CISCO

SBA

SMART BUSINESS ARCHITECTURE

August 2012 Series

## Preface

### **Who Should Read This Guide**

This Cisco® Smart Business Architecture (SBA) guide is for people who fill a variety of roles:

- Systems engineers who need standard procedures for implementing solutions
- Project managers who create statements of work for Cisco SBA implementations
- Sales partners who sell new technology or who create implementation
   documentation
- Trainers who need material for classroom instruction or on-the-job training

In general, you can also use Cisco SBA guides to improve consistency among engineers and deployments, as well as to improve scoping and costing of deployment jobs.

#### **Release Series**

Cisco strives to update and enhance SBA guides on a regular basis. As we develop a series of SBA guides, we test them together, as a complete system. To ensure the mutual compatibility of designs in Cisco SBA guides, you should use guides that belong to the same series.

The Release Notes for a series provides a summary of additions and changes made in the series.

All Cisco SBA guides include the series name on the cover and at the bottom left of each page. We name the series for the month and year that we release them, as follows:

#### month year Series

For example, the series of guides that we released in August 2012 are the "August 2012 Series".

You can find the most recent series of SBA guides at the following sites:

Customer access: http://www.cisco.com/go/sba

Partner access: http://www.cisco.com/go/sbachannel

#### **How to Read Commands**

Many Cisco SBA guides provide specific details about how to configure Cisco network devices that run Cisco IOS, Cisco NX-OS, or other operating systems that you configure at a command-line interface (CLI). This section describes the conventions used to specify commands that you must enter.

Commands to enter at a CLI appear as follows:

configure terminal

Commands that specify a value for a variable appear as follows:

ntp server 10.10.48.17

Commands with variables that you must define appear as follows:

class-map [highest class name]

Commands shown in an interactive example, such as a script or when the command prompt is included, appear as follows:

#### Router# enable

Long commands that line wrap are underlined. Enter them as one command:

wrr-queue random-detect max-threshold 1 100 100 100 100 100

100 100 100

Noteworthy parts of system output or device configuration files appear highlighted, as follows:

interface Vlan64

ip address 10.5.204.5 255.255.25.0

#### **Comments and Questions**

If you would like to comment on a guide or ask questions, please use the SBA feedback form.

If you would like to be notified when new comments are posted, an RSS feed is available from the SBA customer and partner pages.

## What's In This SBA Guide

### **Cisco SBA Borderless Networks**

Cisco SBA helps you design and quickly deploy a full-service business network. A Cisco SBA deployment is prescriptive, out-of-the-box, scalable, and flexible.

Cisco SBA incorporates LAN, WAN, wireless, security, data center, application optimization, and unified communication technologies—tested together as a complete system. This component-level approach simplifies system integration of multiple technologies, allowing you to select solutions that solve your organization's problems—without worrying about the technical complexity.

Cisco SBA Borderless Networks is a comprehensive network design targeted at organizations with up to 10,000 connected users. The SBA Borderless Network architecture incorporates wired and wireless local area network (LAN) access, wide-area network (WAN) connectivity, WAN application optimization, and Internet edge security infrastructure.

### **Route to Success**

To ensure your success when implementing the designs in this guide, you should first read any guides that this guide depends upon—shown to the left of this guide on the route below. As you read this guide, specific prerequisites are cited where they are applicable.

### **About This Guide**

This *deployment guide* contains one or more deployment chapters, which each include the following sections:

- Business Overview—Describes the business use case for the design. Business decision makers may find this section especially useful.
- Technology Overview—Describes the technical design for the business use case, including an introduction to the Cisco products that make up the design. Technical decision makers can use this section to understand how the design works.
- **Deployment Details**—Provides step-by-step instructions for deploying and configuring the design. Systems engineers can use this section to get the design up and running quickly and reliably.

You can find the most recent series of Cisco SBA guides at the following sites:

Customer access: http://www.cisco.com/go/sba

Partner access: http://www.cisco.com/go/sbachannel

## Introduction

One of the most profound advances in modern networks is the degree of mobility those networks support. Users can move around wirelessly inside the campus and enjoy the same degree of connectivity as if they were plugged in using cables in their offices. Users can leave their primary networks completely and work from a home-office environment that offers the same connectivity and user experience as they would get in their offices. Users also have the option of being truly mobile and connecting from any place that offers Internet access. With smartphones and tablets, this mobility now commonly includes connecting while travelling down the highway or on a train. This guide describes business-use cases related to the truly mobile users who use a laptop, smartphone, or tablet device to connect through infrastructure that is not provided by their organizations. The guide does not cover use cases related to campus wireless access or home teleworker solutions.

#### **Business Overview**

As users move outside the boundaries of the traditional network, their requirements for access to job-related data, such as email, calendars, and more, don't change. To be productive, the network needs to allow users access wherever they are to whatever data they need to accomplish their tasks, from any device the organization allows. At the same time, the network must ensure that all access is secure and appropriate and that it follows organizational guidelines.

Mobile remote users connect using devices that can generally be broken down into two categories: laptop computers and the new group of mobile devices, such as smartphones and tablets. Networks have handled laptops for years. The newer mobile devices are being integrated currently. This integration continues to challenge network design and administration.

An organization's network must meet many requirements today that are sometimes contradictory. The network must be secure and prevent unauthorized access while being open enough to allow users to do their jobs regardless of where they are. As the mobility of users has increased, the requirements the network must meet have increased. In the past, a worker might have needed laptop connectivity while at the office or at home. Today, a worker needs access to the network from a smartphone while traveling, from a laptop while on site at a customer's or partner's office, or from both while sitting in the local coffee shop. And although providing this access is the primary requirement for the network, other requirements, such as ease of use and security, have not been relaxed.

Because these mobile users are outside the traditional perimeter (or physical border) of the network, their devices are exposed to potentially more malicious activity than a device that is located inside the protection of the network. So protection of the end device and the data being accessed and stored is critical. The mobile user's device needs to have protection from things such as malware and viruses. Ideally, this protection occurs even if the device is not connected to the headquarters network or if such a connection isn't possible. Because many mobile devices are smaller and are used much more often than a laptop, they are also more easily lost or stolen. In today's security environment where these devices potentially carry the same information that a laptop might, there is a need to protect the data on the devices and prevent unauthorized users from retrieving it.

As a standard part of their processes and guidelines, many organizations are required to control what sites users access on the Internet while they are using organizational resources. Providing this level of control for mobile users who do not reside within the boundaries of the network is challenging. To provide a complete solution, the network enforces standard access guidelines on the device, whether the device resides inside the headquarters or is connecting from a coffee shop. The end users should have similar experiences inside or outside the traditional network perimeter. They should also receive the same protection from malware whether they are inside the network or outside.

An often-overlooked component of access is ease of use. Having to check whether a secure connection is needed and enabled and having to constantly enter user credentials on a mobile device to enable a secure connection might make users look for ways to bypass the solution. Thus, a solution that is as integrated and seamless as possible doesn't impact users, hamper their day-to-day activities, or reduce their productivity as significantly. As part of ease of use, the solution should be automated as much as the platform allows, preventing users from either forgetting to follow the procedure or specifically trying to bypass procedures because they feel the procedures are restrictive.

As more users move outside the boundaries of the network, a corresponding increase in network load occurs on the organization's Internet connection. This can raise costs. Intelligent routing of traffic is a priority to control which traffic from a user has to go through the Internet edge component of the organization's network and which traffic can be kept out on the Internet.

August 2012 Series

Reducing security on this traffic is not an option that is readily available, Traffic destined for the Internet that has to be brought back to the Internet edge for security inspection increases bandwidth usage and load on the Internet edge design while increasing latency on user connections.

### **Technology Overview**

The Cisco Smart Business Architecture (SBA) Internet edge design provides the basic framework for the enhancements and additions that will be discussed in this guide. A prerequisite for using this deployment guide is that you must have already followed the guidance in the *Remote Access VPN Deployment Guide*, which itself builds upon the *Firewall and IPS Deployment Guide*. The *Internet Edge Design Overview* describes the goals of the overall design and how the pieces interact together.

Mobile remote users connect to their organization's network by using devices that generally fall into two categories: laptops and mobile devices such as smartphones and tablets. Because the devices operate and are used differently, the capabilities currently available for each group differ.

The Internet edge design covers remote access (RA) VPN for laptops running the Cisco AnyConnect Secure Mobility Solution client (for SSL VPN or IP Security [IPsec] connections). A feature built into the Cisco AnyConnect 3.0 client is the ability to interface with the Cisco ScanSafe Cloud Web Security service. This feature gives the Cisco AnyConnect client the ability to let Internet web traffic go out through a Cisco ScanSafe proxy directly to the destination without forcing it through the organization's headend. Without Cisco ScanSafe, the traffic must be routed down the VPN tunnel, inspected at the campus Internet edge, and then redirected to the original destination; this process consumes bandwidth and potentially increases user latency. With Cisco ScanSafe, the connection can be proxied through the Cisco ScanSafe cloud and never has to traverse the VPN tunnel. Figure 1 - Traffic flow through VPN tunnel and Cisco ScanSafe Cloud

Other capabilities for the Cisco AnyConnect 3.0 client include features that allow the client to reconnect if the tunnel goes down, to disable the tunnel if the client moves onto the trusted network, or to bring up the tunnel if the client moves from a trusted to an untrusted network. These features make using the client more seamless and friendly because users don't have to manually bring up the VPN tunnel. Users are prompted for credentials when the tunnel is needed, and the tunnel is brought down when it isn't needed. Mobile devices typically use a different deployment model in which basic services, such as mail, calendar, and contacts, are provided over Microsoft ActiveSync, which gives quick access to these commonly used services. For access to other services, including voice, video, internally hosted web servers, file shares, or other network services, a VPN tunnel is required.

Mobile devices such as the iPhone and iPad and some Android devices have access to the Cisco AnyConnect 2.5 client, which allows SSL VPN connectivity (check the app store for the device in question for availability). Using Cisco AnyConnect to connect the device to the corporate network provides full access to the internal network.

This document covers the additional configuration for remote access VPN for the Cisco AnyConnect 3.0 client that is required to activate Cisco ScanSafe Web Security, Always On, and other features. It also covers interaction with the Cisco ScanSafe Cloud management tool, ScanCenter. Last, the document covers configuration of Cisco Adaptive Security Appliance (ASA) to support mobile devices like smartphones and tablets and the configuration of the Cisco AnyConnect client for those devices that is required to let them connect to Cisco ASA.

#### Notes

## **Deployment Details**

The first part of the deployment details describes how to configure the components to enable Cisco ScanSafe Cloud Web Security service for Cisco AnyConnect 3.0 users that connect with laptop devices. The second part of the deployment details describes how to configure access for mobile devices with ActiveSync. The third part describes how to configure access for mobile devices with the Cisco AnyConnect client.

#### Process

Configuring Access for Laptop Devices

- 1. Enable ScanSafe security configuration
- 2. Configure Beacon Server on LAN
- 3. Configure ASA VPN policy for web security
- 4. Configure ASA AnyConnect group policies
- 5. Test the current configuration
- 6. Test Beacon Server functionality
- 7. Configure Trusted Network Detection
- 8. Test Trusted Network Detection
- 9. Install the certificate on the client
- 10. Enable Always On
- 11. Test the Always On setting

**Enable ScanSafe security configuration** 

This guide assumes you have purchased a Cisco ScanSafe license and created a Cisco ScanSafe account that allows a user to log in and administer the account.

It also assumes that you have different groups built in Active Directory (AD) to allow differentiation based on those groups.

**Step 1:** In the Cisco ScanSafe ScanCenter Portal, after logging in with administrator rights, navigate to the following location:

https://scancenter.scansafe.com

Step 2: Navigate to Admin > Management > Groups.

### Tech Tip

Policy can differ based on organizational requirements. Windows Active Directory (AD) groups are the default method of applying policy in Cisco ScanSafe. Administrators will define one or more AD groups in the ScanCenter tool to which users belong. Policy can then be applied to one of the defined groups or the default group, which consists of users not in one of the defined groups.

💿 ScanCenter 💩	a@cisco.com logged into: Cisco_Smart Business Architecture Group	Logout   Help   Contact Us 🏼 🏹 ScanSaf
	Home Dashboard Web Virus Spyware Web Filtering	g Email Admin - Reports - Supp
Your account   Authentication	n 🕙 Management 🔍 Reports 💽	
Manage Groups		
	h, add or delete groups	
Sear	rch: Search	Reload list 🚱
Grou	up Name	Delete
WinN	IT://CISCO\Enterprise Operators	
WinN	IT://CISCO/Network Device Admins	
WinN	IT://CISCO\vpn-user	

A company-wide proxy authentication license key is generated for use in the Cisco ASA VPN configuration.

#### Step 3: Navigate to Authentication > Company Key.

🖻 ScanCe	nter 🕳	logged into: Cisco_Smart Business /	Architecture Group		Logou	it Help Con	tact Us 🛛 🗸 S	canSafe
	Home	Dashboard - Web Viru	s Spyware	- Web Filtering	Email	Admin	Reports	Support
Your account	Company Key Group Keys User Keys, thentication k Email Messages	anagement   Reports  rey for Cisco_Smart Business A t Business Architecture Group	•	p				
		Dea	tivate Revoke					

**Step 4:** Click **Create Key**. Cisco ScanSafe generates a key that it sends to an email address of your choosing.

Write this key down because it cannot be rebuilt and can only be replaced with a new key. After it is displayed the first time (on generation) and sent in email, you can no longer view it in ScanCenter. After this key is generated, the page options change to Deactivate or Revoke.

#### Step 5: Navigate to Web Filtering > Management > Filters.

**Step 6:** Edit the filter called **default** to reference the Pornography, Sports and Recreation, and Gambling categories, and then click **Save**.

**Step 7:** Create a new filter called **VPN\_Users** that references the Sports and Recreation category, and then click **Save**.

Step 8: Create a filter called Admins that references Sports, and then click Save.

#### Step 9: Navigate to Management > Policy.

Step 10: Click Default, change the rule action to Allow, and then click Save.

**Step 11:** Create a rule called **All\_Users** with a rule action of **Block**. Assign the filter **default** to this rule. This blocks all access to porn, gambling, or sports sites.

Step 12: Create a rule called VPN\_Users with a rule action of WARN.

Step 13: Under Define Group, select the vpn-user domain group.

Step 14: Under Define Filters, select VPN\_Users, and then click Create Rule.

Step 15: Create a rule called Admins with a rule action of Allow.

Step 16: Under Define Group, select the Network Device Admin domain group.

Step 17: Under Define Filters, select Admins, and then click Create Rule.

Step 18: Click Active on all rules, and then click Apply Changes.

Because all rules are evaluated on a first-hit rule, the following is the correct order for the rules in this example:

- 1. Admins (which allows anyone matching this rule access to sports sites)
- VPN\_Users (which allows this group access to sports sites but with a warning)
- 3. All\_Users (which blocks sports, gambling, and pornography sites)
- 4. Default (which permits all other sites to all groups)

#### **Procedure 2**

#### **Configure Beacon Server on LAN**

In this procedure, you install and configure the Beacon Server software on a server in the inside network. This server should be accessible from anywhere in the network. Access to this server will tell the Cisco AnyConnect client that it currently resides inside the network and that the Web Security module does not need to run. You will configure Beacon Server to not accept connections from hosts with specific IP addresses where you wish the Web Security module to always run (for example, when the host is connected from outside the network through RA VPN and is assigned an address from the RA VPN pool).

Step 1: On an internal server that is reachable from anywhere in the organization, in the Cisco ScanSafe ScanCenter, navigate to Admin > Downloads > Secure Mobility.

Your account	Authentication ( Management ( Audit ( Downloads (		
Secure Mobility			
Secure Hobility	Select a file to download		
	File name and description		
	Beacon Server	Download 📩	
	Release Note for the current version	Download 📩	
	AnyConnect Web Security Mac Installation Package	Download 📩	2
	Anyconnect Profileeditor (Windows)	Download 📩	r42.
	AnyConnect Web Security Windows Installation Package	Download 📩	
	Sample transforms and documentation	Download 📩	
	an Bruno, CA 94066 ScanSafe EMEA - Qube, 90 Whitfield Street, London W1T 4EZ, United Kingdom		

#### Step 2: Select Beacon Server, and then click Download.

**Step 3:** Expand the downloaded package by using a .zip program. Inside the package, you will find OpenSSL.

**Step 4:** In the folder containing the openssl.exe program, from a command prompt on the Windows server, type the following.

openssl	geni	rsa -	-out DO	Lprv	.pem 1	1024			
openssl	rsa	-in	DOLprv	.pem	-out	DOLpub.	pem	-outform	PEM
-pubout									

**Step 5:** Copy the DOLprv.pem file to the folder containing the BeaconServer.msi file.

**Step 6:** Copy the DOLpub.pem file to the device running Cisco Adaptive Security Device Manager (ASDM).

**Step 7:** In the package, in the Beacon Server directory, double-click the Beacon Server.msi file.

**Step 8:** Right-click the Windows Taskbar icon, and set preferences for Beacon Server.

**Step 9:** In the Disallowed IP Addresses box, enter the addresses used for remote access VPN.

Beacon Server Configuration	×
Listening TCP Port	5001
Errant connections cleanup timeout (secs)	10
Disallowed IP Addresses (semi-colon separated)	10.4.28.0/22
	OK Cancel
Procedure 3 Configure AS	SA VPN policy for web security

Step 1: Open ASDM connected to the RA VPN firewall.

Step 2: In Configuration > Remote Access VPN > Network (Client) Access > AnyConnect Client Profiles, select Add.

Step 3: On the Add AnyConnect Client Profile dialog box, in the Profile Name box, enter web\_security\_profile.

Step 4: In the Profile Usage list, choose Web Security, and then click OK.

ø	Add AnyConne	ect Client Profile	×
	Profile Name	web_security_profile

			Upload
	Group Policy	<unassigned></unassigned>	
		Enable 'Always On VPN' for selected group	
L		OK Cancel Help	

**Step 5:** Select the newly created web\_security\_profile profile, and then click **Edit**.

**Step 6:** In the Scanning Proxy section, write down the IP addresses of the different proxies. You can also use the Default Scanning Proxy drop-down list to choose a default proxy location that best matches your location.

**Step 7:** Under Authentication, in the Proxy Authentication License Key box, enter the key for your company-wide group.

**Step 8:** In the Service Password box, enter a new password that will be associated with the Web Security service when the service is running on the end host.

**Step 9:** In the Use Enterprise Domains box, enter the domain information to which you wish to apply policy and click **Add**.

**Step 10:** From the Web Security menu, choose **Preferences**, and then do the following:

- 1. If your organization allows users to control use of web security functions, select **User Controllable**.
- 2. Select Automatic Scanning Proxy Selection.
- 3. Select Beacon Check.
- 4. Click **Browse** for the **Public Key File**, and then navigate to the public key file (DOLpub.pem) you copied in "Configure Beacon Server on LAN" earlier in this guide .
- 5. In the **New Beacon Address** field, enter the address of the server on which the Beacon Server software was installed.

	OK Cancel Help	

Step 11: Click OK, and then Apply.

Procedure 4

**Configure ASA AnyConnect group policies** 

Step 1: In ASDM, navigate to Configuration > Remote Access VPN > Network Client Access > Group Policies, select the GroupPolicy\_ AnyConnect policy, and then click Edit.

Step 2: Under Advanced, select Split Tunneling.

Step 3: Next to Policy, clear the Inherit check box, and then choose Exclude Network List Below.

Step 4: Next to Network List, clear the Inherit check box, and then click Manage.

**Step 5:** In **ACL Manager**, click **Add**, and then select **Add ACL**. Use Scansafe\_Tower\_Exclude for the ACL name.

Step 6: Select the ACL you just created, and then click Add > Add ACE.

**Step 7:** For the address, add each Cisco ScanSafe scanning proxy address from Step 6 of "Configure ASA VPN policy for web security" earlier in this guide into its own access control entry (ACE), and then click **OK**.

This step configures the Cisco AnyConnect client to allow split tunneled traffic destined to each of the Cisco ScanSafe proxy addresses. All other traffic is sent down the VPN tunnel to the main site.

🕂 Add	- 🗹 Edit 前 Delete 🛉	🗲   👗 🖻 🛍	<b>v</b>

Step 12: Click OK, and then Apply.

**Test the current configuration** 

**Step 1:** Open a browser on a client, and then navigate to the following outside IP address of the RA VPN ASA: https://ie-asa5545.cisco.local

**Step 2:** Log in using a known username and password that is part of the vpn-user group in Windows AD. If Cisco AnyConnect 3.0 is not installed, the client downloads and installs it.

	Login
Please enter you	r username and password.
GROUP:	AnyConnect 🔻
USERNAME:	employee1
PASSWORD:	•••••
	Login

**Step 3:** When connected, click the Cisco AnyConnect taskbar icon. This displays the client information panel.

CISCO Secure Mobility Client
VPN: Connected to VPN-ASA5525. VPN-ASA5525  Disconnect
Web Security: Enabled (US West Coast)
Advanced

**Step 4:** Verify there is a green check box next to both VPN and Web Security.

**Step 5:** Click **Disconnect**, and then verify that Web Security remains enabled.

#### Procedure 6 Test Beacon Server functionality

**Step 1:** Select a client that is connected outside the network and has the Web Security module enabled, and then move that client inside the network.

When the client is inside, it should be getting a DHCP address that is not part of the address space defined in the Beacon Server configuration. The client can now make a connection to Beacon Server. The ability to connect to Beacon Server successfully tells the Cisco AnyConnect client that the client is inside and that the Web Security module should not be run because the client is on a trusted network. The host's web connections to external websites are now secured by the organization's Internet edge devices and policy

#### Procedure 7

#### **Configure Trusted Network Detection**

The Always On setting allows an administrator to enforce that if a laptop is outside the network and has connectivity, a VPN connection to the headend occurs and all connections go through the main site, where security policy can be applied. If the device cannot connect to the VPN, then no connections will be allowed.

If policy enforcement is not the end-use case, but instead ease of use is the end goal, then enabling the Auto Connect on Start, Auto Reconnect, and Automatic VPN Policy features that define a trusted network satisfy many requirements without applying strict enforcement that the VPN tunnel be up at all times if network access to Cisco ASA is available. Enabling these features makes access to the internal network more seamless to the end user and presents less opportunity for end users to forget to bring up their VPN tunnel while working remotely or to attempt to bring up the VPN tunnel while on the internal network.

To identify whether a device is on the trusted network, before a VPN tunnel is enabled, the client checks either for a trusted DNS domain or DNS server. If a trusted DNS domain or DNS server can be reached, then the client is on the trusted domain, and no VPN tunnel is needed. If not, then the VPN tunnel is needed to access internal resources.

Step 1: Navigate to ASDM > Configuration > Remote Access VPN > Network (Client) Access > AnyConnect Client Profile, select ra\_profile, and then click Edit.

Step 2: In Preferences (Part 1), select Auto Connect On Start and Auto Reconnect, and, if policy permits, select User Controllable. In the Auto Reconnect Behavior list, ensure ReconnectAfterResume is chosen.

AnyConnect Client Profile Edite	or - ra_profile		×

Step 6: Click OK, and then click Apply.

Procedure 8

**Test Trusted Network Detection** 

Test the configuration to ensure that Trusted Network Detection is functional and that the VPN client attempts to start at startup if needed or when the client moves outside the network.

**Step 1:** On a laptop outside the network, connect the VPN to Cisco ASA.

**Step 2:** Move the client into the internal network, and establish a network connection again. The client should identify that it is on a trusted network and that the VPN is not required (the Web Security check box should also be disabled because the client is on the trusted network).

	CISCO Secure Mobility Client	
	VPN: On a trusted network.	Connect
I	Web Security: On a trusted net	work.
	Advanced	

Step 3: Move the client back outside the network.

**Step 4:** At the VPN connect prompt, enter the credentials, and then verify that VPN and Web Security are enabled and the check boxes are green.

#### Procedure 9

Install the certificate on the client

As described in the *Remote Access VPN Deployment Guide*, a self-signed certificate is generated and applied to Cisco ASA's outside interfaces. Because the certificate used in the lab is self-signed, all clients generate an error until the certificate is manually added to the trusted certificates. Certificates signed by a public certificate authority (CA) don't need to be manually added.

Because some of the features configured later in this guide involve automatic certificate checking, it isn't acceptable to have the errors show up when self-signed certificates are used. This procedure solves the error problems.

Publicly signed certificates do not have these issues and are easier to use in practice.

**Step 1:** On a client located outside the network, open a web browser (this procedure details the process for Internet Explorer), and go to the Cisco ASA address:

https://vpn-asa5525.cisco.local

The first page reports a problem with the certificate.

#### Step 2: Click Continue to this website.

Step 3: On the next page, in the URL bar, click Certificate Error.

Step 4: Select View Certificate.

**Step 5:** At the bottom of the **Certificate** page, select **Install Certificate**. When the Certificate Import Wizard opens, click **Next**.

Step 6: Select Place all Certificates in the following store, and then click Browse.

Step 7: Select Trusted Root Certification Authorities, and then click OK.

Step 8: Click Next, and then click Finish.

Step 9: Accept the security warning and install the certificate.

#### Tech Tip

When outside a lab environment, be very careful when installing certificates; after they are installed, they are implicitly trusted by the client. Publicly signed certificates do not have to be manually trusted.

Step 10: In the Certificate window, click OK.

**Step 11:** Close and relaunch the browser, and then navigate to the following location:

#### https://vpn-asa5525.cisco.local

The SSL VPN Service page loads without any certificate warnings or errors.

Procedure 10 Enable Always On
Tech Tip
If an incorrect Always On configuration is pushed to the client, it is likely that the Cisco AnyConnect software will need to be unin- stalled from the client and then reinstalled after the configuration is fixed.

Step 1: In ASDM, navigate to Configuration > Remote Access VPN > Network Client Access > AnyConnect Client Profile, select ra\_profile, and then click Edit.

Step 2: In Preferences (Part 2), select Always On and Allow VPN Disconnect.

Collect diagnostic information for all installed components. Diagnostics	Administrative Domain: 172.16.130.122 Status: Unconfirmed Appliance: Not Available Reset Export Stats

Step 4: Click OK, and then click Apply.

**Step 1:** Connect a client, click the AnyConnect icon in the Windows Taskbar, and then click **Advanced**.

**Step 3:** With the client disconnected, check that **VPN Connection Required** appears on the Cisco AnyConnect screen. Browse to a known good website. It should fail because no access is allowed without the VPN tunnel being up.

#### Process

Configuring Access for Mobile Devices: ActiveSync

- 1. Configure the DMZ firewall
- 2. Configure ActiveSync access on Cisco ASA
- 3. Configure additional security

The first step in providing access for mobile devices like smartphones and tablets is providing email, calendar, and contacts availability. This is a basic requirement and for some users might be enough access. For those users that need or want full tunnel access or for those users connecting on more powerful devices such as tablets, full access can be achieved using SSL VPN in some cases or through the built-in IPsec client. Full access is needed for things such as internal file shares, internal web servers for employee directories, any other internally hosted web applications, or other services such as voice or video.

To this end, most administrators deploy Microsoft ActiveSync on a Microsoft Internet Security and Acceleration (ISA) server in their demilitarized zones (DMZs). ActiveSync connects to the Microsoft Exchange system internally. This setup can provide access to email, calendars, and contacts from a wide variety of mobile devices, including devices that run the Android, iOS, and Windows Mobile operating systems.

The steps in this guide assume that the setup and configuration of ISA, Exchange, and ActiveSync is complete and functional. This process discusses the configuration of Cisco ASA to support such a deployment as well as additional security steps to help improve the overall security of such a deployment.

#### **Procedure 1**

**Configure the DMZ firewall** 

A new DMZ will host the ISA server and allow incoming connections from the outside to the ISA server. It will also allow the ISA server to connect to inside resources as required. Configuration of Cisco ASA and the DMZ switch must be updated.

Step 1: Open ASDM, and then navigate to Configuration > Device Setup > Interfaces.

Step 2: Click Add to create a new DMZ interface, and then enter the required data.

🔁 Add Interface	×
General Advanced IPv6	
Hardware Port: GigabitEthernet0/1 💌	
VLAN ID: 1122	
Subinterface ID: 1122	
Interface Name: dmz-isa

Dedicate this interface to management only	
Channel Group:	
✓ Enable Interface	
IP Address	
Use Static IP Obtain Address via DHCP Use PPPoE     Use PPPoE	
IP Address: 192.168.22.1	
Subnet Mask: 255.255.255.0	
Description: Interface to the ISA DMZ	
OK Cancel Help	

Step 3: Click OK, and then click Apply.

## Step 4: Navigate to Configuration > Device Management > High Availability > Failover.

**Step 5:** Edit the dmz-isa line to include the standby IP address for the interface: **192.168.22.2**.

**Step 6:** On the DMZ switch, add the appropriate VLAN to the trunk ports that connect to the appliances.

Primary appliance

interface GigabitEthernet1/0/24

switchport trunk allowed vlan add 1122

Secondary appliance

interface GigabitEthernet2/0/24
switchport trunk allowed vlan add 1122

Procedure 2

**Configure ActiveSync access on Cisco ASA** 

To allow ActiveSync to work through an external firewall, two things must be done. The first is building a Network Address Translation (NAT) translation for the ISA server to the outside network. The second is allowing the needed connections to traverse the firewall. Allowing the connections to traverse the firewall includes outside hosts making connections to the ISA server, and also the ISA server making connections to the Exchange server.

This configuration is performed on the Cisco ASA firewall that controls access to the network and contains the DMZ where the ISA server resides.

Step 1: Open ASDM, and then navigate to Configuration > Firewall > Objects > Network Objects/Groups

Step 2: Click Add > Network Object.

**Step 3:** On the **Add Network Object** dialog box, enter a name for this object for the ISA server, enter the IP address of the ISA server on the outside ISP, and then click **OK**.

付 Edit Network	Object	x
Name:	dmz-isa-ISPa	_
Type:	Host	•
IP Address:	172.16.130.55	
Description:	ISA Server outside ISP A address	
NAT		<b>&gt;</b>
	OK Cancel Help	

Step 4: Navigate to Configuration > Firewall > NAT Rules, and then click Add Network Object NAT rule. This creates the NAT object that ties the external address to the actual address of the ISA server in the DMZ.

**Step 5:** Enter the object name to be used to reference the ISA server in the Cisco ASA configuration, and then enter its actual address.

**Step 6:** Under NAT, select **Add Automatic Address Translation Rules**, in Type, choose **Static**, in Translated Addr, choose the ISA server network object that references the public address of the ISA server created in Step 3, and then click **OK**.

Edit Network	Object	×		
Name:	dmz-isa_srvr			
Type:	Host	•		
IP Address:	192.168.22.25			
Description:	Address of ISA server in dmz-isa			
NAT		\$		
	tic Address Translation Rules			
Type:	Static			
	ldr: dmz-isa-ISPa			
	Translated Address:			
Round Robin				
Fall through to interface PAT(dest intf):				
Advanced				
	OK Cancel Help			

Step 7: Navigate to Configuration > Firewall > Access Rules, and then click Add > Add Access Rule.

Step 8: In the Edit Access Rule window, enter the following information:

Interface—Any

- Action—Permit
- Source—Any
- Destination—dmz-isa\_srvr
- Service—tcp/http and tcp/https

This adds a new access control entry (ACE) rule to the global list of access rules. The rule allows outside hosts to make HTTP and HTTPS connections to the ISA server.

Edit Acces	ss Rule
Interface:	Any
Action: 💿	Permit O Deny
Source:	any
User:	
Destination	dmz-isa_srvr
Service:	tcp/http, tcp/https
Description:	Opening up access ports to ISA on DMZ
🔽 Enable Lo	ogging
Logging L	evel: Default 🔻
More Opt	ions 🛞
	OK Cancel Help

Next, Create another Cisco ACE. This allows the ISA server access to the internal Exchange server,

Step 9: In the Edit Access Rule window, enter the following information:

- Interface—Any
- Action—Permit
- Source—dmz-isa\_srvr
- Destination—internal-exchange
- Service—tcp/http and tcp/https

🔂 Edit Acce	ss Rule
Interface:	Any
Action: 🔘	Permit O Deny
Source:	dmz-isa_srvr
User:	
Destination	internal-exchange
Service:	tcp/http, tcp/https
Description:	
🔽 Enable Lo	ogging
Logging l	level: Default 🔻
More Opt	ions
	OK Cancel Help

**Step 10:** Permit access, using the examples above, from the ISA server to the Active Directory server and the DNS server in the data center (in this example, the AD server is also the DNS server and is called DNS). The AD server requires ports on TCP 135, 445, 1025, 49158, and 49164 and UDP 389 and the DNS server portion requires UDP 53.

#	Enabled	Source	User	Destination	Service	Action
10	V	🖳 dmz-isa_srv		📇 internal-dns	cm→ echo-reply     cm→ echo-reply     1025     cm→ 135     cm→ 445     cm→ 49158     cm→ 49164     um→ 389     um→ domain	✓ Permit

**Step 11:** Move these access rules above any rule already configured that denies DMZ networks access to other networks.

#### Procedure 3

#### **Configure additional security**

To increase the security of the deployment, ActiveSync includes some security options that administrators may deploy. These options include password requirements, inactivity timeout, device encryption, and a maximum number of failed password attempts before the data on the device is deleted. Security options vary by device. The organizational security policy should be used as a guide on how to approach the use of smartphones in the network.

Step 1: In the Exchange Management Console, navigate to Organization Configuration > Client Access.

Step 2: Click the Exchange ActiveSync Mailbox Policies tab, select the policy you want to view in the action pane, and then click Properties.

**Step 3:** On the **Password** tab, set password requirements for Exchange ActiveSync clients, as follows:

- 1. Select Require password.
- Select Allow simple password. This check box allows pin-numberstyle simple passwords (a minimum level of security but easy to type and remember).
- 3. Select Require encryption on device.
- Enter a number for Number of failed attempts allowed. This setting limits the number of failed password attempts before all information on the device is deleted.
- 5. Enter a time in minutes for **Time without user input before password must be re-entered**.
- 6. Click OK

#### Process

Configuring Access for Mobile Devices: AnyConnect Client

1. Configure full access using SSL VPN

#### Procedure 1

**Configure full access using SSL VPN** 

The Cisco AnyConnect client is available for some versions of smartphones or tablets (check the app store for your phone for availability). If available, your device can be configured to connect to Cisco ASA by using SSL VPN to provide full access to the internal network and its resources.

To better support the mobility of smartphones and tablets, a change should be made to the Cisco AnyConnect client profile that is used.

## Step 1: In ASDM, navigate to Configuration > Remote Access VPN > Network Client Access > AnyConnect Client Profile.

**Step 2:** Select the profile with profile usage set to VPN that is assigned to the group policy that mobile phone users will be using (in this case, ra\_profile associated with GroupPolicy\_AnyConnect, GroupPolicy\_Administrators, and GroupPolicy\_Partner), and then click **Edit**.

**Step 3:** In the tree, select **Server List**, highlight the server host name (VPN-ASA5525), and then click **Edit**.

Step 4: On the Server List Entry page, select Additional mobile-only settings, and then click Edit.

Step 5: Select Reconnect when roaming between 3G / WiFi networks, and then click OK.

#### **Reader Tip**

The next steps are client-based and will be done on the actual phone or tablet device.

Step 6: On the device, download the AnyConnect client from the app store.

Step 7: Launch the AnyConnect application.

Step 8: Click Add VPN Connection, enter ASA SSL in the Description field, enter vpn-asa5525.cisco.local in the Server Address field, and then click Save.

## Appendix C: Changes

This appendix summarizes the changes to this guide since the previous Cisco SBA series.

- We updated the guide to reflect the changes to products and software used in the *Firewall and IPS Deployment Guide*.
- We made minor changes to improve the readability of this guide.

#### Feedback
