SMART BUSINESS ARCHITECTURE

August 2012 Series

Preface

Who Should Read This Guide

This Cisco® Smart Business Architecture (SBA) guide is for people who fill a variety of roles:

- Systems engineers who need standard procedures for implementing solutions
- Project managers who create statements of work for Cisco SBA implementations
- Sales partners who sell new technology or who create implementation
 documentation
- Trainers who need material for classroom instruction or on-the-job training

In general, you can also use Cisco SBA guides to improve consistency among engineers and deployments, as well as to improve scoping and costing of deployment jobs.

Release Series

Cisco strives to update and enhance SBA guides on a regular basis. As we develop a series of SBA guides, we test them together, as a complete system. To ensure the mutual compatibility of designs in Cisco SBA guides, you should use guides that belong to the same series.

The Release Notes for a series provides a summary of additions and changes made in the series.

All Cisco SBA guides include the series name on the cover and at the bottom left of each page. We name the series for the month and year that we release them, as follows:

month year Series

For example, the series of guides that we released in August 2012 are the "August 2012 Series".

You can find the most recent series of SBA guides at the following sites:

Customer access: http://www.cisco.com/go/sba

Partner access: http://www.cisco.com/go/sbachannel

How to Read Commands

Many Cisco SBA guides provide specific details about how to configure Cisco network devices that run Cisco IOS, Cisco NX-OS, or other operating systems that you configure at a command-line interface (CLI). This section describes the conventions used to specify commands that you must enter.

Commands to enter at a CLI appear as follows:

configure terminal

Commands that specify a value for a variable appear as follows:

ntp server 10.10.48.17

Commands with variables that you must define appear as follows:

class-map [highest class name]

Commands shown in an interactive example, such as a script or when the command prompt is included, appear as follows:

Router# enable

Long commands that line wrap are underlined. Enter them as one command:

wrr-queue random-detect max-threshold 1 100 100 100 100 100

100 100 100

Noteworthy parts of system output or device configuration files appear highlighted, as follows:

interface Vlan64

ip address 10.5.204.5 255.255.255.0

Comments and Questions

If you would like to comment on a guide or ask questions, please use the SBA feedback form.

If you would like to be notified when new comments are posted, an RSS feed is available from the SBA customer and partner pages.

What's In This SBA Guide

Cisco SBA Solutions

Cisco SBA helps you design and quickly deploy a full-service business network. A Cisco SBA deployment is prescriptive, out-of-the-box, scalable, and flexible.

Cisco SBA incorporates LAN, WAN, wireless, security, data center, application optimization, and unified communication technologies—tested together as a complete system. This component-level approach simplifies system integration of multiple technologies, allowing you to select solutions that solve your organization's problems—without worrying about the technical complexity.

Cisco SBA Solutions are designs for specific problems found within the most common technology trends. Often, Cisco SBA addresses more than one use case per solution because customers adopt new trends differently and deploy new technology based upon their needs.

Route to Success

To ensure your success when implementing the designs in this guide, you should first read any guides that this guide depends upon—shown to the left of this guide on the route below. As you read this guide, specific prerequisites are cited where they are applicable.

About This Guide

This *deployment guide* contains one or more deployment chapters, which each include the following sections:

- Business Overview—Describes the business use case for the design. Business decision makers may find this section especially useful.
- Technology Overview—Describes the technical design for the business use case, including an introduction to the Cisco products that make up the design. Technical decision makers can use this section to understand how the design works.
- **Deployment Details**—Provides step-by-step instructions for deploying and configuring the design. Systems engineers can use this section to get the design up and running quickly and reliably.

You can find the most recent series of Cisco SBA guides at the following sites:

Customer access: http://www.cisco.com/go/sba

Partner access: http://www.cisco.com/go/sbachannel

Introduction

Note

This guide is based on the *Cisco SBA—Borderless Networks Advanced Guest Wireless Deployment Guide*. The goal of this guide is to show you how a BYOD business problem can be solved by using Cisco Smart Business Architecture. Cisco has previously developed solutions to solve issues that are similar to the various BYOD business problems. Cisco SBA uses Cisco Identity Services Engine to solve the BYOD problem of providing guest wireless access.

There is a trend in the marketplace today that is often referred to as *Bring Your Own Device* (BYOD). BYOD is a spectrum of business problems that can be solved in various ways. These range from accessing guest wireless networks to providing device authentication and identification. The goal is to provide a common work environment, regardless of the type of device being used. This could be accomplished by providing a virtualized desktop or by allowing users to self-register devices for use on the network.

Organizations are experiencing an unprecedented transformation in the network landscape. In the past, IT typically provided network resources only to corporate-managed PCs, such as laptops and desktops. Today, employees are requiring access from both corporate managed and unmanaged devices, including mobile devices like smart phones and tablets. This rapid proliferation of mobile devices capable of supporting applications drastically increases workforce mobility and productivity, but it also presents an enormous challenge to IT organizations seeking to enforce security policies across a growing population of devices, operating systems, and connectivity profiles.

The distinction between a work device and a personal device has evolved. This evolution of mobile device usage and the introduction of mobile devices into the workplace has caused a paradigm shift in how IT views what qualifies as a network "end point device" and also what it means to "be at work." An organization needs to know not only who is accessing their wired and wireless networks, but also when the networks are accessed and from where. In addition, with the wide adoption of nontraditional devices, such as smart phones and tablets, and people bringing their own devices to access the network, organizations need to know how many of these devices are connecting. With this information, the organization can create policy to prevent connection by nontraditional devices, limit connection to approved devices, or make access to network resources easier for these non-traditional devices. This presents a challenge for IT organizations that seek to provide end-users with a consistent network access experience and the freedom to use any device, while still enforcing stringent security policies to protect corporate intellectual property. Further complicating the situation is delivering both consistent access and enforcing proper security policy based on the specific user-access scenario (wired, wireless, guest, local, branch, and remote users).

To balance the productivity gains versus the security risks, IT needs to implement a solution that allows for seamless on-boarding of users and devices, simplicity of on-going operations, and the ability to extend enduser applications to any user or any device at any time.

Other Cisco SBA Solutions guides addressing BYOD business problems include:

- · BYOD—Internal Corporate Access Deployment Guide
- BYOD—Identity and Authentication Deployment Guide
- · BYOD—Remote Mobile Access Deployment Guide

Business Overview

Organizations' facilities are frequently called upon to host a wide range of guest users including customers, partners, and vendors. Many of these users want network connectivity while they are onsite in order to gain access to authorized organizational resources, as well as VPN connectivity to their employer's network and the Internet, so they can be as productive as possible. However, by offering guests the same level of network access that the organization's users have, the organization is exposed to a significant risk.

Relying on a set group of internal users, such as receptionists and IT helpdesk staff, to create the guest accounts may not be as flexible as an organization requires. The group might not be available 24-hours per day to create accounts, or the turnaround time for creation of the accounts might be significant. The turnaround times tend to be most significant when the resources that create the accounts have a cost associated with them. For example, a helpdesk representative might spend time creating guest accounts only after all higher priority issues have been resolved.

After a guest account has been created, you typically need to tell the guest the account details, the access instructions, and the acceptable-use policy. Dealing with this information when the guest arrives can take a lot of time. Additionally, a guest account often needs to change after it has been created. For example, you may want to extend the time on the guest account so you don't need to create a new one for the guest when it expires, or you may want to resend the account details to a guest if the information has been lost or forgotten.

Technical Overview

Cisco Identity Services Engine (ISE) is an identity and access-control policy platform that enables organizations to enforce compliance, enhance infrastructure security, and streamline their service operations. With the included sponsor portal, you can quickly open a web connection to the server running Cisco ISE, authenticate with a Microsoft Active Directory username and password, and create a guest account. The entire process is quick, easy, and involves no additional staff or costs.

Cisco ISE is deployed by organizations in their networks to manage all the different aspects of identity, including guest access. Cisco ISE includes a complete provisioning and reporting system that provides temporary network access for guests, visitors, contractors, consultants, and customers. Integrating Cisco ISE into the guest wireless network is accomplished by using ISE as the RADIUS server for authentication and accounting. Cisco ISE works alongside the Cisco wireless LAN controller (WLC), which provides the enforcement point for guest access and serves as a proxy for guest web authentication requests to the ISE server.

If the sponsor has a visitor coming for a meeting the following day, he can create a guest account and automatically send an email or Short Message Service (SMS) text message with account details to the visitor the night before. If the guest arrives early, she can get connected while waiting for the meeting.

When guest accounts are created, they are stored within the built-in database of the Cisco ISE server. When a guest user connects to the wireless guest network by using the guest Secure Set Identifier (SSID), their traffic is tunneled from the WLC that controls the AP they are using to the guest WLC in the demilitarized zone (DMZ) of the Internet edge component. The guest WLC then uses a web authorization redirect to point the guest user to the Cisco ISE guest login page. The guest WLC uses the credentials supplied to Cisco ISE by the guest user, and then uses those credentials in a RADIUS request to the Cisco ISE server to retrieve other information, like connection time. Cisco ISE verifies the supplied credentials against its own internal database, where guest information is stored.

The Cisco ISE server provisions the guest account for the amount of time that is specified when the account is created. Upon expiry of the account, Cisco ISE sends a RADIUS message that notifies the WLC of the amount of valid time that remains on the account before the WLC must remove the user.

Risk is minimized because the guest account gives access only to the Internet, not the internal network. Sponsors can also suspend a guest account. Normally this feature is used in the event of malicious use of the account, but the organization could have a policy that requires suspension of the guest account as soon as the visitor leaves.

Because reporting is an important aspect of any guest access system, the whole process is recorded for audit purposes. If your organization gets a phone call from the security team at another company, and they explain that they were attacked at a specific time and date by an IP address that belongs to your organization's guest wireless deployment, you can use Cisco ISE to get a full audit trail of who had that IP address, when they logged in and out, and who created the account.

There are two deployment models used for guest wireless access, as illustrated in Figure 1:

- Dedicated guest model, in which the guest WLC resides in the DMZ and handles only guest users
- Shared guest model, in which the WLC supports both internal staff and guests, and resides in the internal network

Shared guest wireless topology

Deployment Details

Process

Deploying Cisco ISE

- 1. Perform initial setup of Cisco ISE
- 2. Install the Cisco ISE license
- 3. Configure network devices in Cisco ISE
- 4. Configure Cisco ISE to use Active Directory

Procedure 1

Perform initial setup of Cisco ISE

Step 1: Boot Cisco ISE, and then, at the initial prompt, enter **setup**. The installation begins.

Step 2: Enter the host name, IP address, subnet mask, and default router of Cisco ISE.

Enter hostname[]: ise-1
Enter IP address[]: 10.4.48.41
Enter IP default netmask[]: 255.255.255.0
Enter IP default gateway[]: 10.4.48.1

Step 3: Enter Domain Name System (DNS) information.

Enter default DNS domain[]: cisco.local
Enter primary nameserver[]: 10.4.48.10
Add/Edit another nameserver? Y/N : n

Step 4: Configure the time.

Enter primary NTP server[time.nist.gov]: ntp.cisco.local
Add/Edit secondary NTP server? Y/N : n
Enter system timezone[UTC]: PST8PDT

Reader Tip

For time zone abbreviations, see the *Cisco Identity Services* Engine CLI Reference Guide, Release 1.1, here:

http://www.cisco.com/en/US/docs/security/ise/1.1/cli_ref_guide/ ise_cli_app_a.html#wp1571855 Step 5: Configure an administrator account.

You must configure an administrator account in order to access the CLI console. This account is not the same as the one used to access the GUI.

```
Enter username[admin]: admin
```

Enter password: [password]

```
Enter password again: [password]
```

Cisco ISE completes the installation and reboots. This process takes several minutes.

Step 6: During the provisioning of the internal database, when you are asked, enter a new database administrator password and a new database user password. Do not press Control-C during the installation, or it will end the installation.

Cisco ISE is now installed.

Procedure 2

Install the Cisco ISE license

Cisco ISE comes with a 90-day demo license for both the Base and Advanced packages. To go beyond 90 days, you need to obtain a license from Cisco.

Step 1: In your browser, enter **http://ise-1.cisco.local**. The Cisco ISE GUI opens.

Step 2: On the menu bar, mouse over **Administration**, and then, in the System section, choose **Licensing**.

Notice that you see only one node here because the secondary node does not require licensing.

Step 3: Click the name of the Cisco ISE server. This allows you to edit the license details.

Step 4: Under Licensed Services, click Add Service.

Step 5: Locate your license file by clicking Browse, and then click Import.

Step 6: If you have multiple licenses to install, repeat the process for each.

When installing a Base license and an Advanced license, you

Procedure 3

Tech Tip

must install the Base license first.

Configure network devices in Cisco ISE

Configure Cisco ISE to accept authentication requests from network devices. RADIUS requires a shared secret key to enable encrypted communications. Each network device that uses Cisco ISE for authentication needs to have this key.

Step 1: On the menu bar, mouse over **Administration**, and then, in the Network Resources section, choose **Network Devices**.

Step 2: In the left pane, click Default Device.

Tech Tip

Each network device can be configured individually, or devices can be grouped by location, by device type, or by using IP address ranges. The other option is to use the default device to configure the parameters for devices that aren't specifically configured. All of Cisco's network devices have to use the same key, so for simplicity, this example uses the default device.

Step 3: In the Default Network Device Status list, choose Enable.

Step 4: In the **Shared Secret** box, enter the RADIUS shared secret, and then click **Save**.

Procedure 4

Configure Cisco ISE to use Active Directory

Cisco ISE uses the existing Active Directory (AD) server as an external authentication server. First, you must configure the external authentication server.

Step 1: On the menu bar, mouse over **Administration**, and then, in the Identity Management section, choose **External Identity Sources**.

Step 2: In the left panel, click Active Directory.

Step 3: On the Connection tab, configure the connection to the AD server by entering the AD domain (example: cisco.local), the name of the server (example: AD1), and then click **Save Configuration**.

Step 4: Verify these settings by selecting the node, clicking Test Connection, and then choosing Basic Test.

Step 5: Enter the credentials for a domain user, and then click OK.

	Test Connection × User Name: employee1 Password:			

Step 7: Enter the credentials for a domain administrator account. Cisco ISE is now joined to the AD domain.

Next, select the groups from AD that Cisco ISE uses for authentication.

Step 8: Click the Groups tab, click Add, and then click Select Groups from Directory.

Step 9: Search for the groups you wish to add. The domain field is already filled in. The default filter is a wildcard to list all groups. You can click **Retrieve Groups** if you want to get a list of all groups in your domain.

Step 10: Select the groups you want to use for authentication, and then click **OK**. For example, if you want to select all users in the domain, select the group <domain>/Users/Domain Users.

Process

Configuring Cisco ISE Sponsor Portal Services

- 1. Configure sponsor settings
- 2. Configure guest settings

A sponsor portal provides a web-based interface to privileged users, or sponsors, within an organization that allows you to create guest accounts. This process covers the steps required to customize the sponsor portal and to configure general sponsor settings, which govern how sponsors access customized web portals for the creation and management of guest accounts.

Setting up the portal is a two-part task. First you need to configure sponsor settings, or specify who can create guest accounts, and then you need to configure guest settings.

Procedure 1

Configure sponsor settings

A sponsor group defines which privileges are available to the sponsor after the sponsor has been authenticated. These privileges determine the menu options that are available, the guest accounts that can be managed, and the network access privileges that can be granted to a guest through role assignment and time restrictions. Organizations should set up sponsor groups according to their own policy. The privileges that are assignable are:

- **SponsorAllAccounts**—The sponsor in this group can manage all guest accounts.
- **SponsorGroups**—The sponsor in this group can manage all guest accounts created by sponsors in the same sponsor group only.
- **SponsorGroupOwnAccounts**—The sponsor in this group can manage only guest accounts that the sponsor created.

For this deployment, new groups are not required because the SponsorAllAccounts default group is sufficient, but the following steps detail how to build a new group in order to show the different settings available when setting up groups. **Step 1:** In the Cisco ISE admin management web interface, navigate to **Administration > System > Settings > SMTP Server**, and then enter the location of the SMTP server that should be used to send guest wireless account notifications after creation. Emails can be sourced from either the sponsor's email address or from a global address.

Procedure 2

Configure guest settings

In order to perform web-based authentication, guest users need a portal that allows the user to enter their login credentials, and also provides optional services, like password changes, device registration, or self-service account creation.

Step 1: Navigate to Administration > Web Portal Management > Settings, and then, in the Settings section, expand Guest.

Step 2: On the left-hand panel, select **Multi-Portal Configurations**, and then click **DefaultGuestPortal**.

Step 3: On the Authentication tab, in the Authentication Type list, choose Guest. The Guest setting uses only the internal guest user database, which stores sponsor-created guest accounts.

Step 4: Click Save.

Process

Integrating the Cisco Wireless LAN Controller and Cisco ISE

- 1. Configure a firewall policy
- 2. Configure the wireless LAN controller

Procedure 1

Configure a firewall policy

If there is a firewall between the guest WLC and the Cisco ISE server, you need to allow UDP/1812 and UDP/1813.

Step 1: Connect to the Internet edge firewall by using Cisco ASDM.

Step 2: Navigate to Configuration > Firewall > Objects > Network Objects / Groups.

Step 3: Click Add, and then click Network Object.

Step 4: In the **Name** box, enter the name of the Cisco ISE server (example: internal_ISE-1).

Step 5: In the Type list, choose Host.

Step 6: In the **IP Address** box, enter the IP address of the Cisco ISE server (example: 10.4.48.41).

付 Add Networl	k Object	X
Name:	internal_ISE-1	
Type:	Host	•
IP Address:	10.4.48.41	
Description:	ISE 1 Server	
NAT		۲
	OK Cancel Help	

Step 7: Click OK, and then click Apply.

Step 8: Navigate to Configuration > Firewall > Access Rules.

If you are using the shared deployment model, in which the WLC resides on the internal network, skip to Step 12. If you are using the dedicated deployment model, in which the WLC resides on the DMZ, continue to the next step.

Step 9: Click the rule that denies DMZ-network access to the internal networks.

Step 10: Click **Add**, and then click **Insert**. A new access rule is inserted before the deny rule that was selected.

Step 11: Enter the following access rule details, and then click OK.

- Source—**192.168.19.0/24**. This is the IP address for the guest Cisco Wireless LAN Controller management network.
- Destination—internal_ISE-1. This is the address of the Cisco ISE server.
- Service—udp/1812, udp/1813

Guest client IP addresses need access through the firewall to the Cisco ISE server for web authentication attempts.

Step 12: Click the rule that denies DMZ-guest-network access to the DMZ-networks and the internal-network.

Step 13: Click **Add**, and then click **Insert**. A new access rule is inserted before the deny rule that is currently selected.

Step 14: Enter the following access rule details:

- Source—192.168.28.0/22. This is the network IP address for the DMZ guest network.
- Destination—internal_ISE-1
- Service—tcp/8443

Step 15: Click OK, click Apply, and then click Save.

Procedure 2

Configure the wireless LAN controller

Step 1: In your browser, enter the address of the guest anchor WLC management interface (example: https://guest-wlc), and then log in.

Step 2: Navigate to **Security** > **AAA** > **RADIUS** > **Authentication**. From here, you can add the Cisco ISE server as an authentication server in the WLC.

Step 3: If you are using the dedicated WLC model, ensure that the RADIUS servers that are already configured on this WLC are either disabled or removed; this ensures that Cisco ISE is used for guest user authentication. If you are using the shared model, there could possibly be other defined AAA servers.

Step 4: Click New.

Step 5: Enter 10.4.48.41. This is the IP Address for the server running Cisco ISE.

Step 6: In the Shared Secret box, enter a shared secret.

Step 7: In the Confirm Shared Secret box, re-enter the shared secret.

Step 8: Next to Management, clear the Enable check box, and then click Apply.

Step 9: Navigate to **Security** > **AAA** > **RADIUS** > **Accounting**. From here, you can add the guest server as an accounting server in the WLC.

Step 10: Click New

Step 11: In the Server Address box, enter 10.4.48.41. This is the IP address of the Cisco ISE server.

Step 12: In the Shared Secret box, enter a shared secret.

Step 13: In the Confirm Shared Secret box, re-enter the shared secret.

 > Local EAP > Priority Order > Certificate > Access Control Lists > Wireless Protection Policies > Web Auth > Advanced 								

Step 14: Click Apply.

Step 15: On the menu bar, click WLANs.

Step 16: In order to modify the Web Authentication Type later in the procedure, you must disable the WLANs using Web-Auth as an authentication method.

Step 17: Next to Guest, select the check box.

							Sa <u>v</u> e	Configu	ration Ping Lo	gout <u>R</u> efresh
cisco	MONITOR	<u>W</u> LANs	<u>C</u> ONTROLLER	WIRELESS	<u>S</u> ECURITY	M <u>A</u> NAGEMENT	C <u>O</u> MMANDS	HELP	<u>F</u> EEDBACK

Advanced		_					Admin			
	ID	Туре	Profile Nam	e	WLAN	SSID	Status		urity Policies	
	<u>2</u>	WLAN	Guest		Guest		Enabled	1 We	ab-Auth	

Step 18: Click the arrow next to Create New, in the list, choose Disable Selected, and then click Go.

Step 19: Click **OK**. This confirms that you want to disable the selected WLANs.

Step 20: Click the WLAN ID for the WLAN that you want to edit (example: 2).

Step 21: On the Advanced tab, next to Allow AAA Override, select **Enabled**. This allows the per-client session timeout to be set from the Cisco ISE server.

Step 22: Click Apply.

In order for the guest to have access to resources that they need before they authenticate, a pre-authentication ACL needs to be created that allows the guest access to DNS services and the Cisco ISE server.

Step 23: Navigate to Security > Access Control Lists > Access Control Lists.

Step 24: Click New. This allows you to create a new access control list.

Step 25: In the Access Control List Name box, enter a name for the ACL, and then click Apply.

<u>w</u> L	ANs.	<u>C</u> ONTROLLER	W <u>I</u> RELESS	<u>S</u> ECURITY	M <u>A</u> NAGEMENT	C <u>O</u> MMANDS	HE <u>L</u> P	<u>F</u> EEDBACK

	Acc	ess Control Lis	t Name Pre-	Auth-for-Exte	rnal-Web-Server			
	AC	CL Type	•	DIPv4 CIPv6	5			

Step 26: Click the name of the ACL.

Step 27: Click Add New Rule

Step 28: Enter the following information, and then click **Apply**. This defines an ACL that allows access to the management network. In this example, access is allowed to the 10.4.48.0 network, and access to specific resources is controlled on the Cisco ASA itself. This reduces the locations in which changes need to be made as the network evolves.

- Sequence-1

If you are using a shared deployment model, in which the WLC lives inside the firewall on the internal network and handles both guest users and internal users, continue to the next steps. If you are using a dedicated deployment model, in which the WLC resides on the DMZ and handles guest traffic only, skip to Step 36.

For this deployment, Cisco ISE is used only for guest traffic and not for the internal users. To support that, you need to set up the guest WLAN to use the Cisco ISE server for authentication.

Step 35: Navigate to Security > AAA Servers.

Step 36: Next to Server 1, in the Authentication Servers and Accounting Servers lists, choose the Cisco ISE server, 10.4.48.41.

Step 37: Under Authentication priority order for web auth user, in the **Order Used for Authentication** list, move **RADIUS** to the first position in the list, followed by **LOCAL**, and then ensure that **LDAP** is removed.

When a guest wants to log in to the wireless network, they are presented with a web-based login screen that authenticates them against the credentials stored on the Cisco ISE server's internal database. To do this, any web session the guest begins must be redirected to the Cisco ISE server's web authentication URL to allow credential input. When the guest user enters their credentials, the WLC intercepts the credentials and the results, and uses them in a separate RADIUS request to Cisco ISE to retrieve the other options, such as time, that are specific to this guest account.

Step 38: Navigate to Security > Web Auth > Web Login Page.

Step 39: In the Web Authentication Type list, choose External (Redirect to external server).

Step 40: In the External Webauth URL box, enter **https://ise-1.cisco. local:8443/guestportal/Login.action**. This is the location of the Cisco ISE server's guest portal login page. **Step 41:** Click **Apply**, and then click **OK**. This confirms that the pre-authentication ACL has been configured.

. cısco	<u>M</u> ONITOR <u>W</u> LANs <u>C</u>	DNTROLLER W <u>I</u> RELESS	<u>S</u> ECURITY	M <u>A</u> NAGEMENT	C <u>O</u> MMANDS	HELP	<u>F</u> EEDBACK

Step 42: On the menu bar, navigate to WLANs.

Step 43: Click the WLAN ID for the specific WLAN that you want to edit (example: 2).

Step 44: Next to Guest, select the check box.

Step 45: Next to Create New, click the arrow, and then choose **Enable Selected**.

Step 46: Click Go, and then click OK.

Because of a change made in iOS device behavior (Apple iPhone, iPad, and iMac), you need to execute a command on the CLI of the WLC to allow those devices to be guests on the wireless network.

Step 47: Using SSH, navigate to the IP address of the WLC, and then log in with an administrator account.

Step 48: Enter the following command. This turns on captive bypass.

(Cisco Controller) >config network web-auth captive-bypass
enable

Step 49: In the WLC GUI, on the right-hand side of the page, click **Save Configuration**.

Step 50: On the menu bar, navigate to **Commands**, and then click **Reboot**. The WLC reboots.

Process Creating and Using Guest Accounts 1. Use the Sponsor Portal 2. Use guest accounts Procedure 1 Use the Sponsor Portal

To create the guest account, the authorized guest-user-account sponsor performs the following steps.

Step 1: In your browser, enter **https://ise-1.cisco.local:8443/sponsorportal**, and then log in to the Cisco ISE Sponsor Portal.

Step 2: Click Create Single Guest User Account.

Step 3: Enter the information for the guest account as required by corporate policy (and the settings implemented in the "Configure Sponsor Portal" procedure in the "Configuring Cisco ISE Sponsor Portal Services" process). After you enter the required Guest User account info, click **Submit.**

Step 4: In this particular example, first and last name, email address, and company were entered by the sponsor.

If the account was successfully created, Cisco ISE displays the guest account and credentials.

cisco Sponsor F	employee1 Logout About Help Portal		
▼_ Sponsor	Account Management > View All Guest Accounts > Create Guest Account		
Home Settings Customization	Successfully Created Guest Account: jdoe0001		
	Username: jdoe0001 Password: D-2288RGR First Name: John Last Name: Doe Email Address: jdoe@corp.com Phone Number: Company: testcord Status: AWAITING INITIAL LOGIN Suspended: false Optional Data 1: Optional Data 2: Optional Data 3:		
Account Management View Guest Accounts Create Single Account Create Random Accounts Import Accounts	Optional Data 4: Optional Data 5: Group Role: Guest Time Profile: DefaultOneHour Timezone: US/Pacific • Account Start Date: 2012-03-13 14:36:38 PDT • Account Expiration Date: 2012-03-13 15:36:38 PDT Language Template for Email/SMS Notifications: English Email Print Create Another Account		

Step 5: If you want to customize sponsor account options, such as language and email notification, click **Settings Customization**.

Procedure 2 Use guest accounts

For guests to be authenticated, they need to connect to the guest SSID and get an IP address in the 192.168.28.0/22 range.

Step 1: In your browser, browse to a known website. The browser is redirected to the Cisco ISE Guest Portal, where the guest account credentials can be entered.

Step 2: Enter guest credentials. The Acceptable Use Policy opens.

Step 3: Select Accept terms and conditions, and then click Accept.

The credentials have been successfully authenticated by Cisco ISE and the guest now has access as determined by the security policy implemented on the firewall.

Web Authentication					
You can now use all regular network services over the wireless network.					
Please retain this small logout window in order to logoff when done. Note that you can always use the following URL to retrieve this page: https://192.0.2.1/logout.html					

August 2012 Series

Appendix A: Product List

Appendix B: Changes

This appendix summarizes the changes to this guide since the previous Cisco SBA series.

- We upgraded Cisco ISE software to 1.1.1
- We added procedures for applying guest wireless with Cisco ISE for a shared guest/internal user WLC deployment.
