### **Usage Guidelines**

The valid *command* values follow. For each *command*, the syntax following *command* is identical to the syntax supported by the associated **debug** command. Refer to the associated **debug** command for information about the supported syntax.

The availability of each *command* value depends upon the command modes that support the applicable **debug** command.

### Examples

The following commands enable debugging for authentication, accounting, and Flash memory. The **show debug** command is used in three ways to demonstrate how you can use it to view all debugging configuration, debugging configuration for a specific feature, and even debugging configuration for a subset of a feature.

```
hostname# debug aaa authentication
debug aaa authentication enabled at level 1
hostname# debug aaa accounting
debug aaa accounting enabled at level 1
hostname# debug disk filesystem
```

```
debug disk filesystem enabled at level 1
hostname# show debug
debug aaa authentication enabled at level 1
debug aaa accounting enabled at level 1
debug disk filesystem enabled at level 1
hostname# show debug aaa
debug aaa authentication enabled at level 1
debug aaa authentication is disabled.
debug aaa accounting enabled at level 1
debug aaa internal is disabled.
debug aaa vpn is disabled.
hostname# show debug aaa accounting
debug aaa accounting enabled at level 1
hostname#
```

### show debug mmp

To display current debug settings for the MMP inspection module, use the show debug mmp command in privileged EXEC mode.

#### show debug mmp

- **Syntax Description** This command has no arguments or keywords.
- Defaults No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	—

#### **Command History** Modification Release 8.0(4)The command was introduced.

### Examples

The following example shows the use of the **show debug mmp** command to displaythe current debug settings for the MMP inspection module:

hostname# show debug mmp debug mmp enabled at level 1

**Related Commands** 

Command	Description
debug mmp	Display inspect MMP events.
inspect mmp	Configures the MMP inspection engine.

# show dhcpd

To view DHCP binding, state, and statistical information, use the **show dhcpd** command in privileged EXEC or global configuration mode.

show dhcpd {binding [IP\_address] | state | statistics}

Syntax Description	binding	-	• •	nformation for a ardware address	-		and its	
	IP_address	Shows the binding information for the specified IP address.						
	state	Displays the state of the DHCP server, such as whether it is enabled in the						
				l whether it is en				
	statistics	bindin		information, su- indings, malforr				
Defaults	No default behavio	or or values.						
Command Modes	The following table	e shows the m	odes in whic	h you can enter	the comma	nd:

	The following is sample output from the <b>show dhcpd state</b> command: hostname# <b>show dhcpd state</b> Context Not Configured for DHCP Interface outside, Not Configured for DHCP							

Interface inside, Not Configured for DHCP

The following is sample output from the **show dhcpd statistics** command:

hostname# show dhcpd statistics

DHCP UDP Unreachable Errors:	0
DHCP Other UDP Errors: 0	
Address pools 1	
Automatic bindings 1	
Expired bindings 1	
Malformed messages 0	

Message	Received
BOOTREQUEST	0
DHCPDISCOVER	1
DHCPREQUEST	2
DHCPDECLINE	0
DHCPRELEASE	0
DHCPINFORM	0
Message	Sent
BOOTREPLY	0
DHCPOFFER	1
DHCPACK	1
DHCPNAK	1

**Related Commands** 

Command	Description
clear configure dhcpd	Removes all DHCP server settings.
clear dhcpd	Clears the DHCP server bindings and statistic counters.
dhcpd lease	Defines the lease length for DHCP information granted to clients.
show running-config dhcpd	Displays the current DHCP server configuration.

### show dhcprelay state

To view the state of the DHCP relay agent, use the **show dhcprelay state** command in privileged EXEC or global configuration mode.

#### show dhcprelay state

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	—	•	•	

Command History	Release	Modification
	Preexisting	This command was preexisting.

**Usage Guidelines** This command displays the DHCP relay agent state information for the current context and each interface.

**Examples** The following is sample output from the **show dhcprelay state** command:

#### hostname# show dhcprelay state

Context Configured as DHCP Relay Interface outside, Not Configured for DHCP Interface infrastructure, Configured for DHCP RELAY SERVER Interface inside, Configured for DHCP RELAY

<b>Related Commands</b>	Command	Description
	show dhcpd	Displays DHCP server statistics and state information.
	show dhcprelay statistics	Displays the DHCP relay statistics.
	show running-config dhcprelay	Displays the current DHCP relay agent configuration.

### show dhcprelay statistics

To display the DHCP relay statistics, use the **show dhcprelay statistics** command in privileged EXEC mode.

show dhcprelay statistics

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security C	ontext	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	—	•	•	

Command History	Release	Modification
	Preexisting	This command was preexisting.

Usage Guidelines The output of the show dhcprelay statistics command increments until you enter the clear dhcprelay statistics command.

#### **Examples** The following shows sample output for the **show dhcprelay statistics** command:

#### hostname# show dhcprelay statistics

DHCP UDP Unreachable Errors: 0 DHCP Other UDP Errors: 0

Packets Relayed	
BOOTREQUEST	0
DHCPDISCOVER	7
DHCPREQUEST	3
DHCPDECLINE	0
DHCPRELEASE	0
DHCPINFORM	0
BOOTREPLY	0
DHCPOFFER	7
DHCPACK	3
DHCPNAK	0
hostname#	

Related Commands	Command	Description
	clear configure dhcprelay	Removes all DHCP relay agent settings.
	clear dhcprelay statistics	Clears the DHCP relay agent statistic counters.
	debug dhcprelay	Displays debug information for the DHCP relay agent.
	show dhcprelay state	Displays the state of the DHCP relay agent.
	show running-config dhcprelay	Displays the current DHCP relay agent configuration.

# show disk

To display the contents of the Flash memory for the adaptive security appliance only, use the **show disk** command in privileged EXEC mode. To display the contents of the Flash memory for a PIX security appliance only, see the **show flash** command.

show disk[0 | 1] [filesys | all] controller

Syntax Description	0   1	-	fies the interrory (1).	al Flash memor	$\overline{y}$ (0, the de	efault) or the ex	ternal Flas
	controller	Speci	fies the Flash	controller mode	el number.		
	filesys	Show	s information	about the comp	act Flash c	ard.	
	all	Show	s the contents	s of Flash memor	ry plus the	file system inf	ormation,
Defaults	Shows the inter	rnal Flash memo	ry by default.				
Command Modes	The following	table shows the r	nodes in whic	h you can enter	the comma	ind:	
			Firewall N	lode	Security (	Context	
						Multiple	
	Command Mod	e	Routed	Transparent	Single	Context	System

<b>Related Commands</b>	Command	Description
	dir	Displays the directory contents.
	show flash	Displays the contents of the internal Flash memory for the PIX security appliance only.

### show dns-hosts

To show the DNS cache, use the **show dns-hosts** command in privileged EXEC mode. The DNS cache includes dynamically learned entries from a DNS server as well as manually entered name and IP addresses using the **name** command.

#### show dns-hosts

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security C	Context	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	

Command History	Release	Modification
	7.0(1)	This command was introduced.

Examples

### The following is sample output from the **show dns-hosts** command:

	Age	Type	Address(es)
OK)	0	IP	10.102.255.44
OK)	0	IP	192.168.241.185
OK)	0	IP	10.94.146.101
OK)	0	IP	10.94.146.80
	OK) OK)	OK) 0 OK) 0 OK) 0	OK) 0 IP OK) 0 IP

### Table 11 shows each field description.

Table 26-1show dns-hosts Fields
---------------------------------

Field	Description
Host	Shows the hostname.
Flags	Shows the entry status, as a combination of the following:
	• temp—This entry is temporary because it comes from a DNS server. The security appliance removes this entry after 72 hours of inactivity.
	• perm—This entry is permanent because it was added with the <b>name</b> command.
	• OK—This entry is valid.
	• ??—This entry is suspect and needs to be revalidated.
	• EX—This entry is expired.
Age	Shows the number of hours since this entry was last referenced.
Туре	Shows the type of DNS record; this value is always IP.
Address(es)	The IP addresses.

### Related Commands

Command	Description
clear dns-hosts	Clears the DNS cache.
dns domain-lookup	Enables the security appliance to perform a name lookup.
dns name-server	Configures a DNS server address.
dns retries	Specifies the number of times to retry the list of DNS servers when the security appliance does not receive a response.
dns timeout	Specifies the amount of time to wait before trying the next DNS server.

# show eigrp events

To display the EIGRP event log, use the **show eigrp events** command in privileged EXEC mode.

show eigrp [as-number] events [{start end} | type]

Syntax Description	as-number	<i>(Optional)</i> Specifies the autonomous system number of the EIGRP process for which you are viewing the event log. Because the security appliance only supports one EIGRP routing process, you do not need to specify the autonomous system number.						
	end			he output to the g with the <i>end</i> in			the start index	
	start	start no the eve	umber cause	per specifying th s the output to st by the <i>end</i> argu	art with the	specified even	t and end with	
	type	(Optio	nal) Display	s the events that	are being l	ogged.		
Defaults	If a <i>start</i> and <i>end</i> is	not specified	l, all log entr	ies are shown.				
Command Modes	The following table	shows the m	odes in whic	ch you can enter	the comma	nd:		
		Firewall Mode Security Context						
						Multiple		
	<b>Command Mode</b>		Routed	Transparent	Single	Context	System	
	Privileged EXEC		•	—	•	—	—	
Command History	Release	Modifi	cation					
	8.0(2)	This c	ommand was	s introduced.				
Usage Guidelines	The <b>show eigrp eve</b> reached, new events the output. You can use the <b>cle</b>	s are added to	the bottom	of the output and	d old events	s are removed		
	The <b>show eigrp eve</b> changes, neighbor v event logging using					•	-	

#### **Examples** The following is sample output from the show eigrp events command: hostname# show eigrp events Event information for AS 100: 1 12:11:23.500 Change queue emptied, entries: 4 2 12:11:23.500 Metric set: 10.1.0.0/16 53760 3 12:11:23.500 Update reason, delay: new if 4294967295 4 12:11:23.500 Update sent, RD: 10.1.0.0/16 4294967295 5 12:11:23.500 Update reason, delay: metric chg 4294967295 12:11:23.500 Update sent, RD: 10.1.0.0/16 4294967295 6 7 12:11:23.500 Route install: 10.1.0.0/16 10.130.60.248 8 12:11:23.500 Find FS: 10.1.0.0/16 4294967295 9 12:11:23.500 Rcv update met/succmet: 53760 28160 10 12:11:23.500 Rcv update dest/nh: 10.1.0.0/16 10.130.60.248 11 12:11:23.500 Metric set: 10.1.0.0/16 4294967295 The following is sample output from the **show eigrp events** command with a start and stop number defined: hostname# show eigrp events 3 8 Event information for AS 100: 3 12:11:23.500 Update reason, delay: new if 4294967295 4 12:11:23.500 Update sent, RD: 10.1.0.0/16 4294967295 5 12:11:23.500 Update reason, delay: metric chg 4294967295 6 12:11:23.500 Update sent, RD: 10.1.0.0/16 4294967295 12:11:23.500 Route install: 10.1.0.0/16 10.130.60.248 7 8 12:11:23.500 Find FS: 10.1.0.0/16 4294967295 The following is sample output from the **show eigrp events** command when there are no entries in the EIGRP event log: hostname# show eigrp events Event information for AS 100: Event log is empty. EIGRP-IPv4 Event Logging for AS 100: Log Size 500 Neighbor Changes Enable Neighbor Warnings Enable Dual FSM Enable

#### Related Commands

Command	Description
clear eigrp events	Clears the EIGRP event logging buffer.
eigrp log-neighbor-changes	Enables the logging of neighbor change events.
eigrp log-neighbor-warnings	Enables the logging of neighbor warning events.

# show eigrp interfaces

To display the interfaces participating in EIGRP routing, use the **show eigrp interfaces** command in privileged EXEC mode.

show eigrp [as-number] interfaces [if-name] [detail]

Syntax Description	as-number		(Optional) Specifies the autonomous system number of the EIGRP process for which you are displaying active interfaces. Because the security appliance only supports one EIGRP routing process, you do not need to specify the autonomous system number.							
	detail		(Optiona	l) Displays	s detail informat	tion.				
	if-name				ne of an interfac face name limits					
Defaults	If you do not	t specify a	an interface n	ame, infor	mation for all E	IGRP inter	faces is display	yed.

Table 26-2 describes the significant fields shown in the display.

 Table 26-2
 show eigrp interfaces Field Descriptions

Field	Description
process	Autonomous system number for the EIGRP routing process.
Peers	Number of directly-connected peers.
Xmit Queue Un/Reliable	Number of packets remaining in the Unreliable and Reliable transmit queues.
Mean SRTT	Mean smooth round-trip time interval (in seconds).
Pacing Time Un/Reliable	Pacing time (in seconds) used to determine when EIGRP packets should be sent out the interface (unreliable and reliable packets).
Multicast Flow Timer	Maximum number of seconds in which the security appliance will send multicast EIGRP packets.
Pending Routes	Number of routes in the packets in the transmit queue waiting to be sent.

Table 26-2 describes the significant fields shown in the display.

Table 26-3show eigrp neighbors Field Descriptions

Field	Description
process	Autonomous system number for the EIGRP routing process.
Address	IP address of the EIGRP neighbor.
Interface	Interface on which the security appliance receives hello packets from the neighbor.
Holdtime	Length of time (in seconds) that the security appliance waits to hear from the neighbor before declaring it down. This hold time is received from the neighbor in the hello packet, and begins decreasing until another hello packet is received from the neighbor.
	If the neighbor is using the default hold time, this number will be less than 15. If the peer configures a non-default hold time, the non-default hold time will be displayed.
	If this value reaches 0, the security appliance considers the neighbor unreachable.
Uptime	Elapsed time (in hours:minutes: seconds) since the security appliance first heard from this neighbor.
Q Count	Number of EIGRP packets (update, query, and reply) that the security appliance is waiting to send.
Seq Num	Sequence number of the last update, query, or reply packet that was received from the neighbor.
SRTT	Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the security appliance to receive an acknowledgment of that packet.
RTO	Retransmission timeout (in milliseconds). This is the amount of time the security appliance waits before resending a packet from the retransmission queue to a neighbor.

The following is sample output from the show eigrp neighbors static command:

hostname# show eigrp neighbors static

EIGRP-IPv4 neighbors for process 100 Static Address Interface 192.168.1.5 management

Table 26-5 describes the significant fields shown in the display.

Field	Description
process	Autonomous system number for the EIGRP routing process.
Н	This column lists the order in which a peering session was established with the specified neighbor. The order is specified with sequential numbering starting with 0.
Address	IP address of the EIGRP neighbor.
Interface	Interface on which the security appliance receives hello packets from the neighbor.
Holdtime	Length of time (in seconds) that the security appliance waits to hear from the neighbor before declaring it down. This hold time is received from the neighbor in the hello packet, and begins decreasing until another hello packet is received from the neighbor.
	If the neighbor is using the default hold time, this number will be less than 15. If the peer configures a non-default hold time, the non-default hold time will be displayed.
	If this value reaches 0, the security appliance considers the neighbor unreachable.
Uptime	Elapsed time (in hours:minutes: seconds) since the security appliance first heard from this neighbor.
SRTT	Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the security appliance to receive an acknowledgment of that packet.

 Table 26-5
 show ip eigrp neighbors details Field Descriptions

Field	Description
RTO	Retransmission timeout (in milliseconds). This is the amount of time the security appliance waits before resending a packet from the retransmission queue to a neighbor.
Q Count	Number of EIGRP packets (update, query, and reply) that the security appliance is waiting to send.
Seq Num	Sequence number of the last update, query, or reply packet that was received from the neighbor.
Version	The software version that the specified peer is running.
Retrans	The number of times that a packet has been retransmitted.
Retries	The number of times an attempt was made to retransmit a packet.
Restart time	Elapsed time (in hours:minutes: seconds) since the specified neighbor has restarted.

```

Table 26-6 describes the significant fields shown in the displays.

Table 26-6show eigrp topology Field Information

Field	Description
Codes	State of this topology table entry. Passive and Active refer to the EIGRP state with respect to this destination; Update, Query, and Reply refer to the type of packet that is being sent.
P - Passive	The route is known to be good and no EIGRP computations are being performed for this destination.
A - Active	EIGRP computations are being performed for this destination.
U - Update	Indicates that an update packet was sent to this destination.
Q - Query	Indicates that a query packet was sent to this destination.
R - Reply	Indicates that a reply packet was sent to this destination.
r - Reply status	Flag that is set after the software has sent a query and is waiting for a reply.
address mask	Destination IP address and mask.
successors	Number of successors. This number corresponds to the number of next hops in the IP routing table. If "successors" is capitalized, then the route or next hop is in a transition state.
FD	Feasible distance. The feasible distance is the best metric to reach the destination or the best metric that was known when the route went active. This value is used in the feasibility condition check. If the reported distance of the router (the metric after the slash) is less than the feasible distance, the feasibility condition is met and that path is a feasible successor. Once the software determines it has a feasible successor, it need not send a query for that destination.
via	IP address of the peer that told the software about this destination. The first $n$ of these entries, where $n$ is the number of successors, is the current successors. The remaining entries on the list are feasible successors.
(cost/adv_cost)	The first number is the EIGRP metric that represents the cost to the destination. The second number is the EIGRP metric that this peer advertised.
interface	The interface from which the information was learned.

The following is sample output from the **show eigrp topology** used with an IP address. The output shown is for an internal route.

```
hostname# show eigrp topology 10.2.1.0 255.255.255.0
```

EIGRP-IPv4 (AS 100): Topology Default-IP-Routing-Table(0) entry for entry for 10.2.1.0 255.255.255.0

```
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 281600
Routing Descriptor Blocks:
    0.0.0.0 (Ethernet0/0), from Connected, Send flag is 0x0
    Composite metric is (281600/0), Route is Internal
    Vector metric:
        Minimum bandwidth is 10000 Kbit
        Total delay is 1000 microseconds
        Reliability is 255/255
        Load is 1/255
        Minimum MTU is 1500
        Hop count is 0
```

hostname# show eigrp topology 10.4.80.0 255.255.255.0

The following is sample output from the **show eigrp topology** used with an IP address. The output shown is for an external route.

```
EIGRP-IPv4 (AS 100): Topology Default-IP-Routing-Table(0) entry for entry for 10.4.80.0
255.255.255.0
   State is Passive, Query origin flag is 1, 1 Successor(s), FD is 409600
   Routing Descriptor Blocks:
       10.2.1.1 (Ethernet0/0), from 10.2.1.1, Send flag is 0{\rm x}0
           Composite metric is (409600/128256), Route is External
           Vector metric:
               Minimum bandwidth is 10000 Kbit
               Total delay is 6000 microseconds
               Reliability is 255/255
               Load is 1/255
               Minimum MTU is 1500
               Hop count is 1
           External data:
               Originating router is 10.89.245.1
               AS number of route is 0
               External protocol is Connected, external metric is 0
               Administrator tag is 0 (0x0000000)
```

<b>Related Commands</b>	Command	Description
	clear eigrp topology	Clears the dynamically discovered entries from the EIGRP topology table.

# show eigrp traffic

To display the number of EIGRP packets sent and received, use the **show eigrp traffic** command in privileged EXEC mode.

show eigrp [as-number] traffic

Syntax Description	<i>as-number</i> (Optional) Specifies the autonomous system number of the EIGRP process for which you are viewing the event log. Because the security appliance only supports one EIGRP routing process, you do not need to specify the autonomous system number.							
Defaults	No default behavio	ors or values.						
Command Modes	The following table	e shows the modes in which	ch you can enter	the comma	and:			
		Firewall	Vode	Security (	Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Privileged EXEC	•	_	•		_		
Command History	Release	Modification						
	8.0(2)This command was introduced.							
Usage Guidelines	You can use the <b>cle</b>	e <b>ar eigrp traffic</b> comman	d to clear the EIC	GRP traffic	statistics.			
Examples	The following is sa	imple output from the <b>sho</b>	w eigrp traffic c	command:				
	Hellos sent/red Updates sent/red Queries sent/red Replies sent/red Acks sent/redei Input queue hig SIA-Queries ser	eceived: 7/23 eceived: 2/0 eceived: 0/2 ived: 21/14 gh water mark 0, 0 drop nt/received: 0/0 nt/received: 0/0 ID: 1719439416						

Field	Description
process	Autonomous system number for the EIGRP routing process.
Hellos sent/received	Number of hello packets sent and received.
Updates sent/received	Number of update packets sent and received.
Queries sent/received	Number of query packets sent and received.
Replies sent/received	Number of reply packets sent and received.
Acks sent/received	Number of acknowledgment packets sent and received.
Input queue high water mark/drops	Number of received packets that are approaching the maximum receive threshold and number of dropped packets.
SIA-Queries sent/received	Stuck in active queries sent and received.
SIA-Replies sent/received	Stuck in active replies sent and received.

### **Related Commands**

Command	Description
debug eigrp packets	Displays debug information for EIGRP packets sent and received.
debug eigrp transmit	Displays debug information for EIGRP messages sent.

# show failover

To display information about the failover status of the unit, use the **show failover** command in privileged EXEC mode.

show failover [group num | history | interface | state | statistics]

Syntax Description	group	Displays the runni	ng state of the sp	pecified fail	lover group.	
	history					
	interface	Displays failover of	command and sta	teful link i	nformation.	
	num	Failover group nur	nber.			
	state	Displays the failover state of both failover units. The information displayed includes the primary or secondary status of the unit, the Active/Standby status of the unit, and the last reported reason for failover. The fail reason remains in the output even when the reason for failure is cleared.				
	statistics	Displays transmit	and receive pack	et count of	failover comm	and interface.
Defaults	No default behavior	or values.				
Command Modes	The following table shows the modes in which you can enter the command:					
		Firewall Mode Security Context				
					Multiple	
	<b>Command Mode</b>	Routed	Transparent	Single	Context	System
	Privileged EXEC	•	•	•	•	•
Command History	Privileged EXEC	• Modification	•	•	•	•

Command History Usage Guidelines	<b>Release</b> 7.0(1) The <b>show failover</b> co Failover statistics. The	This command wa ommand displays the dy he Stateful Failover Log Fhe "xerr" and "rerr" val	s modified. The namic failover in ical Update Stati	nformation, istics outpu	udes additional interface statu t appears only	information. s, and Stateful when Stateful

- Stateful Obj has these values:
  - xmit—Indicates the number of packets transmitted.
  - xerr—Indicates the number of transmit errors.
  - rcv—Indicates the number of packets received.
  - rerr-Indicates the number of receive errors.
- Each row is for a particular object static count as follows:
  - General-Indicates the sum of all stateful objects.
  - sys cmd—Refers to the logical update system commands, such as login or stay alive.
  - up time—Indicates the value for the security appliance up time, which the active security appliance passes on to the standby security appliance.
  - RPC services—Remote Procedure Call connection information.
  - TCP conn—Dynamic TCP connection information.
  - UDP conn—Dynamic UDP connection information.
  - ARP tbl—Dynamic ARP table information.
  - Xlate\_Timeout—Indicates connection translation timeout information.
  - VPN IKE upd—IKE connection information.
  - VPN IPSEC upd—IPSec connection information.
  - VPN CTCP upd—cTCP tunnel connection information.
  - VPN SDI upd—SDI AAA connection information.
  - VPN DHCP upd—Tunneled DHCP connection information.
  - SIP Sesson—SIP signalling session information.

If you do not enter a failover IP address, the **show failover** command displays 0.0.0.0 for the IP address, and monitoring of the interfaces remain in a "waiting" state. You must set a failover IP address for failover to work.

Table 26-8 describes the interface states for failover.

Table 26-8Failover Interface States

State	Description
Normal	The interface is up and receiving hello packets from the corresponding interface on the peer unit.
Normal (Waiting)	The interface is up but has not yet received a hello packet from the corresponding interface on the peer unit. Verify that a standby IP address has been configured for the interface and that there is connectivity between the two interfaces.
Normal (Not-Monitored)	The interface is up but is not monitored by the failover process. The failure of an interface that is not monitored does not trigger failover.
No Link	The physical link is down.
No Link (Waiting)	The physical link is down and the interface has not yet received a hello packet from the corresponding interface on the peer unit. After restoring the link, verify that a standby IP address has been configured for the interface and that there is connectivity between the two interfaces.

State	Description
No Link (Not-Monitored)	The physical link is down but is not monitored by the failover process. The failure of an interface that is not monitored does not trigger failover.
Link Down	The physical link is up, but the interface is administratively down.
Link Down (Waiting)	The physical link is up, but the interface is administratively down and the interface has not yet received a hello packet from the corresponding interface on the peer unit. After bringing the interface up (using the <b>no</b> <b>shutdown</b> command in interface configuration mode), verify that a standby IP address has been configured for the interface and that there is connectivity between the two interfaces.
Link Down (Not-Monitored)	The physical link is up, but the interface is administratively down but is not monitored by the failover process. The failure of an interface that is not monitored does not trigger failover.
Testing	The interface is in testing mode due to missed hello packets from the corresponding interface on the peer unit.
Failed	Interface testing has failed and the interface is marked as failed. If the interface failure causes the failover criteria to be met, then the interface failure causes a failover to the secondary unit or failover group.

#### Table 26-8 Failover Interface States (continued)

In multiple configuration mode, only the **show failover** command is available in a security context; you cannot enter the optional keywords.

#### **Examples**

The following is sample output from the **show failover** command for Active/Standby Failover. The security appliances are ASA 5500 series adaptive security appliances, each equipped with a CSC SSM as shown in the details for slot 1 of each security appliance.

====Configuration State===
      Sync Done
====Communication State===
      Mac set
```

The following is sample output from the **show failover state** command for an active-standby setup:

hostname(config) # show failover state

This host -	State Primary	Last Failure Reason	Date/Time
Other host -	Negotiation Secondary	Backplane Failure	15:44:56 UTC Jun 20 2009
	Not Detected	Comm Failure	15:36:30 UTC Jun 20 2009
====Configurat Sync D ====Communicat Mac se	oone ion State===		

Table 26-9 describes the output of the show failover state command.

Field	Description				
Configuration State	Displays the state of configuration synchronization.				
	The following are possible configuration states for the standby unit:				
	• <b>Config Syncing - STANDBY</b> —Set while the synchronized configuration is being executed.				
	Interface Config Syncing - STANDBY				
	• <b>Sync Done - STANDBY</b> —Set when the standby unit has completed a configuration synchronization from the active unit.				
	The following are possible configuration states for the active unit:				
	• <b>Config Syncing</b> —Set on the active unit when it is performing a configuration synchronization to the standby unit.				
	Interface Config Syncing				
	• <b>Sync Done</b> —Set when the active unit has completed a successful configuration synchronization to the standby unit.				
	• <b>Ready for Config Sync</b> —Set on the active unit when the standby unit signals that it is ready to receive a configuration synchronization.				
Communication State	Displays the status of the MAC address synchronization.				
	• <b>Mac set</b> —The MAC addresses have been synchronized from the peer unit to this unit.				
	• <b>Updated Mac</b> —Used when a MAC address is updated and needs to be synchronized to the other unit. Also used during the transition period where the unit is updating the local MAC addresses synchronized from the peer unit.				
Date/Time	Displays a date and timestamp for the failure.				
Last Failure Reason	Displays the reason for the last reported failure. This information is not cleared, even if the failure condition is cleared. This information changes only when a failover occurs.				
	The following are possible fail reasons:				
	• <b>Ifc Failure</b> —The number of interfaces that failed met the failover criteria and caused failover.				
	• <b>Comm Failure</b> —The failover link failed or peer is down.				
	Backplane Failure				
State	Displays the Primary/Secondary and Active/Standby status for the unit.				
This host/Other host	This host indicates information for the device upon which the command was executed. Other host indicates information for the other device in the failover pair.				

Table 26-9 show failover state Output Descripti
---

The following is sample output from the show failover history command:

hostname# show failover history

From State To State Reason

At 16:28:50 UTC Sep 9 2006 Not Detected Negotiation No Error At 16:29:18 UTC Sep 9 2006 Negotiation Cold Standby Detected an Active mate At 16:29:19 UTC Sep 9 2006 Cold Standby Sync Config Detected an Active mate At 16:29:31 UTC Sep 9 2006 Sync Config Sync File System Detected an Active mate 16:29:31 UTC Sep 9 2006 At. Each entry provides the time and date the state change occurred, the beginning state, the resulting state, and the reason for the state change. The newest entries are located at the bottom of the display. Older entries appear at the top. A maximum of 60 entries can be displayed. Once the maximum number of entries has been reached, the oldest entries are removed from the top of the output as new entries are added to the bottom.

Table 26-10 shows the failover states. There are two types of states—stable and transient. Stable states are states that the unit can remain in until some occurrence, such as a failure, causes a state change. A transient state is a state that the unit passes through while reaching a stable state.

State	Description
Initialization	The unit checks platform capabilities and configuration and prepares the failover communication channels. This is a transient state.
Disabled	Failover is disabled. This is a stable state.

State	Description				
Negotiation	The unit establishes the connection with peer and negotiates with peer to determine software version compatibility and Active/Standby role. Depending upon the role that is negotiated, the unit will go through the Standby Unit States or the Active Unit States or enter the failed state. This is a transient state.				
Failed	The unit is in the failed state. This is a stable state.				
Standby Unit States					
Cold Standby	The unit waits for the peer to reach the Active state. When the peer unit reaches the Active state, this unit progresses to the Standby Config state. This is a transient state.				
Sync Config	The unit requests the running configuration from the peer unit. If an error occurs during the configuration synchronization, the unit returns to the Initialization state. This is a transient state.				
Sync File System	The unit synchronizes the file system with the peer unit. This is a transient state.				
Bulk Sync	The unit receives state information from the peer. This state only occurs when Stateful Failover is enabled. This is a transient state.				
Standby Ready	The unit is ready to take over if the active unit fails. This is a stable state.				
Active Unit States					
Just Active	The first state the unit enters when becoming the active unit. During this state a message is sent to the peer alerting the peer that the unit is becoming active and the IP and MAC addresses are set for the interfaces. This is a transient state.				
Active Drain	Queues messages from the peer are discarded. This is a transient state.				
Active Applying Config	The unit is applying the system configuration. This is a transient state.				
Active Config Applied	The unit has finished applying the system configuration. This is a transient state.				
Active	The unit is active and processing traffic. This is a stable state.				

#### Table 26-10 Failover States

Each state change is followed by a reason for the state change. The reason typically remains the same as the unit progresses through the transient states to the stable state. The following are the possible state change reasons:

- No Error
- Set by the CI config cmd
- Failover state check
- Failover interface become OK
- HELLO not heard from mate
- Other unit has different software version
- Other unit operating mode is different
- Other unit license is different

- Other unit chassis configuration is different
- Other unit card configuration is different
- Other unit want me Active
- Other unit want me Standby
- Other unit reports that I am failed
- Other unit reports that it is failed
- Configuration mismatch
- Detected an Active mate
- No Active unit found
- Configuration synchronization done
- Recovered from communication failure
- Other unit has different set of vlans configured
- Unable to verify vlan configuration
- Incomplete configuration synchronization
- Configuration synchronization failed
- Interface check
- My communication failed
- ACK not received for failover message
- Other unit got stuck in learn state after sync
- No power detected from peer
- No failover cable
- HA state progression failed
- Detect service card failure
- Service card in other unit has failed
- My service card is as good as peer
- LAN Interface become un-configured
- Peer unit just reloaded
- Switch from Serial Cable to LAN-Based fover
- Unable to verify state of config sync
- Auto-update request
- Unknown reason

#### Commands Command Description show running-config failover Displays the failover commands in the current configuration.

# show failover exec

To display the **failover exec** command mode for the specified unit, use the **show failover exec** command in privileged EXEC mode.

show failover exec {active | standby | mate}

	<b>active</b> Displays the <b>failover exec</b> command mode for the active unit.							
	mate	Displays the <b>failov</b>	er exec commar	nd mode for	r the peer unit.			
	standby     Displays the failover exec command mode for the standby unit.							
Defaults	No default behavior or v	alues.

# show firewall

To show the current firewall mode (routed or transparent), use the **show firewall** command in privileged EXEC mode.

show firewall

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context			
Command Mode	Routed			Multiple	Multiple	
		Transparent	Single	Context	System	
Privileged EXEC	•	•	•	•	•	

Command History	ommand HistoryRelease7.0(1)	Modification
	7.0(1)	This command was introduced.

**Examples** The following is sample output from the **show firewall** command:

hostname# **show firewall** Firewall mode: Router

<b>Related Commands</b>		
	firewall transparent	Sets the firewall mode.
	show mode	Shows the current context mode, either single or multiple.

#### show flash

To display the contents of the internal Flash memory, use the **show flash:** command in privileged EXEC mode.

show flash:

In the ASA 5500 series, the flash keyword is aliased to disk0.

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

Command Mode	Firewall N	Security Context				
				Multiple	Multiple	
	Routed	Transparent	Single	Context	System	
Privileged EXEC	•	•	•	•	•	

<b>Command History</b>	Release	Modification
Preexisting		This command was preexisting.

Examples

The following example shows how to display the contents of the internal Flash memory:

Command	Description
fragment	Provides additional management of packet fragmentation and improves compatibility with NFS.
show running-config fragment	Displays the IP fragment reassembly configuration.

To display the garbage collection process statistics, use the **show gc** command in privileged EXEC mode.

show gc

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behaviors or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode Security Context				
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	•

This command was preexisting.

Command History Release Modification

Preexisting

Examples

The following is sample output from the **show gc** command:

hostname# show gc

Garbage collection process stats:		
Total tcp conn delete response	:	0
Total udp conn delete response	:	0
Total number of zombie cleaned	:	0
Total number of embryonic conn cleaned	:	0
Total error response	:	0
Total queries generated	:	0
Total queries with conn present response	:	0
Total number of sweeps	:	946
Total number of invalid vcid	:	0
Total number of zombie vcid	:	0

<b>Related Commands</b>	Command	Description
clear gc		Removes the garbage collection process statistics.

26-49

### show h225

To display information for H.225 sessions established across the security appliance, use the **show h225** command in privileged EXEC mode.

show h225

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode Security Context				
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	•

Command History	Release	Modification
Preexisting		This command was preexisting.

**Usage Guidelines** The **show h225** command displays information for H.225 sessions established across the security appliance. Along with the **debug h323 h225 event**, **debug h323 h245 event**, and **show local-host** commands, this command is used for troubleshooting H.323 inspection engine issues.

Before using the **show h225**, **show h245**, or **show h323-ras** commands, we recommend that you configure the **pager** command. If there are a lot of session records and the **pager** command is not configured, it may take a while for the **show** output to reach its end. If there is an abnormally large number of connections, check that the sessions are timing out based on the default timeout values or the values set by you. If they are not, then there is a problem that needs to be investigated.

#### Examples

The following is sample output from the **show h225** command:

hostname# show h225
Total H.323 Calls: 1
1 Concurrent Call(s) for
| Local: | 10.130.56.3/1040 | Foreign: 172.30.254.203/1720
| 1. CRV 9861
| Local: | 10.130.56.3/1040 | Foreign: 172.30.254.203/1720
0 Concurrent Call(s) for
| Local: | 10.130.56.4/1050 | Foreign: 172.30.254.205/1720

This output indicates that there is currently 1 active H.323 call going through the security appliance between the local endpoint 10.130.56.3 and foreign host 172.30.254.203, and for these particular endpoints, there is 1 concurrent call between them, with a CRV (Call Reference Value) for that call of 9861.

For the local endpoint 10.130.56.4 and foreign host 172.30.254.205, there are 0 concurrent Calls. This means that there is no active call between the endpoints even though the H.225 session still exists. This could happen if, at the time of the **show h225** command, the call has already ended but the H.225 session has not yet been deleted. Alternately, it could mean that the two endpoints still have a TCP connection opened between them because they set "maintainConnection" to TRUE, so the session is kept open until they set it to FALSE again, or until the session times out based on the H.225 timeout value in your configuration.

Related Commands	Commands	Description
	debug h323	Enables the display of debug information for H.323.
	inspect h323	Enables H.323 application inspection.
	show h245	Displays information for H.245 sessions established across the security appliance by endpoints using slow start.
	show h323-ras	Displays information for H.323 RAS sessions established across the security appliance.
	timeout h225   h323	Configures idle time after which an H.225 signalling connection or an H.323 control connection will be closed.

### show h245

To display information for H.245 sessions established across the security appliance by endpoints using slow start, use the **show h245** command in privileged EXEC mode.

show h245

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	Firewall Mode		Security Context	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	•

Command History	Release	Modification
	Preexisting	This command was preexisting.

Usage GuidelinesThe show h245 command displays information for H.245 sessions established across the security<br/>appliance by endpoints using slow start. (Slow start is when the two endpoints of a call open another<br/>TCP control channel for H.245. Fast start is where the H.245 messages are exchanged as part of the<br/>H.225 messages on the H.225 control channel.) Along with the debug h323 h245 event, debug h323<br/>h225 event, and show local-host commands, this command is used for troubleshooting H.323 inspection<br/>engine issues.

#### Examples

The following is sample output from the **show h245** command:

hostname# show h245
Total: 1
 | LOCAL | TPKT | FOREIGN | TPKT
1 | 10.130.56.3/1041 | 0 | 172.30.254.203/1245 | 0
 | MEDIA: LCN 258 Foreign 172.30.254.203 RTP 49608 RTCP 49609
 | Local | 10.130.56.3 RTP 49608 RTCP 49609
 | MEDIA: LCN 259 Foreign 172.30.254.203 RTP 49606 RTCP 49607
 | Local | 10.130.56.3 RTP 49606 RTCP 49607

There is currently one H.245 control session active across the security appliance. The local endpoint is 10.130.56.3, and we are expecting the next packet from this endpoint to have a TPKT header because the TPKT value is 0. (The TKTP header is a 4-byte header preceding each H.225/H.245 message. It gives

the length of the message, including the 4-byte header.) The foreign host endpoint is 172.30.254.203, and we are expecting the next packet from this endpoint to have a TPKT header because the TPKT value is 0.

The media negotiated between these endpoints have a LCN (logical channel number) of 258 with the foreign RTP IP address/port pair of 172.30.254.203/49608 and a RTCP IP address/port of 172.30.254.203/49609 with a local RTP IP address/port pair of 10.130.56.3/49608 and a RTCP port of 49609.

The second LCN of 259 has a foreign RTP IP address/port pair of 172.30.254.203/49606 and a RTCP IP address/port pair of 172.30.254.203/49607 with a local RTP IP address/port pair of 10.130.56.3/49606 and RTCP port of 49607.

Related Commands	Commands	Description
	debug h323	Enables the display of debug information for H.323.
	inspect h323	Enables H.323 application inspection.
	show h245	Displays information for H.245 sessions established across the security appliance by endpoints using slow start.
	show h323-ras	Displays information for H.323 RAS sessions established across the security appliance.
	timeout h225   h323	Configures idle time after which an H.225 signalling connection or an H.323 control connection will be closed.

#### show h323-ras

To display information for H.323 RAS sessions established across the security appliance between a gatekeeper and its H.323 endpoint, use the **show h323-ras** command in privileged EXEC mode.

show h323-ras

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall M	Firewall Mode		Security Context	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	•	•	•	•

Command History	Release	Modification
	Preexisting	This command was preexisting.

**Usage Guidelines** The **show h323-ras** command displays information for H.323 RAS sessions established across the security appliance between a gatekeeper and its H.323 endpoint. Along with the **debug h323 ras event** and **show local-host** commands, this command is used for troubleshooting H.323 RAS inspection engine issues.

The **show h323-ras** command displays connection information for troubleshooting H.323 inspection engine issues, and is described in the **inspect protocol h323 {h225 | ras**} command page.

Examples

The following is sample output from the **show h323-ras** command:

hostname# **show h323-ras** Total: 1 |GK|Caller |172.30.254.214 10.130.56.14 hostname#

This output shows that there is one active registration between the gatekeeper 172.30.254.214 and its client 10.130.56.14.

**Related Commands** 

Commands	Description		
debug h323	Enables the display of debug information for H.323.		
inspect h323	Enables H.323 application inspection.		
show h245	Displays information for H.245 sessions established across the security appliance by endpoints using slow start.		
show h323-ras	Displays information for H.323 RAS sessions established across the security appliance.		
timeout h225   h323	Configures idle time after which an H.225 signalling connection or an H.323 control connection will be closed.		

#### show history

To display the previously entered commands, use the **show history** command in user EXEC mode.

show history

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode Sec		Security (	Security Context	
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
User EXEC	•	•	•	•	•

<b>Command History</b>	Release	Modification
	Preexisting	This command was preexisting.

**Usage Guidelines** The **show history** command lets you display previously entered commands. You can examine commands individually with the up and down arrows, enter **^p** to display previously entered lines, or enter **^n** to display the next line.

Examples

The following example shows how to display previously entered commands when you are in user EXEC mode:

hostname> **show history** show history help show history

The following example shows how to display previously entered commands in privileged EXEC mode:

hostname# show history
 show history
 help
 show history
 enable
 show history

This example shows how to display previously entered commands in global configuration mode:

```
hostname(config)# show history
    show history
    help
```

show h	istory
enable	
show h	istory
config	t
show h	istory

<b>Related Commands</b>	Command	Description
	help	Displays help information for the command specified.

# show icmp

To display the ICMP configuration, use the **show icmp** command in privileged EXEC mode.

show icmp

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	Firewall Mode		Security Context	
	Routed	Transparent		Multiple	
Command Mode			Single	Context	System
Privileged EXEC	•	•	•	•	•

Command History	Release	Modification
	Preexisting	This command was previously existing.

**Usage Guidelines** The **show icmp** command displays the ICMP configuration.

**Examples** The following example shows the ICMP configuration: hostname# **show icmp** 

<b>Related Commands</b>	clear configure icmp	Clears the ICMP configuration.
	debug icmp	Enables the display of debug information for ICMP.
	icmp	Configures access rules for ICMP traffic that terminates at a security appliance interface.
	inspect icmp	Enables or disables the ICMP inspection engine.
	timeout icmp	Configures the idle timeout for ICMP.

To display information about the status of interface descriptor blocks, use the **show idb** command in privileged EXEC mode.

show idb

**Syntax Description** This command has no arguments or keywords.

Defaults

No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall M	Firewall Mode		Security Context		
				Multiple	Multiple	
Command Mode	Routed	Transparent	Single	Context	System	
User EXEC	•	•	•	_	•	

Command History	Release	Modification
	7.0(1)	This command was introduced.

**Usage Guidelines** IDBs are the internal data structure representing interface resources. See the "Examples" section for a description of the display output.

Examples

The following is sample output from the **show idb** command:

### show interface

To view interface statistics, use the show interface command in privileged EXEC mode.

show interface [{physical\_interface | redundantnumber}[.subinterface] | mapped\_name |
interface\_name | vlan number] [stats | detail]

Syntax Description	detail	· •		tailed interface		-		
				vas added, the statistics, if er	-		al state, and ommand. If you	
	show all interfaces, then information about the internal interfaces for SSMs displays if installed on the ASA 5500 series adaptive security appliance. The							
	displays, if installed on the ASA 5500 series adaptive security appl internal interface is not user-configurable, and the information is							
		debugging p			uruore, une			
	<i>interface_name</i> (Optional) Identifies the interface name set with the <b>nameif</b> command.							
	mapped_name	· • • /	1	e context mod l <b>ocate-interfa</b>		11	name if it was	
	physical_interface	· •		the interface I for accepted va		gigabitethern	et 0/1. See the	
	<b>redundant</b> number	(Optional) Id	dentifies	the redundant	interface I	D, such as <b>red</b>	dundant1.	
	stats	default, so this keyword is optional.						
	subinterface							
	vlan number(Optional) For models with a built-in switch, such as the ASA 5505 adaptive security appliance, specifies the VLAN interface.							
Defaults	If you do not identify any options, this command shows basic statistics for all interfaces.							
Command Modes	The following table sh	lows the modes i	n which	you can enter	the comma	nd:		
		Firewall Mode Security Context				ontext		
						Multiple		
	Command Mode		ted	Transparent	Single	Context	System	
	Privileged EXEC	•		•	•	•	•	
Command History	Release	Modification	1					
-	7.0(1)			nodified to incl keyword for cl			bering scheme, ord.	
	7.0(4)			l support for th	-			

Release	Modification
7.2(1)	This command added support for switch interfaces.
8.0(2)	This command added support for redundant interfaces. Also, the delay is added for subinterfaces. Two new counters were added: input reset drops and output reset drops.

#### **Usage Guidelines**

If an interface is shared among contexts, and you enter this command within a context, the security appliance shows only statistics for the current context. When you enter this command in the system execution space for a physical interface, the security appliance shows the combined statistics for all contexts.

The number of statistics shown for subinterfaces is a subset of the number of statistics shown for a physical interface.

You cannot use the interface name in the system execution space, because the **nameif** command is only available within a context. Similarly, if you mapped the interface ID to a mapped name using the **allocate-interface** command, you can only use the mapped name in a context. If you set the **visible** keyword in the **allocate-interface** command, the security appliance shows the interface ID in the output of the **show interface** command.

Note

The number of bytes transmitted or received in the Hardware count and the Traffic Statistics count are different.

In the hardware count, the amount is retrieved directly form hardware, and reflects the Layer 2 packet size. While in traffic statistics, it reflects the Layer 3 packet size.

The count difference is varied based upon the design of the interface card hardware.

For example, for a Fast Ethernet card, the Layer 2 count is 14 bytes greater than the traffic count, because it includes the Ethernet header. On the Gigabit Ethernet card, the Layer 2 count is 18 bytes greater than the traffic count, because it includes both the Ethernet header and the CRC.

See the "Examples" section for a description of the display output.

Examples	The following is sample output from the <b>show interface</b> command:
	hostname# <b>show interface</b>
	Interface GigabitEthernet0/0 "outside", is up, line protocol is up Hardware is i82546GB rev03, BW 1000 Mbps, DLY 1000 usec

#### Table 26-1 shows each field description.

Table 26-12	show interface Fields

Field	Description	
Interface <i>ID</i>	The interface ID. Within a context, the security appliance shows the mapped nan (if configured), unless you set the <b>allocate-interface</b> command <b>visible</b> keywor	
"interface_name"	The interface name set with the <b>nameif</b> command. In the system execution space, this field is blank because you cannot set the name in the system. If you do not configure a name, the following message appears after the Hardware line:	
	Available but not configured via nameif	
is state	The administrative state, as follows:	
	• up—The interface is not shut down.	
	• administratively down—The interface is shut down with the <b>shutdown</b> command.	
Line protocol is <i>state</i>	The line status, as follows:	
	• up—A working cable is plugged into the network interface.	
	• down—Either the cable is incorrect or not plugged into the interface connector.	
VLAN identifier	For subinterfaces, the VLAN ID.	
Hardware	The interface type, maximum bandwidth, delay, duplex, and speed. When the link is down, the duplex and speed show the configured values. When the link is up, these fields show the configured values with the actual settings in parentheses. The following list describes the common hardware types:	
	• i82542 - Intel PCI Fiber Gigabit card used on PIX platforms	
	• i82543 - Intel PCI-X Fiber Gigabit card used on PIX platforms	
	• i82546GB - Intel PCI-X Copper Gigabit used on ASA platforms	
	• i82547GI - Intel CSA Copper Gigabit used as backplane on ASA platforms	
	• i82557 - Intel PCI Copper Fast Ethernet used on ASA platforms	
	• i82559 - Intel PCI Copper Fast Ethernet used on PIX platforms	
	• VCS7380 - Vitesse Four Port Gigabit Switch used in SSM-4GE	
Media-type	(For 4GE SSM interfaces only) Shows if the interface is set as RJ-45 or SFP.	
message area	A message might be displayed in some circumstances. See the following examples:	
	• In the system execution space, you might see the following message:	
	Available for allocation to a context	
	• If you do not configure a name, you see the following message:	
	Available but not configured via nameif	
	• If an interface is a member of a redundant interface, you see the following message:	
	Active member of Redundant5	
MAC address	The interface MAC address.	

Field	Description	
MTU	The maximum size, in bytes, of packets allowed on this interface. If you do not s the interface name, this field shows "MTU not set."	
IP address	The interface IP address set using the <b>ip address</b> command or received from a DHCP server. In the system execution space, this field shows "IP address unassigned" because you cannot set the IP address in the system.	
Subnet mask	The subnet mask for the IP address.	
Packets input	The number of packets received on this interface.	
Bytes	The number of bytes received on this interface.	
No buffer	The number of received packets discarded because there was no buffer space in the main system. Compare this with the ignored count. Broadcast storms on Ethernet networks are often responsible for no input buffer events.	
Received:		
Broadcasts	The number of broadcasts received.	
Input errors	The number of total input errors, including the types listed below. Other input-related errors can also cause the input error count to increase, and some datagrams might have more than one error; therefore, this sum might exceed the number of errors listed for the types below.	
Runts	The number of packets that are discarded because they are smaller than the minimum packet size, which is 64 bytes. Runts are usually caused by collisions. They might also be caused by poor wiring and electrical interference.	
Giants	The number of packets that are discarded because they exceed the maximum packet size. For example, any Ethernet packet that is greater than 1518 bytes is considered a giant.	
CRC	The number of Cyclical Redundancy Check errors. When a station sends a frame, it appends a CRC to the end of the frame. This CRC is generated from an algorithm based on the data in the frame. If the frame is altered between the source and destination, the security appliance notes that the CRC does not match. A high number of CRCs is usually the result of collisions or a station transmitting bad data.	
Frame	rame The number of frame errors. Bad frames include packets with an incorrect len or bad frame checksums. This error is usually the result of collisions or a malfunctioning Ethernet device.	
Overrun	The number of times that the security appliance was incapable of handing receive data to a hardware buffer because the input rate exceeded the security appliance capability to handle the data.	
Ignored	This field is not used. The value is always 0.	
Abort	This field is not used. The value is always 0.	
L2 decode drops	The number of packets dropped because the name is not configured ( <b>nameif</b> command) or a frame with an invalid VLAN id is received.	
Packets output	The number of packets sent on this interface.	
Bytes	The number of bytes sent on this interface.	

Table 26-12	show interface Fields (continued)
-------------	-----------------------------------

Field	Description				
Underruns	The number of times that the transmitter ran faster than the security appliance could handle.				
Output Errors	The number of frames not transmitted because the configured maximum number of collisions was exceeded. This counter should only increment during heavy network traffic.				
Collisions	The number of messages retransmitted due to an Ethernet collision (single and multiple collisions). This usually occurs on an overextended LAN (Ethernet or transceiver cable too long, more than two repeaters between stations, or too many cascaded multiport transceivers). A packet that collides is counted only once by the output packets.				
Interface resets	The number of times an interface has been reset. If an interface is unable to transmit for three seconds, the security appliance resets the interface to restart transmission. During this interval, connection state is maintained. An interface reset can also happen when an interface is looped back or shut down.				
Babbles	Unused. ("babble" means that the transmitter has been on the interface longer than the time taken to transmit the largest frame.)				
Late collisions	The number of frames that were not transmitted because a collision occurred outside the normal collision window. A late collision is a collision that is detected late in the transmission of the packet. Normally, these should never happen. When two Ethernet hosts try to talk at once, they should collide early in the packet and both back off, or the second host should see that the first one is talking and wait.				
	If you get a late collision, a device is jumping in and trying to send the packet on the Ethernet while the security appliance is partly finished sending the packet. The security appliance does not resend the packet, because it may have freed the buffers that held the first part of the packet. This is not a real problem because networking protocols are designed to cope with collisions by resending packets. However, late collisions indicate a problem exists in your network. Common problems are large repeated networks and Ethernet networks running beyond the specification.				
Deferred	The number of frames that were deferred before transmission due to activity on the link.				
input reset drops	Counts the number of packets dropped in the RX ring when a reset occurs.				
output reset drops	Counts the number of packets dropped in the TX ring when a reset occurs.				
Rate limit drops	(For 4GE SSM interfaces only) The number of packets dropped if you configured the interface at non-Gigabit speeds and attempted to transmit more than 10 Mbps or 100 Mbps, depending on configuration				
Lost carrier	The number of times the carrier signal was lost during transmission.				
No carrier	Unused.				
Input queue (curr/max packets):	The number of packets in the input queue, the current and the maximum.				
Hardware	The number of packets in the hardware queue.				
Software	The number of packets in the software queue. Not available for Gigabit Ethernet				

Table 26-12	show interface Fields (continued)
-------------	-----------------------------------

interfaces.

Field	Description
Output queue (curr/max packets):	The number of packets in the output queue, the current and the maximum.
Hardware	The number of packets in the hardware queue.
Software	The number of packets in the software queue.
Traffic Statistics:	The number of packets received, transmitted, or dropped.
Packets input	The number of packets received and the number of bytes.
Packets output	The number of packets transmitted and the number of bytes.
Packets dropped	The number of packets dropped. Typically this counter increments for packets dropped on the accelerated security path (ASP), for example, if a packet is dropped due to an access list deny.
	See the <b>show asp drop</b> command for reasons for potential drops on an interface.
1 minute input rate	The number of packets received in packets/sec and bytes/sec over the last minute.
1 minute output rate	The number of packets transmitted in packets/sec and bytes/sec over the last minute.
1 minute drop rate	The number of packets dropped in packets/sec over the last minute.
5 minute input rate	The number of packets received in packets/sec and bytes/sec over the last 5 minutes.
5 minute output rate	The number of packets transmitted in packets/sec and bytes/sec over the last 5 minutes.
5 minute drop rate	The number of packets dropped in packets/sec over the last 5 minutes.
Redundancy Information:	For redundant interfaces, shows the member physical interfaces. The active interface has "(Active)" after the interface ID.
	If you have not yet assigned members, you see the following output:
	Members unassigned
Last switchover	For redundant interfaces, shows the last time the active interface failed over to the standby interface.

Table 26-12show interface Fields (continued)

The following is sample output from the **show interface** command on the ASA 5505 adaptive security appliance, which includes switch ports:

```
hostname# show interface
Interface Vlan1 "inside", is up, line protocol is up
  Hardware is EtherSVI, BW 100 Mbps, DLY 100 usec
        MAC address 00d0.2bff.449f, MTU 1500
        IP address 1.1.1.1, subnet mask 255.0.0.0
  Traffic Statistics for "inside":
        0 packets input, 0 bytes
        0 packets output, 0 bytes
        0 packets dropped
      1 minute input rate 0 pkts/sec, 0 bytes/sec
     1 minute output rate 0 pkts/sec, 0 bytes/sec
     1 minute drop rate, 0 pkts/sec
      5 minute input rate 0 pkts/sec, 0 bytes/sec
      5 minute output rate 0 pkts/sec, 0 bytes/sec
      5 minute drop rate, 0 pkts/sec
    Interface Ethernet0/0 "", is up, line protocol is up
     Hardware is 88E6095, BW 100 Mbps, DLY 1000 usec
           Auto-Duplex(Half-duplex), Auto-Speed(100 Mbps)
           Available but not configured via nameif
           MAC address 00d0.2bfd.6ec5, MTU not set
            IP address unassigned
            407 packets input, 53587 bytes, 0 no buffer
            Received 103 broadcasts, 0 runts, 0 giants
            0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
            0 L2 decode drops
            43 switch ingress policy drops
            0 packets output, 0 bytes, 0 underruns
            0 output errors, 0 collisions, 0 interface resets
            0 babbles, 0 late collisions, 0 deferred
            0 lost carrier, 0 no carrier
            0 rate limit drops
            0 switch egress policy drops
```

Table 26-14 shows each field description for the **show interface** command for switch interfaces, such as those for the ASA 5505 adaptive security appliance. See Table 26-1 for fields that are also shown for the **show interface** command.

Field	Description			
switch ingress policy drops	This drop is usually seen when a port is not configured correctly. This drop is incremented when a packet cannot be successfully forwarded within switch ports as a result of the default or user configured switch port settings. The following configurations are the likely reasons for this drop:			
	• The <b>nameif</b> command was not configured on the VLAN interface.			
	<b>Note</b> For interfaces in the same VLAN, even if the <b>nameif</b> command was not configured, switching within the VLAN is successful, and this counter does not increment.			
	• The VLAN is shut down.			
	• An access port received an 802.1Q-tagged packet.			
	• A trunk port received a tag that is not allowed or an untagged packet.			
	• The security appliance is connected to another Cisco device that has Ethernet keepalives. For example, Cisco IOS software uses Ethernet loopback packets to ensure interface health. This packet is not intended to be received by any other device; the health is ensured just by being able to send the packet. These types of packets are dropped at the switch port, and the counter increments.			
	• The VLAN only has one physical interface, but the DEST of the packet does not match the MAC address of the VLAN, and it is not the broadcast address.			
switch egress policy drops	Not currently in use.			

Table 26-13show interface for Switch Interfaces Fields

The following is sample output from the **show interface detail** command. The following example shows detailed interface statistics for all interfaces, including the internal interfaces (if present for your platform) and asymmetrical routing statistics, if enabled by the **asr-group** command:

```
hostname# show interface detail
Interface GigabitEthernet0/0 "outside", is up, line protocol is up
  Hardware is i82546GB rev03, BW 1000 Mbps, DLY 1000 usec
        Auto-Duplex(Full-duplex), Auto-Speed(100 Mbps)
        MAC address 000b.fcf8.c44e, MTU 1500
        IP address 10.86.194.60, subnet mask 255.255.254.0
        1330214 packets input, 124580214 bytes, 0 no buffer
        Received 1216917 broadcasts, 0 runts, 0 giants
        0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
        9 L2 decode drops
        124863 packets output, 86956597 bytes, 0 underruns
        0 output errors, 0 collisions
        0 late collisions, 0 deferred
        input queue (curr/max packets): hardware (0/7)
        output queue (curr/max packets): hardware (0/13)
  Traffic Statistics for "outside":
        1330201 packets input, 99995120 bytes
        124863 packets output, 84651382 bytes
        525233 packets dropped
  Control Point Interface States:
```

```
Interface number is 1
        Interface config status is active
        Interface state is active
Interface Internal-Data0/0 "", is up, line protocol is up
  Hardware is i82547GI rev00, BW 1000 Mbps, DLY 1000 usec
        (Full-duplex), (1000 Mbps)
        MAC address 0000.0001.0002, MTU not set
        IP address unassigned
        6 packets input, 1094 bytes, 0 no buffer
        Received 6 broadcasts, 0 runts, 0 giants
        0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
        0 L2 decode drops, 0 demux drops
        0 packets output, 0 bytes, 0 underruns
        0 output errors, 0 collisions
        0 late collisions, 0 deferred
        input queue (curr/max packets): hardware (0/2) software (0/0)
        output queue (curr/max packets): hardware (0/0) software (0/0)
   Control Point Interface States:
        Interface number is unassigned
. . .
```

Table 26-14 shows each field description for the **show interface detail** command. See Table 26-1 for fields that are also shown for the **show interface** command.

Field	Description
Demux drops	(On Internal-Data interface only) The number of packets dropped because the security appliance was unable to demultiplex packets from SSM interfaces. SSM interfaces communicate with the native interfaces across the backplane, and packets from all SSM interfaces are multiplexed on the backplane.
Control Point Interface States:	
Interface number	A number used for debugging that indicates in what order this interface was created, starting with 0.
Interface config status	<ul> <li>The administrative state, as follows:</li> <li>active—The interface is not shut down.</li> <li>not active—The interface is shut down with the shutdown command.</li> </ul>
Interface state	The actual state of the interface. In most cases, this state matches the config status above. If you configure high availability, it is possible there can be a mismatch because the security appliance brings the interfaces up or down as needed.
Asymmetrical Routing Statistics:	
Received X1 packets	Number of ASR packets received on this interface.
Transmitted X2 packets	Number of ASR packets sent on this interfaces.
Dropped X3 packets	Number of ASR packets dropped on this interface. The packets might be dropped if the interface is down when trying to forward the packet.

Table 26-14 show interface detail Fields

### **Related Commands**

Command	Description		
allocate-interface	Assigns interfaces and subinterfaces to a security context.		
clear interface	Clears counters for the <b>show interface</b> command.		
delay	Changes the delay metric for an interface.		
interface	Configures an interface and enters interface configuration mode.		
nameif	Sets the interface name.		
show interface ip brief	Shows the interface IP address and status.		

# show interface ip brief

To view interface IP addresses and status, use the **show interface ip brief** command in privileged EXEC mode.

show interface [physical\_interface[.subinterface] | mapped\_name | interface\_name | vlan number]
ip brief

Syntax Description	<i>interface_name</i> (Optional) Identifies the interface name set with the <b>nameif</b> command.							
	mapped_name	(Optional) In multiple context mode, identifies the mapped name if it was assigned using the <b>allocate-interface</b> command.						
	physical_interface	(Optional) Identifies the interface ID, such as <b>gigabitethernet0/1</b> . See the <b>interface</b> command for accepted values.						
	subinterface		nal) Identifie subinterface	es an integer bet e.	ween 1 and	4294967293 d	lesignating a	
	vlan number	· •		els with a built-i specifies the VI			5505 adaptive	
Defaults	If you do not specify	an interface.	, the securit	y appliance show	vs all interfa	aces.		
Command Modes	The following table sl	hows the mc	odes in whic	h you can enter	the comman	nd:		
			Firewall M	lode	Security Context			
						Multiple		
	Command Mode		Routed	Transparent <sup>1</sup>	<sup>1</sup> Single	Context	System	
	Privileged EXEC		•	•	•	•		
	1. Available for the Management 0/0 interface or subinterface only.							
Command History	Release	Modific	cation					
	7.0(1)	This co	mmand was	introduced.				
	7.2(1)							
Usage Guidelines	In multiple context mode, if you mapped the interface ID in the <b>allocate-interface</b> command, you can only specify the mapped name or the interface name in a context. See the "Examples" section for a description of the display output.							
Examples	nples The following is sample output from the show ip brief command: hostname# show interface ip brief							

Interface	IP-Address	OK?	Method	Status	Protocol
Control0/0	127.0.1.1	YES	CONFIG	up	up
GigabitEthernet0/0	209.165.200.226	YES	CONFIG	up	up
GigabitEthernet0/1	unassigned	YES	unset	administratively dow	n down
GigabitEthernet0/2	10.1.1.50	YES	manual	administratively dow	n down
GigabitEthernet0/3	192.168.2.6	YES	DHCP	administratively dow	n down
Management0/0	209.165.201.3	YES	CONFIG	up	

Table 26-14 shows each field description.

Table 26-15	show interface ip brief Fields
-------------	--------------------------------

Field	Description					
Interface	The interface ID or, in multiple context mode, the mapped name if you configured it using the <b>allocate-interface</b> command. If you show all interfaces, then information about the internal interface for the AIP SSM displays, if installed on the ASA adaptive security appliance. The internal interface is not user-configurable, and the information is for debugging purposes only.					
IP-Address	The interface IP address.					
OK?	This column is not currently used, and always shows "Yes."					
Method	The method by which the interface received the IP address. Values include the following:					
	• unset—No IP address configured.					
	• manual—Configured the running configuration.					
	• CONFIG—Loaded from the startup configuration.					
	• DHCP—Received from a DHCP server.					
Status	The administrative state, as follows:					
	• up—The interface is not shut down.					
	• administratively down—The interface is shut down with the <b>shutdown</b> command.					
Protocol	The line status, as follows:					
	• up—A working cable is plugged into the network interface.					
	• down—Either the cable is incorrect or not plugged into the interface connector.					

<b>Related Commands</b>	Command	Description
	allocate-interface	Assigns interfaces and subinterfaces to a security context.
	interface	Configures an interface and enters interface configuration mode.
	ip address	Sets the IP address for the interface or sets the management IP address for a transparent firewall.
	nameif	Sets the interface name.
	show interface	Displays the runtime status and statistics of interfaces.

### show inventory

To display information about all of the Cisco products installed in the networking device that are assigned a product identifier (PID), version identifier (VID), and serial number (SN), use the **show inventory** command in user EXEC or privileged EXEC mode. If a Cisco entity is not assigned a PID, that entity is not retrieved or displayed.

show inventory [slot]

Syntax Description	slot       (Optional) Specifies the SSM slot number (the system is slot 0)							
Defaults	If you do not specify a slot t • Show inventory informa			ower suppl	y)			
Command Modes	The following table shows t	he modes in whic	ch you can enter	the comma	und:			
		Firewall N	lode	Security (	Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Global configuration	•	•	_		•		
Usage Guidelines	The <b>show inventory</b> command retrieves and displays inventory information about each Cisco product in the form of a UDI. The UDI is a combination of three separate data elements: a product identifier (PID), a version identifier (VID), and the serial number (SN).							
	The PID is the name by which the product can be ordered; it has been historically called the "Product Name" or "Part Number." This is the identifier that one would use to order an exact replacement part.							
	The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. The VID is incremented according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.							
	The SN is the vendor-unique serialization of the product. Each manufactured product will carry a unique serial number assigned at the factory, which cannot be changed in the field. This is the means by which to identify an individual, specific instance of a product.							
	The UDI refers to each product as an entity. Some entities, such as a chassis, will have subentities like slots. Each entity will display on a separate line in a logically ordered presentation that is arranged hierarchically by Cisco entities.							
	Use the <b>show inventory</b> command without options to display a list of Cisco entities installed in the networking device that are assigned a PID.							

### **Examples** The following is sample output from the **show inventory** command without any keywords or arguments.

This sample output displays a list of Cisco entities installed in a router that are assigned a PID.

```
ciscoasa# show inventory
Name: "Chassis", DESCR: "ASA 5540 Adaptive Security Appliance"
PID:ASA5540
                     , VID:V01 , SN:P3000000998
Name:"slot 1", DESCR:"ASA 5500 Series Security Services Module-20"
PID:ASA-SSM-20
                      , VID:V01 , SN:P0000000999
Name: "power supply", DESCR: "ASA 5500 Series 180W AC Power Supply"
PID:ASA-180W-PWR-AC , VID:V01 , SN:123456789AB
ciscoasa# show inventory 0
Name: "Chassis", DESCR: "ASA 5540 Adaptive Security Appliance"
PID:ASA5540
                      , VID:V01 , SN:P3000000998
ciscoasa# show inventory 1
Name: "slot 1", DESCR: "ASA 5500 Series Security Services Module-20"
PID:ASA-SSM-20
                      , VID:V01 , SN:P0000000999
```

Table 26-16describes the fields shown in the display.

Field Description Name Physical name (text string) assigned to the Cisco entity. For example, console or a simple component number (port or module number), such as "1," depending on the physical component naming syntax of the device. Equivalent to the entPhysicalName MIB variable in RFC 2737. DESCR Physical description of the Cisco entity that characterizes the object. Equivalent to the entPhysicalDesc MIB variable in RFC 2737. PID Entity product identifier. Equivalent to the entPhysicalModelName MIB variable in RFC 2737. VID Entity version identifier. Equivalent to the entPhysicalHardwareRev MIB variable in RFC 2737. SN Entity serial number. Equivalent to the entPhysicalSerialNum MIB variable in RFC 2737.

Table 26-16 show inventory Field Descriptions

<b>Related Commands</b>	Command	Description
	show diag	Displays diagnostic information about the controller, interface processor, and port adapters for a networking device.
	show tech-support	Displays general information about the router when it reports a problem.

## show ip address

To view interface IP addresses or, for transparent mode, the management IP address, use the **show ip address** command in privileged EXEC mode.

show ip address [physical\_interface[.subinterface] | mapped\_name | interface\_name |
 vlan number]

Syntax Description	interface_name	· 1		he interface n				
	mapped_name		-	context mod ocate-interfa			name if it was	
	physical_interface	(Optional) Identifies the interface ID, such as <b>gigabitethernet0/1</b> . See the <b>interface</b> command for accepted values.						
	<i>subinterface</i> (Optional) Identifies an integer between 1 and 4294967293 designating a logical subinterface.							
	vlan number	(Optional) Fe	or models	with a built-i ecifies the VI			A 5505 adaptive

#### Table 26-14 shows each field description.

#### Table 26-17 show ip address Fields

Field	Description
Interface	The interface ID or, in multiple context mode, the mapped name if you configured it using the <b>allocate-interface</b> command.
Name	The interface name set with the <b>nameif</b> command.
IP address	The interface IP address.
Subnet mask	The IP address subnet mask.
Method	The method by which the interface received the IP address. Values include the following:
	• unset—No IP address configured.
	• manual—Configured the running configuration.
	• CONFIG—Loaded from the startup configuration.
	• DHCP—Received from a DHCP server.

<b>Related Commands</b>	Command	Description
	allocate-interface	Assigns interfaces and subinterfaces to a security context.
	interface	Configures an interface and enters interface configuration mode.
	nameif	Sets the interface name.
	show interface	Displays the runtime status and statistics of interfaces.
	show interface ip brief	Shows the interface IP address and status.

### show ip address dhcp

To view detailed information about the DHCP lease or server for an interface, use the **show ip address dhcp** command in privileged EXEC mode.

show ip address {physical\_interface[.subinterface] | mapped\_name | interface\_name } dhcp
{lease | server }

Syntax Description	<i>interface_name</i> Identifies the interface name set with the <b>nameif</b> command.							
	lease	Shows i	informatior	n about the DHC	P lease.			
	mapped_name			t mode, identifies f <b>ace</b> command.	the mapped	l name if it was	assigned using	
	physical_interface	Identifies the interface ID, such as <b>gigabitethernet0/1</b> . See the <b>interface</b> command for accepted values.						
	server	Shows information about the DHCP server.						
	subinterface	Identifi subinter		er between 1 and	429496729	03 designating	a logical	
Defaults	No default behavior or	r values.

Next timer fires after:111797 secs
Retry count:0, Client-ID:cisco-0000.0000.0000-outside
Proxy: TRUE Proxy Network: 10.1.1.1
Hostname: device1
```

Table 26-14 shows each field description.

Field	Description
Temp IP Addr	The IP address assigned to the interface.
Temp sub net mask	The subnet mask assigned to the interface.
DHCP Lease server	The DHCP server address.
state	The state of the DHCP lease, as follows:
	• Initial—The initialization state, where the security appliance begins the process of acquiring a lease. This state is also shown when a lease ends or when a lease negotiation fails.
	• Selecting—The security appliance is waiting to receive DHCPOFFER messages from one or more DHCP servers, so it can choose one.
	• Requesting—The security appliance is waiting to hear back from the server to which it sent its request.
	• Purging—The security appliance is removing the lease because the client has released the IP address or there was some other error.
	• Bound—The security appliance has a valid lease and is operating normally.
	• Renewing—The security appliance is trying to renew the lease. It regularly sends DHCPREQUEST messages to the current DHCP server, and waits for a reply.
	• Rebinding—The security appliance failed to renew the lease with the original server, and now sends DHCPREQUEST messages until it gets a reply from any server or the lease ends.
	• Holddown—The security appliance started the process to remove the lease.
	• Releasing—The security appliance sends release messages to the server indicating that the IP address is no longer needed.
DHCP transaction id	A random number chosen by the client, used by the client and server to associate the request messages.
Lease	The length of time, specified by the DHCP server, that the interface can use this IP address.
Renewal	The length of time until the interface automatically attempts to renew this lease.

Table 26-18 show ip address dhcp lease Fields

Field	Description			
Rebind	The length of time until the security appliance attempts to rebind to a DHCP server. Rebinding occurs if the security appliance cannot communicate with the original DHCP server, and 87.5 percent of the lease time has expired. The security appliance then attempts to contact any available DHCP server by broadcasting DHCP requests.			
Temp default-gateway addr	The default gateway address supplied by the DHCP server.			
Temp ip static route0	The default static route.			
Next timer fires after	The number of seconds until the internal timer triggers.			
Retry count	If the security appliance is attempting to establish a lease, this field shows the number of times the security appliance tried sending a DHCP message. For example, if the security appliance is in the Selecting state, this value shows the number of times the security appliance sent discover messages. If the security appliance is in the Requesting state, this value shows the number of times the security appliance sent request messages.			
Client-ID	The client ID used in all communication with the server.			
Proxy	Specifies if this interface is a proxy DHCP client for VPN clients, True or False.			
Proxy Network	The requested network.			
Hostname	The client hostname.			

Table 26-18show ip address dhcp lease Fields (continued)

```

Table 26-19 shows each field description.

Table 26-19show ip address dhcp server Fields

Field	Description
DHCP server	The DHCP server address from which this interface obtained a lease. The top entry ("ANY") is the default server and is always present.
Leases	The number of leases obtained from the server. For an interface, the number of leases is typically 1. If the server is providing address for an interface that is running proxy for VPN, there will be several leases.

Field	Description
Offers	The number of offers from the server.
Requests	The number of requests sent to the server.
Acks	The number of acknowledgements received from the server.
Naks	The number of negative acknowledgements received from the server.
Declines	The number of declines received from the server.
Releases	The number of releases sent to the server.
Bad	The number of bad packets received from the server.
DNS0	The primary DNS server address obtained from the DHCP server.
DNS1	The secondary DNS server address obtained from the DHCP server.
WINS0	The primary WINS server address obtained from the DHCP server.
WINS1	The secondary WINS server address obtained from the DHCP server.
Subnet	The subnet address obtained from the DHCP server.
DNS Domain	The domain obtained from the DHCP server.

Sensor nar	ne		Sensor ID
ips1			1
ips2			2

<b>Related Commands</b>	Command	Description
	allocate-ips	Assigns a virtual sensor to a security context.
	ips	Diverts traffic to the AIP SSM.

### show ipsec sa

To display a list of IPSec SAs, use the **show ipsec sa** command in global configuration mode or privileged EXEC mode. You can also use the alternate form of this command: **show crypto ipsec sa**.

show ipsec sa [entry | identity | map map-name | peer peer-addr] [detail]

Syntax Description	detail	(Option	(Optional) Displays detailed error information on what is displayed.						
	entry	(Option	al) Display	s IPSec SAs sort	ted by peer	address			
	identity		al) Display a condense	s IPSec SAs for d form.	sorted by i	dentity, not inc	cluding ESPs.		
	map map-name			s IPSec SAs for	the specifi	ed crypto map.			
	<b>peer</b> <i>peer-addr</i> (Optional) Displays IPSec SAs for specified peer IP addresses.								
Defaults Command Modes	No default behavior	No default behavior or values.							
	The following table	The following table shows the modes in which you can enter the command:							
			Firewall N	lode	Security (				
	Command Mode		Routed	Transparent	Single	Multiple Context Syste			
	Global configuratio	n	•	•	•	_	_		
	Privileged EXEC		•	•	•	_	_		
Command History	Release	Release Modification							
	Preexisting	Preexisting This command was preexisting.							
Examples	The following example, entered in global configuration mode, displays IPSec SAs.								
	hostname(config)# <b>show ipsec sa</b> interface: outside2 Crypto map tag: def, local addr: 10.132.0.17

```

Fragmentation statistics are pre-fragmentation statistics if the IPSec SA policy states that fragmentation occurs before IPSec processing. Post-fragmentation statistics appear if the SA policy states that fragmentation occurs after IPSec processing.

The following example, entered in global configuration mode, displays IPSec SAs for a crypto map named def.

```
hostname(config) # show ipsec sa map def
cryptomap: def
    Crypto map tag: def, local addr: 172.20.0.17
      local ident (addr/mask/prot/port): (0.0.0.0/0.0.0.0/0/0)

	clear configure isakmp	Clears all the ISAKMP configuration.
	clear configure isakmp policy	Clears all ISAKMP policy configuration.
	clear isakmp sa	Clears the IKE runtime SA database.

Command	Description
isakmp enable	Enables ISAKMP negotiation on the interface on which the IPSec peer communicates with the security appliance.
show running-config isakmp	Displays all the active ISAKMP configuration.

### show ipsec sa summary

To display a summary of IPSec SAs, use the **show ipsec sa summary** command in global configuration mode or privileged EXEC mode.

#### show ipsec sa summary

Syntax Description This command has no arguments or variables.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context		
Command Mode				Multiple	
	Routed	Transparent	Single	Context	System
Global configuration	•	•	•	_	
Privileged EXEC	•	•	•	_	

Command History	Release	Modification
	7.0(1)	This command was introduced.

#### Examples

The following example, entered in global configuration mode, displays a summary of IPSec SAs by the following connection types:

- IPSec
- IPSec over UDP
- IPSec over NAT-T
- IPSec over TCP
- IPSec VPN load balancing

hostname(config) # show ipsec sa summary

Current IPSec SA	's:		Peak IPSec SA's:	
IPSec	:	2	Peak Concurrent SA :	14
IPSec over UDP	:	2	Peak Concurrent L2L :	0
IPSec over NAT-T	:	4	Peak Concurrent RA :	14
IPSec over TCP	:	6		
IPSec VPN LB	:	0		
Total	:	14		
hostname(config)#				

#### **Related Commands**

Command	Description	
clear ipsec sa	Removes IPSec SAs entirely or based on specific parameters.	
show ipsec sa	Displays a list of IPSec SAs.	
show ipsec stats	Displays a list of IPSec statistics.	

### show ipsec stats

To display a list of IPSec statistics, use the **show ipsec stats** command in global configuration mode or privileged EXEC mode.

show ipsec stats

Syntax Description This command has no keywords or variables.

**Defaults** No default behavior or values.

Release

7.0(1)

**Command Modes** The following table shows the modes in which you can enter the command:

**Modification** This command was introduced.

**Usage Guidelines** 

**s** The following table describes what the output entries indicate.

Output	Description
IPsec Global Statistics	This section pertains to the total number of IPsec tunnels that the security appliance supports.
Active tunnels	The number of IPsec tunnels that are currently connected.
Previous tunnels	The number of IPsec tunnels that have been connected, including the active ones.
Inbound	This section pertains to inbound encrypted traffic that is received through IPsec tunnels.
Bytes	The number of bytes of encrypted traffic that has been received.
Decompressed bytes	The number of bytes of encrypted traffic that were received after decompression was performed, if applicable. This counter should always be equal to the previous one if compression is not enabled.
Packets	The number of encrypted IPsec packets that were received.

Output (continued)	Description (continued)
Dropped packets	The number of encrypted IPsec packets that were received and dropped because of errors.
Replay failures	The number of anti-replay failure that were detected on received, encrypted IPsec packets.
Authentications	The number of successful authentications performed on received, encrypted IPsec packets.
Authentication failures	The number of authentications failure detected on received, encrypted IPsec packets.
Decryptions	The number of successful decryptions performed on received, encrypted IPsec packets.
Decryption failures	The number of decryptions failures detected on received, encrypted IPsec packets.
Decapsulated fragments needing reassembly	The number of decryption IPsec packets that include IP fragments to be reassembled.
Outbound	This section pertains to outbound cleartext traffic to be transmitted through IPsec traffic.
Bytes	The number of bytes of cleartext traffic to be encrypted and transmitted through IPsec tunnels.
Uncompressed bytes	The number of bytes of uncompressed cleartext traffic to be encrypted and transmitted through IPsec tunnels. The counter should always be equal to the previous one if compression is not enabled
Packets	The number of cleartext packets to be encrypted and transmitted through IPsec tunnels.
Dropped packets	The number of cleartext packets to be encrypted and transmitted through IPsec tunnels that have been dropped because of errors.
Authentications	The number of successful authentications performed on packets to be transmitted through IPsec tunnels.
Authentication failures	The number of authentication failures that were detected on packets to be transmitted through IPsec tunnels.
Encryptions	The number of successful encryptions that were performed on packets to be transmitted through IPsec tunnels.
Encryption failures	The number of encryption failures that were detected on packets to be transmitted through IPsec tunnels.
Fragmentation successes	The number of successful fragmentation operations that were performed as part of outbound IPsec packet transformation.
Pre-fragmentation successes	The number of successful prefragmentation operations that were performed as part of outbound IPsec packet transformation. Prefragmentation occurs before the cleartext packet is encrypted and encapsulated as one or more IPsec packets.

Output (continued)	Description (continued)
Post-fragmentation successes	The number of successful prefragmentation operations that were performed as part of outbound IPsec packet transformation. Post-fragmentation occurs after the cleartext packet is encrypted and encapsulated as an IPsec packet, which results in multiple IP fragments. These fragments must be reassembled before decryption.
Fragmentation failures	The number of fragmentation failures that have occurred during outbound IPsec packet transformation.
Pre-fragmentation failures	The number of prefragmentation failures that have occurred during outbound IPsec packet transformation. Prefragmentation occurs before the cleartext packet is encrypted and encapsulated as one or more IPsec packets.
Post-fragmentation failure	The number of post-fragmentation failure that have occurred during outbound IPsec packet transformation. Post-fragmentation occurs after the cleartext packet is encrypted and encapsulated as an IPsec packet, which results in multiple IP fragments. These fragments must be reassembled before decryption.
Fragments created	The number of fragments that were created as part of IPsec transformation.
PMTUs sent	The number of path MTU messages that were sent by the IPsec system. IPsec will send a PMTU message to an inside host that is sending packets that are too large to be transmitted through an IPsec tunnel after encapsulation. The PMTU message is a request for the host to lower its MTU and send smaller packets for transmission through the IPsec tunnel.
PMTUs recvd	The number of path MTU messages that were received by the IPsec system. IPsec will receive a path MTU message from a downstream network element if the packets it is sending through the tunnel are too large to traverse that network element. IPsec will usually lower its tunnel MTU when a path MTU message is received.
Protocol failures	The number of malformed IPsec packets that have been received.
Missing SA failures	The number of IPsec operations that have been requested for which the specified IPsec security association does not exist.
System capacity failures	The number of IPsec operations that cannot be completed because the capacity of the IPsec system is not high enough to support the data rate.

#### Examples

The following example, entered in global configuration mode, displays IPSec statistics: hostname(config)# **show ipsec stats** 

IPsec Global Statistics Active tunnels: 2 Previous tunnels: 9

```
Inbound
   Bytes: 4933013
   Decompressed bytes: 4933013
   Packets: 80348
   Dropped packets: 0
   Replay failures: 0
   Authentications: 80348
   Authentication failures: 0
   Decryptions: 80348
   Decryption failures: 0
   Decapsulated fragments needing reassembly: 0
Outbound
   Bytes: 4441740
   Uncompressed bytes: 4441740
   Packets: 74029
   Dropped packets: 0
   Authentications: 74029
   Authentication failures: 0
    Encryptions: 74029
    Encryption failures: 0
   Fragmentation successes: 3
       Pre-fragmentation successes:2
       Post-fragmentation successes: 1
   Fragmentation failures: 2
       Pre-fragmentation failures:1
       Post-fragmentation failures: 1
   Fragments created: 10
   PMTUs sent: 1
   PMTUs recvd: 2
Protocol failures: 0
Missing SA failures: 0
System capacity failures: 0
hostname(config)#
```

Related Commands	Command	Description
	clear ipsec sa	Clears IPSec SAs or counters based on specified parameters.
	crypto ipsec transform-set	Defines a transform set.
	show ipsec sa	Displays IPSec SAs based on specified parameters.
	show ipsec sa summary	Displays a summary of IPSec SAs.

## show ipv6 access-list

To display the IPv6 access list, use the **show ipv6 access-list** command in privileged EXEC mode. The IPv6 access list determines what IPv6 traffic can pass through the security appliance.

**show ipv6 access-list** [*id* [*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*]]

Syntax Description	any (Optional) An abbreviation for the IPv6 prefix ::/0.							
	host(Optional) IPv6 address of a specific host. When provided, only th rules for the specified host are displayed.							
	source-ipv6-address id	(Optional) The ac	-	-	ad only the en	acified access		
	ia	list is displayed.		nen provid	eu, onry the sp	eenneu access		
	source-ipv6-prefix  prefix-length	(Optional) IPv6 n access rules for th		-	-	, only the		
Defaults	Displays all IPv6 acces	s lists.						
Command Modes	The following table sho	ows the modes in whi	ich you can enter	the comma	ind:

#### **Related Commands**

Command	Description
ipv6 access-list	Creates an IPv6 access list.

## show ipv6 interface

To display the status of interfaces configured for IPv6, use the **show ipv6 interface** command in privileged EXEC mode.

show ipv6 interface [brief] [if\_name [prefix]]

Syntax Description	<b>brief</b> Displays a brief summary of IPv6 status and configuration for each interface.							
	<i>if_name</i> (Optional) The internal or external interface name, as designated by the <b>nameif</b> command. The status and configuration for only the designated interface is shown.							
	prefix			enerated from a the IPv6 addres		prefix pool. T	he prefix is the	
Defaults	Displays all IPv6 in	terfaces.						
Command Modes	The following table	shows the mo	odes in whic	h you can enter	the comma	ind:		
			Firewall M	ode	Security C	Context		
						Multiple		
	Command Mode		Routed	Transparent	Single	Context	System	
	Privileged EXEC		•	—	•	•	—	
Command History	Release Modification							
	7.0(1)This command was introduced.							
Usage Guidelines	The <b>show ipv6 inter</b> it is IPv6-specific. I provide two-way co	f the interface	e hardware is	s usable, the inte	erface is ma			
	When an interface n interface n interface name displ	-				ces is displaye	ed. Specifying ar	
Examples	The following is sar	nple output fi	rom the <b>shov</b>	v ipv6 interface	command:	:		
	hostname# <b>show ipv</b> interface ethernet IPv6 is enabled, Global unicast a 2000::2, subne Joined group ado FF02::1	t0 "outside" , link-local address(es): et is 2000::	is up, lir address is	-	-	IVE]		

```
FF02::1:FF11:6770
MTU is 1500 bytes
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
```

The following is sample output from the **show ipv6 interface** command when entered with the **brief** keyword:

```
hostname# show ipv6 interface brief
outside [up/up]
    unassigned
inside [up/up]
    fe80::20d:29ff:fe1d:69f0
    fec0::a:0:0:a0a:a70
vlan101 [up/up]
    fe80::20d:29ff:fe1d:69f0
    fec0::65:0:0:a0a:6570
dmz-ca [up/up]
    unassigned
```

The following is sample output from the **show ipv6 interface** command. It shows the characteristics of an interface which has generated a prefix from an address.

```
hostname# show ipv6 interface inside prefix
IPv6 Prefix Advertisements inside
Codes: A - Address, P - Prefix-Advertisement, O - Pool
U - Per-user prefix, D - Default N - Not advertised, C - Calendar
AD fec0:0:0:a::/64 [LA] Valid lifetime 2592000, preferred lifetime 604800
```

### show ipv6 mld traffic

To display the Multicast Listener Discovery (MLD) traffic counter information, use the **show ipv6 mld traffic** command in privileged EXEC mode.

#### show ipv6 mld traffic

Syntax Description This command has no keywords or variables.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall M	Firewall Mode		Security Context		
				Multiple	Multiple	
Command Mode	Routed	Transparent	Single	Context	System	
Privileged EXEC	•	—	•	•	_	

Command History	Release	Modification
	7.2(4)	This command was introduced.

**Usage Guidelines** The **show ipv6 mld traffic** command allows you to check if the expected number of MLD messages have been received and sent.

The following information is provided by the show ipv6 mld traffic command:

- Elapsed time since counters cleared—the amount of time since the counters were cleared.
- Valid MLD Packets—the number of valid MLD packets that are received and sent.
- Queries—the number of valid queries that are received and sent.
- **Reports**—the number of valid reports that are received and sent.
- Leaves—the number of valid leaves received and sent.
- Mtraee packets—the number of multicast trace packets that are received and sent.
- Errors—the types of errors and the number of errors that have occurred.

Examples	The following is sample output from the <b>show ipv6 mld traffic</b> command:
	hostname# show ipv6 mld traffic
	show ipv6 mld traffic
	MLD Traffic Counters
	Elapsed time since counters cleared: 00:01:19
	Received Sent
	Valid MLD Packets 1 3

Queries	1		0
Reports	0		3
Leaves	0		0
Mtrace packets	0	0	
Errors:			
Malformed Packets	0		
Martian source	0		
Non link-local sour	rce O		
Hop limit is not ea	qual to 1 0		

<b>Related Commands</b>	Command	Description
	clear ipv6 mld traffic	Resets all MLD traffic counters.

# show ipv6 neighbor

To display the IPv6 neighbor discovery cache information, use the **show ipv6 neighbor** command in privileged EXEC mode.

show ipv6 neighbor [if\_name | address]

<ul> <li>a static entry.</li> <li>Link-layer Addr—MAC address. If the address is unknown, a hyphen (-) is displayed.</li> <li>State—The state of the neighbor cache entry.</li> <li>Note Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache</li> </ul>	Syntax Description	<i>address</i> (Optional) Displays neighbor discovery cache information for the supplied IPv6 address only.								
Command Modes       The following table shows the modes in which you can enter the command:         Firewall Mode       Security Context         Command Mode       Routed       Transparent       Single       Context       System         Privileged EXEC       •       -       •       •       -       •       -         Command History       Release       Modification       7.0(1)       This command was introduced.       The following information is provided by the show ipv6 neighbor command:       IPv6 Address—the IPv6 address of the neighbor or interface.         Usage Guidelines       The following information is provided by the show ipv6 neighbor command:       IPv6 Address—the IPv6 address of the neighbor or interface.       Age—the time (in minutes) since the address was confirmed to be reachable. A hyphen (-) india a static entry.         Usate       Link-layer Addr—MAC address. If the address is unknown, a hyphen (-) is displayed.       State—The state of the neighbor cache entry.         Note       Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache therefore, the descriptions for the INCMP (Incomplete) and REACH (Reachable) states a different for dynamic and static cache entries.		if_name				supplied inter	face name, as

If the address is unknown, a hyphen (-) is displayed.								
therefore, the descriptions for the <b>INCMP</b> (Incomplete) and <b>REACH</b> (Reachable) states a different for dynamic and static cache entries.		• <b>State</b> —The state of the neighbor cache entry.								
therefore, the descriptions for the <b>INCMP</b> (Incomplete) and <b>REACH</b> (Reachable) states a different for dynamic and static cache entries.										
The following are possible states for dynamic entries in the IPv6 neighbor discovery cache:		therefore, the descriptions for the INCMP (Incomplete) and REACH (Reachable) states are								
The following are possible states for dynamic entries in the IPv6 neighbor discovery cache:										
- INCMP—(Incomplete) Address resolution is being performed on the entry. A neighbor			-			-	-			

Interface inside inside inside

- REACH—(Reachable) Positive confirmation was received within the last ReachableTime
  milliseconds that the forward path to the neighbor was functioning properly. While in REACH
  state, the device takes no special action as packets are sent.
- STALE—More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. While in STALE state, the device takes no action until a packet is sent.
- DELAY—More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. A packet was sent within the last DELAY\_FIRST\_PROBE\_TIME seconds. If no reachability confirmation is received within DELAY\_FIRST\_PROBE\_TIME seconds of entering the DELAY state, send a neighbor solicitation message and change the state to PROBE.
- PROBE—A reachability confirmation is actively sought by resending neighbor solicitation messages every RetransTimer milliseconds until a reachability confirmation is received.
- ????—Unknown state.

The following are possible states for static entries in the IPv6 neighbor discovery cache:

- INCMP—(Incomplete) The interface for this entry is down.
- **REACH**—(Reachable) The interface for this entry is up.
- Interface

Interface from which the address was reachable.

#### **Examples**

The following is sample output from the **show ipv6 neighbor** command when entered with an interface:

hostname# show ipv6 neighbor inside		
IPv6 Address	Age Link-layer Addr State	
2000:0:0:4::2	0 0003.a0d6.141e REACH	2
FE80::203:A0FF:FED6:141E	0 0003.a0d6.141e REACH	
3001:1::45a	- 0002.7d1a.9472 REACH	

The following is sample output from the **show ipv6 neighbor** command when entered with an IPv6 address:

hostname# show ipv6 neighbor 2000:0:0:4::2IPv6 AddressAge Link-layer Addr State Interface2000:0:0:4::20 0003.a0d6.141eREACH inside

<b>Related Commands</b>	Command	Description
	clear ipv6 neighbors	Deletes all entries in the IPv6 neighbor discovery cache, except static entries.
	ipv6 neighbor	Configures a static entry in the IPv6 neighbor discovery cache.

### show ipv6 route

To display the contents of the IPv6 routing table, use the **show ipv6 route** command in privileged EXEC mode.

show ipv6 route

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Privileged EXEC	•	—	•	•	

Command History	Release	Modification
	7.0(1)	This command was introduced.

**Usage Guidelines** The **show ipv6 route** command provides output similar to the **show route** command, except that the information is IPv6-specific.

The following information appears in the IPv6 routing table:

- Codes—Indicates the protocol that derived the route. Values are as follows:
  - C—Connected
  - L—Local
  - S—Static
  - **R**—RIP derived
  - **– B**—BGP derived
  - I1—ISIS L1—Integrated IS-IS Level 1 derived
  - I2—ISIS L2—Integrated IS-IS Level 2 derived
  - IA—ISIS interarea—Integrated IS-IS interarea derived
- **fe80::/10**—Indicates the IPv6 prefix of the remote network.
- [0/0]—The first number in the brackets is the administrative distance of the information source; the second number is the metric for the route.
- via ::--Specifies the address of the next router to the remote network.

• **inside**—Specifies the interface through which the next router to the specified network can be reached.

```
Examples
                   The following is sample output from the show ipv6 route command:
                   hostname# show ipv6 route
                   IPv6 Routing Table - 7 entries
                   Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
                          U - Per-user Static route
                          I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
                          O - OSPF intra, OI - OSPF inter, OE1 - OSPF ext 1, OE2 - OSPF ext 2
                       fe80::/10 [0/0]
                   L
                        via ::, inside
                        via ::, vlan101
                       fec0::a:0:0:a0a:a70/128 [0/0]
                   L
                        via ::, inside
                       fec0:0:0:a::/64 [0/0]
                   С
                        via ::, inside
                   L
                      fec0::65:0:0:a0a:6570/128 [0/0]
                        via ::, vlan101
                       fec0:0:0:65::/64 [0/0]
                   С
                        via ::, vlan101
                   L
                       ff00::/8 [0/0]
                        via ::, inside
                        via ::, vlan101
                       ::/0 [0/0]
                   S
```

via fec0::65:0:0:a0a:6575, vlan101

<b>Related Commands</b>	Command	Description
	debug ipv6 route	Displays debug messages for IPv6 routing table updates and route cache updates.
	ipv6 route	Adds a static entry to the IPv6 routing table.

# show ipv6 routers

To display IPv6 router advertisement information received from on-link routers, use the **show ipv6 routers** command in privileged EXEC mode.

show ipv6 routers [if\_name]

Syntax Description	<i>if_name</i> (Optional) The internal or external interface name, as designated by the <b>nameif</b> command, that you want to display information about.						
Defaults	No default behavio	or or values.

## show ipv6 traffic

To display statistics about IPv6 traffic, use the show ipv6 traffic command in privileged EXEC mode.

show ipv6 traffic

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

	Firewall Mode Securit			y Context		
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
Privileged EXEC	•	—	•	•	—	

 Release
 Modification

 7.0(1)
 This command was introduced.

**Usage Guidelines** Use the **clear ipv6 traffic** command to clear the traffic counters.

**Examples** The following is sample output from the show ipv6 traffic command: hostname# show ipv6 traffic IPv6 statistics: Rcvd: 545 total, 545 local destination 0 source-routed, 0 truncated 0 format errors, 0 hop count exceeded 0 bad header, 0 unknown option, 0 bad source 0 unknown protocol, 0 not a router 218 fragments, 109 total reassembled 0 reassembly timeouts, 0 reassembly failures Sent: 228 generated, 0 forwarded 1 fragmented into 2 fragments, 0 failed 0 encapsulation failed, 0 no route, 0 too big Mcast: 168 received, 70 sent ICMP statistics: Rcvd: 116 input, 0 checksum errors, 0 too short 0 unknown info type, 0 unknown error type unreach: 0 routing, 0 admin, 0 neighbor, 0 address, 0 port parameter: 0 error, 0 header, 0 option 0 hopcount expired, 0 reassembly timeout,0 too big 0 echo request, 0 echo reply 0 group query, 0 group report, 0 group reduce

```
0 router solicit, 60 router advert, 0 redirects
        31 neighbor solicit, 25 neighbor advert
  Sent: 85 output, 0 rate-limited
       unreach: 0 routing, 0 admin, 0 neighbor, 0 address, 0 port
        parameter: 0 error, 0 header, 0 option
        0 hopcount expired, 0 reassembly timeout,0 too big
        0 echo request, 0 echo reply
        0 group query, 0 group report, 0 group reduce
        0 router solicit, 18 router advert, 0 redirects
        33 neighbor solicit, 34 neighbor advert
UDP statistics:
 Rcvd: 109 input, 0 checksum errors, 0 length errors
        0 no port, 0 dropped
  Sent: 37 output
TCP statistics:
 Rcvd: 85 input, 0 checksum errors
  Sent: 103 output, 0 retransmitted
```
