

AsyncOS for Web 7.1.4

Build 7.1.4-055

Known Limitations Fixed in Hot Patch 1

Fixed: CPU usage is 100% when an HTTPS server requests a client certificate after an SSL handshake

Previously, the CPU usage was 100% because the Web Proxy entered an infinite loop after an HTTPS server requested a client certificate after the SSL handshake. This no longer occurs, and instead the Web Proxy returns a gateway timeout error. To prevent the gateway timeout error, create a custom URL category and define a Decryption Policy to pass through transactions in the custom URL category. [Defect ID: 53901]
