

## CHAPTER 19

### mac address through multicast-routing Commands

---

# mac address

To specify the virtual MAC addresses for the active and standby units, use the **mac address** command in failover group configuration mode. To restore the default virtual MAC addresses, use the **no** form of this command.

```
mac address phy_if [active_mac] [standby_mac]

no mac address phy_if [active_mac] [standby_mac]
```

Syntax Description

|             |  |
|-------------|--|
| phy_if      | The physical name of the interface to set the MAC address.   |
| active_mac  | The virtual MAC address for the active unit. The MAC address must be entered in h.h.h format, where h is a 16-bit hexadecimal number.  |
| standby_mac | The virtual MAC address for the standby unit. The MAC address must be entered in h.h.h format, where h is a 16-bit hexadecimal number. |

Defaults

- The defaults are as follows:
- Active unit default MAC address: 00a0.c9physical\_port\_number.failover\_group\_id01.
  - Standby unit default MAC address: 00a0.c9physical\_port\_number.failover\_group\_id02.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                 | Firewall Mode |             | Security Context |          |        |
|------------------------------|---------------|-------------|------------------|----------|--------|
|                              | Routed        | Transparent | Single           | Multiple |        |
|                              |               |             |                  | Context  | System |
| Failover group configuration | •             | •           | —                | —        | •      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

Usage Guidelines

If the virtual MAC addresses are not defined for the failover group, the default values are used.

If you have more than one Active/Active failover pair on the same network, it is possible to have the same default virtual MAC addresses assigned to the interfaces on one pair as are assigned to the interfaces of the other pairs because of the way the default virtual MAC addresses are determined. To avoid having duplicate MAC addresses on your network, make sure you assign each physical interface a virtual active and standby MAC address.

Examples

```
The following partial example shows a possible configuration for a failover group:

hostname(config)# failover group 1
hostname(config-fover-group)# primary
```

```
hostname(config-fover-group)# preempt 100
hostname(config-fover-group)# exit
hostname(config)# failover group 2
hostname(config-fover-group)# secondary
hostname(config-fover-group)# preempt 100
hostname(config-fover-group)# mac address e1 0000.a000.a011 0000.a000.a012
hostname(config-fover-group)# exit
hostname(config)#
```

**Related Commands**

| Command                     | Description   |
|-----------------------------|---|
| <b>failover group</b>       | Defines a failover group for Active/Active failover.      |
| <b>failover mac address</b> | Specifies a virtual MAC address for a physical interface. |

# mac-address

To manually assign a private MAC address to an interface or subinterface, use the **mac-address** command in interface configuration mode. In multiple context mode, this command can assign a different MAC address to the interface in each context. To revert the MAC address to the default, use the **no** form of this command.

```
mac-address mac_address [standby mac_address]

no mac-address [mac_address [standby mac_address]]
```

Syntax Description

|                                   |   |
|-----------------------------------|---|
| <i>mac_address</i>                | Sets the MAC address for this interface in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. If you use failover, this MAC address is the active MAC address.<br><br><b>Note</b> Because auto-generated addresses (the <b>mac-address auto</b> command) start with A2, you cannot start manual MAC addresses with A2 if you also want to use auto-generation. |
| <b>standby</b> <i>mac_address</i> | (Optional) Sets the standby MAC address for failover. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.  |

Defaults

The default MAC address is the burned-in MAC address of the physical interface. Subinterfaces inherit the physical interface MAC address. Some commands set the physical interface MAC address (including this command in single mode), so the inherited address depends on that configuration.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Interface configuration | •             | •           | •                | •        | —      |

Command History

| Release       | Modification   |
|---------------|--|
| 7.2(1)        | This command was introduced.   |
| 8.0(5)/8.2(2) | The use of A2 to start the MAC address was restricted when also used with the <b>mac-address auto</b> command. |

## Usage Guidelines

In multiple context mode, if you share an interface between contexts, you can assign a unique MAC address to the interface in each context. This feature lets the adaptive security appliance easily classify packets into the appropriate context. Using a shared interface without unique MAC addresses is possible, but has some limitations. See the *Cisco ASA 5500 Series Configuration Guide using the CLI* for more information.

You can assign each MAC address manually with this command, or you can automatically generate MAC addresses for shared interfaces in contexts using the **mac-address auto** command. If you automatically generate MAC addresses, you can use the **mac-address** command to override the generated address.

For single context mode, or for interfaces that are not shared in multiple context mode, you might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address.

You can also set the MAC address using other commands or methods. The MAC address methods have the following priority:

1. **mac-address** command in interface configuration mode.

This command works for physical interfaces and subinterfaces. In multiple context mode, you set the MAC address within each context. This feature lets you set a different MAC address for the same interface in multiple contexts.

2. **failover mac address** command for Active/Standby failover in global configuration mode.

This command applies to physical interfaces. Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

3. **mac address** command for Active/Active failover in failover group configuration mode.

This command applies to physical interfaces. Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

4. **mac-address auto** command in global configuration mode (multiple context mode only).

This command applies to shared interfaces in contexts.

5. For Active/Active failover, auto-generation of active and standby MAC addresses for physical interfaces.

This method applies to physical interfaces. Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

6. Burned-in MAC address. This method applies to physical interfaces.

Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

## Examples

The following example configures the MAC address for GigabitEthernet 0/1.1:

```
hostname/contextA(config)# interface gigabitethernet0/1.1
hostname/contextA(config-if)# nameif inside
hostname/contextA(config-if)# security-level 100
hostname/contextA(config-if)# ip address 10.1.2.1 255.255.255.0
hostname/contextA(config-if)# mac-address 030C.F142.4CDE standby 040C.F142.4CDE
hostname/contextA(config-if)# no shutdown
```

## Related Commands

| Command                     | Description   |
|-----------------------------|---|
| <b>failover mac address</b> | Sets the active and standby MAC address of a physical interface for Active/Standby failover.      |
| <b>mac address</b>          | Sets the active and standby MAC address of a physical interface for Active/Active failover.       |
| <b>mac-address auto</b>     | Auto-generates MAC addresses (active and standby) for shared interfaces in multiple context mode. |
| <b>mode</b>                 | Sets the security context mode to multiple or single.   |
| <b>show interface</b>       | Shows the interface characteristics, including the MAC address.                                   |

# mac-address auto

To automatically assign private MAC addresses to each shared context interface, use the **mac-address auto** command in global configuration mode. To disable automatic MAC addresses, use the **no** form of this command.

**mac-address auto prefix** *prefix*

**no mac-address auto**

## Syntax Description

|                             |   |
|-----------------------------|---|
| <b>prefix</b> <i>prefix</i> | Sets the prefix used as part of the MAC address. The <i>prefix</i> is a decimal value between 0 and 65535. This prefix is converted to a 4-digit hexadecimal number. The prefix ensures that each adaptive security appliance uses unique MAC addresses, so you can have multiple adaptive security appliances on a network segment, for example. See the “ <a href="#">MAC Address Format</a> ” section for more information about how the prefix is used. |
|-----------------------------|---|

## Defaults

Auto-generation is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | •           | —                | —        | •      |

## Command History

| Release       | Modification   |
|---------------|--|
| 7.2(1)        | This command was introduced.   |
| 8.0(5)/8.2(2) | The <b>prefix</b> keyword was added. The MAC address format was changed to use the prefix, to use a fixed starting value (A2), and to use a different scheme for the primary and secondary unit MAC addresses in a failover pair. The MAC addresses are also now persistent across reloads. The command parser now checks if auto-generation is enabled; if you want to also manually assign a MAC address, you cannot start the manual MAC address with A2. |

## Usage Guidelines

To allow contexts to share interfaces, we suggest that you assign unique MAC addresses to each shared context interface. The MAC address is used to classify packets within a context. If you share an interface, but do not have unique MAC addresses for the interface in each context, then the destination IP address is used to classify packets. The destination address is matched with the context NAT configuration, and this method has some limitations compared to the MAC address method. See the *Cisco ASA 5500 Series Configuration Guide using the CLI* for information about classifying packets.

In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, you can manually set the MAC address for the interface within the context. See the **mac-address** command to manually set the MAC address.

### Default MAC Address

By default, the physical interface uses the burned-in MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

All auto-generated MAC addresses start with A2. The auto-generated MAC addresses are persistent across reloads.

### Interaction with Manual MAC Addresses

If you manually assign a MAC address and also enable auto-generation, then the manually assigned MAC address is used. If you later remove the manual MAC address, the auto-generated address is used.

Because auto-generated addresses start with A2, you cannot start manual MAC addresses with A2 if you also want to use auto-generation.

### Failover MAC Addresses

For use with failover, the adaptive security appliance generates both an active and standby MAC address for each interface. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption. See the [“MAC Address Format”](#) section for more information.

For upgrading failover units with the legacy version of the **mac-address auto** command before the **prefix** keyword was introduced, see the [“Legacy MAC Address Format When Not Using the prefix Keyword”](#) section.

### MAC Address Format

The adaptive security appliance generates the MAC address using the following format:

A2xx.yyzz.zzzz

Where xx.yy is a user-defined prefix, and zz.zzzz is an internal counter generated by the adaptive security appliance. For the standby MAC address, the address is identical except that the internal counter is increased by 1.

For an example of how the prefix is used, if you set a prefix of 77, then the adaptive security appliance converts 77 into the hexadecimal value 004D (yyxx). When used in the MAC address, the prefix is reversed (xxyy) to match the adaptive security appliance native form:

A24D.00zz.zzzz

For a prefix of 1009 (03F1), the MAC address is:

A2F1.03zz.zzzz

### When the MAC Address is Generated

When you configure a **nameif** command for the interface in a context, the new MAC address is generated immediately. If you enable this command after you configure context interfaces, then MAC addresses are generated for all interfaces immediately after you enter the command. If you use the **no mac-address auto** command, the MAC address for each interface reverts to the default MAC address. For example, subinterfaces of GigabitEthernet 0/1 revert to using the MAC address of GigabitEthernet 0/1.

### Setting the MAC Address Using Other Methods

You can also set the MAC address using other commands or methods. The MAC address methods have the following priority:

1. **mac-address** command in interface configuration mode.

This command works for physical interfaces and subinterfaces. In multiple context mode, you set the MAC address within each context. This feature lets you set a different MAC address for the same interface in multiple contexts.

2. **failover mac address** command for Active/Standby failover in global configuration mode.

This command applies to physical interfaces. Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

3. **mac address** command for Active/Active failover in failover group configuration mode.

This command applies to physical interfaces. Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

4. **mac-address auto** command in global configuration mode (multiple context mode only).

This command applies to shared interfaces in contexts.

5. For Active/Active failover, auto-generation of active and standby MAC addresses for physical interfaces.

This method applies to physical interfaces. Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

6. Burned-in MAC address. This method applies to physical interfaces.

Subinterfaces inherit the MAC address of the physical interface unless set separately by the **mac-address** or **mac-address auto** command.

### Viewing MAC Addresses in the System Configuration

To view the assigned MAC addresses from the system execution space, enter the **show running-config all context** command.

The **all** option is required to view the assigned MAC addresses. Although this command is user-configurable in global configuration mode only, the **mac-address auto** command appears as a read-only entry in the configuration for each context along with the assigned MAC address. Only allocated interfaces that are configured with a **nameif** command within the context have a MAC address assigned.

#### Note

If you manually assign a MAC address to an interface, but also have auto-generation enabled, the auto-generated address continues to show in the configuration even though the manual MAC address is the one that is in use. If you later remove the manual MAC address, the auto-generated one shown will be used.

### Viewing MAC Addresses Within a Context

To view the MAC address in use by each interface within the context, enter the **show interface | include (Interface)|(MAC)** command.

#### Note

The **show interface** command shows the MAC address in use; if you manually assign a MAC address and also have auto-generation enabled, then you can only view the unused auto-generated address from within the system configuration.

### Legacy MAC Address Format When Not Using the prefix Keyword

Prior to Version 8.0(5), the **mac-address auto** command did not include the **prefix** keyword. This old version of the command is still accepted so you can perform upgrades between failover pairs; the command is not automatically converted when you upgrade so the commands continue to match between the upgraded and non-upgraded failover units. After you upgrade both units to the new software version, you should change this command to use the **prefix** keyword.

Without the **prefix** keyword, the MAC address is generated using the following format:

- Active unit MAC address: *12\_slot.port\_subid.contextid*.
- Standby unit MAC address: *02\_slot.port\_subid.contextid*.

For platforms with no interface slots, the slot is always 0. The *port* is the interface port. The *subid* is an internal ID for the subinterface, which is not viewable. The *contextid* is an internal ID for the context, viewable with the **show context detail** command. For example, the interface GigabitEthernet 0/1.200 in the context with the ID 1 has the following generated MAC addresses, where the internal ID for subinterface 200 is 31:

- Active: 1200.0131.0001
- Standby: 0200.0131.0001

This legacy MAC address generation method does not allow for persistent MAC addresses across reloads, does not allow for multiple adaptive security appliances on the same network segment (because unique MAC addresses are not guaranteed), and does not prevent overlapping MAC addresses with manually assigned MAC addresses.

## Examples

The following example enables automatic MAC address generation with a prefix of 78:

```
hostname(config)# mac-address auto prefix 78
```

The following output from the **show running-config all context admin** command shows the primary and standby MAC address assigned to the Management0/0 interface:

```
hostname# show running-config all context admin

context admin
  allocate-interface Management0/0
  mac-address auto Management0/0 a24d.0000.1440 a24d.0000.1441
  config-url disk0:/admin.cfg
```

The following output from the **show running-config all context** command shows all the MAC addresses (primary and standby) for all context interfaces. Note that because the GigabitEthernet0/0 and GigabitEthernet0/1 main interfaces are not configured with a **nameif** command inside the contexts, no MAC addresses have been generated for them.

```
hostname# show running-config all context

admin-context admin
context admin
  allocate-interface Management0/0
  mac-address auto Management0/0 a2d2.0400.125a a2d2.0400.125b
  config-url disk0:/admin.cfg
!

context CTX1
  allocate-interface GigabitEthernet0/0
  allocate-interface GigabitEthernet0/0.1-GigabitEthernet0/0.5

**Related Commands**

| Command                     | Description  |
|-----------------------------|--|
| <b>failover mac address</b> | Sets the active and standby MAC address of a physical interface for Active/Standby failover.   |
| <b>mac address</b>          | Sets the active and standby MAC address of a physical interface for Active/Active failover.  |
| <b>mac-address</b>          | Manually sets the MAC address (active and standby) for a physical interface or subinterface. In multiple context mode, you can set different MAC addresses in each context for the same interface. |
| <b>mode</b>                 | Sets the security context mode to multiple or single.  |
| <b>show interface</b>       | Shows the interface characteristics, including the MAC address.  |

# mac-address-table aging-time

To set the timeout for MAC address table entries, use the **mac-address-table aging-time** command in global configuration mode. To restore the default value of 5 minutes, use the **no** form of this command.

**mac-address-table aging-time** *timeout\_value*

**no mac-address-table aging-time**

## Syntax Description

*timeout\_value* The time a MAC address entry stays in the MAC address table before timing out, between 5 and 720 minutes (12 hours). 5 minutes is the default.

## Defaults

The default timeout is 5 minutes.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |                  |        |
|----------------------|---------------|-------------|------------------|------------------|--------|
|                      | Routed        | Transparent | Single           | Multiple Context | System |
| Global configuration | —             | •           | •                | •                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

No usage guidelines.

## Examples

The following example sets the MAC address timeout to 10 minutes:

```
hostname(config)# mac-address-timeout aging time 10
```

## Related Commands

| Command                         | Description   |
|---------------------------------|---|
| <b>arp-inspection</b>           | Enables ARP inspection, which compares ARP packets to static ARP entries. |
| <b>firewall transparent</b>     | Sets the firewall mode to transparent.                                    |
| <b>mac-address-table static</b> | Adds static MAC address entries to the MAC address table.                 |
| <b>mac-learn</b>                | Disables MAC address learning.  |
| <b>show mac-address-table</b>   | Shows the MAC address table, including dynamic and static entries.        |

# mac-address-table static

To add a static entry to the MAC address table, use the **mac-address-table static** command in global configuration mode. To remove a static entry, use the **no** form of this command. Normally, MAC addresses are added to the MAC address table dynamically as traffic from a particular MAC address enters an interface. You can add static MAC addresses to the MAC address table if desired. One benefit to adding static entries is to guard against MAC spoofing. If a client with the same MAC address as a static entry attempts to send traffic to an interface that does not match the static entry, then the adaptive security appliance drops the traffic and generates a system message.

**mac-address-table static** *interface\_name* *mac\_address*

**no mac-address-table static** *interface\_name* *mac\_address*

## Syntax Description

|                       |   |
|-----------------------|---|
| <i>interface_name</i> | The source interface.                         |
| <i>mac_address</i>    | The MAC address you want to add to the table. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | —             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Examples

The following example adds a static MAC address entry to the MAC address table:

```
hostname(config)# mac-address-table static inside 0010.7cbe.6101
```

## Related Commands

| Command                             | Description                                       |
|-------------------------------------|---|
| <b>arp</b>                          | Adds a static ARP entry.                          |
| <b>firewall transparent</b>         | Sets the firewall mode to transparent.            |
| <b>mac-address-table aging-time</b> | Sets the timeout for dynamic MAC address entries. |

| Command                           | Description                      |
|-----------------------------------|----------------------------------|
| <b>mac-learn</b>                  | Disables MAC address learning.   |
| <b>show<br/>mac-address-table</b> | Shows MAC address table entries. |

# mac-learn

To disable MAC address learning for an interface, use the **mac-learn** command in global configuration mode. To reenable MAC address learning, use the **no** form of this command. By default, each interface automatically learns the MAC addresses of entering traffic, and the adaptive security appliance adds corresponding entries to the MAC address table. You can disable MAC address learning if desired.

**mac-learn** *interface\_name* **disable**

**no mac-learn** *interface\_name* **disable**

## Syntax Description

|                       |  |
|-----------------------|--|
| <i>interface_name</i> | The interface on which you want to disable MAC learning. |
| <b>disable</b>        | Disables MAC learning.                                   |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | —             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Examples

The following example disables MAC learning on the outside interface:

```
hostname(config)# mac-learn outside disable
```

## Related Commands

| Command                              | Description  |
|--------------------------------------|--|
| <b>clear configure mac-learn</b>     | Sets the <b>mac-learn</b> configuration to the default.            |
| <b>firewall transparent</b>          | Sets the firewall mode to transparent.                             |
| <b>mac-address-table static</b>      | Adds static MAC address entries to the MAC address table.          |
| <b>show mac-address-table</b>        | Shows the MAC address table, including dynamic and static entries. |
| <b>show running-config mac-learn</b> | Shows the <b>mac-learn</b> configuration.                          |

# mac-list

To specify a list of MAC addresses to be used to exempt MAC addresses from authentication and/or authorization, use the **mac-list** command in global configuration mode. To remove a MAC list entry, use the **no** form of this command.

```
mac-list id {deny | permit} mac macmask

no mac-list id {deny | permit} mac macmask
```

Syntax Description

|         |   |
|---------|---|
| deny    | Indicates that traffic matching this MAC address does not match the MAC list and is subject to both authentication and authorization when specified in the <b>aaa mac-exempt</b> command. You might need to add a deny entry to the MAC list if you permit a range of MAC addresses using a MAC address mask such as ffff.ffff.0000, and you want to force a MAC address in that range to be authenticated and authorized.                          |
| id      | Specifies a hexadecimal MAC access list number. To group a set of MAC addresses, enter the <b>mac-list</b> command as many times as needed with the same ID value. The order of entries matters, because the packet uses the first entry it matches, as opposed to a best match scenario. If you have a permit entry, and you want to deny an address that is allowed by the permit entry, be sure to enter the deny entry before the permit entry. |
| mac     | Specifies the source MAC address in 12-digit hexadecimal form; that is, nnnn.nnnn.nnnn  |
| macmask | Specifies the portion of the MAC address that should be used for matching. For example, ffff.ffff.ffff matches the MAC address exactly. ffff.ffff.0000 matches only the first 8 digits.   |
| permit  | Indicates that traffic matching this MAC address matches the MAC list and is exempt from both authentication and authorization when specified in the <b>aaa mac-exempt</b> command.   |

Defaults

No default behaviors or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | •           | •                | •        | —      |

Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

**Usage Guidelines**

To enable MAC address exemption from authentication and authorization, use the **aaa mac-exempt** command. You can only add one instance of the **aaa mac-exempt** command, so be sure that your MAC list includes all the MAC addresses you want to exempt. You can create multiple MAC lists, but you can only use one at a time.

**Examples**

The following example bypasses authentication for a single MAC address:

```
hostname(config)# mac-list abc permit 00a0.c95d.0282 ffff.ffff.ffff
hostname(config)# aaa mac-exempt match abc
```

The following entry bypasses authentication for all Cisco IP Phones, which have the hardware ID 0003.E3:

```
hostname(config)# mac-list acd permit 0003.E300.0000 FFFF.FF00.0000
hostname(config)# aaa mac-exempt match acd
```

The following example bypasses authentication for a group of MAC addresses except for 00a0.c95d.02b2. Enter the deny statement before the permit statement, because 00a0.c95d.02b2 matches the permit statement as well, and if it is first, the deny statement will never be matched.

```
hostname(config)# mac-list 1 deny 00a0.c95d.0282 ffff.ffff.ffff
hostname(config)# mac-list 1 permit 00a0.c95d.0000 ffff.ffff.0000
hostname(config)# aaa mac-exempt match 1
```

**Related Commands**

| Command                             | Description   |
|-------------------------------------|---|
| <b>aaa authentication</b>           | Enables user authentication.  |
| <b>aaa authorization</b>            | Enables user authorization services.  |
| <b>aaa mac-exempt</b>               | Exempts a list of MAC addresses from authentication and authorization.                |
| <b>clear configure mac-list</b>     | Removes a list of MAC addresses previously specified by the <b>mac-list</b> command.  |
| <b>show running-config mac-list</b> | Displays a list of MAC addresses previously specified in the <b>mac-list</b> command. |

# mail-relay

To configure a local domain name, use the **mail-relay** command in parameters configuration mode. To disable this feature, use the **no** form of this command.

**mail-relay** *domain\_name* **action** {**drop-connection** | **log**}

**no mail-relay** *domain\_name* **action** {**drop-connection** | **log**}

## Syntax Description

|                        |                                 |
|------------------------|---------------------------------|
| <i>domain_name</i>     | Specifies the domain name.      |
| <b>drop-connection</b> | Closes the connection.          |
| <b>log</b>             | Generates a system log message. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Parameters configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a mail relay for a specific domain:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# parameters
hostname(config-pmap-p)# mail-relay mail action drop-connection
```

## Related Commands

| Command                               | Description  |
|---------------------------------------|--|
| <b>class</b>                          | Identifies a class map name in the policy map.                               |
| <b>class-map type inspect</b>         | Creates an inspection class map to match traffic specific to an application. |
| <b>policy-map</b>                     | Creates a Layer 3/4 policy map.  |
| <b>show running-config policy-map</b> | Display all current policy map configurations.                               |

# management-access

To allow management access to an interface other than the one from which you entered the adaptive security appliance when using VPN, use the **management-access** command in global configuration mode. To disable management access, use the **no** form of this command.

**management-access** *mgmt\_if*

**no management-access** *mgmt\_if*

## Syntax Description

|                |   |
|----------------|---|
| <i>mgmt_if</i> | Specifies the name of the management interface you want to access when entering the adaptive security appliance from another interface. |
|----------------|---|

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | —           | •                | —        | —      |

## Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

## Usage Guidelines

This command allows you to connect to an interface other than the one you entered the adaptive security appliance from when using a full tunnel IPsec VPN or SSL VPN client (AnyConnect 2.x client, SVC 1.x) or across a site-to-site IPsec tunnel. For example, if you enter the adaptive security appliance from the outside interface, this command lets you connect to the inside interface using Telnet; or you can ping the inside interface when entering from the outside interface.

You can define only one management-access interface.

### Note

Do not apply a static NAT statement to the management access interface; if you do so, then remote VPN users will not be able to access the management interface.

## Examples

The following example shows how to configure a firewall interface named “inside” as the management access interface:

```
hostname(config)# management-access inside
hostname(config)# show running-config management-access
management-access inside
```

| Related Commands | Command                                  | Description  |
|------------------|--|--|
|                  | <b>clear configure management-access</b> | Removes the configuration of an internal interface for management access of the adaptive security appliance. |
|                  | <b>show management-access</b>            | Displays the name of the internal interface configured for management access.                                |

# management-only

To set an interface to accept management traffic only, use the **management-only** command in interface configuration mode. To allow through traffic, use the **no** form of this command.

**management-only**

**no management-only**

## Syntax Description

This command has no arguments or keywords.

## Defaults

The Management 0/0 interface on the ASA 5510 and higher adaptive security appliance is set to management-only mode by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Interface configuration | •             | —           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The ASA 5510 and higher adaptive security appliance includes a dedicated management interface called Management 0/0, which is meant to support traffic to the adaptive security appliance. However, you can configure any interface to be a management-only interface using the **management-only** command. Also, for Management 0/0, you can disable management-only mode so the interface can pass through traffic just like any other interface.

Transparent firewall mode allows only two interfaces to pass through traffic; however, on the ASA 5510 and higher adaptive security appliance, you can use the Management 0/0 interface (either the physical interface or a subinterface) as a third interface for management traffic. The mode is not configurable in this case and must always be management-only. You can also set the IP address of this interface in transparent mode if you want this interface to be on a different subnet from the management IP address, which is assigned to the adaptive security appliance or context, and not to individual interfaces.

## Examples

The following example disables management-only mode on the management interface:

```
hostname(config)# interface management0/0
hostname(config-if)# no management-only
```

The following example enables management-only mode on a subinterface:

 management-only

```
hostname(config)# interface gigabitethernet0/2.1  
hostname(config-subif)# management-only
```

**Related Commands**

| Command          | Description  |
|------------------|--|
| <b>interface</b> | Configures an interface and enters interface configuration mode. |

# map-name

To map a user-defined attribute name to a Cisco attribute name, use the **map-name** command in ldap-attribute-map configuration mode.

To remove this mapping, use the **no** form of this command.

**map-name** *user-attribute-name* *Cisco-attribute-name*

**no map-name** *user-attribute-name* *Cisco-attribute-name*

## Syntax Description

|                             |  |
|-----------------------------|--|
| <i>user-attribute-name</i>  | Specifies the user-defined attribute name that you are mapping to the Cisco attribute. |
| <i>Cisco-attribute-name</i> | Specifies the Cisco attribute name that you are mapping to the user-defined name.      |

## Defaults

By default, no name mappings exist.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                     | Firewall Mode |             | Security Context |                     |        |
|----------------------------------|---------------|-------------|------------------|---------------------|--------|
|                                  | Routed        | Transparent | Single           | Multiple<br>Context | System |
| ldap-attribute-map configuration | •             | •           | •                | •                   | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.1(1)  | This command was introduced. |

## Usage Guidelines

With the **map-name** command, you can map your own attribute names to Cisco attribute names. You can then bind the resulting attribute map to an LDAP server. Your typical steps would include:

1. Use the **ldap attribute-map** command in global configuration mode to create an unpopulated attribute map. This command enters ldap-attribute-map mode.
2. Use the **map-name** and **map-value** commands in ldap-attribute-map mode to populate the attribute map.
3. Use the **ldap-attribute-map** command in aaa-server host mode to bind the attribute map to an LDAP server. Note the hyphen after “ldap” in this command.

### Note

To use the attribute mapping features correctly, you need to understand both the Cisco LDAP attribute names and values as well as the user-defined attribute names and values.

Examples

The following example commands map a user-defined attribute name Hours to the Cisco attribute name cVPN3000-Access-Hours in the LDAP attribute map myldapmap:

```
hostname(config)# ldap attribute-map myldapmap
hostname(config-ldap-attribute-map)# map-name Hours cVPN3000-Access-Hours
hostname(config-ldap-attribute-map)#
```

Within ldap-attribute-map mode, you can enter “?” to display the complete list of Cisco LDAP attribute names, as shown in the following example:

```
hostname(config-ldap-attribute-map)# map-name <name>
ldap mode commands/options:
cisco-attribute-names:
  cVPN3000-Access-Hours
  cVPN3000-Allow-Network-Extension-Mode
  cVPN3000-Auth-Service-Type
  cVPN3000-Authenticated-User-Idle-Timeout
  cVPN3000-Authorization-Required
  cVPN3000-Authorization-Type
  :
  :
  cVPN3000-X509-Cert-Data
hostname(config-ldap-attribute-map)#
```

Related Commands

| Command   | Description   |
|---|---|
| <b>ldap attribute-map (global configuration mode)</b> | Creates and names an LDAP attribute map for mapping user-defined attribute names to Cisco LDAP attribute names. |
| <b>ldap-attribute-map (aaa-server host mode)</b>      | Binds an LDAP attribute map to an LDAP server.  |
| <b>map-value</b>                                      | Maps a user-defined attribute value to a Cisco attribute.   |
| <b>show running-config ldap attribute-map</b>         | Displays a specific running LDAP attribute map or all running attribute maps.                                   |
| <b>clear configure ldap attribute-map</b>             | Removes all LDAP attribute maps.  |

# map-value

To map a user-defined value to a Cisco LDAP value, use the **map-value** command in ldap-attribute-map configuration mode. To delete an entry within a map, use the **no** form of this command.

**map-value** *user-attribute-name user-value-string Cisco-value-string*

**no map-value** *user-attribute-name user-value-string Cisco-value-string*

## Syntax Description

|                            |   |
|----------------------------|---|
| <i>Cisco-value-string</i>  | Specifies the Cisco value string for the Cisco attribute.                                   |
| <i>user-attribute-name</i> | Specifies the user-defined attribute name that you are mapping to the Cisco attribute name. |
| <i>user-value-string</i>   | Specifies the user-defined value string that you are mapping to the Cisco attribute value.  |

## Defaults

By default, there are no user-defined values mapped to Cisco attributes.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                     | Firewall Mode |             | Security Context |          |        |
|----------------------------------|---------------|-------------|------------------|----------|--------|
|                                  | Routed        | Transparent | Single           | Multiple |        |
|                                  |               |             |                  | Context  | System |
| ldap-attribute-map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.1(1)  | This command was introduced. |

## Usage Guidelines

With the **map-value** command, you can map your own attribute values to Cisco attribute names and values. You can then bind the resulting attribute map to an LDAP server. Your typical steps would include:

1. Use the **ldap attribute-map** command in global configuration mode to create an unpopulated attribute map. This command enters ldap-attribute-map mode.
2. Use the **map-name** and **map-value** commands in ldap-attribute-map mode to populate the attribute map.
3. Use the **ldap-attribute-map** command in aaa-server host mode to bind the attribute map to an LDAP server. Note the hyphen after “ldap” in this command.

### Note

To use the attribute mapping features correctly, you need to understand both the Cisco LDAP attribute names and values as well as the user-defined attribute names and values.

Examples

The following example, entered in ldap-attribute-map mode, sets the user-defined value of the user attribute Hours to a user-defined time policy named workDay and a Cisco-defined time policy named Daytime:

```
hostname(config)# ldap attribute-map myldapmap
hostname(config-ldap-attribute-map)# map-value Hours workDay Daytime
hostname(config-ldap-attribute-map)#
```

Related Commands

| Command   | Description   |
|---|---|
| <b>ldap attribute-map (global configuration mode)</b> | Creates and names an LDAP attribute map for mapping user-defined attribute names to Cisco LDAP attribute names. |
| <b>ldap-attribute-map (aaa-server host mode)</b>      | Binds an LDAP attribute map to an LDAP server.  |
| <b>map-name</b>                                       | Maps a user-defined LDAP attribute name with a Cisco LDAP attribute name.                                       |
| <b>show running-config ldap attribute-map</b>         | Displays a specific running LDAP attribute map or all running attribute maps.                                   |
| <b>clear configure ldap attribute-map</b>             | Removes all LDAP maps.  |

# mask

When using the Modular Policy Framework, mask out part of the packet that matches a **match** command or class map by using the **mask** command in match or class configuration mode. This mask action is available in an inspection policy map (the **policy-map type inspect** command) for application traffic; however, not all applications allow this action. For example, you can use **mask** command for the DNS application inspection to mask a header flag before allowing the traffic through the adaptive security appliance. To disable this action, use the **no** form of this command.

**mask** [**log**]

**no mask** [**log**]

## Syntax Description

|            |   |
|------------|---|
| <b>log</b> | Logs the match. The system log message number depends on the application. |
|------------|---|

## Defaults

No default behaviors or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                  | Firewall Mode |             | Security Context |          |        |
|-------------------------------|---------------|-------------|------------------|----------|--------|
|                               | Routed        | Transparent | Single           | Multiple |        |
|                               |               |             |                  | Context  | System |
| Match and class configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

An inspection policy map consists of one or more **match** and **class** commands. The exact commands available for an inspection policy map depends on the application. After you enter the **match** or **class** command to identify application traffic (the **class** command refers to an existing **class-map type inspect** command that in turn includes **match** commands), you can enter the **mask** command to mask part of the packet that matches the **match** command or **class** command.

When you enable application inspection using the **inspect** command in a Layer 3/4 policy map (the **policy-map** command), you can enable the inspection policy map that contains this action, for example, enter the **inspect dns dns\_policy\_map** command where **dns\_policy\_map** is the name of the inspection policy map.

## Examples

The following example masks the RD and RA flags in the DNS header before allowing the traffic through the adaptive security appliance:

```
hostname(config-cmap) # policy-map type inspect dns dns-map1
```

```
hostname(config-pmap-c) # match header-flag RD
hostname(config-pmap-c) # mask log
hostname(config-pmap-c) # match header-flag RA
hostname(config-pmap-c) # mask log
```

Related Commands

| Commands                              | Description  |
|---------------------------------------|--|
| <b>class</b>                          | Identifies a class map name in the policy map.                               |
| <b>class-map type inspect</b>         | Creates an inspection class map to match traffic specific to an application. |
| <b>policy-map</b>                     | Creates a Layer 3/4 policy map.  |
| <b>policy-map type inspect</b>        | Defines special actions for application inspection.                          |
| <b>show running-config policy-map</b> | Display all current policy map configurations.                               |

# mask-banner

To obfuscate the server banner, use the **mask-banner** command in parameters configuration mode. To disable this feature, use the **no** form of this command.

**mask-banner**

**no mask-banner**

## Syntax Description

This command has no arguments or keywords.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Parameters configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to mask the server banner:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# parameters
hostname(config-pmap-p)# mask-banner
```

## Related Commands

| Command                               | Description  |
|---------------------------------------|--|
| <b>class</b>                          | Identifies a class map name in the policy map.                               |
| <b>class-map type inspect</b>         | Creates an inspection class map to match traffic specific to an application. |
| <b>policy-map</b>                     | Creates a Layer 3/4 policy map.  |
| <b>show running-config policy-map</b> | Display all current policy map configurations.                               |

# mask-syst-reply

To hide the FTP server response from clients, use the **mask-syst-reply** command in FTP map configuration mode, which is accessible by using the **ftp-map** command. To remove the configuration, use the **no** form of this command.

- mask-syst-reply**
- no mask-syst-reply**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command is enabled by default.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode          | Firewall Mode |             | Security Context |          |        |
|-----------------------|---------------|-------------|------------------|----------|--------|
|                       | Routed        | Transparent | Single           | Multiple |        |
|                       |               |             |                  | Context  | System |
| FTP map configuration | •             | •           | •                | •        | —      |

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

**Usage Guidelines** Use the mask-syst-reply command with strict FTP inspection to protect the FTP server system from clients. After enabling this command, the servers replies to the **syst** command are replaced by a series of Xs.

**Examples** The following example causes the adaptive security appliance to replace the FTP server replies to the syst command with Xs:

```
hostname(config)# ftp-map inbound_ftp
hostname(config-ftp-map)# mask-syst-reply
hostname(config-ftp-map)#
```

| Commands           | Description   |
|--------------------|---|
| <b>class-map</b>   | Defines the traffic class to which to apply security actions. |
| <b>ftp-map</b>     | Defines an FTP map and enables FTP map configuration mode.    |
| <b>inspect ftp</b> | Applies a specific FTP map to use for application inspection. |

| Commands                              | Description  |
|---------------------------------------|--|
| <b>policy-map</b>                     | Associates a class map with specific security actions. |
| <b>request-command</b><br><b>deny</b> | Specifies FTP commands to disallow.                    |

# match access-list

When using the Modular Policy Framework, use an access list to identify traffic to which you want to apply actions by using the **match access-list** command in class-map configuration mode. To remove the **match access-list** command, use the **no** form of this command.

```
match access-list access_list_name

no match access-list access_list_name
```

|                    |                  |  |
|--------------------|------------------|--|
| Syntax Description | access_list_name | Specifies the name of an access list to be used as match criteria. |
|--------------------|------------------|--|

|          |                                |
|----------|--------------------------------|
| Defaults | No default behavior or values. |
|----------|--------------------------------|

|               |   |
|---------------|---|
| Command Modes | The following table shows the modes in which you can enter the command: |
|---------------|---|

| Command Mode            | Firewall Mode |             | Security Context |                  |        |
|-------------------------|---------------|-------------|------------------|------------------|--------|
|                         | Routed        | Transparent | Single           | Multiple Context | System |
| Class-map configuration | •             | •           | •                | •                | —      |

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

Usage Guidelines

Configuring Modular Policy Framework consists of four tasks:

- Identify the Layer 3 and 4 traffic to which you want to apply actions using the **class-map** command.  
After you enter the **class-map** command, you can enter the **match access-list** command to identify the traffic. Alternatively, you can enter a different type of **match** command, such as the **match port** command. You can only include one **match access-list** command in the class map, and you cannot combine it with other types of **match** commands. The exception is if you define the **match default-inspection-traffic** command which matches the default TCP and UDP ports used by all applications that the adaptive security appliance can inspect, then you can narrow the traffic to match using a **match access-list** command. Because the **match default-inspection-traffic** command specifies the ports to match, any ports in the access list are ignored.
- (Application inspection only) Define special actions for application inspection traffic using the **policy-map type inspect** command.
- Apply actions to the Layer 3 and 4 traffic using the **policy-map** command.
- Activate the actions on an interface using the **service-policy** command.

|          |   |
|----------|---|
| Examples | The following example creates three Layer 3/4 class maps that match three access lists: |
|----------|---|

```

hostname(config)# access-list udp permit udp any any
hostname(config)# access-list tcp permit tcp any any
hostname(config)# access-list host_foo permit ip any 10.1.1.1 255.255.255.255

hostname(config)# class-map all_udp
hostname(config-cmap)# description "This class-map matches all UDP traffic"
hostname(config-cmap)# match access-list udp

hostname(config-cmap)# class-map all_tcp
hostname(config-cmap)# description "This class-map matches all TCP traffic"
hostname(config-cmap)# match access-list tcp

hostname(config-cmap)# class-map to_server
hostname(config-cmap)# description "This class-map matches all traffic to server 10.1.1.1"
hostname(config-cmap)# match access-list host_foo

```

**Related Commands**

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                     | Includes all traffic in the class map.                      |
| <b>match port</b>                    | Identifies a specific port number in a class map.           |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match any

When using the Modular Policy Framework, match all traffic to which you want to apply actions by using the **match any** command in class-map configuration mode. To remove the **match any** command, use the **no** form of this command.

**match any**

**no match any**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Class-map configuration | •             | •           | •                | •        | —      |

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

- Usage Guidelines** Configuring Modular Policy Framework consists of four tasks:
1. Identify the Layer 3 and 4 traffic to which you want to apply actions using the **class-map** command.  
After you enter the **class-map** command, you can enter the **match any** command to identify all traffic. Alternatively, you can enter a different type of **match** command, such as the **match port** command. You cannot combine the **match any** command with other types of **match** commands.
  2. (Application inspection only) Define special actions for application inspection traffic using the **policy-map type inspect** command.
  3. Apply actions to the Layer 3 and 4 traffic using the **policy-map** command.
  4. Activate the actions on an interface using the **service-policy** command.

**Examples** This example shows how to define a traffic class using a class map and the **match any** command:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match any
```

# match body

To configure a match condition on the length or length of a line of an ESMTP body message, use the **match body** command in class-map or policy-map configuration mode. To remove a configured section, use the **no** form of this command.

```
match [not] body [length | line length] gt bytes

no match [not] body [length | line length] gt bytes
```

## Syntax Description

|                    |  |
|--------------------|--|
| <b>length</b>      | Specifies the length of an ESMTP body message.           |
| <b>line length</b> | Specifies the length of a line of an ESMTP body message. |
| <i>bytes</i>       | Specifies the number to match in bytes.                  |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for a body line length in an ESMTP inspection policy map:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# match body line length gt 1000
```

# match called-party

To configure a match condition on the H.323 called party, use the **match called-party** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **called-party** [**regex** *regex*]

**no match** [**not**] **match** [**not**] **called-party** [**regex** *regex*]

## Syntax Description

**regex** *regex* Specifies to match on the regular expression.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |                     |        |
|--------------------------|---------------|-------------|------------------|---------------------|--------|

|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                     | Includes all traffic in the class map.                      |
| <b>match port</b>                    | Identifies a specific port number in a class map.           |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match calling-party

To configure a match condition on the H.323 calling party, use the **match calling-party** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **calling-party** [**regex** *regex*]

**no match** [**not**] **match** [**not**] **calling-party** [**regex** *regex*]

## Syntax Description

**regex** *regex* Specifies to match on the regular expression.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |                     |        |
|--------------------------|---------------|-------------|------------------|---------------------|--------|
|                          | Routed        | Transparent | Single           | Multiple<br>Context | System |
| Policy map configuration | •             | •           | •                | •                   | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for the calling party in an H.323 inspection class map:

```
hostname(config-cmap)# match calling-party regex caller1
```

# match certificate

During the PKI certificate validation process, the adaptive security appliance checks certificate revocation status to maintain security. It can use either CRL checking or Online Certificate Status Protocol (OCSP) to accomplish this task. With CRL checking, the adaptive security appliance retrieves, parses, and caches Certificate Revocation Lists, which provide a complete list of revoked certificates. OCSP offers a more scalable method of checking revocation status in that it localizes certificate status on a Validation Authority, which it queries for the status of a specific certificate.

Certificate match rules let you configure OCSP URL overrides, which specify a URL to check for revocation status, rather than the URL in the AIA field of the remote user certificate. Match rules also let you configure trustpoints to use to validate OCSP responder certificates, which lets the adaptive security appliance validate responder certificates from any CA, including self-signed certificates and certificates external to the validation path of the client certificate.

To configure a certificate match rule, use the **match certificate** command in crypto ca trustpoint mode. To remove the rule from the configuration, use the **no** form of this command.

```
match certificate map-name override ocsp [trustpoint trustpoint-name] seq-num url URL
no match certificate map-name override ocsp
```

|                    |                   |  |
|--------------------|-------------------|--|
| Syntax Description | map-name          | Specifies the name of the certificate map to match to this rule. You must configure the certificate map prior to configuring a match rule. Maximum 65 characters.  |
|                    | match certificate | Specifies the certificate map for this match rule.   |
|                    | override ocsp     | Specifies that the purpose of the rule is to override an OCSP URL in a certificate.  |
|                    | seq-num           | Sets the priority for this match rule. Range is 1 to 10000. The adaptive security appliance evaluates the match rule with the lowest sequence number first, followed by higher numbers until it finds a match. |
|                    | trustpoint        | (Optional) Specifies using a trustpoint for verifying the OCSP responder certificate.  |
|                    | trustpoint-name   | (Optional) Identifies the trustpoint. to use with the override to validate responder certificates.   |
|                    | url               | Specifies accessing a URL for OCSP revocation status.  |
|                    | URL               | Identifies the URL to access for OCSP revocation status.   |
|                    |                   |  |

Defaults No default behavior or values.

**Command Modes**

The following table shows the modes in which you can enter the command:

| Command Mode              | Firewall Mode |             | Security Context |          |        |
|---------------------------|---------------|-------------|------------------|----------|--------|
|                           | Routed        | Transparent | Single           | Multiple |        |
|                           |               |             |                  | Context  | System |
| crypto ca trustpoint mode | •             | •           | •                | •        | •      |

**Command History**

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

**Usage Guidelines**

Be aware of the following tips when configuring OCSP:

- You can configure multiple match rules within a trustpoint configuration, but you can have only one match rule for each crypto ca certificate map. You can, however, configure multiple crypto ca certificate maps and associate them with the same trustpoint.
- You must configure the certificate map before configuring a match rule.
- To configure a trustpoint to validate a self-signed OCSP responder certificates, you import the self-signed responder certificate into its own trustpoint as a trusted CA certificate. Then you configure the **match certificate** command in the client certificate validating trustpoint to use the trustpoint that contains the self-signed OCSP responder certificate to validate the responder certificate. The same applies for validating responder certificates external to the validation path of the client certificate.
- A trustpoint can validate both the client certificate and the responder certificate if the same CA issues both of them. But if different CAs issue the client and responder certificates, you need to configure two trustpoints, one trustpoint for each certificate.
- The OCSP server (responder) certificate typically signs the OCSP response. After receiving the response, the adaptive security appliance tries to verify the responder certificate. The CA normally sets the lifetime of its OCSP responder certificate to a relatively short period to minimize the chance of it being compromised. The CA typically also includes an ocsf-no-check extension in the responder certificate indicating that this certificate does not need revocation status checking. But if this extension is not present, the adaptive security appliance tries to check its revocation status using the same method specified in the trustpoint. If the responder certificate is not verifiable, revocation checks fails. To avoid this possibility, configure **revocation-check none** in the responder certificate validating trustpoint, while configuring **revocation-check ocsf** for the client certificate.
- If the adaptive security appliance does not find a match, it uses the URL in the **ocsf url** command. If you have not configured the **ocsf url** command, it uses the AIA field of the remote user certificate. If the certificate does not have an AIA extension, revocation status checking fails.

**Examples**

The following example shows how to create a certificate match rule for a trustpoint called newtrust. The rule has a map name called mymap, sequence number of 4, a trustpoint called mytrust, and specifies a URL of 10.22.184.22.

```
hostname(config)# crypto ca trustpoint newtrust
hostname(config-ca-trustpoint)# match certificate mymap override ocsf trustpoint mytrust 4
url 10.22.184.22
hostname(config-ca-trustpoint)#
```

The next example shows step-by-step how to configure a crypto ca certificate map, and then a match certificate rule to identify a trustpoint that contains a CA certificate to validate the responder certificate. This is necessary if the CA identified in the newtrust trustpoint does not issue an OSCP responder certificate.

- Step 1** Configure the certificate map that identifies the client certificates to which the map rule applies. In this example the name of the certificate map is mymap and the sequence number is 1. Any client certificate with a subject-name that contains a CN attribute equal to mycert matches the mymap entry.

```
hostname(config)# crypto ca certificate map mymap 1 subject-name attr cn eq mycert
hostname(config-ca-cert-map)# subject-name attr cn eq mycert
hostname(config-ca-cert-map)#
```

- Step 2** Configure a trustpoint that contains the CA certificate to use to validate the OSCP responder certificate. In the case of self-signed certificates, this is the self-signed certificate itself, which is imported and locally trusted. You can also obtain a certificate for this purpose through external CA enrollment. When prompted to do so, paste in the CA certificate.

```
hostname(config-ca-cert-map)# exit
hostname(config)# crypto ca trustpoint mytrust
hostname(config-ca-trustpoint)# enroll terminal
hostname(config-ca-trustpoint)# crypto ca authenticate mytrust
Enter the base 64 encoded CA certificate.
End with the word "quit" on a line by itself
```

```

```

- Step 3** Configure the original trustpoint, newtrust, with OSCP as the revocation checking method. Then set a match rule that includes the certificate map, mymap, and the self-signed trustpoint, mytrust, configured in Step 2.

```
hostname(config)# crypto ca trustpoint newtrust
hostname(config-ca-trustpoint)# enroll terminal
hostname(config-ca-trustpoint)# crypto ca authenticate newtrust
```

```
Enter the base 64 encoded CA certificate.

hostname(config)# crypto ca trustpoint newtrust
hostname(config-ca-trustpoint)# revocation-check ocsp
hostname(config-ca-trustpoint)# match certificate mymap override ocsp trustpoint mytrust 4
url 10.22.184.22

```

Any connection that uses the newtrust trustpoint for client certificate authentication checks to see if the client certificate matches the attribute rules specified in the mymap certificate map. If so, the adaptive security appliance accesses the OCS responder at 10.22.184.22 for certificate revocation status. It then uses the mytrust trustpoint to validate the responder certificate.

**Note**

The newtrust trustpoint is configured to perform revocation checking via OCS for the client certificates. However, the mytrust trustpoint is configured for the default revocation-check method which is none, so no revocation checking is performed on the OCS responder certificate.

**Related Commands**

| Command                          | Description   |
|----------------------------------|---|
| <b>crypto ca certificate map</b> | Creates crypto ca certificate maps. Use this command in global configuration mode.          |
| <b>crypto ca trustpoint</b>      | Enters crypto ca trustpoint mode. Use this command in global configuration mode.            |
| <b>ocsp disable-nonce</b>        | Disables the nonce extension of the OCS request.  |
| <b>ocsp url</b>                  | Specifies the OCS server to use to check all certificates associated with a trustpoint.     |
| <b>revocation-check</b>          | Specifies the method(s) to use for revocation checking, and the order in which to try them. |

# match cmd

To configure a match condition on the ESMTP command verb, use the **match cmd** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **cmd** [**verb** *verb* | **line length gt** *bytes* | **RCPT count gt** *recipients\_number*]

**no match** [**not**] **cmd** [**verb** *verb* | **line length gt** *bytes* | **RCPT count gt** *recipients\_number*]

## Syntax Description

|   |  |
|---|--|
| <b>verb</b> <i>verb</i>                       | Specifies the ESMTP command verb.                  |
| <b>line length gt</b> <i>bytes</i>            | Specifies the length of a line.                    |
| <b>RCPT count gt</b> <i>recipients_number</i> | Specifies the number of recipient email addresses. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |

|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The **match** commands are used to identify the traffic included in the traffic class for a class map. They include different criteria to define the traffic included in a class-map. Define a traffic class using the **class-map** global configuration command as part of configuring a security feature using Modular Policy Framework. From class-map configuration mode, you can define the traffic to include in the class using the **match** command.

After a traffic class is applied to an interface, packets received on that interface are compared to the criteria defined by the **match** statements in the class map. If the packet matches the specified criteria, it is included in the traffic class and is subjected to any actions associated with that traffic class. Packets that do not match any of the criteria in any traffic class are assigned to the default traffic class.

Using the **match default-inspection-traffic** command, you can match default traffic for the individual **inspect** commands. The **match default-inspection-traffic** command can be used in conjunction with one other match command, which is typically an access-list in the form of **permit ip src-ip dst-ip**.

The rule for combining a second **match** command with the **match default-inspection-traffic** command is to specify the protocol and port information using the **match default-inspection-traffic** command and specify all other information (such as IP addresses) using the second **match** command. Any protocol or port information specified in the second **match** command is ignored with respect to the **inspect** commands.

For instance, port 65535 specified in the example below is ignored:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match default-inspection-traffic
hostname(config-cmap)# match port 65535
```

Default traffic for inspections are as follows:

| Inspection Type | Protocol Type | Source Port | Destination Port |
|-----------------|---------------|-------------|------------------|
| ctiqbe          | tcp           | N/A         | 1748             |
| dcerpc          | tcp           | N/A         | 135              |
| dns             | udp           | 53          | 53               |
| ftp             | tcp           | N/A         | 21               |
| gtp             | udp           | 2123,3386   | 2123,3386        |
| h323 h225       | tcp           | N/A         | 1720             |
| h323 ras        | udp           | N/A         | 1718-1719        |
| http            | tcp           | N/A         | 80               |
| icmp            | icmp          | N/A         | N/A              |
| ils             | tcp           | N/A         | 389              |

| ipsec-pass-thru | udp           | N/A         | 500              |
| mgcp            | udp           | 2427,2727   | 2427,2727        |
| netbios         | udp           | 137-138     | N/A              |
| rpc             | udp           | 111         | 111              |
| rsh             | tcp           | N/A         | 514              |
| rtsp            | tcp           | N/A         | 554              |
| sip             | tcp,udp       | N/A         | 5060             |
| skinny          | tcp           | N/A         | 2000             |
| smtp            | tcp           | N/A         | 25               |
| sqlnet          | tcp           | N/A         | 1521             |
| tftp            | udp           | N/A         | 69               |
| xmcp            | udp           | 177         | 177              |

## Examples

The following example shows how to define a traffic class using a class map and the **match default-inspection-traffic** command:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match default-inspection-traffic
hostname(config-cmap)#
```

| <b>class-map</b>                 | Applies a traffic class to an interface.           |
| <b>clear configure class-map</b> | Removes all of the traffic map definitions.        |
| <b>match access-list</b>         | Identifies access list traffic within a class map. |

| Command                                  | Description   |
|--|---|
| <b>match any</b>                         | Includes all traffic in the class map.                      |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match dns-class

To configure a match condition for the Domain System Class in a DNS Resource Record or Question section, use the **match dns-class** command in class-map or policy-map configuration mode. To remove a configured class, use the **no** form of this command.

```
match [not] dns-class {eq c_well_known | c_val} {range c_val1 c_val2}

no match [not] dns-class {eq c_well_known | c_val} {range c_val1 c_val2}
```

Syntax Description

|               |  |
|---------------|--|
| eq            | Specifies an exact match.  |
| c_well_known  | Specifies DNS class by well-known name, IN.                        |
| c_val         | Specifies an arbitrary value in the DNS class field (0-65535).     |
| range         | Specifies a range.   |
| c_val1 c_val2 | Specifies values in a range match. Each value between 0 and 65535. |

Defaults

This command is disabled by default.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

By default, this command inspects all fields (questions and RRs) of a DNS message and matches the specified class. Both DNS query and response are examined.

The match can be narrowed down to the question portion of a DNS query by the following two commands: **match not header-flag QR** and **match question**.

This command can be configured within a DNS class map or policy map. Only one entry can be entered within a DNS class-map.

Examples

The following example shows how to configure a match condition for a DNS class in a DNS inspection policy map:

```
hostname(config)# policy-map type inspect dns preset_dns_map
hostname(config-pmap)# match dns-class eq IN
```

| Related Commands | Command                              | Description   |
|------------------|--------------------------------------|---|
|                  | <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
|                  | <b>clear configure class-map</b>     | Removes all class maps.                                     |
|                  | <b>match any</b>                     | Includes all traffic in the class map.                      |
|                  | <b>match port</b>                    | Identifies a specific port number in a class map.           |
|                  | <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match dns-type

To configure a match condition for a DNS type, including Query type and RR type, use the **match dns-type** command in class-map or policy-map configuration mode. To remove a configured dns type, use the **no** form of this command.

```
match [not] dns-type {eq t_well_known | t_val} {range t_val1 t_val2}

no match [not] dns-type {eq t_well_known | t_val} {range t_val1 t_val2}
```

Syntax Description

|               |  |
|---------------|--|
| eq            | Specifies an exact match.  |
| t_well_known  | Specifies DNS type by well-known name: A, NS, CNAME, SOA, TSIG, IXFR, or AXFR. |
| t_val         | Specifies an arbitrary value in the DNS type field (0-65535).                  |
| range         | Specifies a range.   |
| t_val1 t_val2 | Specifies values in a range match. Each value between 0 and 65535.             |

Defaults

This command is disabled by default.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

By default, this command inspects all sections of a DNS message (questions and RRs) and matches the specified type. Both DNS query and response are examined.

The match can be narrowed down to the question portion of a DNS query by the following two commands: **match not header-flag QR** and **match question**.

This command can be configured within a DNS class map or policy map. Only one entry can be entered within a DNS class-map.

Examples

The following example shows how to configure a match condition for a DNS type in a DNS inspection policy map:

```
hostname(config)# policy-map type inspect dns preset_dns_map
```

```
hostname(config-pmap)# match dns-type eq a
```

**Related Commands**

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                     | Includes all traffic in the class map.                      |

| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match domain-name

To configure a match condition for a DNS message domain name list, use the **match domain-name** command in class-map or policy-map configuration mode. To remove a configured section, use the **no** form of this command.

```
match [not] domain-name regex regex_id
match [not] domain-name regex class class_id
no match [not] domain-name regex regex_id
no match [not] domain-name regex class class_id
```

Syntax Description

|          |  |
|----------|--|
| regex    | Specifies a regular expression.  |
| regex_id | Specifies the regular expression ID.                                       |
| class    | Specifies the class map that contains multiple regular expression entries. |
| class_id | Specifies the regular expression class map ID.                             |

Defaults

This command is disabled by default.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

This command matches domain names in the DNS message against predefined list. Compressed domain names will be expanded before matching. The match condition can be narrowed down to a particular field in conjunction with other DNS **match** commands.

This command can be configured within a DNS class map or policy map. Only one entry can be entered within a DNS class-map.

Examples

The following example shows how to match the DNS domain name in a DNS inspection policy map:

```
hostname(config)# policy-map type inspect dns preset_dns_map
hostname(config-pmap)# match domain-name regex
```

| Related Commands | Command                              | Description   |
|------------------|--------------------------------------|---|
|                  | <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
|                  | <b>clear configure class-map</b>     | Removes all class maps.                                     |
|                  | <b>match any</b>                     | Includes all traffic in the class map.                      |
|                  | <b>match port</b>                    | Identifies a specific port number in a class map.           |
|                  | <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match dscp

To identify the IETF-defined DSCP value (in an IP header) in a class map, use the **match dscp** command in class-map configuration mode. To remove this specification, use the **no** form of this command.

```
match dscp {values}

no match dscp {values}
```

Syntax Description

|        |  |
|--------|--|
| values | Specifies up to eight different the IETF-defined DSCP values in the IP header. Range is 0 to 63. |
|--------|--|

Defaults

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Class-map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

Usage Guidelines

The **match** commands are used to identify the traffic included in the traffic class for a class map. They include different criteria to define the traffic included in a class-map. Define a traffic class using the **class-map** global configuration command as part of configuring a security feature using Modular Policy Framework. From class-map configuration mode, you can define the traffic to include in the class using the **match** command.

After a traffic class is applied to an interface, packets received on that interface are compared to the criteria defined by the **match** statements in the class map. If the packet matches the specified criteria, it is included in the traffic class and is subjected to any actions associated with that traffic class. Packets that do not match any of the criteria in any traffic class are assigned to the default traffic class.

Using the **match dscp** command, you can match the IETF-defined DSCP values in the IP header.

Examples

The following example shows how to define a traffic class using a class map and the **match dscp** command:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match dscp af43 cs1 ef
hostname(config-cmap)#
```

| <b>Related Commands</b> | <b>Command</b>                       | <b>Description</b>   |
|-------------------------|--------------------------------------|--|
|                         | <b>class-map</b>                     | Applies a traffic class to an interface.   |
|                         | <b>clear configure class-map</b>     | Removes all of the traffic map definitions.  |
|                         | <b>match access-list</b>             | Identifies access list traffic within a class map.   |
|                         | <b>match port</b>                    | Specifies the TCP/UDP ports as the comparison criteria for packets received on that interface. |
|                         | <b>show running-config class-map</b> | Displays the information about the class map configuration.                                    |

# match ehlo-reply-parameter

To configure a match condition on the ESMTP ehlo reply parameter, use the **match ehlo-reply-parameter** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

```
match [not] ehlo-reply-parameter parameter

no match [not] ehlo-reply-parameter parameter
```

|                    |           |                                     |
|--------------------|-----------|-------------------------------------|
| Syntax Description | parameter | Specifies the ehlo reply parameter. |

| Policy map configuration | •             | •           | •                | •                | —      |

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 7.2(1)  | This command was introduced. |

Examples

The following example shows how to configure a match condition for an ehlo reply parameter in an ESMTP inspection policy map:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# match ehlo-reply-parameter auth
```

| Related Commands | Command                              | Description   |
|------------------|--------------------------------------|---|
|                  | <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
|                  | <b>clear configure class-map</b>     | Removes all class maps.                                     |
|                  | <b>match any</b>                     | Includes all traffic in the class map.                      |
|                  | <b>match port</b>                    | Identifies a specific port number in a class map.           |
|                  | <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match filename

To configure a match condition for a filename for FTP transfer, use the **match filename** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **filename regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **filename regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

*regex\_name* Specifies a regular expression.

**class** *regex\_class\_name* Specifies a regular expression class map.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an FTP class map or policy map. Only one entry can be entered in a FTP class map.

## Examples

The following example shows how to configure a match condition for an FTP transfer filename in an FTP inspection class map:

```
hostname(config)# class-map type inspect ftp match-all ftp_class1
hostname(config-cmap)# description Restrict FTP users ftp1, ftp2, and ftp3 from accessing /root
hostname(config-cmap)# match username regex class ftp_regex_user
hostname(config-cmap)# match filename regex ftp-file
```

## Related Commands

match filename

| Command                                  | Description   |
|--|---|
| <b>class-map</b>                         | Creates a Layer 3/4 class map.                              |
| <b>clear configure<br/>class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                         | Includes all traffic in the class map.                      |
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match filetype

To configure a match condition for a filetype for FTP transfer, use the **match filetype** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **filetype regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **filetype regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |

|----------------------------------|--|
| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

| Command                                  | Description   |
|--|---|
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match flow ip destination-address

To specify the flow IP destination address in a class map, use the **match flow ip destination-address** command in class-map configuration mode. To remove this specification, use the **no** form of this command.

**match flow ip destination-address**

**no match flow ip destination-address**

## Syntax Description

This command has no arguments or keywords.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |                  |        |
|-------------------------|---------------|-------------|------------------|------------------|--------|
|                         | Routed        | Transparent | Single           | Multiple Context | System |
| Class-map configuration | •             | •           | •                | •                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The **match** commands are used to identify the traffic included in the traffic class for a class map. They include different criteria to define the traffic included in a class-map. Define a traffic class using the **class-map** global configuration command as part of configuring a security feature using Modular Policy Framework. From class-map configuration mode, you can define the traffic to include in the class using the **match** command.

After a traffic class is applied to an interface, packets received on that interface are compared to the criteria defined by the **match** statements in the class map. If the packet matches the specified criteria, it is included in the traffic class and is subjected to any actions associated with that traffic class. Packets that do not match any of the criteria in any traffic class are assigned to the default traffic class.

To enable flow-based policy actions on a tunnel group, use the **match flow ip destination-address** and **match tunnel-group** commands with the **class-map**, **policy-map**, and **service-policy** commands. The criteria to define flow is the destination IP address. All traffic going to a unique IP destination address is considered a flow. Policy action is applied to each flow instead of the entire class of traffic. QoS action police is applied using the **match flow ip destination-address** command. Use **match tunnel-group** to police every tunnel within a tunnel group to a specified rate.

Examples

The following example shows how to enable flow-based policing within a tunnel group and limit each tunnel to a specified rate:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match tunnel-group
hostname(config-cmap)# match flow ip destination-address
hostname(config-cmap)# exit
hostname(config)# policy-map pmap
hostname(config-pmap)# class cmap
hostname(config-pmap)# police 56000
hostname(config-pmap)# exit
hostname(config)# service-policy pmap global
hostname(config)#
```

Related Commands

| Command                       | Description  |
|-------------------------------|--|
| class-map                     | Applies a traffic class to an interface.                                 |
| clear configure class-map     | Removes all of the traffic map definitions.                              |
| match access-list             | Identifies access list traffic within a class map.                       |
| show running-config class-map | Displays the information about the class map configuration.              |
| tunnel-group                  | Creates and manages the database of connection-specific records for VPN. |

# match header

To configure a match condition on the ESMTP header, use the **match header** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **header** [[**length** | **line length**] **gt** *bytes* | **to-fields count** **gt** *to\_fields\_number*]

**no match** [**not**] **header** [[**length** | **line length**] **gt** *bytes* | **to-fields count** **gt** *to\_fields\_number*]

## Syntax Description

|  |  |
|--|--|
| <b>length gt</b> <i>bytes</i>                            | Specifies to match on the length of the ESMTP header message.          |
| <b>line length gt</b> <i>bytes</i>                       | Specifies to match on the length of a line of an ESMTP header message. |
| <b>to-fields count</b> <b>gt</b> <i>to_fields_number</i> | Specifies to match on the number of To: fields.                        |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for a header in an ESMTP inspection policy map:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# match header length gt 512
```

## Related Commands

| Command                          | Description                            |
|----------------------------------|--|
| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

| Command                                  | Description   |
|--|---|
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match header-flag

To configure a match condition for a DNS header flag, use the **match header-flag** command in class-map or policy-map configuration mode. To remove a configured header flag, use the **no** form of this command.

**match** [**not**] **header-flag** [**eq**] {*f\_well\_known* | *f\_value*}

**no match** [**not**] **header-flag** [**eq**] {*f\_well\_known* | *f\_value*}

| Syntax Description | eq                  | Specifies an exact match. If not configured, specifies a <b>match-all</b> bit mask match.   |
|--------------------|---------------------|---|
|                    | <i>f_well_known</i> | Specifies DNS header flag bits by well-known name. Multiple flag bits may be entered and logically OR'd.<br><br>QR (Query, note: QR=1, indicating a DNS response)<br>AA (Authoritative Answer)<br>TC (TrunCation)<br>RD (Recursion Desired)<br>RA (Recursion Available) |
|                    | <i>f_value</i>      | Specifies an arbitrary 16-bit value in hexadecimal form.  |

**Defaults** This command is disabled by default.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 7.2(1)  | This command was introduced. |

**Usage Guidelines** This command can be configured in a DNS class map or policy map. Only one entry can be entered in a DNS class map.

**Examples** The following example shows how to configure a match condition for a DNS header flag in a DNS inspection policy map:

**match header-flag**

```
hostname(config)# policy-map type inspect dns preset_dns_map
hostname(config-pmap)# match header-flag AA
```

**Related Commands**

# match im-subscriber

To configure a match condition for a SIP IM subscriber, use the **match im-subscriber** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **im-subscriber** **regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **im-subscriber** **regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in a SIP class map or policy map. Only one entry can be entered in a SIP class map.

## Examples

The following example shows how to configure a match condition for a SIP IM subscriber in a SIP inspection class map:

```
hostname(config-cmap)# match im-subscriber regex class im_sender
```

## Related Commands

| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match invalid-recipients

To configure a match condition on the ESMTP invalid recipient address, use the **match invalid-recipients** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **invalid-recipients count gt** *number*

**no match** [**not**] **invalid-recipients count gt** *number*

## Syntax Description

**count gt** *number* Specifies to match on the invalid recipient number.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

|                          | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          |               |             |                  | Multiple |        |
| Command Mode             | Routed        | Transparent | Single           | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for invalid recipients count in an ESMTP inspection policy map:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# match invalid-recipients count gt 1000
```

## Related Commands

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                     | Includes all traffic in the class map.                      |

| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match ip address

To redistribute any routes that have a route address or match packet that is passed by one of the access lists specified, use the **match ip address** command in route-map configuration mode. To restore the default settings, use the **no** form of this command.

**match ip address** {acl...}

**no match ip address** {acl...}

## Syntax Description

|            |  |
|------------|--|
| <i>acl</i> | Name an access list. Multiple access lists can be specified. |
|------------|--|

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |                  |        |
|-------------------------|---------------|-------------|------------------|------------------|--------|
|                         | Routed        | Transparent | Single           | Multiple Context | System |
| Route-map configuration | •             | —           | •                | —                | —      |

## Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

## Usage Guidelines

The **route-map global** configuration command and the **match** and **set** configuration commands allow you to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has **match** and **set** commands that are associated with it. The **match** commands specify the match criteria—the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the set actions—the particular redistribution actions to perform if the criteria that is enforced by the **match** commands are met. The **no route-map** command deletes the route map.

## Examples

The following example shows how to redistribute internal routes:

```
hostname(config)# route-map name
hostname(config-route-map)# match ip address acl_dmz1 acl_dmz2
```

## Related Commands

| Command                  | Description   |
|--------------------------|---|
| <b>match interface</b>   | Distributes distribute any routes that have their next hop out one of the interfaces specified,                 |
| <b>match ip next-hop</b> | Distributes any routes that have a next-hop router address that is passed by one of the access lists specified. |
| <b>match metric</b>      | Redistributes routes with the metric specified.   |
| <b>route-map</b>         | Defines the conditions for redistributing routes from one routing protocol into another.                        |
| <b>set metric</b>        | Specifies the metric value in the destination routing protocol for a route map.                                 |

# match ip next-hop

To redistribute any routes that have a next-hop router address that is passed by one of the access lists specified, use the **match ip next-hop** command in route-map configuration mode. To remove the next-hop entry, use the **no** form of this command.

```
match ip next-hop {acl...} | prefix-list prefix_list
no match ip next-hop {acl...} | prefix-list prefix_list
```

Syntax Description

|                                       |   |
|---------------------------------------|---|
| <i>acl</i>                            | Name of an ACL. Multiple ACLs can be specified. |
| <b>prefix-list</b> <i>prefix_list</i> | Name of prefix list.                            |

Defaults

Routes are distributed freely, without being required to match a next-hop address.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Route-map configuration | •             | —           | •                | —        | —      |

Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

Usage Guidelines

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the *acl* argument.

The **route-map global** configuration command and the **match** and **set** configuration commands allow you to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has **match** and **set** commands that are associated with it. The **match** commands specify the match criteria—the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the set actions—the particular redistribution actions to perform if the criteria that is enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **match** route-map configuration command has multiple formats. You can enter the **match** commands in any order. All **match** commands must “pass” to cause the route to be redistributed according to the set actions given with the **set** commands. The **no** forms of the **match** commands remove the specified match criteria.

When you are passing routes through a route map, a route map can have several parts. Any route that does not match at least one match clause relating to a **route-map** command is ignored. To modify only some data, you must configure a second route map section and specify an explicit match.

**Examples**

The following example shows how to distribute routes that have a next-hop router address passed by access list `acl_dmz1` or `acl_dmz2`:

```
hostname(config)# route-map name
hostname(config-route-map)# match ip next-hop acl_dmz1 acl_dmz2
```

**Related Commands**

| Command                  | Description   |
|--------------------------|---|
| <b>match interface</b>   | Distributes distribute any routes that have their next hop out one of the interfaces specified.                 |
| <b>match ip next-hop</b> | Distributes any routes that have a next-hop router address that is passed by one of the access lists specified. |
| <b>match metric</b>      | Redistributes routes with the metric specified.   |
| <b>route-map</b>         | Defines the conditions for redistributing routes from one routing protocol into another.                        |
| <b>set metric</b>        | Specifies the metric value in the destination routing protocol for a route map.                                 |

# match ip route-source

To redistribute routes that have been advertised by routers and access servers at the address that is specified by the ACLs, use the **match ip route-source** command in the route-map configuration mode. To remove the next-hop entry, use the **no** form of this command.

```
match ip route-source {acl...} | prefix-list prefix_list
```

```
no match ip route-source {acl...}
```

Syntax Description

|                    |   |
|--------------------|---|
| <i>acl</i>         | Name of an ACL. Multiple ACLs can be specified. |
| <i>prefix_list</i> | Name of prefix list.                            |

Defaults

No filtering on a route source.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |

Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

Usage Guidelines

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the access-list-name argument.

The **route-map global** configuration command and the **match** and **set** configuration commands allow you to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has **match** and **set** commands that are associated with it. The **match** commands specify the match criteria—the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the set actions—the particular redistribution actions to perform if the criteria that is enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **match** route-map configuration command has multiple formats. You can enter the **match** commands in any order. All **match** commands must “pass” to cause the route to be redistributed according to the set actions given with the **set** commands. The **no** forms of the **match** commands remove the specified match criteria.

A route map can have several parts. Any route that does not match at least one match clause relating to a **route-map** command is ignored. To modify only some data, you must configure a second route map section and specify an explicit match. The next-hop and source-router address of the route are not the same in some situations.

## Examples

The following example shows how to distribute routes that have been advertised by routers and access servers at the addresses specified by ACLs `acl_dmz1` and `acl_dmz2`:

```
hostname(config)# route-map name
hostname(config-route-map)# match ip route-source acl_dmz1 acl_dmz2
```

## Related Commands

| Command                  | Description   |
|--------------------------|---|
| <b>match interface</b>   | Distributes distribute any routes that have their next hop out one of the interfaces specified.         |
| <b>match ip next-hop</b> | Distributes any routes that have a next-hop router address that is passed by one of the ACLs specified. |
| <b>match metric</b>      | Redistributes routes with the metric specified.   |
| <b>route-map</b>         | Defines the conditions for redistributing routes from one routing protocol into another.                |
| <b>set metric</b>        | Specifies the metric value in the destination routing protocol for a route map.                         |

# match login-name

To configure a match condition for a client login name for instant messaging, use the **match login-name** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **login-name** **regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **login-name** **regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an IM class map or policy map. Only one entry can be entered in a IM class map.

## Examples

The following example shows how to configure a match condition for a client login name in an instant messaging class map:

```
hostname(config)# class-map type inspect im im_class
hostname(config-cmap)# match login-name regex login
```

## Related Commands

| Command                          | Description                    |
|----------------------------------|--------------------------------|
| <b>class-map</b>                 | Creates a Layer 3/4 class map. |
| <b>clear configure class-map</b> | Removes all class maps.        |

| Command                                  | Description   |
|--|---|
| <b>match any</b>                         | Includes all traffic in the class map.                      |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match media-type

To configure a match condition on the H.323 media type, use the **match media-type** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **media-type** [**audio** | **data** | **video**]

**no match** [**not**] **media-type** [**audio** | **data** | **video**]

## Syntax Description

|              |                                      |
|--------------|--------------------------------------|
| <b>audio</b> | Specifies to match audio media type. |
| <b>data</b>  | Specifies to match data media type.  |
| <b>video</b> | Specifies to match video media type. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for audio media type in an H.323 inspection class map:

```
hostname(config-cmap)# match media-type audio
```

## Related Commands

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                     | Includes all traffic in the class map.                      |
| <b>match port</b>                    | Identifies a specific port number in a class map.           |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match message id

To configure a match condition for a GTP message ID, use the **match message id** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **message id** [*message\_id* | **range** *lower\_range* *upper\_range*]

**no match** [**not**] **message id** [*message\_id* | **range** *lower\_range* *upper\_range*]

## Syntax Description

|  |   |
|--|---|
| <i>message_id</i>                                  | Specifies an alphanumeric identifier between 1 and 255. |
| <b>range</b> <i>lower_range</i> <i>upper_range</i> | Specifies a lower and upper range of IDs.               |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in a GTP class map or policy map. Only one entry can be entered in a GTP class map.

## Examples

The following example shows how to configure a match condition for a message ID in a GTP inspection class map:

```
hostname(config-cmap)# match message id 33
```

## Related Commands

| Command                          | Description                            |
|----------------------------------|--|
| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

 match message id

| Command                                  | Description   |
|--|---|
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match message length

To configure a match condition for a GTP message ID, use the **match message length** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **message length** **min** *min\_length* **max** *max\_length*

**no match** [**not**] **message length** **min** *min\_length* **max** *max\_length*

## Syntax Description

|                              |  |
|------------------------------|--|
| <b>min</b> <i>min_length</i> | Specifies a minimum message ID length. Value is between 1 and 65536. |
| <b>max</b> <i>max_length</i> | Specifies a maximum message ID length. Value is between 1 and 65536. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in a GTP class map or policy map. Only one entry can be entered in a GTP class map.

## Examples

The following example shows how to configure a match condition for a message length in a GTP inspection class map:

```
hostname(config-cmap)# match message length min 8 max 200
```

## Related Commands

| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

 match message length

| Command                                  | Description   |
|--|---|
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match message-path

To configure a match condition for the path taken by a SIP message as specified in the Via header field, use the **match message-path** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **message-path** **regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **message-path** **regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in a SIP class map or policy map. Only one entry can be entered in a SIP class map.

## Examples

The following example shows how to configure a match condition for the path taken by a SIP message in a SIP inspection class map:

```
hostname(config-cmap)# match message-path regex class sip_message
```

## Related Commands

| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match mime

To configure a match condition on the ESMTP mime encoding type, mime filename length, or mime file type, use the **match mime** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **mime** [**encoding** *type* | **filename length** **gt** *bytes* | **filetype** *regex*]

**no match** [**not**] **mime** [**encoding** *type* | **filename length** **gt** *bytes* | **filetype** *regex*]

## Syntax Description

|   |  |
|---|--|
| <b>encoding</b> <i>type</i>                   | Specifies to match on the encoding type.   |
| <b>filename length</b> <b>gt</b> <i>bytes</i> | Specifies to match on the filename length. |
| <b>filetype</b> <i>regex</i>                  | Specifies to match on the file type.       |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for a mime filename length in an ESMTP inspection policy map:

```
hostname(config)# policy-map type inspect esmtp esmtp_map
hostname(config-pmap)# match mime filename length gt 255
```

## Related Commands

# match peer-ip-address

To configure a match condition for the peer IP address for instant messaging, use the **match peer-ip-address** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [not] **peer-ip-address** *ip\_address ip\_address\_mask*

**no match** [not] **peer-ip-address** *ip\_address ip\_address\_mask*

## Syntax Description

|                        |   |
|------------------------|---|
| <i>ip_address</i>      | Specifies a hostname or IP address of the client or server. |
| <i>ip_address_mask</i> | Specifies the netmask for the client or server IP address.  |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an IM class map or policy map. Only one entry can be entered in a IM class map.

## Examples

The following example shows how to configure a match condition for the peer IP address in an instant messaging class map:

```
hostname(config)# class-map type inspect im im_class
hostname(config-cmap)# match peer-ip-address 10.1.1.0 255.255.255.0
```

| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match peer-login-name

To configure a match condition for the peer login name for instant messaging, use the **match peer-login-name** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **peer-login-name** **regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **peer-login-name** **regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an IM class map or policy map. Only one entry can be entered in a IM class map.

## Examples

The following example shows how to configure a match condition for the peer login name in an instant messaging class map:

```
hostname(config)# class-map type inspect im im_class
hostname(config-cmap)# match peer-login-name regex peerlogin
```

## Related Commands

| Command                          | Description                    |
|----------------------------------|--------------------------------|
| <b>class-map</b>                 | Creates a Layer 3/4 class map. |
| <b>clear configure class-map</b> | Removes all class maps.        |

 match peer-login-name

| Command                          | Description   |
|----------------------------------|---|
| match any                        | Includes all traffic in the class map.                      |
| show running-config<br>class-map | Displays the information about the class map configuration. |

# match port

When using the Modular Policy Framework, match the TCP or UDP ports to which you want to apply actions by using the **match port** command in class-map configuration mode. To remove the **match port** command, use the **no** form of this command.

**match port** {tcp | udp} {eq port | range beg\_port end\_port}

**no match port** {tcp | udp} {eq port | range beg\_port end\_port}

## Syntax Description

|                                |   |
|--------------------------------|---|
| <b>eq port</b>                 | Specifies a single port name or number.                               |
| <b>range beg_port end_port</b> | Specifies beginning and ending port range values between 1 and 65535. |
| <b>tcp</b>                     | Specifies a TCP port.   |
| <b>udp</b>                     | Specifies a UDP port.   |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Class-map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

Configuring Modular Policy Framework consists of four tasks:

1. Identify the Layer 3 and 4 traffic to which you want to apply actions using the **class-map** or **class-map type management** command.

After you enter the **class-map** command, you can enter the **matchport** command to identify the traffic. Alternatively, you can enter a different type of **match** command, such as the **match access-list** command (the **class-map type management** command only allows the match port command). You can only include one **match port** command in the class map, and you cannot combine it with other types of **match** commands.

2. (Application inspection only) Define special actions for application inspection traffic using the **policy-map type inspect** command.
3. Apply actions to the Layer 3 and 4 traffic using the **policy-map** command.
4. Activate the actions on an interface using the **service-policy** command.

Examples

The following example shows how to define a traffic class using a class map and the **match port** command:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match port tcp eq 8080
```

Related Commands

| Command                       | Description   |
|-------------------------------|---|
| class-map                     | Creates a Layer 3/4 class map.                              |
| clear configure class-map     | Removes all class maps.                                     |
| match access-list             | Matches traffic according to an access list.                |
| match any                     | Includes all traffic in the class map.                      |
| show running-config class-map | Displays the information about the class map configuration. |

# match precedence

To specify a precedence value in a class map, use the **match precedence** command in class-map configuration mode. To remove this specification, use the **no** form of this command.

**match precedence** *value*

**no match precedence** *value*

## Syntax Description

*value* Specifies up to four precedence values separated by a space. Range is 0 to 7.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Class-map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The **match** commands are used to identify the traffic included in the traffic class for a class map. They include different criteria to define the traffic included in a class-map. Define a traffic class using the **class-map** global configuration command as part of configuring a security feature using Modular Policy Framework. From class-map configuration mode, you can define the traffic to include in the class using the **match** command.

After a traffic class is applied to an interface, packets received on that interface are compared to the criteria defined by the **match** statements in the class map. If the packet matches the specified criteria, it is included in the traffic class and is subjected to any actions associated with that traffic class. Packets that do not match any of the criteria in any traffic class are assigned to the default traffic class.

Use the **match precedence** command to specify the value represented by the TOS byte in the IP header.

## Examples

The following example shows how to define a traffic class using a class map and the **match precedence** command:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match precedence 1
hostname(config-cmap)#
```

**Related Commands**

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Applies a traffic class to an interface.                    |
| <b>clear configure class-map</b>     | Removes all of the traffic map definitions.                 |
| <b>match access-list</b>             | Identifies access list traffic within a class map.          |
| <b>match any</b>                     | Includes all traffic in the class map.                      |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match protocol

To configure a match condition for a specific instant messaging protocol, such as MSN or Yahoo, use the **match protocol** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

```
match [not] protocol {msn-im | yahoo-im}
```

```
no match [not] protocol {msn-im | yahoo-im}
```

## Syntax Description

|                 |  |
|-----------------|--|
| <b>msn-im</b>   | Specifies to match the MSN instant messaging protocol.   |
| <b>yahoo-im</b> | Specifies to match the Yahoo instant messaging protocol. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an IM class map or policy map. Only one entry can be entered in a IM class map.

## Examples

The following example shows how to configure a match condition for the Yahoo instant messaging protocol in an instant messaging class map:

```
hostname(config)# class-map type inspect im im_class
hostname(config-cmap)# match protocol yahoo-im
```

## Related Commands

|----------------------------------|--------------------------------|
| <b>class-map</b>                 | Creates a Layer 3/4 class map. |
| <b>clear configure class-map</b> | Removes all class maps.        |

| Command                                  | Description   |
|--|---|
| <b>match any</b>                         | Includes all traffic in the class map.                      |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match question

To configure a match condition for a DNS question or resource record, use the **match question** command in class-map or policy-map configuration mode. To remove a configured section, use the **no** form of this command.

**match** { **question** | { **resource-record answer** | **authority** | **additional** } }

**no match** { **question** | { **resource-record answer** | **authority** | **additional** } }

## Syntax Description

|                        |   |
|------------------------|---|
| <b>question</b>        | Specifies the question portion of a DNS message.        |
| <b>resource-record</b> | Specifies the resource record portion of a DNS message. |
| <b>answer</b>          | Specifies the Answer RR section.                        |
| <b>authority</b>       | Specifies the Authority RR section.                     |
| <b>additional</b>      | Specifies the Additional RR section.                    |

## Defaults

This command is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

By default, this command inspects the DNS header and matches the specified field. It can be used in conjunction with other DNS **match** commands to define inspection of a particular question or RR type..

This command can be configured within a DNS class map or policy map. Only one entry can be entered within a DNS class-map.

## Examples

The following example shows how to configure a match condition for a DNS question in a DNS inspection policy map:

```
hostname(config)# policy-map type inspect dns preset_dns_map
hostname(config-pmap)# match question
```

|                                    | Routed        | Transparent | Single           | Multiple |        |
|                                    |               |             |                  | Context  | System |
| Class-map type regex configuration | •             | •           | •                | —        | •      |

## Command History

| Release | Modification                |
|---------|-----------------------------|
| 7.0(2)  | We introduced this command. |

## Usage Guidelines

The **regex** command can be used for various features that require text matching. You can group regular expressions in a regular expression class map using the **class-map type regex** command and then multiple **match regex** commands.

For example, you can configure special actions for application inspection using an inspection policy map (see the **policy map type inspect** command). In the inspection policy map, you can identify the traffic you want to act upon by creating an inspection class map containing one or more **match** commands or you can use **match** commands directly in the inspection policy map. Some **match** commands let you identify text in a packet using a regular expression; for example, you can match URL strings inside HTTP packets.

## Examples

The following is an example of an HTTP inspection policy map and the related class maps. This policy map is activated by the Layer 3/4 policy map, which is enabled by the service policy.

```
hostname(config)# regex url_example example\.com
hostname(config)# regex url_example2 example2\.com
hostname(config)# class-map type regex match-any URLs
hostname(config-cmap)# match regex url_example
hostname(config-cmap)# match regex url_example2
```

```

hostname(config-cmap)# class-map type inspect http match-all http-traffic
hostname(config-cmap)# match req-resp content-type mismatch
hostname(config-cmap)# match request body length gt 1000
hostname(config-cmap)# match not request uri regex class URLs

hostname(config-cmap)# policy-map type inspect http http-map1
hostname(config-pmap)# class http-traffic
hostname(config-pmap-c)# drop-connection log
hostname(config-pmap-c)# match req-resp content-type mismatch
hostname(config-pmap-c)# reset log
hostname(config-pmap-c)# parameters
hostname(config-pmap-p)# protocol-violation action log
hostname(config-pmap-p)# policy-map test
hostname(config-pmap)# class test [a Layer 3/4 class map not shown]
hostname(config-pmap-c)# inspect http http-map1
hostname(config-pmap-c)# service-policy test interface outside

```

**Related Commands**

| Command                     | Description                             |
|-----------------------------|---|
| <b>class-map type regex</b> | Creates a regular expression class map. |
| <b>regex</b>                | Adds a regular expression.              |
| <b>test regex</b>           | Tests a regular expression.             |

# match regex

To identify a regular expression in a regular expression class map, use the **match regex** command in class-map type regex configuration mode. To remove the regular expression from the class map, use the **no** form of this command.

**match regex** *name*

**no match regex** *name*

## Syntax Description

*name* The name of the regular expression you added with the **regex** command.

## Command Default

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                       | Firewall Mode |             | Security Context |          |        |
|------------------------------------|---------------|-------------|------------------|----------|--------|

```
hostname(config)# regex url_example example\.com
hostname(config)# regex url_example2 example2\.com
hostname(config)# class-map type regex match-any URLs
hostname(config-cmap)# match regex url_example
hostname(config-cmap)# match regex url_example2
```

```

hostname(config-cmap)# class-map type inspect http match-all http-traffic
hostname(config-cmap)# match req-resp content-type mismatch
hostname(config-cmap)# match request body length gt 1000
hostname(config-cmap)# match not request uri regex class URLs

hostname(config-cmap)# policy-map type inspect http http-map1
hostname(config-pmap-c)# class http-traffic
hostname(config-pmap-c)# drop-connection log
hostname(config-pmap-c)# match req-resp content-type mismatch
hostname(config-pmap-c)# reset log
hostname(config-pmap-c)# parameters
hostname(config-pmap-p)# protocol-violation action log
hostname(config-pmap-p)# policy-map test
hostname(config-pmap)# class test [a Layer 3/4 class map not shown]
hostname(config-pmap-c)# inspect http http-map1
hostname(config-pmap-c)# service-policy test interface outside

```

#### Related Commands

| Command                     | Description                             |
|-----------------------------|---|
| <b>class-map type regex</b> | Creates a regular expression class map. |
| <b>regex</b>                | Adds a regular expression.              |
| <b>test regex</b>           | Tests a regular expression.             |

# match req-resp

To configure a match condition for both HTTP requests and responses, use the **match req-resp** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match [not] req-resp content-type mismatch**

**no match [not] req-resp content-type mismatch**

## Syntax Description

|                     |  |
|---------------------|--|
| <b>content-type</b> | Specifies to match the content type in the response to the accept types in the request.                                    |
| <b>mismatch</b>     | Specifies that the content type field in the response must match one of the mime types in the accept field of the request. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command enables the following checks:

- Verifies that the value of the header content-type is in the internal list of supported content types,
- Verifies that the header content-type matches the actual content in the data or entity body portion of the message.
- Verifies the content type field in the HTTP response matches the **accept** field in the corresponding HTTP request message.

If the message fails any of the above checks, the adaptive security appliance takes the configured action.

The following is the list of supported content types.

|                            |                               |                        |
|----------------------------|-------------------------------|------------------------|
| audio/*                    | audio/basic                   | video/x-msvideo        |
| audio/mpeg                 | audio/x-adpcm                 | audio/midi             |
| audio/x-ogg                | audio/x-wav                   | audio/x-aiff           |
| application/octet-stream   | application/pdf               | application/msword     |
| application/vnd.ms-excel   | application/vnd.ms-powerpoint | application/postscript |
| application/x-java-arching | application/x-msn-messenger   | application/x-gzip     |
| image                      | application/x-java-xm         | application/zip        |
| image/jpeg                 | image/cgf                     | image/gif              |
| image/x-3ds                | image/png                     | image/tiff             |
| image/x-portable-bitmap    | image/x-bitmap                | image/x-niff           |
| text/*                     | image/x-portable-greymap      | image/x-xpm            |
| text/plain                 | text/css                      | text/html              |
| text/xmcd                  | text/richtext                 | text/sgml              |
| video/-flc                 | text/xml                      | video/*                |
| video/sgi                  | video/mpeg                    | video/quicktime        |
| video/x-mng                | video/x-avi                   | video/x-fli            |

Some content-types in this list may not have a corresponding regular expression (magic number) so they cannot be verified in the body portion of the message. When this case occurs, the HTTP message will be allowed.

## Examples

The following example shows how to restrict HTTP traffic based on the content type of the HTTP message in an HTTP policy map:

```
hostname(config)# policy-map type inspect http http_map
hostname(config-pmap)# match req-resp content-type mismatch
```

## Related Commands

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match request-command

To restrict specific FTP commands, use the **match request-command** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **request-command** *ftp\_command* [*ftp\_command...*]

**no match** [**not**] **request-command** *ftp\_command* [*ftp\_command...*]

## Syntax Description

*ftp\_command* Specifies one or more FTP commands to restrict.

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |                  |        |
|---------------------------------------|---------------|-------------|------------------|------------------|--------|
|                                       | Routed        | Transparent | Single           | Multiple Context | System |
| Class-map or policy map configuration | •             | •           | •                | •                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an FTP class map or policy map. Only one entry can be entered in a FTP class map.

## Examples

The following example shows how to configure a match condition for a specific FTP command in an FTP inspection policy map:

```
hostname(config)# policy-map type inspect ftp ftp_map1
hostname(config-pmap)# match request-command stou
```

## Related Commands

| Command                          | Description                            |
|----------------------------------|--|
| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

| Command                                  | Description   |
|--|---|
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match request-method

To configure a match condition for the SIP method type, use the **match request-method** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **request-method** *method\_type*

**no match** [**not**] **request-method** *method\_type*

## Syntax Description

|                    |   |
|--------------------|---|
| <i>method_type</i> | Specifies a method type according to RFC 3261 and supported extensions. Supported method types include: ack, bye, cancel, info, invite, message, notify, options, prack, refer, register, subscribe, unknown, update. |
|--------------------|---|

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

|                                       | Firewall Mode |             | Security Context |                  |        |
|---------------------------------------|---------------|-------------|------------------|------------------|--------|
|                                       | Routed        | Transparent | Single           | Multiple Context | System |
| Class-map or policy map configuration | •             | •           | •                | •                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in a SIP class map or policy map. Only one entry can be entered in a SIP class map.

## Examples

The following example shows how to configure a match condition for the path taken by a SIP message in a SIP inspection class map:

```
hostname(config-cmap)# match request-method ack
```

## Related Commands

| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match request method

To configure a match condition for HTTP requests, use the **match request method** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **request** { *built-in-regex* | **regex** { *regex\_name* | **class** *class\_map\_name* } }

**no match** [**not**] **request** { *built-in-regex* | **regex** { *regex\_name* | **class** *class\_map\_name* } }

## Syntax Description

|                                    |   |
|------------------------------------|---|
| <i>built-in-regex</i>              | Specifies the built-in regex for content type, method, or transfer encoding.            |
| <b>class</b> <i>class_map name</i> | Specifies the name of the class map of regex type.                                      |
| <b>regex</b> <i>regex_name</i>     | Specifies the name of the regular expression configured using the <b>regex</b> command. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

**Table 19-1 Built-in Regex Values**

|               |          |              |                   |
|---------------|----------|--------------|-------------------|
| bcopy         | bdelete  | bmove        | bpropfind         |
| bproppatch    | connect  | copy         | delete            |
| edit          | get      | getattribute | getattributenames |
| getproperties | head     | index        | lock              |
| mkcol         | mkdir    | move         | notify            |
| options       | poll     | post         | propfind          |
| proppatch     | put      | revadd       | revlabel          |
| revlog        | revnum   | save         | search            |
| setattribute  | startrev | stoprev      | subscribe         |
| trace         | unedit   | unlock       | unsubscribe       |

Examples

The following example shows how to define an HTTP inspection policy map that will allow and log any HTTP connection that attempts to access "www\.xyz.com/\*.asp" or "www\.xyz[0-9][0-9]\.com" with methods "GET" or "PUT." All other URL/Method combinations will be silently allowed:

```
hostname(config)# regex url1 "www\.xyz.com/*.asp"
hostname(config)# regex url2 "www\.xyz[0-9][0-9]\.com"
hostname(config)# regex get "GET"
hostname(config)# regex put "PUT"
hostname(config)# class-map type regex match-any url_to_log
hostname(config-cmap)# match regex url1
hostname(config-cmap)# match regex url2
hostname(config-cmap)# exit
hostname(config)# class-map type regex match-any methods_to_log
hostname(config-cmap)# match regex get
hostname(config-cmap)# match regex put
hostname(config-cmap)# exit
hostname(config)# class-map type inspect http http_url_policy
hostname(config-cmap)# match request uri regex class url_to_log
hostname(config-cmap)# match request method regex class methods_to_log
hostname(config-cmap)# exit
hostname(config)# policy-map type inspect http http_policy
hostname(config-pmap)# class http_url_policy
hostname(config-pmap-c)# log
```

Related Commands

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

## match route-type

To redistribute routes of the specified type, use the **match route-type** command in route-map configuration mode. To remove the route type entry, use the **no** form of this command.

```
match route-type {local | internal | {external [type-1 | type-2]} | {nssa-external [type-1 | type-2]}}
```

```
no match route-type {local | internal | {external [type-1 | type-2]} | {nssa-external [type-1 | type-2]}}
```

### Syntax Description

|                      |  |
|----------------------|--|
| <b>local</b>         | Locally generated BGP routes.                                  |
| <b>internal</b>      | OSPF intra-area and interarea routes or EIGRP internal routes. |
| <b>external</b>      | OSPF external routes or EIGRP external routes.                 |
| <b>type-1</b>        | (Optional) Specifies the route type 1.                         |
| <b>type-2</b>        | (Optional) Specifies the route type 2.                         |
| <b>nssa-external</b> | Specifies the external NSSA.                                   |

### Defaults

This command is disabled by default.

### Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Route-map configuration | •             | —           | •                | —        | —      |

### Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

### Usage Guidelines

The **route-map** global configuration command and the **match** and **set** configuration commands allow you to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has **match** and **set** commands that are associated with it. The **match** commands specify the match criteria—the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the set actions—the particular redistribution actions to perform if the criteria that is enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **match** route-map configuration command has multiple formats. You can enter the **match** commands in any order. All **match** commands must “pass” to cause the route to be redistributed according to the set actions given with the **set** commands. The **no** forms of the **match** commands remove the specified match criteria.

A route map can have several parts. Any route that does not match at least one match clause relating to a **route-map** command is ignored. To modify only some data, you must configure a second route map section and specify an explicit match.

For OSPF, the **external type-1** keywords match only type 1 external routes and the **external type-2** keywords match only type 2 external routes.

Examples

The following example shows how to redistribute internal routes:

```
hostname(config)# route-map name
hostname(config-route-map)# match route-type internal
```

Related Commands

| Command           | Description   |
|-------------------|---|
| match interface   | Distributes distribute any routes that have their next hop out one of the interfaces specified,                 |
| match ip next-hop | Distributes any routes that have a next-hop router address that is passed by one of the access lists specified. |
| match metric      | Redistributes routes with the metric specified.   |
| route-map         | Defines the conditions for redistributing routes from one routing protocol into another.                        |
| set metric        | Specifies the metric value in the destination routing protocol for a route map.                                 |

# match rtp

To specify a UDP port range of even-number ports in a class map, use the **match rtp** command in class-map configuration mode. To remove this specification, use the **no** form of this command.

**match rtp** *starting\_port range*

**no match rtp** *starting\_port range*

## Syntax Description

|                      |  |
|----------------------|--|
| <i>starting_port</i> | Specifies lower bound of even-number UDP destination port. Range is 2000-65535 |
| <i>range</i>         | Specifies range of RTP ports. Range is 0-16383.                                |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Class-map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The **match** commands are used to identify the traffic included in the traffic class for a class map. They include different criteria to define the traffic included in a class-map. Define a traffic class using the **class-map** global configuration command as part of configuring a security feature using Modular Policy Framework. From class-map configuration mode, you can define the traffic to include in the class using the **match** command.

After a traffic class is applied to an interface, packets received on that interface are compared to the criteria defined by the **match** statements in the class map. If the packet matches the specified criteria, it is included in the traffic class and is subjected to any actions associated with that traffic class. Packets that do not match any of the criteria in any traffic class are assigned to the default traffic class.

Use the **match rtp** command to match RTP ports (even UDP port numbers between the *starting\_port* and the *starting\_port* plus the *range*).

## Examples

The following example shows how to define a traffic class using a class map and the **match rtp** command:

```
hostname(config)# class-map cmap
```

 match rtp

```
hostname(config-cmap)# match rtp 20000 100  
hostname(config-cmap)#
```

**Related Commands**

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Applies a traffic class to an interface.                    |
| <b>clear configure class-map</b>     | Removes all of the traffic map definitions.                 |
| <b>match access-list</b>             | Identifies access list traffic within a class map.          |
| <b>match any</b>                     | Includes all traffic in the class map.                      |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match sender-address

To configure a match condition on the ESMTP sender e-mail address, use the **match sender-address** command in policy-map configuration mode. To disable this feature, use the **no** form of this command.

**match** [**not**] **sender-address** [**length gt** *bytes* | **regex** *regex*]

**no match** [**not**] **sender-address** [**length gt** *bytes* | **regex** *regex*]

## Syntax Description

|                               |   |
|-------------------------------|---|
| <b>length gt</b> <i>bytes</i> | Specifies to match on the sender e-mail address length. |
| <b>regex</b> <i>regex</i>     | Specifies to match on the regular expression.           |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

|                          | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          |               |             |                  | Multiple |        |
| Command Mode             | Routed        | Transparent | Single           | Context  | System |
| Policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to configure a match condition for the sender email address of length greater than 320 characters in an ESMTP inspection policy map:

```
hostname(config-pmap)# match sender-address length gt 320
```

## Related Commands

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                     | Includes all traffic in the class map.                      |
| <b>match port</b>                    | Identifies a specific port number in a class map.           |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match server

To configure a match condition for an FTP server, use the **match server** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

```
match [not] server regex [regex_name | class regex_class_name]

no match [not] server regex [regex_name | class regex_class_name]
```

Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

Defaults

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

This command can be configured in an FTP class map or policy map. Only one entry can be entered in a FTP class map.

The adaptive security appliance matches the server name based using the initial 220 server message that is displayed above the login prompt when connecting to an FTP server. The 220 server message might contain multiple lines. The server match is not based on the FQDN of the server name resolved through DNS.

Examples

The following example shows how to configure a match condition for an FTP server in an FTP inspection policy map:

```
hostname(config-pmap)# match server class regex ftp-server
```

Related Commands

| Command                                  | Description   |
|--|---|
| <b>class-map</b>                         | Creates a Layer 3/4 class map.                              |
| <b>clear configure<br/>class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                         | Includes all traffic in the class map.                      |
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match service

To configure a match condition for a specific instant messaging service, use the **match service** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

```
match [not] service { chat | file-transfer | games | voice-chat | webcam | conference }
```

```
no match [not] service { chat | file-transfer | games | voice-chat | webcam | conference }
```

## Syntax Description

|                      |   |
|----------------------|---|
| <b>chat</b>          | Specifies to match the instant messaging chat service.          |
| <b>file-transfer</b> | Specifies to match the instant messaging file transfer service. |
| <b>games</b>         | Specifies to match the instant messaging games service.         |
| <b>voice-chat</b>    | Specifies to match the instant messaging voice chat service.    |
| <b>webcam</b>        | Specifies to match the instant messaging webcam service.        |
| <b>conference</b>    | Specifies to match the instant messaging conference service.    |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an IM class map or policy map. Only one entry can be entered in a IM class map.

## Examples

The following example shows how to configure a match condition for the chat service in an instant messaging class map:

```
hostname(config)# class-map type inspect im im_class
hostname(config-cmap)# match service chat
```

**Related Commands**

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Creates a Layer 3/4 class map.                              |
| <b>clear configure class-map</b>     | Removes all class maps.                                     |

| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match third-party-registration

To configure a match condition for the requester of a third-party registration, use the **match third-party-registration** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

```
match [not] third-party-registration regex [regex_name | class regex_class_name]

no match [not] third-party-registration regex [regex_name | class regex_class_name]
```

Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

Defaults

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

This command can be configured in a SIP class map or policy map. Only one entry can be entered in a SIP class map.

The third-party registration match command is used to identify the user who can register others with a SIP registrar or SIP proxy. It is identified by the From header field in the REGISTER message in the case of mismatching From and To values.

Examples

The following example shows how to configure a match condition for third-party registration in a SIP inspection class map:

```
hostname(config-cmap)# match third-party-registration regex class sip_regist
```

Related Commands

| Command                                  | Description   |
|--|---|
| <b>class-map</b>                         | Creates a Layer 3/4 class map.                              |
| <b>clear configure<br/>class-map</b>     | Removes all class maps.                                     |
| <b>match any</b>                         | Includes all traffic in the class map.                      |
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match tunnel-group

To match traffic in a class map that belongs to a previously defined tunnel-group, use the **match tunnel-group** command in class-map configuration mode. To remove this specification, use the **no** form of this command.

**match tunnel-group** *name*

**no match tunnel-group** *name*

Syntax Description

|             |                                 |
|-------------|---------------------------------|
| <i>name</i> | Text for the tunnel group name. |
|-------------|---------------------------------|

Defaults

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Class-map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

Usage Guidelines

The **match** commands are used to identify the traffic included in the traffic class for a class map. They include different criteria to define the traffic included in a class-map. Define a traffic class using the **class-map** global configuration command as part of configuring a security feature using Modular Policy Framework. From class-map configuration mode, you can define the traffic to include in the class using the **match** command.

After a traffic class is applied to an interface, packets received on that interface are compared to the criteria defined by the **match** statements in the class map. If the packet matches the specified criteria, it is included in the traffic class and is subjected to any actions associated with that traffic class. Packets that do not match any of the criteria in any traffic class are assigned to the default traffic class.

To enable flow-based policy actions, use the **match flow ip destination-address** and **match tunnel-group** commands with the **class-map**, **policy-map**, and **service-policy** commands. The criteria to define flow is the destination IP address. All traffic going to a unique IP destination address is considered a flow. Policy action is applied to each flow instead of the entire class of traffic. QoS action police is applied using the **police** command. Use **match tunnel-group** along with **match flow ip destination-address** to police every tunnel within a tunnel group to a specified rate.

**Examples**

The following example shows how to enable flow-based policing within a tunnel group and limit each tunnel to a specified rate:

```
hostname(config)# class-map cmap
hostname(config-cmap)# match tunnel-group
hostname(config-cmap)# match flow ip destination-address
hostname(config-cmap)# exit
hostname(config)# policy-map pmap
hostname(config-pmap)# class cmap
hostname(config-pmap)# police 56000
hostname(config-pmap)# exit
hostname(config)# service-policy pmap global
```

**Related Commands**

| Command                              | Description   |
|--------------------------------------|---|
| <b>class-map</b>                     | Applies a traffic class to an interface.  |
| <b>clear configure class-map</b>     | Removes all of the traffic map definitions.   |
| <b>match access-list</b>             | Identifies access list traffic within a class map.                                  |
| <b>show running-config class-map</b> | Displays the information about the class map configuration.                         |
| <b>tunnel-group</b>                  | Creates and manages the database of connection-specific records for IPSec and L2TP, |

# match uri

To configure a match condition for the URI in the SIP headers, use the **match uri** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

```
match [not] uri { sip | tel } length gt gt_bytes

no match [not] uri { sip | tel } length gt gt_bytes
```

## Syntax Description

|                           |  |
|---------------------------|--|
| <b>sip</b>                | Specifies a SIP URI.   |
| <b>tel</b>                | Specifies a TEL URI.   |
| <b>length gt gt_bytes</b> | Specifies the maximum length of the URI. Value is between 0 and 65536. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in a SIP class map or policy map. Only one entry can be entered in a SIP class map.

## Examples

The following example shows how to configure a match condition for the URI in the SIP message:

```
hostname(config-cmap)# match uri sip length gt
```

## Related Commands

| Command                          | Description                            |
|----------------------------------|--|
| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

| Command                                  | Description   |
|--|---|
| <b>match port</b>                        | Identifies a specific port number in a class map.           |
| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match url-filter

To configure a match condition for URL filtering in an RTSP message, use the **match url-filter** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

```
match [not] url-filter regex [regex_name | class regex_class_name]

no match [not] url-filter regex [regex_name | class regex_class_name]
```

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an RTSP class map or policy map.

## Examples

The following example shows how to configure a match condition for URL filtering in an RTSP inspection policy map:

```
hostname(config)# regex badurl www.url1.com/rtsp.avi
hostname(config)# policy-map type inspect rtsp rtsp-map
hostname(config-pmap)# match url-filter regex badurl
hostname(config-pmap-p)# drop-connection
```

| <b>show running-config<br/>class-map</b> | Displays the information about the class map configuration. |

# match username

To configure a match condition for an FTP username, use the **match username** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **username regex** [*regex\_name* | **class** *regex\_class\_name*]

**no match** [**not**] **username regex** [*regex\_name* | **class** *regex\_class\_name*]

## Syntax Description

|                                      |   |
|--------------------------------------|---|
| <i>regex_name</i>                    | Specifies a regular expression.           |
| <b>class</b> <i>regex_class_name</i> | Specifies a regular expression class map. |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command can be configured in an FTP class map or policy map. Only one entry can be entered in a FTP class map.

## Examples

The following example shows how to configure a match condition for an FTP username in an FTP inspection class map:

```
hostname(config)# class-map type inspect ftp match-all ftp_class1
hostname(config-cmap)# match username regex class ftp_regex_user
```

## Related Commands

| Command                          | Description                            |
|----------------------------------|--|
| <b>class-map</b>                 | Creates a Layer 3/4 class map.         |
| <b>clear configure class-map</b> | Removes all class maps.                |
| <b>match any</b>                 | Includes all traffic in the class map. |

| Command                              | Description   |
|--------------------------------------|---|
| <b>match port</b>                    | Identifies a specific port number in a class map.           |
| <b>show running-config class-map</b> | Displays the information about the class map configuration. |

# match version

To configure a match condition for a GTP message ID, use the **match message length** command in class-map or policy-map configuration mode. To remove the match condition, use the **no** form of this command.

**match** [**not**] **version** [*version\_id* | **range** *lower\_range* *upper\_range*]

**no match** [**not**] **version** [*version\_id* | **range** *lower\_range* *upper\_range*]

Syntax Description

|  |  |
|--|--|
| <i>version_id</i>                                  | Specifies a version between 0 and 255.         |
| <b>range</b> <i>lower_range</i> <i>upper_range</i> | Specifies a lower and upper range of versions. |

Defaults

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                          | Firewall Mode |             | Security Context |          |        |
|---------------------------------------|---------------|-------------|------------------|----------|--------|
|                                       | Routed        | Transparent | Single           | Multiple |        |
|                                       |               |             |                  | Context  | System |
| Class-map or policy map configuration | •             | •           | •                | •        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

This command can be configured in a GTP class map or policy map. Only one entry can be entered in a GTP class map.

Examples

The following example shows how to configure a match condition for a message version in a GTP inspection class map:

```
hostname(config-cmap)# match version 1
```

# max-failed-attempts

To specify the number of failed attempts allowed for any given server in the server group before that server is deactivated, use the **max-failed-attempts** command in AAA-server group configuration mode. To remove this specification and revert to the default value, use the **no** form of this command:

**max-failed-attempts** *number*

**no max-failed-attempts**

|                           |               |   |
|---------------------------|---------------|---|
| <b>Syntax Description</b> | <i>number</i> | An integer in the range 1-5, specifying the number of failed connection attempts allowed for any given server in the server group specified in a prior <b>aaa-server</b> command. |
|---------------------------|---------------|---|

|                 |  |
|-----------------|--|
| <b>Defaults</b> | The default value of <i>number</i> is 3. |
|-----------------|--|

|                      |   |
|----------------------|---|
| <b>Command Modes</b> | The following table shows the modes in which you can enter the command: |
|----------------------|---|

| Command Mode                   | Firewall Mode |             | Security Context |                  |        |
|--------------------------------|---------------|-------------|------------------|------------------|--------|
|                                | Routed        | Transparent | Single           | Multiple Context | System |
| AAA-server group configuration | •             | •           | •                | •                | —      |

| Release | Modification                 |

| 7.0(1)  | This command was introduced. |

|                         |  |
|-------------------------|--|
| <b>Usage Guidelines</b> | You must have configured the AAA server/group before issuing this command. |
|-------------------------|--|

|                 |  |
|-----------------|--|
| <b>Examples</b> | <pre>hostname(config)# aaa-server svrgrp1 protocol tacacs+ hostname(config-aaa-server-group)# max-failed-attempts 4 hostname(config-aaa-server-group)#</pre> |
|-----------------|--|

| Related Commands | Command   | Description   |
|------------------|---|---|
|                  | <b>aaa-server</b> <i>server-tag</i> <b>protocol</b> <i>protocol</i> | Enters AAA server group configuration mode so you can configure AAA server parameters that are group-specific and common to all hosts in the group. |

---

|                                       |   |
|---------------------------------------|---|
| <b>clear configure<br/>aaa-server</b> | Removes all AAA server configuration.   |
| <b>show running-config aaa</b>        | Displays AAA server statistics for all AAA servers, for a particular server group, for a particular server within a particular group, or for a particular protocol. |

---

# max-forwards-validation

To enable check on Max-forwards header field of 0, use the **max-forwards-validation** command in parameters configuration mode. Parameters configuration mode is accessible from policy map configuration mode. To disable this feature, use the **no** form of this command.

**max-forwards-validation action { drop | drop-connection | reset | log } [log]**

**no max-forwards-validation action { drop | drop-connection | reset | log } [log]**

## Syntax Description

|                        |  |
|------------------------|--|
| <b>drop</b>            | Drops the packet if validation occurs.   |
| <b>drop-connection</b> | Drops the connection of a violation occurs.  |
| <b>reset</b>           | Resets the connection of a violation occurs.   |
| <b>log</b>             | Specifies standalone or additional log in case of violation. It can be associated to any of the actions. |

## Defaults

This command is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode             | Firewall Mode |             | Security Context |          |        |
|--------------------------|---------------|-------------|------------------|----------|--------|
|                          | Routed        | Transparent | Single           | Multiple |        |
|                          |               |             |                  | Context  | System |
| Parameters configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

This command counts the number of hops to destination, which cannot be 0 before reaching the destination.

## Examples

The following example shows how to enable max forwards validation in a SIP inspection policy map:

```
hostname(config)# policy-map type inspect sip sip_map
hostname(config-pmap)# parameters
hostname(config-pmap-p)# max-forwards-validation action log
```

## Related Commands

| Command                               | Description  |
|---------------------------------------|--|
| <b>class</b>                          | Identifies a class map name in the policy map.                               |
| <b>class-map type inspect</b>         | Creates an inspection class map to match traffic specific to an application. |
| <b>policy-map</b>                     | Creates a Layer 3/4 policy map.  |
| <b>show running-config policy-map</b> | Display all current policy map configurations.                               |

# max-header-length

To restrict HTTP traffic based on the HTTP header length, use the **max-header-length** command in HTTP map configuration mode, which is accessible using the **http-map** command. To remove this command, use the **no** form of this command.

```
max-header-length {request bytes [response bytes] | response bytes} action {allow | reset | drop}
[log]

no max-header-length {request bytes [response bytes] | response bytes} action {allow | reset |
drop} [log]
```

## Syntax Description

|                 |  |
|-----------------|--|
| <b>action</b>   | The action taken when a message fails this command inspection. |
| <b>allow</b>    | Allow the message.   |
| <b>drop</b>     | Closes the connection.   |
| <b>bytes</b>    | Number of bytes, range is 1 to 65535.                          |
| <b>log</b>      | (Optional) Generate a syslog.                                  |
| <b>request</b>  | Request message.   |
| <b>reset</b>    | Send a TCP reset message to client and server.                 |
| <b>response</b> | (Optional) Response message.                                   |

## Defaults

This command is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode           | Firewall Mode |             | Security Context |          |        |
|------------------------|---------------|-------------|------------------|----------|--------|
|                        | Routed        | Transparent | Single           | Multiple |        |
|                        |               |             |                  | Context  | System |
| HTTP map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

After enabling the **max-header-length** command, the adaptive security appliance only allows messages having an HTTP header within the configured limit and otherwise takes the specified action. Use the **action** keyword to cause the adaptive security appliance to reset the TCP connection and optionally create a syslog entry.

### Examples

The following example restricts HTTP requests to those with HTTP headers that do not exceed 100 bytes. If a header is too large, the adaptive security appliance resets the TCP connection and creates a syslog entry.

```
hostname(config)# http-map inbound_http
hostname(config-http-map)# max-header-length request bytes 100 action log reset
hostname(config-http-map)#
```

### Related Commands

| Commands            | Description   |
|---------------------|---|
| <b>class-map</b>    | Defines the traffic class to which to apply security actions.                         |
| <b>debug appfw</b>  | Displays detailed information about traffic associated with enhanced HTTP inspection. |
| <b>http-map</b>     | Defines an HTTP map for configuring enhanced HTTP inspection.                         |
| <b>inspect http</b> | Applies a specific HTTP map to use for application inspection.                        |
| <b>policy-map</b>   | Associates a class map with specific security actions.                                |

# max-object-size

To set a maximum size for objects that the adaptive security appliance can cache for WebVPN sessions, use the `max-object-size` command in cache mode. To change the size, use the command again.

**max-object-size** *integer range*

|                           |                                   |
|---------------------------|-----------------------------------|
| <b>Syntax Description</b> | <i>integer range</i> 0 - 10000 KB |
|---------------------------|-----------------------------------|

|                 |         |
|-----------------|---------|
| <b>Defaults</b> | 1000 KB |
|-----------------|---------|

|                      |   |
|----------------------|---|
| <b>Command Modes</b> | The following table shows the modes in which you enter the command: |
|----------------------|---|

| Command Mode | Firewall Mode |             | Security Context |          |        |
|--------------|---------------|-------------|------------------|----------|--------|
|              | Routed        | Transparent | Single           | Multiple |        |
|              |               |             |                  | Context  | System |
| Cache mode   | •             | —           | •                | —        | —      |

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 7.1(1)  | This command was introduced. |

|                         |   |
|-------------------------|---|
| <b>Usage Guidelines</b> | The Maximum object size must be larger than the minimum object size. The adaptive security appliance calculates the size after compressing the object, if cache compression is enabled. |
|-------------------------|---|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to set a maximum object size of 4000 KB: |
|-----------------|--|

```
hostname(config)# webvpn
hostname(config-webvpn)# cache
hostname(config-webvpn-cache)# max-object-size 4000
hostname(config-webvpn-cache)#
```

| Related Commands | Command                 | Description  |
|------------------|-------------------------|--|
|                  | <b>cache</b>            | Enters WebVPN Cache mode.  |
|                  | <b>cache-compressed</b> | Configures WebVPN cache compression.   |
|                  | <b>disable</b>          | Disables caching.  |
|                  | <b>expiry-time</b>      | Configures the expiration time for caching objects without revalidating them.              |
|                  | <b>lmfactor</b>         | Sets a revalidation policy for caching objects that have only the last-modified timestamp. |
|                  | <b>min-object-size</b>  | Defines the minimum size of an object to cache.  |

# max-retry-attempts

To configure the number of times the adaptive security appliance retries a failed SSO authentication attempt before letting the request time out, use the **max-retry-attempts** command in the webvpn configuration mode for the specific SSO server type.

To return to the default value, use the **no** form of this command.

**max-retry-attempts** *retries*

**no max-retry-attempts**

## Syntax Description

|                |   |
|----------------|---|
| <i>retries</i> | The number of times the adaptive security appliance retries a failed SSO authentication attempt. The range is 1 to 5 retries. |
|----------------|---|

## Defaults

The default value for this command is 3.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                 | Firewall Mode |             | Security Context |          |        |
|------------------------------|---------------|-------------|------------------|----------|--------|
|                              | Routed        | Transparent | Single           | Multiple |        |
|                              |               |             |                  | Context  | System |
| config-webvpn-ss0-saml       | •             | —           | •                | —        | —      |
| config-webvpn-ss0-siteminder | •             | —           | •                | —        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.1(1)  | This command was introduced. |

## Usage Guidelines

Single sign-on support, available only for WebVPN, lets users access different secure services on different servers without entering a username and password more than once. The adaptive security appliance currently supports the SiteMinder-type of SSO server and the SAML POST-type SSO server.

This command applies to both types of SSO Servers.

Once you have configured the adaptive security appliance to support SSO authentication, optionally you can adjust two timeout parameters:

- The number of times the adaptive security appliance retries a failed SSO authentication attempt using the **max-retry-attempts** command.
- The number of seconds before a failed SSO authentication attempt times out (see the **request-timeout** command).

## Examples

The following example, entered in webvpn-ss0-siteminder configuration mode, configures four authentication retries for the SiteMinder SSO server named my-ss0-server:

```
hostname(config-webvpn)# sso-server my-sso-server type siteminder
hostname(config-webvpn-sso-siteminder)# max-retry-attempts 4
hostname(config-webvpn-sso-siteminder)#
```

#### Related Commands

| Command                       | Description   |
|-------------------------------|---|
| <b>policy-server-secret</b>   | Creates a secret key used to encrypt authentication requests to a SiteMinder SSO server.                            |
| <b>request-timeout</b>        | Specifies the number of seconds before a failed SSO authentication attempt times out.                               |
| <b>show webvpn sso-server</b> | Displays the operating statistics for all SSO servers configured on the security device.                            |
| <b>sso-server</b>             | Creates a single sign-on server.  |
| <b>web-agent-url</b>          | Specifies the SSO server URL to which the adaptive security appliance makes SiteMinder SSO authentication requests. |

# max-uri-length

To restrict HTTP traffic based on the length of the URI in the HTTP request message, use the **max-uri-length** command in HTTP map configuration mode, which is accessible using the **http-map** command. To remove this command, use the **no** form of this command.

**max-uri-length** *bytes* **action** {**allow** | **reset** | **drop**} [**log**]

**no max-uri-length** *bytes* **action** {**allow** | **reset** | **drop**} [**log**]

## Syntax Description

|               |  |
|---------------|--|
| <b>action</b> | The action taken when a message fails this command inspection. |
| <b>allow</b>  | Allow the message.   |
| <b>drop</b>   | Closes the connection.   |
| <b>bytes</b>  | Number of bytes, range is 1 to 65535.                          |
| <b>log</b>    | (Optional) Generate a syslog.                                  |
| <b>reset</b>  | Send a TCP reset message to client and server.                 |

## Defaults

This command is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode           | Firewall Mode |             | Security Context |          |        |
|------------------------|---------------|-------------|------------------|----------|--------|
|                        | Routed        | Transparent | Single           | Multiple |        |
|                        |               |             |                  | Context  | System |
| HTTP map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

After enabling the **max-uri-length** command, the adaptive security appliance only allows messages having a URI within the configured limit and otherwise takes the specified action. Use the **action** keyword to cause the adaptive security appliance to reset the TCP connection and create a syslog entry.

URIs with a length less than or equal to the configured value will be allowed. Otherwise, the specified action will be taken.

## Examples

The following example restricts HTTP requests to those with URIs that do not exceed 100 bytes. If a URI is too large, the adaptive security appliance resets the TCP connection and creates a syslog entry.

```
hostname(config)# http-map inbound_http
hostname(config-http-map)# max-uri-length 100 action reset log
hostname(config-http-map)#
```

| Related Commands | Commands            | Description   |
|------------------|---------------------|---|
|                  | <b>class-map</b>    | Defines the traffic class to which to apply security actions.                         |
|                  | <b>debug appfw</b>  | Displays detailed information about traffic associated with enhanced HTTP inspection. |
|                  | <b>http-map</b>     | Defines an HTTP map for configuring enhanced HTTP inspection.                         |
|                  | <b>inspect http</b> | Applies a specific HTTP map to use for application inspection.                        |
|                  | <b>policy-map</b>   | Associates a class map with specific security actions.                                |

# mcc

To identify the mobile country code and the mobile network code for IMSI prefix filtering, use the **mcc** command in GTP map configuration mode. To remove the configuration, use the **no** form of this command.

```
mcc country_code mnc network_code
```

```
no mcc country_code mnc network_code
```

## Syntax Description

|                     |   |
|---------------------|---|
| <i>country_code</i> | A non-zero, three-digit value identifying the mobile country code. One or two-digit entries will be prepended by 0 to create a three-digit value. |
| <i>network_code</i> | A two or three-digit value identifying the network code.  |

## Defaults

By default, the adaptive security appliance does not check for valid MCC/MNC combinations.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode          | Firewall Mode |             | Security Context |          |        |
|-----------------------|---------------|-------------|------------------|----------|--------|
|                       | Routed        | Transparent | Single           | Multiple |        |
|                       |               |             |                  | Context  | System |
| GTP map configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

This command is used for IMSI Prefix filtering. The MCC and MNC in the IMSI of the received packet is compared with the MCC/MNC configured with this command and is dropped if it does not match.

This command must be used to enable IMSI Prefix filtering. You can configure multiple instances to specify permitted MCC and MNC combinations. By default, the adaptive security appliance does not check the validity of MNC and MCC combinations, so you must verify the validity of the combinations configured. To find more information about MCC and MNC codes, see the ITU E.212 recommendation, *Identification Plan for Land Mobile Stations*.

## Examples

The following example identifies traffic for IMSI Prefix filtering with an MCC of 111 and an MNC of 222:

```
hostname(config)# gtp-map gtp-policy
hostname(config-gtpmap)# mcc 111 mnc 222
hostname(config-gtpmap)#
```

| Related Commands | Commands                                | Description   |
|------------------|---|---|
|                  | <b>clear service-policy inspect gtp</b> | Clears global GTP statistics.                                 |
|                  | <b>debug gtp</b>                        | Displays detailed information about GTP inspection.           |
|                  | <b>gtp-map</b>                          | Defines a GTP map and enables GTP map configuration mode.     |
|                  | <b>inspect gtp</b>                      | Applies a specific GTP map to use for application inspection. |
|                  | <b>show service-policy inspect gtp</b>  | Displays the GTP configuration.                               |

# media-termination

To specify the media termination instance to use for media connections to the Phone Proxy feature, use the **media-termination** command in global configuration mode.

To remove the media-termination address from the Phone Proxy configuration, use the **no** form of this command.

**media-termination** *instance\_name*

**no media-termination** *instance\_name*

## Syntax Description

*instance\_name* Specifies the name of the interface for which the media termination address is used. Only one media-termination address can be configured per interface.

## Defaults

There are no default settings for this command.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | —           | •                | —        | —      |

## Command History

| Release | Modification  |
|---------|---|
| 8.0(4)  | The command was introduced.   |
| 8.2(1)  | This command was updated to allow for using NAT with the media-termination address. The <b>rtp-min-port</b> and <b>rtp-max-ports</b> keywords were removed from the command syntax and included as a separate command |

## Usage Guidelines

The adaptive security appliance must have IP addresses for media termination that meet the following criteria:

For the media termination instance, you can configure a global media-termination address for all interfaces or configure a media-termination address for different interfaces. However, you cannot use a global media-termination address and media-termination addresses configured for each interface at the same time.

If you configure a media termination address for multiple interfaces, you must configure an address on each interface that the adaptive security appliance uses when communicating with IP phones.

The IP addresses are publicly routable addresses that are unused IP addresses within the address range on that interface.

See *Cisco ASA 5500 Series Configuration Guide using the CLI* for the complete list of prerequisites that you must follow when creating the media termination instance and configuring the media termination addresses.

Examples

The following example shows the use of the media-termination address command to specify the IP address to use for media connections:

```
hostname(config-phone-proxy) # media-termination mta_instance1
```

Related Commands

| Command     | Description                          |
|-------------|--------------------------------------|
| phone-proxy | Configures the Phone Proxy instance. |

# media-type

To set the media type to copper or fiber Gigabit Ethernet, use the **media-type** command in interface configuration mode. The fiber SFP connector is available on the 4GE SSM for the ASA 5500 series adaptive security appliance. To restore the media type setting to the default, use the **no** form of this command.

**media-type {rj45 | sfp}**

**no media-type [rj45 | sfp]**

|                           |             |  |
|---------------------------|-------------|--|
| <b>Syntax Description</b> | <b>rj45</b> | (Default) Sets the media type to the copper RJ-45 connector. |
|                           | <b>sfp</b>  | Sets the media type to the fiber SFP connector.              |

**Defaults** The default is **rj45**.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Interface configuration | •             | •           | •                | —        | •      |

| <b>Command History</b> | Release | Modification                 |
|------------------------|---------|------------------------------|
|                        | 7.0(4)  | This command was introduced. |

**Usage Guidelines** The **sfp** setting uses a fixed speed (1000 Mbps), so the **speed** command allows you to set whether the interface negotiates link parameters or not. The **duplex** command is not supported for **sfp**.

**Examples** The following example sets the media type to SFP:

```
hostname(config)# interface gigabitethernet1/1
hostname(config-if)# media-type sfp
hostname(config-if)# nameif inside
hostname(config-if)# security-level 100
hostname(config-if)# ip address 10.1.1.1 255.255.255.0
hostname(config-if)# no shutdown
```

## Related Commands

| <b>speed</b>                         | Sets the interface speed.  |

# member

To assign a context to a resource class, use the **member** command in context configuration mode. To remove the context from the class, use the **no** form of this command.

**member** *class\_name*

**no member** *class\_name*

## Syntax Description

*class\_name* Specifies the class name you created with the **class** command.

## Defaults

By default, the context is assigned to the default class.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode          | Firewall Mode |             | Security Context |          |        |
|-----------------------|---------------|-------------|------------------|----------|--------|
|                       | Routed        | Transparent | Single           | Multiple |        |
|                       |               |             |                  | Context  | System |
| Context configuration | •             | •           | —                | —        | •      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

By default, all security contexts have unlimited access to the resources of the adaptive security appliance, except where maximum limits per context are enforced. However, if you find that one or more contexts use too many resources, and they cause other contexts to be denied connections, for example, then you can configure resource management to limit the use of resources per context. The adaptive security appliance manages resources by assigning contexts to resource classes. Each context uses the resource limits set by the class.

## Examples

The following example assigns the context test to the gold class:

```
hostname(config-ctx) # context test
hostname(config-ctx) # allocate-interface gigabitethernet0/0.100 int1
hostname(config-ctx) # allocate-interface gigabitethernet0/0.102 int2
hostname(config-ctx) # allocate-interface gigabitethernet0/0.110-gigabitethernet0/0.115
int3-int8
hostname(config-ctx) # config-url ftp://user1:passw0rd@10.1.1.1/configlets/test.cfg
hostname(config-ctx) # member gold
```

## Related Commands

| <b>show resource types</b>      | Shows the resource types for which you can set limits. |

# member-interface

To assign a physical interface to a redundant interface, use the **member-interface** command in interface configuration mode. This command is available only for the redundant interface type. You can assign two member interfaces to a redundant interface. To remove a member interface, use the **no** form of this command. You cannot remove both member interfaces from the redundant interface; the redundant interface requires at least one member interface.

**member-interface** *physical\_interface*

**no member-interface** *physical\_interface*

## Syntax Description

*physical\_interface* Identifies the interface ID, such as **gigabitethernet 0/1**. See the **interface** command for accepted values. Both member interfaces must be the same physical type.

## Defaults

No default behaviors or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Interface configuration | •             | •           | •                | —        | •      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

## Usage Guidelines

Both member interfaces must be of the same physical type. For example, both must be Ethernet.

You cannot add a physical interface to the redundant interface if you configured a name for it. You must first remove the name using the **no nameif** command.

### Caution

If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

The only configuration available to physical interfaces that are part of a redundant interface pair are physical parameters such as **speed** and **duplex** commands, the **description** command, and the **shutdown** command. You can also enter run-time commands like **default** and **help**.

If you shut down the active interface, then the standby interface becomes active.

To change the active interface, enter the **redundant-interface** command.

The redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can assign a MAC address to the redundant interface, which is used regardless of the member interface MAC addresses (see the **mac-address** command or the **mac-address auto** command). When the active interface fails over to the standby, the same MAC address is maintained so traffic is not disrupted.

### Examples

The following example creates two redundant interfaces:

```
hostname(config)# interface redundant 1
hostname(config-if)# member-interface gigabitethernet 0/0
hostname(config-if)# member-interface gigabitethernet 0/1
hostname(config-if)# interface redundant 2
hostname(config-if)# member-interface gigabitethernet 0/2
hostname(config-if)# member-interface gigabitethernet 0/3
```

### Related Commands

| Command                          | Description  |
|----------------------------------|--|
| <b>clear interface</b>           | Clears counters for the <b>show interface</b> command.                   |
| <b>debug redundant-interface</b> | Displays debug messages related to redundant interface events or errors. |
| <b>interface redundant</b>       | Creates a redundant interface.   |
| <b>redundant-interface</b>       | Changes the active member interface.                                     |
| <b>show interface</b>            | Displays the runtime status and statistics of interfaces.                |

# memberof

To specify a list of group-names that this user is a member of, use the **memberof** command in username attributes configuration mode. To remove this attribute from the configuration, use the **no** form of this command.

**memberof** *group\_1[,group\_2,...group\_n]*

**[no] memberof** *group\_1[,group\_2,...group\_n]*

## Syntax Description

*group\_1 through group\_n* Specifies the groups to which this user belongs.

## Defaults

No default behavior or value.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                      | Firewall Mode |             | Security Context |          |        |
|-----------------------------------|---------------|-------------|------------------|----------|--------|
|                                   | Routed        | Transparent | Single           | Multiple |        |
|                                   |               |             |                  | Context  | System |
| Username attributes configuration | •             | —           | •                | —        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

## Usage Guidelines

Enter a comma separated list of group names to which this user belongs.

## Usage Guidelines

The following table lists the commands belonging in this group and the tunnel-group type where you can configure them:

| General Attribute           | Availability by Tunnel-Group Type |
|-----------------------------|-----------------------------------|
| accounting-server-group     | IPSec RA, IPSec L2L, WebVPN       |
| address-pool                | IPSec RA                          |
| authentication-server-group | IPSec RA, WebVPN                  |
| authorization-dn-attributes | IPSec RA, WebVPN                  |
| authorization-required      | WebVPN                            |
| authorization-server-group  | IPSec RA                          |

| General Attribute         | Availability by Tunnel-Group Type |
|---------------------------|-----------------------------------|
| default-group-policy      | IPSec RA, IPSec L2L               |
| dhcp-server               | IPSec RA                          |
| override-account-disabled | IPSec RA, WebVPN                  |
| password-management       | IPSec RA, WebVPN                  |
| strip-group               | IPSec RA, WebVPN,                 |
| strip-realm               | IPSec RA, WebVPN                  |

### Examples

The following example entered in global configuration mode, creates a username called newuser, then specifies that newuser is a member of the DevTest and management groups.

```
hostname(config)# username newuser nopassword
hostname(config)# username newuser attributes
hostname(config-username)# memberof DevTest,management
hostname(config-username)#
```

### Related Commands

| Command                             | Description  |
|-------------------------------------|--|
| <b>clear configure username</b>     | Clears the entire username database or just the specified username.                          |
| <b>show running-config username</b> | Displays the currently running username configuration for a specified user or for all users. |
| <b>username</b>                     | Creates and manages the database of user names.  |

# memory delayed-free-poisoner enable

To enable the delayed free-memory poisoner tool, use the **memory delayed-free-poisoner enable** command in privileged EXEC mode. To disable the delayed free-memory poisoner tool, use the **no** form of this command. The delayed free-memory poisoner tool lets you monitor freed memory for changes after it has been released by an application.

**memory delayed-free-poisoner enable**

**no memory delayed-free-poisoner enable**

## Syntax Description

This command has no arguments or keywords.

## Defaults

The **memory delayed-free-poisoner enable** command is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |                  |        |
|-----------------|---------------|-------------|------------------|------------------|--------|
|                 | Routed        | Transparent | Single           | Multiple Context | System |
| Privileged EXEC | •             | •           | •                | —                | •      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

Enabling the delayed free-memory poisoner tool has a significant impact on memory usage and system performance. The command should only be used under the supervision of the Cisco TAC. It should not be run in a production environment during heavy system usage.

When you enable this tool, requests to free memory by the applications running on the adaptive security appliance are written to a FIFO queue. As each request is written to the queue, each associated byte of memory that is not required by lower-level memory management is “poisoned” by being written with the value 0xcc.

The freed memory requests remain in the queue until more memory is required by an application than is in the free memory pool. When memory is needed, the first freed memory request is pulled from the queue and the poisoned memory is validated.

If the memory is unmodified, it is returned to the lower-level memory pool and the tool reissues the memory request from the application that made the initial request. The process continues until enough memory for the requesting application is freed.

If the poisoned memory has been modified, then the system forces a crash and produces diagnostic output to determine the cause of the crash.

The delayed free-memory poisoner tool periodically performs validation on all of the elements of the queue automatically. Validation can also be started manually using the **memory delayed-free-poisoner validate** command.

The **no** form of the command causes all of the memory referenced by the requests in the queue to be returned to the free memory pool without validation and any statistical counters to be cleared.

Examples

The following example enables the delayed free-memory poisoner tool:

```
hostname# memory delayed-free-poisoner enable
```

The following is sample output when the delayed free-memory poisoner tool detects illegal memory reuse:

```
delayed-free-poisoner validate failed because a
data signature is invalid at delayfree.c:328.

025b1cd0: cc cc cc cc cc cc cc cc | .....
```

An internal error occurred. Specifically, a programming assertion was violated. Copy the error message exactly as it appears, and get the output of the show version command and the contents of the configuration file. Then call your technical support representative.

```
assertion "0" failed: file "delayfree.c", line 191
```

Table 19-2 describes the significant portion of the output.

Table 19-2 Illegal Memory Usage Output Description

| Field          | Description  |
|----------------|--|
| heap region    | The address region and size of the region of memory available for use by the requesting application. This is not the same as the requested size, which may be smaller given the manner in which the system may parcel out memory at the time the memory request was made.  |
| memory address | The location in memory where the fault was detected.   |
| byte offset    | The byte offset is relative to the beginning of the heap region and can be used to find the field that was modified if the result was used to hold a data structure starting at this address. A value of 0 or that is larger than the heap region byte count may indicate that the problem is an unexpected value in the lower level heap package. |

**Table 19-2** *Illegal Memory Usage Output Description*

| Field                 | Description   |
|-----------------------|---|
| allocated by/freed by | Instruction addresses where the last malloc/calloc/realloc and free calls were made involving this particular region of memory.   |
| Dumping...            | A dump of one or two regions of memory, depending upon how close the detected fault was to the beginning of the region of heap memory. The next eight bytes after any system heap header is the memory used by this tool to hold a hash of various system header values plus the queue linkage. All other bytes in the region until any system heap trailer is encountered should be set to 0xcc. |

**Related Commands**

| Command                                      | Description   |
|--|---|
| <b>clear memory delayed-free-poisoner</b>    | Clears the delayed free-memory poisoner tool queue and statistics.                |
| <b>memory delayed-free-poisoner validate</b> | Forces validation of the elements in the delayed free-memory poisoner tool queue. |
| <b>show memory delayed-free-poisoner</b>     | Displays a summary of the delayed free-memory poisoner tool queue usage.          |

# memory delayed-free-poisoner validate

To force validation of all elements in the **memory delayed-free-poisoner** queue, use the **memory delayed-free-poisoner validate** command in privileged EXEC mode.

## memory delayed-free-poisoner validate

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behaviors or values.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |                  |        |
|-----------------|---------------|-------------|------------------|------------------|--------|
|                 | Routed        | Transparent | Single           | Multiple Context | System |
| Privileged EXEC | •             | •           | •                | —                | •      |

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

**Usage Guidelines** You must enable the delayed free-memory poisoner tool using the **memory delayed-free-poisoner enable** command before issuing the **memory delayed-free-poisoner validate** command.

The **memory delayed-free-poisoner validate** command causes each element of the **memory delayed-free-poisoner** queue to be validated. If an element contains unexpected values, then the system forces a crash and produces diagnostic output to determine the cause of the crash. If no unexpected values are encountered, the elements remain in the queue and are processed normally by the tool; the **memory delayed-free-poisoner validate** command does not cause the memory in the queue to be returned to the system memory pool.

**Note**

The delayed free-memory poisoner tool periodically performs validation on all of the elements of the queue automatically.

**Examples** The following example causes all elements in the **memory delayed-free-poisoner** queue to be validated:

```
hostname# memory delayed-free-poisoner validate
```

**Related Commands**

| Command  | Description  |
|--|--|
| <b>clear memory<br/>delayed-free-poisoner</b>      | Clears the delayed free-memory poisoner tool queue and statistics.       |
| <b>memory<br/>delayed-free-poisoner<br/>enable</b> | Enables the delayed free-memory poisoner tool.                           |
| <b>show memory<br/>delayed-free-poisoner</b>       | Displays a summary of the delayed free-memory poisoner tool queue usage. |

# memory caller-address

To configure a specific range of program memory for the call tracing, or caller PC, to help isolate memory problems, use the **memory caller-address** command in privileged EXEC mode. The caller PC is the address of the program that called a memory allocation primitive. To remove an address range, use the **no** form of this command.

```
memory caller-address startPC endPC

no memory caller-address
```

Syntax Description

|         |  |
|---------|--|
| endPC   | Specifies the end address range of the memory block.   |
| startPC | Specifies the start address range of the memory block. |

Defaults

The actual caller PC is recorded for memory tracing.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |          |        |
|-----------------|---------------|-------------|------------------|----------|--------|
|                 | Routed        | Transparent | Single           | Multiple |        |
|                 |               |             |                  | Context  | System |
| Privileged EXEC | •             | •           | —                | •        | •      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0     | This command was introduced. |

Usage Guidelines

Use the **memory caller-address** command to isolate memory problems to a specific block of memory. In certain cases the actual caller PC of the memory allocation primitive is a known library function that is used at many places in the program. To isolate individual places in the program, configure the start and end program address of the library function, thereby recording the program address of the caller of the library function.

Note

The adaptive security appliance might experience a temporary reduction in performance when caller-address tracing is enabled.

Examples

The following examples show the address ranges configured with the **memory caller-address** commands, and the resulting display of the **show memory-caller address** command:

```
hostname# memory caller-address 0x00109d5c 0x00109e08
hostname# memory caller-address 0x009b0ef0 0x009b0f14
hostname# memory caller-address 0x00cf211c 0x00cf4464
```

```
hostname# show memory-caller address
Move down stack frame for the addresses:
pc = 0x00109d5c-0x00109e08
pc = 0x009b0ef0-0x009b0f14
pc = 0x00cf211c-0x00cf4464
```

## Related Commands

| Command                           | Description  |
|-----------------------------------|--|
| <b>memory profile enable</b>      | Enables the monitoring of memory usage (memory profiling).   |
| <b>memory profile text</b>        | Configures a text range of memory to profile.  |
| <b>show memory</b>                | Displays a summary of the maximum physical memory and current free memory available to the operating system. |
| <b>show memory binsize</b>        | Displays summary information about the chunks allocated for a specific bin size.                             |
| <b>show memory profile</b>        | Displays information about the memory usage (profiling) of the adaptive security appliance.                  |
| <b>show memory-caller address</b> | Displays the address ranges configured on the adaptive security appliance.                                   |

# memory profile enable

To enable the monitoring of memory usage (memory profiling), use the **memory profile enable** command in privileged EXEC mode. To disable memory profiling, use the **no** form of this command.

**memory profile enable peak** *peak\_value*

**no memory profile enable peak** *peak\_value*

Syntax Description

|                   |   |
|-------------------|---|
| <i>peak_value</i> | Specifies the memory usage threshold at which a snapshot of the memory usage is saved to the peak usage buffer. The contents of this buffer could be analyzed at a later time to determine the peak memory needs of the system. |
|-------------------|---|

Defaults

Memory profiling is disabled by default.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |          |        |
|-----------------|---------------|-------------|------------------|----------|--------|
|                 | Routed        | Transparent | Single           | Multiple |        |
|                 |               |             |                  | Context  | System |
| Privileged EXEC | •             | •           | —                | •        | •      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0     | This command was introduced. |

Usage Guidelines

Before enabling memory profiling, you must first configure a memory text range to profile with the **memory profile text** command.

Some memory is held by the profiling system until you enter the **clear memory profile** command. See the output of the **show memory status** command.

Note

The adaptive security appliance might experience a temporary reduction in performance when memory profiling is enabled.

The following example enables memory profiling:

```
hostname# memory profile enable
```

**Related Commands**

| Command                    | Description   |
|----------------------------|---|
| <b>memory profile text</b> | Configures a text range of memory to profile.   |
| <b>show memory profile</b> | Displays information about the memory usage (profiling) of the adaptive security appliance. |

# memory profile text

To configure a program text range of memory to profile, use the **memory profile text** command in privileged EXEC mode. To disable, use the **no** form of this command.

```
memory profile text {startPC endPC | all resolution}

no memory profile text {startPC endPC | all resolution}
```

Syntax Description

|            |   |
|------------|---|
| all        | Specifies the entire text range of the memory block.            |
| endPC      | Specifies the end text range of the memory block.               |
| resolution | Specifies the resolution of tracing for the source text region. |
| startPC    | Specifies the start text range of the memory block.             |

Defaults

No default behaviors or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |          |        |
|-----------------|---------------|-------------|------------------|----------|--------|
|                 | Routed        | Transparent | Single           | Multiple |        |
|                 |               |             |                  | Context  | System |
| Privileged EXEC | •             | •           | —                | •        | •      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0     | This command was introduced. |

Usage Guidelines

For a small text range, a resolution of “4” normally traces the call to an instruction. For a larger text range, a coarse resolution is probably enough for the first pass and the range could be narrowed down to a set of smaller regions in the next pass.

After entering the text range with the **memory profile text** command, you must then enter the **memory profile enable** command to begin memory profiling. Memory profiling is disabled by default.

Note

The adaptive security appliance might experience a temporary reduction in performance when memory profiling is enabled.

Examples

The following example shows how to configure a text range of memory to profile, with a resolution of 4:

```
hostname# memory profile text 0x004018b4 0x004169d0 4
```

The following example displays the configuration of the text range and the status of memory profiling (OFF):

```
hostname# show memory profile
InUse profiling: OFF
Peak profiling: OFF
Profile:
0x004018b4-0x004169d0(00000004)
```

**Note**

To begin memory profiling, you must enter the **memory profile enable** command. Memory profiling is disabled by default.

**Related Commands**

| Command                           | Description   |
|-----------------------------------|---|
| <b>clear memory profile</b>       | Clears the buffers held by the memory profiling function.                                   |
| <b>memory profile enable</b>      | Enables the monitoring of memory usage (memory profiling).                                  |
| <b>show memory profile</b>        | Displays information about the memory usage (profiling) of the adaptive security appliance. |
| <b>show memory-caller address</b> | Displays the address ranges configured on the adaptive security appliance.                  |

# memory-size

To configure the amount of memory on the adaptive security appliance which the various components of WebVPN can access, use the **memory-size** command in webvpn mode. You can configure the amount of memory either as a set amount of memory in KB or as a percentage of total memory. To remove a configured memory size, use the **no** form of this command.

Note

A reboot is required for the new memory size setting to take effect.

```
memory-size {percent | kb} size
no memory-size [{percent | kb} size]
```

Syntax Description

|         |  |
|---------|--|
| kb      | Specifies the amount of memory in Kilobytes.   |
| percent | Specifies the amount of memory as a percentage of total memory on the adaptive security appliance. |
| size    | Specifies the amount of memory, either in KB or as a percentage of total memory.                   |

Defaults

No default behavior or value.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode | Firewall Mode |             | Security Context |          |        |
|--------------|---------------|-------------|------------------|----------|--------|
|              | Routed        | Transparent | Single           | Multiple |        |
|              |               |             |                  | Context  | System |
| Webvpn mode  | •             | —           | •                | —        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.1(1)  | This command was introduced. |

Usage Guidelines

The configured amount of memory will be allocated immediately. Before configuring this command, check the amount of available memory by using show memory. If a percentage of total memory is used for configuration, ensure that the configured value is below the available percentage. If a Kilobyte value is used for configuration, ensure that the configured value is below the available amount of memory in Kilobytes.

Examples

The following example shows how to configure a WebVPN memory size of 30 per cent:

```
hostname(config)# webvpn
hostname(config-webvpn)# memory-size percent 30
```

```
hostname(config-webvpn) #  
hostname(config-webvpn) # reload
```

| Command                   | Description                              |
|---------------------------|--|
| <b>show memory webvpn</b> | Displays WebVPN memory usage statistics. |

# memory tracking enable

To enable the tracking of heap memory request, use the **memory tracking enable** command in privileged EXEC mode. To disable memory tracking, use the **no** form of this command.

- memory tracking enable
- no memory tracking enable

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behaviors or values.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |          |        |
|-----------------|---------------|-------------|------------------|----------|--------|
|                 | Routed        | Transparent | Single           | Multiple |        |
|                 |               |             |                  | Context  | System |
| Privileged EXEC | •             | •           | —                | •        | •      |

| Release | Modification                 |
|---------|------------------------------|
| 7.0(8)  | This command was introduced. |

**Usage Guidelines** Use the **memory tracking enable** command to track heap memory requests. To disable memory tracking, use the **no** form of this command.

**Examples** The following example enables tracking heap memory requests:

```
hostname# memory tracking enable
```

| Command                      | Description   |
|------------------------------|---|
| clear memory tracking        | Clears all currently gathered information.  |
| show memory tracking         | Shows currently allocated memory.   |
| show memory tracking address | Lists the size, location, and topmost caller function of each currently allocated piece memory tracked by the tool. |
| show memory tracking dump    | This command shows the size, location, partial callstack, and a memory dump of the given memory address.            |
| show memory tracking detail  | Shows various internal details to be used in gaining insight into the tool's internal behavior.                     |

# merge-dacl

To merge a downloadable ACL with the ACL received in the Cisco AV pair from a RADIUS packet, use the **merge-dacl** command in aaa-server group configuration mode. To disable the merging of a downloadable ACL with the ACL received in the Cisco AV pair from a RADIUS packet, use the **no** form of this command.

**merge dacl { before\_avpair | after\_avpair }**

**no merge dacl**

## Syntax Description

|                      |  |
|----------------------|--|
| <b>after_avpair</b>  | Specifies that the downloadable ACL entries should be placed after the Cisco AV pair entries. This option applies only to VPN connections. For VPN users, ACLs can be in the form of Cisco AV pair ACLs, downloadable ACLs, and an ACL that is configured on the adaptive security appliance. This option determines whether or not the downloadable ACL and the AV pair ACL are merged, and does not apply to any ACLs configured on the adaptive security appliance. |
| <b>before_avpair</b> | Specifies that the downloadable ACL entries should be placed before the Cisco AV pair entries.   |

## Defaults

The default setting is **no merge dacl**, which specifies that downloadable ACLs will not be merged with Cisco AV pair ACLs.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                   | Firewall Mode |             | Security Context |          |        |
|--------------------------------|---------------|-------------|------------------|----------|--------|
|                                | Routed        | Transparent | Single           | Multiple |        |
|                                |               |             |                  | Context  | System |
| AAA-server group configuration | •             | •           | •                | •        | •      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

## Usage Guidelines

If both an AV pair and a downloadable ACL are received, the AV pair has priority and is used.

## Examples

The following example specifies that the downloadable ACL entries should be placed before the Cisco AV pair entries:

```
hostname(config)# aaa-server servergroup1 protocol radius
hostname(config-aaa-server-group)# merge-dacl before-avpair
```

| Related Commands | Command                    | Description  |
|------------------|----------------------------|--|
|                  | <b>aaa-server host</b>     | Identifies the server and the AAA server group to which it belongs.  |
|                  | <b>aaa-server protocol</b> | Identifies the server group name and the protocol.   |
|                  | <b>max-failed-attempts</b> | Specifies the maximum number of requests sent to a AAA server in the group before trying the next server.. |

# message-length

To filter GTP packets that do not meet the configured maximum and minimum length, use the **message-length** command in GTP map configuration mode, which is accessed by using the **gtp-map** command. Use the **no** form to remove the command.

**message-length** **min** *min\_bytes* **max** *max\_bytes*

**no message-length** **min** *min\_bytes* **max** *max\_bytes*

## Syntax Description

|                  |  |
|------------------|--|
| <b>max</b>       | Specifies the maximum number of bytes allowed in the UDP payload.            |
| <i>max_bytes</i> | The maximum number of bytes in the UDP payload. The range is from 1 to 65536 |
| <b>min</b>       | Specifies the minimum number of bytes allowed in the UDP payload             |
| <i>min_bytes</i> | The minimum number of bytes in the UDP payload. The range is from 1 to 65536 |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

|                       | Firewall Mode |             | Security Context |                     |        |
|-----------------------|---------------|-------------|------------------|---------------------|--------|
|                       | Routed        | Transparent | Single           | Multiple<br>Context | System |
| GTP map configuration | •             | •           | •                | •                   | No     |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The length specified by this command is the sum of the GTP header and the rest of the message, which is the payload of the UDP packet.

## Examples

The following example allows messages between 20 bytes and 300 bytes in length:

```
hostname(config)# gtp-map gtp-policy
hostname(config-gtpmap)# permit message-length min 20 max 300
hostname(config-gtpmap)#
```

## Related Commands

message-length

| Commands                                | Description   |
|---|---|
| <b>clear service-policy inspect gtp</b> | Clears global GTP statistics.                                 |
| <b>debug gtp</b>                        | Displays detailed information about GTP inspection.           |
| <b>gtp-map</b>                          | Defines a GTP map and enables GTP map configuration mode.     |
| <b>inspect gtp</b>                      | Applies a specific GTP map to use for application inspection. |
| <b>show service-policy inspect gtp</b>  | Displays the GTP configuration.                               |

# mfib forwarding

To reenable MFIB forwarding on an interface, use the **mfib forwarding** command in interface configuration mode. To disable MFIB forwarding on an interface, use the **no** form of this command.

**mfib forwarding**

**no mfib forwarding**

## Syntax Description

This command has no arguments or keywords.

## Defaults

The **multicast-routing** command enables MFIB forwarding on all interfaces by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |                  |        |
|-------------------------|---------------|-------------|------------------|------------------|--------|
|                         | Routed        | Transparent | Single           | Multiple Context | System |
| Interface configuration | •             | —           | •                | —                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.1(1)  | This command was introduced. |

## Usage Guidelines

When you enable multicast routing, MFIB forwarding is enabled on all interfaces by default. Use the **no** form of the command to disable MFIB forwarding on a specific interface. Only the **no** form of the command appears in the running configuration.

When MFIB forwarding is disabled on an interface, the interface does not accept any multicast packets unless specifically configured through other methods. IGMP packets are also prevented when MFIB forwarding is disabled.

## Examples

The following example disables MFIB forwarding on the specified interface:

```
hostname(config)# interface GigabitEthernet 0/0
hostname(config-if)# no mfib forwarding
```

## Related Commands

| Command                  | Description                  |
|--------------------------|------------------------------|
| <b>multicast-routing</b> | Enables multicast routing.   |
| <b>pim</b>               | Enables PIM on an interface. |

# min-object-size

To set a minimum size for objects that the adaptive security appliance can cache for WebVPN sessions, use the `min-object-size` command in cache mode. To change the size, use the command again. To set no minimum object size, enter a value of zero (0).

**min-object-size** *integer range*

|                           |                                    |
|---------------------------|------------------------------------|
| <b>Syntax Description</b> | <i>integer range</i> 0 - 10000 KB. |
|---------------------------|------------------------------------|

|                 |                           |
|-----------------|---------------------------|
| <b>Defaults</b> | The default size is 0 KB. |
|-----------------|---------------------------|

|                      |   |
|----------------------|---|
| <b>Command Modes</b> | The following table shows the modes in which you enter the command: |
|----------------------|---|

| Command Mode | Firewall Mode |             | Security Context |          |        |
|--------------|---------------|-------------|------------------|----------|--------|
|              | Routed        | Transparent | Single           | Multiple |        |
|              |               |             |                  | Context  | System |
| Cache mode   | •             | —           | •                | —        | —      |

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 7.1(1)  | This command was introduced. |

|                         |  |
|-------------------------|--|
| <b>Usage Guidelines</b> | The minimum object size must be smaller than the maximum object size. The adaptive security appliance calculates the size after compressing the object, if cache compression is enabled. |
|-------------------------|--|

|                 |  |
|-----------------|--|
| <b>Examples</b> | The following example shows how to set a maximum object size of 40 KB: |
|-----------------|--|

```
hostname(config)# webvpn
hostname(config-webvpn)# cache
hostname(config-webvpn-cache)# min-object-size 40
hostname(config-webvpn-cache)#
```

| Related Commands | Command                 | Description   |
|------------------|-------------------------|---|
|                  | <b>cache</b>            | Enters WebVPN Cache mode.   |
|                  | <b>cache-compressed</b> | Configures WebVPN cache compression.  |
|                  | <b>disable</b>          | Disables caching.   |
|                  | <b>expiry-time</b>      | Configures the expiration time for caching objects without revalidating them. |

| Command                | Description  |
|------------------------|--|
| <b>lmfactor</b>        | Sets a revalidation policy for caching objects that have only the last-modified timestamp. |
| <b>max-object-size</b> | Defines the maximum size of an object to cache.  |

# mkdir

To create a new directory, use the **mkdir** command in privileged EXEC mode.

**mkdir** [/noconfirm] [disk0: | disk1: | flash:]*path*

## Syntax Description

|                  |   |
|------------------|---|
| <b>noconfirm</b> | (Optional) Suppresses the confirmation prompt.  |
| <b>disk0:</b>    | (Optional) Specifies the internal Flash memory, followed by a colon.  |
| <b>disk1:</b>    | (Optional) Specifies the external Flash memory card, followed by a colon.   |
| <b>flash:</b>    | (Optional) Specifies the internal Flash memory, followed by a colon. In the ASA 5500 series adaptive security appliances, the <b>flash</b> keyword is aliased to <b>disk0</b> . |
| <i>path</i>      | The name and path of the directory to create.   |

## Defaults

If you do not specify a path, the directory is created in the current working directory.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |          |        |
|-----------------|---------------|-------------|------------------|----------|--------|
|                 | Routed        | Transparent | Single           | Multiple |        |
|                 |               |             |                  | Context  | System |
| Privileged EXEC | •             | •           | •                | —        | •      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

If a directory with the same name already exists, then the new directory is not created.

## Examples

The following example shows how to make a new directory called “backup”:

```
hostname# mkdir backup
```

## Related Commands

| Command      | Description   |
|--------------|---|
| <b>cd</b>    | Changes the current working directory to the one specified. |
| <b>dir</b>   | Displays the directory contents.                            |
| <b>rmdir</b> | Removes the specified directory.                            |
| <b>pwd</b>   | Display the current working directory.                      |

# mobile-device portal

To change the clientless vpn access web portal from the mini-portal to the full-browser portal, for all mobile devices, use the **mobile-device portal** command from webvpn configuration mode. You will only need to make this configuration for smart phones running older operating systems such as Windows CE. You will not need to configure this option using modern smart phones as they use the full-browser portal by default.

**mobile-device portal {full}**

**no mobile-device portal {full}**

## Syntax Description

**mobile-device portal {full}** Changes the clientless vpn access portal from the mini-portal to the full-browser portal for all mobile devices.

## Command Default

Before you run the command, the default behavior is that some mobile devices will get clientless vpn access through the mini-portal and some will use the full portal.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| webvpn configuration | •             | —           | •                | —        | —      |

## Command History

| Release | Modification  |
|---------|---|
| 8.2(5)  | We introduced this command simultaneously in 8.2(5) and 8.4(2). |
| 8.4(2)  | We introduced this command simultaneously in 8.2(5) and 8.4(2). |

## Usage Guidelines

Use this command only if you are recommended to do so by Cisco Technical Assistance Center (TAC).

## Examples

Changes the clientless vpn access portal to a full-browser portal for all mobile devices.

```
hostname# config t
hostname(config)# webvpn
hostname(config-webvpn)# mobile-device portal full
```

## Related Commands

| Command                    | Description                                    |
|----------------------------|--|
| show running-config webvpn | Displays the running configuration for webvpn. |

# mode

To set the security context mode to single or multiple, use the **mode** command in global configuration mode. You can partition a single adaptive security appliance into multiple virtual devices, known as security contexts. Each context behaves like an independent device, with its own security policy, interfaces, and administrators. Multiple contexts are similar to having multiple standalone appliances. In single mode, the adaptive security appliance has a single configuration and behaves as a single device. In multiple mode, you can create multiple contexts, each with its own configuration. The number of contexts allowed depends on your license.

```
mode {single | multiple} [noconfirm]
```

|                    |                  |   |
|--------------------|------------------|---|
| Syntax Description | <b>multiple</b>  | Sets multiple context mode.   |
|                    | <b>noconfirm</b> | (Optional) Sets the mode without prompting you for confirmation. This option is useful for automated scripts. |
|                    | <b>single</b>    | Sets the context mode to single.  |

**Defaults** No default behavior or values.

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | •           | •                | —        | •      |

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 7.0(1)  | This command was introduced. |

**Usage Guidelines** In multiple context mode, the adaptive security appliance includes a configuration for each context that identifies the security policy, interfaces, and almost all the options you can configure on a stand-alone device (see the **config-url** command to identify the context configuration location). The system administrator adds and manages contexts by configuring them in the system configuration, which, like a single mode configuration, is the startup configuration. The system configuration identifies basic settings for the adaptive security appliance. The system configuration does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses one of the contexts that is designated as the admin context.

When you change the context mode using the **mode** command, you are prompted to reboot.

The context mode (single or multiple) is not stored in the configuration file, even though it does endure reboots. If you need to copy your configuration to another device, set the mode on the new device to match using the **mode** command.

When you convert from single mode to multiple mode, the adaptive security appliance converts the running configuration into two files: a new startup configuration that comprises the system configuration, and admin.cfg that comprises the admin context (in the root directory of the internal Flash memory). The original running configuration is saved as old\_running.cfg (in the root directory of the internal Flash memory). The original startup configuration is not saved. The adaptive security appliance automatically adds an entry for the admin context to the system configuration with the name “admin.”

If you convert from multiple mode to single mode, you might want to first copy a full startup configuration (if available) to the adaptive security appliance; the system configuration inherited from multiple mode is not a complete functioning configuration for a single mode device.

Not all features are supported in multiple context mode. See the *Cisco ASA 5500 Series Configuration Guide using the CLI* for more information.

## Examples

The following example sets the mode to multiple:

```
hostname(config)# mode multiple
WARNING: This command will change the behavior of the device
WARNING: This command will initiate a Reboot
Proceed with change mode? [confirm] y
Convert the system configuration? [confirm] y
Flash Firewall mode: multiple

***
*** --- SHUTDOWN NOW ---
***
*** Message to all terminals:
***
*** change mode

Rebooting...

Booting system, please wait...
```

The following example sets the mode to single:

```
hostname(config)# mode single
WARNING: This command will change the behavior of the device
WARNING: This command will initiate a Reboot
Proceed with change mode? [confirm] y
Flash Firewall mode: single

***
*** --- SHUTDOWN NOW ---
***
*** Message to all terminals:
***
*** change mode

Rebooting...

Booting system, please wait...
```

## Related Commands

| Command          | Description   |
|------------------|---|
| <b>context</b>   | Configures a context in the system configuration and enters context configuration mode. |
| <b>show mode</b> | Shows the current context mode, either single or multiple.                              |

# monitor-interface

To enable health monitoring on a specific interface, use the **monitor-interface** command in global configuration mode. To disable interface monitoring, use the **no** form of this command.

**monitor-interface** *if\_name*

**no monitor-interface** *if\_name*

## Syntax Description

|                |  |
|----------------|--|
| <i>if_name</i> | Specifies the name of the interface being monitored. |
|----------------|--|

## Defaults

Monitoring of physical interfaces is enabled by default; monitoring of logical interfaces is disabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | •           | •                | •        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

## Usage Guidelines

The number of interfaces that can be monitored for the adaptive security appliance is 250. Hello messages are exchanged during every interface poll frequency time period between the adaptive security appliance failover pair. The failover interface poll time is 3 to 15 seconds. For example, if the poll time is set to 5 seconds, testing begins on an interface if 5 consecutive hellos are not heard on that interface (25 seconds).

Monitored failover interfaces can have the following status:

- Unknown—Initial status. This status can also mean the status cannot be determined.
- Normal—The interface is receiving traffic.
- Testing—Hello messages are not heard on the interface for five poll times.
- Link Down—The interface or VLAN is administratively down.
- No Link—The physical link for the interface is down.
- Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.

In Active/Active failover, this command is only valid within a context.

**Examples**

The following example enables monitoring on an interface named “inside”:

```
hostname(config)# monitor-interface inside
hostname(config)#
```

**Related Commands**

| Command                                      | Description   |
|--|---|
| <b>clear configure monitor-interface</b>     | Restores the default interface health monitoring for all interfaces.                            |
| <b>failover interface-policy</b>             | Specifies the number or percentage of monitored interface that must fail for failover to occur. |
| <b>failover polltime</b>                     | Specifies the interval between hello messages on an interface (Active/Standby failover).        |
| <b>polltime interface</b>                    | Specifies the interval between hello messages on an interface (Active/Active failover).         |
| <b>show running-config monitor-interface</b> | Displays the <b>monitor-interface</b> commands in the running configuration.                    |

# more

To display the contents of a file, use the **more** command in privileged EXEC mode.

```
more [/ascii | /binary | /ebcdic | disk0: | disk1: | flash: | ftp: | http: | https: | system: |
tftp:}filename
```

| Syntax Description |  |
|--------------------|--|
| /ascii             | (Optional) Displays a binary file in binary mode and an ASCII file in binary mode.   |
| /binary            | (Optional) Displays any file in binary mode.   |
| /ebcdic            | (Optional) Displays binary files in EBCDIC.  |
| <b>disk0:</b>      | (Optional) Displays a file on the internal Flash memory.   |
| <b>disk1:</b>      | (Optional) Displays a file on the external Flash memory card.  |
| <i>filename</i>    | Specifies the name of the file to display.   |
| <b>flash:</b>      | (Optional) Specifies the internal Flash memory, followed by a colon. In the ASA 5500 series adaptive security appliance, the <b>flash</b> keyword is aliased to <b>disk0</b> . |
| <b>ftp:</b>        | (Optional) Displays a file on an FTP server.   |
| <b>http:</b>       | (Optional) Displays a file on a website.   |
| <b>https:</b>      | (Optional) Displays a file on a secure website.  |
| <b>system:</b>     | (Optional) Displays the file system.   |
| <b>tftp:</b>       | (Optional) Displays a file on a TFTP server.   |

**Defaults** ASCII mode

**Command Modes** The following table shows the modes in which you can enter the command:

| Command Mode    | Firewall Mode |             | Security Context |          |        |
|-----------------|---------------|-------------|------------------|----------|--------|
|                 | Routed        | Transparent | Single           | Multiple |        |
|                 |               |             |                  | Context  | System |
| Privileged EXEC | •             | •           | •                | —        | •      |

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 | 7.0(1)  | This command was introduced. |

**Usage Guidelines** The **more filesystem:** command prompts you to enter the alias of the local directory or file systems.

**Examples** The following example shows how to display the contents of a local file named “test.cfg”:

```
hostname# more test.cfg
: Saved
: Written by enable_15 at 10:04:01 Apr 14 2005
```

more

```

**Related Commands**

| Command    | Description                             |
|------------|---|
| <b>cd</b>  | Changes to the specified directory.     |
| <b>pwd</b> | Displays the current working directory. |

## mount (CIFS)

To make a Common Internet File System (CIFS) accessible to the security appliance, use the **mount** command in global configuration mode. This command lets you enter config-mount-cifs configuration mode. To un-mount the CIFS network file system, use the **no** form of this command.

**mount** *name* **type** **cifs** **server** *server-name* **share** *share* **status** **enable** | **status** **disable** [**domain** *domain-name* ] **username** *username* **password** *password*

[**no**] **mount** *name* **type** **cifs** **server** *server-name* **share** *share* **status** **enable** | **status** **disable** [**domain** *domain-name* ] **username** *username* **password** *password*

### Syntax Description

|                                     |   |
|-------------------------------------|---|
| <b>domain</b> <i>domain-name</i>    | (Optional) For CIFS file systems only, this argument specifies the Windows NT domain name. A maximum of 63 characters is permitted.         |
| <i>name</i>                         | Specifies the name of an existing file system to be assigned to the Local CA.   |
| <b>no</b>                           | Removes an already mounted CIFS file system and renders it inaccessible.  |
| <b>password</b> <i>password</i>     | Identifies the authorized password for file-system mounting.  |
| <b>server</b> <i>server-name</i>    | Specifies the predefined name (or the IP address in dotted decimal notation) of the CIFS file-system server.                                |
| <b>share</b> <i>sharename</i>       | Explicitly identifies a specific server share (a folder) by name to access file data within a server.                                       |
| <b>status</b> <b>enable/disable</b> | Identifies the state of the file system as mounted or un-mounted (available or unavailable).  |
| <b>type</b>                         | Specifies the CIFS type of file system to mount. For alternative <b>type</b> keywords, refer to the <b>mount (FTP)</b> command.             |
| <b>type</b> <b>cifs</b>             | Specifies that the file system being mounted is CIFS, a file system that provides volume-mounting capabilities for CIFS-shared directories. |
| <b>user</b> <i>username</i>         | The authorized username for file-system mounting.   |

### Defaults

No default behavior or values.

### Command Modes

The following table shows the modes in which you can enter the command:

|                                 | Firewall Mode |             | Security Context |                  |        |
|---------------------------------|---------------|-------------|------------------|------------------|--------|
|                                 | Routed        | Transparent | Single           | Multiple Context | System |
| config-mount-cifs configuration | •             | •           | •                | —                | •      |
| Global configuration            | •             | •           | •                | —                | •      |

### Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

Usage Guidelines

The **mount** command uses the Installable File System (IFS) to mount the CIFS file system. IFS, a filesystem API, enables the security appliance to recognize and load drivers for file systems.

The **mount** command attaches the CIFS file system on the security appliance to the UNIX file tree. Conversely, the **no mount** command detaches it.

The *mount-name* specified in the **mount** command is used by other CLI commands to refer to the filesystem already mounted on the security appliance. For example, the **database** command, which sets up file storage for the Local Certificate Authority, needs the mount name of an existing mounted file system to save database files to non-flash storage.

The CIFS remote file-access protocol is compatible with the way applications share data on local disks and network file servers. Running over TCP/IP and using the Internet's global DNS, CIFS is an enhanced version of Microsoft's open, cross-platform Server Message Block (SMB) protocol, the native file-sharing protocol in the Windows operating systems.

Always exit from the root shell after using the **mount** command. The **exit** keyword in mount-cifs-config mode returns the user to global configuration mode.

In order to reconnect, remap your connections to storage.

Note

Mounting of CIFS and FTP file systems are supported. (See the **mount name type ftp** command.) Mounting Network File System (NFS) volumes is not supported for this release.

Examples

The following example mounts *cifs://amer;chief:big-boy@myfiler02/my\_share* as the label, *cifs\_share*:

```
hostname(config)# mount cifs_share type CIFS
hostname (config-mount-cifs)# server myfiler02a
```

Related Commands

| Command                    | Description   |
|----------------------------|---|
| <b>debug cifs</b>          | Logs CIFS debug messages.   |
| <b>debug ntdomain</b>      | Logs Web VPN NT Domain debug messages   |
| <b>debug webvpn cifs</b>   | Logs WebVPN CIFS debug messages.  |
| <b>dir all-filesystems</b> | Displays the files of all filesystems mounted on the adaptive security appliance. |

## mount (FTP)

To make a File Transfer Protocol (FTP) file system accessible to the security appliance, use the **mount name type ftp** command in global configuration mode to enter Mount FTP configuration mode. The **no mount name type ftp** command is used to un-mount the FTP network file system.

**[no] mount name type FTP server server-name path pathname status enable | status disable mode active | mode passive username username password password**

| Syntax Description           |  |   |
|------------------------------|--|---|
| <b>exit</b>                  |  | Exit from Mount-FTP Configuration mode and return to Global Configuration mode.   |
| <b>ftp</b>                   |  | Specifies that the file system being mounted is FTP, a Linux kernel module, enhancing the Virtual File System (VFS) with FTP volume-mounting capabilities that allow you to mount FTP-shared directories. |
| <b>mode</b>                  |  | Identifies the FTP Transfer Mode as either Active or Passive.   |
| <b>no</b>                    |  | Removes an already mounted FTP file system, rendering it inaccessible.  |
| <b>password password</b>     |  | Identifies the authorized password for file-system mounting.  |
| <b>path pathname</b>         |  | Specifies the directory pathname to the specified FTP file-system server. The pathname cannot contain spaces.   |
| <b>server server-name</b>    |  | Specifies the predefined name (or the IP address in dotted decimal notation) of the FTPFS file-system server.   |
| <b>status enable/disable</b> |  | Identifies the state of the file system as mounted or un-mounted (available or unavailable).  |
| <b>username username</b>     |  | Specifies the authorized username for file-system mounting  |

### Defaults

No default behavior or values.

### Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| config-mount-ftp     | •             | •           | •                | —        | •      |
| Global Configuration | •             | •           | •                | —        | •      |

### Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

Usage Guidelines

The **mount name type ftp** command uses the Installable File System (IFS) to mount the specified network file system. IFS, a filesystem API, enables the security appliance to recognize and load drivers for file systems.

To confirm that the FTP file system actually is mounted, use the **dir all-filesystems** instruction

The mount-name specified in the **mount** command is used when other CLI commands refer to the filesystem already mounted on the security appliance. For example, the **database** command, which sets up file storage for the Local Certificate Authority, needs the mount name of a mounted file system to save database files to non-flash storage.

Note

Using the **mount** command when you create an FTP-type mount requires that the FTP Server must have a UNIX directory listing style. Microsoft FTP servers have a default of MS-DOS directory listing style.

Note

Mounting of CIFS and FTP file systems are supported. (See the **mount name type ftp** command.) Mounting Network File System (NFS) volumes is not supported for this release.

Examples

This example mounts *ftp://amor;chief:big-kid@myfiler02* as the label, *my ftp*:

```
hostname(config)# mount myftp type ftp server myfiler02a path status enable username
chief password big-kid
```

Related Commands

| Command                 | Description   |
|-------------------------|---|
| <b>debug webvpn</b>     | Logs WebVPN debug messages.   |
| <b>ftp mode passive</b> | Controls interaction between the FTP client on the security appliance and the FTP server. |

# mroute

To configure a static multicast route, use the **mroute** command in global configuration mode. To remove a static multicast route, use the **no** form of this command.

**mroute** *src smask* { *in\_if\_name* [**dense** *output\_if\_name*] | *rpf\_addr* } [*distance*]

**no** mroute *src smask* { *in\_if\_name* [**dense** *output\_if\_name*] | *rpf\_addr* } [*distance*]

## Syntax Description

|                                    |   |
|------------------------------------|---|
| <b>dense</b> <i>output_if_name</i> | (Optional) The interface name for dense mode output.<br>The <b>dense</b> <i>output_if_name</i> keyword and argument pair is only supported for SMR stub multicast routing (igmp forwarding).  |
| <i>distance</i>                    | (Optional) The administrative distance of the route. Routes with lower distances have preference. The default is 0.   |
| <i>in_if_name</i>                  | Specifies the incoming interface name for the mroute.   |
| <i>rpf_addr</i>                    | Specifies the incoming interface for the mroute. If the RPF address PIM neighbor, PIM join, graft, and prune messages are sent to it. The <i>rpf_addr</i> argument can be a host IP address of a directly connected system or a network/subnet number. When it is a route, a recursive lookup is done from the unicast routing table to find a directly connected system. |
| <i>smask</i>                       | Specifies the multicast source network address mask.  |
| <i>src</i>                         | Specifies the IP address of the multicast source.   |

## Defaults

No default behavior or values.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |                     |        |
|----------------------|---------------|-------------|------------------|---------------------|--------|
|                      | Routed        | Transparent | Single           | Multiple<br>Context | System |
| Global configuration | •             | —           | •                | —                   | —      |

## Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

## Usage Guidelines

This command lets you statically configure where multicast sources are located. The adaptive security appliance expects to receive multicast packets on the same interface as it would use to send unicast packets to a specific source. In some cases, such as bypassing a route that does not support multicast routing, multicast packets may take a different path than the unicast packets.

Static multicast routes are not advertised or redistributed.

Use the **show mroute** command displays the contents of the multicast route table. Use the **show running-config mroute** command to display the mroute commands in the running configuration.

Examples

The following example shows how configure a static multicast route using the **mroute** command:

```
hostname(config)# mroute 172.16.0.0 255.255.0.0 inside
```

Related Commands

| Command                    | Description  |
|----------------------------|--|
| clear configure mroute     | Removes the <b>mroute</b> commands from the configuration. |
| show mroute                | Displays the IPv4 multicast routing table.                 |
| show running-config mroute | Displays the <b>mroute</b> commands in the configuration.  |

# mschapv2-capable

To enable MS-CHAPv2 authentication requests to the RADIUS server, use the **mschapv2-capable** command in aaa-server host configuration mode. To disable MS-CHAPv2, use the **no** form of this command.

**mschapv2-capable**

**no mschapv2-capable**

## Syntax Description

This command has no arguments or keywords.

## Defaults

MS-CHAPv2 is enabled by default.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode                  | Firewall Mode |             | Security Context |                  |        |
|-------------------------------|---------------|-------------|------------------|------------------|--------|
|                               | Routed        | Transparent | Single           | Multiple Context | System |
| Aaa-server host configuration | •             | •           | •                | •                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.2(1)  | This command was introduced. |

## Usage Guidelines

To enable MS-CHAPv2 as the protocol used between the adaptive security appliance and the RADIUS server for a VPN connection, password management must be enabled in the tunnel-group general-attributes. Enabling password management generates an MS-CHAPv2 authentication request from the adaptive security appliance to the RADIUS server. See the description of the **password-management** command for details.

If you use double authentication and enable password management in the tunnel group, then the primary and secondary authentication requests include MS-CHAPv2 request attributes. If a RADIUS server does not support MS-CHAPv2, then you can configure that server to send a non-MS-CHAPv2 authentication request by using the **no mschapv2-capable** command.

## Examples

The following example disables MS-CHAPv2 for the RADIUS server authsrv1.cisco.com:

```
hostname(config)# aaa-server rsaradius protocol radius
hostname(config-aaa-server-group)# aaa-server rsaradius (management) host
authsrv1.cisco.com
hostname(config-aaa-server-host)# key secretpassword
hostname(config-aaa-server-host)# authentication-port 21812
hostname(config-aaa-server-host)# accounting-port 21813
hostname(config-aaa-server-host)# no mschapv2-capable
```

| Related Commands | Command                               | Description  |
|------------------|---------------------------------------|--|
|                  | aaa-server host                       | Identifies a AAA server for a AAA server group.  |
|                  | password-management                   | When you configure the password-management command, the adaptive security appliance notifies the remote user at login that the user's current password is about to expire or has expired. The adaptive security appliance then offers the user the opportunity to change the password. |
|                  | secondary-authentication-server-group | Specifies the secondary AAA server group, which cannot be an SDI server group.   |

# msie-proxy except-list

To configure Microsoft Internet Explorer browser proxy exception list settings for a local bypass on the client PC, enter the **msie-proxy except-list** command in group-policy configuration mode. To remove the attribute from the configuration, use the **no** form of the command.

**msie-proxy except-list {value *server[:port]* | none}**

**no msie-proxy except-list**

## Syntax Description

|                                 |  |
|---------------------------------|--|
| <b>none</b>                     | Indicates that there is no IP address/hostname or port and prevents inheriting an exception list.                            |
| <b>value</b> <i>server:port</i> | Specifies the IP address or name of an MSIE server and port that is applied for this client PC. The port number is optional. |

## Defaults

By default, msie-proxy except-list is disabled.

## Command Modes

The following table shows the modes in which you can enter the command:

|                            | Firewall Mode |             | Security Context |          |        |
|----------------------------|---------------|-------------|------------------|----------|--------|
|                            |               |             |                  | Multiple |        |
| Command Mode               | Routed        | Transparent | Single           | Context  | System |
| Group-policy configuration | •             | —           | •                | —        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

The line containing the proxy server IP address or hostname and the port number must be less than 100 characters long.

## Examples

The following example shows how to set a Microsoft Internet Explorer proxy exception list, consisting of the server at IP address 192.168.20.1, using port 880, for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy except-list value 192.168.20.1:880
hostname(config-group-policy)#
```

## Related Commands

| Command  | Description  |
|--|--|
| <b>show running-configuration group-policy</b> | Shows the value of the configured group-policy attributes. |
| <b>clear configure group-policy</b>            | Removes all configured group-policy attributes.            |

# msie-proxy local-bypass

To configure Microsoft Internet Explorer browser proxy local-bypass settings for a client PC, enter the **msie-proxy local-bypass** command in group-policy configuration mode. To remove the attribute from the configuration, use the **no** form of the command.

**msie-proxy local-bypass {enable | disable}**

**no msie-proxy local-bypass {enable | disable}**

## Syntax Description

|                |   |
|----------------|---|
| <b>disable</b> | Disables Microsoft Internet Explorer browser proxy local-bypass settings for a client PC. |
| <b>enable</b>  | Enables Microsoft Internet Explorer browser proxy local-bypass settings for a client PC.  |

## Defaults

By default, msie-proxy local-bypass is disabled.

## Command Modes

The following table shows the modes in which you can enter the command:

|                            | Firewall Mode |             | Security Context |                  |        |
|----------------------------|---------------|-------------|------------------|------------------|--------|
|                            | Routed        | Transparent | Single           | Multiple Context | System |
| Group-policy configuration | •             | —           | •                | —                | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Examples

The following example shows how to enable Microsoft Internet Explorer proxy local-bypass for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy local-bypass enable
hostname(config-group-policy)#
```

## Related Commands

| Command  | Description  |
|--|--|
| <b>show running-configuration group-policy</b> | Shows the value of the configured group-policy attributes. |
| <b>clear configure group-policy</b>            | Removes all configured group-policy attributes.            |

# msie-proxy lockdown

Enabling this feature hides the Connections tab in Microsoft Internet Explorer for the duration of an AnyConnect VPN session. Disabling the feature leaves the display of the Connections tab unchanged

To hide the Connections tab in Microsoft Internet Explorer for the duration of an AnyConnect VPN session or to leave it unchanged, use the **msie-proxy lockdown** command in group-policy configuration mode.

**msie-proxy lockdown** [**enable** | **disable**]

## Syntax Description

|                |   |
|----------------|---|
| <b>disable</b> | Leaves the Connections tab in Microsoft Internet Explorer unchanged.                                    |
| <b>enable</b>  | Hides the Connections tab in Microsoft Internet Explorer for the duration of an AnyConnect VPN session. |

## Defaults

The default value of this command in the default group policy is enable. Each group policy inherits its default values from the default group policy.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode               | Firewall Mode |             | Security Context |          |        |
|----------------------------|---------------|-------------|------------------|----------|--------|
|                            | Routed        | Transparent | Single           | Multiple |        |
|                            |               |             |                  | Context  | System |
| Group-policy configuration | •             | •           | •                | —        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.2(3)  | This command was introduced. |

## Usage Guidelines

This command makes a temporary change to the user registry for the duration of the AnyConnect VPN session. This registry change hides the Connections tab from both Internet Explorer and the Microsoft Windows Control Panel > Internet Options application. When AnyConnect closes the VPN session, it returns the registry to the state it was in before the session.

You might enable this feature to prevent users from specifying a proxy service and changing LAN settings. Preventing user access to these settings enhances endpoint security during the AnyConnect session.

## Examples

The following example hides the Connections tab for the duration of the AnyConnect session:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy lockdown enable
```

The following example leaves the Connections tab unchanged:

```
hostname(config-group-policy) # msie-proxy lockdown disable
```

| Related Commands | Command                                 | Description  |
|------------------|---|--|
|                  | <b>msie-proxy except-list</b>           | Specifies an exception list of proxy servers for Microsoft Internet Explorer on the client PC.         |
|                  | <b>msie-proxy local-bypass</b>          | Bypasses the local browser proxy settings configured in Microsoft Internet Explorer on the client PC.  |
|                  | <b>msie-proxy method</b>                | Specifies the browser proxy actions for a client PC.   |
|                  | <b>msie-proxy pac-url</b>               | Specifies a URL from which to retrieve a proxy auto-configuration file that defines the proxy servers. |
|                  | <b>msie-proxy server</b>                | Configures proxy server for Microsoft Internet Explorer on the client PC.                              |
|                  | <b>show running-config group-policy</b> | Shows the group policy settings in the running configuration.  |

# msie-proxy method

To configure the browser proxy actions (“methods”) for a client PC, enter the **msie-proxy method** command in group-policy configuration mode. To remove the attribute from the configuration, use the **no** form of the command.

**msie-proxy method** [**auto-detect** | **no-modify** | **no-proxy** | **use-server** | **use-pac-url**]

**no msie-proxy method** [**auto-detect** | **no-modify** | **no-proxy** | **use-server** | **use-pac-url**]

**Note**

See the Usage Guidelines section for qualifications that apply to this syntax.

**Syntax Description**

|                    |   |
|--------------------|---|
| <b>auto-detect</b> | Enables the use of automatic proxy server detection in Internet Explorer or Firefox for the client PC.  |
| <b>no-modify</b>   | Leaves the HTTP browser proxy server setting in the browser unchanged for this client PC.   |
| <b>no-proxy</b>    | Disables the HTTP proxy setting in the browser for the client PC.   |
| <b>use-pac-url</b> | Directs Internet Explorer to retrieve the HTTP proxy server setting from the proxy auto-configuration file URL specified in the <b>msie-proxy pac-url</b> command. This option is valid only for Internet Explorer. |
| <b>use-server</b>  | Sets the HTTP proxy server setting in the browser to use the value configured in the <b>msie-proxy server</b> command.  |

**Defaults**

The default method is use-server.

**Command Modes**

The following table shows the modes in which you can enter the command:

| Command Mode               | Firewall Mode |             | Security Context |          |        |
|----------------------------|---------------|-------------|------------------|----------|--------|
|                            | Routed        | Transparent | Single           | Multiple |        |
|                            |               |             |                  | Context  | System |
| Group-policy configuration | •             | —           | •                | —        | —      |

**Command History**

| Release | Modification                  |
|---------|-------------------------------|
| 7.2(1)  | This command was introduced.  |
| 8.0(2)  | Added the use-pac-url option. |

**Usage Guidelines**

The line containing the proxy server IP address or hostname and the port number can contain up to 100 characters.

The Safari browser does not support auto-detect. The Firefox and Safari browsers support the use of only one of these command options at a time. Microsoft Internet Explorer supports the following combinations of options for this command:

**[no] msie-proxy method no-proxy**

**[no] msie-proxy method no-modify**

**[no] msie-proxy method [auto-detect] [use-server] [use-pac-url]**

You can use a text editor to create a proxy auto-configuration (.pac) file for your browser. A .pac file is a JavaScript file that contains logic that specifies one or more proxy servers to be used, depending on the contents of the URL. The .pac file resides on a web server. When you specify **use-pac-url**, Internet Explorer uses the .pac file to determine the proxy settings. Use the **msie-proxy pac-url** command to specify the URL from which to retrieve the .pac file.

### Examples

The following example shows how to configure auto-detect as the Microsoft Internet Explorer proxy setting for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy method auto-detect
hostname(config-group-policy)#
```

The following example configures the Microsoft Internet Explorer proxy setting for the group policy named FirstGroup to use the server QAsrver, port 1001 as the server for the client PC:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy server QAsrver:port 1001
hostname(config-group-policy)# msie-proxy method use-server
hostname(config-group-policy)#
```

### Related Commands

| Command  | Description   |
|--|---|
| <b>msie-proxy pac-url</b>                      | Specifies a URL from which to retrieve a proxy auto-configuration file.                 |
| <b>msie-proxy server</b>                       | Configures a Microsoft Internet Explorer browser proxy server and port for a client PC. |
| <b>show running-configuration group-policy</b> | Shows the value of the configured group-policy attributes.                              |
| <b>clear configure group-policy</b>            | Removes all configured group-policy attributes.   |

# msie-proxy pac-url

To tell a browser where to look for proxy information, enter the **msie-proxy pac-url** command in group-policy configuration mode. To remove the attribute from the configuration, use the **no** form of the command.

**msie-proxy pac-url** { **none** | **value** *url* }

**no msie-proxy pac-url**

## Syntax Description

|                         |  |
|-------------------------|--|
| <b>none</b>             | Specifies that there is no URL value.  |
| <b>value</b> <i>url</i> | Specifies the URL of the website at which the browser can get the proxy auto-configuration file that defines the proxy server or servers to use. |

## Defaults

The default value is none.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode               | Firewall Mode |             | Security Context |          |        |
|----------------------------|---------------|-------------|------------------|----------|--------|
|                            | Routed        | Transparent | Single           | Multiple |        |
|                            |               |             |                  | Context  | System |
| Group-policy configuration | •             | —           | •                | —        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 8.0(2)  | This command was introduced. |

## Usage Guidelines

### Requirements

To use the proxy auto-configuration feature, the remote user must use the Cisco AnyConnect VPN Client. To enable the use of the proxy auto-configuration URL, you must also configure the **msie-proxy method** command with the **use-pac-url** option.

### Why Use This Command

Many network environments define HTTP proxies that connect a web browser to a particular network resource. The HTTP traffic can reach the network resource only if the proxy is specified in the browser and the client routes the HTTP traffic to the proxy. SSLVPN tunnels complicate the definition of HTTP proxies because the proxy required when tunneled to an enterprise network can differ from that required when connected to the Internet via a broadband connection or when on a third-party network.

In addition, companies with large networks might need to configure more than one proxy server and let users choose between them, based on transient conditions. By using .pac files, an administrator can author a single script file that determines which of numerous proxies to use for all client computers throughout the enterprise.

The following are some examples of how you might use a PAC file:

- Choosing a proxy at random from a list for load balancing.
- Rotating proxies by time of day or day of the week to accommodate a server maintenance schedule.
- Specifying a backup proxy server to use in case the primary proxy fails.
- Specifying the nearest proxy for roaming users, based on the local subnet.

#### How to Use the Proxy Auto-Configuration Feature

You can use a text editor to create a proxy auto-configuration (.pac) file for your browser. A .pac file is a JavaScript file that contains logic that specifies one or more proxy servers to be used, depending on the contents of the URL. Use the **msie-proxy pac-url** command to specify the URL from which to retrieve the .pac file. Then, when you specify **use-pac-url** in the **msie-proxy method** command, the browser uses the .pac file to determine the proxy settings.

#### Examples

The following example shows how to configure a browser to get its proxy setting from the URL [www.mycompanyserver.com](http://www.mycompanyserver.com) for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy pac-url value http://www.mycompanyserver.com
hostname(config-group-policy)#
```

The following example disables the proxy auto-configuration feature for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy pac-url none
hostname(config-group-policy)#
```

#### Related Commands

| Command  | Description   |
|--|---|
| <b>msie-proxy method</b>                       | Configures the browser proxy actions (“methods”) for a client PC.                       |
| <b>msie-proxy server</b>                       | Configures a Microsoft Internet Explorer browser proxy server and port for a client PC. |
| <b>show running-configuration group-policy</b> | Shows the value of the configured group-policy attributes.                              |
| <b>clear configure group-policy</b>            | Removes all configured group-policy attributes.   |

# msie-proxy server

To configure a Microsoft Internet Explorer browser proxy server and port for a client PC, enter the **msie-proxy server** command in group-policy configuration mode. To remove the attribute from the configuration, use the **no** form of the command.

**msie-proxy server** {**value** *server[:port]* | **none**}

**no msie-proxy server**

## Syntax Description

|                                 |  |
|---------------------------------|--|
| <b>none</b>                     | Indicates that there is no IP address/hostname or port specified for the proxy server and prevents inheriting a server.      |
| <b>value</b> <i>server:port</i> | Specifies the IP address or name of an MSIE server and port that is applied for this client PC. The port number is optional. |

## Defaults

By default, no msie-proxy server is specified.

## Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode               | Firewall Mode |             | Security Context |          |        |
|----------------------------|---------------|-------------|------------------|----------|--------|
|                            | Routed        | Transparent | Single           | Multiple |        |
|                            |               |             |                  | Context  | System |
| Group-policy configuration | •             | —           | •                | —        | —      |

## Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

## Usage Guidelines

The line containing the proxy server IP address or hostname and the port number must be less than 100 characters long.

## Examples

The following example shows how to configure the IP address 192.168.10.1 as a Microsoft Internet Explorer proxy server, using port 880, for the group policy named FirstGroup:

```
hostname(config)# group-policy FirstGroup attributes
hostname(config-group-policy)# msie-proxy server value 192.168.21.1:880
hostname(config-group-policy)#
```

## Related Commands

| Command  | Description  |
|--|--|
| <b>show running-configuration group-policy</b> | Shows the value of the configured group-policy attributes. |
| <b>clear configure group-policy</b>            | Removes all configured group-policy attributes.            |

# mtu

To specify the maximum transmission unit for an interface, use the **mtu** command in global configuration mode. To reset the MTU block size to 1500 for Ethernet interfaces, use the **no** form of this command. This command supports IPv4 and IPv6 traffic.

```
mtu interface_name bytes

no mtu interface_name bytes
```

Syntax Description

|                       |   |
|-----------------------|---|
| <i>bytes</i>          | Number of bytes in the MTU; valid values are from 64 to 65,535 bytes. |
| <i>interface_name</i> | Internal or external network interface name.                          |

Defaults

The default *bytes* is 1500 for Ethernet interfaces.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | —             | •           | •                | •        | —      |

Command History

| Release     | Modification                  |
|-------------|-------------------------------|
| Preexisting | This command was preexisting. |

Usage Guidelines

The **mtu** command lets you to set the data size that is sent on a connection. Data that is larger than the MTU value is fragmented before being sent.

The adaptive security appliance supports IP path MTU discovery (as defined in RFC 1191), which allows a host to dynamically discover and cope with the differences in the maximum allowable MTU size of the various links along the path. Sometimes, the adaptive security appliance cannot forward a datagram because the packet is larger than the MTU that you set for the interface, but the “don’t fragment” (DF) bit is set. The network software sends a message to the sending host, alerting it to the problem. The host has to fragment packets for the destination so that they fit the smallest packet size of all the links along the path.

The default MTU is 1500 bytes in a block for Ethernet interfaces (which is also the maximum). This value is sufficient for most applications, but you can pick a lower number if network conditions require it.

When using the Layer 2 Tunneling Protocol (L2TP), we recommend that you set the MTU size to 1380 to account for the L2TP header and IPSec header length.

---

**Examples**

This example shows how to specify the MTU for an interface:

```
hostname(config)# show running-config mtu
mtu outside 1500
mtu inside 1500
hostname(config)# mtu inside 8192
hostname(config)# show running-config mtu
mtu outside 1500
mtu inside 8192
```

---

**Related Commands**

| Command                        | Description   |
|--------------------------------|---|
| clear configure mtu            | Clears the configured maximum transmission unit values on all interfaces. |
| <b>show running-config mtu</b> | Displays the current maximum transmission unit block size.                |

# multicast boundary

To configure a multicast boundary for administratively-scoped multicast addresses, use the **multicast boundary** command in interface configuration mode. To remove the boundary, use the **no** form of this command. A multicast boundary restricts multicast data packet flows and enables reuse of the same multicast group address in different administrative domains.

**multicast boundary** *acl* [**filter-aurorp**]

**no multicast boundary** *acl* [**filter-aurorp**]

Syntax Description

|                      |  |
|----------------------|--|
| <i>acl</i>           | Specifies an access list name or number. The access list defines the range of addresses affected by the boundary. Use only standard ACLs with this command; extended ACLs are not supported. |
| <b>filter-aurorp</b> | Filters Auto-RP messages denied by the boundary ACL. If not specified, all Auto-RP messages are passed.  |

Defaults

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode            | Firewall Mode |             | Security Context |          |        |
|-------------------------|---------------|-------------|------------------|----------|--------|
|                         | Routed        | Transparent | Single           | Multiple |        |
|                         |               |             |                  | Context  | System |
| Interface configuration | •             | —           | •                | —        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.2(1)  | This command was introduced. |

Usage Guidelines

Use this command to configure an administratively scoped boundary on an interface to filter multicast group addresses in the range defined by the *acl* argument. A standard access list defines the range of addresses affected. When this command is configured, no multicast data packets are allowed to flow across the boundary in either direction. Restricting multicast data packet flow enables reuse of the same multicast group address in different administrative domains.

If you configure the **filter-aurorp** keyword, the administratively scoped boundary also examines Auto-RP discovery and announcement messages and removes any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary ACL. An Auto-RP group range announcement is permitted and passed by the boundary only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

## Examples

The following example sets up a boundary for all administratively scoped addresses and filters the Auto-RP messages:

```
hostname(config)# access-list boundary_test deny 239.0.0.0 0.255.255.255
hostname(config)# access-list boundary_test permit 224.0.0.0 15.255.255.255
hostname(config)# interface GigabitEthernet0/3
hostname(config-if)# multicast boundary boundary_test filter-autorp
```

## Related Commands

| Command                  | Description   |
|--------------------------|---|
| <b>multicast-routing</b> | Enables multicast routing on the adaptive security appliance. |

# multicast-routing

To enable IP multicast routing on the adaptive security appliance, use the **multicast routing** command in global configuration mode. To disable IP multicast routing, use the **no** form of this command.

**multicast-routing**

**no multicast-routing**

Syntax Description

This command has no arguments or keywords.

Defaults

The **multicast-routing** command enables PIM and IGMP on all interfaces by default.

Command Modes

The following table shows the modes in which you can enter the command:

| Command Mode         | Firewall Mode |             | Security Context |          |        |
|----------------------|---------------|-------------|------------------|----------|--------|
|                      | Routed        | Transparent | Single           | Multiple |        |
|                      |               |             |                  | Context  | System |
| Global configuration | •             | —           | •                | —        | —      |

Command History

| Release | Modification                 |
|---------|------------------------------|
| 7.0(1)  | This command was introduced. |

Usage Guidelines

The **multicast-routing** command enables PIM and IGMP on all interfaces.

Note

PIM is not supported with PAT. The PIM protocol does not use ports and PAT only works with protocols that use ports.

If the security appliance is the PIM RP, use the untranslated outside address of the security appliance as the RP address.

The number of entries in the multicast routing tables are limited by the amount of RAM on the system. [Table 19-3](#) lists the maximum number of entries for specific multicast tables based on the amount of RAM on the security appliance. Once these limits are reached, any new entries are discarded.

Table 19-3 Entry Limits for Multicast Tables

| Table       | 16 MB | 128 MB | 128+ MB |
|-------------|-------|--------|---------|
| MFIB        | 1000  | 3000   | 5000    |
| IGMP Groups | 1000  | 3000   | 5000    |
| PIM Routes  | 3000  | 7000   | 12000   |

**Examples**

The following example enables IP multicast routing on the adaptive security appliance:

```
hostname(config)# multicast-routing
```

**Related Commands**

| Command     | Description                   |
