preexisting	This command was preexisting.

### Usage Guidelines

The setup dialog automatically appears at boot time if there is no startup configuration in Flash memory.

Before you can use the **setup** command, you must have an inside interface already configured. The PIX 500 series default configuration includes an inside interface (Ethernet 1), but the ASA 550 series default configuration does not. Before using the **setup** command, enter the **interface** command for the interface you want to make inside, and then the **nameif inside** command.

In multiple context mode, you can use the **setup** command in the system execution space and for each context.

When you enter the **setup** command, you are asked for the information in [Table 24-1](#). The system **setup** command includes a subset of these prompts. If there is already a configuration for the prompted parameter, it appears in brackets so you can either accept it as the default or override it by entering something new.

**Table 24-1 Setup Prompts**

Prompt	Description
Pre-configure Firewall now through interactive prompts [yes]?	Enter <b>yes</b> or <b>no</b> . If you enter <b>yes</b> , the setup dialog continues. If <b>no</b> , the setup dialog stops and the global configuration prompt (hostname(config)#) appears.

**Table 24-1 Setup Prompts (continued)**

Firewall Mode [Routed]:	Enter <b>routed</b> or <b>transparent</b> .
Enable password:	Enter an enable password. (The password must have at least three characters.)
Allow password recovery [yes]?	Enter <b>yes</b> or <b>no</b> .
Clock (UTC):	You cannot enter anything in this field. UTC time is used by default.
Year:	Enter the year using four digits, for example, 2005. The year range is 1993 to 2035.
Month:	Enter the month using the first three characters of the month; for example, <b>Sep</b> for September.
Day:	Enter the day of the month, from 1 to 31.
Time:	Enter the hour, minutes, and seconds in 24-hour time format. For example, enter <b>20:54:44</b> for 8:54 p.m and 44 seconds.
Inside IP address:	Enter the IP address for the inside interface.
Inside network mask:	Enter the network mask that applies to the inside IP address. You must specify a valid network mask, such as 255.0.0.0 or 255.255.0.0.
Host name:	Enter the hostname that you want to display in the command line prompt.
Domain name:	Enter the domain name of the network on which the security appliance runs.
IP address of host running Device Manager:	Enter the IP address of the host that needs to access ASDM.
Use this configuration and write to flash?	Enter <b>yes</b> or <b>no</b> . If you enter <b>yes</b> , the inside interface is enabled and the requested configuration is written to the Flash partition.  If you enter <b>no</b> , the setup dialog repeats, beginning with the first question:  Pre-configure Firewall now through interactive prompts [yes]?  Enter <b>no</b> to exit the setup dialog or <b>yes</b> to repeat it.

**Examples**

This example shows how to complete the **setup** command prompts:

```
hostname(config)# setup
Pre-configure Firewall now through interactive prompts [yes]? yes
Firewall Mode [Routed]: routed
Enable password [<use current password>]: writer
Allow password recovery [yes]? yes
Clock (UTC):
  Year: 2005
  Month: Nov
  Day: 15
  Time: 10:0:0
Inside IP address: 192.168.1.1
Inside network mask: 255.255.255.0
Host name: tech_pubs
Domain name: your_company.com
IP address of host running Device Manager: 10.1.1.1
```

The following configuration will be used:  
Enable password: writer

```
Allow password recovery: yes
Clock (UTC): 20:54:44 Sep 17 2005
Firewall Mode: Routed

Command	Description
<b>configure</b>	Restores the default configuration.
<b>factory-default</b>	

# show aaa local user

To show the list of usernames that are currently locked, or to show details about the username, use the **show aaa local user** command in global configuration mode.

**show aaa local user [locked]**

<b>Syntax Description</b>	<b>locked</b> (Optional) Shows the list of usernames that are currently locked.
---------------------------	---

<b>Defaults</b>	No default behavior or values.
-----------------	--------------------------------

<b>Command Modes</b>	The following table shows the modes in which you can enter the command:
----------------------	---

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global configuration	•	•	•	•	—

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	7.0(1)	This command was introduced.

<b>Usage Guidelines</b>	<p>If you omit the optional keyword <b>locked</b>, the security appliance displays the failed-attempts and lockout status details for all AAA local users.</p> <p>You can specify a single user by using the <b>username</b> option or all users with the <b>all</b> option.</p> <p>This command affects only the status of users that are locked out.</p> <p>The administrator cannot be locked out of the device.</p>
-------------------------	---

<b>Examples</b>	The following example shows use of the <b>show aaa local user</b> command to display the lockout status of all usernames:
-----------------	---

This example shows the use of the **show aaa local user** command to display the number of failed authentication attempts and lockout status details for all AAA local users, after the limit has been set to 5:

```
hostname(config)# aaa local authentication attempts max-fail 5
hostname(config)# show aaa local user
Lock-time  Failed-attempts  Locked  User
-           6              Y      test
-           2              N      mona
-           1              N      cisco
-           4              N      newuser
hostname(config)#
```

This example shows the use of the **show aaa local user** command with the **lockout** keyword to display the number of failed authentication attempts and lockout status details only for any locked-out AAA local users, after the limit has been set to 5:

```
hostname(config)# aaa local authentication attempts max-fail 5
hostname(config)# show aaa local user
Lock-time  Failed-attempts  Locked  User
-          6              Y      test
hostname(config)#
```

#### Related Commands

Command	Description
<b>aaa local authentication attempts max-fail</b>	Configures the maximum number of times a user can enter a wrong password before being locked out.
<b>clear aaa local user fail-attempts</b>	Resets the number of failed attempts to 0 without modifying the lockout status.
<b>clear aaa local user lockout</b>	Clears the lockout status of the specified user or all users and sets their failed attempts counters to 0.

# show aaa-server

To display AAA server statistics for AAA servers, use the **show aaa-server** command in privileged EXEC mode:

```
show aaa-server [LOCAL | groupname [host hostname] | protocol protocol]
```

Syntax Description	LOCAL	(Optional) Shows statistics for the LOCAL user database.
	<i>groupname</i>	(Optional) Shows statistics for servers in a group.
	<b>host</b> <i>hostname</i>	(Optional) Shows statistics for a particular server in the group.
	<b>protocol</b> <i>protocol</i>	(Optional) Shows statistics for servers of the specified protocol: <ul style="list-style-type: none"> <li>• <b>http form</b></li> <li>• <b>kerberos</b></li> <li>• <b>ldap</b></li> <li>• <b>nt</b></li> <li>• <b>radius</b></li> <li>• <b>sdi</b></li> <li>• <b>tacacs+</b></li> </ul>

**Defaults** By default, all AAA server statistics display.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	—	—	•

Command History	Release	Modification
	Preexisting	This command was preexisting.
	7.1(1)	The http form protocol was added.

**Examples** This example shows the use of the **show aaa-server** command to display statistics for a particular host in server group group1:

```
hostname(config)# show aaa-server group1 host 192.68.125.60
Server Group:      group1
Server Protocol:   RADIUS
Server Address:    192.68.125.60
Server port:       1645
Server status:     ACTIVE/FAILED. Last transaction (success) at 11:10:08 UTC  Fri Aug 22
```

```

Number of pending requests 20
Average round trip time 4ms
Number of authentication requests 20
Number of authorization requests 0
Number of accounting requests 0
Number of retransmissions 1
Number of accepts 16
Number of rejects 4
Number of challenges 5
Number of malformed responses 0
Number of bad authenticators 0
Number of pending requests 0
Number of timeouts 0
Number of unrecognized responses 0
hostname(config)#

```

This example shows the use of the **show aaa-server** command to show the statistics for all servers in a small, inactive system:

```

hostname(config)# show aaa-server
Server Group:      LOCAL
Server Protocol:   Local database
Server Address:    None
Server port:       None
Server status:     ACTIVE, Last transaction at unknown
Number of pending requests      0
Average round trip time         0ms
Number of authentication requests 0
Number of authorization requests 0
Number of accounting requests   0
Number of retransmissions       0
Number of accepts               0
Number of rejects               0
Number of challenges            0
Number of malformed responses    0
Number of bad authenticators     0
Number of timeouts              0
Number of unrecognized responses 0
hostname(config)#

```

## Related Commands

<b>show running-config aaa-server</b>	Display statistics for all servers in the indicated server group or for a particular server.
<b>clear aaa-server statistics</b>	Clear the AAA server statistics.

# show access-list

To display the counters for an access list, use the **show access-list** command in privileged EXEC mode.

**show access-list** *id*

<b>Syntax Description</b>	<i>id</i> Identifies the access list.
---------------------------	---------------------------------------

<b>Defaults</b>	No default behavior or values.
-----------------	--------------------------------

<b>Command Modes</b>	The following table shows the modes in which you can enter the command:
----------------------	---

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Privileged EXEC	•	•	•	•	—

Command History	Release	Modification
	Preexisting	This command was preexisting.

<b>Examples</b>	The following is sample output from the <b>show access-list</b> command:
-----------------	--

```
hostname# show access-list
access-list cached ACL log flows: total 0, denied 0 (deny-flow-max 4096)
      alert-interval 300
access-list 101; 10 elements
access-list 101 line 1 extended permit tcp any eq www any (hitcnt=0) 0xa14fc533
access-list 101 line 2 extended permit tcp any eq www any eq www (hitcnt=0) 0xaa73834e
access-list 101 line 3 extended permit tcp any eq www any range telnet www (hitcnt=0)
0x49ac02e6
access-list 101 line 4 extended permit tcp any range telnet www any range telnet www
(hitcnt=0) 0xa0021a9f
access-list 101 line 5 extended permit udp any range biff www any (hitcnt=0) 0xf89a7328
access-list 101 line 6 extended permit udp any lt ntp any (hitcnt=0) 0x8983c43 access-list
101 line 7 extended permit udp any any lt ntp (hitcnt=0) 0xf361ffb6
access-list 101 line 8 extended permit udp any any range ntp biff (hitcnt=0) 0x219581
access-list 101 line 9 extended permit icmp any any (hitcnt=0) 0xe8fa08e1
access-list 101 line 10 extended permit icmp any any echo (hitcnt=0) 0x2eb8deea
access-list 102; 1 elements access-list 102 line 1 extended permit icmp any any echo
(hitcnt=0) 0x59e2fea8
```

The output contains a unique hexadecimal identifier for each access control entry at the end of each line.

## Related Commands

Command	Description
<b>access-list ethertype</b>	Configures an access list that controls traffic based on its EtherType.
<b>access-list extended</b>	Adds an access list to the configuration and configures policy for IP traffic through the firewall.
<b>clear access-list</b>	Clears an access list counter.
<b>clear configure access-list</b>	Clears an access list from the running configuration.
<b>show running-config access-list</b>	Displays the current running access-list configuration.

# show activation-key

To display the commands in the configuration for features that are enabled by your activation key, including the number of contexts allowed, use the **show activation-key** command in privileged EXEC mode.

## show activation-key

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no default settings.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	•	•

Command History	Release	Modification
	PIX Version 7.0	Support for this command was introduced on the security appliance.

**Usage Guidelines** The **show activation-key** command output indicates the status of the activation key as follows:

- If the activation key in the security appliance Flash file system is the same as the activation key running on the security appliance, then the **show activation-key** output reads as follows:  
The flash activation key is the SAME as the running key.
- If the activation key in the security appliance Flash file system is different from the activation key running on the security appliance, then the **show activation-key** output reads as follows:  
The flash activation key is DIFFERENT from the running key.  
The flash activation key takes effect after the next reload.
- If you downgrade your activation key, the display shows that the running key (the old key) differs from the key that is stored in the Flash (the new key). When you restart, the security appliance uses the new key.
- If you upgrade your key to enable extra features, the new key starts running immediately without a restart.

- For the PIX Firewall platform, if there is any change in the failover feature (R/UR/FO) between the new key and the oldkey, it prompts for confirmation. If the user enters **n**, it aborts the change; otherwise it updates the key in the Flash file system. When you restart the security appliance uses the new key.

## Examples

This example shows how to display the commands in the configuration for features that are enabled by your activation key:

```
hostname(config)# show activation-key
```

```
Serial Number: P3000000134 Running Activation Key: 0xyadayada 0xyadayada 0xyadayada
0xyadayada 0xyadayada
```

```
License Features for this Platform:
```

```
Maximum Physical Interfaces : Unlimited
Maximum VLANs               : 50
Inside Hosts                 : Unlimited
Failover                     : Enabled
VPN-DES                      : Enabled
VPN-3DES-AES                 : Disabled
Cut-through Proxy            : Enabled
Guards                       : Enabled
URL-filtering                 : Enabled
Security Contexts            : 20
GTP/GPRS                     : Disabled
VPN Peers                    : 5000
```

```
The flash activation key is the SAME as the running key.
```

```
hostname(config)#
```

## Related Commands

Command	Description
<a href="#">activation-key</a>	Changes the activation key.

# show admin-context

To display the context name currently assigned as the admin context, use the **show admin-context** command in privileged EXEC mode.

**show admin-context**

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	—	—	•

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Examples

The following is sample output from the **show admin-context** command. The following example shows the admin context called “admin” and stored in the root directory of flash:

```
hostname# show admin-context
Admin: admin flash:/admin.cfg
```

## Related Commands

Command	Description
<b>admin-context</b>	Sets the admin context.
<b>changeto</b>	Changes between contexts or the system execution space.
<b>clear configure context</b>	Removes all contexts.
<b>mode</b>	Sets the context mode to single or multiple.
<b>show context</b>	Shows a list of contexts (system execution space) or information about the current context.

# show arp

To view the ARP table, use the **show arp** command in privileged EXEC mode. This command shows dynamic and manual ARP entries, but does not identify the origin of each entry.

**show arp**

## Syntax Description

This command has no arguments or keywords.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	•	—

## Command History

Release	Modification
Preexisting	This command was preexisting.

## Examples

The following is sample output from the **show arp** command:

```
hostname# show arp
inside 10.86.195.205 0008.023b.9892
inside 10.86.194.170 0001.023a.952d
inside 10.86.194.172 0001.03cf.9e79
inside 10.86.194.1 00b0.64ea.91a2
inside 10.86.194.146 000b.fcf8.c4ad
inside 10.86.194.168 000c.ce6f.9b7e
```

## Related Commands

Command	Description
<b>arp</b>	Adds a static ARP entry.
<b>arp-inspection</b>	For transparent firewall mode, inspects ARP packets to prevent ARP spoofing.
<b>clear arp statistics</b>	Clears ARP statistics.
<b>show arp statistics</b>	Shows ARP statistics.
<b>show running-config arp</b>	Shows the current configuration of the ARP timeout.

# show arp-inspection

To view the ARP inspection setting for each interface, use the **show arp-inspection** command in privileged EXEC mode.

## show arp-inspection

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	—	•	•	•	—

Release	Modification
7.0(1)	This command was introduced.

**Examples** The following is sample output from the **show arp-inspection** command:

```
hostname# show arp-inspection
interface      arp-inspection      miss
-----
inside1        enabled              flood
outside        disabled              -
```

The **miss** column shows the default action to take for non-matching packets when ARP inspection is enabled, either “flood” or “no-flood.”

Related Commands	Command	Description
	<b>arp</b>	Adds a static ARP entry.
	<b>arp-inspection</b>	For transparent firewall mode, inspects ARP packets to prevent ARP spoofing.
	<b>clear arp statistics</b>	Clears ARP statistics.
	<b>show arp statistics</b>	Shows ARP statistics.
	<b>show running-config arp</b>	Shows the current configuration of the ARP timeout.

# show arp statistics

To view ARP statistics, use the show arp statistics command in privileged EXEC mode.

**show arp statistics**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	•	—

Release	Modification
Preexisting	This command was preexisting.

**Command History**

**Examples** The following is sample output from the **show arp statistics** command:

```
hostname# show arp statistics
  Number of ARP entries:
    ASA : 6
  Dropped blocks in ARP: 6
  Maximum Queued blocks: 3
  Queued blocks: 1
  Interface collision ARPs Received: 5
  ARP-defense Gratuitous ARPs sent: 4
  Total ARP retries: 15
  Unresolved hosts: 1
  Maximum Unresolved hosts: 2
```

[Table 2](#) shows each field description.

**Table 24-2** *show arp statistics Fields*

Field	Description
Number of ARP entries	The total number of ARP table entries.
Dropped blocks in ARP	The number of blocks that were dropped while IP addresses were being resolved to their corresponding hardware addresses.
Maximum queued blocks	The maximum number of blocks that were ever queued in the ARP module, while waiting for the IP address to be resolved.

**Table 24-2** *show arp statistics Fields (continued)*

Field	Description
Queued blocks	The number of blocks currently queued in the ARP module.
Interface collision ARPs received	The number of ARP packets received at all security appliance interfaces that were from the same IP address as that of a security appliance interface.
ARP-defense gratuitous ARPs sent	The number of gratuitous ARPs sent by the security appliance as part of the ARP-Defense mechanism.
Total ARP retries	The total number of ARP requests sent by the ARP module when the address was not resolved in response to first ARP request.
Unresolved hosts	The number of unresolved hosts for which ARP requests are still being sent out by the ARP module.
Maximum unresolved hosts	The maximum number of unresolved hosts that ever were in the ARP module since it was last cleared or the security appliance booted up.

**Related Commands**

Command	Description
<b>arp-inspection</b>	For transparent firewall mode, inspects ARP packets to prevent ARP spoofing.
<b>clear arp statistics</b>	Clears ARP statistics and resets the values to zero.
<b>show arp</b>	Shows the ARP table.
<b>show running-config arp</b>	Shows the current configuration of the ARP timeout.

# show asdm history

To display the contents of the ASDM history buffer, use the **show asdm history** command in privileged EXEC mode.

**show asdm history** [**view** *timeframe*] [**snapshot**] [**feature** *feature*] [**asdmclient**]

Syntax Description	
<b>asdmclient</b>	(Optional) Displays the ASDM history data formatted for the ASDM client.
<b>feature</b> <i>feature</i>	(Optional) Limits the history display to the specified feature. The following are valid values for the <i>feature</i> argument: <ul style="list-style-type: none"> <li>• <b>all</b>—Displays the history for all features (default).</li> <li>• <b>blocks</b>—Displays the history for the system buffers.</li> <li>• <b>cpu</b>—Displays the history for CPU usage.</li> <li>• <b>failover</b>—Displays the history for failover.</li> <li>• <b>ids</b>—Displays the history for IDS.</li> <li>• <b>interface</b> <i>if_name</i>—Displays the history for the specified interface. The <i>if_name</i> argument is the name of the interface as specified by the <b>nameif</b> command.</li> <li>• <b>memory</b>—Displays memory usage history.</li> <li>• <b>perfmon</b>—Displays performance history.</li> <li>• <b>sas</b>—Displays the history for Security Associations.</li> <li>• <b>tunnels</b>—Displays the history for tunnels.</li> <li>• <b>xlates</b>—Displays translation slot history.</li> </ul>
<b>snapshot</b>	(Optional) Displays only the last ASDM history data point.
<b>view</b> <i>timeframe</i>	(Optional) Limits the history display to the specified time period. Valid values for the <i>timeframe</i> argument are: <ul style="list-style-type: none"> <li>• <b>all</b>—all contents in the history buffer (default).</li> <li>• <b>12h</b>—12 hours</li> <li>• <b>5d</b>—5 days</li> <li>• <b>60m</b>—60 minutes</li> <li>• <b>10m</b>—10 minutes</li> </ul>

## Defaults

If no arguments or keywords are specified, all history information for all features is displayed.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	•	•

## Command History

Release	Modification
7.0(1)	This command was changed from the <b>show pdm history</b> command to the <b>show asdm history</b> command.

## Usage Guidelines

The **show asdm history** command displays the contents of the ASDM history buffer. Before you can view ASDM history information, you must enable ASDM history tracking using the **asdm history enable** command.

## Examples

The following is sample output from the **show asdm history** command. It limits the output to data for the outside interface collected during the last 10 minutes.

```
hostname# show asdm history view 10m feature interface outside

### Related Commands

Command	Description
<b>asdm history enable</b>	Enables ASDM history tracking.

# show asdm image

To the current ASDM software image file, use the show **asdm image** command in privileged EXEC mode.

**show asdm image**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	—	•

Command History	Release	Modification
	7.0(1)	This command was changed from the <b>show pdm image</b> command to the <b>show asdm image</b> command.

**Examples** The following is sample output from the **show asdm image** command:

```
hostname# show asdm image
Device Manager image file, flash:/ASDM
```

Related Commands	Command	Description
	<b>asdm image</b>	Specifies the current ASDM image file.

# show asdm log\_sessions

To display a list of active ASDM logging sessions and their associated session IDs, use the **show asdm log\_sessions** command in privileged EXEC mode.

**show asdm log\_sessions**

## Syntax Description

This command has no arguments or keywords.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	•	—

## Command History

Release	Modification
7.0(1)	This command was introduced.

## Usage Guidelines

Each active ASDM session has one or more associated ASDM logging sessions. ASDM uses the logging session to retrieve syslog messages from the security appliance. Each ASDM logging session is assigned a unique session ID. You can use this session ID with the **asdm disconnect log\_session** command to terminate the specified session.

### Note

Because each ASDM session has at least one ASDM logging session, the output for the **show asdm sessions** and **show asdm log\_sessions** may appear to be the same.

## Examples

The following is sample output from the **show asdm log\_sessions** command:

```
hostname# show asdm log_sessions

0 192.168.1.1
1 192.168.1.2
```

## Related Commands

Command	Description
<b>asdm disconnect log_session</b>	Terminates an active ASDM logging session.

# show asdm sessions

To display a list of active ASDM sessions and their associated session IDs, use the **show asdm sessions** command in privileged EXEC mode.

## show asdm sessions

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple Context	System
Privileged EXEC	•	•	•	•	—

Command History	Release	Modification
	7.0(1)	This command was changed from the <b>show pdm sessions</b> command to the <b>show asdm sessions</b> command.

**Usage Guidelines** Each active ASDM session is assigned a unique session ID. You can use this session ID with the **asdm disconnect** command to terminate the specified session.

**Examples** The following is sample output from the **show asdm sessions** command:

```
hostname# show asdm sessions

0 192.168.1.1
1 192.168.1.2
```

Related Commands	Command	Description
	<b>asdm disconnect</b>	Terminates an active ASDM session.
