

Cisco Catalyst Blade Switch 3040 for FSC Cisco IOS Commands

aaa accounting dot1x

Use the **aaa accounting dot1x** global configuration command to enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions. Use the **no** form of this command to disable IEEE 802.1x accounting.

no aaa accounting dot1x {*name* | **default**}

Syntax Description	name	Name of a server group. This is optional when you enter it after the broadcast group and group keywords.
	default	Use the accounting methods that follow as the default list for accounting services.
	start-stop	Send a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server.
	broadcast	Enable accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.
	group	Specify the server group to be used for accounting services. These are valid server group names:
		• <i>name</i> —Name of a server group.
		• radius—List of all RADIUS hosts.
		• tacacs +—List of all TACACS+ hosts.
		The group keyword is optional when you enter it after the broadcast group and group keywords. You can enter more than optional group keyword.

aaa accounting dot1x {name | default} start-stop {broadcast group {name | radius | tacacs+}
 [group {name | radius | tacacs+} ...] | group {name | radius | tacacs+} [group {name | radius
 | tacacs+} ...]}

	radius	(Optional) Enable RADIUS authorization.
	tacacs+	(Optional) Enable TACACS+ accounting.
Defaults	AAA accounting i	is disabled.
Command Modes	Global configurati	ion
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	We recommend th	quires access to a RADIUS server. at you enter the dot1x reauthentication interface configuration command before 802.1x RADIUS accounting on an interface.
Examples	Switch(config)#	
	Switch(config)#	aaa accounting dot1x default start-stop group radius
Note	The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.	

Related Commands	Command	Description
	aaa authentication dot1x	Specifies one or more AAA methods for use on interfaces running IEEE 802.1x.
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	dot1x reauthentication	Enables or disables periodic reauthentication.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.

OL-10696-05	

aaa authentication dot1x

Use the **aaa authentication dot1x** global configuration command to specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication. Use the **no** form of this command to disable authentication.

aaa authentication dot1x {default} method1

no aaa authentication dot1x {default}

Syntax Description	default	Use the listed authentication method that follows this argument as the default method when a user logs in.
	method1	Enter the group radius keywords to use the list of all RADIUS servers for authentication.
Note	Though other keyw keywords are supp	orted.
Defaults	No authentication i	is performed.
Command Modes	Global configuration	on
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	to validate the pass	ent identifies the method that the authentication algorithm tries in the given sequence word provided by the client. The only method that is truly IEEE 802.1x-compliant is nethod, in which the client data is validated against a RADIUS authentication server.
		p radius , you must configure the RADIUS server by entering the radius-server host
	Use the show runr authentication met	hing-config privileged EXEC command to display the configured lists of hods.
Examples	-	vs how to enable AAA and how to create an IEEE 802.1x-compliant authentication ation first tries to contact a RADIUS server. If this action returns an error, the user is to the network.
	Switch(config)# a Switch(config)# a	aaa new-model aaa authentication dot1x default group radius
	You can verify you	r settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

aaa authorization network

Use the **aaa authorization network** global configuration command to the configure the switch to use user-RADIUS authorization for all network-related service requests, such as IEEE 802.1x per-user access control lists (ACLs) or VLAN assignment. Use the **no** form of this command to disable RADIUS user authorization.

aaa authorization network default group radius

no aaa authorization network default

Syntax Description	default group radius	Use the list of all RADIUS hosts in the server group as the default authorization list.	
Defaults	Authorization is disabled.		
Command Modes	Global configuration	1	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	switch to download IEEE 802.1x authorization parameters from the RADIUS servers in the default authorization list. The authorization parameters are used by features such as per-user ACLs or VLAN assignment to get parameters from the RADIUS servers. Use the show running-config privileged EXEC command to display the configured lists of authorization methods.		
Examples	This example shows service requests:	how to configure the switch for user RADIUS authorization for all network-related	
	Switch(config)# aaa authorization network default group radius You can verify your settings by entering the show running-config privileged EXEC command.		
Related Commands	Command	Description	
	show running-conf	 Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands. 	

action

Use the **action** access-map configuration command to set the action for the VLAN access map entry. Use the **no** form of this command to return to the default setting.

action {drop | forward}

no action

Syntax Description	drop Drop the packet when the specified conditions are matched.		
	forward	Forward the packet when the specified conditions are matched.	
Defaults	The default action is to forward packets.		
Command Modes	Access-map con	figuration	
Command History	Release	Modification	
	12.2(25)SEF	This command was introduced.	
Usage Guidelines	If the action is d	-map configuration mode by using the vlan access-map global configuration command. rop , you should define the access map, including configuring any access control list match clauses, before applying the map to a VLAN, or all packets could be dropped.	
	In access-map configuration mode, use the match access-map configuration command to define t match conditions for a VLAN map. Use the action command to set the action that occurs when a p matches the conditions.		
	The drop and for	ward parameters are not used in the no form of the command.	
Examples	This example shows how to identify and apply a VLAN access map <i>vmap4</i> to VLANs 5 and 6 that causes the VLAN to forward an IP packet if the packet matches the conditions defined in access list <i>al2</i> :		
	Switch(config-a Switch(config-a Switch(config-a	<pre># vlan access-map vmap4 access-map)# match ip address al2 access-map)# action forward access-map)# exit # vlan filter vmap4 vlan-list 5-6</pre>	
	You can verify y	our settings by entering the show vlan access-map privileged EXEC command.	

Related Commands	Command	Description
	access-list {deny permit}	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	ip access-list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	mac access-list extended	Creates a named MAC address access list.
	match (class-map configuration)	Defines the match conditions for a VLAN map.
	show vlan access-map	Displays the VLAN access maps created on the switch.
	vlan access-map	Creates a VLAN access map.

archive download-sw

Use the **archive download-sw** privileged EXEC command to download a new image from a TFTP server to the switch and to overwrite or keep the existing image.

archive download-sw {/force-reload | /imageonly | /leave-old-sw | /no-set-boot | /no-version-check | overwrite | /reload | /safe} source-url

Syntax Description	/force-reload	Unconditionally force a system reload after successfully downloading the software image.
	/imageonly	Download only the software image but not the HTML files associated with the embedded device manager. The HTML files for the existing version are deleted only if the existing version is being overwritten or removed.
	/leave-old-sw	Keep the old software version after a successful download.
	/no-set-boot	Do not alter the setting of the BOOT environment variable to point to the new software image after it is successfully downloaded.
	/no-version-check	Download the software image without checking the compatibility of the stack protocol version on the image.
	/overwrite	Overwrite the software image in flash memory with the downloaded one.
	/reload	Reload the system after successfully downloading the image unless the configuration has been changed and not been saved.
	/safe	Keep the current software image; do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.
	source-url	The source URL alias for a local or network file system. These options are supported:
		• The syntax for the local flash file system on the switch: flash:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		• The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar
		The <i>image-name</i> .tar is the software image to download and install on the switch.

Defaults	The current software image is not overwritten with the downloaded image. Both the software image and HTML files are downloaded. The new image is downloaded to the flash: file system.			
	The BOOT environn	nent variable is changed to point to the new software image on the flash: file system.		
	Image names are cas	se sensitive; the image file is provided in tar format.		
	Compatibility of the on the switch stack.	Compatibility of the stack protocol version on the image to be downloaded is checked with the version		
Command Modes	Privileged EXEC			
Command History	Release	Modification		
•	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	The /imageonly option removes the HTML files for the existing image if the existing image is being removed or replaced. Only the Cisco IOS image (without the HTML files) is downloaded.			
	Using the /safe or /leave-old-sw option can cause the new image download to fail if there is insufficient flash memory. If leaving the software in place prevents the new image from fitting in flash memory due to space constraints, an error results.			
	If you used the /leave-old-sw option and did not overwrite the old image when you downloaded the new one, you can remove the old image by using the delete privileged EXEC command. For more information, see the "delete" section on page 2-80.			
	Use the /overwrite	option to overwrite the image on the flash device with the downloaded one.		
	If you specify the command <i>without</i> the /overwrite option, the download algorithm verifies that the new image is not the same as the one on the switch flash device. If the images are the same, the download does not occur. If the images are different, the old image is deleted, and the new one is downloaded.			
		a new image, enter the reload privileged EXEC command to begin using the new e /reload or /force-reload option in the archive download-sw command.		
Examples	This example shows how to download a new image from a TFTP server at 172.20.129.10 and overwrite the image on the switch:			
	Switch# archive download-sw /overwrite tftp://172.20.129.10/test-image.tar			
	This example shows how to download only the software image from a TFTP server at 172.20.129.10 to the switch:			
	Switch# archive do	ownload-sw /imageonly tftp://172.20.129.10/test-image.tar		
	This example shows how to keep the old software version after a successful download:			
	Switch# archive download-sw /leave-old-sw tftp://172.20.129.10/test-image.tar			

Related Commands	Command	Description
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.
	archive upload-sw	Uploads an existing image on the switch to a server.
	delete	Deletes a file or directory on the flash memory device.

Use the **archive tar** privileged EXEC command to create a tar file, list files in a tar file, or extract the files from a tar file.

archive tar {/create destination-url flash:/file-url} | {/table source-url} | {/xtract source-url flash:/file-url [dir/file...]}

Syntax Description	/create destination-url	Create a new tar file on the local or network file system.
	flash:/file-url	For <i>destination-url</i> , <i>specify</i> the destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:
		• The syntax for the local flash file system: flash:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for the Remote Copy Protocol (RCP) is: rcp:[[//username@location]/directory]/tar-filename.tar
		 The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar
		The <i>tar-filename</i> .tar is the tar file to be created.
		For flash: <i>/file-url, specify the</i> location on the local flash file system from which the new tar file is created.
		An optional list of files or directories within the source directory can be specified to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.

/table source-url	Display the contents of an existing tar file to the screen.
	For <i>source-url</i> , specify the source URL alias for the local or network file system. These options are supported:
	• The syntax for the local flash file system: flash:
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tar
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar
	The <i>tar-filename</i> .tar is the tar file to display.
/xtract source-url	Extract files from a tar file to the local file system.
flash:/file-url [dir/file]	For <i>source-url</i> , specify <i>t</i> he source URL alias for the local file system. These options are supported:
	• The syntax for the local flash file system: flash:
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tag
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	• The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar
	The <i>tar-filename</i> .tar is the tar file from which to extract.
	For flash :/ <i>file-url</i> [<i>dir/file</i>], specify the location on the local flash file system into which the tar file is extracted. Use the <i>dir/file</i> option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.

Defaults

There is no default setting.

Command Modes Privileged EXEC **Command History** Release Modification 12.2(25)SEF2 This command was introduced. **Usage Guidelines** Filenames and directory names are case sensitive. Image names are case sensitive. Examples This example shows how to create a tar file. The command writes the contents of the new-configs directory on the local flash device to a file named *saved.tar* on the TFTP server at 172.20.10.30: Switch# archive tar /create tftp:172.20.10.30/saved.tar flash:/new-configs This example shows how to display the contents of the file that is in flash memory. The contents of the tar file appear on the screen: Switch# archive tar /table flash:.tar info (219 bytes) / (directory) (610856 bytes) /info (219 bytes) info.ver (219 bytes) This example shows how to display only the */html* directory and its contents: Switch# archive tar /table flash:.tar /html /html/ (directory) /html/const.htm (556 bytes) /html/xhome.htm (9373 bytes) /html/menu.css (1654 bytes) <output truncated> This example shows how to extract the contents of a tar file on the TFTP server at 172.20.10.30. This

This example snows now to extract the contents of a tar file on the TFTP server at 1/2.20.10.30. This command extracts just the *new-configs* directory into the root directory on the local flash file system. The remaining files in the *saved.tar* file are ignored.

Switch# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/ new-configs

Related Commands	Command Description	
	archive download-sw	Downloads a new image from a TFTP server to the switch.
	archive upload-sw	Uploads an existing image on the switch to a server.

archive upload-sw

Use the archive upload-sw privileged EXEC command to upload an existing switch image to a server.

archive upload-sw [/version version_string] destination-url

	· · · · · ·			
Syntax Description	/version version_string			
	destination-url	The destination URL alias for a local or network file system. These options are supported:		
		• The syntax for the local flash file system on the switch: flash:		
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar 		
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
		 The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar The image-name.tar is the name of software image to be stored on the server. 		
Defaults	Uploads the currently running image from the flash: file system. Privileged EXEC			
Command Modes				
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	Use the upload feature or installed with the existing	nly if the HTML files associated with the embedded device manager have been g image.		
	The files are uploaded in are uploaded, the software	this sequence: the Cisco IOS image, the HTML files, and info. After these files re creates the tar file.		
	Image names are case set	nsitive.		

ExamplesThis example shows how to upload the currently running image to a TFTP server at 172.20.140.2:
Switch# archive upload-sw tftp://172.20.140.2/test-image.tar

Related Commands	Command	Description
	archive download-sw	Downloads a new image to the switch.
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.

authentication control-direction

Use the **authentication control-direction** interface configuration command to configure the port mode as unidirectional or bidirectional. Use the **no** form of this command to return to the default setting.

authentication control-direction {both | in}

no authentication control-direction

Syntax Description	both	Enable bidirectional control on port. The port cannot receive packets from or		
Cyntax Description	both	send packets to the host.		
	in	Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.		
Defaults	The port is in bidirecti	The port is in bidirectional mode.		
Command Modes	Interface configuration	1		
Command History	Release	Modification		
,	12.2(50)SE	This command was introduced.		
Examples	-	ow to enable bidirectional mode:		
	Switch(config)# aut	nentication control-direction both		
		nentication control-direction both ow to enable unidirectional mode:

Related Commands	This example shows h Switch(config)# aut) You can verify your se Command authentication event authentication fallback authentication	ow to enable unidirectional mode: hentication control-direction in ettings by entering the show authentication privileged EXEC command. Description Sets the action for specific authentication events. Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.		

Command	Description
authentication periodic	Enable or disables reauthentication on a port.
authentication port-control	Enables manual control of the port authorization state.
authentication priority	Adds an authentication method to the port-priority list.
authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.
authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port with the maximum number of devices already connected to that port.
show authentication	Displays information about authentication manager events on the switch.

authentication event

Use the **authentication event** interface configuration command to set the actions for specific authentication events on the port.

- authentication event fail {[action [authorize vlan *vlan-id* | next-method] {| retry {retry count}]} { no-response action authorize vlan *vlan-id* } {server {alive action reinitialize} | {dead action authorize}}
- no authentication event fail {[action[authorize vlan vlan-id | next-method] {| retry {retry count}]} {no-response action authorize vlan vlan-id} {server {alive action reinitialize} | {dead action authorize}}

Syntax Description	action	Configure the required action for an authentication event.
	alive	Configure the authentication, authorization, and accounting (AAA) server alive actions.
	authorize	Authorize the port.
	dead	Configure the AAA server dead actions.
	fail	Configure the failed-authentication parameters.
	next-method	Move to next authentication method.
	no-response	Configure the non-responsive host actions.
	reinitialize	Reinitialize all authorized clients
	retry	Enable retry attempts after a failed authentication.
	retry count	Number of retry attempts from 0 to 5.
	server	Configure the actions for AAA server events.
	vlan	Specify the authentication-fail VLAN from 1 to 4094.
	vlan-id	VLAN ID number from 1 to 4094.
Defaults Command Modes	No event responses of the second seco	nses are configured on the port.
Command History	Release	Modification
	12.2(50)SE	This command was introduced.
Usage Guidelines	Use this comma specific action.	and with the fail , no-response , or event keywords to configure the switch response for a

For *server-dead* events:

- When the switch moves to the critical-authentication state, only new hosts trying to authenticate are moved to the critical-authentication VLAN. Authenticated hosts remain in the authenticated VLAN, and the reauthentication timers are disabled.
- If a client is running Windows XP and the critical port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.

If the Windows XP client is configured for DHCP and has an IP address from the DHCP server and a critical port receives an EAP-Success message, the DHCP configuration process might not re-initiate.

For *no-response* events:

- If you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.
- The switch maintains the EAPOL packet history. If another EAPOL packet is detected on the port during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is cleared.
- If the switch port is moved to the guest VLAN (multi-host mode), multiple non-IEEE 802.1x-capable clients are allowed access. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put in the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication restarts.

You can configure any active VLAN except a Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is supported only on access ports. It is not supported on internal VLANs (routed ports) or trunk ports.

- When MAC authentication bypass is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address if IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address.
 - If authorization succeeds, the switch grants the client access to the network.
 - If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

For more information, see the "Using IEEE 802.1x Authentication with MAC Authentication Bypass" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.

For authentication-fail events:

- If the supplicant fails authentication, the port is moved to a restricted VLAN, and an EAP success message is sent to the supplicant because it is not notified of the actual authentication failure.
 - If the EAP success message is not sent, the supplicant tries to authenticate every 60 seconds (the default) by sending an EAP-start message.
 - Some hosts (for example, devices running Windows XP) cannot implement DHCP until they receive an EAP success message.

The restricted VLAN is supported only in single host mode (the default port mode). When a port is placed in a restricted VLAN, the supplicant's MAC address is added to the MAC address table. Any other MAC address on the port is treated as a security violation.

• You cannot configure an internal VLANs for Layer 3 ports as a restricted VLAN. You cannot specify the same VLAN as a restricted VLAN and as a voice VLAN.

Enable re-authentication with restricted VLANs. If re-authentication is disabled, the ports in the restricted VLANs do not receive re-authentication requests if it is disabled.

To start the re-authentication process, the restricted VLAN must receive a link-down event or an Extensible Authentication Protocol (EAP) logoff event from the port. If a host is connected through a hub:

- The port might not receive a link-down event when the host is disconnected.
- The port might not detect new hosts until the next re-authentication attempt occurs.

When you reconfigure a restricted VLAN as a different type of VLAN, ports in the restricted VLAN are also moved and stay in their currently authorized state.

Examples This example shows how to configure the **authentication event fail** command:

 $\texttt{Switch}(\texttt{config}) \, \# \, \, \textbf{authentication event fail action authorize vlan 20}$

This example shows how to configure a no-response action:

Switch(config)# authentication event no-response action authorize vlan 10

This example shows how to configure a server-response action:

Switch(config)# authentication event server alive action reinitialize

You can verify your settings by entering the **show authentication** privileged EXEC command.

Related Commands	Command	Description
	authentication control-direction	Configures the port mode as unidirectional or bidirectional.
	authentication fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication
	authentication host-mode	Sets the authorization manager mode on a port.
	authentication open	Enables or disable open access on a port.
	authentication order	Sets the order of authentication methods used on a port.
	authentication periodic	Enables or disables reauthentication on a port
	authentication port-control	Enables manual control of the port authorization state.
	authentication priority	Adds an authentication method to the port-priority list.
	authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.
	authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.
	show authentication	Displays information about authentication manager events on the switch.

OL-10696-05

authentication fallback

Use the **authentication fallback** interface configuration command to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the **no** form of this command.

authentication fallback name

no authentication fallback name

Syntax Description	name S	Specify a web authentication fallback profile.	
Defaults	No fallback is enabled.		
Command Modes	Interface configuration		
Command History	Release	Modification	
Command motory	12.2(50)SE	This command was introduced.	
Usage Guidelines	You must enter the auth configuring a fallback n	nentication port-control auto interface configuration command before nethod.	
		web authentication as a fallback method to 802.1x or MAB, so one or both of thods should be configured for the fallback to enable.	
Examples	This example shows how	w to specify a fallback profile on a port:	
	Switch(config)# authe	ntication fallback profile1	
	You can verify your sett	ings by entering the show authentication privileged EXEC command.	
Related Commands	Command	Description	
nelateu commanus	authentication	Configures the port mode as unidirectional or bidirectional.	
	control-direction	configures the port mode as undirectional of bidirectional.	
	authentication event	Sets the action for specific authentication events.	
	authentication host-mode	Sets the authorization manager mode on a port.	
	authentication open	Enables or disable open access on a port.	
	authentication order	Sets the order of authentication methods used on a port.	
	authentication periodic	Enables or disables reauthentication on a port.	

Command	Description
authentication port-control	Enables manual control of the port authorization state.
authentication priority	Adds an authentication method to the port-priority list.
authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.
authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.
show authentication	Displays information about authentication manager events on the switch.

authentication host-mode

Use the **authentication host-mode** interface configuration command to set the authorization manager mode on a port.

authentication host-mode [multi-auth | multi-domain | multi-host | single-host] no authentication host-mode [multi-auth | multi-domain | multi-host | single-host]]

Syntax Description	multi-auth	Enable multiple-authorization mode (multiauth mode) on the port.	
-,	multi-domain	Enable multiple-domain mode on the port.	
	multi-host	Enable multiple-host mode on the port.	
	single-host	Enable single-host mode on the port.	
Defaults	Single host mode i	s enabled.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(50)SE	This command was introduced.	
Usage Guidelines	 Single-host mode should be configured if only one data host is connected. Do not connect a voice device to authenticate on a single-host port. Voice device authorization fails if no voice VLAN is configured on the port. Multi-domain mode should be configured if data host is connected through an IP Phone to the port. Multi-domain mode should be configured if the voice device needs to be authenticated. Multi-auth mode should be configured to allow up to eight devices behind a hub to obtain secured port access through individual authentication. Only one voice device can be authenticated in this mode if a voice VLAN is configured. Multi-host mode also offers port access for multiple hosts behind a hub, but multi-host mode gives unrestricted port access to the devices after the first user gets authenticated. 		
Examples	Switch(config)# a This example show Switch(config)# au This example show Switch(config)# au	ws how to enable multiauth mode on a port: authentication host-mode multi-auth ws how to enable multi-domain mode on a port: athentication host-mode multi-domain ws how to enable multi-host mode on a port: athentication host-mode multi-host ws how to enable single-host mode on a port:	

Switch(config)# authentication host-mode single-host

You can verify your settings by entering the show authentication privileged EXEC command.

Related Commands	Command	Description
	authentication control-direction	Configures the port mode as unidirectional or bidirectional.
	authentication event	Sets the action for specific authentication events.
	authentication fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication
	authentication open	Enables or disable open access on a port.
	authentication order	Sets the order of authentication methods used on a port.
	authentication periodic	Enables or disable reauthentication on a port.
	authentication port-control	Enables manual control of the port authorization state.
	authentication priority	Adds an authentication method to the port-priority list.
	authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.
	authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.
	show authentication	Displays information about authentication manager events on the switch.

authentication open

Use the **authentication open** interface configuration command to enable or disable open access on a port. Use the **no** form of this command to disable open access.

authentication open

no authentication open

- **Defaults** Open access is disabled.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(50)SE	This command was introduced.

- Usage GuidelinesOpen authentication must be enabled if a device requires network access before it is authenticated.A port ACL should be used to restrict host access when open authentication is enabled.
- Examples
 This example shows how to enable open access on a port:

 Switch(config)# authentication open
 - This example shows how to set the port to disable open access on a port:

Switch(config) # no authentication open

Related Commands	Command	Description
	authentication control-direction	Configures the port mode as unidirectional or bidirectional.
	authentication event	Sets the action for specific authentication events.
	authentication fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	authentication host-mode	Sets the authorization manager mode on a port.
	authentication order	Sets the order of authentication methods used on a port.
	authentication periodic	Enables or disables reauthentication on a port.
	authentication port-control	Enables manual control of the port authorization state.
	authentication priority	Adds an authentication method to the port-priority list.

Command	Description	
authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.	
authentication violationConfigures the violation modes that occur when a new devi port or when a new device connects to a port after the maxi devices are connected to that port.		
show authentication	Displays information about authentication manager events on the switch.	

methods used on a port.

no authentication order

methods.

authentication order

dot1x

webauth

mab

Syntax Description

Command Default

Command Modes	Interface configuration	
Command History	Release	Modification

authentication order [dot1x | mab] {webauth}

Command History	Release	Modification
	12.2(50)SE	This command was introduced.
Usage Guidelines	Ordering sets the o	rder of methods that the switch attempts when trying to authenticate a new device

Add 802.1x to the order of authentication methods.

The default authentication order is **dot1x** followed by **mab** and **webauth**.

connected to a port. If one method in the list is unsuccessful, the next method is attempted.

Each method can only be entered once. Flexible ordering is only possible between 802.1x and MAB.

Use the authentication order interface configuration command to set the order of authentication

Add MAC authentication bypass (MAB) to the order of authentication

Add web authentication to the order of authentication methods.

Web authentication can be configured as either a standalone method or as the last method in the order after either 802.1x or MAB. Web authentication should be configured only as fallback to **dot1x** or **mab.**

Examples This example shows how to add 802.1x as the first authentication method, MAB as the second method, and web authentication as the third method:

Switch(config)# authentication order dotx mab webauth

This example shows how to add MAC authentication Bypass (MAB) as the first authentication method and web authentication as the second authentication method:

Switch(config) # authentication order mab webauth

You can verify your settings by entering the show authentication privileged EXEC command.

authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.
mab	Enables MAC authentication bypass on a port.
mab eap	Configures a port to use Extensible Authentication Protocol (EAP).
show authentication	Displays information about authentication manager events on the switch.

authentication periodic

Use the **authentication periodic** interface configuration command to enable or disable reauthentication on a port. Enter the **no** form of this command to disable reauthentication.

authentication periodic

no authentication periodic

- **Command Default** Reauthentication is disabled.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(50)SE	This command was introduced.

Usage Guidelines You configure the amount of time between periodic re-authentication attempts by using the **authentication timer reauthentication** interface configuration command.

Examples This example shows how to enable periodic reauthentication on a port: Switch(config)# authentication periodic

This example shows how to disable periodic reauthentication on a port:

Switch(config) # no authentication periodic

You can verify your settings by entering the show authentication privileged EXEC command.

Related Commands	Command	Description
	authentication control-direction	Configures the port mode as unidirectional or bidirectional.

authentication port-control

Use the **authentication port-control** interface configuration command to enable manual control of the port authorization state. Use the **no** form of this command to return to the default setting.

authentication port-control {auto | force-authorized | force-un authorized}

no authentication port-control {auto | force-authorized | force-un authorized}

Syntax Description	auto	Enable IEEE 802.1x authentication on the port. The port changes to the authorized or unauthorized state based, on the IEEE 802.1x authentication exchange between the switch and the client.	
	force-authorized	Disable IEEE 802.1x authentication on the port. The port changes to the authorized state without an authentication exchange. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client.	
	force-un authorized	Deny all access the port. The port changes to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.	
Defaults	The default setting is fo	prce-authorized.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(50)SE	This command was introduced.	
Usage Guidelines	Use the auto keyword o	only on one of these port types:	
	• Trunk port—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.		
	• Dynamic ports—A dynamic port can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, an error message appears, and the port mode does not change.		
	• Dynamic-access ports—If you try to enable IEEE 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN, an error message appears, and the VLAN configuration does not change.		
	• EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.		

• Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

To globally disable IEEE 802.1x authentication on the switch, use the **no dot1x system-auth-control** global configuration command. To disable IEEE 802.1x authentication on a specific port or to return to the default setting, use the **no authentication port-control** interface configuration command.

 Examples
 This example shows how to set the port state to automatic:

 Switch(config)# authentication port-control auto

 This example shows how to set the port state to the force- authorized state:

 Switch(config)# authentication port-control force-authorized

 This example shows how to set the port state to the force-unauthorized

 This example shows how to set the port state to the force-unauthorized

 Switch(config)# authentication port-control force-unauthorized state:

 Switch(config)# authentication port-control force-unauthorized

 You can verify your settings by entering the show authentication privileged EXEC command.

Related Commands	Command	Description
	authentication control-direction	Configures the port mode as unidirectional or bidirectional.
	authentication event	Sets the action for specific authentication events.
	authentication fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	authentication host-mode	Sets the authorization manager mode on a port.

	show authentication	Displays information about authentication manager events on the switch.

authentication priority

Use the **authentication priority** interface configuration command to add an authentication method to the port-priority list.

auth priority [dot1x | mab] {webauth}

no auth priority [dot1x | mab] {webauth}

Syntax Description	dot1x	Add 802.1x to the order of authentication methods.			
	mabAdd MAC authentication bypass (MAB) to the order of authentication methods.				
	webauth	Add web authentication to the order of authentication methods.			
Command Default	The default priority is 802.1x authentication, followed by MAC authentication bypass and web authentication.				
Command Modes					
Command History	Release	Modification			
	12.2(50)SE	This command was introduced.			
Usage Guidelines	Ordering sets the order of methods that the switch attempts when trying to authenticate a new device is connected to a port.				
	When configuring multiple fallback methods on a port, set web authentication (webauth) last.				
	Assigning priorities to different authentication methods allows a higher-priority method to interrupt an in-progress authentation method with a lower priority.				
Note	If a client is already authenticated, it might be reauthenticated if an interruption from a higher-priority method occurs.				
	The default priority of an authentication method is equivalent to its position in execution-list order: 802.1x authentication, MAC authentication bypass, and web authentication. Use the dot1x , mab , and webauth keywords to change this default order.				
Examples	This example shows how to set 802.1x as the first authentication method and web authentication as the second authentication method:				
	Switch(config)# authentication priority dotx webauth				

This example shows how to set MAC authentication Bypass (MAB) as the first authentication method and web authentication as the second authentication method:

Switch(config)# authentication priority mab webauth

You can verify your settings by entering the show authentication privileged EXEC command.

auto qos voip

Use the **auto qos voip** interface configuration command to automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain. Use the **no** form of this command to return to the default setting.

auto qos voip {cisco-phone | cisco-softphone | trust}

no auto qos voip [cisco-phone | cisco-softphone | trust]

Syntax Description	cisco-phone	Identify this port as connected to a Cisco IP Phone, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected.
	cisco-softphone	Identify this port as connected to a device running the Cisco SoftPhone, and automatically configure QoS for VoIP.
	trust	Identify this port as connected to a trusted switch or router, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

Defaults

Auto-QoS is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues as shown in Table 2-1.

Table 2-1 Traffic Types, Packet Labels, and Queues

	VoIP Data Traffic	VoIP Control Traffic	Routing Protocol Traffic	STP ¹ BPDU ² Traffic	Real-Time Video Traffic	All Other T	raffic
DSCP ³	46	24, 26	48	56	34	_	
CoS ⁴	5	3	6	7	3	_	
CoS-to-Ingress Queue Map	2, 3, 4, 5, 6, 7 (queue 2)				0, 1 (queu	e 1)	
CoS-to-Egress Queue Map	5 (queue 1)	3, 6, 7 (queue	2)		4 (queue 3)	2 (queue 3)	0, 1 (queue 4)

1. STP = Spanning Tree Protocol

2. BPDU = bridge protocol data unit

3. DSCP = Differentiated Services Code Point

4. CoS = class of service

Table 2-2 shows the generated auto-QoS configuration for the ingress queues.

Ingress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size
SRR ¹ shared	1	0, 1	81 percent	67 percent
Priority	2	2, 3, 4, 5, 6, 7	19 percent	33 percent

Table 2-2 Auto-QoS Configuration for the Ingress Queues

1. SRR = shaped round robin. Ingress queues support shared mode only.

Table 2-3 shows the generated auto-QoS configuration for the egress queues.

Table 2-3 Auto-QoS Configuration for the Egress Queues

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	5	10 percent	16 percent	10 percent
SRR shared	2	3, 6, 7	10 percent	6 percent	10 percent
SRR shared	3	2, 4	60 percent	17 percent	26 percent
SRR shared	4	0, 1	20 percent	61 percent	54 percent

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines

es Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the switch for VoIP with Cisco IP Phones on switch and routed ports and for VoIP with devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

- QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are added.
- When you enter the **auto qos voip cisco-phone** interface configuration command on a port at the edge of the network that is connected to a Cisco IP Phone, the switch enables the trusted boundary feature. The switch uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP Phone. When a Cisco IP Phone is detected, the ingress classification on the port is set to trust the QoS label received in the packet. When a Cisco IP Phone is absent, the ingress classification is set to not trust the QoS label in the packet. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.
- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the switch uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the interior of the network, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices). The switch configures the ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

When a device running Cisco SoftPhone is connected to a switch or routed port, the switch supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging. For more information, see the **debug auto qos** command.

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the **no mls qos** global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

Examples

This example shows how to enable auto-QoS and to trust the QoS labels received in incoming packets when the switch or router connected to the port is a trusted device:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# auto gos voip trust

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Related Commands

Command	Description
debug auto qos	Enables debugging of the auto-QoS feature.
mls qos cos	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
mls qos map { cos-dscp <i>dscp1 dscp8</i> dscp-cos <i>dscp-list</i> to <i>cos</i> }	Defines the CoS-to-DSCP map or the DSCP-to-CoS map.
mls qos queue-set output buffers	Allocates buffers to a queue-set.
mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
mls qos srr-queue input cos-map	Maps CoS values to an ingress queue or maps CoS values to a queue and to a threshold ID.
mls qos srr-queue input dscp-map	Maps DSCP values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
mls qos srr-queue output cos-map	Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID.
mls qos srr-queue output dscp-map	Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID.
mls qos trust	Configures the port trust state.
queue-set	Maps a port to a queue-set.
show auto qos	Displays auto-QoS information.
show mls qos interface	Displays QoS information at the port level.
srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

boot config-file

Use the **boot config-file** global configuration command to specify the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration. Use the **no** form of this command to return to the default setting.

boot config-file flash:/file-url

no boot config-file

Syntax Description	flash:/file-url	The path (directory) and name of the configuration file.
Defaults	The default configur	ration file is flash:config.text.
Command Modes	Global configuration	1
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	Filenames and direc	tory names are case sensitive.

channel-group

Use the **channel-group** interface configuration command to assign an Ethernet port to an EtherChannel group, to enable an EtherChannel mode, or both. Use the **no** form of this command to remove an Ethernet port from an EtherChannel group.

channel-group channel-group-number mode {active | {auto [non-silent]} | {desirable
 [non-silent]} | on | passive}

no channel-group

PAgP modes:

channel-group channel-group-number mode {{auto [non-silent]} | {desirable [non-silent}}

LACP modes:

channel-group channel-group-number mode {active | passive}

On mode:

channel-group channel-group-number mode on

Syntax Description	channel-group-number	Specify the channel group number. The range is 1 to 12.
	mode	Specify the EtherChannel mode.
	active	Unconditionally enable Link Aggregation Control Protocol (LACP).
		Active mode places a port into a negotiating state in which the port initiates negotiations with other ports by sending LACP packets. A channel is formed with another port group in either the active or passive mode.
	auto	Enable the Port Aggregation Protocol (PAgP) only if a PAgP device is detected.
		Auto mode places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. A channel is formed only with another port group in desirable mode. When auto is enabled, silent operation is the default.
	desirable	Unconditionally enable PAgP.
		Desirable mode places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets. An EtherChannel is formed with another port group that is in the desirable or auto mode. When desirable is enabled, silent operation is the default.
	non-silent	(Optional) Use in PAgP mode with the auto or desirable keyword when traffic is expected from the other device.
	on	Enable on mode.
		In on mode, a usable EtherChannel exists only when both connected port groups are in the on mode.
	passive	Enable LACP only if a LACP device is detected.
		Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

Defaults

No channel groups are assigned. No mode is configured.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.

Usage Guidelines

For Layer 2 EtherChannels, you do not have to create a port-channel interface first by using the **interface port-channel** global configuration command before assigning a physical port to a channel group. Instead, you can use the **channel-group** interface configuration command. It automatically creates the port-channel interface when the channel group gets its first physical port if the logical interface is not already created. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

You do not have to disable the IP address that is assigned to a physical port that is part of a channel group, but we strongly recommend that you do so.

You create Layer 3 port channels by using the **interface port-channel** command followed by the **no switchport** interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group.

After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk.

If you do not specify **non-silent** with the **auto** or **desirable** mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. A example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent.

In the **on** mode, an EtherChannel exists only when a port group in the **on** mode is connected to another port group in the **on** mode.

You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the **channel-group** interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Do not configure a secure port as part of an EtherChannel or an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

/1\ Caution

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

```
Examples
```

This example shows how to configure an EtherChannel. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	channel-protocol	Restricts the protocol used on a port to manage channeling.
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show lacp	Displays LACP channel-group information.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

channel-protocol

Use the **channel-protocol** interface configuration command to restrict the protocol used on a port to manage channeling. Use the **no** form of this command to return to the default setting.

channel-protocol {lacp | pagp}

no channel-protocol

Syntax Description		Configure an EtherChannel with the Link Aggregation Control Protocol (LACP).	
	pagp	Configure an EtherChannel with the Port Aggregation Protocol (PAgP).	
Defaults	No protocol is a	ssigned to the EtherChannel.	
Command Modes	Interface config	aration	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	Use the channel-protocol command only to restrict a channel to LACP or PAgP. If you set the protocol by using the channel-protocol command, the setting is not overridden by the channel-group interface configuration command.		
	You must use the channel-group interface configuration command to configure the EtherChannel parameters. The channel-group command also can set the mode for the EtherChannel.		
	You cannot enable both the PAgP and LACP modes on an EtherChannel group.		
	PAgP and LACF	P are not compatible; both ends of a channel must use the same protocol.	
Examples	Ĩ	nows how to specify LACP as the protocol that manages the EtherChannel: if) # channel-protocol lacp	
	You can verify y privileged EXE0	your settings by entering the show etherchannel [<i>channel-group-number</i>] protocol C command.	
Related Commands	Command	Description	
	channel-group	Assigns an Ethernet port to an EtherChannel group.	
	show ethercha	nnel protocol Displays protocol information the EtherChannel.	

cisp enable

Use the **cisp enable** global configuration command to enable Client Information Signalling Protocol (CISP) on a switch so that it acts as an authenticator to a supplicant switch.

cisp enable

no cisp enable

Syntax Description	cisp enable E	nable CISP.
Defaults	There is no default settin	g.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(50)SE	This command was introduced.
Usage Guidelines	 switches, the VTP domain When you configure VTI VLANs are not configure domain. 	henticator and supplicant switch is a trunk. When you enable VTP on both in name must be the same, and the VTP mode must be <i>server</i> . P mode, to avoid the MD5 checksum mismatch error, verify that: igured on two different.switches, which can be caused by two VTP servers in he different configuration revision numbers.
Examples	This example shows how to enable CISP: switch(config)# cisp enable	
Related Commands	Command	Description
	dot1x credentials (glob configuration) <i>profile</i>	al Configures a profile on a supplicant switch.
	show cisp	Displays CISP information for a specified interface.

class

Use the **class** policy-map configuration command to define a traffic classification match criteria (through the **police**, **set**, and **trust** policy-map class configuration commands) for the specified class-map name. Use the **no** form of this command to delete an existing class map.

class class-map-name

no class class-map-name

Syntax Description	class-map-name	Name of the class map.	
Defaults	No policy map class-	maps are defined.	
Command Modes	Policy-map configura	ation	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	identify the policy ma can configure a policy	s command, you must use the policy-map global configuration command to ap and to enter policy-map configuration mode. After specifying a policy map, you for new classes or modify a policy for any existing classes in that policy map. You to a port by using the service-policy interface configuration command.	
	After entering the cla configuration comma	ss command, you enter policy-map class configuration mode, and these nds are available:	
	• exit: exits policy	-map class configuration mode and returns to policy-map configuration mode.	
	• no : returns a com	nmand to its default setting.	
	bandwidth limita	policer or aggregate policer for the classified traffic. The policer specifies the tions and the action to take when the limits are exceeded. For more information, d police aggregate policy-map class commands.	
	• set : specifies a va command.	alue to be assigned to the classified traffic. For more information, see the set	
		rust state for traffic classified with the class or the class-map command. For more the trust command.	
		To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.	
	the class command w	berforms the same function as the class-map global configuration command . Use when a new classification, which is not shared with any other ports, is needed. Use and when the map is shared among many ports.	

ExamplesThis example shows how to create a policy map called *policy1*. When attached to the ingress direction,
it matches all the incoming traffic defined in *class1*, sets the IP Differentiated Services Code Point
(DSCP) to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding
the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	police	Defines a policer for classified traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for the traffic classified through the class policy-map configuration command or the class-map global configuration command.

class-map

Use the **class-map** global configuration command to create a class map to be used for matching packets to the class name you specify and to enter class-map configuration mode. Use the **no** form of this command to delete an existing class map and to return to global configuration mode.

class-map [match-all | match-any] class-map-name

no class-map [match-all | match-any] class-map-name

Syntax Description	match-all	(Optional) Perform a logical-AND of all matching statements under this class map. All criteria in the class map must be matched.
	match-any	(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria must be matched.
	class-map-name	Name of the class map.
Defaults	No class maps are c	lefined.
	If neither the matcl	h-all or match-any keyword is specified, the default is match-all.
Command Modes	Global configuratio	'n
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	match criteria and t	to specify the name of the class for which you want to create or modify class-map o enter class-map configuration mode.
	-	amand and its subcommands are used to define packet classification, marking, and as part of a globally named service policy applied on a per-port basis.
	After you are in qua are available:	ality of service (QoS) class-map configuration mode, these configuration commands
	-	escribes the class map (up to 200 characters). The show class-map privileged EXEC ays the description and the name of the class-map.
	• exit : exits from	QoS class-map configuration mode.
	 match: configuration) 	rres classification criteria. For more information, see the match (class-map command.
	• no : removes a n	match statement from a class map.
		tes the current class map. If you rename a class map with a name that is already used, class-map with this name already exists appears.

Examples

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-all** and **match-any** keywords are equivalent.

Only one access control list (ACL) can be configured in a class map. The ACL can have multiple access control entries (ACEs).

This example shows how to configure the class map called *class1* with one match criterion, which is an access list called *103*:

```
Switch(config)# access-list 103 permit any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
```

This example shows how to delete the class map *class1*:

Switch(config) # no class-map class1

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	match (class-map configuration)	Defines the match criteria to classify traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show class-map	Displays QoS class maps.

clear dot1x

Use the **clear dot1x** privileged EXEC command to clear IEEE 802.1x information for the switch or for the specified port.

clear dot1x {all | interface interface-id}

Syntax Description	all	Clear all IEEE 802.1x information for the switch.
	interface interface-id	Clear IEEE 802.1x information for the specified interface.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Examples	This example shows how	w to clear all IEEE 8021.x information:
Examples	Switch# clear dot1x a	
	This example shows how	w to clear IEEE 8021.x information for the specified interface:
	Switch# clear dot1x i	nterface gigabithethernet0/1
	You can verify that the in	nformation was deleted by entering the show dot1x privileged EXEC command.
Related Commands	Command	Description
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.

clear eap sessions

Use the **clear eap sessions** privileged EXEC command to clear Extensible Authentication Protocol (EAP) session information for the switch or for the specified port.

clear eap sessions [credentials name [interface interface-id] | interface interface-id | method name | transport name] [credentials name | interface interface-id | transport name] ...

Syntax Description	credentials name	Clear EAP credential information for the specified profile.	
	interface interface-id	Clear EAP information for the specified interface.	
	method name	Clear EAP information for the specified method.	
	transport name	Clear EAP transport information for the specified lower level.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	You can clear all counte information by using the	rs by using the clear eap sessions command, or you can clear only the specific e keywords.	
Examples	This example shows how	w to clear all EAP information:	
· •	Switch# clear eap		
	-	w to clear EAP-session credential information for the specified profile:	
	Switch# clear eap sessions credential type1		
	You can verify that the in	nformation was deleted by entering the show dot1x privileged EXEC command.	
Related Commands	Command	Description	

clear energywise neighbors

Use the **clear energywise neighbors** privileged EXEC command to delete the EnergyWise neighbor tables.

clear energywise neighbors

Syntax Description	This command has no arguments or keywords.

Defaults No default is defined.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(50)SE	This command was introduced.

Examples This example shows how to delete the neighbor tables:

Switch# **clear energywise neighbors** Cleared all non static energywise neighbors

You can verify that the tables were deleted by entering the **show energywise neighbors** privileged EXEC command.

Related Commands	Command	Description
	show energywise neighbors	Displays the EnergyWise neighbor tables.

clear errdisable interface

Use the **clear errdisable interface** privileged EXEC command on the switch stack or on a standalone switch to re-enable a VLAN that was error disabled.

clear errdisable interface interface-id vlan [vlan-list]

Syntax Description	vlan list	(Optional) Specify a list of VLANs to be re-enabled. If a vlan-list is not specified, then all VLANs are re-enabled.
Command Default	No default is defined	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(37)SE	This command was introduced.
Examples	This example shows h	ow to re-enable all VLANs that were error-disabled on port Gi4/0/2.
Examples	1	able interface GigabitEthernet4/0/2 vlan
Related Commands	Command	Description
	errdisable detect cau	Enables error-disabled detection for a specific cause or all causes.
	errdisable recovery	Configures the recovery mechanism variables.
	show errdisable dete	ct Displays error-disabled detection status.
	show errdisable reco	very Display error-disabled recovery timer information.
	show interfaces statu	us err-disabled Displays interface status of a list of interfaces in error-disabled state.

Use the **clear ipc** privileged EXEC command to clear Interprocess Communications Protocol (IPC) statistics.

clear ipc {queue-statistics | statistics}

Syntax Description	queue-statistics	Clear the IPC queue statistics.
	statistics	Clear the IPC statistics.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines		stics by using the clear ipc statistics command, or you can clear only the queue clear ipc queue-statistics command.
Usage Guidelines	statistics by using the	clear ipc queue-statistics command.
Usage Guidelines Examples	statistics by using the This example shows h	clear ipc queue-statistics command.

clear l2protocol-tunnel counters

Use the **clear l2protocol-tunnel counters** privileged EXEC command to clear the protocol counters in protocol tunnel ports.

clear l2protocol-tunnel counters [interface-id]

Syntax Description	<i>interface-id</i> (Optional) Specify interface (physical interface or port channel) for protocol counters are to be cleared.		
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(40)SE	This command was introduced.	
Usage Guidelines	Use this command to clear protocol tunnel counters on the switch or on the specified interface.		
Examples	This example shows how to clear Layer 2 protocol tunnel counters on an interface:		
	Switch# clear 12protocol-tunnel counters gigabitethernet0/3		
Related Commands	Command	Description	
	show l2protocol-tunn	Displays information about ports configured for Layer 2 protocol tunneling.	

clear ip dhcp snooping Use the **clear ip dhcp snooping** privileged EXEC command on the switch stack or on a standalone switch to clear the DHCP snooping binding database, the DHCP snooping binding database agent statistics, or the DHCP snooping statistics counters. **clear ip dhcp snooping {binding {* |** *ip-address* **| interface interface-id | vlan vlan-id} | database**

statistics | statistics }

Chapter 2 Cisco Catalyst Blade Switch 3040 for FSC Cisco IOS Commands

Syntax Description	binding	Clear the DHCP snooping binding database.		
	*	Clear all automatic bindings.		
	ip-address	Clear the binding entry IP address.		
	interface interface-ia	<i>l</i> Clear the binding input interface.		
	vlan vlan-id	Clear the binding entry VLAN.		
	database statistics	Clear the DHCP snooping binding database agent statistics.		
	statistics	Clear the DHCP snooping statistics counter.		
Defaults	No default is defined.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.2(37)SE	The command was introduced.		
		The *, <i>ip-address</i> , interface <i>interface-id</i> , <i>and</i> vlan <i>vlan-id</i> keywords were introduced.		
Usage Guidelines	When you enter the clear ip dhcp snooping database statistics command, the switch does not update the entries in the binding database and in the binding file before clearing the statistics.			
Examples	This example shows how to clear the DHCP snooping binding database agent statistics:			
	Switch# clear ip dhcp snooping database statistics			
	You can verify that the statistics were cleared by entering the show ip dhcp snooping database privileged EXEC command.			
	This example shows how to clear the DHCP snooping statistics counters:			
	Switch# clear ip dhcp snooping statistics			
	You can verify that the statistics were cleared by entering the show ip dhcp snooping statistics user EXEC command.			

Related Commands Co

Related Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	show ip dhcp snooping binding	Displays the status of DHCP snooping database agent.
	show ip dhcp snooping statistics	Displays the DHCP snooping statistics.

clear lacp

Use the **clear lacp** privileged EXEC command to clear Link Aggregation Control Protocol (LACP) channel-group counters.

clear lacp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 12.	
	counters	Clear traffic counters.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.	
Usage Guidelines		s by using the clear lacp counters command, or you can clear only the counters group by using the clear lacp <i>channel-group-number</i> counters command.	
Examples	This example shows how to clear all channel-group information:		
	Switch# clear lacp counters		
	This example shows how to clear LACP traffic counters for group 4:		
	Switch# clear lacp 4 counters		
	You can verify that the information was deleted by entering the show lacp counters or the show lacp 4 counters privileged EXEC command.		
	Command	Description	
Related Commands	Commanu	Description	

clear mac address-table

Use the **clear mac address-table** privileged EXEC command to delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, or all dynamic addresses on a particular VLAN. This command also clears the MAC address notification global counters.

clear mac address-table {dynamic [address mac-addr | interface interface-id | vlan vlan-id] |
 notification}

Syntax Description	dynamic Delete all dyn		namic MAC addresses. elete the specified dynamic MAC address. elete all dynamic MAC addresses on the specified physical port rel.	
	mac-addr			
		notification	Clear the noti	fications in the history table and reset the counters.
Defaults	No default is defined.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.2(25)SEF2	This comman	d was introduced.	
Examples	This example shows how to remove a specific MAC address from the dynamic address table: Switch# clear mac address-table dynamic address 0008.0070.0007			
	You can verify that the information was deleted by entering the show mac address-table pr EXEC command.			
Related Commands	Command		Description	
	mac address-table not	ification	Enables the MAC address notification feature.	
	show mac address-tab	le	Displays the MAC address table static and dynamic entries.	
	show mac address-tab	le notification	Displays the MAC address notification settings for all interfaces or the specified interface.	
	snmp trap mac-notific	ation	Enables the Simple Network Management Protocol (SNMP) MAC address notification trap on a specific interface.	

clear mac address-table move update

Use the **clear mac address-table move update** privileged EXEC command to clear the mac address-table-move update-related counters.

clear mac address-table move update

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

Defaults No default is defined.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Examples This example shows how to clear the mac address-table move update related counters.

Switch# clear mac address-table move update

You can verify that the information was cleared by entering the **show mac address-table move update** privileged EXEC command.

Related Commands	Command	Description
	<pre>mac address-table move update {receive transmit}</pre>	Configures MAC address-table move update on the switch.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

clear nmsp statistics

Use the **clear nmsp statistics** privileged EXEC command to clear the Network Mobility Services Protocol (NMSP) statistics. This command is available only when your switch is running the cryptographic (encrypted) software image.

clear nmsp statistics

Syntax Description	This command has n	no arguments or keywords.	
Defaults	No default is defined	d.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(50)SE	This command was introduced.	
Examples	This example shows how to clear NMSP statistics: Switch# clear nmsp statistics		
	You can verify that information was deleted by entering the show nmsp statistics privileged command.		
Related Commands	Command	Description	
	show nmsp	Displays the NMSP information.	

clear pagp

Use the **clear pagp** privileged EXEC command to clear Port Aggregation Protocol (PAgP) channel-group information.

clear pagp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 12.	
	counters	Clear traffic counters.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release Modification		
	12.2(25)SEF2	This command was introduced.	
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.	
Usage Guidelines	You can clear all counters by using the clear pagp counters command, or you can clear only the counter for the specified channel group by using the clear pagp <i>channel-group-number</i> counters command.		
Examples	This example shows how Switch# clear pagp con	v to clear all channel-group information:	
	This example shows how to clear PAgP traffic counters for group 10: Switch# clear pagp 10 counters		
	You can verify that information was deleted by entering the show pagp privileged EXEC command.		
Related Commands	Command	Description	
Related Commands	oommana		

clear port-security

Use the **clear port-security** privileged EXEC command to delete from the MAC address table all secure addresses or all secure addresses of a specific type (configured, dynamic, or sticky) on the switch or on an interface.

clear port-security {all | configured | dynamic | sticky} [[address mac-addr | interface interface-id] [vlan {vlan-id | {access | voice}}]]

Syntax Description	all	Delete all secure MAC addresses.	
	configured	Delete configured secure MAC addresses.	
	dynamic	Delete secure MAC addresses auto-learned by hardware.	
	sticky	Delete secure MAC addresses, either auto-learned or configured.	
	address mac-addr	(Optional) Delete the specified dynamic secure MAC address.	
	interface interface-id	(Optional) Delete all the dynamic secure MAC addresses on the specified physical port or VLAN.	
	vlan	(Optional) Delete the specified secure MAC address from the specified VLAN. Enter one of these options after you enter the vlan keyword:	
		• <i>vlan-id</i> —On a trunk port, specify the VLAN ID of the VLAN on which this address should be cleared.	
		• access —On an access port, clear the specified secure MAC address on the access VLAN.	
		• voice —On an access port, clear the specified secure MAC address on the voice VLAN.	
		Note The voice keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Examples	This example shows ho	w to clear all secure addresses from the MAC address table:	
	Switch# clear port-security all		
	-	w to remove a specific configured secure address from the MAC address table:	
	Switch# clear port-se	curity configured address 0008.0070.0007	

This example shows how to remove all the dynamic secure addresses learned on a specific interface:

Switch # clear port-security dynamic interface gigabitethernet0/1

This example shows how to remove all the dynamic secure addresses from the address table:

Switch# clear port-security dynamic

You can verify that the information was deleted by entering the **show port-security** privileged EXEC command.

Related Commands Command

Command	Description
switchport port-security	Enables port security on an interface.
switchport port-security mac-address mac-address	Configures secure MAC addresses.
switchport port-security maximum value	Configures a maximum number of secure MAC addresses on a secure interface.
show port-security	Displays the port security settings defined for an interface or for the switch.

clear spanning-tree counters

Use the **clear spanning-tree counters** privileged EXEC command to clear the spanning-tree counters.

clear spanning-tree counters [interface interface-id]

Syntax Description	interface interface-id	(Optional) Clear all spanning-tree counters on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 12.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
	12.2(50)SE	
	12.2(30)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.
Usage Guidelines		
Usage Guidelines Examples	If the <i>interface-id</i> is not	to 12.
	If the <i>interface-id</i> is not	to 12. specified, spanning-tree counters are cleared for all interfaces. w to clear spanning-tree counters for all interfaces:
	If the <i>interface-id</i> is not This example shows how	to 12. specified, spanning-tree counters are cleared for all interfaces. w to clear spanning-tree counters for all interfaces:

clear spanning-tree detected-protocols

Use the **clear spanning-tree detected-protocols** privileged EXEC command to restart the protocol migration process (force the renegotiation with neighboring switches) on all interfaces or on the specified interface.

clear spanning-tree detected-protocols [interface interface-id]

	interface interface-id	(Optional) Restart the protocol migration process on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 12.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
-	12.2(25)SEF2	This command was introduced.
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.
	legacy IEEE 802.1D con it sends only IEEE 802.1	IEEE 802.1D switches. If a rapid-PVST+ switch or an MSTP switch receives a figuration bridge protocol data unit (BPDU) with the protocol version set to 0, D BPDUs on that port. A multiple spanning-tree (MST) switch can also detect dary of a region when it receives a legacy BPDU, an MST BPDU (Version 3)
	However, the switch doe receives IEEE 802.1D Bl	nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. Use the clear spanning-tree
Examples	However, the switch doe receives IEEE 802.1D Bl the link unless the legacy detected-protocols com	nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. Use the clear spanning-tree
Examples	However, the switch doe receives IEEE 802.1D B the link unless the legacy detected-protocols com This example shows how	nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. Use the clear spanning-tree mand in this situation.
Examples Related Commands	However, the switch doe receives IEEE 802.1D B the link unless the legacy detected-protocols com This example shows how	nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. 	However, the switch doe receives IEEE 802.1D Bl the link unless the legacy detected-protocols com This example shows how Switch# clear spanning	nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. Use the clear spanning-tree mand in this situation. y to restart the protocol migration process on a port: g-tree detected-protocols interface gigabitethernet0/1

clear vmps statistics

Use the **clear vmps statistics** privileged EXEC command to clear the statistics maintained by the VLAN Query Protocol (VQP) client.

clear vmps statistics

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** No default is defined.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Examples This example shows how to clear VLAN Membership Policy Server (VMPS) statistics: Switch# clear vmps statistics

You can verify that information was deleted by entering the **show vmps statistics** privileged EXEC command.

Related Commands	Command	Description
	show vmps	Displays the VQP version, reconfirmation interval, retry count, VMPS IP addresses, and the current and primary servers.
		addresses, and the current and primary servers.

clear vtp counters

Use the **clear vtp counters** privileged EXEC command to clear the VLAN Trunking Protocol (VTP) and pruning counters.

clear vtp counters

Syntax Description This command has no arguments or keywords.

Defaults No default is defined.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Examples This example shows how to clear the VTP counters:

Switch# clear vtp counters

You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

Related Commands	Command	Description
	show vtp	Displays general information about the VTP management domain, status, and counters.

define interface-range

Use the **define interface-range** global configuration command to create an interface-range macro. Use the **no** form of this command to delete the defined macro.

define interface-range macro-name interface-range

no define interface-range macro-name interface-range

Syntax Description	macro-name	Name of the interface-range macro; up to 32 characters.	
	interface-range	Interface range; for valid values for interface ranges, see "Usage Guidelines."	
Defaults	This command has no default setting.		
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	The macro name i	s a 32-character maximum character string.	
	A macro can contain up to five ranges.		
		All interfaces in a range must be the same type; that is, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs, but you can combine multiple interface types in a macro.	
	When entering the	<i>interface-range</i> , use this format:	
	• type {first-inte	erface} - {last-interface}	
	• You must add a space between the first interface number and the hyphen when entering an <i>interface-range</i> . For example, gigabitethernet 0/1 - 2 is a valid range; gigabitethernet 0/1-2 is not a valid range		
	Valid values for <i>type</i> and <i>interface</i> :		
	• vlan <i>vlan-id</i> , where the VLAN ID is 1 to 4094		
	VLAN interfaces must have been configured with the interface vlan command (the show running-config privileged EXEC command displays the configured VLAN interfaces). VLAN interfaces not displayed by the show running-config command cannot be used in <i>interface-ranges</i> .		
	• port-channel port-channel-number, where port-channel-number is from 1 to 12		
	• gigabitethern	• gigabitethernet module/{first port} - {last port}	
	For physical interf	faces:	
	• module is alw	ays 0.	
	• the range is ty	<i>ppe</i> 0 / <i>number</i> - <i>number</i> (for example, gigabitethernet 0 / 1 - 2).	

When you define a range, you must enter a space before the hyphen (-), for example:

gigabitethernet0/1 - 2

You can also enter multiple ranges. When you define multiple ranges, you must enter a space after the first entry before the comma (,). The space after the comma is optional, for example:

gigabitethernet0/3, gigabitethernet 0/6-7

gigabitethernet0/3 - 4, gigabitethernet 0/6 - 7

Examples

This example shows how to create a multiple-interface macro:

Switch(config)# define interface-range macrol gigabitethernet0/1 - 2

Related Commands	Command	Description
	interface range	Executes a command on multiple ports at the same time.
	show running-config	Displays the current operating configuration, including defined macros. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

delete

Use the **delete** privileged EXEC command to delete a file or directory on the flash memory device.

delete [/force] [/recursive] filesystem:/file-url

Syntax Description	/force	(Optional) Suppress the prompt that confirms the deletion.		
	/recursive	it.		
	filesystem:	Alias for a flash file system.		
		The syntax for the local flash file system: flash:		
	lfile-url	The path (directory) and filename to delete.		
Command Modes	Privileged EXE	C		
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
	of every file. The prompting default, the swi	recursive keyword without the /force keyword, you are prompted to confirm the deletion behavior depends on the setting of the file prompt global configuration command. By tch prompts for confirmation on destructive file operations. For more information about see the <i>Cisco IOS Command Reference, Release 12.2</i> .		
Examples	This example shows how to remove the directory that contains the old software image after a successful download of a new image:			
	Switch# delete /force /recursive flash:/old-image			
	You can verify command.	that the directory was removed by entering the dir <i>filesystem</i> : privileged EXEC		
Related Commands	Command	Description		
	archive down	oad-sw Downloads a new image to the switch and overwrites or keeps the existing image.		

deny (IPv6 access-list configuration)

Use the **deny** command in IPv6 access list configuration mode on the switch stack or on a standalone switch to set deny conditions for an IPv6 access list. Use the **no** form of this command to remove the deny conditions.

- deny {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value]
 [time-range name]
- **no deny** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**sequence** *value*] [**time-range** *name*]

Internet Control Message Protocol

deny icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [sequence value] [time-range name]

Transmission Control Protocol

deny tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name]
 [urg]

User Datagram Protocol

deny udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [sequence value] [time-range name]

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp , esp , icmp , ipv6 , pcp , sctp , tcp , or udp , or an integer in the range from 0 to
		255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks about which to set deny conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	any	An abbreviation for the IPv6 prefix ::/0.
	host source-ipv6-address	The source IPv6 host address for which to set deny conditions.
		This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
		The range operator requires two port numbers. All other operators require one port number.
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set deny conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	host	The destination IPv6 host address for which to set deny conditions.
	destination-ipv6-address	This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	dscp value	(Optional) Match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

fragments	(Optional) Match non-initial fragmented packets where the fragment extension header contains a non-zero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.		
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages sent to the console is controlled by the logging console command.)		
	The message includes the access list name and sequence number, whether the packet was denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets denied in the prior 5-minute interval.		
	Note Logging is not supported for port ACLs.		
log-input	(Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.		
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.		
time-range name	(Optional) Specify the time range that applies to the deny statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.		
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by an ICMP message type. The type is a number from 0 to 255.		
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.		
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or an ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.		
ack	(Optional) Only for the TCP protocol: Acknowledgment (ACK) bit set.		
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.		
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.		
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.		
psh	(Optional) Only for the TCP protocol: Push function bit set.		
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.		
rst	(Optional) Only for the TCP protocol: Reset bit set.		
syn	(Optional) Only for the TCP protocol: Synchronize bit set.		
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.		

<u>Note</u>

Although visible in the command-line help strings, the **flow-label**, **routing**, and **undetermined-transport** keywords are not supported.

Defaults	No IPv6 access list is defined.		
Command Modes	IPv6 access list configuration		
Command History	Release 12.2(25)SED	Modification This command was introduced.	
	1212(20)022		
Usage Guidelines	•	ccess-list configuration mode) command is similar to the deny (IPv4 access-list le) command, except that it is IPv6-specific.	
	Use the deny (IPv6) command after the ipv6 access-list command to enter IPv6 access list configuration mode and to define the conditions under which a packet passes the access list.		
	Specifying IPv6 for the <i>protocol</i> argument matches against the IPv6 header of the packet.		
	By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.		
	You can add permit , deny , or remark statements to an existing access list without re-entering the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to show where it belongs.		
Note	any any statemen discovery. To disa nd-ns, there must	as implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 ts as its last match conditions. The two permit conditions allow ICMPv6 neighbor llow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any be an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement IPv6 ACL must contain at least one entry.	
	The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.		
	for traffic filtering	<i>bv6-prefix/prefix-length</i> and <i>destination-ipv6-prefix/prefix-length</i> arguments are used g. (The source prefix filters traffic based upon the traffic source; the destination prefix d upon the traffic destination.)	
		rts only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global ocal host addresses.	
	The fragments ke	eyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>]	

arguments are not specified.

This is a list of ICMP message names:

beyond-scope	destination-unreachable
echo-reply	echo-request
header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures the IPv6 access list named CISCO and applies the access list to outbound traffic on a Layer 3 interface. The first deny entry in the list prevents all packets that have a destination TCP port number greater than 5000 from leaving the interface. The second deny entry in the list prevents all packets that have a source UDP port number less than 5000 from leaving the interface. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets to leave the interface. The second permit entry in the list permits all other traffic to leave the interface. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
Switch(config)# interface gigabitethernet0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

deny (MAC access-list configuration)

Use the **deny** MAC access-list configuration command to prevent non-IP traffic from being forwarded if the conditions are matched. Use the **no** form of this command to remove a deny condition from the named MAC access list.

- {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask |mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src MAC-addr src-MAC-addr mask	Define a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
	host <i>dst-MAC-addr</i> <i>dst-MAC-addr</i> mask	Define a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		The type is 0 to 65535, specified in hexadecimal.
		The <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
	lavc-sca	(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.	
	<i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.	
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.	
mop-dump	(Optional) Select EtherType DEC-MOP Dump.	
msdos	(Optional) Select EtherType DEC-MSDOS.	
mumps	(Optional) Select EtherType DEC-MUMPS.	
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).	
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.	
vines-ip (Optional) Select EtherType VINES IP.		
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary Ethertype in decimal, hexadecimal, or octal.	

Note

Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-4.

Table 2-4	IPX Filtering Criteria
-----------	------------------------

IPX Encapsulation Type		
Cisco IOS Name	Novel Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes MAC-access list configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Permits non-IP traffic to be forwarded if conditions are matched.

Displays access control lists configured on a switch.

Usage Guidelines You enter MAC-access list configuration mode by using the mac access-list extended global configuration command. If you use the host keyword, you cannot enter an address mask; if you do not use the host keyword, you must enter an address mask. When an access control entry (ACE) is added to an access control list, an implied deny-any-any condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets. For more information about named MAC extended access lists, see the software configuration guide for this release. **Examples** This example shows how to define the named MAC extended access list to deny NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is denied. Switch(config-ext-macl)# deny any host 00c0.00a0.03fa netbios. This example shows how to remove the deny condition from the named MAC extended access list: Switch(config-ext-macl)# no deny any 00c0.00a0.03fa 0000.0000.0000 netbios. This example denies all packets with Ethertype 0x4321: Switch(config-ext-macl)# deny any 0x4321 0 You can verify your settings by entering the **show access-lists** privileged EXEC command. **Related Commands** Command Description Creates an access list based on MAC addresses for non-IP traffic. mac access-list extended

permit (MAC access-list

configuration) show access-lists

dot1x

Use the **dot1x** global configuration command to globally enable IEEE 802.1x authentication. Use the **no** form of this command to return to the default setting.

dot1x {critical {eapol | recovery delay milliseconds} | {guest-vlan supplicant} |
 system-auth-control}

no dot1x {critical {eapol | recovery delay} | {guest-vlan supplicant} | system-auth-control}

Though visible in the command-line help strings, the credentials name keywords are not supported.

Syntax Description	critical {eapol Configure the inaccessible authentication bypass parameters. For more information, see the dot1x critical (global configuration) command milliseconds}		
	guest-vlan supplicant	Enable optional guest VLAN behavior globally on the switch.	
	system-auth-control	Enable IEEE 802.1x authentication globally on the switch.	
Defaults	IEEE 802.1x authenticat	tion is disabled, and the optional guest VLAN behavior is disabled.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list before globally enabling IEEE 802.1x authentication. A method list describes the sequence and authentication methods to be used to authenticate a user.		
	Before globally enabling IEEE 802.1x authentication on a switch, remove the EtherChannel configuration from the interfaces on which IEEE 802.1x authentication and EtherChannel are configured.		
	If you are using a device running the Cisco Access Control Server (ACS) application for IEEE 802.1x authentication with EAP-Transparent LAN Services (TLS) and with EAP-MD5, make sure that the device is running ACS Version 3.2.1 or later.		
	You can use the guest-vlan supplicant keywords to enable the optional IEEE 802.1x guest VLAN behavior globally on the switch. For more information, see the dot1x guest-vlan command.		
Examples	This example shows how	v to globally enable IEEE 802.1x authentication on a switch:	
	Switch(config)# dot1x system-auth-control		

This example shows how to globally enable the optional guest VLAN behavior on a switch:

Switch(config)# dot1x guest-vlan supplicant

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands

Command	Description
dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
dot1x guest-vlan	Enables and specifies an active VLAN as an IEEE 802.1x guest VLAN.
dot1x port-control	Enables manual control of the authorization state of the port.
<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x auth-fail max-attempts

Use the **dot1x auth-fail max-attempts** interface configuration command to configure the maximum allowable authentication attempts before a port is moved to the restricted VLAN. To return to the default setting, use the **no** form of this command.

dot1x auth-fail max-attempts max-attempts

no dot1x auth-fail max-attempts

Syntax Description	<i>max-attempts</i> Specify a maximum number of authentication attempts allowed before a is moved to the restricted VLAN. The range is 1 to 3, the default value		
Defaults	The default value	is 3 attempts.	
Command Modes	Interface configur	ation	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	• •	e the maximum number of authentication attempts allowed by the VLAN, the change the re-authentication timer expires.	
Examples	-	ws how to set 2 as the maximum number of authentication attempts allowed before the he restricted VLAN on port 3:	
	<pre>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet0/3 Switch(config-if)# dot1x auth-fail max-attempts 2 Switch(config-if)# end Switch(config)# end Switch#</pre>		
	You can verify yo command.	ur settings by entering the show dot1x [interface interface-id] privileged EXEC	

Related Commands	Command	Description
	dot1x auth-fail vlan [vlan id]	Enables the optional restricted VLAN feature.
	<pre>dot1x max-reauth-req [count]</pre>	Sets the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

OL-10696-05

dot1x auth-fail vlan

Use the **dot1x auth-fail vlan** interface configuration command to enable the restricted VLAN on a port. To return to the default setting, use the **no** form of this command.

dot1x auth-fail vlan vlan-id

no dot1x auth-fail vlan

Syntax Description	vlan-id	Specify a VLAN in the range of 1 to 4094.		
Defaults	No restricted VLAN is configured.			
Command Modes	Interface configur	ration		
Command History	Release	Modification		
-	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	You can configure	e a restricted VLAN on ports configured as follows:		
-	• single-host (default) mode			
	• auto mode fo	or authorization		
	You should enable re-authentication. The ports in restricted VLANs do not receive re-authentication requests if it is disabled. To start the re-authentication process, the restricted VLAN must receive a link-down event or an Extensible Authentication Protocol (EAP) logoff event from the port. If a hose connected through a hub, the port might never receive a link-down event when that host is disconnect and, as a result, might not detect any new hosts until the next re-authentication attempt occurs.			
	If the supplicant fails authentication, the port is moved to a restricted VLAN, and an EAP <i>success</i> message is sent to the supplicant. Because the supplicant is not notified of the actual authentication failure, there might be confusion about this restricted network access. An EAP success message is sent for these reasons:			
• If the EAP success message is not sent, the supplicant tries to authenticate every 6 default) by sending an EAP-start message.				
	or example, devices running Windows XP) cannot implement DHCP until they receive ess message.			
	A supplicant might cache an incorrect username and password combination after receiving an EAP success message from the authenticator and re-use that information in every re-authentication. Until the supplicant sends the correct username and password combination, the port remains in the restricted VLAN.			
	Internal VLANs u	sed for Layer 3 ports cannot be configured as restricted VLANs.		
	You cannot configure a VLAN to be both a restricted VLAN and a voice VLAN. If you do this, a syslog message is generated.			

When a restricted VLAN port is moved to an unauthorized state, the authentication process restarts. If the supplicant fails the authentication process again, the authenticator waits in the held state. After the supplicant has correctly re-authenticated, all IEEE 802.1x ports are reinitialized and treated as normal IEEE 802.1x ports.

When you reconfigure a restricted VLAN as a different VLAN, any ports in the restricted VLAN are also moved, and the ports stay in their currently authorized state.

When you shut down or remove a restricted VLAN from the VLAN database, any ports in the restricted VLAN are immediately moved to an unauthorized state, and the authentication process restarts. The authenticator does not wait in a held state because the restricted VLAN configuration still exists. While the restricted VLAN is inactive, all authentication attempts are counted so that when the restricted VLAN becomes active, the port is immediately placed in the restricted VLAN.

The restricted VLAN is supported only in single host mode (the default port mode). For this reason, when a port is placed in a restricted VLAN, the supplicant's MAC address is added to the MAC address table, and any other MAC address that appears on the port is treated as a security violation.

Examples

This example shows how to configure a restricted VLAN on port 1:

Switch# configure terminal

```
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x auth-fail vlan 40
Switch(config-if)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x auth-fail max-attempts [max-attempts]	Configures the number of authentication attempts allowed before assigning a supplicant to the restricted VLAN.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x control-direction

dot1x control-direction

Use the **dot1x control-direction** interface configuration command to enable the IEEE 802.1x authentication with the wake-on-LAN (WoL) feature and to configure the port control as unidirectional or bidirectional. Use the **no** form of this command to return to the default setting.

dot1x control-direction {both | in}

no dot1x control-direction

Syntax Description	both	Enable bidirectional control on port. The port cannot receive packets from or send packets to the host.		
	in	Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.		
Defaults	The port is in bidire	ectional mode.		
Command Modes	Interface configurat	ion		
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
		on about WoL, see the "Using IEEE 802.1x Authentication with Wake-on-LAN" Figuring IEEE 802.1x Port-Based Authentication" chapter in the software		
	configuration guide.			
Examples	This example shows how to enable unidirectional control:			
	Switch(config-if)# dot1x control-direction in			
	This example shows how to enable bidirectional control:			
	Switch(config-if)# dot1x control-direction both			
	You can verify your settings by entering the show dot1x all privileged EXEC command.			
		privileged EXEC command output is the same for all switches except for the port of the port. If a host is attached to the port but is not yet authenticated, a display ars:		
	Supplicant MAC 0002.b39a.9275 AuthSM State = CONNECTING BendSM State = IDLE PortStatus = UNAUTHORIZED			

If you enter the **dot1x control-direction in** interface configuration command to enable unidirectional control, this appears in the **show dot1x all** command output:

ControlDirection = In

If you enter the **dot1x control-direction in** interface configuration command and the port cannot support this mode due to a configuration conflict, this appears in the **show dot1x all** command output:

ControlDirection = In (Disabled due to port settings)

Related Commands	Command	Description	
	<pre>show dot1x [all interface interface-id]</pre>	Displays control-direction port setting status for the specified interface.	

dot1x credentials (global configuration)

Use the **dot1x credentials** global configuration command to configure a profile on a supplicant switch.

dot1x credentials profile

no dot1x credentials profile

Syntax Description	profile	Specify a profile for the supplicant switch.	
Defaults	No profile is config	gured for the switch.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.2(50)SE	This command was introduced.	
Usage Guidelines	You must have ano	ther switch set up as the authenticator for this switch to be the supplicant.	
Examples	This example show	vs how to configure a switch as a supplicant:	
	Switch(config)# dot1x credentials profile		
	You can verify you	r settings by entering the show running-config privileged EXEC command.	
Related Commands	Command	Description	
	cisp enable	Enables Client Information Signalling Protocol (CISP).	
	show cisp	Displays CISP information for a specified interface.	

dot1x critical (global configuration)

Use the **dot1x critical** global configuration command to configure the parameters for the inaccessible authentication bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. To return to default settings, use the **no** form of this command.

dot1x critical {eapol | recovery delay milliseconds}

no dot1x critical {eapol | recovery delay}

Syntax Description	eapol		Specify that the switch sends an EAPOL-Success message when the switch puts the critical port in the critical-authentication state.	
	recovery delay m	illiseconds	Set the recovery delay period in milliseconds. The range is from 1 to 10000 milliseconds.	
Defaults			APOL-Success message to the host when the switch successfully y putting the critical port in the critical-authentication state.	
	The recovery dela	y period is 10	000 milliseconds (1 second).	
Command Modes	Global configurati	on		
Command History	Release	Modificati	on	
	12.2(25)SEF2	This comn	nand was introduced.	
Usage Guidelines			fy that the switch sends an EAPOL-Success message when the switch cal-authentication state.	
	Use the recovery delay <i>milliseconds</i> keyword to set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The default recovery delay period is 1000 milliseconds. A port can be re-initialized every second.			
	command. To cont	figure the acc	cation bypass on a port, use the dot1x critical interface configuration ess VLAN to which the switch assigns a critical port, use the dot1x configuration command.	
Examples	-		200 as the recovery delay period on the switch:	
	Switch# dot1x cr			
	You can verify your configuration by entering the show dot1x privileged EXEC command.			

Related Commands	Command	Description
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature, and configures the access VLAN for the feature.
	show dot1x	Displays IEEE 802.1x status for the specified port.

dot1x critical (interface configuration)

Use the **dot1x critical** interface configuration command to enable the inaccessible-authentication-bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. You can also configure the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state. To disable the feature or return to default, use the **no** form of this command.

dot1x critical [recovery action reinitialize | vlan vlan-id]

no dot1x critical [recovery | vlan]

Syntax Description	recovery action re			
		specify that the recovery action is to authenticate the port when an authentication server is available.		
	vlan vlan-id	Specify the access VLAN to which the switch can assign a critical		
	vian vian-ia	port. The range is from 1 to 4094.		
Defaults	The inaccessible-au	thentication-bypass feature is disabled.		
	The recovery action	is not configured.		
	The access VLAN i	s not configured.		
Command Modes	Interface configurat	ion		
Command History	Release	Modification		
Commanu mistory				
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	To specify the access VLAN to which the switch assigns a critical port when the port is in the critical-authentication state, use the vlan <i>vlan-id</i> keywords. The specified type of VLAN must match the type of port, as follows:			
	• If the critical po	ort is an access port, the VLAN must be an access VLAN.		
	• If the critical port is a private VLAN host port, the VLAN must be a secondary private VLAN.			
	• If the critical port is a routed port, you can specify a VLAN, but this is optional.			
		ng Windows XP and the critical port to which the client is connected is in the on state, Windows XP might report that the interface is not authenticated.		
	If the Windows XP of	client is configured for DHCP and has an IP address from the DHCP server, receiving		

You can configure the inaccessible authentication bypass feature and the restricted VLAN on an IEEE 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, the switch changes the port state to the critical authentication state, and it remains in the restricted VLAN.

You can configure the inaccessible bypass feature and port security on the same switch port.

Examples

This example shows how to enable the inaccessible authentication bypass feature on port 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x critical
Switch(config-if)# end
Switch(config)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x default

Use the **dot1x default** interface configuration command to reset the IEEE 802.1x parameters to their default values.

dot1x default

Syntax Description	This command has no a	rguments or keywords.
Defaults	 The number of seco The periodic re-auth The quiet period is The retransmission The maximum retra The host mode is si The client timeout periodic second seco	 802.1x protocol enable state is disabled (force-authorized). onds between re-authentication attempts is 3600 seconds. hentication is disabled. 60 seconds. time is 30 seconds. ansmission number is 2 times.
Command Modes	Interface configuration	
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Examples	Switch(config-if)# dc	w to reset the IEEE 802.1x parameters on a port: btlx default tings by entering the show dot1x [interface interface-id] privileged EXEC
Related Commands	Command	Description
	show dot1x [interface	· · · · · · · · · · · · · · · · · · ·
		merjace ia Displays IEEE 002.1X status for the specified port.

dot1x fallback

Use the **dot1xfallback** interface configuration command on the switch stack or on a standalone switch to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the **no** form of this command.

dot1x fallback *profile*

no dot1x fallback

Syntax Description	profile	Specify a fall authentication	back profile for clients that do not support IEEE 802.1x n.	
Defaults	No fallback is er	abled.		
Command Modes	Interface configu	iration		
Command History	Release	Modification		
	12.2(35)SE	This command wa	as introduced.	
Usage Guidelines	You must enter the dot1x port-control auto interface configuration command on a switch port before entering this command.			
Examples	This example shows how to specify a fallback profile to a switch port that has been configured for IEEE 802.1x authentication:			
	<pre>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet1/0/3 Switch(config-if)# dot1x fallback profile1 Switch(config-fallback-profile)# exit Switch(config)# end</pre>			
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.			
Related Commands	Command		Description	
	show dot1x [int	erface interface-id]	Displays IEEE 802.1x status for the specified port.	
	fallback profile	-	Create a web authentication fallback profile.	
	ip admission		Enable web authentication on a port	
	ip admission na	ame proxy http	Enable web authentication globally on a switch	

dot1x guest-vlan

Use the **dot1x guest-vlan** interface configuration command to specify an active VLAN as an IEEE 802.1x guest VLAN. Use the **no** form of this command to return to the default setting.

dot1x guest-vlan vlan-id

no dot1x guest-vlan

Syntax Description	vlan-id	Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094.			
Defaults	No guest VLAN is	s configured.			
Command Modes	Interface configura	ation			
Command History	Release	Modification			
	12.2(25)SEF2	This command was introduced.			
Usage Guidelines	You can configure a guest VLAN on one of these switch ports:				
	• A static-access port that belongs to a nonprivate VLAN.				
	• A private-VLAN port that belongs to a secondary private VLAN. All the hosts connected to the switch port are assigned to private VLANs, whether or not the posture validation was successful. The switch determines the primary private VLAN by using the primary- and secondary-private-VLAN associations on the switch.				
	For each IEEE 802.1x port on the switch, you can configure a guest VLAN to provide limited services to clients (a device or workstation connected to the switch) not running IEEE 802.1x authentication. These users might be upgrading their systems for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.				
	When you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.				
	The switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is reset upon loss of link.				
	Any number of non-IEEE 802.1x-capable clients are allowed access when the switch port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication is restarted.				
	Guest VLANs are	supported on IEEE 802.1x ports in single-host or multiple-hosts mode.			

You can configure any active VLAN except an Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (**dot1x timeout quiet-period** and **dot1x timeout tx-period** interface configuration commands). The amount to decrease the settings depends on the connected IEEE 802.1x client type.

The switch supports *MAC authentication bypass*. When it is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified. For more information, see the "Using IEEE 802.1x Authentication with MAC Authentication Bypass" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.

Examples

This example shows how to specify VLAN 5 as an IEEE 802.1x guest VLAN:

Switch(config-if) # dot1x guest-vlan 5

This example shows how to set 3 as the quiet time on the switch, to set 15 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request, and to enable VLAN 2 as an IEEE 802.1x guest VLAN when an IEEE 802.1x port is connected to a DHCP client:

Switch(config-if)# dot1x timeout quiet-period 3
Switch(config-if)# dot1x timeout tx-period 15
Switch(config-if)# dot1x guest-vlan 2

This example shows how to enable the optional guest VLAN behavior and to specify VLAN 5 as an IEEE 802.1x guest VLAN:

Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x guest-vlan 5

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x	Enables the optional guest VLAN supplicant feature.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x host-mode

Use the **dot1x host-mode** interface configuration command to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port that has the **dot1x port-control** interface configuration command set to **auto**. Use the **no** form of this command to return to the default setting.

dot1x host-mode {multi-host | single-host}

no dot1x host-mode [multi-host | single-host]

Syntax Description	multi-host	Enable multiple-hosts mode on the switch.			
	single-host	Enable single-host mode on the switch.			
Defaults	The default is single-host mode.				
Command Modes	Interface configuration				
Command History	Release	Modification			
	12.2(25)SEF2	This command was introduced.			
Usage Guidelines	Use this command to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to an IEEE 802.1x-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.				
	Before entering this command, make sure that the dot1x port-control interface configuration command is set to auto for the specified port.				
Examples	This example shows how to enable IEEE 802.1x authentication globally, to enable IEEE 802.1x authentication on a port, and to enable multiple-hosts mode:				
	Switch(config)# dot1x system-auth-control Switch(config)# interface gigabitethernet0/1 Switch(config-if)# dot1x port-control auto Switch(config-if)# dot1x host-mode multi-host				
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.				
Related Commands	Command	Description			
	show dot1x [inter	face <i>interface-id</i>] Displays IEEE 802.1x status for the specified port.			

dot1x initialize

Use the **dot1x initialize** privileged EXEC command to manually return the specified IEEE 802.1x-enabled port to an unauthorized state before initiating a new authentication session on the port.

dot1x initialize [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be initialized.	
Defaults	There is no default setting.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	Use this command to initialize the IEEE 802.1x state machines and to set up a fresh environment for authentication. After you enter this command, the port status becomes unauthorized. There is not a no form of this command.		
Examples	This example shows how to manually initialize a port: Switch# dot1x initialize interface gigabitethernet0/2		
	You can verify the unauthorized port status by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.		
Related Commands	Command	Description	
	<pre>show dot1x [interface i</pre>	<i>nterface-id</i>] Displays IEEE 802.1x status for the specified port.	

dot1x mac-auth-bypass

Use the **dot1x mac-auth-bypass** interface configuration command to enable the MAC authentication bypass feature. Use the **no** form of this command to disable MAC authentication bypass feature.

dot1x mac-auth-bypass [eap]

no dot1x mac-auth-bypass

Syntax Description	eap (Optional) Configure the switch to use Extensible Authentication Protocol (EAP) for authentication.				
Defaults	MAC authentication bypass is disabled.				
Command Modes	Interface configuration				
Command History	Release	Modification			
	12.2(25)SEF2	This command was introduced.			
Usage Guidelines	Unless otherwise stated, the MAC authentication bypass usage guidelines are the same as the IEEE 802.1x authentication guidelines.				
	If you disable MAC authentication bypass from a port after the port has been authenticated with its MAC address, the port state is not affected.				
	If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.				
	If the port is in the authorized state, the port remains in this state until re-authorization occurs.				
	If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant and uses IEEE 802.1x authentication (not MAC authentication bypass) to authorize the interface.				
	Clients that were authorized with MAC authentication bypass can be re-authenticated.				
	For more information about how MAC authentication bypass and IEEE 802.1x authentication interact, see the "Understanding IEEE 802.1x Authentication with MAC Authentication Bypass" section and the "IEEE 802.1x Authentication Configuration Guidelines" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.				
Examples	This example shows how to enable MAC authentication bypass and to configure the switch to use EAP for authentication:				
	Switch(config-if)#	dot1x mac-auth-bypass eap			

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x max-reauth-req

Use the **dot1x max-reauth-req** interface configuration command to set the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state. Use the **no** form of this command to return to the default setting.

dot1x max-reauth-req count

no dot1x max-reauth-req

Syntax Description	count	Number of times that the switch restarts the authentication process before the port changes to the unauthorized state. The range is 0 to 10.
Defaults	The default is 2 times	
Command Modes	Interface configuratio	n
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	•	e default value of this command only to adjust for unusual circumstances such as ecific behavioral problems with certain clients and authentication servers.
Examples	-	now to set 4 as the number of times that the switch restarts the authentication rt changes to the unauthorized state:
	Switch(config-if)#	dot1x max-reauth-req 4
	You can verify your se command.	ettings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC
Related Commands	Command	Description
	dot1x max-req	Sets the maximum number of times that the switch forwards an EAP frame (assuming that no response is received) to the authentication server before restarting the authentication process.
	dot1x timeout tx-per	riod Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.
	<pre>show dot1x [interfac interface-id]</pre>	ce Displays IEEE 802.1x status for the specified port.

dot1x max-req

Use the **dot1x max-req** interface configuration command to set the maximum number of times that the switch sends an Extensible Authentication Protocol (EAP) frame from the authentication server (assuming that no response is received) to the client before restarting the authentication process. Use the **no** form of this command to return to the default setting.

dot1x max-req count

no dot1x max-req

Syntax Description	countNumber of times that the switch resends an EAP frame from the authentication server before restarting the authentication process. The range is 1 to 10.		
Defaults	The default is 2 times.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	•	ault value of this command only to adjust for unusual circumstances such as behavioral problems with certain clients and authentication servers.	
Examples	-	o set 5 as the number of times that the switch sends an EAP frame from the client before restarting the authentication process:	
	Switch(config-if)# dot1x max-req 5		
	You can verify your setting command.	gs by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC	
Related Commands	Command	Description	
	dot1x timeout tx-period	Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.	
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.	

dot1x pae

Use the **dot1x pae** interface configuration command to configure the port as an IEEE 802.1x port access entity (PAE) authenticator. Use the **no** form of this command to disable IEEE 802.1x authentication on the port.

dot1x pae authenticator

no dot1x pae

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

Defaults The port is not an IEEE 802.1x PAE authenticator, and IEEE 802.1x authentication is disabled on the port.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines Use the **no dot1x pae** interface configuration command to disable IEEE 802.1x authentication on the port.

When you configure IEEE 802.1x authentication on a port, such as by entering the **dot1x port-control** interface configuration command, the switch automatically configures the port as an EEE 802.1x authenticator. After the **no dot1x pae** interface configuration command is entered, the Authenticator PAE operation is disabled.

Examples This example shows how to disable IEEE 802.1x authentication on the port: Switch(config-if)# no dot1x pae

You can verify your settings by entering the show dot1x or show eap privileged EXEC command.

Related Commands	Command	Description
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.
	show eap	Displays EAP registration and session information for the switch or for the specified port.

dot1x port-control

Use the **dot1x port-control** interface configuration command to enable manual control of the authorization state of the port. Use the **no** form of this command to return to the default setting.

dot1x port-control {auto | force-authorized | force-unauthorized}

no dot1x port-control

Syntax Description	autoEnable IEEE 802.1x authentication on the port and cause the port to change the authorized or unauthorized state based on the IEEE 802.1x authentication exchange between the switch and the client.	
	force-authorized Disable IEEE 802.1x authentication on the port and cause the port to trate to the authorized state without an authentication exchange. The port se receives normal traffic without IEEE 802.1x-based authentication of the	
	force-unauthorized	Deny all access through this port by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.
Defaults	The default is force-a	uthorized.
Command Modes	Interface configuratio	n
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	inesYou must globally enable IEEE 802.1x authentication on the switch by using the dot1x system-auth-control global configuration command before enabling IEEE 802.1x authenticat specific port.The IEEE 802.1x standard is supported on Layer 2 static-access ports, voice VLAN ports, and routed ports.	
	The IEEE 802.1x star	ndard is supported on Layer 2 static-access ports and voice VLAN ports.
	You can use the auto	keyword only if the port is not configured as one of these:
	appears, and IEE	ou try to enable IEEE 802.1x authentication on a trunk port, an error message E 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled error message appears, and the port mode is not changed.
	you try to enable IEEE 802.1x auth	A port in dynamic mode can negotiate with its neighbor to become a trunk port. If IEEE 802.1x authentication on a dynamic port, an error message appears, and nentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled an error message appears, and the port mode is not changed.

2-113

	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.
Related Commands	Command	Description
	You can verify your settings by entering command.	the show dot1x [interface <i>interface-id</i>] privileged EXEC
	<pre>Switch(config)# interface gigabitet Switch(config-if)# dot1x port-contr</pre>	
Examples	This example shows how to enable IEEI	E 802.1x authentication on a port:
	global configuration command. To disab	tication on the switch, use the no dot1x system-auth-control ble IEEE 802.1x authentication on a specific port or to return to ct-control interface configuration command.
	IEEE 802.1x authentication on a po IEEE 802.1x authentication is disab	d Remote SPAN (RSPAN) destination ports—You can enable rt that is a SPAN or RSPAN destination port. However, led until the port is removed as a SPAN or RSPAN destination. tication on a SPAN or RSPAN source port.
	EtherChannel as an IEEE 802.1x pc	re a port that is an active or a not-yet-active member of an ort. If you try to enable IEEE 802.1x authentication on an e appears, and IEEE 802.1x authentication is not enabled.

dot1x re-authenticate

Use the **dot1x re-authenticate** privileged EXEC command to manually initiate a re-authentication of the specified IEEE 802.1x-enabled port.

dot1x re-authenticate [interface interface-id]

Syntax Description	interface interface-id	(Optional) Module and port number of the interface to re-authenticate.
Defaults	There is no default settir	ng.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines		nd to re-authenticate a client without waiting for the configured number of
Ū		nd to re-authenticate a client without waiting for the configured number of entication attempts (re-authperiod) and automatic re-authentication.
-	seconds between re-auth	6 6
-	seconds between re-auth This example shows how	entication attempts (re-authperiod) and automatic re-authentication.
Examples	seconds between re-auth This example shows how	entication attempts (re-authperiod) and automatic re-authentication.
Examples Related Commands	seconds between re-auth This example shows how Switch# dot1x re-auth	entication attempts (re-authperiod) and automatic re-authentication. v to manually re-authenticate the device connected to a port: enticate interface gigabitethernet0/1 Description

dot1x reauthentication

Use the **dot1x reauthentication** interface configuration command to enable periodic re-authentication of the client. Use the **no** form of this command to return to the default setting.

dot1x reauthentication

no dot1x reauthentication

Syntax Description	This command has no arg	guments or keywords.
--------------------	-------------------------	----------------------

- **Defaults** Periodic re-authentication is disabled.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(25)SEF2This command was introduced.	

Usage Guidelines You configure the amount of time between periodic re-authentication attempts by using the dot1x timeout reauth-period interface configuration command.

Examples This example shows how to disable periodic re-authentication of the client:

Switch(config-if) # no dot1x reauthentication

This example shows how to enable periodic re-authentication and to set the number of seconds between re-authentication attempts to 4000 seconds:

Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x re-authenticate	Manually initiates a re-authentication of all IEEE 802.1x-enabled ports.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x test eapol-capable

Use the **dot1x test eapol-capable** privileged EXEC command to monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x.

dot1x test eapol-capable [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be queried.	
Defaults	There is no default settin	ng.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(44)SE	This command was introduced.	
Usage Guidelines	Use this command to test the IEEE 802.1x capability of the devices connected to all ports or to specific ports on a switch.		
	There is not a no form o	of this command.	
Examples	This example shows how to enable the IEEE 802.1x readiness check on a switch to query a port. It also shows the response received from the queried port verifying that the device connected to it is IEEE 802.1x-capable:		
	<pre>switch# dot1x test eapol-capable interface gigabitethernet0/13</pre>		
	DOT1X_PORT_EAPOL_CAPA capable	BLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL	
Related Commands	Command	Description	
	dot1x test timeout time	•	

dot1x test timeout

Use the **dot1x test timeout** global configuration command on the switch stack or on a standalone switch to configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness.

dot1x test timeout timeout

Syntax Description	timeout	Time in seconds to wait for an EAPOL response. The range is from 1 to 65535 seconds.
Defaults	The default setting is	10 seconds.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(44)SE	This command was introduced.
Usage Guidelines	Use this command to o There is not a no form	configure the timeout used to wait for EAPOL response. of this command.
Examples	Switch# dot1x test	ow to configure the switch to wait 27 seconds for an EAPOL response: imeout 27 eout configuration status by entering the show run privileged EXEC command.
Related Commands	Command	Description
	dot1x test eapol-cap <i>interface-id</i>]	able [interfaceChecks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports.

dot1x timeout

Use the **dot1x timeout** interface configuration command to set IEEE 802.1x timers. Use the **no** form of this command to return to the default setting.

dot1x timeout {quiet-period seconds | ratelimit-period seconds | reauth-period {seconds |
 server} | server-timeout seconds | supp-timeout seconds | tx-period seconds}

no dot1x timeout {quiet-period | reauth-period | server-timeout | supp-timeout | tx-period}

Syntax Description	quiet-period seconds	Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535.
	ratelimit-period seconds	Number of seconds that the switch ignores Extensible Authentication Protocol over LAN (EAPOL) packets from clients that have been successfully authenticated during this duration. The range is 1 to 65535.
	reauth-period { seconds	Set the number of seconds between re-authentication attempts.
	server }	The keywords have these meanings:
		• <i>seconds</i> —Sets the number of seconds from 1 to 65535; the default is 3600 seconds.
		• server —Sets the number of seconds as the value of the Session-Timeout RADIUS attribute (Attribute[27]).
	server-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the authentication server. The range is 30 to 65535.
	supp-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the IEEE 802.1x client. The range is 30 to 65535.
	tx-period seconds	Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65535.

Defaults

These are the default settings:

reauth-period is 3600 seconds.

quiet-period is 60 seconds.

tx-period is 5 seconds.

supp-timeout is 30 seconds.

server-timeout is 30 seconds.

rate-limit is 1 second.

Command Modes Interface

Interface configuration

Command History	Release	Modification			
	12.2(25)SEF2	This command was introduced.			
	12.2(40)SE	The range for tx-period seconds is incorrect. The correct range is from 1 to 65535.			
Usage Guidelines	You should change t	the default value of this command only to adjust for unusual circumstances such as			
Usage duluellines	U	unreliable links or specific behavioral problems with certain clients and authentication servers.			
	 The dot1x timeout reauth-period interface configuration command affects the behavior of the switch only if you have enabled periodic re-authentication by using the dot1x reauthentication interface configuration command. During the quiet period, the switch does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default. 				
		period is set to 0 (the default), the switch does not ignore EAPOL packets from en successfully authenticated and forwards them to the RADIUS server.			
Examples	This example shows between re-authentic	s how to enable periodic re-authentication and to set 4000 as the number of seconds cation attempts:			
	Switch(config-if)# dot1x reauthentication Switch(config-if)# dot1x timeout reauth-period 4000				
	This example shows how to enable periodic re-authentication and to specify the value of the Session-Timeout RADIUS attribute as the number of seconds between re-authentication attempts:				
	Switch(config-if)# dot1x reauthentication Switch(config-if)# dot1x timeout reauth-period server				
	This example shows	s how to set 30 seconds as the quiet time on the switch:			
	Switch(config-if) #	# dot1x timeout quiet-period 30			
	This example shows	s how to set 45 seconds as the switch-to-authentication server retransmission time:			
	Switch(config)# d	ot1x timeout server-timeout 45			
	This example shows request frame:	s how to set 45 seconds as the switch-to-client retransmission time for the EAP			
	Switch(config-if) #	# dot1x timeout supp-timeout 45			
	This example shows how to set 60 as the number of seconds to wait for a response to an EAP-request/identity frame from the client before re-transmitting the request:				
	Switch(config-if)# dot1x timeout tx-period 60				
	This example shows how to set 30 as the number of seconds that the switch ignores EAPOL packets from successfully authenticated clients:				
	Switch(config-if) #	# dot1x timeout ratelimit-period 30			
	You can verify your	settings by entering the show dot1x privileged EXEC command.			

Related Commands	Command	Description
	dot1x max-req	Sets the maximum number of times that the switch sends an EAP-request/identity frame before restarting the authentication process.
	dot1x reauthentication	Enables periodic re-authentication of the client.
	show dot1x	Displays IEEE 802.1x status for all ports.

dot1x violation-mode

Use the **dot1x violation-mode** interface configuration command on the switch stack or on a standalone switch to configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.

dot1x violation-mode { shutdown | restrict | protect }

no dot1x violation-mode

Syntax Description		Error disables the port or the virtual port on which a new unexpected MAC address occurs.
	restrict	Generates a syslog error when a violation error occurs.
	-	Silently discards packets from any new MAC addresses. This is the default setting.
Defaults	By default dot1x violatio	n-mode protect is enabled.
Command Modes	Interface configuration	
Command History	Release	Modification
	12.2(46)SE	This command was introduced.
	This example shows how to and change the port to rest Switch(config-if)# dot1 This example shows how to when it is connected to the	 1x violation-mode shutdown to configure an IEEE 802.1x-enabled port to generate a system error message stricted mode when a new device connects to the port: 1x violation-mode restrict to configure an IEEE 802.1x-enabled port to ignore a new connected device
	You can verify your setting command.	ngs by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC
Related Commands	Command	Description
	show dot1x [interface int	tterface-id] Displays IEEE 802.1x status for the specified port.
		terfuce in Displays IEEE 002.1X status for the specified port.

duplex

Use the **duplex** interface configuration command to specify the duplex mode of operation for a port. Use the **no** form of this command to return the port to its default value.

duplex {auto | full | half}

no duplex

Syntax Description	auto		Enable automatic duplex configuration; port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.		
	full	full Enable full-duplex mode.			
	half		Enable half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.		
Defaults	The default is auto for Gigabit Ethernet ports. The default is full for 100BASE- <i>x</i> (where - <i>x</i> is -BX, -FX, -FX-FE, or - LX) SFP modules.				
	 Duplex options are not supported on the 1000BASE-x (where -x is -BX, -CWDM, -LX, -SX, or -ZX) SFP modules. Duplex options are not supported on the 1000BASE-X ports that are connected through the blade server backplane to the internal NIC. 				
	For info	For information about which SFP modules are supported on your switch, see the product release notes.			
Command History	Releas	e	Modification		
ooninana motory	-	5)SEF2	This command was introduced.		
Usage Guidelines	-		ports, setting the port to auto has the same effect as specifying full if the attached negotiate the duplex parameter.		
	Note	connected de	mode is supported on Gigabit Ethernet interfaces if the duplex mode is auto and the evice is operating at half duplex. However, you cannot configure these interfaces to alf-duplex mode.		
	Certain ports can be configured to be either full duplex or half duplex. Applicability of this command depends on the device to which the switch is attached.				
	If both	1 6 4 1	ne support autonegotiation, we highly recommend using the default autonegotiation		

Cisco Catalyst Blade Switch 3040 for FSC Command Reference

energywise (global configuration)

Use the **energywise** global configuration command to enable and configure EnergyWise on an entity. Use the **no** form of this command to disable EnergyWise and to remove the EnergyWise configuration.

energywise {importance importance | keywords word,word,... | level level | management udp-port-number | name name | neighbor [hostname| ip-address] udp-port-number | role role }

no energywise {importance | keywords | management | name | neighbor | role}

Syntax Description	importance importance	Set the importance of the entity.
		The range is from 1 to 100.
	keywords word, word,	Assign at least one keyword for the entity.
		When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.
	level level	Set the power level of the entity.
		The range is from 1 to 10.
	management udp-port-number	Specify the UDP port that sends and receives queries.
		The range is from 1 to 65000.
	name name	Specify the EnergyWise-specific entity name.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.
	neighbor [hostname ip-address] udp-port-number	Assign a static neighbor:
		• (Optional) Hostname (<i>hostname</i>) or IP address (<i>ip-address</i>).
		• UDP port (<i>udp-port-number</i>) that sends and receives queries.
		The range is from 1 to 65000.
	role role	Specify the role of the entity in the EnergyWise domain. For example, lobby.b20.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.

Defaults

EnergyWise is disabled. The importance is 1. No keywords are defined. The power level is 10. The *udp-port-number* is 43440. The name is the hostname. No neighbors are assigned. The role is the model number.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(50)SE	This command was introduced.

Usage Guidelines When you add an entity to a domain, EnergyWise is enabled on the entity and its PoE ports.

Examples This example shows how to enable EnergyWise, assign the entity to a domain, and set the password. Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30 Switch(config)# energywise importance 50 Switch(config)# energywise keywords lab1,devlab

Switch(config)# energywise management 60500 Switch(config)# energywise name Entity01 Switch(config)# energywise neighbor TG3560G-21 43440 Switch(config)# energywise role role.labaccess Switch(config)# end

Related Commands	Command	Description
	show energywise	Displays the EnergyWise settings and status.
	show energywise domain	Displays the domain to which the entity belongs.
	show energywise recurrence	Displays the recurrence settings and status.

energywise (interface configuration)

Use the **energywise** interface configuration command to configure EnergyWise on the power over Ethernet (PoE) port. Use the **no** form of this command to disable EnergyWise and to remove the EnergyWise configuration.

energywise [**importance** *importance* | **keywords** *word*,*word*,... | **level** *level* [**recurrence at** *minute hour day_of_month month day_of_week*] | **name** *name* | **role** *role*]

no energywise [importance | keywords | level | name | role]

Syntax Description	importance importance	(Optional) Set the importance of the port.				
		The range is from 1 to 100.				
	keywords word, word,	Assign at least one keyword for the port.				
		When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.				
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.				
		• Do not use an asterisk (*) or a blank space between the characters and symbols.				
	level level	(Optional) Set the power level of the port.				
		The range is from 0 and 10.				
		If the power level is 0, the port is powered off.				
		If the power level is from 1 to 10, the port is powered. You can enter any value this range to power the PoE port.				
	recurrence	(Optional) Schedule the power-on or power-off recurrence.				
	importance <i>importance</i> at <i>minute hour</i> <i>day_of_month month</i> <i>day_of_week</i>	• importance <i>importance</i> —Set the importance of the port in the domain. The range is from 1 to 100.				
		• <i>minute</i> —The range is from 0 to 59. Use * for the wildcard.				
		• <i>hour</i> —The range is from 0 to 23. Use * for the wildcard.				
		• <i>day_of_month</i> —The range is from 1 to 31. Use * for the wildcard.				
		• <i>month</i> —The range is from 1 (January) to 12 (December). Use * for t wildcard.				
		• <i>day_of_week</i> —The range is from 0 (Sunday) to 6 (Saturday). Use * for the wildcard.				
		Note The specified times are local times based on the PoE-entity time zone.				

		(Ontingal) Suggify the Engage Wing an ariting and the sugg
	name name	(Optional) Specify the EnergyWise-specific port name.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.
	role role	(Optional) Specify the role of the port in the domain. For example, lobbyport.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.
Defaults	The importance is 1.	
	No keywords are defined	l.
	The power level is 10.	
	The name is the short ver	rsion of the port name; for example, Gi0.2 for Gigabit Ethernet /2.
	The role is the model num	mber.

energywise domain

Use the **energywise domain** global configuration command to enable EnergyWise on the entity, assign the entity to a domain, and set the password for secure communication among the domain entities. Use the **no** form of this command to disable EnergyWise and to remove the EnergyWise configuration.

energywise domain domain-name secret [0 | 7] password [protocol udp port udp-port-number [interface interface-id | ip ip-address]]

no energywise domain

Syntax Description	domain domain-name	Assign the entity to a domain with the specified <i>domain-name</i> .				
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.				
		• Do not use an asterisk (*) or a blank space between the characters and symbols.				
	secret [0 7] password	Set the <i>password</i> for secure communication among the entities in the domain.				
		• (Optional) 0 —Use an unencrypted password.				
		• (Optional) 7—Use an hidden password.				
		If you do not enter 0 or 7 , the entity uses the default value of 0.				
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.				
		• Do not use an asterisk (*) or a blank space between the characters and symbols.				
	port udp-port-number	er (Optional) Specify the UDP port that sends and receives queries.				
		The range is from 1 to 65000.				
	interface interface-id	(Optional) Specify the port from which the EnergyWise messages are sent.				
	ip ip-address	(Optional) Specify the IP address from which the EnergyWise messages are sent.				
Defaults		and the entity is not assigned to a domain.				
	The password is not set.					
	The <i>udp-port-number</i> is	43440.				
Command Modes	The <i>udp-port-number</i> is Privileged EXEC	43440.				
Command Modes		43440. Modification				

Usage Guidelines		<i>lomain-name</i> secret [0 7] <i>password</i> command, the entity selects e with the network and with management applications.		
Examples	This example shows how to enable EnergyWise, set the <i>domain-name</i> and <i>password</i> , and specify the IP address:			
	Switch(config)# energywise domain	cisco secret cisco protocol udp port 43440 ip 2.2.4.30		
Related Commands	Command	Description		
	show energywise	Displays the EnergyWise settings and status.		
	show energywise domain	Displays the domain to which the entity belongs.		

energywise query

Use the **energywise query** privileged EXEC command to display power information or to power the entities or PoE ports in the domain.

- energywise query importance importance {keywords word, word, ... | name name} set level level
- energywise query importance importance {keywords word, word, ... | name name} sum {delta |
 usage}

Syntax Description	importance <i>importance</i>	Filter the results based on the importance value. Only entities with values less than or equal to the specified value appear.
		The <i>importance</i> range is from 1 to 100.
	keywords word, word,	Filter the results based on one or more of the specified keywords.
		When specifying multiple keywords, separate the keywords with commas, and do not use spaces between keywords.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.
	name name	Filter the results based on the name.
		For the wildcard, use * or <i>name</i> * with the asterisk at the end of the name phrase.
		• You can enter alphanumeric characters and symbols such as #, (, %, !, or &.
		• Do not use an asterisk (*) or a blank space between the characters and symbols.
	collect {delta usage}	Display the delta or usage values for the entities or the PoE ports.
		• delta —Display only the differences between the current and available power usage.
		• usage —Display only the current power usage.
	set level level	Set the power level of the entities or the PoE ports.
		The range is from 0 to 10.
		An entity supports level 1 to level 10.
		A PoE port supports level 0 to level 10.
	<pre>sum {delta usage}</pre>	Display the sum of the delta or usage values for the entities or the PoE ports.
		• delta —Display only the sum of the differences between the current and available power usage.
		• usage —Display only the current power usage.

Defaults	_	The importance value is 1.				
	The power lev	vel 18 10.

Queried: 1 Responded: 1 Time: 0.11 seconds

errdisable detect cause

Use the **errdisable detect cause** global configuration command to enable error-disabled detection for a specific cause or all causes. Use the **no** form of this command to disable the error-disabled detection feature.

- errdisable detect cause { all | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard |link-flap | loopback | pagp-flap | security-violation shutdown vlan | sfp-config-mismatch }
- no errdisable detect cause {all | bpduguard |dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | inline-power | link-flap | pagp-flap | security-violation shutdown vlan | sfp-config-mismatch }

For the BPDU guard and port-security features, you can use this command to globally configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

When the per-VLAN error-disable feature is turned off and a BPDU guard violation occurs, the entire port is disabled. Use the **no** form of this command to disable the per-VLAN error-disable feature.

errdisable detect cause bpduguard shutdown vlan

no errdisable detect cause bpduguard shutdown vlan

Syntax Description	all	Enable error detection for all error-disabled causes.				
	bpduguard shutdown vlan	Enable per-VLAN error-disable for BPDU guard.				
	arp-inspection	Enable error detection for dynamic Address Resolution Protocol				
		(ARP) inspection.				
	dhcp-rate-limit	Enable error detection for DHCP snooping.				
	dtp-flap	Enable error detection for the Dynamic Trunking Protocol (DTP) flapping.				
	gbic-invalid	Enable error detection for an invalid Gigabit Interface Converter (GBIC) module.				
		Note This error refers to an invalid small form-factor pluggable (SFP) module.				
	inline-power	Enable error detection for inline power.				
	l2ptguard	Enable error detection for a Layer 2 protocol-tunnel error-disabled cause.				
	link-flap	Enable error detection for link-state flapping.				
	loopback	Enable error detection for detected loopbacks.				
	pagp-flap	Enable error detection for the Port Aggregation Protocol (PAgP) f error-disabled cause.				
	security-violation shutdown vlan	Enable voice aware 802.1x security.				
	sfp-config-mismatch	Enable error detection on an SFP configuration mismatch.				

Command Default Detection is enabled for all causes.

Command Modes Global configuration

Command History	Release	Modification			
	12.2(25)SEF2	This command was introduced.			
	12.2(37)SEThe Per-VLAN error-detection feature was added. The bpduguard , inline-power and sfp-config-mismatch keywords were added.				
	12.2(44)SE	The security-violation shutdown vlan keywords were added.			
Usage Guidelines	A cause (link-flap, dhcp-rate-limit , and so forth) is the reason why the error-disabled state occurred. When a cause is detected on a port, the port is placed in an error-disabled state, an operational state that is similar to a link-down state.				
	When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard, voice aware 802.1x security, and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.				
	command for the cause, operation when all caus	echanism for the cause by entering the errdisable recovery global configuration, the port is brought out of the error-disabled state and allowed to retry the ses have timed out. If you do not set a recovery mechanism, you must enter the no shutdown commands to manually recover a port from the error-disabled state.			
Examples	1	w to enable error-disabled detection for the link-flap error-disabled cause:			
		ow to globally configure BPDU guard for per-VLAN error disable:			
	This commond shows h	ow to globally configure voice ewere 802 1x security for per VLAN error			

This command shows how to globally configure voice aware 802.1x security for per-VLAN error disable:

Switch(config)# errdisable detect cause security-violation shutdown vlan

You can verify your setting by entering the show errdisable detect privileged EXEC command.

Related Commands	Command	Description
	show errdisable detect	Displays error-disabled detection information.
	show interfaces status err-disabled	Displays interface status or a list of interfaces in the error-disabled state.
	clear errdisable interface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.

errdisable detect cause small-frame

Use the **errdisable detect cause small-frame** global configuration command on the switch stack or on a standalone switch to allow any switch port to be error disabled if incoming VLAN-tagged packets are small frames (67 bytes or less) and arrive at the minimum configured rate (the threshold). Use the **no** form of this command to return to the default setting.

errdisable detect cause small-frame

no errdisable detect cause small-frame

Syntax Description	This command has no	arguments or keywords.
Defaults	This feature is disable	ed.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(44)SE	This command was introduced.
Usage Guidelines	configuration comman You can configure the small-frame global co	ly enables the small-frame arrival feature. Use the small violation-rate interface and to set the threshold for each port. It port to be automatically re-enabled by using the errdisable recovery cause configuration command. You configure the recovery time by using the errdisable <i>erval global configuration command</i> .
Examples	<pre>small frames arrive at Switch(config)# err</pre>	now to enable the switch ports to be put into the error-disabled mode if incoming the configured threshold: disable detect cause small-frame etting by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	errdisable recovery cause small-frame	Enables the recovery timer.
	errdisable recovery interval interval	Specifies the time to recover from the specified error-disabled state.
	show interfaces	Displays the interface settings on the switch, including input and output flow control.
	small-frame violation rate	Configures the rate (threshold) for incoming small frames to cause a port to be put into the error-disabled state.

errdisable recovery cause small-frame

Use the **errdisable recovery cause small-frame** global configuration command on the switch stack or on a standalone switch to enable the recovery timer for ports to be automatically re-enabled after they are error disabled by the arrival of small frames. Use the **no** form of this command to return to the default setting.

errdisable recovery cause small-frame

no errdisable recovery cause small-frame

- Syntax Description This command has no arguments or keywords.
- **Defaults** This feature is disabled.
- Command Modes Global configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.

Usage Guidelines This command enables the recovery timer for error-disabled ports. You configure the recovery time by using the errdisable **recovery interval** *interval interface configuration command*.

Examples This example shows how to set the recovery timer:

Switch(config)# errdisable recovery cause small-frame

You can verify your setting by entering the show interfaces user EXEC command.

Related Commands	Command	Description
	errdisable detect cause small-frame	Allows any switch port to be put into the error-disabled state if an incoming frame is smaller than the configured minimum size and arrives at the specified rate (threshold).
	show interfaces	Displays the interface settings on the switch, including input and output flow control.
	small-frame violation rate	Configures the size for an incoming (small) frame to cause a port to be put into the error-disabled state.

errdisable recovery

Use the **errdisable recovery** global configuration command to configure the recover mechanism variables. Use the **no** form of this command to return to the default setting.

errdisable recovery {cause {all |bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | inline-power | link-flap | loopback | pagp-flap | psecure-violation | security-violation | sfp-mismatch | udld | vmps} | {interval interval}

no errdisable recovery {cause {all | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | l2ptguard | inline-power | link-flap | loopback | pagp-flap | psecure-violation | security-violation | sfp-mismatch | udld | vmps } | {interval interval}

cause all	Enable the error-disabled mechanism to recover from a specific cause. Enable the timer to recover from all error-disabled causes.
all	Enable the timer to recover from all error disabled causes
	Enable the timer to recover from an error-disabled causes.
bpduguard	Enable the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.
channel-misconfig	Enable the timer to recover from the EtherChannel misconfiguration error-disabled state.
dhcp-rate-limit	Enable the timer to recover from the DHCP snooping error-disabled state.
dtp-flap	Enable the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.
gbic-invalid	Enable the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.
	Note This error refers to an invalid small form-factor pluggable (SFP) error-disabled state.
inline-power	Enable error detection for inline-power.
l2ptguard	Enable the timer to recover from a Layer 2 protocol tunnel error-disabled state.
link-flap	Enable the timer to recover from the link-flap error-disabled state.
loopback	Enable the timer to recover from a loopback error-disabled state.
pagp-flap	Enable the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.
psecure-violation	Enable the timer to recover from a port security violation disable state.
security-violation	Enable the timer to recover from an IEEE 802.1x-violation disabled state.
sfp-config-mismatch	Enable error detection on an SFP configuration mismatch.
udld	Enable the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.
	dhcp-rate-limitdtp-flapgbic-invalidinline-powerl2ptguardlink-flaploopbackpagp-flappsecure-violationsecurity-violationsfp-config-mismatch

	vmps	Enable the timer to recover from the VLAN Membership Policy Server (VMPS) error-disabled state.
	interval interval	Specify the time to recover from the specified error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds.
		Note The error-disabled recovery timer is initialized at a random differential from the configured interval value. The difference between the actual timeout value and the configured value can be up to 15 percent of the configured interval.
Note	Though visible in the	command-line help strings, the ilpower , storm-control , and unicast-flood
	keywords are not sup	
Defaults	Recovery is disabled The default recovery	for all causes. interval is 300 seconds.

This example shows how to set the timer to 500 seconds:

Switch(config)# errdisable recovery interval 500

You can verify your settings by entering the show errdisable recovery privileged EXEC command.

Related Commands	Command	Description
	show errdisable recovery	Displays error-disabled recovery timer information.
	show interfaces status err-disabled	Displays interface status or a list of interfaces in error-disabled state.
	clear errdisable interface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.

exception crashinfo

Use the **exception crashinfo** global configuration command to configure the switch to create the extended crashinfo file when the Cisco IOS image fails. Use the **no** form of this command to disable this feature.

exception crashinfo

no exception crashinfo

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** The switch creates the extended crashinfo file.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines The basic crashinfo file includes the Cisco IOS image name and version that failed, and a list of the processor registers. The extended crashinfo file includes additional information that can help determine the cause of the switch failure.

Use the **no exception crashinfo** global configuration command to configure the switch to not create the extended crashinfo file.

Examples This example shows how to configure the switch to not create the extended crashinfo file: Switch(config)# no exception crashinfo

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the operating configuration, including defined macros. For syntax information, select Cisco IOS Configuration
		Fundamentals Command Reference, Release 12.2 > File
		Management Commands > Configuration File Management Commands.

fallback profile

Use the **fallback profile** global configuration command on the switch stack or on a standalone switch to create a fallback profile for web authentication. To return to the default setting, use the **no** form of this command.

fallback profile profile

no fallback profile

Syntax Description	profile	Specify the fallback profile for clients that do not support IEEE 802.1x authentication.
Defaults	No fallback pro	file is configured.
Command Modes	Global configur	ation
Command History	Release	Modification
	12.2(35)SE	This command was introduced.
Usage Guidelines	-	ofile is used to define the IEEE 802.1x fallback behavior for IEEE 802.1x ports that do cants. The only supported behavior is to fall back to web authentication.
	After entering the fallback profile command, you enter profile configuration mode, and these configuration commands are available:	
	• ip: Create a	n IP configuration.
	• access-group: Specify access control for packets sent by hosts that have not yet been authenticated	
	• admission:	Apply an IP admission rule.
Examples	This example sh	nows how to create a fallback profile to be used with web authentication:
	Switch(config) Switch(config- Switch(config- Switch(config- Switch(config)	<pre># ip admission name rule1 proxy http # fallback profile profile1 fallback-profile)# ip access-group default-policy in fallback-profile)# ip admission rule1 fallback-profile)# exit # interface gigabitethernet0/1 if)# dot1x fallback profile1</pre>
	You can verify y privileged EXE	your settings by entering the show running-configuration [interface <i>interface-id</i>] C command.

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	ip admission	Enable web authentication on a switch port
	ip admission name proxy http	Enable web authentication globally on a switch
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.
	show fallback profile	Display the configured profiles on a switch.

flowcontrol

Use the **flowcontrol** interface configuration command to set the receive flow-control state for an interface. When flow control **send** is operable and on for a device and it detects any congestion at its end, it notifies the link partner or the remote device of the congestion by sending a pause frame. When flow control **receive** is on for a device and it receives a pause frame, it stops sending any data packets. This prevents any loss of data packets during the congestion period.

Use the receive off keywords to disable flow control.

flowcontrol receive {desired | off | on}

The switch can receive, but not send, pause frames.

ackets from a remote device. e that is required to send is not required to but can send		
w-control packets to an interface.		
e that is required to send is not required to but can send		
Note that the on and desired keywords have the same result.		
When you use the flowcontrol command to set a port to control traffic rates during congestion, you are setting flow control on a port to one of these conditions:		
can operate with an attached device receive pause frames.		
i		

Table 2-5 shows the flow control results on local and remote ports for a combination of settings. The table assumes that **receive desired** has the same results as using the **receive on** keywords.

Flow Control Settings		Flow Control Resolution	
Local Device	Remote Device	Local Device	Remote Device Sends and receives
send off/receive on	send on/receive on	Receives only	
	send on/receive off	Receives only	Sends only
	send desired/receive on	Receives only	Sends and receives
	send desired/receive off	Receives only	Sends only
	send off/receive on	Receives only	Receives only
	send off/receive off	Does not send or receive	Does not send or receive
send off/receive off	send on/receive on	Does not send or receive	Does not send or receive
	send on/receive off	Does not send or receive	Does not send or receive
	send desired/receive on	Does not send or receive	Does not send or receive
	send desired/receive off	Does not send or receive	Does not send or receive
	send off/receive on	Does not send or receive	Does not send or receive
	send off/receive off	Does not send or receive	Does not send or receive

Table 2-5 Flow Control Settings and Local and Remote Port Flow Control Resolution

Examples This example shows how to configure the local port to not support flow control by the remote port:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# flowcontrol receive off

You can verify your settings by entering the show interfaces privileged EXEC command.

Related Commands	Command Description	
	show interfaces	Displays the interface settings on the switch, including input and output flow control.

interface port-channel

Use the **interface port-channel** global configuration command to access or create the port-channel logical interface. Use the **no** form of this command to remove the port-channel.

interface port-channel port-channel-number

no interface port-channel port-channel-number

	port-channel-number	Port-channel number. The range is 1 to 12.
Defaults	No port-channel logical interfaces are defined. Global configuration	
Command Modes		
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.
	command. It automatically creates the port-channel interface when the channel group gets its first physical port. If you create the port-channel interface first, the <i>channel-group-number</i> can be the same as the <i>port-channel-number</i> , or you can use a new number. If you use a new number, the channel-group command dynamically creates a new port channel.	
	command dynamically of You create Layer 3 port switchport interface co	creates a new port channel. channels by using the interface port-channel command followed by the no nfiguration command. You should manually configure the port-channel logical
	command dynamically of You create Layer 3 port switchport interface co interface before putting	creates a new port channel. channels by using the interface port-channel command followed by the no
 Caution	command dynamically of You create Layer 3 port switchport interface co interface before putting Only one port channel i	creates a new port channel. channels by using the interface port-channel command followed by the no nfiguration command. You should manually configure the port-channel logical the interface into the channel group. n a channel group is allowed. mel interface as a routed port, do not assign Layer 3 addresses on the physical

Follow these guidelines when you use the interface port-channel command:

- If you want to use the Cisco Discovery Protocol (CDP), you must configure it only on the physical port and not on the port-channel interface.
- Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE 802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Examples This example shows how to create a port-channel interface with a port channel number of 5: Switch(config)# interface port-channel 5

You can verify your setting by entering the **show running-config** privileged EXEC or **show etherchannel** *channel-group-number* **detail** privileged EXEC command.

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

interface range

Use the **interface range** global configuration command to enter interface range configuration mode and to execute a command on multiple ports at the same time. Use the **no** form of this command to remove an interface range.

interface range {port-range | macro name}

no interface range {*port-range* | **macro** *name*}

Syntax Description	port-range	Port range. For a list of valid values for <i>port-range</i> , see the "Usage Guidelines" section.	
	macro name	Specify the name of a macro.	
Defaults	This command h	as no default setting.	
Command Modes	Global configura	ition	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	When you enter all interfaces wit	interface range configuration mode, all interface parameters you enter are attributed to hin the range.	
	For VLANs, you can use the interface range command only on existing VLAN switch virtual interfaces (SVIs). To display VLAN SVIs, enter the show running-config privileged EXEC command. VLANs not displayed cannot be used in the interface range command. The commands entered under interface range command are applied to all existing VLAN SVIs in the range.		
	All configuration changes made to an interface range are saved to NVRAM, but the interface range itself is not saved to NVRAM.		
	You can enter the interface range in two ways:		
	• Specifying up to five interface ranges		
	• Specifying a previously defined interface-range macro		
	All interfaces in a range must be the same type; that is, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs. However, you can define up to five interface ranges with a single command, with each range separated by a comma.		
	Valid values for <i>port-range</i> type and interface:		
	• vlan vlan-ID, where VLAN ID is from 1 to 4094		
	• gigabitether	rnet module/{ <i>first port</i> } - { <i>last port</i> }, where module is always 0	
	For physical	interfaces:	
	– module	is always 0	

- the range is type 0/number number (for example, gigabitethernet0/1 2)
- **port-channel** *port-channel-number port-channel-number*, where *port-channel-number* is from 1 to 12

```
Note
```

When you use the **interface range** command with port channels, the first and last port channel number in the range must be active port channels.

When you define a range, you must enter a space between the first entry and the hyphen (-):

```
interface range gigabitethernet0/1 -2
```

When you define multiple ranges, you must still enter a space after the first entry and before the comma (,):

```
gigabitethernet0/1 - 2, gigabitethernet0/11 - 12
interface range gigabitethernet0/1 - 2, gigabitethernet0/5 - 7
```

You cannot specify both a macro and an interface range in the same command.

You can also specify a single interface in *port-range*. The command is then similar to the **interface** *interface-id* global configuration command.

For more information about configuring interface ranges, see the software configuration guide for this release.

Examples This example shows how to use the **interface range** command to enter interface-range configuration mode to apply commands to two ports:

```
Switch(config)# interface range gigabitethernet0/1 - 2
Switch(config-if-range)#
```

This example shows how to use a port-range macro *macro1* for the same function. The advantage is that you can reuse *macro1* until you delete it.

```
Switch(config)# define interface-range macrol gigabitethernet0/1 - 2
Switch(config)# interface range macro macrol
Switch(config-if-range)#
```

Related Commands	Command	Description
	define interface-range	Creates an interface range macro.
	show running-config	Displays the configuration information currently running on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

interface vlan

Use the **interface vlan** global configuration command to create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode. Use the **no** form of this command to delete an SVI.

interface vlan vlan-id

no interface vlan vlan-id

Syntax Description	vlan-id	VLAN number. The range is 1 to 4094.
Defaults	The default VLAN i	interface is VLAN 1.
Command Modes	Global configuration	n
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
	-	or the VLAN ID configured for an access port.
Note	When you create an	SVI, it does not become active until it is associated with a physical port.
	•	by entering the no interface vlan <i>vlan-id</i> command, the deleted interface is no output from the show interfaces privileged EXEC command.
Note	You cannot delete th	ne VLAN 1 interface.
		deleted SVI by entering the interface vlan <i>vlan-id</i> command for the deleted face comes back up, but the previous configuration is gone.
	The interrelationship	p between the number of SVIs configured on a switch and the number of other

The interrelationship between the number of SVIs configured on a switch and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.

Examples This example shows how to create a new SVI with VLAN ID 23 and to enter interface configuration mode:

Switch(config)# interface vlan 23
Switch(config-if)#

You can verify your setting by entering the **show interfaces** and **show interfaces vlan** *vlan-id* privileged EXEC commands.

Related Commands	Command	Description
	show interfaces vlan vlan-id	Displays the administrative and operational status of all interfaces or the specified VLAN.

ip access-group

Use the **ip access-group** interface configuration command to control access to a Layer 2 or Layer 3 interface. Use the **no** form of this command to remove all access groups or the specified access group from the interface.

ip access-group {*access-list-number* | *name*} {**in** | **out**}

no ip access-group [access-list-number | name] {**in** | **out**}

Syntax Description	access-list-number	The number of the IP access control list (ACL). The range is 1 to 199 or 1300 to 2699.	
	name	The name of an IP ACL, specified in the ip access-list global configuration command.	
	in	Specify filtering on inbound packets.	
	out	Specify filtering on outbound packets. This keyword is valid only on Layer 3 interfaces.	
Defaults	No access list is applie	ed to the interface.	
Command Modes	Interface configuration	1	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
	12.2(44)SE	The out keyword was added.	
Usage Guidelines	access list by name, us access list, use the acc	or numbered standard or extended IP access lists to an interface. To define an the ip access-list global configuration command. To define a numbered tess list global configuration command. You can used numbered standard access 99 and 1300 to 1999 or extended access lists ranging from 100 to 199 and	
	You can use this command to apply an access list to a Layer 2 or Layer 3 interface. However, note these limitations for Layer 2 interfaces (port ACLs):		
	• You can only apply ACLs in the inbound direction; the out keyword is not supported for Layer 2 interfaces.		
	• You can only apply one IP ACL and one MAC ACL per interface.		
	• Layer 2 interfaces do not support logging; if the log keyword is specified in the IP ACL, it is ignored		
	• An IP ACL applied to a Layer 2 interface only filters IP packets. To filter non-IP packets, use the mac access-group interface configuration command with MAC extended ACLs.		

You can use input port ACLs and VLAN maps on the same switch. However, a port ACL takes precedence over a VLAN map. When both an input port ACL and a VLAN map are applied, incoming packets received on ports with the port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.

You can use router ACLs, input port ACLs, and VLAN maps on the same switch. However, a port ACL takes precedence over a router ACL or VLAN map:

- When an input port ACL is applied to an interface and a VLAN map is applied to a VLAN that the interface is a member of, incoming packets received on ports with the ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACLs exist in an switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
- When a VLAN map, output router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

You can apply IP ACLs to both outbound or inbound Layer 3 interfaces.

A Layer 3 interface can have one IP ACL applied in each direction.

You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

For standard inbound access lists, after the switch receives a packet, it checks the source address of the packet against the access list. IP extended access lists can optionally check other fields in the packet, such as the destination IP address, protocol type, or port numbers. If the access list permits the packet, the switch continues to process the packet. If the access list denies the packet, the switch discards the packet. If the access list has been applied to a Layer 3 interface, discarding a packet (by default) causes the generation of an Internet Control Message Protocol (ICMP) Host Unreachable message. ICMP Host Unreachable messages are not generated for packets discarded on a Layer 2 interface.

For standard outbound access lists, after receiving a packet and sending it to a controlled interface, the switch checks the packet against the access list. If the access list permits the packet, the switch sends the packet. If the access list denies the packet, the switch discards the packet and, by default, generates an ICMP Host Unreachable message.

If the specified access list does not exist, all packets are passed.

Examples	This example shows how to apply IP access list 101 to inbound packets on a port:
	<pre>Switch(config)# interface gigabitethernet0/1 Switch(config-if)# ip access-group 101 in</pre>

You can verify your settings by entering the **show ip interface**, **show access-lists**, or **show ip access-lists** privileged EXEC command.

Related Commands

Command	Description	
access list	Configures a numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands

ip address

Use the **ip address** interface configuration command to set an IP address for the Layer 2 switch or an IP address for each switch virtual interface (SVI) or routed port on the Layer 3 switch. Use the **no** form of this command to remove an IP address or to disable IP processing.

ip address ip-address subnet-mask [secondary]

no ip address [ip-address subnet-mask] [secondary]

Syntax Description	ip-address	IP address.	
	subnet-mask	Mask for the associated IP subnet.	
	secondary	(Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.	
Defaults	No IP address is defi	ned.	
Command Modes	Interface configuration	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	If you remove the switch IP address through a Telnet session, your connection to the switch will be lost. Hosts can find subnet masks using the Internet Control Message Protocol (ICMP) Mask Request message. Routers respond to this request with an ICMP Mask Reply message. You can disable IP processing on a particular interface by removing its IP address with the no ip address		
	command. If the switch detects another host using one of its IP addresses, it will send an error message to the console.		
	You can use the optional keyword secondary to specify an unlimited number of secondary addresses. Secondary addresses are treated like primary addresses, except the system never generates datagrams other than routing updates with secondary source addresses. IP broadcasts and ARP requests are handled properly, as are interface routes in the IP routing table.		
<u>Note</u>	must also use a secon	work segment uses a secondary address, all other devices on that same segment adary address from the same network or subnet. Inconsistent use of secondary ork segment can very quickly cause routing loops.	
	•	g Open Shortest Path First (OSPF), ensure that all secondary addresses of an same OSPF area as the primary addresses.	

If your switch receives its IP address from a Bootstrap Protocol (BOOTP) or a DHCP server and you remove the switch IP address by using the **no ip address** command, IP processing is disabled, and the BOOTP or the DHCP server cannot reassign the address.

A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is not limited by software; however, the interrelationship between this number and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.

Examples	This example shows how to configure the IP address for the Layer 2 switch on a subnetted network:			
	Switch(config)# interface vlan 1 Switch(config-if)# ip address 172.20.128.2 255.255.255.0			
	This example shows how to configure the IP address for a port on the Layer 3 switch:			
	<pre>Switch(config)# ip multicast-routing Switch(config)# interface gigabitethernet0/1 Switch(config-if)# no switchport Switch(config-if)# ip address 172.20.128.2 255.255.255.0</pre>			
	You can verify your settings by entering the show running-config privileged EXEC command.			
Related Commands	Command Description			

Related Commands	Command	Description
	show running-config	Displays the running configuration on the switch. For syntax information,
		select Cisco IOS Configuration Fundamentals Command Reference,
		Release 12.2 > File Management Commands > Configuration File
		Management Commands.

ip admission

Use the **ip admission** interface configuration command to enable web authentication. You can also use this command in fallback-profile mode. Use the **no** form of this command to disable web authentication.

ip admission rule

no ip admission

Syntax Description	rule	Apply an IP admission rule to the interface.	
Command Modes	Global configuration		
Command History	Release Modification		
	12.2(35)SE	This command was introduced.	
Usage Guidelines	The ip admission con	mmand applies a web authentication rule to a switch port.	
Examples	This example shows how to apply a web authentication rule to a switchport:		
	Switch# configure terminal Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)# ip admission rule1		
	This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.		
	Switch# configure terminal Switch(config)# fallback profile profile1 Switch(config)# ip admission name rule1 Switch(config)# end		
Related Commands	Command	Description	
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.	
	fallback profile	Enable web authentication on a port	
	ip admission name proxy http	Enable web authentication globally on a switch	

show ip admission	Displays information about NAC cached entries or the NAC configuration.
	For more information, see the Network Admission Control Software
	Configuration Guide on Cisco.com.

ip admission name proxy http

Use the **ip admission name proxy http** global configuration command to enable web authentication. Use the **no** form of this command to disable web authentication.

ip admission name proxy http

no ip admission name proxy http

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

- **Defaults** Web authentication is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(35)SE	This command was introduced.

Usage Guidelines The **ip admission name proxy http** command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the **ip access-group in** and **ip admission** *web-rule* interface configuration commands to enable web authentication on a specific interface.

Examples

This example shows how to configure only web authentication on a switchport:

```
Switch# configure terminal
Switch(config) ip admission name http-rule proxy http
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 101 in
Switch(config-if)# ip admission rule
Switch(config-if)# end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switchport.

```
Switch# configure terminal
Switch(config)# ip admission name rule2 proxy http
Switch(config)# fallback profile profile1
Switch(config)# ip access group 101 in
Switch(config)# ip admission name rule2
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x fallback profile1
Switch(config-if)# end
```

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	fallback profile	Create a web authentication fallback profile.
	ip admission	Enable web authentication on a port
	show ip admission	Displays information about NAC cached entries or the NAC configuration. For more information, see the <i>Network Admission Control Software</i> <i>Configuration Guide</i> on Cisco.com.

ip dhcp snooping

Use the **ip dhcp snooping** global configuration command to globally enable DHCP snooping. Use the **no** form of this command to return to the default setting.

ip dhcp snooping

no ip dhcp snooping

- **Defaults** DHCP snooping is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage GuidelinesFor any DHCP snooping configuration to take effect, you must globally enable DHCP snooping.DHCP snooping is not active until you enable snooping on a VLAN by using the ip dhcp snooping vlan
vlan-id global configuration command.

ExamplesThis example shows how to enable DHCP snooping:
Switch(config)# ip dhcp snoopingYou can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	ip dhcp snooping vlan	Enables DHCP snooping on a VLAN.
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping binding

Use the **ip dhcp snooping binding** privileged EXEC command on the switch stack or on a standalone switch to configure the DHCP snooping binding database and to add binding entries to the database. Use the **no** form of this command to delete entries from the binding database.

ip dhcp snooping binding mac-address **vlan** vlan-id ip-address **interface** interface-id **expiry** seconds

no ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id

ntry. ntry is no longer		
ntry is no longer		
Use this command when you are testing or debugging the switch. In the DHCP snooping binding database, each database entry, also referred to a binding, has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database can have up to 8192 bindings.		
Use the show ip dhcp snooping binding privileged EXEC command to display only the configured bindings. Use the show ip source binding privileged EXEC command to display the dynamically and statically configured bindings.		
This example shows how to generate a DHCP binding configuration with an expiration time of 1000 seconds on a port in VLAN 1:		
Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gigabitethernet1/0/1 expiry 1000		
You can verify your settings by entering the show ip dhcp snooping binding or the show ip dhcp source binding privileged EXEC command.		

ated Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	show ip dhcp snooping binding	Displays the dynamically configured bindings in the DHCP snooping binding database and the configuration information.
	show ip source binding	Displays the dynamically and statically configured bindings in the DHCP snooping binding database.

ip dhcp snooping database

Use the **ip dhcp snooping database** global configuration command on the switch stack or on a standalone switch to configure the DHCP snooping binding database agent. Use the **no** form of this command to disable the agent, to reset the timeout value, or to reset the write-delay value.

ip dhcp snooping database {{flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password]@]{hostname | host-ip][/directory]/image-name.tar | rcp://user@host/filename | tftp://host/filename} | timeout seconds | write-delay seconds}

no ip dhcp snooping database [timeout | write-delay]

		101	
Syntax Description	flash[number]:/	filename	Specify that the database agent or the binding file is in the flash memory.
			(Optional) Use the <i>number</i> parameter to specify the stack member number of the stack master. The range for <i>number</i> is 1 to 9.
	ftp://user:passv	vord@hostlfilename	Specify that the database agent or the binding file is on an FTP server.
		me:password]@] rt-ip}[/directory] r	Specify that the database agent or the binding file is on an FTP server.
	rcp: //user@hos	tlfilename	Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.
	tftp://host/filen	ame	Specify that the database agent or the binding file is on a TFTP server.
	timeout second	S	Specify (in seconds) how long to wait for the database transfer process to finish before stopping.
			The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.
	write-delay sec	onds	Specify (in seconds) the duration for which the transfer should be delayed after the binding database changes. The default is 300 seconds. The range is 15 to 86400.
Defaults	The URL for the database agent or binding file is not defined.		
	The timeout value is 300 seconds (5 minutes).		
	The write-delay value is 300 seconds (5 minutes).		
Command Modes	Global configur	ation	
Command History	Release	Modification	
	12.2(25)SEF2	This command wa	as introduced.

Usage Guidelines The DHCP snooping binding database can have up to 8192 bindings. To ensure that the lease time in the database is accurate, we recommend that Network Time Protocol (NTP) is enabled and configured for these features: • NTP authentication NTP peer and server associations NTP broadcast service • NTP access restrictions • NTP packet source IP address If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP. Because both NVRAM and the flash memory have limited storage capacities, we recommend that you store a binding file on a TFTP server. You must create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can first write bindings to the binding file at that URL. Use the **ip dhcp snooping database flash**[number]:/filename command to save the DHCP snooping binding database in the stack master NVRAM. The database is not saved in a stack member NVRAM. If you set the **ip dhcp snooping database timeout** command to 0 seconds and the database is being written to a TFTP file, if the TFTP server goes down, the database agent continues to try the transfer indefinitely. No other transfer can be initiated while this one is in progress. This might be inconsequential because if the server is down, no file can be written to it. Use the **no ip dhcp snooping database** command to disable the agent. Use the **no ip dhcp snooping database timeout** command to reset the timeout value. Use the no ip dhcp snooping database write-delay command to reset the write-delay value. **Examples** This example shows how to store a binding file at an IP address of 10.1.1.1 that is in a directory called directory. A file named file must be present on the TFTP server. Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file This example shows how to store a binding file called *file01.txt* in the stack master NVRAM: Switch(config)# ip dhcp snooping database flash:file01.txt You can verify your settings by entering the show ip dhcp snooping database privileged EXEC command.

Related Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	ip dhcp snooping binding	Configures the DHCP snooping binding database.
	show ip dhcp snooping database	Displays the status of DHCP snooping database agent.

ip dhcp snooping information option

Use the **ip dhcp snooping information option** global configuration command to enable DHCP option-82 data insertion. Use the **no** form of this command to disable DHCP option-82 data insertion.

ip dhcp snooping information option

no ip dhcp snooping information option

- **Defaults** DHCP option-82 data is inserted.
- Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines You must globally enable DHCP snooping by using the **ip dhcp snooping** global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled and a switch receives a DHCP request from a host, it adds the option-82 information in the packet. The option-82 information contains the switch MAC address (the remote ID suboption) and the port identifier, **vlan-mod-port**, from which the packet is received (circuit ID suboption). The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

When the DHCP server receives the packet, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or a circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. When the client and server are on the same subnet, the server broadcasts the reply. The switch inspects the remote ID and possibly the circuit ID fields to verify that it originally inserted the option-82 data. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP host that sent the DHCP request.

Examples

This example shows how to enable DHCP option-82 data insertion:

Switch(config) # ip dhcp snooping information option

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping information option allow-untrusted

Use the ip dhcp snooping information option allow-untrusted global configuration command on an aggregation switch to configure it to accept DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. Use the **no** form of this command to return to the default setting. ip dhcp snooping information option allow-untrusted no ip dhcp snooping information option allow-untrusted Syntax Description This command has no arguments or keywords. Defaults The switch drops DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. **Command Modes** Global configuration **Command History** Release Modification 12.2(25)SEF2 This command was introduced. **Usage Guidelines** You might want an edge switch to which a host is connected to insert DHCP option-82 information at the edge of your network. You might also want to enable DHCP security features, such as DHCP snooping, IP source guard, or dynamic Address Resolution Protocol (ARP) inspection, on an aggregation switch. However, if DHCP snooping is enabled on the aggregation switch, the switch drops packets with option-82 information that are received on an untrusted port and does not learn DHCP snooping bindings for connected devices on a trusted interface. If the edge switch to which a host is connected inserts option-82 information and you want to use DHCP snooping on an aggregation switch, enter the **ip dhcp snooping information option allow-untrusted** command on the aggregation switch. The aggregation switch can learn the bindings for a host even though the aggregation switch receives DHCP snooping packets on an untrusted port. You can also enable DHCP security features on the aggregation switch. The port on the edge switch to which the aggregation switch is connected must be configured as a trusted port. Note Do not enter the **ip dhcp snooping information option allow-untrusted** command on an aggregation switch to which an untrusted device is connected. If you enter this command, an untrusted device might spoof the option-82 information. Examples This example shows how to configure an access switch to not check the option-82 information in untrusted packets from an edge switch and to accept the packets: Switch(config) # ip dhcp snooping information option allow-untrusted

L

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related	Commands
---------	----------

Command	Description
show ip dhcp snooping	Displays the DHCP snooping configuration.
show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping information option format remote-id

Use the **ip dhcp snooping information option format remote-id** global configuration command on the switch to configure the option-82 remote-ID suboption. Use the **no** form of this command to configure the default remote-ID suboption.

ip dhcp snooping information option format remote-id [string ASCII-string | hostname]

no ip dhcp snooping information option format remote-id

Control Description			
Syntax Description	string ASCII-string	Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).	
	hostname	Specify the switch hostname as the remote ID.	
Defaults	The switch MAC address is the remote ID.		
Command Modes	Global configuration		
Command History	Release Modificat	ion	
	12.2(25)SEF2 This com	mand was introduced.	
Usage Guidelines	You must globally enable DHCP snooping by using the ip dhcp snooping global configuration command for any DHCP snooping configuration to take effect. When the option-82 feature is enabled, the default remote-ID suboption is the switch MAC address. This command allows you to configure either the switch hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.		
Note	If the hostname exceeds 63 characters, it will be truncated to 63 characters in the remote-ID configuration.		
Examples	This example shows how to configure the option- 82 remote-ID suboption: Switch(config)# ip dhcp snooping information option format remote-id hostname		
	You can verify your settings by entering the show ip dhcp snooping user EXEC com		
Related Commands	Command	Description

	show ip dhcp snooping	Displays the DHCP snooping configuration.	

ip dhcp snooping limit rate

Use the **ip dhcp snooping limit rate** interface configuration command to configure the number of DHCP messages an interface can receive per second. Use the **no** form of this command to return to the default setting.

ip dhcp snooping limit rate rate

no ip dhcp snooping limit rate

Syntax Description	rate	Number of DHC 2048.	CP messages an interface can receive per second. The range is 1 to
Defaults	DHCP snooping ra	te limiting is disa	abled.
Command Modes	Interface configura	ation	
Command History	Release	Modification	
	12.2(25)SEF2	This comman	nd was introduced.
Usage Guidelines	Normally, the rate limit applies to untrusted interfaces. If you want to configure rate limiting for trusted interfaces, keep in mind that trusted interfaces might aggregate DHCP traffic on multiple VLANs (some of which might not be snooped) in the switch, and you will need to adjust the interface rate limits to a higher value.		
	errdisable recove again when all the	ry dhcp-rate-lim causes have time	face is error-disabled. If you enabled error recovery by entering the it global configuration command, the interface retries the operation d out. If the error-recovery mechanism is not enabled, the interface l you enter the shutdown and no shutdown interface configuration
Examples	This example shows how to set a message rate limit of 150 messages per second on an interface:		
	Switch(config-if)# ip dhcp snooping limit rate 150 You can verify your settings by entering the show ip dhcp snooping user EXEC command.		
Related Commands	Command		Description
	errdisable recove	ery	Configures the recover mechanism.
	show ip dhcp sno	oping	Displays the DHCP snooping configuration.
	show ip dhcp sno	oping binding	Displays the DHCP snooping binding information.

ip dhcp snooping trust

Use the **ip dhcp snooping trust** interface configuration command to configure a port as trusted for DHCP snooping purposes. Use the **no** form of this command to return to the default setting.

ip dhcp snooping trust

no ip dhcp snooping trust

Syntax Description This command has no argument	s or keywords.
---	----------------

Defaults	DHCP snooping trust is disabled.
----------	----------------------------------

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines Configure as trusted ports those that are connected to a DHCP server or to other switches or routers. Configure as untrusted ports those that are connected to DHCP clients.

Examples This example shows how to enable DHCP snooping trust on a port:

Switch(config-if)# ip dhcp snooping trust

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description	
	show ip dhcp snooping	Displays the DHCP snooping configuration.	
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.	

ip dhcp snooping verify

Use the **ip dhcp snooping verify** global configuration command to configure the switch to verify on an untrusted port that the source MAC address in a DHCP packet matches the client hardware address. Use the **no** form of this command to configure the switch to not verify the MAC addresses.

ip dhcp snooping verify mac-address

no ip dhcp snooping verify mac-address

Syntax Description	This command has no arguments or keywords.
--------------------	--

Defaults The switch verifies the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SE1	This command was introduced.
	12.2(25)SEF2	This command was introduced.

Usage Guidelines In a service-provider network, when a switch receives a packet from a DHCP client on an untrusted port, it automatically verifies that the source MAC address and the DHCP client hardware address match. If the addresses match, the switch forwards the packet. If the addresses do not match, the switch drops the packet.

Examples This example shows how to disable the MAC address verification:

Switch(config)# no ip dhcp snooping verify mac-address

You can verify your settings by entering the **show ip dhcp snooping** user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.

ip dhcp snooping vlan

Use the **ip dhcp snooping vlan** global configuration command to enable DHCP snooping on a VLAN. Use the **no** form of this command to return to the default setting.

ip dhcp snooping vlan vlan-range

no ip dhcp snooping vlan vlan-range

Syntax Description	vlan vlan-range	Specify a VLAN range is 1 to 409	ID or a range of VLANs on which to enable DHCP snooping. The 4.
		You can enter a s IDs separated by	ingle VLAN ID identified by VLAN ID number, a series of VLAN commas, a range of VLAN IDs separated by hyphens, or a range parated by entering the starting and ending VLAN IDs separated
Defaults	DHCP snooping is	s disabled on all V	LANs.
Command Modes	Global configurat	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command	l was introduced.
Usage Guidelines	You must first glo	bally enable DHCI	P snooping before enabling DHCP snooping on a VLAN.
Examples	-		DHCP snooping on VLAN 10:
		ip dhcp snooping ur settings by enter	ring the show ip dhcp snooping user EXEC command.
Related Commands	Command		Description
	show ip dhcp sno	ooping	Displays the DHCP snooping configuration.
	show ip dhcp sno		Displays the DHCP snooping binding information.

ip dhcp snooping vlan information option format-type circuit-id string

Use the **ip dhcp snooping vlan information option format-type circuit-id string** interface configuration command on the switch to configure the option-82 circuit-ID suboption. Use the **no** form of this command to configure the default circuit-ID suboption.

ip dhcp snooping vlan vlan information option format-type circuit-id string ASCII-string

no ip dhcp snooping vlan vlan information option format-type circuit-id string

Syntax Description	vlan vlan	Specify the VLAN ID. The range is 1 to 4094.
	stringASCII-string	g Specify a circuit ID, using from 3 to 63 ASCII characters (no spaces).
Defaults	The switch VLAN	and the port identifier, in the format vlan-mod-port , is the default circuit ID.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	command for any l When the option-8	enable DHCP snooping by using the ip dhcp snooping global configuration DHCP snooping configuration to take effect. 2 feature is enabled, the default circuit-ID suboption is the switch VLAN and the port rmat vlan-mod-port . This command allows you to configure a string of ASCII e circuit ID.
Note	strings on the NVF	a large number of circuit IDs on a switch, consider the impact of lengthy character RAM or flash memory. If the circuit-ID configurations, combined with other data, y of the NVRAM or the flash memory, an error message appears.
Examples	-	vs how to configure the option-82 circuit-ID suboption:
	string customerA)# ip dhcp snooping vlan 250 information option format-type circuit-id BC-250-0-0
	You can verify you	r settings by entering the show ip dhcp snooping user EXEC command.

The **show ip dhcp snooping user EXEC** command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.

Related Commands

Description
Configures the option-82 remote-ID suboption.

ip igmp filter

Use the **ip igmp filter** interface configuration command to control whether or not all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an Internet Group Management Protocol (IGMP) profile to the interface. Use the **no** form of this command to remove the specified profile from the interface.

ip igmp filter *profile number*

no ip igmp filter

Syntax Description	profile number	The IGMP profile number to be applied. The range is 1 to 4294967295.	
Defaults	No IGMP filters a	re applied.	
Command Modes	Interface configura	ation	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines		<i>AP</i> filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed	
	1	al interfaces (SVIs), or ports that belong to an EtherChannel group. can be applied to one or more switch port interfaces, but one port can have only one it.	
Examples	This example show	ws how to apply IGMP profile 22 to a port:	
	Switch(config)# interface gigabitethernet0/2 Switch(config-if)# ip igmp filter 22		
	You can verify you specifying an inter	ur setting by using the show running-config privileged EXEC command and by rface.	

Related Commands	Command	Description
	ip igmp profile	Configures the specified IGMP profile number.
	show ip dhcp snooping statistics	Displays the characteristics of the specified IGMP profile.
	show running-config interface <i>interface-id</i>	Displays the running configuration on the switch interface, including the IGMP profile (if any) that is applied to an interface. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

ip igmp max-groups

Use the **ip igmp max-groups** interface configuration command to set the maximum number of Internet Group Management Protocol (IGMP) groups that a Layer 2 interface can join or to configure the IGMP throttling action when the maximum number of entries is in the forwarding table. Use the **no** form of this command to set the maximum back to the default, which is to have no maximum limit, or to return to the default throttling action, which is to drop the report.

ip igmp max-groups {number | action {deny | replace}}

no ip igmp max-groups {*number* | **action**}

Syntax Description	number	The maximum number of IGMP groups that an interface can join. The range is 0 to 4294967294. The default is no limit.	
	action deny	action deny When the maximum number of entries is in the IGMP snooping forwarding table, dro the next IGMP join report. This is the default action.	
	action replace	When the maximum number of entries is in the IGMP snooping forwarding table, replace the existing group with the new group for which the IGMP report was received.	
Defaults	The default maximum number of groups is no limit.		
	After the switch learns the maximum number of IGMP group entries on an interface, the default throttling action is to drop the next IGMP report that the interface receives and to not add an entry for the IGMP group to the interface.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(25)SEF2	2 This command was introduced.	
Usage Guidelines	You can use this command only on Layer 2 physical interfaces and on logical EtherChannel interfaces You cannot set IGMP maximum groups for routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.		
	Follow these guidelines when configuring the IGMP throttling action:		
	• If you configure the throttling action as deny and set the maximum group limitation, the entries tha were previously in the forwarding table are not removed but are aged out. After these entries are aged out, when the maximum number of entries is in the forwarding table, the switch drops the nex IGMP report received on the interface.		
	that were	figure the throttling action as replace and set the maximum group limitation, the entries previously in the forwarding table are removed. When the maximum number of entries is warding table, the switch replaces a randomly selected multicast entry with the received port.	

• When the maximum group limitation is set to the default (no maximum), entering the **ip igmp max-groups** {**deny** | **replace**} command has no effect.

Examples

This example shows how to limit to 25 the number of IGMP groups that a port can join:

Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip igmp max-groups 25

This example shows how to configure the switch to replace the existing group with the new group for which the IGMP report was received when the maximum number of entries is in the forwarding table:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip igmp max-groups action replace

You can verify your setting by using the **show running-config** privileged EXEC command and by specifying an interface.

Related Commands	Command	Description
	show running-config interface <i>interface-id</i>	Displays the running configuration on the switch interface, including the maximum number of IGMP groups that an interface can join and the throttling action. For syntax information, select Cisco IOS
		Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

ip igmp profile

Use the **ip igmp profile** global configuration command to create an Internet Group Management Protocol (IGMP) profile and enter IGMP profile configuration mode. From this mode, you can specify the configuration of the IGMP profile to be used for filtering IGMP membership reports from a switchport. Use the **no** form of this command to delete the IGMP profile.

ip igmp profile *profile number*

no ip igmp profile *profile number*

Syntax Description	profile number	The IGMP profile number being configured. The range is 1 to 4294967295.	
Defaults	No IGMP profiles are defined. When configured, the default action for matching an IGMP profile is to deny matching addresses. Global configuration		
Command Modes			
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	When you are in I	GMP profile configuration mode, you can create the profile by using these commands:	
	• deny : specifies that matching addresses are denied; this is the default condition.		
	• exit: exits from igmp-profile configuration mode.		
	• no: negates a command or resets to its defaults.		
• permit : specifies that matching addresses are permitted.		fies that matching addresses are permitted.	
		ies a range of IP addresses for the profile. This can be a single IP address or a range and an end address.	
	When enterin	g a range, enter the low IP multicast address, a space, and the high IP multicast address.	
	You can apply an profile applied to	IGMP profile to one or more Layer 2 interfaces, but each interface can have only one it.	
Examples	This example show	ws how to configure IGMP profile 40 that permits the specified range of IP multicast	
	Switch(config)# Switch(config-ig	<pre>ip igmp profile 40 gmp-profile)# permit gmp-profile)# range 233.1.1.1 233.255.255.255</pre>	
	You can verify yo	ur settings by using the show ip igmp profile privileged EXEC command.	

Related Commands	Command	Description
	ip igmp filter	Applies the IGMP profile to the specified interface.
	show ip dhcp snooping statistics	Displays the characteristics of all IGMP profiles or the specified IGMP profile number.

ip igmp snooping

Use the **ip igmp snooping** global configuration command to globally enable Internet Group Management Protocol (IGMP) snooping on the switch or to enable it on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping [**vlan** *vlan-id*]

no ip igmp snooping [**vlan** *vlan-id*]

Syntax Description	vlan <i>vlan-id</i> (Optional) Enable IGMP snooping on the specified VLAN. The range is 1 t 1001 and 1006 to 4094.		
Defaults	IGMP snooping is g	lobally enabled on the switch.	
	IGMP snooping is en	nabled on VLAN interfaces.	
Command Modes	Global configuration	1	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	1	ng is enabled globally, it is enabled in all the existing VLAN interfaces. When IGMP disabled, it is disabled on all the existing VLAN interfaces.	
	VLAN IDs 1002 to snooping.	1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
Examples	This example shows	how to globally enable IGMP snooping:	
	Switch(config)# ip igmp snooping		
	This example shows how to enable IGMP snooping on VLAN 1:		
	Switch(config)# ig) igmp snooping vlan 1	
	You can verify your	settings by entering the show ip igmp snooping privileged EXEC command.	

Related Commands	Command	Description
	ip igmp snooping report-suppression	Enables IGMP report suppression.
	show ip igmp snooping	Displays the snooping configuration.
	show ip igmp snooping groups	Displays IGMP snooping multicast information.
	show ip igmp snooping mrouter	Displays the IGMP snooping router ports.
	show ip igmp snooping querier	Displays the configuration and operation information for the IGMP querier configured on a switch.

ip igmp snooping last-member-query-interval

Use the **ip igmp snooping last-member-query-interval** global configuration command to enable the Internet Group Management Protocol (IGMP) configurable-leave timer globally or on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping [vlan vlan-id] last-member-query-interval time

no ip igmp snooping [vlan vlan-id] last-member-query-interval

Syntax Descriptiont	vlan vlan-id(Optional) Enable IGMP snooping and the leave timer on the spectrumVLAN. The range is 1 to 1001 and 1006 to 4094.	
	time	Interval time out in seconds. The range is 100 to 32768 milliseconds.
Defaults	The default timeout	setting is 1000 milliseconds.
Command Modes	Global configuration	1
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
	12.2(46)SE	The range for <i>time</i> was modified to 100 to 32768 milliseconds
Usage Guidelines	interfaces. When IG VLAN interfaces. VLAN IDs 1002 to 1 snooping.	ng is globally enabled, IGMP snooping is enabled on all the existing VLAN MP snooping is globally disabled, IGMP snooping is disabled on all the existing 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP
	Configuring the leave timer on a VLAN overrides the global setting.	
	The IGMP configura	ble leave time is only supported on devices running IGMP Version 2.
	The configuration is	saved in NVRAM.
Examples	-	how to globally enable the IGMP leave timer for 2000 milliseconds: igmp snooping last-member-query-interval 2000
	-	how to configure the IGMP leave timer for 3000 milliseconds on VLAN 1:
	Switch(config)# ip igmp snooping vlan 1 last-member-query-interval 3000 You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping querier

Use the **ip igmp snooping querier** global configuration command to globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. Use the **no** form of this command to return to the default settings.

ip igmp snooping querier [**vlan** *vlan-id*] [**address** *ip-address* | **max-response-time** *response-time* | **query-interval** *interval-count* | **tcn query** [**count** *count* | **interval** *interval*] | **timer expiry** | **version** *version*]

no ip igmp snooping querier [vlan *vlan-id*] [**address** | **max-response-time** | **query-interval** | **tcn query** { **count** *count* | **interval** *interval* | **timer expiry** | **version**]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping and the IGMP querier function on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.
	address ip-address	(Optional) Specify a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.
	max-response-time response-time	(Optional) Set the maximum time to wait for an IGMP querier report. The range is 1 to 25 seconds.
	query-interval interval-count	(Optional) Set the interval between IGMP queriers. The range is 1 to 18000 seconds.
	tcn query[count <i>count</i> interval <i>interval</i>]	(Optional) Set parameters related to Topology Change Notifications (TCNs). The keywords have these meanings:
		• count —Set the number of TCN queries to be executed during the TCN interval time. The range is 1 to 10.
		• interval <i>interval</i> —Set the TCN query interval time. The range is 1 to 255.
	timer expiry	(Optional) Set the length of time until the IGMP querier expires. The range is 60 to 300 seconds.
	version version	(Optional) Select the IGMP version number that the querier feature uses. Select 1 or 2.
Defaults	The IGMP snooping que	rier feature is globally disabled on the switch.
2014110	1 0 1	P snooping querier disables itself if it detects IGMP traffic from a
Command Modes	Global configuration	
Command History	Release	Modification
-	12.2(25)SEF2	This command was introduced.

Usage Guidelines	Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a <i>querier</i> .		
	By default, the IGMP snooping querier is configured to detect devices that use IGMP <i>Version 2</i> (IGMPv2) but does not detect clients that are using IGMP <i>Version 1</i> (IGMPv1). You can manually configure the max-response-time value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured and is set to zero).		
	Non-RFC compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the max-response-time value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1.		
	VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.		
Examples	This example shows how to globally enable the IGMP snooping querier feature:		
	This example shows how to set the IGMP snooping querier maximum response time to 25 seconds: Switch(config)# ip igmp snooping querier max-response-time 25		
	This example shows how to set the IGMP snooping querier interval time to 60 seconds: Switch(config)# ip igmp snooping querier query-interval 60		
	This example shows how to set the IGMP snooping querier TCN query count to 25: Switch(config)# ip igmp snooping querier tcn count 25		
	This example shows how to set the IGMP snooping querier timeout to 60 seconds: Switch(config)# ip igmp snooping querier timeout expiry 60		
	This example shows how to set the IGMP snooping querier feature to version 2: Switch(config)# ip igmp snooping querier version 2		
	You can verify your settings by entering the show ip igmp snooping privileged EXEC command.		

Related Commands	Command	Description
	ip igmp snooping report-suppression	Enables IGMP report suppression.
	show ip igmp snooping	Displays the IGMP snooping configuration.

	show ip igmp snooping mrouter	Displays the IGMP snooping router ports.

ip igmp snooping report-suppression

Use the **ip igmp snooping report-suppression** global configuration command to enable Internet Group Management Protocol (IGMP) report suppression. Use the **no** form of this command to disable IGMP report suppression and to forward all IGMP reports to multicast routers.

ip igmp snooping report-suppression

no ip igmp snooping report-suppression

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** IGMP report suppression is enabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression by entering the **no ip igmp snooping report-suppression** command, all IGMP reports are forwarded to all the multicast routers.

Examples This example shows how to disable report suppression: Switch(config)# no ip igmp snooping report-suppression

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping tcn

Use the **ip igmp snooping tcn** global configuration command to configure the Internet Group Management Protocol (IGMP) Topology Change Notification (TCN) behavior. Use the **no** form of this command to return to the default settings.

ip igmp snooping tcn {flood query count count | query solicit}

no ip igmp snooping tcn {flood query count | query solicit}

Syntax Description		
Syntax Description	flood query count count	Specify the number of IGMP general queries for which the multicast traffic is flooded. The range is 1 to 10.
	query solicit	Send an IGMP leave message (global leave) to speed the process of recovering from the flood mode caused during a TCN event.
Defaults	The TCN flood query cou	
	The TCN query solicitatio	n is disabled.

Related Commands	Command	Description
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
	ip igmp snooping tcn flood	Specifies flooding on an interface as the IGMP snooping spanning-tree TCN behavior.
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping tcn flood

Use the **ip igmp snooping tcn flood** interface configuration command to specify multicast flooding as the Internet Group Management Protocol (IGMP) snooping spanning-tree Topology Change Notification (TCN) behavior. Use the **no** form of this command to disable the multicast flooding.

ip igmp snooping tcn flood

no ip igmp snooping tcn flood

Syntax Description	This command has no	o arguments or keywords.
--------------------	---------------------	--------------------------

Defaults Multicast flooding is enabled on an interface during a spanning-tree TCN event.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines When the switch receives a TCN, multicast traffic is flooded to all the ports until two general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, the flooding might exceed the capacity of the link and cause packet loss.

You can change the flooding query count by using the **ip igmp snooping tcn flood query count** global configuration command.

Examples This example shows how to disable the multicast flooding on an interface:

Switch(config)# interface gigabitethernet0/2
Switch(config-if)# no ip igmp snooping tcn flood

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
	ip igmp snooping tcn	Configures the IGMP TCN behavior on the switch.
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping vlan immediate-leave

Use the **ip igmp snooping immediate-leave** global configuration command to enable Internet Group Management Protocol (IGMP) snooping immediate-leave processing on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping vlan vlan-id immediate-leave

no ip igmp snooping vlan vlan-id immediate-leave

Syntax Description	vlan-id		snooping and the Immediate-Leave feature on the specified nge is 1 to 1001 and 1006 to 4094.
Defaults	IGMP immediate-leave	processing is dis	abled.
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command	l was introduced.
Usage Guidelines	VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.		
			ave feature only when there is a maximum of one receiver on on is saved in NVRAM.
	The Immediate-Leave	feature is supporte	ed only with IGMP Version 2 hosts.
Examples	This example shows ho	ow to enable IGMI	P immediate-leave processing on VLAN 1:
	Switch(config)# ip i	gmp snooping vla	an 1 immediate-leave
	You can verify your set	tings by entering	the show ip igmp snooping privileged EXEC command.
Related Commands	Command		Description
	ip igmp snooping rep	ort-suppression	Enables IGMP report suppression.
	show ip igmp snoopin		Displays the snooping configuration.
	show ip igmp snoopin	ig groups	Displays IGMP snooping multicast information.
	show ip igmp snoopin		Displays the IGMP snooping router ports.
	show ip igmp snoopin	ıg querier	Displays the configuration and operation information for the IGMP querier configured on a switch.

ip igmp snooping vlan mrouter

Use the **ip igmp snooping mrouter** global configuration command to add a multicast router port or to configure the multicast learning method. Use the **no** form of this command to return to the default settings.

ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

no ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

Syntax Description	vlan-id	Enable IGMP snooping, and add the port in the specified VLAN as the multicast router port. The range is 1 to 1001 and 1006 to 4094.	
	interface interface-id	Specify the next-hop interface to the multicast router. The keywords have these meanings:	
		• fastethernet <i>interface number</i> —a Fast Ethernet IEEE 802.3 interface.	
		• gigabitethernet <i>interface number</i> —a Gigabit Ethernet IEEE 802.3z interface.	
		• port-channel <i>interface number</i> —a channel interface. The range is 0 to 12.	
	learn {cgmp pim-dvmrp}	Specify the multicast router learning method. The keywords have these meanings:	
		• cgmp —Set the switch to learn multicast router ports by snooping on Cisco Group Management Protocol (CGMP) packets.	
		• pim-dvmrp —Set the switch to learn multicast router ports by snooping on IGMP queries and Protocol-Independent Multicast-Distance Vector Multicast Routing Protocol (PIM-DVMRP) packets.	
Defaults	By default, there are no	multicast router ports.	
		thod is pim-dvmrp —to snoop IGMP queries and PIM-DVMRP packets.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.	
Usage Guidelines	VLAN IDs 1002 to 100 snooping.	5 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
	The CGMP learn metho	d is useful for reducing control traffic.	

The configuration is saved in NVRAM.

ExamplesThis example shows how to configure a port as a multicast router port:
Switch(config)# ip igmp snooping vlan 1 mrouter interface gigabitethernet0/2This example shows how to specify the multicast router learning method as CGMP:
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp
You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Commands Command Description ip igmp snooping report-suppression Enables IGMP report suppression. show ip igmp snooping Displays the snooping configuration. show ip igmp snooping groups Displays IGMP snooping multicast information. show ip igmp snooping mrouter Displays the IGMP snooping router ports. show ip igmp snooping querier Displays the configuration and operation information for the IGMP querier configured on a switch.

ip snap forwarding

Use the **ip snap forwarding** global configuration command to enable forwarding of IP Version 4 (IPv4) and IP Version 6 (IPv6) frames with Subnetwork Access Protocol (SNAP) encapsulation. Use **no** form of this command to disable forwarding of these frames.

ip snap forwarding

no ip snap forwarding

Syntax Description	This command has no	o arguments or	keywords.
--------------------	---------------------	----------------	-----------

Defaults The switch does not forward IPv4 and IPv6 frames with SNAP encapsulation.

Command Modes Global configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.

Usage Guidelines Use the **ip snap forwarding** global configuration command to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation.

If a switch that is joining the stack does not support forwarding of IPv4 and IPv6 frames with SNAP encapsulation, all the switches in the stack do not forward the IPv4 and IPv6 frames, and this forwarding feature is disabled.

Examples This example shows how to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation: Switch(config)# **ip snap forwarding**

You can verify your settings by entering the **show running-config** privileged EXEC command.

Related Commands Command Descrip		Description
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands >
		Configuration File Management Commands.

ip source binding

Use the **ip source binding** global configuration command on the switch stack or on a standalone switch to configure static IP source bindings on the switch. Use the **no** form of this command to delete static bindings.

ip source binding mac-address vlan vlan-id ip-address interface interface-id

no source binding mac-address vlan vlan-id ip-address interface interface-id

2(25)SEF2 This	Specify a MAC address. Specify a VLAN number. The range is from 1 to 4094. Specify an IP address. Specify an interface on which to add or delete an IP source binding. re configured. ification command was introduced.

lease Modi 2(25)SEF2 This		
2(25)SEF2 This		
	command was introduced.	
A static IP source binding entry has an IP address, its associated MAC address, and its associated VLAN number. The entry is based on the MAC address and the VLAN number. If you modify an entry by changing only the IP address, the switch updates the entry instead creating a new one.		
s example shows how	w to add a static IP source binding:	
Switch(config)# ip source binding 0001.1234.1234 vlan 1 172.20.50.5 interface gigabitethernet0/1		
This example shows how to add a static binding and then modify the IP address for it:		
abitethernet0/1	wurce binding 0001.1357.0007 vlan 1 172.20.50.25 interface wurce binding 0001.1357.0007 vlan 1 172.20.50.30 interface	
ı can verify your sett	ings by entering the show ip source binding privileged EXEC command.	
. : : : : : : : : : : : : : : : : : : :	s example shows how tch(config)# ip sc abitethernet0/1 s example shows how tch(config)# ip sc abitethernet0/1 tch(config)# ip sc abitethernet0/1	

Related Commands	Command	Description
	ip verify source	Enables IP source guard on an interface.
	show ip source binding	Displays the IP source bindings on the switch.
	show ip verify source	Displays the IP source guard configuration on the switch or on a specific interface.

ip ssh

Use the ip ssh global configuration command to configure the switch to run Secure Shell (SSH) Version 1 or SSH Version 2. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the **no** form of this command to return to the default setting. ip ssh version [1 | 2] no ip ssh version [1 | 2] Syntax Description 1 (Optional) Configure the switch to run SSH Version 1 (SSHv1). 2 (Optional) Configure the switch to run SSH Version 2 (SSHv1). Defaults The default version is the latest SSH version supported by the SSH client. **Command Modes** Global configuration **Command History** Release Modification 12.2(25)SEF2 This command was introduced. **Usage Guidelines** If you do not enter this command or if you do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2. The switch supports an SSHv1 or an SSHv2 server. It also supports an SSHv1 client. For more information about the SSH server and the SSH client, see the software configuration guide for this release. A Rivest, Shamir, and Adelman (RSA) key pair generated by an SSHv1 server can be used by an SSHv2 server and the reverse. **Examples** This example shows how to configure the switch to run SSH Version 2: Switch(config) # ip ssh version 2 You can verify your settings by entering the show ip ssh or show ssh privileged EXEC command.

Related Commands	Command	Description
	show ip ssh	Displays if the SSH server is enabled and displays the version and configuration information for the SSH server. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command References > Cisco IOS Security Command Reference, Release 12.2 > Other Security Features > Secure Shell Commands .
	show ssh	Displays the status of the SSH server. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command References > Cisco IOS Security Command Reference, Release 12.2 > Other Security Features > Secure Shell Commands .

ip sticky-arp (global configuration)

Use the **ip sticky-arp** global configuration command to enable sticky Address Resolution Protocol (ARP) on a switch virtual interface (SVI) that belongs to a private VLAN. Use the **no** form of this command to disable sticky ARP.

ip sticky-arp

no ip sticky-arp

Syntax Description	This command has	no arguments or	keywords.
--------------------	------------------	-----------------	-----------

Defaults Sticky ARP is enabled.

Command Modes Global configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.

Usage Guidelines

Sticky ARP entries are those learned on private-VLAN SVIs. These entries do not age out.

The **ip sticky-arp** global configuration command is supported only on SVIs belonging to private VLANs.

• When you configure a private VLAN, sticky ARP is enabled on the switch (the default).

If you enter the **ip sticky-arp** *interface* configuration command, it does not take effect.

If you enter the **no ip sticky-arp** *interface* configuration command, you do not disable sticky ARP on an interface.

<u>Note</u>

We recommend that you use the **show arp** privileged EXEC command to display and verify private-VLAN interface ARP entries.

• If you disconnect the switch from a device and then connect it to another device with a different MAC address but with the same IP address, the ARP entry is not created, and this message appears:

```
*Mar 2 00:26:06.967: %IP-3-STCKYARPOVR: Attempt to overwrite Sticky ARP entry: 20.6.2.1, hw: 0000.0602.0001 by hw: 0000.0503.0001
```

- If a MAC address of a device changes, you must use the **no arp** *ip-address* global configuration command to manually remove the private-VLAN interface ARP entries.
- Use the **arp** *ip-address hardware-address* **type** global configuration command to add a private-VLAN ARP entry.

Γ

- Use the **no sticky-arp** global configuration command to disable sticky ARP on the switch.
- Use the **no sticky-arp** interface configuration command to disable sticky ARP on an interface when sticky ARP is disabled on the switch.

ExamplesTo disable sticky ARP:
Switch(config)# no ip sticky-arpYou can verify your settings by using the show arp privileged EXEC command.

Related Commands	Command	Description
	arp	Adds a permanent entry in the ARP table. For syntax information, see the Cisco IOS IP Addressing Services Command Reference , Release 12.4 > ARP Commands .
	show arp	Displays the entries in the ARP table. For syntax information, see the Cisco IOS IP Addressing Services Command Reference, Release 12.4 > ARP Commands.

ip sticky-arp (interface configuration)

Use the **ip sticky-arp** interface configuration command to enable sticky Address Resolution Protocol (ARP) on a switch virtual interface (SVI) or a Layer 3 interface. Use the **no** form of this command to disable sticky ARP.

ip sticky-arp

no ip sticky-arp

Syntax Description	This command has no arguments or keywords.
--------------------	--

DefaultsSticky ARP is enabled on private-VLAN SVIs.Sticky ARP is disabled on Layer 3 interfaces and normal SVIs.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.

Usage Guidelines

Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out. The **ip sticky-arp** interface configuration command is only supported on

• Layer 3 interfaces

- SVIs belonging to normal VLANs
- SVIs belonging to private VLANs

On a Layer 3 interface or on an SVI belonging to a normal VLAN

- Use the sticky-arp interface configuration command to enable sticky ARP.
- Use the **no sticky-arp** interface configuration command to disable sticky ARP.

On private-VLAN SVIs

• When you configure a private VLAN, sticky ARP is enabled on the switch (the default).

If you enter the ip sticky-arp interface configuration command, it does not take effect.

If you enter the **no ip sticky-arp** *interface* configuration command, you do not disable sticky ARP on an interface.

We recommend that you use the **show arp** privileged EXEC command to display and verify private-VLAN interface ARP entries.

• If you disconnect the switch from a device and then connect it to another device with a different MAC address but with the same IP address, the ARP entry is not created, and this message appears:

*Mar 2 00:26:06.967: %IP-3-STCKYARPOVR: Attempt to overwrite Sticky ARP entry: 20.6.2.1, hw: 0000.0602.0001 by hw: 0000.0503.0001

- If a MAC address of a device changes, you must use the **no arp** *ip-address* global configuration command to manually remove the private-VLAN interface ARP entries.
- Use the **arp** *ip-address hardware-address* **type** global configuration command to add a private-VLAN ARP entry.
- Use the no sticky-arp global configuration command to disable sticky ARP on the switch.
- Use the no sticky-arp interface configuration command to disable sticky ARP on an interface.

Release 12.4 > ARP Commands.

Examples To enable sticky ARP on a normal SVI: Switch(config-if)# ip sticky-arp To disable sticky ARP on a Layer 3 interface or an SVI: Switch(config-if)# no ip sticky-arp You can verify your settings by using the show arp privileged EXEC command. **Related Commands** Command Description Adds a permanent entry in the ARP table. For syntax information, arp see the Cisco IOS IP Addressing Services Command Reference, Release 12.4 > ARP Commands. show arp Displays the entries in the ARP table. For syntax information, see the **Cisco IOS IP Addressing Services Command Reference**,

ip verify source

Use the **ip verify source** interface configuration command on the switch stack or on a standalone switch to enable IP source guard on an interface. Use the **no** form of this command to disable IP source guard.

ip verify source [port-security]

no ip verify source

Syntax Description	port-security	(Optional) Enable IP source guard with IP and MAC address filtering.	
		If you do not enter the port-security keyword, IP source guard with IP address filtering is enabled.	
Defaults	IP source guard	is disabled.	
Command Modes	Interface config	uration	
Command History	Release	Modification	
-	12.2(20)SE	This command was introduced.	
-	configuration co To enable IP sou port-security in	arce guard with source IP address filtering, use the ip verify source interface ommand. arce guard with source IP and MAC address filtering, use the ip verify source atterface configuration command. arce guard with source IP and MAC address filtering, you must enable port security on	
Examples	-	nows how to enable IP source guard with source IP address filtering: if) # ip verify source	
	This example shows how to enable IP source guard with source IP and MAC address filtering:		
	Switch(config-if)# ip verify source port-security		
	You can verify y	your settings by entering the show ip source binding privileged EXEC command.	
Related Commands	Command	Description	
	ip source bindi	ng Configures static bindings on the switch.	
	show ip verify	source Displays the IP source guard configuration on the switch or on a specific interface.	

ipv6 access-list

Use the **ipv6 access-list** global configuration command on the switch stack or on a standalone switch to define an IPv6 access list and to place the switch in IPv6 access list configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list access-list-name

	no ipv6 access-list access-list-name			
Note		This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	access-list-name	Name of the IPv6 access list. Names cannot contain a space or quotation mark or begin with a numeric.		
Defaults	No IPv6 access list is	s defined.		
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(25)SED	This command was introduced.		
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 global configuration command and reload the switch.			
•	The ipv6 access-list	command is similar to the ip access-list command, except that it is IPv6-specific.		
Note IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). A an IPv6 ACL cannot share the same name.				
	for more information	ccess-list configuration) and permit (IPv6 access-list configuration) commands on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer ation. See the "Examples" section for an example of a translated IPv6 ACL		
Note	any any statements a discovery. To disallow	implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 is its last match conditions. The two permit conditions allow ICMPv6 neighbor w ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement		

to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. You can apply inbound and outbound IPv6 ACLs to Layer 3 physical interfaces or switch virtual interfaces for routed ACLs, but only inbound IPv6 ACLs to Layer 2 interfaces for port ACLs.

Note

An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded by the switch and does not filter traffic generated by the switch.

Examples

This example puts the switch in IPv6 access list configuration mode and configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on an interface. The first ACL entry prevents all packets from the network FE80:0:0:2::/64 (packets that have the link-local prefix FE80:0:0:2 as the first 64 bits of their source IPv6 address) from leaving the interface. The second entry in the ACL permits all other traffic to leave the interface. The second entry is necessary because an implicit deny-all condition is at the end of each IPv6 ACL.

```
Switch(config)# ipv6 access-list list2
Switch(config-ipv6-acl)# deny FE80:0:0:2::/64 any
Switch(config-ipv6-acl)# permit any any
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter list2 out
```

```
Note
```

IPv6 ACLs that rely on the implicit deny condition or specify a **deny any any** statement to filter traffic should contain **permit** statements for link-local addresses to avoid the filtering of protocol packets. Additionally IPv6 ACLs that use **deny** statements to filter traffic should also use a **permit any any** statement as the last statement in the list.

Related Commands	Command	Description
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

ipv6 mld snooping

Use the **ipv6 mld snooping** global configuration command on the switch stack or on a standalone switch without keywords to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN. Use the **no** form of this command to disable MLD snooping on the switch or switch stack or the VLAN.

ipv6 mld snooping [vlan vlan-id]

no ipv6 mld snooping [vlan vlan-id]

Note	This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.	
Syntax Description	vlan vlan-id	(Optional) Enable or disable IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
Defaults	MLD snooping is global	ly disabled on the switch.
	MLD snooping is enabled on all VLANs. However, MLD snooping must be globally enabled before VLAN snooping will take place.	
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines	•	⁴ and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) nmand and reload the switch.
	globally enable MLD sn	globally disabled, it is disabled on all the existing VLAN interfaces. When you ooping, it is enabled on all VLAN interfaces that are in the default state guration will override global configuration on interfaces on which MLD led.
		bally disabled, you cannot enable it on a VLAN. If MLD snooping is globally to individual VLANs.
	range 1006 to 4094), IPv switch in order for the C	t router is a Catalyst 6500 switch and you are using extended VLANs (in the 6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the

user EXEC

Examples	This example shows how to globally set the last-listener query count: Switch(config)# ipv6 mld snooping last-listener-query-count 1
	This example shows how to set the last-listener query count for VLAN 10: Switch(config)# ipv6 mld snooping vlan 10 last-listener-guery-count 3
	You can verify your settings by entering the show ipv6 mld snooping [vlan <i>vlan-id</i>] to command.

Related Commands	Command	Description
	ipv6 mld snooping last-listener-query-interval	Sets IPv6 MLD snooping last-listener query interval.
	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
	show ipv6 mld snooping querier	Displays MLD snooping configuration.

ipv6 mld snooping last-listener-query-interval

Use the **ipv6 mld snooping last-listener-query-interval** global configuration command on the switch stack or on a standalone switch to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping last-listener query interval on the switch or on a VLAN. This time interval is the maximum time that a multicast router waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group. Use the **no** form of this command to reset the query time to the default settings.

ipv6 mld snooping [vlan vlan-id] last-listener-query-interval integer_value

no ipv6 mld snooping [vlan vlan-id] last-listener-query-interval

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	(Optional) Configure last-listener query interval on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
	integer_value	Set the time period (in thousands of a second) that a multicast router to wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second),	
Command Default	The default global query interval (maximum response time) is 1000 (1 second). The default VLAN query interval (maximum response time) is 0 (the global count is used).		
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan } global configuration command and reload the switch.		
	In MLD snooping, when the IPv6 multicast router receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the router deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the router waits before deleting a nonresponsive port from the multicast group.		
	When a VLAN query interval is set, this overrides the global query interval. When the VLAN interval is set at 0, the global value is used.		
	-	02 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

ExamplesThis example shows how to globally set the last-listener query interval to 2 seconds:
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC
command.

Related Commands	Command	Description

	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
	show ipv6 mld snooping querier	Sets IPv6 MLD snooping last-listener query interval.

ipv6 mld snooping listener-message-suppression

Use the **ipv6 mld snooping listener-message-suppression** global configuration command on the switch stack or on a standalone switch to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression. Use the **no** form of this command to disable MLD snooping listener message suppression.

ipv6 mld snooping listener-message-suppression

no ipv6 mld snooping listener-message-suppression

	*			
<u> </u>		ilable only if you have configured a dual IPv4 and IPv6 Switch Database template on the switch.		
Command Default	The default is for ML	D snooping listener message suppression to be disabled.		
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(25)SED	This command was introduced.		
Usage Guidelines	global configuration of MLD snooping listen enabled, received ML	IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) command and reload the switch. er message suppression is equivalent to IGMP snooping report suppression. When LDv1 reports to a group are forwarded to IPv6 multicast routers only once in every This prevents the forwarding of duplicate reports.		
Examples	This example shows how to enable MLD snooping listener-message-suppression: Switch(config)# ipv6 mld snooping listener-message-suppression			
	I.	This example shows how to disable MLD snooping listener-message-suppression:		
		ipv6 mld snooping listener-message-suppression		
	You can verify your s command.	settings by entering the show ipv6 mld snooping [vlan vlan-id] user EXEC		

Command	Description
ipv6 mld snooping	Enables IPv6 MLD snooping.
sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
show ipv6 mld snooping	Displays MLD snooping configuration.

ipv6 mld snooping robustness-variable

Use the **ipv6 mld snooping robustness-variable** global configuration command on the switch stack or on a standalone switch to configure the number of IP version 6 (IPv6) Multicast Listener Discovery (MLD) queries that the switch sends before deleting a listener that does not respond, or enter a VLAN ID to configure on a per-VLAN basis. Use the **no** form of this command to reset the variable to the default settings.

ipv6 mld snooping [vlan vlan-id] robustness-variable integer_value

no ipv6 mld snooping [vlan vlan-id] robustness-variable

 Note	This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	vlan vlan-id	(Optional) Configure the robustness variable on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
	integer_value	The range is 1 to 3.	
Command Default	The default global r	obustness variable (number of queries before deleting a listener) is 2.	
	The default VLAN robustness variable (number of queries before aging out a multicast address) is 0, which means that the system uses the global robustness variable for aging out the listener.		
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines		al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) in command and reload the switch.	
	is removed from a n configured number	ured in terms of the number of MLDv1 queries sent with no response before a port nulticast group. A port is deleted when there are no MLDv1 reports received for the of MLDv1 queries. The global value determines the number of queries that the deleting a listener that does not respond and applies to all VLANs that do not have	
		e configured for a VLAN overrides the global value. If the VLAN robustness value e global value is used.	
	VLAN numbers 100 in MLD snooping.	02 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

show ipv6 mld snooping

Displays MLD snooping configuration.

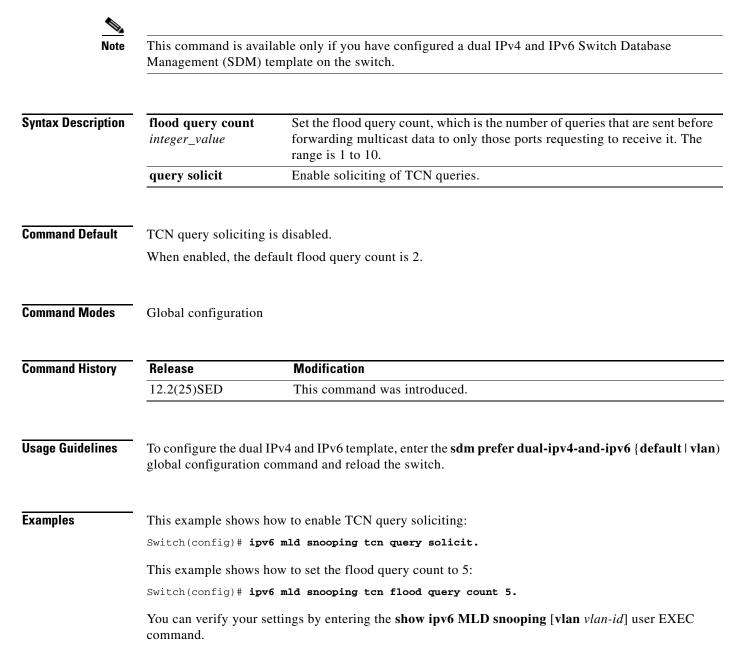

Examples This example shows how to configure the global robustness variable so that the switch sends out three queries before it deletes a listener port that does not respond: Switch(config)# ipv6 mld snooping robustness-variable 3 This example shows how to configure the robustness variable for VLAN 1. This value overrides the global configuration for the VLAN: Switch(config)# ipv6 mld snooping vlan 1 robustness-variable 1 You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC command. **Related Commands** Command Description ipv6 mld snooping last-listener-query-count Sets IPv6 MLD snooping last-listener query count. sdm prefer Configures an SDM template to optimize system resources based on how the switch is being used.

ipv6 mld snooping tcn

Use the **ipv6 mld snooping tcn** global configuration commands on the switch stack or on a standalone switch to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) Topology Change Notifications (TCNs). Use the **no** form of the commands to reset the default settings.

ipv6 mld snooping tcn {**flood query count** *integer_value* | **query solicit**}

no ipv6 mld snooping tcn {**flood query count** *integer_value* | **query solicit**}

	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
	show ipv6 mld snooping	Displays MLD snooping configuration.

ipv6 mld snooping vlan

Use the **ipv6 mld snooping vlan** global configuration command on the switch stack or on a standalone switch to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface. Use the **no** form of this command to reset the parameters to the default settings.

- **ipv6 mld snooping vlan** *vlan-id* [**immediate-leave** | **mrouter interface** *interface-id* | **static** *ipv6-multicast-address* **interface** *interface-id*]
- **no ipv6 mld snooping vlan** *vlan-id* [**immediate-leave** | **mrouter interface** *interface-id* | **static** *ip-address* **interface** *interface-id*]

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	Specify a VLAN number. The range is 1 to 1001 and 1006 to 4094.	
	immediate-leave	(Optional) Enable MLD Immediate-Leave processing on a VLAN interface. Use the no form of the command to disable the Immediate Leave feature on the interface.	
	mrouter interface	(Optional) Configure a multicast router port. The no form of the command removes the configuration.	
	static ipv6-multicast-ad	<i>Idress</i> (Optional) Configure a multicast group with the specified IPv6 multicast address.	
	interface interface-id	Add a Layer 2 port to the group. The mrouter or static interface can be a physical port or a port-channel interface in the range of 1 to 12.	
Command Default	MLD snooping Immedia	tte-Leave processing is disabled.	
	By default, there are no static IPv6 multicast groups.		
	By default, there are no multicast router ports.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.	
Usage Guidelines	-	74 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) nmand and reload the switch.	

You should only configure the Immediate-Leave feature when there is only one receiver on every port in the VLAN. The configuration is saved in NVRAM.

The static keyword is used for configuring the MLD member ports statically.

The configuration and the static ports and groups are saved in NVRAM.

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

Examples This example shows how to enable MLD Immediate-Leave processing on VLAN 1: Switch(config) # ipv6 mld snooping vlan 1 immediate-leave This example shows how to disable MLD Immediate-Leave processing on VLAN 1: Switch(config) # no ipv6 mld snooping vlan 1 immediate-leave This example shows how to configure a port as a multicast router port: Switch(config) # ipv6 mld snooping vlan 1 mrouter interface gigabitethernet0/2 This example shows how to configure a static multicast group: Switch(config) # ipv6 mld snooping vlan 2 static FF12::34 interface gigabitethernet0/2 You can verify your settings by entering the **show ipv6 mld snooping vlan** vlan-id user EXEC command. **Related Commands** Command Description ipv6 mld snooping Enables IPv6 MLD snooping.

ipv6 mld snooping vlan	Configures IPv6 MLD snooping on the VLAN.	
sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.	
show ipv6 mld snooping	Displays IPv6 MLD snooping configuration.	

ipv6 traffic-filter

Use the **ipv6 traffic-filter** interface configuration command on the switch stack or on a standalone switch to filter IPv6 traffic on an interface. You can filter both incoming or outgoing IPv6 traffic on Layer 3 interfaces (router ACLs), but only incoming traffic on Layer 2 interfaces (port ACLs). Use the **no** form of this command to disable the filtering of IPv6 traffic on an interface.

ipv6 traffic-filter access-list-name {in | out}

no ipv6 traffic-filter access-list-name {in | out}

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	access-list-name	Specify an IPv6 access name.
	in	Specify incoming IPv6 traffic.
	out	Specify outgoing IPv6 traffic.
		Note This keyword is not supported on Layer 2 interfaces.
Defaults	Filtering of IPv6 traff	ic on an interface is not configured.
Command Modes	Interface configuratio	n
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines		IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) command and reload the switch.
	-	traffic-filter command on physical interfaces (Layer 2 or Layer 3 ports), Layer 3 ch virtual interfaces (SVIs).
	11	nbound and outbound filtering on Layer 3 interfaces (router ACLs), but only Layer 2 ports (port ACLs).
	If any port ΔCL (IPv/	, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets,

Examples This example filters inbound IPv6 traffic on an IPv6-configured interface as defined by the access list

```
named cisco:
Switch (config)# interface gigabitethernet0/1
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter cisco in
```

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and sets deny or permit conditions for the defined access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.
	show ipv6 interface	Displays the usability status of interfaces configured for IPv6.

I2protocol-tunnel

Use the **l2protocol-tunnel** interface configuration command on the switch stack or on a standalone switch to enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel. You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets. Use the **no** form of this command to disable tunneling on the interface.

12protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] value] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] value]

no l2protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]]

Syntax Description	l2protocol-tunnel	Enable point-to-multipoint tunneling of CDP, STP, and VTP packets.
	cdp	(Optional) Enable tunneling of CDP, specify a shutdown threshold for CDP, or specify a drop threshold for CDP.
	stp	(Optional) Enable tunneling of STP, specify a shutdown threshold for STP, or specify a drop threshold for STP.
	vtp	(Optional) Enable tunneling or VTP, specify a shutdown threshold for VTP, or specify a drop threshold for VTP.
	point-to-point	(Optional) Enable point-to point tunneling of PAgP, LACP, and UDLD packets.
	pagp	(Optional) Enable point-to-point tunneling of PAgP, specify a shutdown threshold for PAgP, or specify a drop threshold for PAgP.
	lacp	(Optional) Enable point-to-point tunneling of LACP, specify a shutdown threshold for LACP, or specify a drop threshold for LACP.
	udld	(Optional) Enable point-to-point tunneling of UDLD, specify a shutdown threshold for UDLD, or specify a drop threshold for UDLD.
	shutdown-threshold	(Optional) Set a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.
	drop-threshold	(Optional) Set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.
	value	Specify a threshold in packets per second to be received for encapsulation before the interface shuts down, or specify the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

Defaults

The default is that no Layer 2 protocol packets are tunneled.

The default is no shutdown threshold for the number of Layer 2 protocol packets.

The default is no drop threshold for the number of Layer 2 protocol packets.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.
Usage Guidelines	You must enter this	s command, with or without protocol types, to tunnel Layer 2 packets.
	If you enter this co	mmand for a port channel, all ports in the channel must have the same configuration.
	propagated across packets are encaps	Inneling across a service-provider network ensures that Layer 2 information is the network to all customer locations. When protocol tunneling is enabled, protocol ulated with a well-known Cisco multicast address for transmission across the network. reach their destination, the well-known MAC address is replaced by the Layer 2 ress.
	You can enable Lay	yer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.
	EtherChannels by of the service-provide	ler network, you can use Layer 2 protocol tunneling to enhance the creation of emulating a point-to-point network topology. When protocol tunneling is enabled on er switch for PAgP or LACP, remote customer switches receive the protocol data units egotiate automatic creation of EtherChannels.
	topology. To decrea	g of PAgP, LACP, and UDLD packets, you must have a point-to-point network ase the link-down detection time, you should also enable UDLD on the interface when ng of PAgP or LACP packets.
	You can enable point three protocols.	int-to-point protocol tunneling for PAgP, LACP, and UDLD individually or for all
<u> </u>		UDLD tunneling is only intended to emulate a point-to-point topology. An erroneous sends tunneled packets to many ports could lead to a network failure.
	received on an inte the threshold is app	n-threshold keyword to control the number of protocol packets per second that are erface before it shuts down. When no protocol option is specified with the keyword, plied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold e shutdown-threshold value must be greater than or equal to the drop-threshold value.
	entering the errdis brought out of the timed out. If the er	n threshold is reached, the interface is error-disabled. If you enable error recovery by sable recovery cause l2ptguard global configuration command, the interface is error-disabled state and allowed to retry the operation again when all the causes have rror recovery mechanism is not enabled for l2ptguard , the interface stays in the e until you enter the shutdown and no shutdown interface configuration commands.
		eshold keyword to control the number of protocol packets per second that are received

on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.

Examples	This example shows how to enable protocol tunneling for CDP packets and to configure the shutdown threshold as 50 packets per second:
	Switch(config-if)# 12protocol-tunnel cdp Switch(config-if)# 12protocol-tunnel shutdown-threshold cdp 50
	This example shows how to enable protocol tunneling for STP packets and to configure the drop threshold as 400 packets per second:
	Switch(config-if)# 12protocol-tunnel stp Switch(config-if)# 12protocol-tunnel drop-threshold stp 400
	This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and to configure the PAgP drop threshold as 1000 packets per second:
	Chitah (andin if) # 10 mataral turnal naith to maint name

```
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point udld
Switch(config-if)# 12protocol-tunnel drop-threshold point-to-point pagp 1000
```

Related Commands	Command	Description
	l2protocol-tunnel cos	Configures a class of service (CoS) value for all tunneled Layer 2 protocol packets.
	show errdisable recovery	Displays error-disabled recovery timer information.
	show l2protocol-tunnel	Displays information about ports configured for Layer 2 protocol tunneling, including port, protocol, class of service (CoS), and threshold.

l2protocol-tunnel cos

Use the **l2protocol-tunnel cos** global configuration command to configure class of service (CoS) value for all tunneled Layer 2 protocol packets. Use the **no** form of this command to return to the default setting.

l2protocol-tunnel cos value

no l2protocol-tunnel cos

Syntax Description	value	Specify CoS priority value for tunneled Layer 2 protocol packets. If a CoS value is configured for data packets for the interface, the default is to use this CoS value. If no CoS value is configured for the interface, the default is 5. The range is 0 to 7, with 7 being the highest priority.
Defaults		CoS value configured for data on the interface. If no CoS value is configured unneled Layer 2 protocol packets.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	When enabled, the tunn The value is saved in N	eled Layer 2 protocol packets use this CoS value. VRAM.
Examples	This example shows how Switch(config)# 12pro	w to configure a Layer-2 protocol-tunnel CoS value of 7:

	show l2protocol-tunne	Displays information about ports configured for Layer 2 protocol

lacp port-priority

Use the **lacp port-priority** interface configuration command to configure the port priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp port-priority priority

no lacp port-priority

Syntax Description	priority	Port priority for LACP. The range is 1 to 65535.	
Defaults	The default is 3276	8.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines		rity interface configuration command determines which ports are bundled and which standby mode when there are more than eight ports in an LACP channel group.	
	An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.		
	In port-priority comparisons, a numerically <i>lower</i> value has a <i>higher</i> priority: When there are more than eight ports in an LACP channel-group, the eight ports with the numerically lowest values (highest priority values) for LACP port priority are bundled into the channel group, and the lower-priority ports are put in hot-standby mode. If two or more ports have the same LACP port priority (for example, they are configured with the default setting of 65535) an internal value for the port number determines the priority.		
<u>Note</u>		prities are only effective if the ports are on the switch that controls the LACP link. n-priority global configuration command for determining which switch controls the	
	Use the show lacp i number values.	nternal privileged EXEC command to display LACP port priorities and internal port	
	For information about configuring LACP on physical ports, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.		
Examples	-	s how to configure the LACP port priority on a port:	
		nterface gigabitethernet0/1 # lacp port-priority 1000	

You can verify your settings by entering the **show lacp** [*channel-group-number*] **internal** privileged EXEC command.

Related Commands

Command	Description
channel-group	Assigns an Ethernet port to an EtherChannel group.
lacp system-priority	Configures the LACP system priority.
<pre>show lacp [channel-group-number] internal</pre>	Displays internal information for all channel groups or for the specified channel group.

lacp system-priority

Use the **lacp system-priority** global configuration command to configure the system priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp system-priority priority

no lacp system-priority

Syntax Description	priority	System priority for LACP. The range is 1 to 65535.	
Defaults	The default is 32768		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	The lacp system-pr	iority command determines which switch in an LACP link controls port priorities.	
	An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel-group, the switch on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other switch (the noncontrolling end of the link) are ignored.		
	In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both switches have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the switch MAC address) determines which switch is in control.		
	The lacp system-priority command applies to all LACP EtherChannels on the switch.		
	Use the show etherchannel summary privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).		
	For more information about configuring LACP on physical ports, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.		
Examples	This example shows	how to set the LACP system priority:	
	Switch(config)# lacp system-priority 20000		
	You can verify your	settings by entering the show lacp sys-id privileged EXEC command.	

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	lacp port-priority	Configures the LACP port priority.
	show lacp sys-id	Displays the system identifier that is being used by LACP.

location (global configuration)

Use the **location global configuration** command to configure location information for an endpoint. Use the **no** form of this command to remove the location information.

 An interface that is defined as an upstream interface cannot also be defined as a downstrea interface in the same or a different link-state group. The reverse is also true. 		 Do not configur 		
• You can configure only two link-state groups per switch.		• An interface that	at is defined as an upstream interface cannot also be defined as a downstream	

Examples

This example shows how to configure the interfaces as **upstream** in group 2:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/15
Switch(config-if)# link state group 2 upstream
Switch(config-if)# end
```

```
<u>Note</u>
```

If the interfaces are part of an EtherChannel, you must specify the port channel name as part of the link state group, not the individual port members.

This example shows how to create a link-state group using ports in an EtherChannel:

```
Switch# configure terminal
Switch(config)# link state track 1
Switch(config)# interface P01
Switch(config-if)# link state group 1 upstream
Switch(config-if-range)# interface range gigabitethernet0/1, gigabitethernet0/3,
gigabitethernet0/5
Switch(config-if)# link state group 1 downstream
Switch(config-if)# link state group 1 downstream
```

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	link state track	Enables a link-state group.
	show link state group	Displays the link-state group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference for Release 12.2 > Cisco IOS File Management Commands > Configuration File Commands.

link state track

Use the **link state track** global configuration command to enable a link-state group. Use the **no** form of this command to disable a link-state group.

link state track [number]

no link state track [number]

Syntax Description	number	(Optional) Specify the link-state group number. The group number can be 1 or 2, the default is 1.	
Defaults	Link-state tracking is dis	abled for all groups.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Examples	This example shows how	enable link-state group 2:	
	Switch(config)# link state track 2		
	You can verify your settings by entering the show running-config privileged EXEC command

	link state group	Configures an interface as a member of a link-state group.	
	show link state group	Displays the link-state group information.	
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference for Release 12.2 > Cisco IOS File Management Commands >	

logging event

logging event

Use the **logging event** interface configuration command to enable notification of interface link status changes. Use the **no** form of this command to disable notification.

logging event {bundle-status | link-status | spanning-tree | status | trunk status}

no logging event {bundle-status | link-status | spanning-tree | status | trunk status}

Syntax Description	bundle-status	Enable notification of BUNDLE and UNBUNDLE messages.
	link-status	Enable notification of interface data link status changes.
	spanning-tree	Enable notification of spanning-tree events.
	status	Enable notification of spanning-tree state change messages.
	trunk-status	Enable notification of trunk-status messages.
Defaults	Event logging is d	icablad
Defaults	Event logging is d	Isabled.
Command Modes	Interface configur	ation
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Examples	This example show	vs how to enable spanning-tree logging:
	Switch(config-if)# logging event spanning-tree

logging file

Use the **logging file** global configuration command to set logging file parameters. Use the **no** form of this command to return to the default setting.

logging file *filesystem:filename* [*max-file-size* | **nomax** [*min-file-size*]] [*severity-level-number* | *type*]

no logging file *filesystem:filename* [*severity-level-number* | *type*]

Syntax Description	filesystem:filename	Alias for a flash file system. Contains the path and name of the file that contains the log messages.
		The syntax for the local flash file system: flash:
	max-file-size	(Optional) Specify the maximum logging file size. The range is 4096 to 2147483647.
	nomax	(Optional) Specify the maximum file size of 2147483647.
	min-file-size	(Optional) Specify the minimum logging file size. The range is 1024 to 2147483647.
	severity-level-number	(Optional) Specify the logging severity level. The range is 0 to 7. See the <i>type</i> option for the meaning of each level.
	type	(Optional) Specify the logging type. These keywords are valid:
		• emergencies —System is unusable (severity 0).
		• alerts —Immediate action needed (severity 1).
		• critical —Critical conditions (severity 2).
		• errors —Error conditions (severity 3).
		• warnings—Warning conditions (severity 4).
		• notifications —Normal but significant messages (severity 5).
		• informational —Information messages (severity 6).
		• debugging —Debugging messages (severity 7).
Defaults	The minimum file size i	s 2048 bytes; the maximum file size is 4096 bytes.
		el is 7 (debugging messages and numerically lower levels).
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

The log file is stored in ASCII text format in an internal buffer on the switch. You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. If the switch fails, the log is lost unless you had previously saved it to flash memory by using the logging file flash : <i>filename</i> global configuration command.			
	sh memory by using the logging file flash : <i>filename</i> global configuration e more flash : <i>filename</i> privileged EXEC command to display its contents.		
The command rejects the minimum file size if it is greater than the maximum file size minus 1024; the minimum file size then becomes the maximum file size minus 1024.			
Specifying a <i>level</i> causes messages at that level and numerically lower levels to be displayed.			
This example shows how to save informational log messages to a file in flash memory:			
	g file flash:logfile informational and gradient states and the show running-config privileged EXEC command.		
Command	Description		
show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration		
	system messages by using configured syslog server. memory by using the logg After saving the log to fla command, you can use the The command rejects the minimum file size then be Specifying a <i>level</i> causes This example shows how Switch(config)# logging You can verify your settin		

mac access-group

Use the **mac access-group** interface configuration command to apply a MAC access control list (ACL) to a Layer 2 interface. Use the **no** form of this command to remove all MAC ACLs or the specified MAC ACL from the interface. You create the MAC ACL by using the **mac access-list extended** global configuration command.

mac access-group {name} in

no mac access-group {*name*}

Syntax Description	onnameSpecify a named MAC access list.		
	in	Specify that the ACL is applied in the ingress direction. Outbound ACLs are not	
		supported on Layer 2 interfaces.	
Defaults	No MAC ACL	is applied to the interface.	
Command Modes	Interface config	guration (Layer 2 interfaces only)	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	You can apply MAC ACLs only to ingress Layer 2 interfaces. You cannot apply MAC ACLs to Layer 3 interfaces.		
	On Layer 2 interfaces, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC access lists. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP ACL and a MAC ACL to the interface. You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface.		
	If a MAC ACL is already configured on a Layer 2 interface and you apply a new MAC ACL to interface, the new ACL replaces the previously configured one.		
		ACL to a Layer 2 interface on a switch, and the switch has a VLAN map applied to a interface is a member of, the ACL applied to the Layer 2 interface takes precedence.	
	If you apply an ACL to a Layer 2 interface on a switch, and the switch has an input Layer 3 ACL or VLAN map applied to a VLAN that the interface is a member of, the ACL applied to the Layer 2 interface takes precedence.		
		and packet is received on an interface with a MAC ACL applied, the switch checks the ns in the ACL. If the conditions are matched, the switch forwards or drops the packet, e ACL.	
	If the specified	ACL does not exist, the switch forwards all packets.	
		mation about configuring MAC extended ACLs, see the "Configuring Network Security apter in the software configuration guide for this release.	

Examples This example shows how to apply a MAC extended ACL named *macacl2* to an interface: Switch(config)# interface gigabitethernet0/1 Switch(config-if)# mac access-group macacl2 in

You can verify your settings by entering the **show mac access-group** privileged EXEC command. You can see configured ACLs on the switch by entering the **show access-lists** privileged EXEC command.

Related Commands	Command	Description
	show access-lists	Displays the ACLs configured on the switch.
	show link state group	Displays the MAC ACLs configured on the switch.
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands >
		Configuration File Management Commands.

mac access-list extended

Use the **mac access-list extended** global configuration command to create an access list based on MAC addresses for non-IP traffic. Using this command puts you in the extended MAC access-list configuration mode. Use the **no** form of this command to return to the default setting.

mac access-list extended name

no mac access-list extended name

Syntax Description	name Assign a name to the MAC extended access list.			
Defaults	By default, there are no MAC access lists created.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	MAC named extended lists are used with VLAN maps and class maps.			
	You can apply named MAC extended ACLs to VLAN maps or to Layer 2 interfaces; you cannot apply named MAC extended ACLs to Layer 3 interfaces.			
	Entering the mac access-list extended command enables the MAC access-list configuration mode. These configuration commands are available:			
	• default : sets a command to its default.			
	• deny : specifies packets to reject. For more information, see the deny (MAC access-list configuration) MAC access-list configuration command.			
	• exit: exits from MAC access-list configuration mode.			
	• no : negates a command or sets its defaults.			
	• permit : specifies packets to forward. For more information, see the permit (MAC access-list configuration) command.			
	For more information about MAC extended access lists, see the software configuration guide for this release.			
Examples	This example shows MAC access-list cor	how to create a MAC named extended access list named <i>mac1</i> and to enter extended ifiguration mode:		
	Switch(config)# mac access-list extended mac1 Switch(config-ext-macl)#			

This example shows how to delete MAC named extended access list *mac1*:

Switch(config) # no mac access-list extended mac1

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Configures the MAC ACL (in extended MAC-access list configuration mode).
	permit (MAC access-list configuration)	
	show access-lists	Displays the access lists configured on the switch.
	vlan access-map	Defines a VLAN map and enters access-map configuration mode where you can specify a MAC ACL to match and the action to be taken.

mac address-table aging-time

Use the **mac address-table aging-time** global configuration command to set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated. Use the **no** form of this command to return to the default setting. The aging time applies to all VLANs or a specified VLAN.

mac address-table aging-time {**0** | *10-1000000*} [**vlan** *vlan-id*]

no mac address-table aging-time {**0** | *10-1000000*} [**vlan** *vlan-id*]

Syntax Description	0	This value disable the table.	s aging. Static address entries are never aged or removed from	
	10-1000000	Aging time in seco	onds. The range is 10 to 1000000 seconds.	
	vlan vlan-id	(Optional) Specify to 4094.	the VLAN ID to which to apply the aging time. The range is 1	
Defaults	The default is 300	seconds.		
Command Modes	Global configuration	on		
Command History	Release	Modification		
	12.2(25)SEF2	This comman	d was introduced.	
Usage Guidelines	If hosts do not send continuously, increase the aging time to record the dynamic entries for a longer time. Increasing the time can reduce the possibility of flooding when the hosts send again.			
	If you do not speci	fy a specific VLAN,	this command sets the aging time for all VLANs.	
Examples	This example shows how to set the aging time to 200 seconds for all VLANs:			
	Switch(config)# mac address-table aging-time 200			
	You can verify you command.	r setting by entering	the show mac address-table aging-time privileged EXEC	
Related Commands	Command		Description	
	show mac address	s-table aging-time	Displays the MAC address table aging time for all VLANs or the specified VLAN.	

mac address-table learning vlan

Use the **mac address-table learning** global configuration command to enable MAC address learning on a VLAN. This is the default state. Use the **no** form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

mac address-table learning vlan vlan-id

no mac address-table learning vlan vlan-id

Syntax Description	vlan-id	Specify a single VLAN ID or a range of VLAN IDs separated by a hyphen or comma. Valid VLAN IDS are 1 to 4094. It cannot be an internal VLAN.	
Defaults	By default, MAC a	uddress learning is enabled on all VLANs.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.2(46)SE	This command was introduced.	
	 vlan 223) or on a range of VLANs (for example, no mac address-table learning vlan 1-10, 15). Before you disable MAC address learning, be sure that you are familiar with the network topolog the switch system configuration. Disabling MAC address learning on a VLAN could cause flood the network. For example, if you disable MAC address learning on a VLAN with a configured sw virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch flooded in that VLAN domain. We recommend that you disable MAC address learning on a VLAN an SVI. You cannot disable MAC address learning on a VLAN that the switch uses internally. If the VLA that you enter in the no mac address-table learning vlan vlan-id command is an internal VLAN switch generates an error message and rejects the command. To view used internal VLANs, enter show vlan internal usage privileged EXEC command. 		
	•	C address learning on a VLAN configured as a private VLAN primary or a secondary addresses are still learned on the other VLAN (primary or secondary) that belongs to	
	You cannot disable	MAC address learning on an RSPAN VLAN. The configuration is not allowed.	

If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on the secure port. If you later disable port security on the interface, the disabled MAC address learning state is enabled.

To display MAC address learning status of all VLANs or a specified VLAN, enter the **show** mac-address-table learning [vlan *vlan-id* command].

Examples This example shows how to disable MAC address learning on VLAN 2003:

Switch(config)# no mac address-table learning vlan 2003

To display MAC address learning status of all VLANs or a specified VLAN, enter the **show mac** address-table learning [vlan *vlan-id*] command.

Related Commands	Command	Description
	show mac address-table learning	Displays the MAC address learning status on all VLANs or on the specified VLAN.

mac address-table move update

Use the **mac address-table move update** global configuration command to enable the MAC address-table move update feature. Use the **no** form of this command to return to the default setting.

mac address-table move update {receive | transmit}

no mac address-table move update {receive | transmit}

Syntax Description	receive	Specify that the switch processes MAC address-table move update messages.
	transmit	Specify that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up.
Command Modes	Global configuration	1.
Defaults	By default, the MAC	C address-table move update feature is disabled.
Command History	Release	Modification
-	12.2(25)SEF2	This command was introduced.
Usage Guidelines		able move update feature allows the switch to provide rapid bidirectional mary (forwarding) link goes down and the standby link begins forwarding traffic.
	link goes down and	the access switch to send the MAC address-table move update messages if the primary the standby link comes up. You can configure the uplink switches to receive and dress-table move update messages.
Examples	This example shows messages:	how to configure an access switch to send MAC address-table move update
	Switch# configure Switch(conf)# mac Switch(conf)# end	terminal address-table move update transmit
	This example shows update messages:	how to configure an uplink switch to get and process MAC address-table move
	Switch# configure Switch(conf)# mac Switch(conf)# end	terminal address-table move update receive
	You can verify your command.	settings by entering the show mac address-table move update privileged EXEC

Related Commands	Command	Description	
	clear mac address-table move update	Clears the MAC address-table move update global counters.	
	debug matm move update	Debugs the MAC address-table move update message processing.	
	show mac address-table move update	Displays the MAC address-table move update information on the switch.	

mac address-table notification

Use the **mac address-table notification** global configuration command to enable the MAC address notification feature on the switch. Use the **no** form of this command to return to the default setting.

mac address-table notification [**history-size** *value*] | [**interval** *value*]

no mac address-table notification [history-size | interval]

Syntax Description	history-size value	(Optional) Configure the maximum number of entries in the MAC notification history table. The range is 0 to 500 entries.	
	interval value	(Optional) Set the notification trap interval. The switch sends the notification traps when this amount of time has elapsed. The range is 0 to 2147483647 seconds.	
Defaults	By default, the MAC address notification feature is disabled.		
	The default trap interv	al value is 1 second.	
	The default number of	entries in the history table is 1.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	network management s from the forwarding ta	fication feature sends Simple Network Management Protocol (SNMP) traps to the system (NMS) whenever a new MAC address is added or an old address is deleted bles. MAC notifications are generated only for dynamic and secure MAC not generated for self addresses, multicast addresses, or other static addresses.	
	When you configure the new table is created.	he history-size option, the existing MAC address history table is deleted, and a	
mac-notification interface configuration command and configure the switch to s		ddress notification feature by using the mac address-table notification so enable MAC address notification traps on an interface by using the snmp trap face configuration command and configure the switch to send MAC address traps he snmp-server enable traps mac-notification global configuration command.	
Examples	_	ow to enable the MAC address-table notification feature, set the interval time to e history-size to 100 entries:	
	Switch(config)# mac	address-table notification address-table notification interval 60 address-table notification history-size 100	

You can verify your settings by entering the show mac address-table notification privileged EXEC command.

Related Comm

Command	Description
clear mac address-table notification	Clears the MAC address notification global counters.
show mac address-table notification	Displays the MAC address notification settings on all interfaces or on the specified interface.
snmp-server enable traps	Sends the SNMP MAC notification traps when the mac-notification keyword is appended.
snmp trap mac-notification	Enables the SNMP MAC notification trap on a specific interface.

mac address-table static

Use the **mac address-table static** global configuration command to add static addresses to the MAC address table. Use the **no** form of this command to remove static entries from the table.

mac address-table static mac-addr vlan vlan-id interface interface-id

no mac address-table static mac-addr vlan vlan-id [interface interface-id]

Syntax Description	mac-addr	Destination MAC address (unicast or multicast) to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.	
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. The range is 1 to 4094.	
	interface interface-id	Interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels.	
Defaults	No static addresses are con	nfigured.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Examples	This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination, the packet is forwarded to the specified interface:		
	Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet0/1		
	You can verify your setting by entering the show mac address-table privileged EXEC command.		
	Command	Description	
Related Commands	Communu	Bocomption	

mac address-table static drop

Use the **mac address-table static drop** global configuration command to enable unicast MAC address filtering and to configure the switch to drop traffic with a specific source or destination MAC address. Use the **no** form of this command to return to the default setting.

mac address-table static mac-addr vlan vlan-id drop

no mac address-table static mac-addr vlan vlan-id

Syntax Description	mac-addr	Unicast source or destination MAC address. Packets with this MAC address are dropped.	
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.	
Defaults	Unicast MAC ad destination MAC	dress filtering is disabled. The switch does not drop traffic for specific source or 2 addresses.	
Command Modes	Global configura	tion	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	Follow these guid	delines when using this feature:	
		AC addresses, broadcast MAC addresses, and router MAC addresses are not supported. are forwarded to the CPU are also not supported.	
	• If you add a unicast MAC address as a static address and configure unicast MAC address filte the switch either adds the MAC address as a static address or drops packets with that MAC add depending on which command was entered last. The second command that you entered override first command.		
	For example, if you enter the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface <i>interface-id</i> global configuration command followed by the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop command, the switch drops packets with the specified MAC address as a source or destination.		
	•	the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop global configuration llowed by the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface <i>interface-id</i>	

ExamplesThis example shows how to enable unicast MAC address filtering and to configure the switch to drop
packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in
VLAN 4 with this MAC address as its source or destination, the packet is dropped:
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 dropThis example shows how to disable unicast MAC address filtering:
Switch(config)# no mac address-table static c2f3.220a.12f4 vlan 4
You can verify your setting by entering the show mac address-table static privileged EXEC command.

Related Commands	Command	Description
	show mac address-table static	Displays only static MAC address table entries.

macro apply

Use the **macro apply** interface configuration command to apply a macro to an interface or to apply and trace a macro configuration on an interface.

macro {**apply** | **trace**} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]

Syntax Description	apply	Apply a macro to the specified interface.		
	trace	Use the trace keyword to apply a macro to an interface and to debug the macro.		
	macro-name	Specify the name of the macro.		
	parameter value	(Optional) Specify unique parameter values that are specific to the interface. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.		
Defaults	This command has no default setting.			
Command Modes	Interface configura	ation		
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines		acro trace <i>macro-name</i> interface configuration command to apply and show the an interface or to debug the macro to find any syntax or configuration errors.		
	If a command fails because of a syntax error or a configuration error when you apply a macro, the macro continues to apply the remaining commands to the interface.			
	When creating a macro that requires the assignment of unique values, use the parameter <i>value</i> keywords to designate values specific to the interface.			
	Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.			
	Some macros might contain keywords that require a parameter value. You can use the macro apply <i>macro-name</i> ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.			
	There are Cisco-default Smartports macros embedded in the switch software. You can display these macros and the commands they contain by using the show parser macro user EXEC command.			

Follow these guidelines when you apply a Cisco-default Smartports macro on an interface:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro** name *macro-name* user EXEC command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter** *value* keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to an interface, the macro name is automatically added to the interface. You can display the applied commands and macro names by using the **show running-configuration interface** *interface-id* user EXEC command.

A macro applied to an interface range behaves the same way as a macro applied to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

You can delete a macro-applied configuration on an interface by entering the **default interface** *interface-id* interface configuration command.

After you have created a macro by using the **macro name** global configuration command, you can apply it to an interface. This example shows how to apply a user-created macro called **duplex** to an interface:

Switch(config-if) # macro apply duplex

To debug a macro, use the **macro trace** interface configuration command to find any syntax or configuration errors in the macro as it is applied to an interface. This example shows how to troubleshoot the user-created macro called **duplex** on an interface:

```
Switch(config-if)# macro trace duplex
Applying command...`duplex auto'
%Error Unknown error.
Applying command...`speed nonegotiate'
```

This example shows how to display the Cisco-default **cisco-desktop** macro and how to apply the macro and set the access VLAN ID to 25 on an interface:

```
Switch# show parser macro cisco-desktop
Macro name : cisco-desktop
Macro type : default
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
switchport port-security maximum 1
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
```

Examples

macro global

Use the **macro global** global configuration command to apply a macro to a switch or to apply and trace a macro configuration on a switch.

macro global {**apply** | **trace**} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]

Syntax Description	apply	Apply a macro to the switch.	
	trace	Apply a macro to a switch and to debug the macro.	
	macro-name	Specify the name of the macro.	
	parameter value	(Optional) Specify unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.	
Defaults	This command has	s no default setting.	
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	You can use the macro trace <i>macro-name</i> global configuration command to apply and to show the macros running on a switch or to debug the macro to find any syntax or configuration errors.		
	If a command fails because of a syntax error or a configuration error when you apply a macro, the macro continues to apply the remaining commands to the switch.		
	When creating a macro that requires the assignment of unique values, use the parameter <i>value</i> keywords to designate values specific to the switch.		
	Keyword matching is case sensitive. All matching occurrences of the keyword are repl corresponding value. Any full match of a keyword, even if it is part of a larger string, i match and is replaced by the corresponding value.		
	Some macros might contain keywords that require a parameter value. You can use the macro global apply <i>macro-name</i> ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.		
	There are Cisco-default Smartports macros embedded in the switch software. You can display these macros and the commands they contain by using the show parser macro user EXEC command.		
	Follow these guidelines when you apply a Cisco-default Smartports macro on a switch:		
	• Display all macros on the switch by using the show parser macro user EXEC command. Display the contents of a specific macro by using the show parser macro name <i>macro-name</i> user EXEC command.		

• Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter** *value* keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to a switch, the macro name is automatically added to the switch. You can display the applied commands and macro names by using the **show running-configuration** user EXEC command.

You can delete a global macro-applied configuration on a switch only by entering the **no** version of each command contained in the macro.

Examples

After you have created a new macro by using the **macro name** global configuration command, you can apply it to a switch. This example shows how see the **snmp** macro and how to apply the macro and set the hostname to test-server and set the IP precedence value to 7:

```
Switch# show parser macro name snmp
Macro name : snmp
Macro type : customizable
#enable port security, linkup, and linkdown traps
snmp-server enable traps port-security
snmp-server enable traps linkup
snmp-server enable traps linkdown
#set snmp-server host
snmp-server host ADDRESS
#set SNMP trap notifications precedence
snmp-server ip precedence VALUE
```

Switch(config) # macro global apply snmp ADDRESS test-server VALUE 7

To debug a macro, use the **macro global trace** global configuration command to find any syntax or configuration errors in the macro when it is applied to a switch. In this example, the **ADDRESS** parameter value was not entered, causing the snmp-server host command to fail while the remainder of the macro is applied to the switch:

```
Switch(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

Related Commands	Command	Description
	macro apply	Applies a macro on an interface or applies and traces a macro on an interface.
	macro description	Adds a description about the macros that are applied to an interface.
	macro global description	Adds a description about the macros that are applied to the switch.
	macro name	Creates a macro.
	show parser macro	Displays the macro definition for all macros or for the specified macro.

L

macro global description

Use the **macro global description** global configuration command to enter a description about the macros that are applied to the switch. Use the **no** form of this command to remove the description.

macro global description text

no macro global description text

Syntax Description	description <i>text</i> Ente	er a description about the macros that are applied to the switch.		
Defaults	This command has no default setting.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	Use the description keyword to associate comment text, or the macro name, with a switch. When multiple macros are applied on a switch, the description text will be from the last applied macro.			
	This example shows how to add a description to a switch: Switch(config)# macro global description udld aggressive mode enabled			
		tings by entering the show parser macro description privileged EXEC		
Related Commands	Command	Description		
	macro apply	Applies a macro on an interface or applies and traces a macro on an interface.		
	macro description	Adds a description about the macros that are applied to an interface.		
	macro global	Applies a macro on a switch or applies and traces a macro on a switch.		
	macro name	Creates a macro.		
	show parser macro	Displays the macro definition for all macros or for the specified macro.		

macro name

Use the **macro name** global configuration command to create a configuration macro. Use the **no** form of this command to delete the macro definition.

macro name macro-name

no macro name macro-name

Syntax Description	macro-name	Name of the macro.	
Defaults	This command has no default setting. Global configuration		
Command Modes			
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	A macro can contain up to 3000 characters. Enter one macro command per line. Use the @ character to end the macro. Use the # character at the beginning of a line to enter comment text within the macro.		
	You can define mandatory keywords within a macro by using a help string to specify the keywords. Enter # macro keywords word to define the keywords that are available for use with the macro. You can enter up to three help string keywords separated by a space. If you enter more than three macro keywords, only the first three are shown.		
	Macro names are case sensitive. For example, the commands macro name Sample-Macro and macro name sample-macro will result in two separate macros.		
	When creating a macro, do not use the exit or end commands or change the command mode by interface <i>interface-id</i> . This could cause commands that follow exit , end , or interface <i>interface interface interfac</i>		
The no form of this command only deletes the macro definition. It does not affect the control those interfaces on which the macro is already applied. You can delete a macro-applied contain interface by entering the default interface <i>interface-id</i> interface configuration command Alternatively, you can create an <i>anti-macro</i> for an existing macro that contains the no for corresponding commands in the original macro. Then apply the anti-macro to the interface		n which the macro is already applied. You can delete a macro-applied configuration on atering the default interface <i>interface-id</i> interface configuration command. It can create an <i>anti-macro</i> for an existing macro that contains the no form of all the	
	created macro over	macro by creating a new macro with the same name as the existing macro. The newly erwrites the existing macro but does not affect the configuration of those interfaces on 1 macro was applied.	

Examples This example shows how to create a macro that defines the duplex mode and speed:

```
Switch(config)# macro name duplex
Enter macro commands one per line. End with the character `@'.
duplex full
speed auto
@
```

This example shows how to create a macro with **# macro keywords**:

```
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
@
```

This example shows how to display the mandatory keyword values before you apply the macro to an interface:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# macro apply test ?
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID ?
WORD Value of first keyword to replace
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD Value of second keyword to replace
```

Related Commands

Command	Description	
macro apply	Applies a macro on an interface or applies and traces a macro on an interface.	
macro description	Adds a description about the macros that are applied to an interface.	
macro global	Applies a macro on a switch or applies and traces a macro on a switch.	
macro global description	Adds a description about the macros that are applied to the switch.	
show parser macro	Displays the macro definition for all macros or for the specified macro.	

match (access-map configuration)

Use the **match** access-map configuration command to set the VLAN map to match packets against one or more access lists. Use the **no** form of this command to remove the match parameters.

- match {ip address {name | number} [name | number] [name | number]...} | {mac address {name}
 [name] [name]...}
- **no match** {**ip address** {*name* | *number*} [*name* | *number*] [*name* | *number*]...} | {**mac address** {*name*} [*name*] [*name*]...}

Syntax Description	ip address	Set the access map to match packets against an IP address access list.
	mac address	Set the access map to match packets against a MAC address access list.
	name	Name of the access list to match packets against.
	number	Number of the access list to match packets against. This option is not valid for MAC access lists.
Defaults	The default act	ion is to have no match parameters applied to a VLAN map.
Command Modes	Access-map co	nfiguration
Command History	Release	Modification
-	12.2(25)SEF2	This command was introduced.
Usage Guidelines	You must enter or more access In access-map of	as-map configuration mode by using the vlan access-map global configuration command. one access list name or number; others are optional. You can match packets against one lists. Matching any of the lists counts as a match of the entry. configuration mode, use the match command to define the match conditions for a VLAN
	map applied to the conditions.	a VLAN. Use the action command to set the action that occurs when the packet matches
		tched only against access lists of the same protocol type; IP packets are matched against and all other packets are matched against MAC access lists.
	Both IP and MA	AC addresses can be specified for the same map entry.
Examples	-	hows how to define and apply a VLAN access map <i>vmap4</i> to VLANs 5 and 6 that will face to drop an IP packet if the packet matches the conditions defined in access list <i>al2</i> .
	<pre>cause the interface to drop an IP packet if the packet matches the conditions defined in access if Switch(config) # vlan access-map vmap4 Switch(config-access-map) # match ip address al2 Switch(config-access-map) # action drop Switch(config-access-map) # exit Switch(config) # vlan filter vmap4 vlan-list 5-6</pre>	

You can verify your settings by entering the show vlan access-map privileged EXEC command.

Related Commands	Command	Description
	access-list	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	action	Specifies the action to be taken if the packet matches an entry in an access control list (ACL).
	ip access list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	mac access-list extended	Creates a named MAC address access list.
	show vlan access-map	Displays the VLAN access maps created on the switch.
	vlan access-map	Creates a VLAN access map.

match (class-map configuration)

match (class-map configuration)

Use the **match** class-map configuration command to define the match criteria to classify traffic. Use the **no** form of this command to remove the match criteria.

no match {access-group *acl-index-or-name* | **input-interface** *interface-id-list* | **ip dscp** *dscp-list* | **ip precedence** *ip-precedence-list*}

Syntax Description		Number or name of an IP standard or extended access control list (ACL) or			
-,	access-group acl-index-or-name	MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.			
	input-interface interface-id-list	Specify the physical ports to which the interface-level class map in a hierarchical policy map applies. This command can only be used in the child-level policy map and must be the only match condition in the child-level policy map. You can specify up to six entries in the list by specifying a port (counts as one entry), a list of ports separated by a space (each port counts as an entry), or a range of ports separated by a hyphen (counts as two entries).			
	ip dscp dscp-list	List of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly-used value.			
	ip precedence ip-precedence-list	List of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly-used value			
Defaults	No match criteria are	defined.			
Command Modes	Class-map configurati	on			
Command History	Release	Modification			
	12.2(25)SEF2	This command was introduced.			
Usage Guidelines		is used to specify which fields in the incoming packets are examined to classify IP access group or the MAC access group matching to the Ether Type/Len are			
	-	ification on a physical-port basis, only one match command per class map is ation, the match-all and match-any keywords are equivalent.			

match {access-group acl-index-or-name | input-interface interface-id-list | ip dscp dscp-list | ip
precedence ip-precedence-list}

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries.

Examples

This example shows how to create a class map called *class2*, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
```

This example shows how to create a class map called *class3*, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using *acl1*:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config) # class-map match-all class4
Switch(config-cmap) # match input-interface gigabitethernet0/1 gigabitethernet0/2
Switch(config-cmap) # exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet0/1 - gigabitethernet0/5
Switch(config-cmap)# exit
```

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	show class-map	Displays quality of service (QoS) class maps.

mdix auto

Use the **mdix auto** interface configuration command to enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the **no** form of this command to disable auto-MDIX.

mdix auto

no mdix auto

Syntax Description	This command has no arguments or keywords.		
Defaults	Auto-MDIX is enabl	ed.	
Command Modes	Interface configuration	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	 When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to auto so that the feature operates correctly. When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect. Auto-MDIX is supported on all 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-T small form-factor pluggable (SFP) module interfaces. 		
Examples	This example shows how to enable auto-MDIX on a port: Switch# configure terminal Switch(config)# interface gigabitethernet0/1 Switch(config-if)# speed auto Switch(config-if)# duplex auto Switch(config-if)# mdix auto Switch(config-if)# mdix auto Switch(config-if)# end You can verify the operational state of auto-MDIX on the interface by entering the show control ethernet-controller interface-id phy privileged EXEC command.		

Related Commands	s Command Description			
	show controllers ethernet-controller interface-id phy	Displays general information about internal registers of an interface, including the operational state of auto-MDIX.		

mls qos

Use the **mls qos** global configuration command to enable quality of service (QoS) for the entire switch. When the **mls qos** command is entered, QoS is enabled with the default parameters on all ports in the system. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

mls qos

no mls qos

Syntax Description	This command	has no	arguments	or keywords.
--------------------	--------------	--------	-----------	--------------

DefaultsQoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified
(the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in
pass-through mode (packets are switched without any rewrites and classified as best effort without any
policing).

When QoS is enabled with the **mls qos** global configuration command and all other QoS settings are set to their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted. The default ingress and egress queue settings are in effect.

Command Modes Global configuration

Command History	Release	Modification
12.2(25)SEF2		This command was introduced.

Usage Guidelines QoS must be globally enabled to use QoS classification, policing, mark down or drop, queueing, and traffic shaping features. You can create a policy-map and attach it to a port before entering the **mls qos** command. However, until you enter the **mls qos** command, QoS processing is disabled.

Policy-maps and class-maps used to configure QoS are not deleted from the configuration by the **no mls qos** command, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To re-enable QoS with the previous configurations, use the **mls qos** command.

Toggling the QoS status of the switch with this command modifies (reallocates) the sizes of the queues. During the queue size modification, the queue is temporarily shut down during the hardware reconfiguration, and the switch drops newly arrived packets for this queue.

Examples

This example shows how to enable QoS on the switch:

Switch(config) # mls qos

You can verify your settings by entering the show mls qos privileged EXEC command.

Related Commands	Command	Description
	show mls qos	Displays QoS information.

mls qos aggregate-policer

Use the **mls qos aggregate-policer** global configuration command to define policer parameters, which can be shared by multiple classes within the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to delete an aggregate policer.

mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action {drop |
 policed-dscp-transmit}

no mls qos aggregate-policer aggregate-policer-name

Syntax Description	aggregate-policer-name	Name of the aggregate policer referenced by the police aggregate policy-map class configuration command.
	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	When the specified rate is exceeded, specify that the switch change the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then send the packet.
Defaults	No aggregate policers are	defined.
Command Modes	Global configuration	
	Global configuration Release	Modification
Command Modes Command History		Modification This command was introduced.
	Release 12.2(25)SEF2	
Command History	Release 12.2(25)SEF2 Define an aggregate polic	This command was introduced. eer if the policer is shared with multiple classes. be shared with other policers for another port; traffic from two different port
Command History	Release 12.2(25)SEF2 Define an aggregate polic Policers for a port cannot cannot be aggregated for The port ASIC device, w user-configurable policer user-configurable policer are constrained by the had	This command was introduced. eer if the policer is shared with multiple classes. be shared with other policers for another port; traffic from two different port

You cannot delete an aggregate policer if it is being used in a policy map. You must first use the **no police aggregate** *aggregate-policer-name* policy-map class configuration command to delete the aggregate policer from all policy maps before using the **no mls qos aggregate-policer** *aggregate-policer-name* command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Examples

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

Switch(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop Switch(config)# policy-map policy2 Switch(config-pmap)# class class1 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap)# class class2 Switch(config-pmap-c)# set dscp 10 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap-c)# exit Switch(config-pmap)# class class3 Switch(config-pmap-c)# trust dscp Switch(config-pmap-c)# police aggregate agg_policer2 Switch(config-pmap-c)# exit

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	police aggregate	Creates a policer that is shared by different classes.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

mls qos cos

Use the **mls qos cos** interface configuration command to define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port. Use the **no** form of this command to return to the default setting.

mls qos cos {*default-cos* | **override**}

no mls qos cos {*default-cos* | **override**}

Syntax Description	default-cos	Assign a default CoS value to a port. If packets are untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7.
	override	Override the CoS of the incoming packets, and apply the default CoS value on the port to all incoming packets.
Defaults		S value for a port is 0.
	CoS override is	disabled.
Command Modes	Interface config	guration
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	all incoming pa	e default value to assign a CoS and Differentiated Services Code Point (DSCP) value to ckets that are untagged (if the incoming packet does not have a CoS value). You also can t CoS and DSCP value to all incoming packets by using the override keyword.
	than packets en precedence, thi values are assig	de keyword when all incoming packets on certain ports deserve higher or lower priority tering from other ports. Even if a port is previously set to trust DSCP, CoS, or IP s command overrides the previously configured trust state, and all the incoming CoS gned the default CoS value configured with the mls qos cos command. If an incoming d, the CoS value of the packet is modified with the default CoS of the port at the
Examples	This example s	hows how to configure the default port CoS to 4 on a port:
	Switch(config-)# interface gigabitethernet0/1 -if)# mls qos trust cos -if)# mls qos cos 4

This example shows how to assign all the packets entering a port to the default port CoS value of 4 on a port:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mls qos cos 4
Switch(config-if)# mls qos cos override
```

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface	Displays quality of service (QoS) information.

mls qos dscp-mutation

Use the **mls qos dscp-mutation** interface configuration command to apply a Differentiated Services Code Point (DSCP)-to-DSCP-mutation map to a DSCP-trusted port. Use the **no** form of this command to return the map to the default settings (no DSCP mutation).

mls qos dscp-mutation dscp-mutation-name

no mls qos dscp-mutation dscp-mutation-name

Syntax Description			
,	dscp-mutation-name	Name of the DSCP-to-DSCP-mutation map. This map was previously defined with the mls qos map dscp-mutation global configuration command.	
Defaults	The default DSCP-to DSCP values.	o-DSCP-mutation map is a null map, which maps incoming DSCPs to the same	
Command Modes	Interface configurati	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
	domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a quality of service (QoS) administrative domain.With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS handles the packet with this new value. The switch sends the packet out the port with the new DSCP value.		
	You can configure multiple DSCP-to-DSCP-mutation maps on ingress ports.		
		only to DSCP-trusted ports. If you apply the DSCP mutation map to an untrusted ice (CoS) or IP-precedence trusted port, the command has no immediate effect until SCP-trusted.	
Examples	This example shows the map to a port:	how to define the DSCP-to-DSCP-mutation map named <i>dscpmutation1</i> and to apply	

This example show how to remove the DSCP-to-DSCP-mutation map name *dscpmutation1* from the port and to reset the map to the default:

Switch(config-if)# no mls gos dscp-mutation dscpmutation1

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands

Command	Description

mls qos map

Use the **mls qos map** global configuration command to define the class of service (CoS)-to-Differentiated Services Code Point (DSCP) map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map. Use the **no** form of this command to return to the default map.

no mls qos map {cos-dscp | dscp-cos | dscp-mutation *dscp-mutation-name* | **ip-prec-dscp | policed-dscp }**

Syntax Description	cos-dscp dscp1dscp8	Define the CoS-to-DSCP map.
		For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to CoS values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.
	dscp-cos dscp-list to cos	Define the DSCP-to-CoS map.
		For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. The range is 0 to 63. Then enter the to keyword.
		For <i>cos</i> , enter a single CoS value to which the DSCP values correspond. The range is 0 to 7.
	dscp-mutation	Define the DSCP-to-DSCP-mutation map.
	dscp-mutation-name in-dscp to out-dscp	For dscp-mutation-name, enter the mutation map name.
		For <i>in-dscp</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
		For <i>out-dscp</i> , enter a single DSCP value.
		The range is 0 to 63.
	ip-prec-dscp dscp1dscp8	Define the IP-precedence-to-DSCP map.
		For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.
	policed-dscp <i>dscp-list</i> to <i>mark-down-dscp</i>	Define the policed-DSCP map.
		For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
		For <i>mark-down-dscp</i> , enter the corresponding policed (marked down) DSCP value.
		The range is 0 to 63.

Defaults

Table 2-6 shows the default CoS-to-DSCP map:

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines All the maps are globally defined. All the maps, except the DSCP-to-DSCP-mutation map, are applied to all ports. The DSCP-to-DSCP-mutation map is applied to a specific port.

Examples This example shows how to define the IP-precedence-to-DSCP map and to map IP-precedence values 0 to 7 to DSCP values of 0, 10, 20, 30, 40, 50, 55, and 60:

Switch# configure terminal Switch(config)# mls qos map ip-prec-dscp 0 10 20 30 40 50 55 60

This example shows how to define the policed-DSCP map. DSCP values 1, 2, 3, 4, 5, and 6 are marked down to DSCP value 0. Marked DSCP values that not explicitly configured are not modified:

```
Switch# configure terminal
Switch(config)# mls gos map policed-dscp 1 2 3 4 5 6 to 0
```

This example shows how to define the DSCP-to-CoS map. DSCP values 20, 21, 22, 23, and 24 are mapped to CoS 1. DSCP values 10, 11, 12, 13, 14, 15, 16, and 17 are mapped to CoS 0:

Switch# configure terminal Switch(config)# mls qos map dscp-cos 20 21 22 23 24 to 1 Switch(config)# mls qos map dscp-cos 10 11 12 13 14 15 16 17 to 0

This example shows how to define the CoS-to-DSCP map. CoS values 0 to 7 are mapped to DSCP values 0, 5, 10, 15, 20, 25, 30, and 35:

```
Switch# configure terminal
Switch(config)# mls gos map cos-dscp 0 5 10 15 20 25 30 35
```

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remain as specified in the null map):

```
Switch# configure terminal
Switch(config)# mls gos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 10
Switch(config)# mls gos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls gos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls gos map dscp-mutation mutation1 0 31 32 33 34 to 30
```

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description
	mls qos dscp-mutation	Applies a DSCP-to-DSCP-mutation map to a DSCP-trusted port.
	show mls qos maps	Displays quality of service (QoS) mapping information.

2-287

mls qos queue-set output buffers

Use the **mls qos queue-set output buffers** global configuration command to allocate buffers to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output qset-id buffers allocation1 ... allocation4

no mls qos queue-set output qset-id buffers

Syntax Description	<i>qset-id</i> ID of the queue-set. Each port belongs to a queue-set, which defines all the		
-		characteristics of the four egress queues per port. The range is 1 to 2.	
	allocation1 allocation4	Buffer space allocation (percentage) for each queue (four values for queues 1 to 4). For <i>allocation1</i> , <i>allocation3</i> , and <i>allocation4</i> , the range is 0 to 99. For <i>allocation2</i> , the range is 1 to 100 (including the CPU buffer). Separate each value with a space.	
Defaults	All allocation values are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of the buffer space.		
Command Modes	Global configura	tion	
Command History Usage Guidelines	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
	Allocate buffers according to the importance of the traffic; for example, give a large percentage of the buffer to the queue with the highest-priority traffic. To configure different classes of traffic with different characteristics, use this command with the mls qos		
	queue-set output <i>qset-id</i> threshold global configuration command.		
Note	• •	e default settings are suitable for most situations. You should change them only when ugh understanding of the egress queues and if these settings do not meet your QoS	
 Note Examples	you have a thoro solution.		
	you have a thoro solution. This example sho queue 1 and 20 p Switch(config)# Switch(config)#	ugh understanding of the egress queues and if these settings do not meet your QoS	

Related Commands	Command	Description
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays quality of service (QoS) information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos queue-set output threshold

Use the **mls qos queue-set output threshold** global configuration command to configure the weighted tail-drop (WTD) thresholds, to guarantee the availability of buffers, and to configure the maximum memory allocation to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output *qset-id* **threshold** *queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold*

no mls qos queue-set output qset-id threshold [queue-id]

Syntax Description	qset-id	ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.
	queue-id	Specific queue in the queue-set on which the command is performed. The range is 1 to 4.
	drop-threshold1 drop-threshold2	Two WTD thresholds expressed as a percentage of the allocated memory of the queue. The range is 1 to 3200 percent.
	reserved-threshold	Amount of memory to be guaranteed (reserved) for the queue and expressed as a percentage of the allocated memory. The range is 1 to 100 percent.
	maximum-threshold	Enable a queue in the full condition to get more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped. The range is 1 to 3200 percent.

Defaults

When quality of service (QoS) is enabled, WTD is enabled.

Table 2-9 shows the default WTD threshold settings.

Table 2-9 Default Egress Queue WTD Threshold Settings

Feature	Queue 1	Queue 2	Queue 3	Queue 4
WTD drop threshold 1	100 percent	200 percent	100 percent	100 percent
WTD drop threshold 2	100 percent	200 percent	100 percent	100 percent
Reserved threshold	50 percent	100 percent	50 percent	50 percent
Maximum threshold	400 percent	400 percent	400 percent	400 percent

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines

Use the **mls qos queue-set output** *qset-id* **buffers** global configuration command to allocate a fixed number of buffers to the four queues in a queue-set.

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue-set to use more of the common pool when available, the maximum number of packets for each queue is still internally limited to 400 percent, or 4 times the allocated number of buffers. One packet can use one 1 or more buffers.

The range increased in Cisco IOS Release 12.2(25)SEE1 or later for the *drop-threshold*, *drop-threshold*2, and *maximum-threshold* parameters.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Examples

This example shows how to map a port to queue-set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers	Allocates buffers to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays QoS information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos rewrite ip dscp

Use the **mls qos rewrite ip dscp** global configuration command to configure the switch to change (rewrite) the Differentiated Services Code Point (DSCP) field of an incoming IP packet. Use the **no** form of this command to configure the switch to not modify (rewrite) the DSCP field of the packet and to enable DSCP transparency.

mls qos rewrite ip dscp

no mls qos rewrite ip dscp

Syntax Description This command has no arguments or keywords.

Defaults DSCP transparency is disabled. The switch changes the DSCP field of the incoming IP packet.

Command Modes Global configuration

Command History	Release	Modification
12.2(25)SE1 This command		This command was introduced.
12.2(25)SEF2 This		This command was introduced.

Usage Guidelines

DSCP transparency affects only the DSCP field of a packet at the egress. If DSCP transparency is enabled by using the **no mls qos rewrite ip dscp** command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

Note

Enabling DSCP transparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.

By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet that the switch uses to generate a class of service (CoS) value representing the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

For example, if QoS is enabled and an incoming packet has a DSCP value of 32, the switch might modify the internal DSCP value based on the policy-map configuration and change the internal DSCP value to 16. If DSCP transparency is enabled, the outgoing DSCP value is 32 (same as the incoming value). If DSCP transparency is disabled, the outgoing DSCP value is 16 because it is based on the internal DSCP value.

L

Examples

This example shows how to enable DSCP transparency and configure the switch to not change the DSCP value of the incoming IP packet:

Switch(config)# mls qos Switch(config)# no mls qos rewrite ip dscp

This example shows how to disable DSCP transparency and configure the switch to change the DSCP value of the incoming IP packet:

Switch(config)# mls qos Switch(config)# mls qos rewrite ip dscp

You can verify your settings by entering the **show running config** | **include rewrite** privileged EXEC command.

Related Commands	Command	Description
	mls qos	Enables QoS globally.

mls qos srr-queue input bandwidth

Use the **mls qos srr-queue input bandwidth** global configuration command to assign shaped round robin (SRR) weights to an ingress queue. The ratio of the weights is the ratio of the frequency in which the SRR scheduler dequeues packets from each queue. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input bandwidth weight1 weight2

no mls qos srr-queue input bandwidth

Syntax Description	weight1 weight2	Ratio of <i>weight1</i> and <i>weight2</i> determines the ratio of the frequency in which the SRR scheduler dequeues packets from ingress queues 1 and 2. The range is 1 to 100. Separate each value with a space.		
Defaults	Weight1 and weight?	2 are 4 (1/2 of the bandwidth is equally shared between the two queues).		
Command Modes	Global configuratio	n		
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	SRR services the priority queue for its configured weight as specified by the bandwidth keyword in the mls qos srr-queue input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global configuration command. Then SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the mls qos srr-queue input bandwidth <i>weight1 weight2</i> global configuration command.			
		ingress queue is the priority queue by using the mls qos srr-queue input bal configuration command.		
Examples	and the shared band Switch(config)# m	s how to assign the ingress bandwidth for the queues. Priority queueing is disabled, lwidth ratio allocated to queue 1 is 25/(25+75) and to queue 2 is 75/(25+75): ls gos srr-queue input priority-queue 2 bandwidth 0 ls gos srr-queue input bandwidth 25 75		
	In this example, queue 2 has three times the bandwidth of queue 1; queue 2 is serviced three times as often as queue 1.			

This example shows how to assign the ingress bandwidths for the queues. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps class of service (CoS) values to an ingress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue input dscp-map	Maps Differentiated Services Code Point (DSCP) values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns weighted tail-drop (WTD) threshold percentages to an ingress queue.
	show mls qos input-queue	Displays ingress queue settings.
	show mls qos interface queueing	Displays quality of service (QoS) information.

mls qos srr-queue input buffers

Use the **mls qos srr-queue input buffers** global configuration command to allocate the buffers between the ingress queues. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input buffers percentage1 percentage2

no mls qos srr-queue input buffers

Syntax Description	percentage1 percentage2	-	ffers allocated to ingress queues 1 and 2. The range is 0 to ch value with a space.	
Defaults	Ninety percent of the	e buffers is allocated to o	queue 1, and 10 percent of the buffers is allocated to queue 2.	
Command Modes	Global configuration	n		
Command History	Release	Modification		
	12.2(25)SEF2	This command w	as introduced.	
Usage Guidelines	You should allocate	the buffers so that the q	ueues can handle any incoming bursty traffic.	
Examples	This example shows how to allocate 60 percent of the buffer space to ingress queue 1 and 40 percent of the buffer space to ingress queue 2: Switch(config)# mls gos srr-queue input buffers 60 40			
	You can verify your settings by entering the show mls qos interface [<i>interface-id</i>] buffers or the show mls qos input-queue privileged EXEC command.			
Related Commands	Command		Description	
	mls qos srr-queue	input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.

2-301

mls qos srr-queue input priority-queue

Use the **mls qos srr-queue input priority-queue** global configuration command to configure the ingress priority queue and to guarantee bandwidth on the internal ring if the ring is congested. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input priority-queue queue-id bandwidth weight

no mls qos srr-queue input priority-queue queue-id

Syntax Description	queue-id	Ingress queue ID. The range is 1 to 2.		
	bandwidth weight	Bandwidth percentage of the internal ring. The range is 0 to 40.		
Defaults	The priority queue is queue 2, and 10 percent of the bandwidth is allocated to it.			
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(25)SEF2	This command was introduced.		
Usage Guidelines	which needs minimum The priority queue is gr jitter under heavy netw	brity queue only for traffic that needs to be expedited (for example, voice traffic, delay and jitter). uaranteed part of the bandwidth on the internal ring, which reduces the delay and rork traffic on an oversubscribed ring (when there is more traffic than the nd the queues are full and dropping frames).		
	 Shaped round robin (SRR) services the priority queue for its configured weight as specified by the bandwidth keyword in the mls qos srr-queue input priority-queue queue-id bandwidth weight glob configuration command. Then SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the mls qos srr-queue input bandwidth weight1 weight2 global configuration command. To disable priority queueing, set the bandwidth weight to 0, for example, mls qos srr-queue input priority-queue queue-id bandwidth 0. 			
Examples	with 10 percent of the 4/(4+4). SRR services	be to assign the ingress bandwidths for the queues. Queue 1 is the priority queue bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then a remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45		
		qos srr-queue input priority-queue 1 bandwidth 10 qos srr-queue input bandwidth 4 4		

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Global configuration

This command was introduced.

Modification

mls qos srr-queue output dscp-map

Use the **mls qos srr-queue output dscp-map** global configuration command to map Differentiated Services Code Point (DSCP) values to an egress or to map DSCP values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

mls qos srr-queue output dscp-map queue *queue-id* {*dscp1...dscp8* | **threshold** *threshold-id dscp1...dscp8*}

no mls qos srr-queue output dscp-map

Syntax Description	queue queue-id	Specify a queue number.
		For queue-id, the range is 1 to 4.
	dscp1dscp8	Map DSCP values to an egress queue.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.
	threshold threshold-id	Map DSCP values to a queue threshold ID.
	dscp1dscp8	For <i>threshold-id</i> , the range is 1 to 3.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.

Defaults

Table 2-13 shows the default DSCP output queue threshold map:

Table 2-13 Default DSCP Output Queue Threshold Map

DSCP Value	Queue ID-Threshold ID
0–15	2-1
16–31	3-1
32–39	4-1
40–47	1–1
48-63	4-1

Usage Guidel	ines	The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
Note		The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.
		You can assign two weighted tail-drop (WTD) threshold percentages to an egress queue by using the mls qos queue-set output <i>qset-id</i> threshold global configuration command.
		You can map each DSCP value to a different queue and threshold combination, allowing the frame to follow different behavior.
		You can map up to eight DSCP values per command.
Examples		This example shows how to map a port to queue-set 1. It maps DSCP values 0 to 3 to egress queue 1 and to threshold ID 1. It configures the drop thresholds for queue 1 to 50 and 70 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped.
		Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 1 0 1 2 3 Switch(config)# mls qos queue-set output 1 threshold 1 50 70 100 200 Switch(config)# interface gigabitethernet0/1 Switch(config-if)# queue-set 1
		You can verify your settings by entering the show mls qos maps , the show mls qos interface [<i>interface-id</i>] buffers , or the show mls qos queue-set privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue output cos-map	Maps class of service (CoS) values to an egress queue or maps CoS values to a queue and to a threshold ID.
	mls qos queue-set output threshold	Configures the WTD thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays quality of service (QoS) information.
	show mls qos maps	Displays QoS mapping information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos trust

Use the **mls qos trust** interface configuration command to configure the port trust state. Ingress traffic can be trusted, and classification is performed by examining the packet Differentiated Services Code Point (DSCP), class of service (CoS), or IP-precedence field. Use the **no** form of this command to return a port to its untrusted state.

mls qos trust [cos | device cisco-phone | dscp | ip-precedence]

no mls qos trust [cos | device | dscp | ip-precedence]

cos	
cos	(Optional) Classify an ingress packet by using the packet CoS value. For an untagged packet, use the port default CoS value.
device cisco-phone	(Optional) Classify an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.
dscp	(Optional) Classify an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.
ip-precedence	(Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.
The port is not truste	ed. If no keyword is specified when the command is entered, the default is dscp .

The
	dscp ip-precedence The port is not truste Interface configuration

Examples

The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cisco IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You must globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP phone. If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port and prevents misuse of a high-priority queue.

If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the **mls qos cos override** interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.

For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.

Classification using a port trust state (for example, **mls qos trust** [**cos** | **dscp** | **ip-precedence**] and a policy map (for example, **service-policy input** *policy-map-name*) are mutually exclusive. The last one configured overwrites the previous configuration.

This example shows how to configure a port to trust the IP precedence field in the incoming packet:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mls qos trust ip-precedence

This example shows how to specify that the Cisco IP Phone connected on a port is a trusted device:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mls gos trust device cisco-phone

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	mls qos cos	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
	mls qos dscp-mutation	Applies a DSCP-to DSCP-mutation map to a DSCP-trusted port.
	mls qos map	Defines the CoS-to-DSCP map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map.
	show mls qos interface	Displays QoS information.

mls qos vlan-based

L

Use the **mls qos vlan-based** interface configuration command to enable VLAN-based quality of service (QoS) on the physical port. Use the **no** form of this command to disable this feature.

mls qos vlan-based

no mls qos vlan-based

Syntax Description	There are no arguments or keywords.
--------------------	-------------------------------------

- **Defaults** VLAN-based QoS is disabled.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines Before attaching a hierarchical policy map to a switch virtual interface (SVI), use the **mls qos vlan-based** interface configuration command on a physical port if the port is to be specified in the secondary interface level of the hierarchical policy map.

When you configure hierarchical policing, the hierarchical policy map is attached to the SVI and affects all traffic belonging to the VLAN. The individual policer in the interface-level traffic classification only affects the physical ports specified for that classification.

For detailed instructions about configuring hierarchical policy maps, see the "Classifying, Policing, and Marking Traffic by Using Hierarchical Policy Maps" section in the software configuration guide for this release.

Examples This example shows how to enable VLAN-based policing on a physical port:

Switch(config)# interface gigabitethernet0/1 Switch(config-if)# mls qos vlan-based

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface	Displays QoS information.

monitor session

Use the **monitor session** global configuration command to start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source or destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, and to limit (filter) SPAN source traffic to specific VLANs. Use the **no** form of this command to remove the SPAN or RSPAN session or to remove source or destination interfaces or filters from the SPAN or RSPAN session. For destination interfaces, the encapsulation options are ignored with the **no** form of the command.

- monitor session_number destination {interface interface-id [, | -] [encapsulation
 replicate] [ingress { dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id }] } | {remote
 vlan vlan-id}
- monitor session session_number filter vlan vlan-id [, | -]
- **monitor session** *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}
- **no monitor session** {*session_number* | **all** | **local** | **remote**}

Syntax Description	session_number	Specify the session number identified with the SPAN or RSPAN session. The range is 1 to 66.
	destination	Specify the SPAN or RSPAN destination. A destination must be a physical port.
	interface interface-id	Specify the destination or source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type and port number). For source interface , port channel is also a valid interface type, and the valid range is 1 to 12.
	encapsulation replicate	(Optional) Specify that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
		These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged.
	ingress	(Optional) Enable ingress traffic forwarding.
	dot1q vlan vlan-id	Accept incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
	isl	Specify ingress forwarding using ISL encapsulation.

untagged vlan vlan-id	Accept incoming packets with untagged encapsulation with the specified VLAN as the default VLAN.
vlan vlan-id	When used with only the ingress keyword, set default VLAN for ingress traffic.
remote vlan vlan-id	Specify the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.
	The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs).
,	(Optional) Specify a series of interfaces or VLANs, or separate a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.
-	(Optional) Specify a range of interfaces or VLANs. Enter a space before and after the hyphen.
filter vlan vlan-id	Specify a list of VLANs as filters on trunk source ports to limit SPAN source traffic to specific VLANs. The <i>vlan-id</i> range is 1 to 4094.
source	Specify the SPAN or RSPAN source. A source can be a physical port, a port channel, or a VLAN.
both, rx, tx	(Optional) Specify the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic.
source vlan vlan-id	Specify the SPAN source interface as a VLAN ID. The range is 1 to 4094.
all, local, remote	Specify all , local , or remote with the no monitor session command to clear all SPAN and RSPAN, all local SPAN, or all RSPAN sessions.

Defaults

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
	12.2(50)SE	The <i>channel-group-number</i> range was incorrect. The correct range is from 1 to 12.

Usage Guidelines

Traffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN. Traffic routed to source ports or source VLANs cannot be monitored. You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch.

You can have a maximum of 64 destination ports on a switch.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports cannot be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A private-VLAN port cannot be configured as a SPAN destination port.

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the **port-channel** number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the **monitor session** *session_number* **filter vlan** *vlan-id* command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to act in these ways:

- When you enter **monitor session** *session_number* **destination interface** *interface-id* with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—dot1q, isl, or **untagged**.

- When you enter monitor session session_number destination interface interface-id encapsulation replicate with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)
 When you enter monitor session session number destination interface interface id encapsulation.
 - When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate ingress**, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—dot1q, isl, or **untagged**. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 to destination port 2:

Switch(config)# monitor session 1 source interface gigabitethernet0/1 both Switch(config)# monitor session 1 destination interface gigabitethernet0/2 This example shows how to delete a destination port from an existing local SPAN session:

Switch(config)# no monitor session 2 destination gigabitethernet0/2

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

Switch(config) # monitor session 1 filter vlan 100 - 110

This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.

```
Switch(config)# monitor session 1 source interface gigabitethernet0/1
Switch(config)# monitor session 1 source interface port-channel 2 tx
Switch(config)# monitor session 1 destination remote vlan 900
Switch(config)# end
```

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic.

```
Switch(config)# monitor session 10 source remote vlan 900
Switch(config)# monitor session 10 destination interface gigabitethernet0/2
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

 $\label{eq:source} {\rm Switch} \, ({\rm config}) \, \# \, \, \mbox{monitor session 2 destination interface gigabitethernet0/2 encapsulation} \\ {\rm replicate ingress \ dotlq \ vlan 5} \\$

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

 $\mathsf{Switch}(\mathsf{config}) \, \# \, \, \texttt{monitor session 2 destination interface gigabitethernet0/2 ingress untagged vlan 5$

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN and RSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Related Commands	Command	Description
	remote-span	Configures an RSPAN VLAN in vlan configuration mode.

Command	Description
show monitor	Displays SPAN and RSPAN session information.
show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

mvr (global configuration)

Use the **mvr** global configuration command without keywords to enable the multicast VLAN registration (MVR) feature on the switch. Use the command with keywords to set the MVR mode for a switch, configure the MVR IP multicast address, set the maximum time to wait for a query reply before removing a port from group membership, and to specify the MVR multicast VLAN. Use the **no** form of this command to return to the default settings.

mvr [group *ip-address* [count] | mode [compatible | dynamic] | querytime value | vlan vlan-id]

no mvr [group *ip-address* | mode [compatible | dynamic] | querytime value | vlan vlan-id]

group ip-address	Statically configure an MVR group IP multicast address on the switch.
	Use the no form of this command to remove a statically configured IP multicast address or contiguous addresses or, when no IP address is entered, to remove all statically configured MVR IP multicast addresses.
count	(Optional) Configure multiple contiguous MVR group addresses. The range is 1 to 256; the default is 1.
mode	(Optional) Specify the MVR mode of operation.
	The default is compatible mode.
compatible	Set MVR mode to provide compatibility with Catalyst 2900 XL and Catalyst 3500 XL switches. This mode does not allow dynamic membership joins on source ports.
dynamic	Set MVR mode to allow dynamic MVR membership on source ports.
querytime value	(Optional) Set the maximum time to wait for IGMP report memberships on a receiver port. This time applies only to receiver-port leave processing. When an IGMP query is sent from a receiver port, the switch waits for the default or configured MVR querytime for an IGMP group membership report before removing the port from multicast group membership.
	The value is the response time in units of tenths of a second. The range is 1 to 100; the default is 5 tenths or one-half second.
	Use the no form of the command to return to the default setting.
vlan vlan-id	(Optional) Specify the VLAN on which MVR multicast data is expected to be received. This is also the VLAN to which all the source ports belong. The range is 1 to 4094; the default is VLAN 1.
	count mode compatible dynamic querytime value

Defaults

MVR is disabled by default.

The default MVR mode is compatible mode.

No IP multicast addresses are configured on the switch by default.

The default group ip address count is 0.

The default query response time is 5 tenths of or one-half second.

The default multicast VLAN for MVR is VLAN 1.

Command Modes Global configuration

Command History Modification Release 12.2(25)SEF2 This command was introduced. **Usage Guidelines** A maximum of 256 MVR multicast groups can be configured on a switch. Use the **mvr group** command to statically set up all the IP multicast addresses that will take part in MVR. Any multicast data sent to a configured multicast address is sent to all the source ports on the switch and to all receiver ports that have registered to receive data on that IP multicast address. MVR supports aliased IP multicast addresses on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx). The mvr querytime command applies only to receiver ports. If the switch MVR is interoperating with Catalyst 2900 XL or Catalyst 3500 XL switches, set the multicast mode to compatible. When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports. MVR can coexist with IGMP snooping on a switch. Multicast routing and MVR cannot coexist on a switch. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled and a warning message appears. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled with an Error message. Examples This example shows how to enable MVR: Switch(config)# mvr Use the show mvr privileged EXEC command to display the current setting for maximum multicast groups. This example shows how to configure 228.1.23.4 as an IP multicast address: Switch(config)# mvr group 228.1.23.4 This example shows how to configure ten contiguous IP multicast groups with multicast addresses from 228.1.23.1 to 228.1.23.10: Switch(config)# mvr group 228.1.23.1 10 Use the show mvr members privileged EXEC command to display the IP multicast group addresses configured on the switch. This example shows how to set the maximum query response time as one second (10 tenths): Switch(config) # mvr querytime 10 This example shows how to set VLAN 2 as the multicast VLAN: Switch(config) # mvr vlan 2 You can verify your settings by entering the **show mvr** privileged EXEC command.

Related Commands	Command	Description
	mvr (interface configuration)	Configures MVR ports.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces with their type, status, and Immediate Leave configuration. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all ports that are members of an MVR multicast group; if the group has no members, its status is shown as Inactive.

mvr (interface configuration)

Use the mvr interface configuration command to configure a Layer 2 port as a multicast VLAN registration (MVR) receiver or source port, to set the Immediate Leave feature, and to statically assign a port to an IP multicast VLAN and IP address. Use the **no** form of this command to return to the default settings.

mvr [immediate | type { receiver | source } | vlan vlan-id group [ip-address]]

no mvr [immediate | type {source | receiver}| vlan vlan-id group [ip-address]]

Syntax Description	immediate	(Optional) Enable the Immediate Leave feature of MVR on a port. Use the no mvr immediate command to disable the feature.
	type	(Optional) Configure the port as an MVR receiver port or a source port.
		The default port type is neither an MVR source nor a receiver port. The no mvr type command resets the port as neither a source or a receiver port.
	receiver	Configure the port as a subscriber port that can only receive multicast data. Receiver ports cannot belong to the multicast VLAN.
	source	Configure the port as an uplink port that can send and receive multicast data for the configured multicast groups. All source ports on a switch belong to a single multicast VLAN.
	vlan vlan-id group	(Optional) Add the port as a static member of the multicast group with the specified VLAN ID.
		The no mvr vlan <i>vlan-id</i> group command removes a port on a VLAN from membership in an IP multicast address group.
	ip-address	(Optional) Statically configure the specified MVR IP multicast group address for the specified multicast VLAN ID. This is the IP address of the multicast group that the port is joining.
Defaults	A port is configured as	neither a receiver nor a source.
	The Immediate Leave feature is disabled on all ports.	
	No receiver port is a m	ember of any configured multicast group.
Command Modes	Interface configuration	
Command History	Release	Modification
-	12.2(25)SEF2	This command was introduced.

Usage Guidelines Configure a port as a source port if that port should be able to both send and receive multicast data bound for the configured multicast groups. Multicast data is received on all ports configured as source ports.

Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.

A port that is not taking part in MVR should not be configured as an MVR receiver port or a source port. A non-MVR port is a normal switch port, able to send and receive multicast data with normal switch behavior.

When Immediate Leave is enabled, a receiver port leaves a multicast group more quickly. Without Immediate Leave, when the switch receives an IGMP leave message from a group on a receiver port, it sends out an IGMP MAC-based query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP MAC-based query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency.

The Immediate Leave feature should be enabled only on receiver ports to which a single receiver device is connected.

The **mvr vlan group** command statically configures ports to receive multicast traffic sent to the IP multicast address. A port statically configured as a member of group remains a member of the group until statically removed. In compatible mode, this command applies only to receiver ports; in dynamic mode, it can also apply to source ports. Receiver ports can also dynamically join multicast groups by using IGMP join messages.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.

An MVR port cannot be a private-VLAN port.

This example shows how to configure a port as an MVR receiver port:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mvr type receiver

Use the **show mvr interface** privileged EXEC command to display configured receiver ports and source ports.

This example shows how to enable Immediate Leave on a port:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mvr immediate

This example shows how to add a port on VLAN 1 as a static member of IP multicast group 228.1.23.4:

Switch(config)# interface gigabitethernet0/2
Switch(config-if)# mvr vlan1 group 230.1.23.4

You can verify your settings by entering the show mvr members privileged EXEC command.

Examples

Related Commands	Command	Description
	mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces or displays the multicast groups to which a receiver port belongs. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all receiver ports that are members of an MVR multicast group.

network-policy

Use the **network-policy** interface configuration command to apply a network-policy profile to an interface. Use the **no** form of this command to remove the policy.

network-policy *profile number*

no network-policy

Syntax Description	profile number	Specify the network-policy profile number.
Defaults	No network-policy profiles are applied.	
Command Modes	Interface configuration	
Command History	Release	Modification
	12.2(50)SE	This command was introduced.
Usage Guidelines	Use the network-policy <i>profile number</i> interface configuration command to apply a profile to an interface. If you first configure a network-policy profile on an interface, you cannot apply the switchport voice	
	you can apply a network-p	rface. If switchport voice vlan <i>vlan-id</i> is already configured on an interface, policy profile on the interface. The interface then has the voice or swork-policy profile applied on the interface.
Examples	This example shows how to apply network-policy profile 60 to an interface:	
	<pre>Switch(config)# interface_id Switch(config-if)# network-policy profile 60</pre>	
Related Commands	Command	Description
	network-policy profile (a configuration)	global Creates the network-policy profile.
	network-policy profile (network-policy configu	Configures the attributes of network-policy profiles.
	show network-policy pro	file Displays the configured network-policy profiles.

network-policy profile (global configuration)

Use the **network-policy profile** global configuration command to create a network-policy profile and to enter network-policy configuration mode. Use the **no** form of this command to delete the policy and to return to global configuration mode.

network-policy profile profile number

no network-policy profile *profile number*

Syntax Description	profile number	Specify the network-policy profile number. The range is 1 to 4294967295.
Defaults	No network-policy p	rofiles are defined.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(50)SE	This command was introduced.
Usage Guidelines	network-policy profi	licy profile global configuration command to create a profile and to enter le configuration mode. leged EXEC mode from the network-policy profile configuration mode, enter the
	•	work-policy profile configuration mode, you can create the profile for voice and pecifying the values for VLAN, class of service (CoS), differentiated services code agging mode.
		tes are then contained in the Link Layer Discovery Protocol for Media Endpoint D) network-policy time-length-value (TLV).
Examples	This example shows	how to create network-policy profile 60:
	Switch(config)# ne Switch(config-netw	twork-policy profile 60 ork-policy)#

Related Commands	Command	Description
	network-policy	Applies a network-policy to an interface.
	network-policy profile (network-policy configuration)	Configures the attributes of network-policy profiles.
	show network-policy profile	Displays the configured network-policy profiles.

network-policy profile (network-policy configuration)

Use the **network-policy profile** configuration mode command to configure the network-policy profile created by using the **network-policy profile** global configuration command. Use the **no** form of this command without additional parameters to delete a profile. Use the **no** form with parameters to change its configured attributes.

network-policy profile *profile number* {**voice | voice-signaling**} **vlan** [*vlan-id* {**cos** *cvalue* | **dscp** *dvalue*}] | [[**dot1p** {**cos** *cvalue* | **dscp** *dvalue*}] | **none** | **untagged**]

no network-policy profile *profile number* {**voice | voice-signaling**} **vlan** [*vlan-id* | {**cos** *cvalue*} | {**dscp** *dvalue*}] | [[**dot1p** {**cos** *cvalue*} | {**dscp** *dvalue*}] | **none** | **untagged**]

Syntax Description	voice	Specify the voice application type.
	voice-signaling	Specify the voice-signaling application type.
	vlan	Specify the native VLAN for voice traffic.
	vlan-id	(Optional) Specify the VLAN for voice traffic. The range is 1 to 4094.
	cos cvalue	(Optional) Specify the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 0.
	dscp dvalue	(Optional) Specify the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 0.
	dot1p	(Optional) Configure the telephone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).
	none	(Optional) Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.
	untagged	(Optional) Configure the telephone to send untagged voice traffic. This is the default for the telephone.
Command Modes	Network-policy cont	-
Command History	Release	Modification
	12.2(50)SE	This command was introduced.
Usage Guidelines	Use the network-po	blicy profile command to configure the attributes of a network-policy profile.
	voice services. Thes	on type is for dedicated IP telephones and similar devices that support interactive devices are typically deployed on a separate VLAN for ease of deployment and arough isolation from data applications.
	signaling than for vo	application type is for network topologies that require a different policy for voice bice media. This application type should not be advertised if all the same network ose advertised in the voice policy TLV.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Switch(config)# network-policy profile 1
Switch(config-network-policy)#voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Switch(config)# network-policy profile 1
Switch(config-network-policy)# voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

Switch(config-network-policy) # voice vlan dot1p cos 4

Related Commands	Command	Description
	network-policy	Applies a network-policy to an interface.
	network-policy profile (global configuration)	Creates the network-policy profile.
	show network-policy profile	Displays the configured network-policy profiles.

nmsp

Use the **nmsp** global configuration command to enable Network Mobility Services Protocol (NMSP) on the switch. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the **no** form of this command to return to the default setting.

nmsp {enable | {notification interval {attachment | location} interval-seconds}}

no nmsp {**enable** | {**notification interval** {**attachment** | **location**} *interval-seconds*}}

enable	
enable	Enable the NMSP features on the switch.
notification interval	Specify the NMSP notification interval.
attachment	Specify the attachment notification interval.
location	Specify the location notification interval.
interval-seconds	Duration in seconds before a switch sends the MSE the location or attachment updates. The range is 1 to 30; the default is 30.
NMSP is disabled.	
Global configuration	
Release	Modification
12.2(50)SE	This command was introduced.
Use the nmsp global configuration command to enable the switch to send NMSP location and attachment notifications to a Cisco Mobility Services Engine (MSE).	
This example shows how seconds:	w to enable NMSP on a switch and set the location notification time to 10
	attachment location interval-seconds NMSP is disabled. Global configuration Release 12.2(50)SE Use the nmsp global contraction

Related Commands	Command	Description
	clear nmsp statistics	Clears the NMSP statistic counters.
	nmsp attachment suppress	Suppresses reporting attachment information from a specified interface.
	show nmsp	Displays the NMSP information.

nmsp attachment suppress

Use the **nmsp attachment suppress** interface configuration mode command to suppress the reporting of attachment information from a specified interface. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the **no** form of this command to return to the default setting.

nmsp attachment suppress

no nmsp attachment suppress

Syntax Description	This command has no ar	guments or keywords.
--------------------	------------------------	----------------------

- **Defaults** This command has no default setting.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(50)SE	This command was introduced.

Usage Guidelines Use the **nmsp attachment suppress** interface configuration command to configure an interface to not send location and attachment notifications to a Cisco Mobility Services Engine (MSE).

 Examples
 This example shows how to configure an interface to not send attachment information to the MSE:

 Switch(config)# switch interface interface-id

 Switch(config-if)# nmsp attachment suppress

Related Commands	Command	Description
	nmsp	Enables Network Mobility Services Protocol (NMSP) on the switch.
	show nmsp	Displays the NMSP information.

pagp learn-method

pagp learn-method

Use the **pagp learn-method** interface configuration command to learn the source address of incoming packets received from an EtherChannel port. Use the **no** form of this command to return to the default setting.

pagp learn-method {aggregation-port | physical-port}

no pagp learn-method

Syntax Description	aggregation-port	Specify address learning on the logical port-channel. The switch sends packets to the source using any of the ports in the EtherChannel. This setting is the default. With aggregate-port learning, it is not important on which physical port the packet arrives.
	physical-port	Specify address learning on the physical port within the EtherChannel. The switch sends packets to the source using the same port in the EtherChannel from which it learned the source address. The other end of the channel uses the same port in the channel for a particular destination MAC or IP address.
Defaults	The default is aggre	gation-port (logical port channel).
Command Modes	Interface configurat	ion
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	The learn method m	ust be configured the same at both ends of the link.
<u>Note</u>	The switch supports address learning only on aggregate ports even though the physical-port keyw provided in the command-line interface (CLI). The pagp learn-method and the pagp port-prior interface configuration commands have no effect on the switch hardware, but they are required for interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.	
	When the link partner to the switch is a physical learner, we recommend that you configure the sw as a physical-port learner by using the pagp learn-method physical-port interface configuration command and to set the load-distribution method based on the source MAC address by using the port-channel load-balance src-mac global configuration command. Use the pagp learn-method interface configuration command only in this situation.	

Examples This example shows how to set the learning method to learn the address on the physical port within the EtherChannel:

Switch(config-if) # pagp learn-method physical-port

This example shows how to set the learning method to learn the address on the port-channel within the EtherChannel:

Switch(config-if)# pagp learn-method aggregation-port

You can verify your settings by entering the **show running-config** privileged EXEC command or the **show pagp** *channel-group-number* **internal** privileged EXEC command.

Related Commands	Command	Description
	pagp port-priority	Selects a port over which all traffic through the EtherChannel is sent.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

pagp port-priority

Use the **pagp port-priority** interface configuration command to select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. Use the **no** form of this command to return to the default setting.

pagp port-priority priority

no pagp port-priority

Syntax Description	priority	A priority number ranging from 0 to 255.
Defaults	The default is 128.	
Command Modes	Interface configurat	ion
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines		ith the highest priority that is operational and has membership in the same one selected for PAgP transmission.
Note	The switch supports address learning only on aggregate ports even though the physical-port keyword is provided in the command-line interface (CLI). The pagp learn-method and the pagp port-priority interface configuration commands have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.	
	When the link partner to the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the pagp learn-method physical-port interface configuration command and to set the load-distribution method based on the source MAC address by using the port-channel load-balance src-mac global configuration command. Use the pagp learn-method interface configuration command only in this situation.	
Examples	This example shows	s how to set the port priority to 200:
	Switch(config-if)	# pagp port-priority 200
	•••	setting by entering the show running-config privileged EXEC command or the <i>-group-number</i> internal privileged EXEC command.

Related Commands	Command	Description
	pagp learn-method	Provides the ability to learn the source address of incoming packets.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

permit (IPv6 access-list configuration)

Use the **permit** IPv6 access list configuration command on the switch stack or on a standalone switch to set permit conditions for an IPv6 access list. Use the **no** form of this command to remove the permit conditions.

- **permit** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator*] [port-number]] {destination-ipv6-prefix/prefix-length | **any** | **host** destination-ipv6-address} [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value] [time-range *name*]
- **no permit** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator*] [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value] [time-range name]

Although visible in the command-line help strings, the **flow-label**, **reflect**, and **routing** keywords are not supported.

Internet Control Message Protocol

permit icmp {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address* } [*operator* [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log] [log-input] [sequence value] [time-range name]

Transmission Control Protocol

permit tcp {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address* } [*operator* [port-number]] {destination-ipv6-prefix/prefix-length | **any** | **host** destination-ipv6-address} [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port | *protocol*] [**psh**] [**range** {*port* | *protocol*]] [**rst**] [**sequence** *value*] [**syn**] [**time-range** *name*] [urg]

User Datagram Protocol

permit udp {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [port-number]] {destination-ipv6-prefix/prefix-length | **any** | **host** destination-ipv6-address} [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port | protocol] [sequence value] [time-range name]

Although visible in the command-line help strings, the flow-label, reflect, and routing keywords are not supported.

This command is available only if your switch has a switch database management (SDM) dual IPv4 and IPv6 template configured.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords
-,	p.00000	ahp, esp, icmp, ipv6, pcp, sctp, tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	any	An abbreviation for the IPv6 prefix ::/0.
	host source-ipv6-address	The source IPv6 host address for which to set permit conditions.
		This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
		The range operator requires two port numbers. All other operators require one port number.
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	host destination-ipv6-address	The destination IPv6 host address for which to set permit conditions.
		This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	dscp value	(Optional) Match a differentiated services codepoint value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

fragments	(Optional) Match noninitial fragmented packets where the fragment extension header contains a nonzero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages logged to the console is controlled by the logging console command.)
	The message includes the access list name and sequence number; whether the packet was permitted; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets permitted in the prior 5-minute interval.
log-input	(Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.
timeout value	(Optional) Interval of idle time (in seconds) after which a reflexive IPv6 access list times out. The acceptable range is from 1 to 4294967295. The default is 180 seconds.
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.
time-range name	(Optional) Specify the time range that applies to the permit statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by the ICMP message type. The type is a number from 0 to 255.
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by the ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.
ack	(Optional) Only for the TCP protocol: acknowledgment (ACK) bit set.
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.
psh	(Optional) Only for the TCP protocol: Push function bit set.
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.
rst	(Optional) Only for the TCP protocol: Reset bit set.
syn	(Optional) Only for the TCP protocol: Synchronize bit set.
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.

Defaults	No IPv6 access list is defined.	
Command Modes	IPv6 access-list cor	figuration
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines		ccess-list configuration mode) command is similar to the permit (IPv4 access-list) command, except that it is IPv6-specific.
	-	v6) command after the ipv6 access-list command to enter IPv6 access-list and to define the conditions under which a packet passes the access list.
	Specifying IPv6 for	the <i>protocol</i> argument matches against the IPv6 header of the packet.
	By default, the first incremented by 10.	statement in an access list is number 10, and the subsequent statements are
	list. To add a new s	t, deny , or remark statements to an existing access list without re-entering the entire tatement anywhere other than at the end of the list, create a new statement with an umber that falls between two existing entry numbers to show where it belongs.
	See the ipv6 access	-list command for more information on defining IPv6 ACLs.
Note	any any statements discovery. To disall nd-ns, there must b	s implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 as its last match conditions. The two permit conditions allow ICMPv6 neighbor ow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any e an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement v6 ACL must contain at least one entry.
	ACLs implicitly all the Address Resolut	discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, tion Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be n an interface.
	for traffic filtering (6-prefix/prefix-length and destination-ipv6-prefix/prefix-length arguments are used (the source prefix filters traffic based upon the traffic source; the destination prefix upon the traffic destination).
	The switch supports unicast and link-loc	s only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global cal host addresses.
	The fragments key	word is an option only if the operator [port-number] arguments are not specified.
	This is a list of ICN	

This is a list of ICMP message names:

beyond-scope echo-reply destination-unreachable echo-request

header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures two IPv6 access lists named OUTBOUND and INBOUND and applies both access lists to outbound and inbound traffic on a Layer 3 interface. The first and second permit entries in the OUTBOUND list permit all TCP and UDP packets from network 2001:ODB8:0300:0201::/64 to leave the interface. The deny entry in the OUTBOUND list prevents all packets from the network FE80:0:0:0201::/64 (packets that have the link-local prefix FE80:0:0:0201 as the first 64 bits of their source IPv6 address) from leaving the interface. The third permit entry in the OUTBOUND list permits all ICMP packets to exit the interface.

The permit entry in the INBOUND list permits all ICMP packets to enter the interface.

```
Switch(config)#ipv6 access-list OUTBOUND
Switch(config-ipv6-acl)# permit tcp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# permit udp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# deny FE80:0:0:0201::/64 any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter OUTBOUND out
Switch(config-if)# ipv6 traffic-filter INBOUND in
```

Note

Given that a **permit any any** statement is not included as the last entry in the OUTBOUND or INBOUND access list, only TCP, UDP, and ICMP packets are permitted out of and into the interface (the implicit deny-all condition at the end of the access list denies all other packet types on the interface).

Г

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

2-341

permit (MAC access-list configuration)

Use the **permit** MAC access-list configuration command to allow non-IP traffic to be forwarded if the conditions are matched. Use the **no** form of this command to remove a permit condition from the extended MAC access list.

- {permit | deny } {any | host src-MAC-addr | src-MAC-addr mask } {any | host dst-MAC-addr |
 dst-MAC-addr mask] [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv |
 diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console |
 mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {permit | deny} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo |vines-ip | xns-idp]

Though visible in the command-line help strings, appletalk is not supported as a matching condition.

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src-MAC-addr src-MAC-addr mask	Define a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
	host <i>dst-MAC-addr</i> <i>dst-MAC-addr</i> mask	Define a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		• <i>type</i> is 0 to 65535, specified in hexadecimal.
		• <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select an arbitrary class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message appears if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
	lavc-sca	(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.
	The <i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.
mop-dump	(Optional) Select EtherType DEC-MOP Dump.
msdos	(Optional) Select EtherType DEC-MSDOS.
mumps	(Optional) Select EtherType DEC-MUMPS.
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.
vines-ip	(Optional) Select EtherType VINES IP.
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-14.

Table 2-14	IPX Filtering Criteria
------------	------------------------

IPX Encapsulation Typ		
Cisco IOS Name	Novell Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes MAC access-list configuration

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

For more information about MAC-named extended access lists, see the software configuration guide for this release.

Examples This example shows how to define the MAC-named extended access list to allow NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

Switch(config-ext-macl)# permit any host 00c0.00a0.03fa netbios

This example shows how to remove the permit condition from the MAC-named extended access list: Switch(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000 netbios

This example permits all packets with Ethertype 0x4321:

Switch(config-ext-macl)# permit any any 0x4321 0

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Denies non-IP traffic to be forwarded if conditions are matched.
	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.
	show access-lists	Displays access control lists configured on a switch.

police

Use the **police** policy-map class configuration command to define a policer for classified traffic. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove an existing policer.

police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]

no police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]

Syntax Description	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 1000000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	(Optional) When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	(Optional) When the specified rate is exceeded, specify that the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.
Defaults	No policers are defined.	
Command Modes	Policy-map class configu	uration
Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.
Usage Guidelines	When configuring hierar secondary interface-level	chical policy maps, you can only use the police policy-map command in a l policy map.
	The port ASIC device, w	which controls more than one physical port, supports 256 policers (255
	user-configurable policer are constrained by the ha	rs plus 1 policer reserved for internal use). The maximum number of rs supported per port is 63. Policers are allocated on demand by the software and rdware and ASIC boundaries. You cannot reserve policers per port. There is no l be assigned to any policer.
	user-configurable policer are constrained by the ha guarantee that a port will	rs supported per port is 63. Policers are allocated on demand by the software and rdware and ASIC boundaries. You cannot reserve policers per port. There is no

Examples

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action drop
Switch(config-pmap-c)# exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Switch(config)# policy-map policy2
Switch(config-pmap)# class class2
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	mls qos map policed-dscp	Applies a policed-DSCP map to a DSCP-trusted port.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for traffic classified through the class policy-map configuration or the class-map global configuration command.

police aggregate

Use the **police aggregate** policy-map class configuration command to apply an aggregate policer to multiple classes in the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove the specified policer.

police aggregate aggregate-policer-name

no police aggregate aggregate-policer-name

Syntax Description	aggregate-policer-na	ame Name of the aggregate policer.	
Defaults	No aggregate policer	rs are defined.	
Command Modes	Policy-map class cor	Policy-map class configuration	
Command History	Release	Modification	
,	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port. There is no guarantee that a port will be assigned to any policer.		
	You set aggregate policer parameters by using the mls qos aggregate-policer global configuration command. You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.		
	To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	You cannot configure	e aggregate policers in hierarchical policy maps.	
Examples	This example shows classes in a policy m	how to define the aggregate policer parameters and to apply the policer to multiple ap:	
	Switch(config)# po Switch(config-pmap Switch(config-pmap Switch(config-pmap Switch(config-pmap Switch(config-pmap	<pre>)# class class1 -c)# police aggregate agg_policer1 -c)# exit)# class class2 -c)# set dscp 10 -c)# police aggregate agg_policer1</pre>	

```
Switch(config-pmap)# class class3
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police aggregate agg_policer2
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	mls qos aggregate-policer	Defines policer parameters, which can be shared by multiple classes within a policy map.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

policy-map

Use the **policy-map** global configuration command to create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name

no policy-map *policy-map-name*

Syntax Description	policy-map-name	Name of the policy map.	
Defaults	No policy maps are de	fined.	
		s to set the Differentiated Services Code Point (DSCP) to 0 if the packet is an IP lass of service (CoS) to 0 if the packet is tagged. No policing is performed.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	After entering the policy-map command, you enter policy-map configuration mode, and these configuration commands are available:		
	• class : defines the classification match criteria for the specified class map. For more information, see the "class" section on page 2-55.		
	• description : describes the policy map (up to 200 characters).		
	• exit: exits policy-map configuration mode and returns you to global configuration mode.		
	• no : removes a previously defined policy map.		
	• rename : renames the current policy map.		
	To return to global configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Before configuring policies for classes whose match criteria are defined in a class map, use the policy-map command to specify the name of the policy map to be created, added to, or modified. Entering the policy-map command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.		
	You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the class-map global configuration and match class-map configuration commands. You define packet classification on a physical-port basis.		

Only one policy map per ingress port or SVI is supported. You can apply the same policy map to multiple physical ports or SVIs.

You can apply a nonhierarchical policy maps to physical ports or to SVIs. A nonhierarchical policy map is the same as a port-based policy maps. However, you can only apply a hierarchical policy map to SVIs.

A hierarchical policy map has two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on an SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI and are specified in the interface-level policy map.

In a primary VLAN-level policy map, you can only configure the trust state or set a new DSCP or IP precedence value in the packet. In a secondary interface-level policy map, you can only configure individual policers on physical ports that belong to the SVI.

After the hierarchical policy map is attached to an SVI, an interface-level policy map cannot be modified or removed from the hierarchical policy map. A new interface-level policy map also cannot be added to the hierarchical policy map. If you want these changes to occur, the hierarchical policy map must first be removed from the SVI.

For more information about hierarchical policy maps, see the "Policing on SVIs" section in the "Configuring QoS" chapter of the software configuration guide for this release.

Examples

This example shows how to create a policy map called *policy1*. When attached to the ingress port, it matches all the incoming traffic defined in *class1*, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

This example shows how to configure multiple classes in a policy map called *policymap2*:

```
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 100000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# set dscp 0 (no policer)
Switch(config-pmap-c)# exit
```

This example shows how to create a hierarchical policy map and attach it to an SVI:

```
Switch(config)# class-map cm-non-int
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# class-map cm-non-int-2
Switch(config-cmap)# match access-group 102
Switch(config-cmap)# exit
Switch(config)# class-map cm-test-int
Switch(config-cmap)# match input-interface gigabitethernet0/2 - gigabitethernet0/3
Switch(config-cmap)# exit
Switch(config-cmap)# exit
Switch(config)# policy-map pm-test-int
```

```
Switch(config-pmap)# class cm-test-int
Switch(config-pmap-c)# police 18000000 8000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map pm-test-pm-2
Switch(config-pmap)# class cm-non-int
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap)# class cm-non-int-2
Switch(config-pmap-c)# set dscp 15
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# end
Switch(config-cmap)# exit
Switch(config-map-c)# exit
Switch(config-map-c)# exit
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input pm-test-pm-2
```

This example shows how to delete *policymap2*:

Switch(config)# no policy-map policymap2

You can verify your settings by entering the **show policy-map** privileged EXEC command.

Related Commands	Command	Description
clas	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration command) for the specified class-map
		name.
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	service-policy	Applies a policy map to a port.
	show mls qos vlan	Displays the quality of service (QoS) policy maps attached to an SVI.
	show policy-map	Displays QoS policy maps.

port-channel load-balance

Use the **port-channel load-balance** global configuration command to set the load-distribution method among the ports in the EtherChannel. Use the **no** form of this command to return to the default setting.

port-channel load-balance {dst-ip | dst-mac | src-dst-ip | src-dst-mac | src-ip | src-mac}

no port-channel load-balance

Syntax Description	dst-ip	Load distribution is based on the destination host IP address.	
	dst-mac	Load distribution is based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent on different ports in the channel.	
	src-dst-ip	Load distribution is based on the source and destination host IP address.	
	src-dst-mac	Load distribution is based on the source and destination host MAC address.	
	src-ip	Load distribution is based on the source host IP address.	
	src-mac	Load distribution is based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.	
Defaults	The default is src-mac .		
ommand Modes	Global configu	uration	
Command History	Release	Modification	
	12.2(25)SEF2	2 This command was introduced.	
Jsage Guidelines	For information about when to use these forwarding methods, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.		
xamples	This example	shows how to set the load-distribution method to dst-mac:	
	Switch(config)# port-channel load-balance dst-mac		
	You can verify your setting by entering the show running-config privileged EXEC command or the show etherchannel load-balance privileged EXEC command.		

Related Commands	Command	Description
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the current operating configuration. For syntax information,
		select Cisco IOS Configuration Fundamentals Command Reference,
		Release 12.2 > File Management Commands > Configuration File
		Management Commands.

priority-queue

Use the **priority-queue** interface configuration command to enable the egress expedite queue on a port. Use the **no** form of this command to return to the default setting.

priority-queue out

no priority-queue out

Syntax Description	out	Enable the egress expedite queue.	
Defaults	The egress expedite	queue is disabled.	
Command Modes	Interface configurati	on	
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	
Usage Guidelines	When you configure the priority-queue out command, the shaped round robin (SRR) weight ratios are affected because there is one fewer queue participating in SRR. This means that <i>weight1</i> in the srr-queue bandwidth shape or the srr-queue bandwidth shape interface configuration command is ignored (not used in the ratio calculation). The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced.		
	Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:		
	• If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.		
	• If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.		
	• •	bedite queue is disabled and the SRR shaped weights are not configured, SRR ue in shared mode.	
Examples	This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.		
	Switch(config-if)# Switch(config-if)#	terface gigabitethernet0/2 srr-queue bandwidth shape 25 0 0 0 srr-queue bandwidth share 30 20 25 25 priority-queue out	

This example shows how to disable the egress expedite queue after the SRR shaped and shared weights are configured. The shaped mode overrides the shared mode.

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# no priority-queue out
```

You can verify your settings by entering the **show mls qos interface** *interface-id* **queueing** or the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface queueing	Displays the queueing strategy (SRR, priority queueing), the weights corresponding to the queues, and the CoS-to-egress-queue map.
	srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
	srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

private-vlan

Use the **private-vlan** VLAN configuration command to configure private VLANs and to configure the association between private-VLAN primary and secondary VLANs. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

private-vlan {association [add | remove] secondary-vlan-list | community | isolated | primary}

no private-vlan {association | community | isolated | primary}

Syntax Description	association	Create an association between the primary VLAN and a secondary VLAN.		
	secondary-vlan-list	Specify one or more secondary VLANs to be associated with a primary VLAN in a private VLAN.		
	add	Associate a secondary VLAN to a primary VLAN.		
	remove	Clear the association between a secondary VLAN and a primary VLAN.		
	community	Designate the VLAN as a community VLAN.		
	isolated	Designate the VLAN as a community VLAN.		
	primary	Designate the VLAN as a community VLAN.		
Defaults	The default is to have a	no private VLANs configured.		
Command Modes	VLAN configuration			
Command History	Release	Modification		
	12.2(40)SE	This command was introduced.		
Usage Guidelines	• • • •	vate VLANs, you must disable VTP (VTP mode transparent). After you configure hould not change the VTP mode to client or server.		
	VTP does not propagate private-VLAN configuration. You must manually configure private VLANs on all switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private-VLAN traffic.			
	You cannot include VLAN 1 or VLANs 1002 to 1005 in the private-VLAN configuration. Extended VLANs (VLAN IDs 1006 to 4094) can be configured in private VLANs.			
	You can associate a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.			
	• A secondary VLA	• A secondary VLAN cannot be configured as a primary VLAN.		
	• The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.			

• If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A **community** VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An **isolated** VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary vlan domain.

A **primary** VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The private-vlan commands do not take effect until you exit from VLAN configuration mode.

Do not configure private-VLAN ports as EtherChannels. While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For information about configuring host ports and promiscuous ports, see the **switchport mode private-vlan** command.

For more information about private-VLAN interaction with other features, see the software configuration guide for this release.

Examples

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan) # private-vlan primary
Switch(config-vlan)# exit
Switch(config) # vlan 501
Switch(config-vlan) # private-vlan isolated
Switch(config-vlan)# exit
Switch(config) # vlan 502
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 503
Switch(config-vlan) # private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 20
Switch(config-vlan) # private-vlan association 501-503
Switch(config-vlan)# end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status** privileged EXEC command.

Related Commands	Command	Description
	show interfaces status	Displays the status of interfaces, including the VLANs to which they belong.
	show vlan private-vlan	Displays the private VLANs and VLAN associations configured on the switch or switch stack.
	switchport mode private-vlan	Configures a private-VLAN port as a host port or promiscuous port.

private-vlan mapping

Use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI) to create a mapping between a private-VLAN primary and secondary VLANs so that both VLANs share the same primary VLAN SVI. Use the **no** form of this command to remove private-VLAN mappings from the SVI.

private-vlan mapping {[add | remove] secondary-vlan-list}

no private-vlan mapping

Syntax Description	secondary-vlan-list	Specify one or more secondary VLANs to be mapped to the primary VLAN SVI.	
	add	(Optional) Map the secondary VLAN to the primary VLAN SVI.	
	remove	(Optional) Remove the mapping between the secondary VLAN and the primary VLAN SVI.	
Defaults	The default is to have r	no private VLAN SVI mapping configured.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(40)SE	This command was introduced.	
Usage Guidelines	The switch must be in VTP transparent mode when you configure private VLANs.		
	The SVI of the primary VLAN is created at Layer 3.		
	Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.		
	<i>st</i> parameter cannot contain spaces. It can contain multiple comma-separated a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list d VLAN and multiple community VLANs.		
	Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.		
	A secondary VLAN can be mapped to only one primary SVI. IF you configure the primary VLAN as a secondary VLAN, all SVIs specified in this command are brought down.		
	If you configure a mapping between two VLANs that do not have a valid Layer 2 private-VLAN association, the mapping configuration does not take effect.		

Examples This exa

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

Switch# configure terminal Switch# interface vlan 18 Switch(config-if)# private-vlan mapping 20 Switch(config-vlan)# end

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

Switch# configure terminal Switch# interface vlan 20 Switch(config-if)# private-vlan mapping 303-305, 307 Switch(config-vlan)# end

You can verify your setting by entering the **show interfaces private-vlan mapping** privileged EXEC command.

Related Commands	Command	Description
	show interfaces private-vlan	Display private-VLAN mapping information for the VLAN SVIs.
	mapping	

queue-set

Use the **queue-set** interface configuration command to map a port to a queue-set. Use the **no** form of this command to return to the default setting.

queue-set *qset-id*

no queue-set qset-id

Syntax Description	1	1	ach port belongs to a queue-set, which defines all the our egress queues per port. The range is 1 to 2.
Defaults	The queue-set ID is	1.	
Command Modes	Interface configuration	on	
Command History	Release	Modification	1
	12.2(25)SEF2	This comma	nd was introduced.
Examples	This example shows how to map a port to queue-set 2: Switch(config)# interface gigabitethernet0/1		
	Switch(config-if)#	queue-set 2	g the show mls qos interface [<i>interface-id</i>] buffers privileged
	EXEC command.	<u> </u>	
Related Commands	Command		Description
	mls qos queue-set o	output buffers	Allocates buffers to a queue-set.
	mls qos queue-set o	output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	show mls qos interf	face buffers	Displays quality of service (QoS) information.

radius-server dead-criteria

Use the **radius-server dead-criteria** global configuration command to configure the conditions that determine when a RADIUS server is considered unavailable or *dead*. Use the **no** form of this command to return to the default settings.

radius-server dead-criteria [time seconds [tries number] | tries number]

no radius-server dead-criteria [time seconds [tries number] | tries number]

Syntax Description	time seconds	(Optional) Set the time in seconds during which the switch does not need to get a valid response from the RADIUS server. The range is from 1 to 120 seconds.
	tries number	(Optional) Set the number of times that the switch does not get a valid response from the RADIUS server before the server is considered unavailable. The range is from 1 to 100.
Defaults	-	namically determines the <i>seconds</i> value that is from 10 to 60 seconds. namically determines the <i>tries</i> value that is from 10 to 100.
Command Modes	Global configu	ration
Command History	Release	Modification
oonnana motory	12.2(25)SEF2

Cisco Catalyst Blade Switch 3040 for FSC Command Reference

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	radius-server retransmit retries	Specifies the number of times that the switch tries to reach the RADIUS servers before considering the servers to be unavailable. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	radius-server timeout seconds	Specifies the time in seconds during which the switch waits for a RADIUS server to respond before the IEEE 802.1x authentication times out. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

radius-server host

Use the **radius-server host** global configuration command to configure the RADIUS server parameters, including the RADIUS accounting and authentication. Use the **no** form of this command to return to the default settings.

radius-server host *ip-address* [acct-port *udp-port*] [auth-port *udp-port*] [test username *name* [idle-time *time*] [ignore-acct-port] [ignore-auth-port]] [key *string*]

no radius-server host ip-address

Syntax Description	ip-address	Specify the IP address of the RADIUS server.	
	acct-port <i>udp-port</i>	(Optional) Specify the UDP port for the RADIUS accounting server. The range is from 0 to 65536.	
	auth-port udp-port	(Optional) Specify the UDP port for the RADIUS authentication server. The range is from 0 to 65536.	
	test username name	(Optional) Enable automatic server testing of the RADIUS server status, and specify the username to be used.	
	idle-time time	(Optional) Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes.	
	ignore-acct-port	(Optional) Disables testing on the RADIUS-server accounting port.	
	ignore-auth-port	(Optional) Disables testing on the RADIUS-server authentication port.	
	key string	(Optional) Specify the authentication and encryption key for all RADIUS communication between the switch and the RADIUS daemon. The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.	
Defaults		RADIUS accounting server is 1646. RADIUS authentication server is 1645.	
	Automatic server testing is disabled.		
	The idle time is 60 minutes (1 hour).		
	When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.		
	The authentication and	encryption key (string) is not configured.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEF2	This command was introduced.	

Usage Guidelines We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.

Use the **test username** *name* keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

You can configure the authentication and encryption key by using the **radius-server host** *ip-address* **key** *string* or the **radius-server key** {0 *string* | 7 *string* | *string*} global configuration command. Always configure the key as the last item in this command.

Examples

This example shows how to configure 1500 as the UDP port for the accounting server and 1510 as the UDP port for the authentication server:

Switch(config)# radius-server host 1.1.1.1 acct-port 1500 auth-port 1510

This example shows how to configure the UDP port for the accounting server and the authentication server, enable automated testing of the RADIUS server status, specify the username to be used, and configure a key string:

Switch(config)# radius-server host 1.1.1.2 acct-port 800 auth-port 900 test username
aaafail idle-time 75 key abc123

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	<pre>radius-server key {0 string 7 string string }</pre>	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

remote-span

Use the **remote-span** VLAN configuration command to configure a VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN. Use the **no** form of this command to remove the RSPAN designation from the VLAN.

remote-span

no remote-span

Syntax Description	This command h	as no arguments	or keywords.
--------------------	----------------	-----------------	--------------

Defaults No RSPAN VLANs are defined.

Command Modes VLAN configuration (config-VLAN)

Command History	Release	Modification
	12.2(25)SEF2	This command was introduced.

Usage Guidelines You can configure RSPAN VLANs only in config-VLAN mode (entered by using the **vlan** global configuration command), not the VLAN configuration mode entered by using the **vlan database** privileged EXEC command.

If VLAN Trunking Protocol (VTP) is enabled, the RSPAN feature is propagated by VTP for VLAN-IDs that are lower than 1005. If the RSPAN VLAN ID is in the extended range, you must manually configure intermediate switches (those in the RSPAN VLAN between the source switch and the destination switch).

Before you configure the RSPAN **remote-span** command, use the **vlan** (global configuration) command to create the VLAN.

The RSPAN VLAN has these characteristics:

- No MAC address learning occurs on it.
- RSPAN VLAN traffic flows only on trunk ports.
- Spanning Tree Protocol (STP) can run in the RSPAN VLAN, but it does not run on RSPAN destination ports.

When an existing VLAN is configured as an RSPAN VLAN, the VLAN is first deleted and then recreated as an RSPAN VLAN. Any access ports are made inactive until the RSPAN feature is disabled.

Examples This example shows how to configure a VLAN as an RSPAN VLAN.

Switch(config)# **vlan 901** Switch(config-vlan)# **remote-span** This example shows how to remove the RSPAN feature from a VLAN.

Switch(config)# **vlan 901** Switch(config-vlan)# **no remote-span**

You can verify your settings by entering the show vlan remote-span user EXEC command.

Related Commands	Command	Description
	monitor session	Enables Switched Port Analyzer (SPAN) and RSPAN monitoring on a port and configures a port as a source or destination port.
	vlan (global configuration)	Changes to config-vlan mode where you can configure VLANs 1 to 4094.

renew ip dhcp snooping database

Use the **renew ip dhcp snooping database** privileged EXEC command to renew the DHCP snooping binding database.

renew ip dhcp snooping database [{flash:/filename | ftp://user:password@host/filename |
nvram:/filename | rcp://user@host/filename | tftp://host/filename}] [validation none]

Syntax Description	6 1 (a 1	
Syntax Description	flash: /filename	(Optional) Specify that the database agent or the binding file is in the flash memory.
	ftp:// user : password @host/filename	(Optional) Specify that the database agent or the binding file is on an FTP server.
	nvram:/filename	(Optional) Specify that the database agent or the binding file is in the NVRAM.
	rcp:// user@host/file name	(Optional) Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.
	tftp://host/filename	(Optional) Specify that the database agent or the binding file is on a TFTP server.
	validation none	(Optional) Specify that the switch does not verify the cyclic redundancy check (CRC) for the entries in the binding file specified by the URL.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release Mo	dification
	12.2(44)SE Th	is command was introduced.
Usage Guidelines	If you do not specify a	a URL, the switch tries to read the file from the configured URL.
		a URL, the switch tries to read the file from the configured URL.
-		
Usage Guidelines Examples	This example shows h in the file:	a URL, the switch tries to read the file from the configured URL.

Related Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	ip dhcp snooping binding	Configures the DHCP snooping binding database.
	show ip dhcp snooping database	Displays the status of the DHCP snooping database agent.

reserved-only

Use the **reserved-only** DHCP pool configuration mode command to allocate only reserved addresses in the Dynamic Host Configuration Protocol (DHCP) address pool. Use the **no** form of the command to return to the default.

reserved-only

no reserved-only

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** The default is to not restrict pool addresses
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.2(50)SE	This command was introduced.

Usage Guidelines Entering the **reserved-only** command restricts assignments from the DHCP pool to preconfigured reservations. Unreserved addresses that are part of the network or on pool ranges are not offered to the client, and other clients are not served by the pool.

By entering this command, users can configure a group of switches with DHCP pools that share a common IP subnet and that ignore requests from clients of other switches.

To access DHCP pool configuration mode, enter the ip dhcp pool name global configuration command.

Examples This example shows how to configure the DHCP pool to allocate only reserved addresses:

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp pool test1
Switch(dhcp-config)# reserved-only
```

You can verify your settings by entering the show ip dhcp pool privileged EXEC command.

Related Commands	Command	Description
	show ip dhcp pool	Displays the DHCP address pools.
