

gateway through hw-module module shutdown Commands

gateway

To specify which group of call agents are managing a particular gateway, use the **gateway** command in MGCP map configuration mode. To remove the configuration, use the **no** form of this command.

gateway ip_address [group_id]

Syntax Description	gateway Specifies the group of call agents that are managing a particular gateway								
	ip_address	<i>ip_address</i> The IP address of the gateway.							
	group_id	The ID of t	he call agent g	group, from 0 to	214748364	17.			
Defaults	This command	is disabled by default.							
Command Modes	The following t	able shows the 1	modes in whic	h you can enter	the comma	nd:			
			Firewall N	lode	Security (Context			
						Multiple			
	Command Mode	9	Routed	Transparent	Single	Context	System		
	MGCP map configuration		•	•	•	•			
Command History	Release Modification								
ooninnana mistory	7.0(1)	This	command was	s introduced.					
Usage Guidelines	Use the gateway command to specify which group of call agents are managing a particular gateway IP address of the gateway is specified with the <i>ip_address</i> option. The <i>group_id</i> option is a number 0 to 4294967295 that must correspond with the <i>group_id</i> of the call agents that are managing the								
Examples The following example allows call agents 10.10.11.5 and 10.10.11.6 to control gateway 10.10.10.10.10.10.10.10.10.10.10.11.7 and 10.10.11.8 to control both gateways 10.10.10.10.116 and 10.10.10.117: hostname(config)# mgcp-map mgcp_policy hostname(config-mgcp-map)# call-agent 10.10.11.5 101 hostname(config-mgcp-map)# call-agent 10.10.11.6 101 hostname(config-mgcp-map)# call-agent 10.10.11.7 102 hostname(config-mgcp-map)# gateway 10.10.10.115 101 hostname(config-mgcp-map)# gateway 10.10.10.116 102 hostname(config-mgcp-map)# gateway 10.10.10.117 102						y 10.10.10.115, 6 and			

Related Commands	Commands	Description	
	debug mgcp	Enables the display of debug information for MGCP.	
	mgcp-map	Defines an MGCP map and enables MGCP map configuration mode.	
	show mgcpDisplays MGCP configuration and session information.		

global

To create a pool of mapped addresses for NAT, use the **global** command in global configuration mode. To remove the pool of addresses, use the **no** form of this command.

global (mapped_ifc) nat_id {mapped_ip[-mapped_ip] [netmask mask] | interface}

no global (*mapped_ifc*) *nat_id* {*mapped_ip*[*-mapped_ip*] [**netmask** *mask*] | **interface**}

Syntax Description	interface	Uses the interface IP address as the mapped address. Use this keyword if you want to use the interface address, but the address is dynamically assigned using DHCP.
	mapped_ifc	Specifies the name of the interface connected to the mapped IP address network.
	mapped_ip[-mapped_ip]	Specifies the mapped address(es) to which you want to translate the real addresses when they exit the mapped interface. If you specify a single address, then you configure PAT. If you specify a range of addresses, then you configure dynamic NAT.
		If the external network is connected to the Internet, each global IP address must be registered with the Network Information Center (NIC).
	nat_id	Specifies an integer for the NAT ID. This ID is referenced by the nat command to associate a mapped pool with the real addresses to translate.
		For regular NAT, this integer is between 1 and 2147483647. For policy NAT (nat id access-list), this integer is between 1 and 65535.
		Do not specify a global command for NAT ID 0; 0 is reserved for identity NAT and NAT exemption, which do not use a global command.
	netmask mask	(Optional) Specifies the network mask for the <i>mapped_ip</i> . This mask does not specify a network when paired with the <i>mapped_ip</i> ; rather, it specifies the subnet mask assigned to the <i>mapped_ip</i> when it is assigned to a host. If you want to configure a range of addresses, you need to specify <i>mapped_ip-mapped_ip</i> .
		If you do not specify a mask, then the default mask for the address class is used

Defaults No default behavior or values.

Command Modes The following table shows the modes in which you can enter the command:

	Firewall Mod	le	Security Context			
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
Global configuration	•	•	•	•	—	

Base NAT is now supported in transparent firewall mode. Usage Guidelines For dynamic NAT and PAT, you first configure a nat command identifying the real addresses on a given interface that you want to translate. Then you configure a separate global command to specify the mapped addresses when exiting another interface in the case of PAT, this is one addresses. Each nat command matches a global command by comparing the NAT ID, a number that you assign to each command. See the nat command for more information about dynamic NAT and PAT. If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT information is used, you can clear the translation table using clear state command. However, clearing the translation table disconnects all of the current connections. Examples For example, to translate the 10.1.1.0/24 network on the inside interface, enter the following command: hostnewstericorfigit a pool of addresses for dynamic NAT as well as a PAT address for when the NAT pool is exhausted, enter the following commands: hostnewstericorfigit plobal (outside) 1 109.155.201.1-209.155.201.20 To translate the low recurity dmz network addresses so they appear to be on the same network as the inside network (10.1.1.0), for example, to simplify routing, enter the following commands: hostname(configit i global (unside) 1 10.1.1.0.255.255.255.00 Mostname (configit i global (unside) 1 10.1.1.0.255.255.255.00 To translate the low recurity dmz network addresses so they appear to be on the same network as the inside network (10.1.1.0), for example, to simplify routing, enter the following commands: hostname(configit i global (unside) 1 10.1.1.45	Command History	Release Modification								
Usage Guidelines For dynamic NAT and PAT, you first configure a nat command identifying the real addresses on a given interface that you want to translate. Then you configure a separate global command to specify the mapped addresses when exiting another interface (in the case of PAT, this is one address). Each nat command matches a global command by comparing the NAT ID, a number that you assign to each command. See the nat command for more information about dynamic NAT and PAT. If you change the NAT configurea (addresse), you can chear the translation table using clear xlate command. However, clearing the translation table disconnects all of the current connections. Examples For example, to translate the 10.1.1.0/24 network on the inside interface, enter the following command: hostname(config)# global (outside) 1 209.165.201.1-209.165.201.30 To identify a pool of addresses for dynamic NAT as well as a PAT address for when the NAT pool is exhausted, enter the following commands: hostname(config)# global (outside) 1 209.165.201.1-209.165.201.20 To translate the lower security dmz network addresses so they appear to be on the same network tas the inside network (10.1.1.0, for example, to simplify routing, enter the following commands: hostname(config)# global (outside) 1 10.1.1.45 To identify a single real address with two different destination addresses using policy NAT, enter the following commands: hostname(config)# access-list NRT permit tp 10.1.2.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.1 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.0 255.255.255.0 209.165.201.1 255.255.		8.0(2)	NAT is now supported in transparent firewall mode.							
 Command matches a global command. by comparing the VAT 10, a number that you assign to each command. See the nat command for more information about dynamic NAT and PAT. If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT information is used, you can clear the translation table using clear klate command. However, clearing the translation table disconnects all of the current connections. Examples For example, to translate the 10.1.1.0/24 network on the inside interface, enter the following command: hostname(config)# global (outside) 1 100.1.1.0 255.255.255.0 hostname(config)# global (outside) 1 200.165.201.1-209.165.201.30 To identify a pool of addresses for dynamic NAT as well as a PAT address for when the NAT pool is exhausted, enter the following commands: hostname(config)# global (outside) 1 209.165.201.5 hostname(config)# global (outside) 1 209.165.201.5 hostname(config)# global (outside) 1 209.165.201.5 hostname(config)# ant (inside) 1 10.1.1.0 255.255.255.0 hostname(config)# global (outside) 1 209.165.201.5 hostname(config)# global (outside) 1 10.1.2.0 255.255.255.0 hostname(config)# ant (inside) 1 10.1.2.0 255.255.255.0 hostname(config)# global (inside) 1 10.1.2.0 255.255.255.0 009.165.201.0 255.255.254 hostname(config)# access-list NET1 permit ip 10.1.2.0 255.255.255.0 209.165.201.0 255.255.255.253.242 hostname(config)# global (outside) 1 209.155.202.120 To identify a single real address/destination address pair that use different ports using policy NAT, enter the following commands: hostname(config)# global (outside) 2 209.165.202.120 hostname(config)# global (outside) 2 209.155.202.120 hostname(config)# global (outside) 2 209.155.202.120 ho	Usage Guidelines	For dynamic NA interface that yo mapped address	For dynamic NAT and PAT, you first configure a nat command identifying the real addresses on a given interface that you want to translate. Then you configure a separate global command to specify the mapped addresses when exiting another interface (in the case of PAT, this is one address). Each nat							
See the nat command for more information about dynamic NAT and PAT. If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT information is used, you can clear the translation table using clear value command. However, clearing the translation table disconnects all of the current connections. Examples For example, to translate the 10.11.10/24 network on the inside interface, enter the following command: hostname(config)* net (inside) 1 10.11.0 255.255.255.0 hostname(config)* global (outside) 1 209.165.201.1209.165.201.30 To identify a pool of addresses for dynamic NAT as well as a PAT address for when the NAT pool is exhausted, enter the following commands: hostname(config)* global (outside) 1 209.165.201.10-209.165.201.20 To translate the lower security dmz network addresses so they appear to be on the same network as the inside network (10.1.1.0), for example, to simplify routing, enter the following commands: hostname(config)* global (unside) 1 10.1.2.0 255.255.250.0 unside dna hostname(config)* global (unside) 1 10.1.2.0 255.255.255.0 209.165.201.0 To translate the lower security dmz network addresses so they appear to be on the same network as the inside network (10.1.1.0), for example, to simplify routing, enter the following commands: hostname(config)* global (unside) 1 10.1.2.0 255.255.255.0 209.165.201.0 255.255.253.24 Hostname(config)* global (unside) 1 10.1.2.0 255.255.255.0 209.165.201.0 255.255.253.24 Hostname(config)* global (unside) 1 209.165.202.129 Hostname(config)* global (unside) 1 209.165.202.139 To identify a single real address/destination addresses using policy NAT, enter the following commands: hostname(config)* global (outside) 2 209.165.202.130 To identify a single real address/destination address pair that use different ports using policy NAT, enter the following commands: hostname(config)* global (outside) 2 209.165.202.130 To identify a single real address/destination address pair that use		command.	nes a giobai command by comparing the NAT 1D, a number that you assign to each							
If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT information is used, you can clear the translation table using clear xlate command. However, clearing the translation table disconnects all of the current connections. Examples For example, to translate the 10.1.1.0/24 network on the inside interface, enter the following command: hostname(config)* mat (inside) 1 209.165.201.1-209.165.201.30 To identify a pool of addresses for dynamic NAT as well as a PAT address for when the NAT pool is exhausted, enter the following commands: hostname(config)* mat (inside) 1 209.165.201.10 Nottname(config)* mat (inside) 1 10.1.1.0 255.255.255.0 hostname(config)* mat (inside) 1 209.165.201.10 To translate the lower security dmz network addresses so they appear to be on the same network as the inside network (10.1.1.0), for example, to simplify routing, enter the following commands: hostname(config)* mat (inside) 1 10.1.1.2.0 255.255.255.0 209.165.201.1 255.255.255.0 209.165.201.1 255.255.255.0 209.165.201.1 255.255.255.0 209.165.201.1 255.255.255.255.0 209.165.201.1 255.255.255.0 209.165.201.1 255.255.255.0 209.165		See the nat command for more information about dynamic NAT and PAT.								
Examples For example, to translate the 10.1.1.0/24 network on the inside interface, enter the following command: hostname(config)# global (outside) 1 209.165.201.1-209.165.201.30 To identify a pool of addresses for dynamic NAT as well as a PAT address for when the NAT pool is exhausted, enter the following commands: hostname(config)# nat (inside) 1 10.1.1.0 255.255.255.0 hostname(config)# global (outside) 1 209.165.201.5 hostname(config)# nat (inside) 1 10.1.1.0 255.255.255.0 hostname(config)# global (outside) 1 209.165.201.10-209.165.201.20 To translate the lower security dmz network addresses so they appear to be on the same network as the inside network (10.1.1.0), for example, to simplify routing, enter the following commands: hostname(config)# at (dmz) 1 10.1.2.0 255.255.255.0 outside dms hostname(config)# global (inside) 1 10.1.1.45 To identify a single real address with two different destination addresses using policy NAT, enter the following commands: hostname(config)# access-list NET1 permit ip 10.1.2.0 255.255.255.0 209.165.201.0 255.255.255.224 hostname(config)# access-list NET2 permit ip 10.1.2.0 255.255.250.0 209.165.200.224 255.255.255.224 hostname(config)# nat (inside) 1 access-list NET1 top 0 2000 udp 10000 hostname(config)# at (inside) 1 209.165.202.139 hostname(config)# at (inside) 2 access-list NET2 top 1000 500 udp 2000 hostname(config)# global (outside) 2 209.165.202.130 To identify a single real address/destination address pair that use different ports using policy NAT, enter the following commands: hostname(config)# access-list TELMET permit top 10.1.2.0 255.255.255.0 209.165.201.11 255.255.255.25 eg 23 hostname(config)# access-list TELMET permit top 10.1.2.0 255.255.255.0 209.165.201.11 255.255.255.25 eg 23 hostname(config)# access-list TELMET hostname(config)# access-list TE		If you change the before the new However, clear	If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT information is used, you can clear the translation table using clear xlate command. Related	Commands
---------	----------

ommands	Command	Description					
	clear configure global	Removes global commands from the configuration.					
	nat	Specifies the real addresses to translate.					
	show running-config global	Displays the global commands in the configuration.					
	static	Configures a one-to-one translation.					

group-alias

To create one or more alternate names by which the user can refer to a tunnel-group, use the **group-alias** command in tunnel-group webvpn configuration mode. To remove an alias from the list, use the **no** form of this command.

group-alias name [enable | disable]

no group-alias name

Syntax Description	disable Disables the group alias.								
	enable	Enables a previously disabled group alias.							
	name	Specifies the nar	ne of a tunnel grou	ıp alias. Th	is can be any s	tring you			
		choose, except th	at the string canno	ot contain s	spaces.				
Defaults	No default group alias, b	out if you do specif	y a group alias, th	at alias is e	enabled by defa	ult.			
Command Modes	The following table show	vs the modes in wh	iich you can enter	the comma	and:				
		Firewall	Mode	Security (Context				
					Multiple				
	Command Mode	Routed	Transparent	Single	Context	System			
	Tunnel-group webvpn configuration	•		•					
Command History	Delesse Medification								
Commanu History	netease Woullication 7 1(1) This command was introduced								
Usage Guidelines	The group alias that you specify here appears in the drop-down list on the login page. Each group can have multiple aliases or no alias. This command is useful when the same group is known by several common names, such as "Devtest" and "QA".								
Examples	The following example shows the commands for configuring the webvpn tunnel group named "devtest" and establishing the aliases "QA" and "Fra-QA" for the group:								
	<pre>hostname(config)# tunnel-group devtest type webvpn hostname(config)# tunnel-group devtest webvpn-attributes hostname(config-tunnel-webvpn)# group-alias QA hostname(config-tunnel-webvpn)# group-alias Fra-QA hostname(config-tunnel-webvpn)#</pre>								

Related Commands	Command	Description				
	clear configure tunnel-group	Clears the entire tunnel-group database or the named tunnel group configuration.				
	show webvpn group-alias	Displays the aliases for the specified tunnel group or for all tunnel groups.				
	tunnel-group webvpn-attributes	Enters the tunnel-group webvpn configuration mode for configuring WebVPN tunnel-group attributes.				

group-delimiter

To enable group-name parsing and specify the delimiter to be used when parsing group names from the user names that are received when tunnels are being negotiated, use the **group-delimiter** command in global configuration mode. To disable this group-name parsing, use the **no** form of this command.

group-delimiter delimiter

no group-delimiter

Syntax Description	delimiter Specifies the character to use as the group-name delimiter. Valid values are: @, #, and !.								
Defaults	By default, r	no delimiter is sp	ecified, disablin	g group-name pa	arsing.				
Command Modes	The followir	ng table shows th	e modes in whic	h you can enter	the comma	nd:			
	Fire		Firewall N	ewall Mode		Security Context			
						Multiple			
	Command M	lode	Routed	Transparent	Single	Context	System		
	Global configuration •		•		•				
Command History	Release Modification								
	7.0(1)This command was introduced.								
Usage Guidelines	The delimite default, no d	er is used to parse lelimiter is specif	e tunnel group n fied, disabling g	ames from user i oup-name parsi	names whe ng.	n tunnels are n	egotiated. By		
Examples	This example shows the group-delimiter command to change the group delimiter to the hash mark hostname(config)# group-delimiter #								
Related Commands	Command			Description					
	clear configure group-delimiter			Clears the configured group delimiter.					
	show running-config group-delimiter			Clears the config	gured group	o delimiter.			
	show runni	ng-config group	niter o-delimiter	Clears the config Displays the cur	gured group rent group-	delimiter. delimiter value	e.		

group-lock

To restrict remote users to access through the tunnel group only, issue the **group-lock** command in group-policy configuration mode or username configuration mode.

To remove the **group-lock** attribute from the running configuration, use the **no** form of this command. This option allows inheritance of a value from another group policy.

group-lock {value tunnel-grp-name | none}

no group-lock

Syntax Description	none	Sets group-lock to a null value, thereby allowing no group-lock restriction. Prevents inheriting a group-lock value from a default or specified group policy.							
	value tunnel-grp-name Specifies the name of an existing tunnel group that the adaptive secural appliance requires for the user to connect.								
Defaults	No default behavior or va	alues.							
Command Modes	The following table shows the modes in which you can enter the command:								
			Firewall N	Aode	Security (Context			
				_		Multiple			
	Command Mode		Kouted	Iransparent	Single	Context	System		
	Group-policyconfigurati	ion	•		•				
	Username configuration		•	—	•				
Usage Guidelines	To disable group-lock, use the group-lock none command. Group-lock restricts users by checking if the group configured in the VPN Client is the same as the tunnel group to which the user is assigned. If it is not, the adaptive security appliance prevents the user from connecting. If you do not configure group-lock, the adaptive security appliance authenticates users without regard to the assigned group.								
Command History	Release	Modifica	ification						
	7.0(1)	This con	ommand was introduced.						
Examples	The following example s hostname(config)# grou hostname(config-group-	shows how up-policy -policy)#	to set gro FirstGro group-lo	up lock for the g up attributes ck value tunnes	roup policy	y named FirstC	droup:		

group-object

To add network object groups, use the **group-object** command in protocol, network, service, and icmp-type configuration modes. To remove network object groups, use the **no** form of this command.

group-object obj_grp_id

no group-object *obj_grp_id*

Syntax Description	obj_grp_id	Identifies the object group (one to 64 characters) and can be any combination of letters, digits, and the "_", "-", "." characters.							
Defaults	No default behavio	r or values.							
Command Modes	The following table	e shows the r	nodes in whic	h you can enter	the comma	nd:			
			Firewall Mode		Security C	ontext			
						Multiple

This erarchical object		
	Duplicate objects are allowed in an object group if they are group objects. For example, if of both group A and group B, it is allowed to define a group C which includes both A and B. allowed, however, to include a group object which causes the group hierarchy to become cin example, it is not allowed to have group A include group B and then also have group B inclu								
•	The maximum allo	wed levels of	f a hierarchica	al object group i	s 10.				
Note	The security applia command for an ob	nce does not oject with IP	support IPv6 v6 entities in :	nested object gr t under another	oups, so yo IPv6 object	u cannot use th t-group.	ne group-object		

Examples

The following example shows how to use the **group-object** command in network configuration mode eliminate the need to duplicate hosts:

```
hostname(config)# object-group network host_grp_1
hostname(config-network)# network-object host 192.168.1.1
hostname(config-network)# network-object host 192.168.1.2
hostname(config)# object-group network host_grp_2
hostname(config-network)# network-object host 172.23.56.1
hostname(config-network)# network-object host 172.23.56.2
hostname(config)# object-group network all_hosts
hostname(config-network)# group-object host_grp_1
hostname(config-network)# group-object host_grp_2
hostname(config-network)# group-object host_grp_1
hostname(config-network)# group-object host_grp_2
hostname(config-network)# exit
hostname(config-network)# exit
hostname(config-network)# group-object host_grp_2
hostname(config)# access-list grp_1 permit tcp object-group host_grp_2 any eq smtp
hostname(config)# access-list all permit tcp object-group all-hosts any eq w
```

Related Commands	Command	Description
	clear configure object-group	Removes all the object-group commands from the configuration.
	network-object	Adds a network object to a network object group.
	object-group	Defines object groups to optimize your configuration.
	port-object	Adds a port object to a service object group.
	show running-config object-group	Displays the current object groups.

group-policy

To create or edit a group policy, use the **group-policy** command in global configuration mode. To remove a group policy from the configuration, use the **no** form of this command.

group-policy name {internal [from group-policy_name] | external server_group server_group
password server_password}

no group-policy name

Syntax Description	external server-groupSpecifies the group policy as external and identifies the AAA server group for the adaptive security appliance to query for attributes.					AAA server ributes.	
	from group-policy_name	from group-policy_name Initializes the attributes of this internal group policy to the values of a pre-existing group policy.					
	internal Identifies the group policy as internal.						
	<i>name</i> Specifies the name of the group policy. The name can be up to 64 characters long and can contain spaces. Group names with spaces must be enclosed in double quotes, for example, "Sales Group".						
	password server_password	Provides the pa AAA server gro cannot contain	ssword to use wl oup. The passwo spaces.	nen retrievin ord can be u	ng attributes fr p to 128 chara	om the external cters long and	
Defaults	No default behavior or value	s. See Usage Gu	idelines.				
Command Modes	The following table shows the modes in which you can enter the command:						
		Firewall N	lode	Security Context			
					Multiple		
	Command Mode	Routed	Transparent	Single	Context	System	
	Global configuration	•		•			
Command History	Polooso Modification						
Commanu mistory							
	7.0.1		s introduced.				
Usage Guidelines	A default group policy, named "DefaultGroupPolicy," always exists on the adaptive security appliance. However, this default group policy does not take effect unless you configure the adaptive security appliance to use it. For configuration instructions, see the <i>Cisco ASA 5500 Series Configuration Guide</i> using the CLI.						
	Use the group-policy attributes command to enter config-group-policy mode, in which you can configure any of the group-policy Attribute-Value Pairs. The DefaultGroupPolicy has these Attribute-Value Pairs:						

Attribute	Default Value
backup-servers	keep-client-config
banner	none
client-access-rules	none
client-firewall	none
default-domain	none
dns-server	none
group-lock	none
ip-comp	disable
ip-phone-bypass	disabled
ipsec-udp	disabled
ipsec-udp-port	10000
leap-bypass	disabled
nem	disabled
password-storage	disabled
pfs	disable
re-xauth	disable
secure-unit-authentication	disabled
split-dns	none
split-tunnel-network-list	none
split-tunnel-policy	tunnelall
user-authentication	disabled
user-authentication-idle-timeout	none
vpn-access-hours	unrestricted
vpn-filter	none
vpn-idle-timeout	30 minutes
vpn-session-timeout	none
vpn-simultaneous-logins	3
vpn-tunnel-protocol	IPSec WebVPN
wins-server	none

In addition, you can configure webvpn-mode attributes for the group policy, either by entering the **webvpn** command in config-group-policy mode or by entering the **group-policy attributes** command and then entering the **webvpn** command in config-group-webvpn mode. See the description of the **group-policy attributes** command for details.

Examples

The following example shows how to create an internal group policy with the name "FirstGroup":

hostname(config)# group-policy FirstGroup internal

The next example shows how to create an external group policy with the name "ExternalGroup," the AAA server group "BostonAAA," and the password "12345678":

hostname(config)# group-policy ExternalGroup external server-group BostonAAA password
12345678

Related Commands

Command	Description		
clear configure group-policy	Removes the configuration for a particular group policy or for all group policies.		
group-policy attributes	Enters config-group-policy mode, which lets you configure attributes and values for a specified group policy or lets you enter webvpn mode to configure webvpn attributes for the group.		
show running-config group-policy	Displays the running configuration for a particular group policy or for all group policies.		
webvpn	Enters config-group-webvpn mode, in which you can configure the WebVPN attributes for the specified group.		

group-policy attributes

To enter the config-group-policy mode, use the **group-policy attributes** command in global configuration mode. To remove all attributes from a group policy, user the **no** version of this command. In config-group-policy mode, you can configure Attribute-Value Pairs for a specified group policy or enter group-policy webvpn configuration mode to configure webvpn attributes for the group.

In addition, you can configure webvpn-mode attributes for the group policy, by entering the **group-policy attributes** command and then entering the **webvpn** command in config-group-policy mode. See the description of the **webvpn** command (group-policy attributes and username attributes modes) for details.

Examples

The following example shows how to enter group-policy attributes mode for the group policy named FirstGroup:

hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)#

Related Commands	Command	Description		
	clear configure group-policy	Removes the configuration for a particular group policy or for all group policies. Creates, edits, or removes a group policy.		
	group-policy			
	show running-config group-policy	Displays the running configuration for a particular group policy or for all group policies.		
	webvpn (group-policy attributes mode)	Enters config-group-webvpn mode, in which you can configure the WebVPN attributes for the specified group.		

group-prompt

To customize the group prompt of the WebVPN page login box that is displayed to WebVPN users when they connect to the security appliance, use the **group-prompt** command in webvpn customization configuration mode. To remove the command from the configuration and cause the value to be inherited, use the **no** form of this command.

group-prompt {text | style} value

no group-prompt {text | style} value

Syntax Description	text Specifies you are changing the text.							
	style Specifies you are changing the style.							
	value	The actua	al text to displa	y (maximum 2	256 characters	s), or Cascadin	g Style Sheet	
		(CSS) pa	rameters (max	imum 256 cha	racters).			
Defaults	The default text	of the group pror	npt is "GROU	P:".				
	The default style	e of the group pro	ompt is color:b	lack;font-weig	ght:bold;text-	align:right.		
Command Modes	The following ta	ble shows the mo	odes in which	you can enter	the command	:		
	-							
			Firewall Mod	le	Security Con	itext		
						Multiple		
	Command Mode		Routed	Transparent	Single	Context	System	
	Webvpn custom configuration	ization	•	—	•	—	—	
Command History	Release Modification							
-	7.1(1)This command was introduced.							
Usage Guidelines	The style option is expressed as any valid Cascading Style Sheet (CSS) parameters. Describing these parameters is beyond the scope of this document. For more information about CSS parameters, consult CSS specifications at the World Wide Web Consortium (W3C) website at www.w3.org. Appendix F of the CSS 2.1 Specification contains a convenient list of CSS parameters, and is available at www.w3.org/TR/CSS21/propidx.html.							
	Here are some tips for making the most common changes to the WebVPN pages—the page colors:							
	• You can use a comma-separated RGB value, an HTML color value, or the name of the color if recognized in HTML.							
	• RGB format comma sepa	is 0,0,0, a range rated entry indica	of decimal nur ates the level o	nbers from 0 to of intensity of	o 255 for each each color to	color (red, gr combine with	een, blue); the the others.	

• HTML format is #000000, six digits in hexadecimal format; the first and second represent red, the third and fourth green, and the fifth and sixth represent blue.

Note

To easily customize the WebVPN pages, we recommend that you use ASDM, which has convenient features for configuring style elements, including color swatches and preview capabilities.

Examples

In the following example, the text is changed to "Corporate Group:", and the default style is changed with the font weight increased to bolder:

F1-asa1(config)# webvpn
F1-asa1(config-webvpn)# customization cisco
F1-asa1(config-webvpn-custom)# group-prompt text Corporate Group:
F1-asa1(config-webvpn-custom)# group-prompt style font-weight:bolder

Related Commands	Command	Description
	password-prompt	Customizes the password prompt of the WebVPN page.
	username-prompt	Customizes the username prompt of the WebVPN page.

group-search-timeout

To specify the maximum time to wait for a response from an Active Directory server queried using the **show ad-groups** command, use the **group-search-timeout** command in AAA server host configuration mode. To remove the command from the configuration, use the **no** form of the command:

group-search-timeout seconds

no group-search-timeout seconds

Syntax Description	<i>seconds</i> The time to wait for a response from the Active Directory server, from 1 to 300 seconds.							
Defaults	The default is 10 se	econds.						
Command Modes	The following table	e shows the r	nodes in whic	h you can enter	the comma	und:

Each mand for ea p or https p	URL/address ca ch URL/addres rotocol.	an be enabled or ss specified. You		
	You cannot associate the same URL/address with multiple groups. The adaptive security appliance verifies the uniqueness of the URL/address before accepting the URL/address for a tunnel group.								

The following example shows the commands for configuring the webvpn tunnel group named "test" and establishing two group URLs, "http://www.cisco.com" and "https://supplier.com" for the group:

```
hostname(config)# tunnel-group test type webvpn
hostname(config)# tunnel-group test webvpn-attributes
hostname(config-tunnel-webvpn)# group-url http://www.cisco.com
hostname(config-tunnel-webvpn)# group-url https://supplier.company.com
hostname(config-tunnel-webvpn)#
```

The following example enables the group URLs http://www.cisco.com and http://192.168.10.10 for the tunnel-group named RadiusServer:

```
hostname(config)# tunnel-group RadiusServer type webvpn
hostname(config)# tunnel-group RadiusServer general-attributes
hostname(config-tunnel-general)# authentication server-group RADIUS
hostname(config-tunnel-general)# accounting-server-group RADIUS
hostname(config-tunnel-general)# tunnel-group RadiusServer webvpn-attributes
hostname(config-tunnel-webvpn)# group-alias "Cisco Remote Access" enable
hostname(config-tunnel-webvpn)# group-url http://www.cisco.com enable
hostname(config-tunnel-webvpn)# group-url http://192.168.10.10 enable
hostname(config-tunnel-webvpn)#
```

Related Commands	Command	Description
	clear configure tunnel-group	Clears the entire tunnel-group database or the named tunnel group configuration.
	show webvpn group-url	Displays the URLs for the specified tunnel group or for all tunnel groups.
	tunnel-group webvpn-attributes	Enters the config-webvpn mode for configuring WebVPN tunnel-group attributes.

h245-tunnel-block

To block H.245 tunneling in H.323, use the **h245-tunnel-block** command in parameters configuration mode. To disable this feature, use the **no** form of this command.

h245-tunnel-block action [drop-connection | log]

no h245-tunnel-block action [drop-connection | log]

Syntax Description	drop-connection Drops the call setup connection when H.245 tunnel is detected.							
	log Issues a log when H.245 tunnel is detected.							
Defaults	No default behavior	or values.						
Command Modes	The following table :	shows the m	nodes in whic	h you can enter	the comma	nd:

hello-interval

To specify the interval between EIGRP hello packets sent on an interface, use the **hello-interval** command in interface configuration mode. To return the hello interval to the default value, use the **no** form of this command.

hello-interval eigrp as-number seconds

no hello-interval eigrp as-number seconds

Syntax Description	<i>as-number</i> The autonomous system number of the EIGRP routing process.							
	<i>seconds</i> Specifies the interval between hello packets that are sent on the interface; valid values are from 1 to 65535 seconds.							
Defaults	The default second	s is 5 seconds.						
Command Modes	The following table	e shows the mod	les in whic	h you can enter	the comma	ind:		
			Firewall N	lode	Security (Context		
	Command Mode	-				Multiple		
			Routed	Transparent	Single	Context	System	
	Interface configura	ation	•	—	•			
Command History	Release Modification							
	8.0(2)This command was introduced.							
Usage Guidelines	The smaller the hel will ensue. This va	lo interval, the lue must be the	faster topo same for a	logical changes ll routers and ac	will be det cess server	ected, but more s on a specific	e routing traffic network.	
Examples	The following example sets the EIGRP hello interval to 10 seconds and the hold time to 30 seconds:							
	<pre>hostname(config-if)# hello-interval eigrp 100 10 hostname(config-if)# hold-time eigrp 100 30</pre>							
Related Commands	Command	Descript	ion					
	hold-time	Configur	res the EIC	GRP hold time ad	dvertised in	hello packets.		

help

To display help information for the command specified, use the help command in user EXEC mode.

```
help {command | ?}
```

Syntax Description	command	Specifies the command for which to display the CLI help.
	?	Displays all commands that are available in the current privilege level and mode.

Defaults No default behaviors or values.

Command Modes The following table shows the modes in which you can enter the command:

	Firewall N	Security Context			
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
User EXEC	•	•	•	•	•

Command History Release Modification Preexisting This command was preexisting.

Usage Guidelines The **help** command displays help information about all commands. You can see help for an individual command by entering the **help** command followed by the command name. If you do not specify a command name and enter **?** instead, all commands that are available in the current privilege level and mode display.

If you enable the **pager** command and when 24 lines display, the listing pauses, and the following prompt appears:

<---> More --->

The More prompt uses syntax similar to the UNIX more command as follows:

- To see another screen of text, press the Space bar.
- To see the next line, press the Enter key.
- To return to the command line, press the **q** key.

Examples

The following example shows how to display help for the **rename** command:

hostname# help rename

USAGE:

rename /noconfirm [{disk0:|disk1:|flash:}] <source path> [{disk0:|disk1:

```
|flash:}] <destination path>
DESCRIPTION:
rename Rename a file
SYNTAX:
/noconfirm No confirmation
{disk0:|disk1:|flash:} Optional parameter that specifies the filesystem
<source path> Source file path
<destination path> Destination file path
hostname#
```

The following examples shows how to display help by entering the command name and a question mark:

```
hostname(config)# enable ?
usage: enable password <pwd> [encrypted]
```

Help is available for the core commands (not the **show**, **no**, or **clear** commands) by entering ? at the command prompt:

...

Related Commands	Command	Description
	show version	Displays information about the operating system software.

hic-fail-group-policy (deprecated)

To specify a group policy to grant a WebVPN user access rights that are different from the default group policy, use the **hic-fail-group-policy** command in tunnel-group-webvpn configuration mode. The **no** form of this command sets the group policy to the default group policy.

hic-fail-group-policy name

no hic-fail-group-policy

Syntax Description	<i>name</i> Specifies the name of the group policy.							
Defaults	DfltGrpPolicy							
Command Modes	The following table show	vs the modes in whic	h you can enter	the comma	ind:			
		Firewall N	lode	Security (Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System		
	Tunnel-group-webvpn configuration	•		•	_			
Command History	Release Modification							
	7.1(1) This command was introduced.							
	8.0(2) This command was deprecated.							
Usage Guidelines	This command is valid only for security appliances with Cisco Secure Desktop installed. Host checking, also called <i>System Detection</i> , involves checking the remote PC for a minimal set of that must be satisfied to apply a VPN feature policy. The adaptive security appliance uses the the hic-fail-group-policy attribute to limit access rights to remote CSD users as follows:					d. Host integrity l set of criteria ses the value of s:		
	• Always uses it if you set the VPN feature policy to "Use Failure Group-Policy."							
	• Uses it if you set the VPN feature policy to "Use Success Group-Policy, if criteria match" a criteria then fail to match.							
•	This attribute specifies the differentiate access right	ne name of the failur s from those associa	e group policy to ted with the defa	o be applied ult group p	d. Use a group policy.	policy to		
Note	The adaptive security app use Success Group-Polic	pliance does not use y."	this attribute if y	you set the	VPN feature po	olicy to "Always		
	For more information, se <i>Administrators</i> .	ee the Cisco Secure L	Desktop Configu	ration Guic	le for Cisco AS	SA 5500 Series		

Examples	The following example creates a WebVPN tunnel group named "FirstGroup" and specifies the failure group policy with the name "group2":					
	<pre>hostname(config)# tunnel-group FirstGroup webvpn hostname(config)# tunnel-group FirstGroup webvpn-attributes hostname(config-tunnel-webvpn)# hic-fail-group-policy group2 hostname(config-tunnel-webvpn)#</pre>					
Related Commands	Command	Description				
	clear configure group-policy	Removes the configuration for a particular group policy or for all group policies.				
		Displays the running configuration for a particular group polic or for all group policies.				
	show running-config group-policy	Displays the running configuration for a particular group policy or for all group policies.				

hidden-parameter

To specify hidden parameters in the HTTP POST request that the adaptive security appliance submits to the authenticating web server for SSO authentication, use the **hidden-parameter** command in aaa-server-host configuration mode. To remove all hidden parameters from the running configuration, use the **no** form of this command.

hidden-parameter string

no hidden-parameter

Note

To configure SSO with the HTTP protocol correctly, you must have a thorough working knowledge of authentication and HTTP protocol exchanges.

Syntax DescriptionA hidden parameter embedded in the form and sent to the SSO server. You can
enter it on multiple lines. The maximum number of characters for each line is
255. The maximum number of characters for all lines together—the complete
hidden parameter—is 2048.

Defaults No default behavior or values.

Command Modes The following table shows the modes in which you can enter the command:

	Firewall N	lode	Security Context		
				Multiple	
Command Mode	Routed	Transparent	Single	Context	System
Aaa-server-host configuration	•		•	_	

 Release
 Modification

 7.1(1)
 This command was introduced.

Usage Guidelines

This is an SSO with HTTP Forms command.

The WebVPN server of the adaptive security appliance uses an HTTP POST request to submit a single sign-on authentication request to an authenticating web server. That request may require specific hidden parameters from the SSO HTML form—other then username and password—that are not visible to the user. You can discover hidden parameters that the web server expects in the POST request by using a HTTP header analyzer on a form received from the web server.

The command **hidden-parameter** lets you specify a hidden parameter the web server requires in the authentication POST request. If you use a header analyzer, you can copy and paste the whole hidden parameter string including any encoded URL parameters.

For ease of entry, you can enter a hidden parameter on multiple, sequential lines. The adaptive security appliance then concatenates the lines into a single hidden parameter. While the maximum characters per hidden-parameter line is 255 characters, you can enter fewer characters on each line.

Note

Any question mark in the string must be preceded by a CTRL-v escape sequence.

Examples

L

The following example shows a hidden parameter comprised of four form entries and their values, separated by &. Excerpted from the POST request, the four entries and their values are:

- SMENC with a value of ISO-8859-1
- SMLOCALE with a value of US-EN
- target with a value of https%3A%2F%2Ftools.cisco.com%2Femco%2Fappdir%2FAreaRoot.do %3FEMCOPageCode%3DENG
- smauthreason with a value of 0

SMENC=ISO-8859-1&SMLOCALE=US-EN&target=https%3A%2F%2Ftools.cisco.com%2Femco%2 Fappdir%2FAreaRoot.do%3FEMCOPageCode%3DENG&smauthreason=0

```
hostname(config)# aaa-server testgrp1 host example.com
hostname(config-aaa-server-host)# hidden-parameter SMENC=ISO-8859-1&SMLOCALE=US-EN&targe
hostname(config-aaa-server-host)# hidden-parameter t=https%3A%2F%2Ftools.cisco.com%2Femc
hostname(config-aaa-server-host)# hidden-parameter o%2Fappdir%2FAreaRoot.do%3FEMCOPageCo

hostname(config-aaa-server-host)#
```

Related Commands	Command	Description					
	action-uri	Specifies a web server URI to receive a username and password for single sign-on authentication.					
	auth-cookie-name	Specifies a name for the authentication cookie.					
	password-parameter	Specifies the name of the HTTP POST request parameter in which a user password must be submitted for SSO authentication.					
	start-url	Specifies the URL at which to retrieve a pre-login cookie.					
	user-parameter	Specifies the name of the HTTP POST request parameter i which a username must be submitted for SSO authentication					

hidden-shares

To control the visibility of hidden shares for CIFS files, use the **hidden-shares** command in config-group-webvpn configuration mode. To remove the hidden shares option from the configuration, use the **no** form of this command.

hidden-shares {none | visible}

[no] hidden-shares {none | visible}

Syntax Description	none Specifies that no configured hidden shares are visible or accessible to users.							
	visible Reveals hidden shares, making them accessible to users.							
Defaults	The default	behavior for this com	mand is none.					
Command Modes	The following table shows the modes in which you can enter the command:							
	Command Mode		Firewall Mode		Security Context			
					Single	Multiple		
			Routed	Transparent		Context	System	
	Group-webvpn configuration		•	•	•	•		
Command History	Release Modification							
communa motory	8.0(2) This command was introduced.							
Usage Guidelines	A hidden share is identified by a dollar sign (\$) at the end of the share name. For example, drive C is shared as C\$. With hidden shares, a shared folder is not displayed, and users are restricted from browsing or accessing these hidden resources.							
	The no form of the hidden-shares command removes the option from the configuration and disables hidden shares as a group policy attribute.							
Examples	The following example makes visible WebVPN CIFS hidden-shares related to GroupPolicy2:							
	hostname(config)# webvpn hostname(config-group-policy)# group-policy GroupPolicy2 attributes hostname(config-group-policy)# webvpn hostname(config-group-webvpn)# hidden-shares visible hostname(config-group-webvpn)#							

Related Commands	Command	Description				
	debug webvpn cifs	Displays debug messages about the CIFS.				
	group-policy attributes	Enters config-group-policy mode, which lets you configure attributes and values for a specified group policy or lets you enter WebVPN mode to configure WebVPN attributes for the group.				
	url-list	(Global Configuration Mode) Configures a set of URLs for WebVPN users to access.				
	url-list	(WebVPN Mode) Applies a list of WebVPN servers and URLs to a particular user or group policy.				

hold-time

To specify the hold time advertised by the adaptive security appliance in EIGRP hello packets, use the **hold-time** command in interface configuration mode. To return the hello interval to the default value, use the **no** form of this command.

hold-time eigrp as-number seconds

no hold-time eigrp as-number seconds

Syntax Description	<i>as-number</i> The autonomous system number of the EIGRP routing process.							
	<i>seconds</i> Specifies the hold time, in seconds. Valid values are from 1 to 65535 seconds.							
Defaults	`The default <i>seconds</i> is 15 seconds.							
Command Modes	The following table shows the modes in which you can enter the command:							
		Firewall	Mode	Security Context				
	Command Mode	Routed	Transparent	Single	Context	System		
	Interface configuration	n •		•	_			
Command History	Release Modification							
	8.0(2) This command was introduced.							
Usage Guidelines	This value is advertised in the EIGRP hello packets sent by the adaptive security appliance. The EIGRP neighbors on that interface use this value to determine the availability of the adaptive security appliance. If they do not receive a hello packet from the adaptive security appliance during the advertised hold time, the EIGRP neighbors will consider the adaptive security appliance to be unavailable.							
	On very congested and large networks, the default hold time might not be sufficient time for all routers and access servers to receive hello packets from their neighbors. In this case, you may want to increase the hold time.							
	We recommend that the hold time be at least three times the hello interval. If the adaptive security appliance does not receive a hello packet within the specified hold time, routes through this neighbor are considered unavailable.							
	Increasing the hold time delays route convergence across the network.							
Examples	The following example sets the EIGRP hello interval to 10 seconds and the hold time to 30 seconds:							
	hostname(config-if)# hello-interval eigrp 100 10							

hostname(config-if) # hold-time eigrp 100 30

Related Commands	Command	Description			
	hello-interval	Specifies the interval between EIGRP hello packets sent on an interface.			

homepage

To specify a URL for the web page that displays upon login for this WebVPN user or group policy, use the **homepage** command in webvpn mode, which you enter from group-policy or username mode. To remove a configured home page, including a null value created by issuing the **homepage none** command, use the **no** form of this command. The **no** option allows inheritance of a value from another group policy. To prevent inheriting a home page, use the **homepage none** command.

homepage {value url-string | none}

no homepage

Syntax Description	none	none Indicates that there is no WebVPN home page. Sets a null value, thereby						
	value url-string	Provides a URL for the home page. The string must begin with either http:// or https://.						
Defaults	There is no default h	ome page.						
Command Modes	The following table shows the modes in which you can enter the command:							
			Firewall Mode		Security Context			
	.				Single	Multiple

Examples	The following example shows how to specify www.example.com as the home page for the group policy named FirstGroup:							
	hostname(config)# group-policy FirstGroup attributes hostname(config-group-policy)# webvpn hostname(config-group-webvpn)# homepage value http://www.example.com							
Related Commands	Command	Description						
------------------	---------	---						
	webvpn	Use in group-policy configuration mode or in username configuration mode. Lets you enter webvpn mode to configure parameters that apply to group policies or usernames.						

host

To specify a host to interact with using RADIUS accounting, use the **host** command in radius-accounting parameter configuration mode, which is accessed by using the **parameters** command in the policy-map type inspect radius-accounting submode. To disable specified host, use the **no** form of this command. This option is disabled by default.

host address [**key** secret]

no host address [key secret]

Syntax Description	host	Specifi	ies a single e	endpoint sending	the RADI	US accounting	messages	
-,	address	The IP address of the client or server sending the RADIUS accounting messages.						
	key Optional keyword to specify the secret of the endpoint sending the gratuitous copy of the accounting messages.							
	secret	The sha to valid	ared secret k date the mes	ey of the endpoin sages. This can	nt sending t be up to 12	he accounting 8 alphanumeri	messages used c characters.	
Defaults	No default behavior or	values.						
Command Modes	The following table sho	ows the mo	odes in whic	h you can enter	the comma	nd:		
		Firewall Mode		lode	Security Context			
						Multiple		
	Command Mode		Routed	Transparent	Single	Context	System

Usage Guidelines	Multiple instances of th	his comma	and are allow	ved.				
Examples	The following example	shows ho	w to specify	a host with RA	DIUS acco	unting:		
	<pre>hostname(config)# policy-map type inspect radius-accounting ra hostname(config-pmap)# parameters hostname(config-pmap-p)# host 209.165.202.128 key cisco123</pre>							

Related Commands	Commands	Description
	inspect radius-accounting	Sets inspection for RADIUS accounting.
	parameters	Sets parameters for an inspection policy map.

hostname

To set the adaptive security appliance hostname, use the **hostname** command in global configuration mode. To restore the default hostname, use the **no** form of this command. The hostname appears as the command line prompt, and if you establish sessions to multiple devices, the hostname helps you keep track of where you enter commands.

hostname name

no hostname [name]

Suntax Description	name Specifies a bestrome up to 62 abarrators. A bestrome must start and with								
Syntax Description	<i>name</i> Specifies a hostname up to 63 characters. A hostname must start and end with a letter or digit, and have as interior characters only letters, digits, or a hyphen.								
Defaults	The default hostname	e depends on your platfo	orm.						
Command Modes	The following table s	shows the modes in which	ch you can enter	the comma	ind:				
		Firewall N	Node	Security (Context				
					Multiple				
	Command Mode	Routed	Transparent	Single	Context	System			
	Global configuration	•	•	•	•	•			
Commond Illiotom	Deleges	Madifiantian							
Command History	Kelease Wodification 7.0(1) You can no longer use non elaboration characters (other than a humber)								
Usage Guidelines	For multiple context	mode, the hostname that	t you set in the s	ystem exec	cution space ap	ppears in the			
	command line prompt for all contexts.								
	The hostname that you optionally set within a context does not appear in the command line, but can be used for the banner command \$(hostname) token.								
Examples	The following examp	ole sets the hostname to	firewall1:						
	hostname(config)# 1 firewall1(config)#	hostname firewall1							
Related Commands	Command	Description							
	banner	Sets a login, messa	age of the day, or	r enable ba	nner.				
	domain-name	Sets the default do	main name.						

hsi

To add an HSI to an HSI group for H.323 protocol inspection, use the **hsi** command in hsi group configuration mode. To disable this feature, use the **no** form of this command.

hsi ip_address

no hsi *ip_address*

Syntax Description	ip_address	<i>ip_address</i> IP address of the host to add. A maximum of five HSIs per HSI group is allowed.								
Defaults	No default behavior or	values.								
Command Modes	The following table sh	ows the m	odes in whic	ch you can enter	the comma	ind:				
			Firewall N	Node	Security (Context

	endpoint	Adds an er	dpoint to	the HSI group.					
	hsi	Adds an H	SI to the H	ISI group.					
	policy-map	Creates a L	Layer 3/4 J	policy map.					
	show running-config Display all current policy map configurations. policy-map								

html-content-filter

To filter Java, ActiveX, images, scripts, and cookies for WebVPN sessions for this user or group policy, use the **html-content-filter** command in webvpn configuration mode. To remove a content filter, use the **no** form of this command.

html-content-filter {java | images | scripts | cookies | none}

no html-content-filter [java | images | scripts | cookies | none]

Syntax Description	cookies Removes cookies from images, providing limited ad filtering and privacy.								
	images	imagesRemoves references to images (removes tags).							
	java Removes references to Java and ActiveX (removes <embed/> ,								
	none	none Indicates that there is no filtering. Sets a null value, thereby disallowing							
		filtering	g. Prevents in	nheriting filterin	ng values.	, ,	U		
	scripts	Remove	es references	to scripting (re	emoves <so< td=""><td>CRIPT> tags).</td><td></td></so<>	CRIPT> tags).			
Defaults	No filtering occurs	i.							
Command Modes	The following table	e shows the mo	odes in which	n you can enter	the comma	nd:			
			Firewall M	ode	Security Context

Examples	The following example shows how to allow the host with the IP address of 10.10.99.1 and the subnet mask of 255.255.255.255 access to the HTTP server via the outside interface:									
	hostname(config)# http 10.10.99.1 255.255.255.255 outside									
	The next example shows how to allow any host access to the HTTP server via the outside interface:									
	hostname(config)# httg	hostname(config)# http 0.0.0.0 0.0.0.0 outside								
Related Commands	Command		Descriptio	n						
	clear configure http		Removes the HTTP configuration: disables the HTTP server and							
	6 I		removes hosts that can access the HTTP server.							
	http authentication-certificate Requires authentication via certificate from users who are establishing HTTPS connections to the adaptive security a					ho are urity appliance.				

Command	Description
http redirect	Specifies that the adaptive security appliance redirect HTTP connections to HTTPS.
http server enable	Enables the HTTP server.
show running-config http	Displays the hosts that can access the HTTP server, and whether or not the HTTP server is enabled.

http-comp

To enable compression of http data over a WebVPN connection for a specific group or user, use the **http-comp** command in the group-policy webvpn and username webvpn configuration modes. To remove the command from the configuration and cause the value to be inherited, use the **no** form of this command.

http-comp {gzip | none}

no http-comp {**gzip** | **none**}

Syntax Description	gzip Specifies compression is enabled for the group or user.									
	none	Specifies	compressio	on is disabled for	the group	or user.				
Defaults	By default, compre	ession is set to ${}_{\delta}$	gzip.							
Command Modes	The following table	e shows the mo	des in whic	ch you can enter	the comma	ınd:				
			Firewall N	Node	Security (Context				
	Command Mode		Routed	Transparent	Sinale	Multiple Context	System

	compression	Enables c	ompressior	n for all SVC, We	ebVPN, IP	Sec VPN conn	ections.			

http-proxy

To configure the adaptive security appliance to use an external proxy server to handle HTTP requests, use the **http-proxy** command in webvpn configuration mode. To remove the HTTP proxy server from the configuration, use the **no** form of this command.

http-proxy {host [port] [exclude ur1] | pac pacfile} [username username {password password}]

no http-proxy

Syntax Description	host	Hostname or IP address for the external HTTP proxy server.
	pac pacfile	Identifies the PAC file that contains a JavaScript function that specifies one or more proxies.
	password	(Optional, and available only if you specify a <i>username</i>) Enter this keyword to accompany each HTTP proxy request with a password to provide basic, proxy authentication.
	password	Password to send to the proxy server with each HTTP request.
	port	(Optional) Port number used by the HTTP proxy server. The default port is 80, which is the port the adaptive security appliance uses if you do not supply a value. The range is 1-65535.
	url	Enter a URL or a comma-delimited list of several URLs to exclude from those that can be sent to the proxy server. The string does not have a character limit, but the entire command cannot exceed 512 characters. You can specify literal URLs or use the following wildcards:
		• * to match any string, including slashes (/) and periods (.). You must accompany this wildcard with an alphanumeric string.
		• ? to match any single character, including slashes and periods.
		• [x-y] to match any single character in the range of x and y, where x represents one character and y represents another character in the ANSI character set.
		• [! <i>x</i> - <i>y</i>] to match any single character that is not in the range.
	username	(Optional) Enter this keyword to accompany each HTTP proxy request with a username to provide basic, proxy authentication.
	username	Username to send to the proxy server with each HTTP request.

Defaults

By default, no HTTP proxy server is configured.

Command Modes The following table shows the modes in which you can enter the command:

	Firewall Mod	le	Security Context			
				Multiple		
Command Mode	Routed	Transparent	Single	Context	System	
Webvpn configuration	•	—	•	—	—	

Command History	Release Modification					
	8.0(2)	Added exclude, username, and password keywords.				
	7.0(1)	This command was introduced.				
Usage Guidelines	Requiring Interne	et access via a server that the organization controls provides another opportunity for e secure Internet access and administrative control.				
	The adaptive sect of this command overwrites the pr if you enter the s command, then n	urity appliance supports only one instance of the http-proxy command. If one instance is already present in the running configuration and you enter another instance, the CLI evious instance. The CLI lists any http-proxy commands in the running configuration how running-config webvpn command. If the response does not list an http -proxy none is present.				
Examples	The following ex 209.165. 201.2 us	ample shows how to configure use of an HTTP proxy server with an IP address of sing the default port, 443:				
	hostname(config hostname(config hostname(config	;)# webvpn webvpn)# http-proxy 209.165.201.2 webvpn)				
	The following example shows how to configure use of the same proxy server, and send a username and password with each HTTP request:					
	hostname(config-webvpn)# http-proxy 209.165.201.2 jsmith password mysecretdonttell hostname(config-webvpn)					
	The following example shows the same command, except when the adaptive security appliance receipt the specific URL www.example.com in an HTTP request, it resolves the request instead of passing it to the proxy server:					
	hostname(config password mysecr hostname(config	<pre>i-webvpn)# http-proxy 209.165.201.2 exclude www.example.com username jsmith retdonttell j-webvpn)</pre>				
	The followiing ex	xample shows how to use the exclude option:				
	hostname(config-webvpn)# http-proxy 10.1.1.1 port 8080 exclude *.com username John pasword 12345678 hostname(config-webvpn)					
	The followiing e	xample shows how to use the pac option.				
	hostname(config hostname(config	r-webvpn) # http-proxy pac http://10.1.1.1/pac.js				
Related Commands	Command	Description				
	https-proxy	Configures the use of an external proxy server to handle HTTPS requests.				

http-proxy (dap)

To enable or disable HTTP proxy port forwarding, use the **http-proxy** command in dap webvpn configuration mode. To remove the attribute from the configuration, use the **no** version of this command.

http-proxy {enable | disable | auto-start}

no http-proxy

Syntax Description	auto-start Enables and automatically starts HTTP proxy port forwarding for the DAP record.								
	enable/disable Enables or disables HTTP proxy port forwarding for the DAP record								
Defaulte	No default value	or behaviors							
Delaults	No default value	of benaviors.							
Command Modes	The following ta	ble shows the	modes in whic	ch you can enter	the comma	und:			
			Firewall N	lode	Security (Context			
						Multiple			
	Command Mode		Routed	Transparent	Single	Context	System		
	Dap-webvpn co	nfiguration	•	•	•		_		
Command History	Release Modification								
	8.0(2)	This	command wa	s introduced.					
Usage Guidelines	The adaptive security appliance can apply attribute values from a variety of sources. It applies them according to the following hierarchy:								
	1 . DAP record	1. DAP record							
	2. Username	2. Username							
	3 . Group policy								
	4. Group policy for the tunnel group								
	5. Default group policy								
	It follows that D policy, or tunnel	AP values for a group.	an attribute ha	ve a higher prior	ity than tho	ose configured	for a user, group		
	When you enable or disable an attribute for a DAP record, the adaptive security appliance applies that value and enforces it. For example, when you disable HTTP proxy in dap webvpn mode, the adaptive security appliance looks no further for a value. When you instead use the no value for the http-proxy command, the attribute is not present in the DAP record, so the adaptive security appliance moves down to the AAA attribute in the username, and if necessary the group policy to find a value to apply								

Examples

The following example shows how to enable HTTP proxy port forwarding for the dynamic access policy record named Finance.

hostname (config)# dynamic-access-policy-record Finance hostname(config-dynamic-access-policy-record)# webvpn hostname(config-dap-webvpn)# http-proxy enable hostname(config-dap-webvpn)#

Related Commands Com

Command	Description
dynamic-access-policy-record	Creates a DAP record.
show running-config	Displays the running configuration for all DAP records, or for
dynamic-access-policy-record	the named DAP record.
[name]	

http redirect

To specify that the adaptive security appliance redirect HTTP connections to HTTPS, use the **http redirect** command in global configuration mode. To remove a specified **http redirect** command from the configuration, use the **no** form of this command. To remove all **http redirect** commands from the configuration, use the **no** form of this command without arguments.

http redirect interface [port]

no http redirect [*interface*]

Syntax Description	interface	Identifies the interface for which the adaptive security appliance should redirect HTTP requests to HTTPS.						
	portIdentifies the port the adaptive security appliance listens on for HTTP requests, which it then redirects to HTTPS. By default it listens on port 80,							
Defaults	HTTP redirect is d	isabled.						
Command Modes	The following tabl	e shows the n	nodes in whic	h you can enter	the comma	nd:

	http authentication-certificate http server enable	mask and the ir Requires authe HTTPS connec Enables the HT	tterface through ntication via cer ations to the adap TTP server for A	which the h tificate from tive securi SDM session	ost accesses th n users who an ty appliance. ons.	e HTTP serv	

Command	Description
http redirect	Specifies that the adaptive security appliance redirect HTTP connections to HTTPS.
show running-config http	Displays the hosts that can access the HTTP server, and whether or not the HTTP server is enabled.

http server session-timeout

To set a session timeout for ASDM connections to the adaptive security appliance, use the **http server session-timeout** command in global configuration mode. To disable the timeout, use the **no** form of this command.

http server session-timeout [minutes]

no http server session-timeout [minutes]

		.	1					
Syntax Description	minutes	The session timeou	it, from 1 minut	e to 1440 m	ninutes.			
Defaults	The session timeout is disabled. ASDM connections have no session time limit.							
Command Modes	The following table shows	the modes in whic	h you can enter	the comma	ind:			
		Firewall N	lode	Security (Context			
					Multiple			
	Command Mode	Routed	Transparent	Single	Context	System

Command History	Release Modification							
	8.2(1)	This command was	s introduced.					
Examples	The following example sets hostname(config)# http s	s a session timeou server session-t:	t for ASDM con imeout 1000	nections to	1000 minutes	::		
Related Commands	Command	Description						
	clear configure http	Removes the HTTP configuration: disables the HTTP server and removes hosts that can access the HTTP server.						
	http	Specifies hosts mask and the ir	that can access t iterface through	he HTTP se which the h	erver by IP add lost accesses t	lress and subnet he HTTP server.		
	http authentication-certificate	Requires authe HTTPS connec	ntication via cer tions to the ada	rtificate from ptive securi	m users who a ty appliance.	re establishing		
	http server enable	Enables the HT	TTP server for A	SDM sessi	ons.			
	http server idle-timeout	Limits the idle time of ASDM sessions to the adaptive security appliance.						

Command	Description
http redirect	Specifies that the adaptive security appliance redirect HTTP connections to HTTPS.
show running-config http	Displays the hosts that can access the HTTP server, and whether or not the HTTP server is enabled.

https-proxy

To configure the adaptive security appliance to use an external proxy server to handle HTTPS requests, use the **https-proxy** command in webvpn configuration mode. To remove the HTTPS proxy server from the configuration, use the **no** form of this command.

https-proxy {host [port] [exclude ur1] | pac pacfile } [username username {password password }]

no https-proxy

Syntax Description	host	Hostname or IP address for the external HTTPS proxy server.
	pac pacfile	Identifies the PAC file that contains a JavaScript function that specifies one or more proxies.
	password	(Optional, and available only if you specify a <i>username</i>) Enter this keyword to accompany each HTTPS proxy request with a password to provide basic, proxy authentication.
	password	Password to send to the proxy server with each HTTPS request.
	port	(Optional) Port number used by the HTTPS proxy server. The default port is 443, which is the port the adaptive security appliance uses if you do not supply a value. The range is 1-65535.
	url	Enter a URL or a comma-delimited list of several URLs to exclude from those that can be sent to the proxy server. The string does not have a character limit, but the entire command cannot exceed 512 characters. You can specify literal URLs or use the following wildcards:
		• * to match any string, including slashes (/) and periods (.). You must accompany this wildcard with an alphanumeric string.
		• ? to match any single character, including slashes and periods.
		• [x-y] to match any single character in the range of x and y, where x represents one character and y represents another character in the ANSI character set.
		• [! <i>x</i> - <i>y</i>] to match any single character that is not in the range.
	username	(Optional) Enter this keyword to accompany each HTTPS proxy request with a username to provide basic, proxy authentication.
	username	Username to send to the proxy server with each HTTPS request.
	-	

Defaults

By default, no HTTPS proxy server is configured.

Command Modes The following table shows the modes in which you can enter the command:

	Firewall Mode		Security Context			
		Transparent		Multiple		
Command Mode	Routed		Single	Context	System	
Webvpn configuration	•	—	•	_	—	

Command History	Release	Modification					
	7.3(0)	Added exclude, username, and password keywords.					
	7.0(1)	This command was introduced.					
Usage Guidelines	Requiring Internet filtering to assure	et access via a server that the organization controls provides another opportunity for e secure Internet access and administrative control.					
	The adaptive secu of this command overwrites the pro- if you enter the sh command, then n	arity appliance supports only one instance of the https-proxy command. If one instance is already present in the running configuration and you enter another instance, the CLI evious instance. The CLI lists any https-proxy commands in the running configuration how running-config webvpn command. If the response does not list an https-proxy one is present.					
Examples	The following ex 209.165. 201.2 us	ample shows how to configure use of an HTTPS proxy server with an IP address of ing the default port, 443:					
	hostname(config)# webvpn hostname(config-webvpn)# https-proxy 209.165.201.2 hostname(config-webvpn)						
	The following expassword with ea	The following example shows how to configure use of the same proxy server, and send a username and password with each HTTPS request:					
	hostname(config hostname(config	-webvpn)# https-proxy 209.165.201.2 jsmith password mysecretdonttell -webvpn)					
	The following exa the specific URL on to the proxy so	ample shows the same command, except when the adaptive security appliance receives www.example.com in an HTTPS request, it resolves the request instead of passing it erver:					
	hostname(config-webvpn)# https-proxy 209.165.201.2 exclude www.example.com username jsmit password mysecretdonttell hostname(config-webvpn)						
	hostname(config pasword 1234567 hostname(config	hostname(config-webvpn) # https-proxy 10.1.1.1 port 8080 exclude *.com username John pasword 12345678 hostname(config-webvpn)					
	The followiing ex	sample shows how to use the pac option:					
	hostname(config hostname(config	-webvpn)# https-proxy pac http://10.1.1.1/pac.js -webvpn)					

Relatedommands	Command	Description		
	http-proxy	Configures the use of an external proxy server to handle HTTP requests.		
	show running-config webvpn	Displays the running configuration for SSL VPN, including any HTTP and HTTPS proxy servers.		

hw-module module allow-ip

To configure host parameters on the SSC, use the **hw-module module allow-ip** command in privileged EXEC mode.

hw-module module slot_num allow-ip ip_address netmask

Syntax Description	allow-ip <i>ip_ address</i>	Specifies the allowed host IP address on the SSC.						
	<i>netmask</i> Specifies the allowed host network mask on the SSC.							
	slot_num	Specifies the slot r	umber, which is	always 1.				
Defaults	No default behavior or	values.						
Command Modes	The following table sho	The following table shows the modes in which you can enter the command:

Yo	the Up state of the modu ou can run t	e and supports ile. The modul he show modu	password reset. e is offline until le command to	

The command always prompts for confirmation. If the command succeeds, no other output appears. If the command fails, an error message appears that explains why the failure occurred. The possible error messages are as follows:

Unable to reset the password on the module in slot 1 Unable to reset the password on the module in slot 1 - unknown module state Unable to reset the password on the module in slot 1 - no module installed Failed to reset the password on the module in slot 1 - module not in Up state Unable to reset the password on the module in slot 1 - unknown module type The module is slot [n] does not support password reset Unable to reset the password on the module in slot 1 - no application found The SSM application version does not support password reset Failed to reset the password on the module in slot 1

Examples

The following example resets a password on a hardware module in slot 1:

hostname (config)# **hw-module module 1 password-reset** Reset the password on module in slot 1? [confirm] **y**

Related Commands	Command	Description				
	hw-module module recover	Recovers an intelligent SSM by loading a recovery image from a TFTP server.				
	hw-module module reload	Reloads the intelligent SSM software.				
	hw-module module reset	Shuts down and resets the SSM hardware.				
	hw-module module shutdown	Shuts down the SSM software in preparation for being powered off without losing configuration data.				
	show module	Shows SSM information.				

hw-module module recover

To load a recovery software image from a TFTP server to an intelligent SSM (for example, the AIP SSM), or to configure network settings to access the TFTP server, use the **hw-module module recover** command in privileged EXEC mode. You might need to recover an SSM using this command if, for example, the SSM is unable to load a local image. This command is not available for interface SSMs (for example, the 4GE SSM).

hw-module module 1 recover {**boot** | **stop** | **configure** [**url** *tfp_url* | **ip** *port_ip_address* | **gateway** *gateway_ip_address* | **vlan** *vlan_id*]}

Syntax Description	1	Specifies the slot n	umber, which is	always 1.					
	boot	Initiates recovery o the configure setting	ge according to image.						
	configure	Configures the network not enter any network prompted for the in	work parameters ork parameters a nformation.	to downloa fter the co	nd a recovery in nfigure keywo	mage. If you do rd, you are			
	gateway gateway_ip_address	(Optional) The gate SSM management	eway IP address interface.	for access t	o the TFTP ser	ver through the			
	ip port_ip_address	(Optional) The IP a	address of the SS	SM manage	ment interface				
	stop	Stops the recovery action, and stops downloading the recovery image. The SSM boots from the original image. You must enter this command within 30 to 45 seconds after starting recovery using the hw-module module boot command. If you issue the stop command after this period, it might cause unexpected results, such as the SSM becoming unresponsive.							
	url <i>tfp_url</i>	(Optional) The UR	(Optional) The URL for the image on a TFTP server, in the following format:						
		tftp://server/[path/]filename							
	vlan vlan_id	(Optional) Sets the VLAN ID for the management interface.							
Defaults	No default behavior or values.								
Command Modes	The following table sh	nows the modes in whic	h you can enter	the comma	nd:
