

Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Cisco IOS Commands

aaa accounting dot1x

Use the **aaa accounting dot1x** global configuration command to enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions. Use the **no** form of this command to disable IEEE 802.1x accounting.

no aaa accounting dot1x {*name* | **default**}

Syntax Description	name	Name of a server group. This is optional when you enter it after the broadcast group and group keywords.
	default	Use the accounting methods that follow as the default list for accounting services.
	start-stop	Send a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server.
	broadcast	Enable accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.
	group	Specify the server group to be used for accounting services. These are valid server group names:
		• <i>name</i> —Name of a server group.
		• radius—List of all RADIUS hosts.
		• tacacs +—List of all TACACS+ hosts.
		The group keyword is optional when you enter it after the broadcast group and group keywords. You can enter more than optional group keyword.

aaa accounting dot1x {name | default} start-stop {broadcast group {name | radius | tacacs+}
 [group {name | radius | tacacs+} ...] | group {name | radius | tacacs+} [group {name | radius
 | tacacs+} ...]}

	radius	(Optional) Enable RADIUS authorization.
	tacacs+	(Optional) Enable TACACS+ accounting.
Defaults	AAA accounting	is disabled.
Command Modes	Global configurat	10n
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	We recommend th	quires access to a RADIUS server. nat you enter the dot1x reauthentication interface configuration command before 802.1x RADIUS accounting on an interface.
Examples	Switch(config)#	ws how to configure IEEE 802.1x accounting: aaa new-model aaa accounting dot1x default start-stop group radius
Note	The RADIUS aut packets from the	hentication server must be properly configured to accept and log update or watchdog AAA client.

Related Commands	Command	Description
	aaa authentication dot1x	Specifies one or more AAA methods for use on interfaces running IEEE 802.1x.
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	dot1x reauthentication	Enables or disables periodic reauthentication.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.

aaa authentication dot1x

Use the **aaa authentication dot1x** global configuration command on the switch stack or on a standalone switch to specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication. Use the **no** form of this command to disable authentication.

aaa authentication dot1x {default} method1

no aaa authentication dot1x {default}

Syntax Description	default	Use the listed authentication method that follows this argument as the default method when a user logs in.	
	method1	Enter the group radius keywords to use the list of all RADIUS servers for authentication.	
Note	Though other key keywords are sup	words are visible in the command-line help strings, only the default and group radius ported.	
Defaults	No authentication	n is performed.	
Command Modes	Global configurat	tion	
Command History	Release	Modification	
·····	12.2(40)EX2	This command was introduced.	
Usage Guidelines	to validate the pas	nent identifies the method that the authentication algorithm tries in the given sequence ssword provided by the client. The only method that is truly IEEE 802.1x-compliant is method, in which the client data is validated against a RADIUS authentication server.	
	If you specify group radius , you must configure the RADIUS server by entering the radius-server host global configuration command.		
	Use the show run authentication me	nning-config privileged EXEC command to display the configured lists of ethods.	
Examples	-	bws how to enable AAA and how to create an IEEE 802.1x-compliant authentication first tries to contact a RADIUS server. If this action returns an error, the user is ss to the network.	
	Switch(config)# Switch(config)#	aaa new-model aaa authentication dot1x default group radius	

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command_ reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

aaa authorization network

Use the **aaa authorization network** global configuration command on the switch stack or on a standalone switch to the configure the switch to use user-RADIUS authorization for all network-related service requests, such as IEEE 802.1x per-user access control lists (ACLs) or VLAN assignment. Use the **no** form of this command to disable RADIUS user authorization.

aaa authorization network default group radius

no aaa authorization network default

Syntax Description	default group radius	Use the list of all RADIUS hosts in the server group as the default authorization list.	
Defaults	Authorization is disab	oled.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	Use the aaa authorization network default group radius global configuration command to allow the switch to download IEEE 802.1x authorization parameters from the RADIUS servers in the default authorization list. The authorization parameters are used by features such as per-user ACLs or VLAN assignment to get parameters from the RADIUS servers.		
	Use the show running methods.	g-config privileged EXEC command to display the configured lists of authorization	
Examples	This example shows h service requests:	ow to configure the switch for user RADIUS authorization for all network-related	
	Switch(config)# aaa authorization network default group radius		
	You can verify your s	ettings by entering the show running-config privileged EXEC command.	
Related Commands	Command	Description	
	show running-confi	 g Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command. 	

action

Use the **action** access-map configuration command on the switch stack or on a standalone switch to set the action for the VLAN access map entry. Use the **no** form of this command to return to the default setting.

action {drop | forward}

no action

Syntax Description	drop	Drop the packet when the specified conditions are matched.
	forward	Forward the packet when the specified conditions are matched.
Defaults	The default actio	n is to forward packets.
Command Modes	Access-map conf	ïguration
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	You enter access-	map configuration mode by using the vlan access-map global configuration command.
	If the action is drop , you should define the access map, including configuring any access control list (ACL) names in match clauses, before applying the map to a VLAN, or all packets could be dropped.	
	In access-map configuration mode, use the match access-map configuration command to define the match conditions for a VLAN map. Use the action command to set the action that occurs when a packet matches the conditions.	
	The drop and for	ward parameters are not used in the no form of the command.
Examples	1	was how to identify and apply a VLAN access map <i>vmap4</i> to VLANs 5 and 6 that causes ward an IP packet if the packet matches the conditions defined in access list <i>al2</i> :
	Switch(config-a Switch(config-a Switch(config-a	vlan access-map vmap4 ccess-map)# match ip address al2 ccess-map)# action forward ccess-map)# exit vlan filter vmap4 vlan-list 5-6
	You can verify yo	our settings by entering the show vlan access-map privileged EXEC command.

Related Commands	Command	Description	
	access-list {deny permit}	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.	
	ip access-list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .	
	mac access-list extended	Creates a named MAC address access list.	
	match (class-map configuration)	Defines the match conditions for a VLAN map.	
	show vlan access-map	Displays the VLAN access maps created on the switch.	
	vlan access-map	Creates a VLAN access map.	

archive copy-sw

Use the **archive copy-sw** privileged EXEC command on the stack master to copy the running image from the flash memory on one stack member to the flash memory on one or more other stack members.

archive copy-sw [/destination-system destination-stack-member-number] [/force-reload] [leave-old-sw] [/no-set-boot] [/overwrite] [/reload] [/safe] source-stack-member-number

This command is supported only on the Catalyst Switch Module 3110.

Syntax Description	/destination-system	(Optional) The number of the stack member to which to copy the running
	destination-stack- member-number	image. The range is 1 to 9.
	/force-reload	(Optional) Unconditionally force a system reload after successfully downloading the software image.
	/leave-old-sw	(Optional) Keep the old software version after a successful download.
	/no-set-boot	(Optional) Do not alter the setting of the BOOT environment variable to point to the new software image after it is successfully downloaded.
	/overwrite	(Optional) Overwrite the software image in flash memory with the downloaded one.
	/reload	(Optional) Reload the system after downloading the image unless the configuration has been changed and not been saved.
	/safe	(Optional) Keep the current software image; do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.
	source-stack-member- number	The number of the stack member from which to copy the running image. The range is 1 to 9.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	The current software im	age is not overwritten with the copied image.
	Both the software image	and HTML files are copied.
	The new image is copied	d to the flash: file system.
	The BOOT environment	variable is changed to point to the new software image on the flash: file system.
	Image names are case se	ensitive; the image file is provided in tar format.

To successfully use the **archive copy-sw** privileged EXEC command, you must have downloaded from a TFTP server the images for both the stack member switch being added and the stack master. You use the **archive download-sw** privileged EXEC command to perform the download.

At least one stack member must be running the image that is to be copied to the switch that has incompatible software.

You can copy the image to more than one specific stack member by repeating the /destination-system *destination-stack-member-number* option in the command for each stack member to be upgraded. If you do not specify the *destination-stack-member-number*, the default is to copy the running image file to all stack members.

Using the **/safe** or **/leave-old-sw** option can cause the new copied image to fail if there is insufficient flash memory. If leaving the software in place would prevent the new image from fitting in flash memory due to space constraints, an error results.

If you used the **/leave-old-sw** option and did not overwrite the old image when you copied the new one, you can remove the old image by using the **delete** privileged EXEC command. For more information, see the "delete" section on page 2-73.

Use the **/overwrite** option to overwrite the image on the flash device with the copied one.

If you specify the command *without* the **/overwrite** option, the algorithm verifies that the new image is not the same as the one on the switch flash device or is not running on any stack members. If the images are the same, the copy does not occur. If the images are different, the old image is deleted, and the new one is copied.

After copying a new image, enter the **reload** privileged EXEC command to begin using the new image, or specify the **/reload** or **/force-reload** option in the **archive copy-sw** command.

You can enter one or more of these options with the source-stack-member-number option:

- /destination-system destination-stack-member-number
- /force-reload
- /leave-old-sw
- /no-set-boot
- /overwrite
- /reload
- /safe

If you enter the *source-stack-member-number* option before one of the previous options, you can enter only the **archive copy-sw** *source-stack-member-number* command.

These are examples of how you can enter the **archive copy-sw** command:

- To copy the running image from a stack member to another stack member and to overwrite the software image in the second stack member's flash memory (if it already exists) with the copied one, enter the **archive copy-sw** /destination destination-stack-member-number /overwrite source-stack-member-number command.
- To copy the running image from a stack member to another stack member, keep the current software image, and reload the system after the image copies, enter the **archive copy-sw** /destination destination-stack-member-number /safe /reload source-stack-member-number command.

Examples This example shows how to copy the running image from stack member 6 to stack member 8: Switch# archive copy-sw /destination-system 8 6 This example shows how to copy the running image from stack member 6 to all the other stack members: Switch# archive copy-sw 6

This example shows how to copy the running image from stack member 5 to stack member 7. If the image being copied already exists on the second stack member's flash memory, it can be overwritten with the copied one. The system reloads after the image is copied:

 ${\tt Switch} \#$ archive copy-sw /destination-system 7 /overwrite /force-reload 5

Related Commands	Command	Description
	archive download-sw	Downloads a new image from a TFTP server to the switch.
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.
	archive upload-sw	Uploads an existing image on the switch to a server.
	delete	Deletes a file or directory on the flash memory device.

archive download-sw

Use the **archive download-sw** privileged EXEC command on the switch stack or on a standalone switch to download a new image from a TFTP server to the switch or switch stack and to overwrite or keep the existing image.

- archive download-sw [/allow-feature-upgrade | /destination-system stack-member-number | /directory | /force-reload | /imageonly | /leave-old-sw | /no-set-boot | /no-version-check | /only-system-type system-type | /overwrite | /reload | /safe] source-url1 [source-url2 source-url3 source-url4]
- archive download-sw [/allow-feature-upgrade | /destination-system stack-member-number | /directory | /force-reload | /imageonly | /leave-old-sw | /no-set-boot | /no-version-check | /only-system-type system-type | /overwrite | /reload | /safe] /directory source-url1 [source-url2 source-url3 source-url4]

Syntax Description	/allow-feature-upgrade	Allow installation of software images with different feature sets (for
		example, upgrade from the IP base feature set to the IP services features set).
	/destination-system	Specify the specific stack member to be upgraded. The range is 1 to 9.
	stack-member-number	This keyword is supported only on the Catalyst Switch Module 3110.
	/directory	Specify a directory for all of the images.
	/force-reload	Unconditionally force a system reload after successfully downloading the software image.
	/imageonly	Download only the software image but not the HTML files associated with the embedded device manager. The HTML files for the existing version are deleted only if the existing version is being overwritten or removed.
	/leave-old-sw	Keep the old software version after a successful download.
	/no-set-boot	Do not alter the setting of the BOOT environment variable to point to the new software image after it is successfully downloaded.
	/no-version-check	Download the software image without checking the compatibility of the stack protocol version on the image and on the switch stack.
		This keyword is supported only on the Catalyst Switch Module 3110.
	/only-system-type system-type	Specify the specific system type to be upgraded. The range is 0 to FFFFFFFF.
		This keyword is supported only on the Catalyst Switch Module 3110.
	/overwrite	Overwrite the software image in flash memory with the downloaded one.
	/reload	Reload the system after successfully downloading the image unless the configuration has been changed and not been saved.
	/safe	Keep the current software image; do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.

source-url1 [sourceurl2	The source URLs for the software images.
sourceurl3 sourceurl4]	On a standalone switch, enter one source URL for the software image that the switch supports.
	In a switch stack, you can enter source URLs for the software images that the stack members support as follows:
	• Up to two source URLs without the /directory keyword.
	• Up to four source URLS with the /directory keyword.
	The <i>image-name</i> .tar is the software image to download and install on the switch.
	These options are supported:
	• Local flash file system syntax on the standalone switch or the stack master: flash:
	Local flash file system syntax on a stack member: flash member number:
	The <i>member number</i> can be from 1 to 9.
	 FTP syntax: ftp:[[//username[:password]@location]/directory]/image-name.tar
	 HTTP server syntax: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 Secure HTTP server syntax: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
	 Remote Copy Protocol (RCP) syntax: rcp:[[//username@location]/directory]/image-name.tar
	 Secure Copy Protocol (SCP) syntax for the: scp:[[//username@location]/directory]/image-name.tar
	• The syntax for the TFTP: tftp:[//location]/directory]/image-name.tar

Defaults	The current software image is not overwritten with the downloaded image.	
Both the software image and HTML files are downloaded.		
	The new image is downloaded to the flash: file system.	
	The BOOT environment variable is changed to point to the new software image on the flash: file system.	
	Image names are case sensitive; the image file is provided in tar format.	
	Compatibility of the stack protocol version on the image to be downloaded is checked with the version on the switch stack.	
Command Modes	Privileged EXEC	

Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Command Reference

Command History	Release	Modification			
	12.2(40)EX2	This command was introduced.			
Usage Guidelines		ure-upgrade option to allow installation of an image with a different feature set, for g from the IP base feature set to the IP services feature.			
		chive download-sw /directory command to specify a directory only once, followed of tar files to be downloaded, instead of specifying complete paths with each tar file.			
		The /imageonly option removes the HTML files for the existing image if the existing image is being removed or replaced. Only the Cisco IOS image (without the HTML files) is downloaded.			
	Using the /safe or /leave-old-sw option can cause the new image download to fail if there is insufficient flash memory. If leaving the software in place prevents the new image from fitting in flash memory due to space constraints, an error results.				
	If you used the /leave-old-sw option and did not overwrite the old image when you downloaded the new one, you can remove the old image by using the delete privileged EXEC command. For more information, see the "delete" section on page 2-73.				
	Use the /no-version-check option if you want to download an image that has a different stack protocol version than the one existing on the switch stack. You must use this option with the /destination-system option to specify the specific stack member to be upgraded with the image.				
Note	the same stack prot	n-check option with care. All stack members, including the stack master, must have ocol version to be in the same switch stack. This option allows an image to be it first confirming the compatibility of its stack protocol version with the version of			
		ore than one specific stack member by repeating the /destination-system option in ach stack member to be upgraded.			
	Use the /overwrite	option to overwrite the image on the flash device with the downloaded one.			
	image is not the sar the images are the s	ommand <i>without</i> the /overwrite option, the download algorithm verifies that the new ne as the one on the switch flash device or is not running on any stack members. If same, the download does not occur. If the images are different, the old image is w one is downloaded.			
		a new image, enter the reload privileged EXEC command to begin using the new ne /reload or /force-reload option in the archive download-sw command.			
	Use the /directory	option to specify a directory for the images.			
Evennlee	This successful shows	a have to describe a large structure of 172 20 120 10 and to			
Examples	This example shows how to download a new image from a TFTP server at 172.20.129.10 and to overwrite the image on the switch:				
	Switch# archive d	lownload-sw /overwrite tftp://172.20.129.10/test-image.tar			
	This example shows the switch:	s how to download only the software image from a TFTP server at 172.20.129.10 to			
	Switch# archive d	ownload-sw /imageonly tftp://172.20.129.10/test-image.tar			

This example shows how to keep the old software version after a successful download:

Switch# archive download-sw /leave-old-sw tftp://172.20.129.10/test-image.tar

This example specifies the location of two tar images without having to specify the path each time:

Switch# archive download-sw tftp://10.1.1.10/ cbs31x0-universal-tar.122-40.EX1.tar cbs31x0-universal-tar.122-40.EX2.tar

This example shows how to upgrade stack members 6 and 8:

```
Switch# archive download-sw /imageonly /destination-system 6 /destination-system 8 tftp://172.20.129.10/test-image.tar
```

Related Commands	Command	Description
	archive copy-sw	Copies the running image from the flash memory on one stack member to the flash memory on one or more other stack members.
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.
	archive upload-sw	Uploads an existing image on the switch to a server.
	delete	Deletes a file or directory on the flash memory device.

archive tar

Use the **archive tar** privileged EXEC command on the switch stack or on a standalone switch to create a tar file, list files in a tar file, or extract the files from a tar file.

archive tar {/create destination-url flash:/file-url} | {/table source-url} | {/xtract source-url flash:/file-url [dir/file...]}

Syntax Description	/ create destination-url flash:/file-url	Create a new tar file on the local or network file system.
		For <i>destination-url</i> , specify <i>t</i> he destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:
		• The syntax for the local flash filesystem: flash:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		• The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/tar-filename.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar
		The <i>tar-filename</i> .tar is the tar file to be created.
		For flash: / <i>file-url</i> , <i>specify</i> the location on the local flash file system from which the new tar file is created.
		An optional list of files or directories within the source directory can be specified to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.

/table source-url	Display the contents of an existing tar file to the screen. For <i>source-url</i> , specify the source URL alias for the local or network file system. These options are supported:		
	• The syntax for the local flash file system: flash:		
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tag 		
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar 		
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar		
	The <i>tar-filename</i> .tar is the tar file to display.		
/xtract source-url	Extract files from a tar file to the local file system.		
flash:/file-url [dir/file]	For <i>source-url</i> , specify <i>t</i> he source URL alias for the local file system. These options are supported:		
	• The syntax for the local flash file system: flash:		
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.ta 		
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar 		
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar		
	The <i>tar-filename</i> .tar is the tar file from which to extract.		
	For flash: <i>/file-url</i> [<i>dir/file</i>], specify the location on the local flash file system into which the tar file is extracted. Use the <i>dir/file</i> option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.		

Defaults

There is no default setting.

Command Modes	Privileged EXEC	Privileged EXEC		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines	Filenames and dire	ctory names are case sensitive.		
	Image names are case sensitive.			
Examples	This example shows how to create a tar file. The command writes the contents of the <i>new-configs</i> directory on the local flash device to a file named <i>saved.tar</i> on the TFTP server at 172.20.10.30:			
	Switch# archive tar /create tftp:172.20.10.30/saved.tar flash:/new-configs			
	This example shows how to display the contents of the <i>cbs31x0-universal-tar.12-40.EX2</i> file that is in flash memory. The contents of the tar file appear on the screen:			
	Switch# archive tar /table flash:cbs31x0-universal-tar12-40.EX2.tar info (219 bytes)			
	cbs31x0-universal-mz.122-40.EX2/ (directory) cbs31x0-universal-mz.122-40.EX2 (610856 bytes) cbs31x0-universal-mz.122-40.EX2/info (219 bytes) info.ver (219 bytes)			
	This example shows how to display only the <i>cbs31x0-universal-tar.12-40.EX2/html</i> directory and its contents:			
	<pre>Switch# archive tar /table flash:cbs31x0-universal-12-40.EX2.tar cbs31x0-universal-12-40/html cbs31x0-universal-mz.122-40.EX2/html/ (directory) cbs31x0-universal-mz.122-40.EX2/html/const.htm (556 bytes) cbs31x0-universal-mz.122-40.EX2/html/xhome.htm (9373 bytes) cbs31x0-universal-mz.122-40.EX2/html/menu.css (1654 bytes) <output truncated=""></output></pre>			
	This example shows how to extract the contents of a tar file on the TFTP server at 172.20.10.30. This command extracts just the <i>new-configs</i> directory into the root directory on the local flash file system. The remaining files in the <i>saved.tar</i> file are ignored.			

Switch# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/ new-configs

Related Commands	Command	Description
	archive copy-sw	Copies the running image from the flash memory on one stack member to the flash memory on one or more other stack members.
	archive download-sw	Downloads a new image from a TFTP server to the switch.
	archive upload-sw	Uploads an existing image on the switch to a server.

archive upload-sw

Use the **archive upload-sw** privileged EXEC command on the switch stack or on a standalone switch to upload an existing switch image to a server.

archive upload-sw [/**source-system-num** stack member number | /**version** version_string] destination-url

Syntax Description	/source-system-num stack member number	Specify the specific stack member containing the image that is to be uploaded.
		This keyword is supported only on the Catalyst Switch Module 3110.
	/version version_string	(Optional) Specify the specific version string of the image to be uploaded.
	destination-url	The destination URL alias for a local or network file system. The <i>image-name</i> .tar is the name of software image to be stored on the server.
		These options are supported:
		• Local flash file system syntax on the standalone switch or the stack master: flash:
		Local flash file system syntax on a stack member: flash member number:
		 FTP syntax: ftp:[[//username[:password]@location]/directory]/image-name.tar
		 HTTP server syntax: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 Secure HTTP server syntax: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 Remote Copy Protocol (RCP) syntax: rcp:[[//username@location]/directory]/image-name.tar
		 TFTP syntax: tftp:[[//location]/directory]/image-name.tar
Defaults	Uploads the currently rur	nning image from the flash: file system.
Command Modes	Privileged EXEC	

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

archive tar

Usage Guidelines	You must specify that the /source-system-num option uses the /version option. The options together upload the specified image, not the running image, of a specific stack member. Use the upload feature only if the HTML files associated with the embedded device manager have been installed with the existing image.			
	The files are uploaded in this sequence: the Cisco IOS image, the HTML files, and info. After these files are uploaded, the software creates the tar file.			
	Image names are case se	ensitive.		
Examples	This example shows how to upload the currently running image on stack member 6 to a TFTP server at 172.20.140.2:			
	Switch# archive upload-sw /source-system-num 6 tftp://172.20.140.2/test-image.tar			
Related Commands	Command	Description		
	archive copy-sw	Copies the running image from the flash memory on one stack member to the flash memory on one or more other stack members.		
	archive download-sw	Downloads a new image to the switch.		

Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.

arp access-list

Use the **arp access-list** global configuration command on the switch stack or on a standalone switch to define an Address Resolution Protocol (ARP) access control list (ACL) or to add clauses to the end of a previously defined list. Use the **no** form of this command to delete the specified ARP access list.

arp access-list acl-name

no arp access-list acl-name

Syntax Description	acl-name	Name of the ACL.	
Defaults	No ARP access lists	are defined.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	After entering the arp access-list command, you enter ARP access-list configuration mode, and these configuration commands are available:		
	• default : returns	s a command to its default setting.	
	• deny : specifies packets to reject. For more information, see the "deny (ARP access-list configuration)" section on page 2-74.		
	• exit: exits ARP access-list configuration mode.		
	• no: negates a command or returns to default settings.		
	• permit : specifies packets to forward. For more information, see the "permit (ARP access-list configuration)" section on page 2-335.		
	Use the permit and deny access-list configuration commands to forward and to drop ARP packets based on the specified matching criteria.		
	When the ARP ACL is defined, you can apply it to a VLAN by using the ip arp inspection filter vlan global configuration command. ARP packets containing only IP-to-MAC address bindings are compared to the ACL. All other types of packets are bridged in the ingress VLAN without validation. If the ACL permits a packet, the switch forwards it. If the ACL denies a packet because of an explicit deny statement, the switch drops the packet. If the ACL denies a packet because of an implicit deny statement, the switch compares the packet to the list of DHCP bindings (unless the ACL is <i>static</i> , which means that packets are not compared to the bindings).		

Examples This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 00001.0000.abcd
Switch(config-arp-nacl)# end
```

You can verify your settings by entering the show arp access-list privileged EXEC command.

Related Commands	Command	Description
	deny (ARP access-list configuration)	Denies an ARP packet based on matches compared against the DHCP bindings.
	ip arp inspection filter vlan	Permits ARP requests and responses from a host configured with a static IP address.
	permit (ARP access-list configuration)	Permits an ARP packet based on matches compared against the DHCP bindings.
	show arp access-list	Displays detailed information about ARP access lists.

auto qos voip

Use the **auto qos voip** interface configuration command on the switch stack or on a standalone switch to automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain. Use the **no** form of this command to return to the default setting.

auto qos voip {cisco-phone | cisco-softphone | trust}

no auto qos voip [cisco-phone | cisco-softphone | trust]

Syntax Description	cisco-phone	Identify this port as connected to a Cisco IP Phone, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected.
	cisco-softphone	Identify this port as connected to a device running the Cisco SoftPhone, and automatically configure QoS for VoIP.
	trust	Identify this port as connected to a trusted switch or router, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

Defaults

Auto-QoS is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues as shown in Table 2-1.

Table 2-1 Traffic Types, Packet Labels, and Queues

	VoIP Data Traffic	VoIP Control Traffic	Routing Protocol Traffic	STP ¹ BPDU ² Traffic	Real-Time Video Traffic	All Other T	raffic
DSCP ³	46	24, 26	48	56	34	-	
CoS ⁴	5	3	6	7	3	-	
CoS-to-ingress queue map	2, 3, 4, 5, 6, 7 (queue 2)				0, 1 (queu	e 1)	
CoS-to-egress queue map	5 (queue 1)	3, 6, 7 (queue 2	2)		4 (queue 3)	2 (queue 3)	0, 1 (queue 4)

1. STP = Spanning Tree Protocol

2. BPDU = bridge protocol data unit

3. DSCP = Differentiated Services Code Point

4. CoS = class of service

Table 2-2 shows the generated auto-QoS configuration for the ingress queues.

Ingress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size
SRR ¹ shared	1	0, 1	81 percent	67 percent
Priority	2	2, 3, 4, 5, 6, 7	19 percent	33 percent

Table 2-2Auto-QoS Configuration for the Ingress Queues

1. SRR = shaped round robin. Ingress queues support shared mode only.

Table 2-3 shows the generated auto-QoS configuration for the egress queues.

Table 2-3 Auto-QoS Configuration for the Egress Queues

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	5	up to 100 percent	16 percent	10 percent
SRR shared	2	3, 6, 7	10 percent	6 percent	10 percent
SRR shared	3	2, 4	60 percent	17 percent	26 percent
SRR shared	4	0, 1	20 percent	61 percent	54 percent

Command Modes Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines

Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the switch for VoIP with Cisco IP Phones on switch and routed ports and for VoIP with devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

- QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are added.
- When you enter the **auto qos voip cisco-phone** interface configuration command on a port at the edge of the network that is connected to a Cisco IP Phone, the switch enables the trusted boundary feature. The switch uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP Phone. When a Cisco IP Phone is detected, the ingress classification on the port is set to trust the QoS label received in the packet. The switch also uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. When a Cisco IP Phone is absent, the ingress classification is set to not trust the QoS label in the packet. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3. The policing is applied to those traffic matching the policy-map classification before the switch enables the trust boundary feature.
- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the switch uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the interior of the network, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices). The switch configures the ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

When a device running Cisco SoftPhone is connected to a switch or routed port, the switch supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging. For more information, see the **debug auto qos** command.

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the **no mls qos** global configuration commands. With QoS

disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

Examples This example shows how to enable auto-QoS and to trust the QoS labels received in incoming packets when the switch or router connected to the port is a trusted device:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# auto gos voip trust

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	debug auto qos	Enables debugging of the auto-QoS feature.
	mls qos cos	Defines the default CoS value of a port or assigns the default
		CoS to all incoming packets on the port.
	<pre>mls qos map {cos-dscp dscp1 dscp8 dscp-cos dscp-list to cos}</pre>	Defines the CoS-to-DSCP map or the DSCP-to-CoS map.
	mls qos queue-set output buffers	Allocates buffers to a queue-set.
	mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps CoS values to an ingress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue input dscp-map	Maps DSCP values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue output cos-map	Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue output dscp-map	Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos trust	Configures the port trust state.
	queue-set	Maps a port to a queue-set.
	show auto qos	Displays auto-QoS information.
	show mls qos interface	Displays QoS information at the port level.
	srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
	srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

boot auto-copy-sw

Use the **boot auto-copy-sw** global configuration command from the stack master to enable the automatic upgrade (auto-upgrade) process. It automatically upgrades a switch in version-mismatch (VM) mode by copying the running software image on any stack member or by copying a tar file image in switch stack flash memory. Use the **no** form of this command to disable the auto-upgrade process.

boot auto-copy-sw

no boot auto-copy-sw

This command is supported only on the Catalyst Switch Module 3110.

Syntax Description This command has no arguments or keywords.

Defaults

Command Modes Global configuration

Enabled.

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines A switch in VM mode is a switch that has a different minor version number than the version on the switch stack. A switch in VM mode cannot join the switch stack as a fully functioning member. If the switch stack has an image that can be copied to a switch in VM mode, the auto-upgrade process automatically copies the image from a stack member to the switch in VM mode. The switch then exits VM mode, reboots, and joins the switch stack as a fully functioning member.

The auto-upgrade process affects only switches in VM mode. It does not affect existing stack members.

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.
	show version	Displays version information for the hardware and firmware.

2-27

boot auto-download-sw

Use the **boot auto-download-sw** global configuration command on the switch stack to specify a URL pathname to use for the automatic software upgrades. Use the **no** form of this command to remove the software image.

boot auto-download-sw source-url

no boot auto-download-sw

This command is supported only on the Catalyst Switch Module 3110.

Syntax Description The source URLs for the software images. The image-name.tar is the source-url software image to download and install on the switch. These options are supported: Local flash file system syntax on the standalone switch or the stack ٠ master: flash: Local flash file system syntax on a stack member: flash member number: The *member number* can be from 1 to 9. FTP syntax: ftp:[[//username[:password]@location]/directory]/image-name.tar • HTTP server syntax for an HTTP server: http://[[username:password]@]{hostname | host-ip { [/directory]/image-name.tar • Secure HTTP server syntax: https://[[username:password]@]{hostname | host-ip { [/directory] / image-name.tar • Remote Copy Protocol (RCP) syntax: rcp:[[//username@location]/directory]/image-name.tar Secure Copy Protocol (SCP) syntax: ٠ scp:[[//username@location]/directory]/image-name.tar TFTP syntax: • tftp:[[//location]/directory]/image-name.tar

Defaults Disabled.

Command Modes Global configuration

 Modification

 12.2(40)EX2
 This command was introduced.

Usage Guidelines This command works properly only from a standalone switch in a stack.

When you enter this command, you can interrupt the automatic boot process by pressing the Break key on the console after the flash file system is initialized.

Note

Despite the setting of this command, you can interrupt the automatic boot process at any time by pressing the MODE button on the switch front panel.

This command changes the setting of the ENABLE_BREAK environment variable. For more information, see Appendix A, "Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Boot Loader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot helper

Use the **boot helper** global configuration command on the switch stack or on a standalone switch to dynamically load files during boot loader initialization to extend or patch the functionality of the boot loader. Use the **no** form of this command to return to the default.

boot helper *filesystem:/file-url* ...

no boot helper

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	The path (directory) and a list of loadable files to dynamically load during loader initialization. Separate each image name with a semicolon.
Defaults	No helper files are	loaded.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines		d only for internal development and testing.
	Filenames and directory names are case sensitive. This command changes the setting of the HELPER environment variable. For more information, see Appendix A, "Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Boot Loader Commands."	
Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot helper-config-file

Use the **boot helper-config-file** global configuration command on the switch stack or on a standalone switch to specify the name of the configuration file to be used by the Cisco IOS helper image. If this is not set, the file specified by the CONFIG_FILE environment variable is used by all versions of Cisco IOS that are loaded. Use the **no** form of this command to return to the default setting.

boot helper-config-file filesystem:/file-url

no boot helper-config file

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.	
	lfile-url	The path (directory) and helper configuration file to load.	
Defaults	No helper configura	ation file is specified.	
Command Modes	Global configuration	n

In a depth-first search encountered subdirectory is completely searched before continuing the search in the n	
Command History	Release	Modification	
,	12.2(40)EX2	This command was introduced.	
Usage Guidelines	Filenames and directory names are case sensitive. If you enter the boot system <i>filesystem:/file-url</i> command on the stack master, the specified software image is loaded only on the stack master during the next boot cycle.		
	On the stack master, use the boot system switch <i>number</i> command to specify that the software image is loaded on the specified stack member during the next boot cycle. Use the boot system switch all command to specify that the software image is loaded on all the stack members during the next boot cycle.		

When you enter the **boot system switch** *number* or the **boot system switch all** command on the stack master, the stack master checks if a software image is already on the stack member (except on the stack master). If the software image does not exist on the stack member (for example, stack member 1), an error message like this appears:

%Command to set boot system switch all xxx on switch=1 failed

If you are using the **archive download-sw** privileged EXEC command to maintain system images, you never need to use the **boot system** command. The **boot system** command is automatically manipulated to load the downloaded image.

This command changes the setting of the BOOT environment variable. For more information, see Appendix A, "Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Boot Loader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

channel-group

Use the **channel-group** interface configuration command on the switch stack or on a standalone switch to assign an Ethernet port to an EtherChannel group, to enable an EtherChannel mode, or both. Use the **no** form of this command to remove an Ethernet port from an EtherChannel group.

channel-group channel-group-number mode {active | {auto [non-silent]} | {desirable
 [non-silent]} | on | passive}

no channel-group

PAgP modes:

channel-group channel-group-number mode {{auto [non-silent]} | {desirable [non-silent}}

LACP modes:

channel-group channel-group-number mode {active | passive}

On mode:

channel-group channel-group-number mode on

Syntax Description	channel-group-number	Specify the channel group number. The range is 1 to 48.
	mode	Specify the EtherChannel mode.
	active	Unconditionally enable Link Aggregation Control Protocol (LACP).
		Active mode places a port into a negotiating state in which the port initiates negotiations with other ports by sending LACP packets. A channel is formed with another port group in either the active or passive mode.
	auto	Enable the Port Aggregation Protocol (PAgP) only if a PAgP device is detected.
		Auto mode places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. A channel is formed only with another port group in desirable mode. When auto is enabled, silent operation is the default.
	desirable	Unconditionally enable PAgP.
		Desirable mode places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets. An EtherChannel is formed with another port group that is in the desirable or auto mode. When desirable is enabled, silent operation is the default.
	non-silent	(Optional) Use in PAgP mode with the auto or desirable keyword when traffic is expected from the other device.
	on	Enable on mode.
		In on mode, a usable EtherChannel exists only when both connected port groups are in the on mode.
	passive	Enable LACP only if a LACP device is detected.
		Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

Defaults No channel groups are assigned. No mode is configured. **Command Modes** Interface configuration Release Modification **Command History** 12.2(40)EX2 This command was introduced. **Usage Guidelines** For Layer 2 EtherChannels, you do not have to create a port-channel interface first by using the interface **port-channel** global configuration command before assigning a physical port to a channel group. Instead, you can use the **channel-group** interface configuration command. It automatically creates the port-channel interface when the channel group gets its first physical port if the logical interface is not already created. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel. You do not have to disable the IP address that is assigned to a physical port that is part of a channel group, but we strongly recommend that you do so. You create Layer 3 port channels by using the **interface port-channel** command followed by the **no** switchport interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group. After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk. If you do not specify **non-silent** with the **auto** or **desirable** mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. A example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent. In the **on** mode, an EtherChannel exists only when a port group in the **on** mode is connected to another port group in the **on** mode. Caution You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur. Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack (but not in a cross-stack configuration). Individual EtherChannel groups can run either PAgP or LACP, but they

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the **channel-group** interface configuration command.

cannot interoperate.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Do not configure a secure port as part of an EtherChannel or an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Caution

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

Examples

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel in a switch stack. It uses LACP passive mode and assigns two ports on stack member 2 and one port on stack member 3 as static-access ports in VLAN 10 to channel 5:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode passive
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# switchport access vlan 10
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# exit
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

Related Commands Command

Command	Description
channel-protocol	Restricts the protocol used on a port to manage channeling.
interface port-channel	Accesses or creates the port channel.
show etherchannel	Displays EtherChannel information for a channel.
show lacp	Displays LACP channel-group information.
show pagp	Displays PAgP channel-group information.
show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing
	page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_ command_reference_list.html
	Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

channel-protocol

Use the **channel-protocol** interface configuration command on the switch stack or on a standalone switch to restrict the protocol used on a port to manage channeling. Use the **no** form of this command to return to the default setting.

channel-protocol {lacp | pagp}

no channel-protocol

Syntax Description	lacp	Configure an EtherChannel with the Link Aggregation Control Protocol (LACP).	
	pagp	Configure an EtherChannel with the Port Aggregation Protocol (PAgP).	
Defaults	No protocol is	assigned to the EtherChannel.	
Command Modes	Interface confi	guration	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	Use the channel-protocol command only to restrict a channel to LACP or PAgP. If you set the protocol by using the channel-protocol command, the setting is not overridden by the channel-group interface configuration command.		
	You must use the channel-group interface configuration command to configure the EtherChannel parameters. The channel-group command also can set the mode for the EtherChannel.		
	You cannot ena	ble both the PAgP and LACP modes on an EtherChannel group.	
	PAgP and LAC	P are not compatible; both ends of a channel must use the same protocol.	
Examples	This example s	hows how to specify LACP as the protocol that manages the EtherChannel:	
	Switch(config-if)# channel-protocol lacp You can verify your settings by entering the show etherchannel [channel-group-number] pr privileged EXEC command.		
Related Commands	Command	Description	
	channel-grou	Assigns an Ethernet port to an EtherChannel group.	
	show ethercha	Displays protocol information the EtherChannel.	

class

Use the **class** policy-map configuration command on the switch stack or on a standalone switch to define a traffic classification match criteria (through the police, set, and trust policy-map class configuration commands) for the specified class-map name. Use the **no** form of this command to delete an existing class map. class class-map-name no class class-map-name Syntax Description Name of the class map. class-map-name Defaults No policy map class-maps are defined. **Command Modes** Policy-map configuration Release Modification **Command History** 12.2(40)EX2 This command was introduced. **Usage Guidelines** Before using the **class** command, you must use the **policy-map** global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the **service-policy** interface configuration command. After entering the class command, you enter policy-map class configuration mode, and these configuration commands are available: exit: exits policy-map class configuration mode and returns to policy-map configuration mode. no: returns a command to its default setting. police: defines a policer or aggregate policer for the classified traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information, see the **police** and **police** aggregate policy-map class commands. set: specifies a value to be assigned to the classified traffic. For more information, see the set command. trust: defines a trust state for traffic classified with the class or the class-map command. For more information, see the **trust** command. To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command. The class command performs the same function as the class-map global configuration command. Use the class command when a new classification, which is not shared with any other ports, is needed. Use the **class-map** command when the map is shared among many ports.

ExamplesThis example shows how to create a policy map called *policy1*. When attached to the ingress direction,
it matches all the incoming traffic defined in *class1*, sets the IP Differentiated Services Code Point
(DSCP) to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding
the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	police	Defines a policer for classified traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for the traffic classified through the class policy-map configuration command or the class-map global configuration command.

class-map

Use the **class-map** global configuration command on the switch stack or on a standalone switch to create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode. Use the **no** form of this command to delete an existing class map and to return to global configuration mode.

class-map [match-all | match-any] class-map-name

no class-map [match-all | match-any] class-map-name

Syntax Description	match-all	(Optional) Perform a logical-AND of all matching statements under this class map. All criteria in the class map must be matched.	
	match-any	(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria must be matched.	
	class-map-name	Name of the class map.	
Defaults	No class maps are c	lefined.	
	If neither the match	n-all or match-any keyword is specified, the default is match-all .	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		to specify the name of the class for which you want to create or modify class-map o enter class-map configuration mode.	
	The class-map command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.		
	After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:		
	• description : describes the class map (up to 200 characters). The show class-map privileged EXEC command displays the description and the name of the class-map.		
	• exit: exits from QoS class-map configuration mode.		
	• match : configures classification criteria. For more information, see the match (class-map configuration) command.		
	• no : removes a 1	natch statement from a class map.	
		es the current class map. If you rename a class map with a name that is already used, class-map with this name already exists appears.	

If you enter the **match-all** or **match-any** keyword, you can only use it to specify an extended named access control list (ACL) with the **match access-group** *acl-index-or-name* class-map configuration command.

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-all** and **match-any** keywords are equivalent.

Only one ACL can be configured in a class map. The ACL can have multiple access control entries (ACEs).

Examples

This example shows how to configure the class map called *class1* with one match criterion, which is an access list called *103*:

```
Switch(config)# access-list 103 permit ip any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
```

This example shows how to delete the class map *class1*:

Switch(config) # no class-map class1

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	match (class-map configuration)	Defines the match criteria to classify traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show class-map	Displays QoS class maps.

clear dot1x

Use the **clear dot1x** privileged EXEC command on the switch stack or on a standalone switch to clear IEEE 802.1x information for the switch or for the specified port.

clear dot1x {all | interface interface-id}

Syntax Description	all	Clear all IEEE 802.1x information for the switch.	
	interface interface-id	Clear IEEE 802.1x information for the specified interface.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Francisco	-	ified interface by using the clear dot1x interface <i>interface-id</i> command.	
Examples	This example shows how to clear all IEEE 8021.x information:		
	Switch# clear dot1x all		
	This example shows how to clear IEEE 8021.x information for the specified interface:		
	Switch# clear dot1x interface gigabithethernet1/0/1		
	You can verify that the in	nformation was deleted by entering the show dot1x privileged EXEC command.	
Related Commands	Command	Description	
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.	

clear eap

Use the **clear eap** privileged EXEC command on the switch stack or on a standalone switch to clear Extensible Authentication Protocol (EAP) session information for the switch or for the specified port.

clear eap sessions [credentials name [interface interface-id] | interface interface-id | method name | transport name] [credentials name | interface interface-id | transport name] ...

Syntax Description	credentials name	Clear EAP credential information for the specified profile.
	interface interface-id	Clear EAP information for the specified interface.
	method name	Clear EAP information for the specified method.
	transport name	Clear EAP transport information for the specified lower level.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	10 0(40)EV0	
	12.2(40)EX2	This command was introduced.
Usage Guidelines		rs by using the clear eap command, or you can clear only the specific

clear errdisable interface

Use the **clear errdisable interface** privileged EXEC command on the switch stack or on a standalone switch to re-enable a VLAN that was error disabled.

clear errdisable interface interface-id vlan [vlan-list]

Syntax Description	vlan-list	(Optional) Specify a list of VLANs to be re-enabled. If a vlan-list is not specified, then all VLANs are re-enabled.
Command Default	No default is defined	
Command Modes	Privileged EXEC	
Command History	Release N	Aodification
	12.2(40)EX2 7	This command was introduced.
Examples	-	re-enable all VLANs that were error-disabled on Gigabit Ethernet port 4/0/2.
	Switch# clear errdisable i	interface gigabitethernet4/0/2 vlan
Related Commands	Command	Description
	errdisable detect cause	Enables error-disabled detection for a specific cause or all causes.
	errdisable recovery	Configures the recovery mechanism variables.
	show errdisable detect	Displays error-disabled detection status.
	show errdisable recovery	Display error-disabled recovery timer information.
	show interfaces status err-disabled	Displays interface status of a list of interfaces in error-disabled state.

clear ip arp inspection log

Use the **clear ip arp inspection log** privileged EXEC command on the switch stack or on a standalone switch to clear the dynamic Address Resolution Protocol (ARP) inspection log buffer.

clear ip arp inspection log

Syntax Description This command has no arguments or keywords.

Defaults No default is defined.

Command Modes Privileged EXEC

 Release
 Modification

 12.2(40)EX2
 This command was introduced.

Examples This example shows how to clear the contents of the log buffer:

Switch# clear ip arp inspection log

You can verify that the log was cleared by entering the show ip arp inspection log privileged command.

elated Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	ip arp inspection vlan logging	Controls the type of packets that are logged per VLAN.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

clear ip arp inspection statistics

Use the **clear ip arp inspection statistics** privileged EXEC command on the switch stack or on a standalone switch to clear the dynamic Address Resolution Protocol (ARP) inspection statistics.

clear ip arp inspection statistics [vlan vlan-range]

Syntax Description	vlan vlan-range	(Optional) Clear statistics for the specified VLAN or VLANs.
bymax Description		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
Defaults	No default is defined	ð.
Command Modes	Privileged EXEC	
Command History	Release 12.2(40)EX2	Modification This command was introduced.
Examples	Switch# clear ip a	how to clear the statistics for VLAN 1: arp inspection statistics vlan 1 the statistics were deleted by entering the show ip arp inspection statistics vlan 1 mmand.
Related Commands	Command show inventory sta	Description tistics Displays statistics for forwarded, dropped, MAC validation failure, and
	show inventory sta	tistics Displays statistics for forwarded, dropped, MAC validation failure, and IP validation failure packets for all VLANs or the specified VLAN.

clear ip dhcp snooping

Use the **clear ip dhcp snooping** privileged EXEC command on the switch stack or on a standalone switch to clear the DHCP binding database agent statistics or the DHCP snooping statistics counters.

clear ip dhcp snooping {database statistics | statistics}

Syntax Description	database Clear the DHCP snooping binding database agent statistics.		
	statistics		
	statistics Clear the DHCP snooping statistics counter.		
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release Modification		
	12.2(40)EX2This command was introduced.		
Usage Guidelines	When you enter the clear ip dhcp snooping database statistics command, the switch does not up the entries in the binding database and in the binding file before clearing the statistics.	odate	
Examples	This example shows how to clear the DHCP snooping binding database agent statistics:		
	Switch# clear ip dhcp snooping database statistics		
	You can verify that the statistics were cleared by entering the show ip dhcp snooping database privileged EXEC command.		
	This example shows how to clear the DHCP snooping statistics counters:		
	Switch# clear ip dhcp snooping statistics		
	You can verify that the statistics were cleared by entering the show ip dhcp snooping statistics us EXEC command.	ser	

Related Commands

ted Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	ip dhcp snooping database	Configures the DHCP snooping binding database agent or the binding file.
	show ip dhcp snooping binding	Displays the status of DHCP snooping database agent.
	show ip dhcp snooping database	Displays the DHCP snooping binding database agent statistics.
	show ip dhcp snooping statistics	Displays the DHCP snooping statistics.

clear ip dhcp snooping

Use the **clear ip dhcp snooping** privileged EXEC command on the switch stack or on a standalone switch to clear the DHCP snooping binding database, the DHCP snooping binding database agent statistics, or the DHCP snooping statistics counters.

clear ip dhcp snooping {binding {* | *ip-address* | interface *interface-id* | vlan *vlan-id*} | database statistics | statistics }

Syntax Description	binding	Clear the DHCP snooping binding database.
Syntax Description		Clear all automatic bindings.
	ip-address	Clear the binding entry IP address.
	interface interface-id	Clear the binding input interface.
	vlan vlan-id	
	database statistics	Clear the binding entry VLAN.
		Clear the DHCP snooping binding database agent statistics.
	statistics	Clear the DHCP snooping statistics counter.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release M	odification
	12.2(46)SE Th	nis command was introduced.
Usage Guidelines	•	ar ip dhcp snooping database statistics command, the switch does not update g database and in the binding file before clearing the statistics.
Examples	This example shows how	v to clear the DHCP snooping binding database agent statistics:
-	Switch# clear ip dhcp	snooping database statistics
	You can verify that the s privileged EXEC comma	statistics were cleared by entering the show ip dhcp snooping database and.
	This example shows how	v to clear the DHCP snooping statistics counters:

clear ipv6 dhcp conflict

Use the **clear ipv6 dhcp conflict** privileged EXEC command on the switch stack or on a standalone switch to clear an address conflict from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server database.

clear ipv6 dhcp conflict {* | IPv6-address}

```
<u>Note</u>
```

This command is available only if the switch stack or standalone switch is running the advanced IP services feature set and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

	*	
Syntax Description	-	Clear all address conflicts.
	IPv6-address	Clear the host IPv6 address that contains the conflicting address.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(46)SE	This command was introduced.
	discovery to detect cli is detected, the address removes the address f	he DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor ents and reports to the server through a DECLINE message. If an address conflict s is removed from the pool, and the address is not assigned until the administrator rom the conflict list.
Examples	This example shows how to clear all address conflicts from the DHCPv6 server database: Switch# clear ipv6 dhcp conflict *	
Related Commands	Command	Description
	show ipv6 dhcp conflict	Displays address conflicts found by a DHCPv6 server, or reported through a DECLINE message from a client.

clear l2protocol-tunnel counters

Use the **clear l2protocol-tunnel counters** privileged EXEC command on the switch stack or on a standalone switch to clear the protocol counters in protocol tunnel ports.

clear l2protocol-tunnel counters [interface-id]

interface-id	(Optional) Specify the interface (physical interface or port channel) for which protocol counters are to be cleared.
No default is defined.	
Privileged EXEC	
Release	Modification
12.2(40)EX2	This command was introduced.
Use this command to c	lear protocol tunnel counters on the switch or on the specified interface.
This example shows ho	ow to clear Layer 2 protocol tunnel counters on an interface:
Switch# clear l2prot	ocol-tunnel counters gigabitethernet1/0/3
Command	Description
show l2protocol-tunn	el Displays information about ports configured for Layer 2 protocol
	No default is defined. Privileged EXEC Release 12.2(40)EX2 Use this command to c This example shows ho Switch# clear 12prot

clear lacp

Use the **clear lacp** privileged EXEC command on the switch stack or on a standalone switch to clear Link Aggregation Control Protocol (LACP) channel-group counters.

clear lacp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 48.
	counters	Clear traffic counters.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Examples	-	el group by using the clear lacp <i>channel-group-number</i> counters command. w to clear all channel-group information:
Examples	Switch# clear lacp co	
	-	w to clear LACP traffic counters for group 4:
	Switch# clear lacp 4	
	_	information was deleted by entering the show lacp counters or the show lacp 4
Related Commands	Command	Description
	show lacp	Displays LACP channel-group information.

clear logging

Use the **clear logging** privileged EXEC command on the switch stack or on a standalone switch to clear all of the on-board failure logging (OBFL) data except for the uptime and CLI-command information stored in the flash memory.

clear logging onboard

Syntax Description	This command has no	arguments or keywords.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines Examples		-	ase the data stored in the flash memory. a except for the uptime and CLI-command
	Switch# clear loggi	-	
	Clear logging onboan You can verify that the command.		he show logging onboard privileged EXEC
Related Commands	Command		Description
	hw-module module [a	switch-number] logging onboard	Enables OBFL.
	show logging onboar	d	Displays OBFL information.

clear mac address-table

Use the **clear mac address-table** privileged EXEC command on the switch stack or on a standalone switch to delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members, or all dynamic addresses on a particular VLAN. This command also clears the MAC address notification global counters.

clear mac address-table {dynamic [address mac-addr | interface interface-id | vlan vlan-id] |
 notification}

Syntax Description			
	dynamic	Delete all dyn	amic MAC addresses.
	dynamic address mac-addr	(Optional) De	lete the specified dynamic MAC address.
	dynamic interface <i>interface-id</i>	(Optional) De or port channe	lete all dynamic MAC addresses on the specified physical port el.
	dynamic vlan vlan-id	(Optional) De range is 1 to 4	lete all dynamic MAC addresses for the specified VLAN. The 094.
	notification	Clear the noti	fications in the history table and reset the counters.
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(40)EX2	This command	d was introduced.
Examples	I.	-	ecific MAC address from the dynamic address table:
	You can verify that the in EXEC command.	nformation was	deleted by entering the show mac address-table privileged
Related Commands		nformation was

clear mac address-table move update

Use the **clear mac address-table move update** privileged EXEC command on the switch stack or on a standalone switch to clear the MAC address table move-update counters.

clear mac address-table move update

Syntax Description This command has no arguments or keywords.

Defaults No default is defined.

Command ModesPrivileged EXEC

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Examples This example shows how to clear the MAC address table move-update counters.

Switch# clear mac address-table move update

You can verify that the information was cleared by entering the **show mac address-table move update** privileged EXEC command.

Related Commands	Command	Description
	<pre>mac address-table move update {receive transmit}</pre>	Configures MAC address-table move update on the switch.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

clear pagp

Use the **clear pagp** privileged EXEC command on the switch stack or on a standalone switch to clear Port Aggregation Protocol (PAgP) channel-group information.

clear pagp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 48.
	counters	Clear traffic counters.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
llaaga Cuidalinaa	Vou con close all counter	a hundred the algor page countage command an you can algor only the countage
Usage Guidelines		s by using the clear pagp counters command, or you can clear only the counters group by using the clear pagp <i>channel-group-number</i> counters command.
Usage Guidelines Examples	for the specified channel	
	for the specified channel	group by using the clear pagp <i>channel-group-number</i> counters command. w to clear all channel-group information:

	for the specified channel This example shows how Switch# clear pagp con This example shows how Switch# clear pagp 10	group by using the clear pagp <i>channel-group-number</i> counters command. w to clear all channel-group information: unters w to clear PAgP traffic counters for group 10:
	for the specified channel This example shows how Switch# clear pagp con This example shows how Switch# clear pagp 10	group by using the clear pagp <i>channel-group-number</i> counters command. w to clear all channel-group information: unters w to clear PAgP traffic counters for group 10: counters

clear port-security

Use the **clear port-security** privileged EXEC command on the switch stack or on a standalone switch to delete from the MAC address table all secure addresses or all secure addresses of a specific type (configured, dynamic, or sticky) on the switch or on an interface.

clear port-security {all | configured | dynamic | sticky} [[address mac-addr | interface interface-id] [vlan {vlan-id | {access | voice}}]]

Syntax Description	all	Delete all secure MAC addresses.		
-	configured	Delete configured secure MAC addresses.		
	dynamic	Delete secure MAC addresses auto-learned by hardware.		
	sticky	Delete secure MAC addresses, either auto-learned or configured.		
	address mac-addr	(Optional) Delete the specified dynamic secure MAC address.		
	interface interface-id	(Optional) Delete all the dynamic secure MAC addresses on the specified physical port or VLAN.		
	vlan	(Optional) Delete the specified secure MAC address from the specified VLAN. Enter one of these options after you enter the vlan keyword:		
		 <i>vlan-id</i>—On a trunk port, specify the VLAN ID of the VLAN on which this address should be cleared. access—On an access port, clear the specified secure MAC address on the access VLAN. voice—On an access port, clear the specified secure MAC address on the voice VLAN. 		
		Note The voice keyword is supported only if voice VLAN is configured on a port and if that port is not the access VLAN.		
Defaults	No default is defined.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Examples	This example shows how to clear all secure addresses from the MAC address table:			
	Switch# clear port-security all			
	This example shows how	w to remove a specific configured secure address from the MAC address table:		
	Switch# clear port-security configured address 0008.0070.0007			

This example shows how to remove all the dynamic secure addresses learned on a specific interface:

Switch # clear port-security dynamic interface gigabitethernet1/0/1

This example shows how to remove all the dynamic secure addresses from the address table:

Switch# clear port-security dynamic

You can verify that the information was deleted by entering the **show port-security** privileged EXEC command.

Related Commands

Command	Description	
switchport port-security	Enables port security on an interface.	
switchport port-security mac-address mac-address	Configures secure MAC addresses.	
switchport port-security maximum <i>value</i>	Configures a maximum number of secure MAC addresses on a secure interface.	
show port-security	Displays the port security settings defined for an interface or for the switch.	

clear spanning-tree counters

Use the **clear spanning-tree counters** privileged EXEC command on the switch stack or on a standalone switch to clear the spanning-tree counters.

clear spanning-tree counters [interface interface-id]

Syntax Description	interface interface-id	(Optional) Clear all spanning-tree counters on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines		
	If the <i>interface-id</i> is not	This command was introduced. specified, spanning-tree counters are cleared for all interfaces.

clear spanning-tree detected-protocols

Use the **clear spanning-tree detected-protocols** privileged EXEC command on the switch stack or on a standalone switch to restart the protocol migration process (force the renegotiation with neighboring switches) on all interfaces or on the specified interface.

clear spanning-tree detected-protocols [interface interface-id]

Syntax Description	interface interface-id	(Optional) Restart the protocol migration process on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
	interoperate with legacy legacy IEEE 802.1D con it sends only IEEE 802.1 that a port is at the bound associated with a different However, the switch does receives IEEE 802.1D BI	(MSTP) supports a built-in protocol migration mechanism that enables it to IEEE 802.1D switches. If a rapid-PVST+ switch or an MSTP switch receives a figuration bridge protocol data unit (BPDU) with the protocol version set to 0, D BPDUs on that port. A multiple spanning-tree (MST) switch can also detect dary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) nt region, or a rapid spanning-tree (RST) BPDU (Version 2). s not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer PDUs because it cannot learn whether the legacy switch has been removed from y switch is the designated switch. Use the clear spanning-tree mand in this situation.
Examples	-	to restart the protocol migration process on a port: g-tree detected-protocols interface gigabitethernet2/0/1
Related Commands	Command	Description
	show spanning-tree	Displays spanning-tree state information.
	spanning-tree link-type	e Overrides the default link-type setting and enables rapid spanning-tree changes to the forwarding state.

clear vmps statistics

Use the **clear vmps statistics** privileged EXEC command on the switch stack or on a standalone switch to clear the statistics maintained by the VLAN Query Protocol (VQP) client.

clear vmps statistics

Syntax Description This command has no arguments or keywords.

Defaults No default is defined.

Command Modes Privileged EXEC

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Examples This example shows how to clear VLAN Membership Policy Server (VMPS) statistics:

Switch# clear vmps statistics

You can verify that information was deleted by entering the **show vmps statistics** privileged EXEC command.

Related Commands	Command Description	
	show vmps	Displays the VQP version, reconfirmation interval, retry count, VMPS IP
		addresses, and the current and primary servers.

clear vtp counters

Use the **clear vtp counters** privileged EXEC command on the switch stack or on a standalone switch to clear the VLAN Trunking Protocol (VTP) and pruning counters.

clear vtp counters

Syntax Description	This command has no	arguments or keywords.
--------------------	---------------------	------------------------

Defaults No default is defined.

Command ModesPrivileged EXEC

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Examples This example shows how to clear the VTP counters:

Switch# clear vtp counters

You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

Related Commands	Command	Description
	show vtp	Displays general information about the VTP management domain, status, and counters.

copy logging onboard

Use the **copy logging onboard** privileged EXEC command on the switch stack or on a standalone switch to copy on-board failure logging (OBFL) data to the local network or a specific file system.

copy logging onboard module stack-member destination

Syntax Description	module stack-member	Specify the stack member number. If the switch is a standalone switch, the switch number is 1. If the switch is in a stack, the range is 1 to 9, depending on the switch member numbers in the stack.
		This keyword is supported only on the Catalyst Switch Module 3110.
	destination	Specify the location on the local network or file system to which the system messages are copied.
		For <i>destination</i> , specify <i>t</i> he destination on the local or network file system and the filename. These options are supported:
		• The syntax for the local flash file system: flash[number]:/filename
		Use the <i>number</i> parameter to specify the stack member number of the stack master. The range for <i>number</i> is 1 to 9.
		 The syntax for the FTP: ftp://username:password@host/filename
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/filename
		• The syntax for the NVRAM: nvram:/filename
		• The syntax for the null file system: null:/ <i>filename</i>
		 The syntax for the Remote Copy Protocol (RCP): rcp://username@host/filename
		• The syntax for the switch file system: system:filename
		• The syntax for the temporary file system: tmpsys:/filename
		• The syntax for the TFTP: tftp:[//location]/directory]/filename

Defaults

This command has no default setting.

Command Modes Privileged EXEC

Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	For information abou	nt OBFL, see the hw-module command	d.
Examples	This example shows how to copy the OBFL data messages to the <i>obfl_file</i> file on the flash file system for stack member 3:		
	Switch# copy loggi : OBFL copy successf Switch#	ng onboard module 3 flash:obfl_fil ul	Le
Related Commands	Command		Description
	hw-module module	[switch-number] logging onboard	Enables OBFL.
	show logging onboa	urd	Displays OBFL information.

define interface-range

Use the **define interface-range** global configuration command on the switch stack or on a standalone switch to create an interface-range macro. Use the **no** form of this command to delete the defined macro.

define interface-range macro-name interface-range

no define interface-range *macro-name interface-range*

Syntax Description	macro-name	Name of the interface-range macro; up to 32 characters.
-,	interface-range	Interface range; for valid values for interface ranges, see "Usage Guidelines."
Defaults	This command ha	s no default setting.
Command Modes	Global configurati	ion
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	The macro name is a 32-character maximum character string.	
	A macro can contain up to five ranges.	
	All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs, but you can combine multiple interface types in a macro.	
	When entering the <i>interface-range</i> , use this format:	
	• type {first-interface} - {last-interface}	
	• You must add a space between the first interface number and the hyphen when entering an <i>interface-range</i> . For example, gigabitethernet 1/0/1 - 2 is a valid range; gigabitethernet 1/0/1-2 is not a valid range	
	Valid values for <i>type</i> and <i>interface</i> :	
	• vlan <i>vlan-id</i> - <i>vlan-ID</i> , where the VLAN ID is 1 to 4094	
	VLAN interfaces must have been configured with the interface vlan command (the show running-config privileged EXEC command displays the configured VLAN interfaces). VLAN interfaces not displayed by the show running-config command cannot be used in <i>interface-ranges</i> .	
	• port-channel	port-channel-number, where port-channel-number is from 1 to 48
	• gigabitethern	net stack member/module/{ <i>first port</i> } - { <i>last port</i> }
	• tengigabiteth	ernet stack member/module/{first port} - {last port}

For physical interfaces:

- stack member is the number used to identify the switch within the stack. The number ranges from 1 to 9 and is assigned to the switch the first time the stack member initializes.
- module is always 0.
- the range is type stack member/0/number number (for example, gigabitethernet 1/0/1 2).

When you define a range, you must enter a space before the hyphen (-), for example:

gigabitethernet1/0/1 - 2

You can also enter multiple ranges. When you define multiple ranges, you must enter a space after the first entry before the comma (,). The space after the comma is optional, for example:

```
gigabitethernet1/0/3, gigabitethernet2/0/1 - 2
```

gigabitethernet1/0/3 -4, tengigabitethernet1/0/1 - 2

Examples

This example shows how to create a multiple-interface macro:

Switch(config)# define interface-range macrol gigabitethernet1/0/1 - 2,
gigabitethernet1/0/5 - 7, gigabitethernet3/0/2 - 4, tengigabitethernet1/0/1 - 2

Related Commands	Command	Description
	interface range	Executes a command on multiple ports at the same time.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_com mand_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

delete

Use the **delete** privileged EXEC command on the switch stack or on a standalone switch to delete a file or directory on the flash memory device.

delete [/force] [/recursive] filesystem:/file-url

Syntax Description	/force	(Optional) Suppress the prompt that confirms the deletion.	
	/recursive	(Optional) Delete the named directory and all subdirectories and the files contained in it.	
	filesystem:	Alias for a flash file system.	
		The syntax for the local flash file system on the stack member or the stack master: flash:	
		From the stack master, the syntax for the local flash file system on a stack member: flash <i>member number</i> :	
	lfile-url	The path (directory) and filename to delete.	
Command Modes	Privileged EXEC	2	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
	of every file. The prompting b default, the swite	ecursive keyword without the /force keyword, you are prompted to confirm the deletion behavior depends on the setting of the file prompt global configuration command. By ch prompts for confirmation on destructive file operations. For more information about ee the <i>Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.</i>	
Examples	This example sh download of a ne	ows how to remove the directory that contains the old software image after a successful ew image:	
	Switch# delete /force /recursive flash:/old-image		
	•	hat the directory was removed by entering the dir filesystem: privileged EXEC	
	command.		
Related Commands	command.	Description	

deny (ARP access-list configuration)

Use the **deny** Address Resolution Protocol (ARP) access-list configuration command on the switch stack or on a standalone switch to deny an ARP packet based on matches against the DHCP bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access list.

- deny {[request] ip { any | host sender-ip | sender-ip sender-ip-mask } mac { any | host sender-mac | sender-mac sender-mac-mask } | response ip { any | host sender-ip | sender-ip sender-ip-mask } [{ any | host target-ip | target-ip target-ip-mask }] mac { any | host sender-mac | sender-mac sender-mac-mask } [{ any | host target-mac | target-mac target-mac mask }] } [log]
- no deny {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]

Syntax Description	request	(Optional) Define a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specify the sender IP address.
	any	Deny any IP or MAC address.
	host sender-ip	Deny the specified sender IP address.
	sender-ip sender-ip-mask	Deny the specified range of sender IP addresses.
	mac	Deny the sender MAC address.
	host sender-mac	Deny a specific sender MAC address.
	sender-mac	Deny the specified range of sender MAC addresses.
	sender-mac-mask	
	response ip	Define the IP address values for the ARP responses.
	host target-ip	Deny the specified target IP address.
	target-ip target-ip-mask	Deny the specified range of target IP addresses.
	mac	Deny the MAC address values for the ARP responses.
	host target-mac	Deny the specified target MAC address.
	target-mac target-mac-mask	Deny the specified range of target MAC addresses.
	log	(Optional) Log a packet when it matches the ACE.

Defaults

There are no default settings. However, at the end of the ARP access list, there is an implicit **deny ip any mac any** command.

Command Modes ARP access-list configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Related Commands	Command Description
	You can verify your settings by entering the show arp access-list privileged EXEC command.
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end
Examples	This example shows how to define an ARP access list and to deny both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:
Usage Guidelines	You can add deny clauses to drop ARP packets based on matching criteria.

	•
arp access-list	Defines an ARP access control list (ACL).
ip arp inspection filter vlan	Permits ARP requests and responses from a host configured with a static IP address.
permit (ARP access-list configuration)	Permits an ARP packet based on matches against the DHCP bindings.
show arp access-list	Displays detailed information about ARP access lists.
	ip arp inspection filter vlan permit (ARP access-list configuration)

deny (IPv6 access-list configuration)

Use the **deny** command in IPv6 access list configuration mode on the switch stack or on a standalone switch to set deny conditions for an IPv6 access list. Use the **no** form of this command to remove the deny conditions.

- deny {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence
 value] [time-range name]
- **no deny** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**routing**] [**sequence** *value*] [**time-range** *name*]

Internet Control Message Protocol

deny icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [routing] [sequence value] [time-range name]

Transmission Control Protocol

deny tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [routing] [sequence value] [syn] [time-range
 name] [urg]

User Datagram Protocol

deny udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [routing] [sequence value] [time-range name]

This command is supported only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp , esp , icmp , ipv6 , pcp , sctp , tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks about which to set deny conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	any	An abbreviation for the IPv6 prefix ::/0.

host source-ipv6-address	The source IPv6 host address for which to set deny conditions.
	This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
	If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
	If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
	The range operator requires two port numbers. All other operators require one port number.
	The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set deny conditions.
	This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
host	The destination IPv6 host address for which to set deny conditions.
destination-ipv6-address	This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
dscp value	(Optional) Match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.
fragments	(Optional) Match non-initial fragmented packets where the fragment extension header contains a non-zero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages sent to the console is controlled by the logging console command.)
	The message includes the access list name and sequence number, whether the packet was denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets denied in the prior 5-minute interval.
	Note Logging is not supported for port ACLs.
log-input	(Optional) Provide the same function as the log keyword, but the logging message also includes the receiving interface.
routing	(Optional) Match packets with the routing extension header.

sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.	
time-range name	(Optional) Specify the time range that applies to the deny statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.	
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by an ICMP message type. The type is a number from 0 to 255.	
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.	
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or an ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.	
ack	(Optional) Only for the TCP protocol: Acknowledgment (ACK) bit set.	
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.	
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.	
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.	
psh	(Optional) Only for the TCP protocol: Push function bit set.	
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.	
rst	(Optional) Only for the TCP protocol: Reset bit set.	
syn	(Optional) Only for the TCP protocol: Synchronize bit set.	
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.	

Although visible in the command-line help strings, the **flow-label**, **routing**, and **undetermined-transport** keywords are not supported.

Defaults No IPv6 access list is defined.

Command Modes IPv6 access list configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines

The **deny** (IPv6 access-list configuration mode) command is similar to the **deny** (IPv4 access-list configuration mode) command, but it is IPv6-specific.

Use the **deny** (IPv6) command after the **ipv6 access-list** command to enter IPv6 access list configuration mode and to define the conditions under which a packet passes the access list.

Specifying IPv6 for the *protocol* argument matches against the IPv6 header of the packet.

By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.

You can add **permit**, **deny**, or **remark** statements to an existing access list without re-entering the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number between two existing entry numbers to show where it belongs.

Note

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. The two **permit** conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny **icmp any any nd-na** or **icmp any any nd-ns**, there must be an explicit **deny** entry in the ACL. For the three implicit statements to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Both the *source-ipv6-prefix/prefix-length* and *destination-ipv6-prefix/prefix-length* arguments are used for traffic filtering. (The source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination.)

The switch supports IPv6 address matching for a full range of prefix-lengths.

The **fragments** keyword is an option only if the protocol is **ipv6** and the *operator* [*port-number*] arguments are not specified.

This is a list of ICMP message names:

beyond-scope	destination-unreachable
echo-reply	echo-request
header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering

router-solicitationtime-exceededunreachable**Examples**This example configures the IPv6 access list named CISCO and applies the access list to outbound traffic
on a Layer 3 interface. The first deny entry in the list prevents all packets that have a destination TCP
port number greater than 5000 from leaving the interface. The second deny entry in the list prevents all
packets that have a source UDP port number less than 5000 from leaving the interface. The second deny
also logs all matches to the console. The first permit entry in the list permits all ICMP packets to leave
the interface. The second permit entry in the list permits all other traffic to leave the interface. The
second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access
list.Switch(config) # ipv6 access-list CISCO
Switch(config-ipv6-acl) # deny tcp any any gt 5000
Switch config-ipv6-acl) # deny tcp any any gt 5000
Switch config-ipv6-acl) # deny tcp in the second to the second second

```
Switch (config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch (config-ipv6-acl)# permit icmp any any
Switch (config-ipv6-acl)# permit any any
Switch (config-ipv6-acl)# exit
Switch (config)# interface gigabitethernet1/0/3
Switch (config-if)# no switchport
Switch (config-if)# ipv6 address 2001::/64 eui-64
Switch (config-if)# ipv6 traffic-filter CISCO out
```

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

deny (MAC access-list configuration)

Use the **deny** MAC access-list configuration command on the switch stack or on a standalone switch to prevent non-IP traffic from being forwarded if the conditions are matched. Use the **no** form of this command to remove a deny condition from the named MAC access list.

- {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
 dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv |
 diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console |
 mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src MAC-addr src-MAC-addr mask	Define a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
	host <i>dst-MAC-addr</i> <i>dst-MAC-addr</i> mask	Define a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		The type is 0 to 65535, specified in hexadecimal.
		The <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
	lut	(opuona) serve Laner Spe 220 Lane

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.
	<i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.
mop-dump	(Optional) Select EtherType DEC-MOP Dump.
msdos	(Optional) Select EtherType DEC-MSDOS.
mumps	(Optional) Select EtherType DEC-MUMPS.
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.
vines-ip	(Optional) Select EtherType VINES IP.
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary Ethertype in decimal, hexadecimal, or octal.

Note

Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-4.

Table 2-4 IPX Filtering Criteria

IPX Encapsulation Type		
Cisco IOS Name	Novel Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However; the default action for a MAC-named ACL is to deny.

Command Modes MAC-access list configuration

	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.

Permits non-IP traffic to be forwarded if conditions are matched.

Displays access control lists configured on a switch.

diagnostic monitor

Use the **diagnostic monitor** global configuration command to configure health-monitoring diagnostic testing. Use the **no** form of this command to disable testing and to return to the default settings.

- **diagnostic monitor interval switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**} *hh:mm:ss milliseconds day*
- **diagnostic monitor switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**}
- diagnostic monitor syslog
- **diagnostic monitor threshold switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**} **failure count** *count*
- no diagnostic monitor interval switch number test {name | test-id | test-id-range | all}
- no diagnostic monitor switch number test {name | test-id | test-id-range | all}
- no diagnostic monitor syslog
- **no diagnostic monitor threshold switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**} **failure count** *count*

Syntax Description	interval	Configure the interval between tests.
	switch number	Specify the switch number, which is the stack member number. If the switch is a standalone switch, the switch number is 1. If the switch is in a stack, the range is 1 to 9, depending on the switch member numbers in the stack.
		This keyword is supported only on the Catalyst Switch Module 3110.
	test	Specify the tests to be run.
	name	Specify the name of the test. For more information, see the "Usage Guidelines" section.
	test-id	Specify the ID number of the test. The range is from 1 to 7. For more information, see the "Usage Guidelines" section.
	test-id-range	Specify more than one test with the range of test ID numbers. For more information, see the "Usage Guidelines" section.
	all	Specify all of the diagnostic tests.
	hh:mm:ss	Configure the monitoring interval in hours, minutes, and seconds. For formatting information, see the "Usage Guidelines" section.
	milliseconds	Configure the monitoring interval in milliseconds (ms). The range is from 0 to 999 ms.
	day	Configure the monitoring interval in the number of days. The range is from 0 to 20 days. For formatting information, see the "Usage Guidelines" section.
	syslog	Enable the generation of a syslog message when a health-monitoring test fails.

	threshold	Configure the failure threshold.
	failure count	Set the failure threshold count. The range for <i>count</i> is from 0 to 99.
Defaults	Monitoring is di	sabled, and a failure threshold value is not set.
Command Modes	Global configura	ation
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	Follow these gu	idelines when configuring health-monitoring diagnostic testing:
	• <i>name</i> —Enter the test ID 1	er the show diagnostic content privileged EXEC command to display the test names in ist.
	• <i>test-id</i> —Ent	ter the show diagnostic content command to display the test numbers in the test ID list.
	ID list. Ente	<i>e</i> —Enter the show diagnostic content command to display the test numbers in the test retrease as integers separated by a comma and a hyphen (for example, 1,3-6 specifies 5, 4, 5, and 6).
	• <i>hh</i> —Enter tl	he hours from 0 to 24.
	• <i>mm</i> —Enter	the minutes from 0 to 60.
	• <i>ss</i> —Enter th	e seconds from 0 to 60.
	• millisecond.	s—Enter the test time in milliseconds from 0 to 999.
	• <i>day</i> —Enter	the number of days between test from 0 to 20.
	• Enter the di	agnostic monitor test 1 command to enable diagnostic monitoring.
	You must config monitoring.	gure the failure threshold and the interval between tests before enabling diagnostic
	•	he diagnostic monitor switch <i>number</i> test { <i>name</i> <i>test-id</i> <i>test-id-range</i> all } nust isolate network traffic by disabling all connected ports, and do not send test packets
Examples	This example sh	ows how to configure a health-monitoring test:
	Switch(config)	<pre># diagnostic monitor threshold switch 2 test 1 failure count 20 # diagnostic monitor interval switch 2 test 1 12:30:00 750 5</pre>
Related Commands	Command	Description
	show diagnosti	c Displays online diagnostic test results.

diagnostic schedule

Use the **diagnostic schedule** global configuration command to configure the diagnostic test schedule. Use the **no** form of this command to remove the schedule.

diagnostic schedule switch *number* **test** {*name* | *test-id* | *test-id-range* | **all** | **basic** | **non-disruptive**} {**daily** *hh:mm* | **on** *mm dd yyyy hh:mm* | **weekly** *day-of-week hh:mm*}

no diagnostic schedule switch *number* **test** {*name* | *test-id* | *test-id-range* | **all** | **basic** | **non-disruptive**} {daily *hh:mm* | **on** *mm dd yyyy hh:mm* | **weekly** *day-of-week hh:mm*}

Syntax Description	switch number	Specify the switch number, which is the stack member number. If the switch is a standalone switch, the switch number is 1. If the switch is in a stack, the range is 1 to 9, depending on the switch member numbers in the stack.
		This keyword is supported only on the Catalyst Switch Module 3110.
	test	Specify the tests to be scheduled.
	name	Specify the name of the test. For more information, see the "Usage Guidelines" section.
	test-id	Specify the ID number of the test. The range is from 1 to 7. For more information, see the "Usage Guidelines" section.
	test-id-range	Specify more than one test with the range of test ID numbers. For more information, see the "Usage Guidelines" section.
	all	Specify all of the diagnostic tests.
	basic	Specify the basic on-demand diagnostic tests.
	non-disruptive	Specify the nondisruptive health-monitoring tests.
	daily hh:mm	Specify the daily scheduling of the diagnostic tests. For formatting information, see the "Usage Guidelines" section.
	on mm dd yyyy hh:mm	Specify the scheduling of the diagnostic tests on a specific day and time. For formatting information, see the "Usage Guidelines" section.
	weekly day-of-week hh:mm	Specify the weekly scheduling of the diagnostic tests. For formatting information, see the "Usage Guidelines" section.
Defaults	This command has no	o default settings.
Command Modes	Global configuration	
Command History	Release Mo	odification
	12.2(40)EX2 Th	is command was introduced.

Use these guidelines when scheduling testing:

name—Enter the show diagnostic content privileged EXEC command to display the test names in the test ID list. *test-id*—Enter the **show diagnostic content** command to display the test numbers in the test ID list. *test-id-range*—Enter the **show diagnostic content** command to display the test numbers in the test ID list. Enter the range as integers separated by a comma and a hyphen (for example, 1,3-6 specifies test IDs 1, 3, 4, 5, and 6). • *hh:mm*—Enter the time as a 2-digit number (for a 24-hour clock) for hours:minutes; the colon (:) is required, such as 12:30. For *mm dd* yyyy: - mm—Spell out the month, such as January, February, and so on, with upper case or lower case characters. - *dd*—Enter the day as a 2-digit number, such as 03 or 16. - yyyy—Enter the year as a 4-digit number, such as 2006. day-of-week—Spell out the day of the week, such as Monday, Tuesday, and so on, with upper case or lower case characters. Note If you are running a diagnostic test that has the reload attribute on a switch in a stack, you could potentially partition the stack depending on your cabling configuration. To avoid partitioning your stack, enter the show switch detail privileged EXEC command to verify the stack configuration. Examples This example shows how to schedule diagnostic testing for a specific day and time on stack member 3 when this command is entered on a stack master: Switch(config)# diagnostic schedule switch 3 test 1,2,4-6 on november 3 2006 23:10 This example shows how to schedule diagnostic testing to occur weekly at a specific time on a standalone switch: Switch(config)# diagnostic schedule test TestPortAsicMem weekly friday 09:23 **Related Commands** Command Description show diagnostic Displays online diagnostic test results.

Usage Guidelines

diagnostic start

Use the diagnostic start privileged EXEC command to run an online diagnostic test.

diagnostic start switch *number* **test** {*name* | *test-id* | *test-id-range* | **all** | **basic** | **non-disruptive**}

Syntax Description	switch number	Specify the switch number, which is the stack member number. If the switch is a standalone switch, the switch number is 1. If the switch is stack, the range is 1 to 9, depending on the switch member numbers in stack.	
		This keyword is supported only on the Catalyst Switch Module 3110.	
	test	Specify the tests to run.	
	name	Specify the name of a test. For more information, see the "Usage Guidelines" section.	
	test-id	Specify the ID number of a test. The range is from 1 to 7. For more information, see the "Usage Guidelines" section.	
	test-id-range	Specify more than one test with the range of test ID numbers. For mo information, see the "Usage Guidelines" section.	
	all	Specify all the diagnostic tests.	
	basic	Specify the basic on-demand diagnostic tests.	
	1		
	non-disruptive This command ha Privileged EXEC	Specify the nondisruptive health-monitoring tests.	
Command Modes	This command ha	as no default setting.	
Defaults Command Modes Command History	This command ha	as no default setting.

Modification This command was introduced. orts these tests: [On-Demand Test Attributes] bicStackPortLoopback bicLoopback [B*D*R**] bicCam [B*D*R**] bicRingLoopback [B*D*R**] bicRingLoopback [B*D*R**] bicMem	

When specifying a test name, use the **show diagnostic content** privileged EXEC command to display the test ID list. To specify test 3 by using the test name, enter the **diagnostic start switch** *number* **test TestPortAsicCam** privileged EXEC command.

If specifying more than one test to run, use the *test-id-range* parameter, and enter integers separated by a comma and a hyphen. For example, to specify tests 2, 3, and 4, enter the **diagnostic start switch** *number* **test 2-4** command. To specify tests 1, 3, 4, 5, and 6, enter the **diagnostic start switch** *number* **test 1,3-6** command.

After starting the tests by using the **diagnostic start** command, you cannot stop the testing process.

Examples

This example shows how to start diagnostic test 1 on stack member 2 when this command is entered on a stack master:

```
Switch# diagnostic start switch 2 test 1
Switch#
06:27:50: %DIAG-6-TEST_RUNNING: Switch 2: Running TestPortAsicStackPortLoopback{ID=1} ...
(switch-1)
06:27:51: %DIAG-6-TEST_OK: Switch 2: TestPortAsicStackPortLoopback{ID=1} has completed
successfully (switch-2)
```

This example shows how to start diagnostic test 2 on a stack member in a switch stack. Running this test disrupts the normal system operation, causes the switch to lose stack connectivity, and then causes the switch to reload.

```
Switch# diagnostic start switch 1 test 2
Switch 1: Running test(s) 2 will cause the switch under test to reload after completion of
the test list.
Switch 1: Running test(s) 2 may disrupt normal system operation
Do you want to continue? [no]: y
Switch#
16:43:29: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state DOWN
16:43:30: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 9 has changed to state DOWN
16:43:30: %STACKMGR-4-SWITCH_REMOVED: Switch 1 has been REMOVED from the stack
Switch#
16:44:35: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 2 has changed to state UP
16:44:37: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state UP
16:44:45: %STACKMGR-4-SWITCH_ADDED: Switch 1 has been ADDED to the stack
16:45:00: %STACKMGR-5-SWITCH_READY: Switch 1 is READY
16:45:00: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 1 has changed to state UP
16:45:00: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 1 has changed to state UP
00:00:20: %STACKMGR-4-SWITCH_ADDED: Switch 1 has been ADDED to the stack (Switch-1)
00:00:20: %STACKMGR-4-SWITCH_ADDED: Switch 2 has been ADDED to the stack (Switch-1)
00:00:25: %SPANTREE-5-EXTENDED_SYSID: Extended SysId enabled for type vlan (Switch-1)

00:00:29: %STACKMGR-5-MASTER_READY: Master Switch 2 is READY (Switch-1)
00:00:30: %STACKMGR-5-SWITCH_READY: Switch 1 is READY (Switch-1)
00:00:30: %DIAG-6-TEST_RUNNING: Switch 1: Running TestPortAsicLoopback{ID=2} ...
(Switch-1)
00:00:30: %DIAG-6-TEST_OK: Switch 1: TestPortAsicLoopback{ID=2} has completed successfully
(Switch-1)
```

This message appears if the configured test can cause the switch to lose stack connectivity:

Switch 3: Running test(s) 2 will cause the switch under test to reload after completion of the test list. Switch 3: Running test(s) 2 may disrupt normal system operation Do you want to continue? [no]:

This message appears if the configured test can cause a stack partition:

Switch 6: Running test(s) 2 will cause the switch under test to reload after completion of the test list. Switch 6: Running test(s) 2 will partition stack Switch 6: Running test(s) 2 may disrupt normal system operation Do you want to continue? [no]:

Related Commands	Command	Description
	show diagnostic	Displays online diagnostic test results.

dot1x

Use the **dot1x** global configuration command on the switch stack or on a standalone switch to globally enable IEEE 802.1x authentication. Use the **no** form of this command to return to the default setting.

dot1x {critical {eapol | recovery delay milliseconds} | {guest-vlan supplicant} |
 system-auth-control}

no dot1x {critical {eapol | recovery delay} | {guest-vlan supplicant} | system-auth-control}

Though visible in the command-line help strings, the credentials name keywords are not supported.

Syntax Description	critical {eapol recovery delay milliseconds}	Configure the inaccessible authentication bypass parameters. For more information, see the dot1x critical (global configuration) command.
	guest-vlan supplicant	Enable optional guest VLAN behavior globally on the switch.
	system-auth-control	Enable IEEE 802.1x authentication globally on the switch.
Defaults	IEEE 802.1x authentica	ation is disabled, and the optional guess VLAN behavior is disabled.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	method list before glob	ntication, authorization, and accounting (AAA) and specify the authentication ally enabling IEEE 802.1x authentication. A method list describes the sequence nods to be used to authenticate a user.
	- ·	ng IEEE 802.1x authentication on a switch, remove the EtherChannel interfaces on which IEEE 802.1x authentication and EtherChannel are
		e running the Cisco Access Control Server (ACS) application for IEEE 802.1x P-Transparent LAN Services (TLS) and with EAP-MD5, make sure that the Version 3.2.1 or later.
	You can use the guest-	vlan supplicant keywords to enable the optional IEEE 802.1x guest VLAN

Examples This example shows how to globally enable IEEE 802.1x authentication on a switch: Switch(config)# dot1x system-auth-control This example shows how to globally enable the optional guess VLAN behavior on the switch: Switch(config)# dot1x guest-vlan supplicant

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
	dot1x guest-vlan	Enables and specifies an active VLAN as an IEEE 802.1x guest VLAN.
	dot1x port-control	Enables manual control of the authorization state of the port.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x auth-fail max-attempts

Use the **dot1x auth-fail max-attempts** interface configuration command on the switch stack or on a standalone switch to configure the maximum allowable authentication attempts before a port is moved to the restricted VLAN. To return to the default setting, use the **no** form of this command.

dot1x auth-fail max-attempts max-attempts

no dot1x auth-fail max-attempts

Syntax Description	max-attempts	Specify a maximum number of authentication attempts allowed before a port is moved to the restricted VLAN. The range is 1 to 3, the default value is 3.	
Defaults	The default value	is 3 attempts.	
Command Modes	Interface configur	ration	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		e the maximum number of authentication attempts allowed by the VLAN, the change the re-authentication timer expires.	
Examples	-	ws how to set 2 as the maximum number of authentication attempts allowed before the he restricted VLAN on port 3:	
	<pre>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet1/0/3 Switch(config-if)# dot1x auth-fail max-attempts 2 Switch(config-if)# end Switch(config)# end Switch#</pre>		
	You can verify yo command.	our settings by entering the show dot1x [interface interface-id] privileged EXEC	

Related Commands	Command	Description
	dot1x auth-fail vlan [vlan id]	Enables the optional restricted VLAN feature.
	dot1x max-reauth-req [count]	Sets the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x auth-fail vlan

Use the **dot1x auth-fail vlan** interface configuration command on the switch stack or on a standalone switch to enable the restricted VLAN on a port. To return to the default setting, use the **no** form of this command.

dot1x auth-fail vlan vlan-id

no dot1x auth-fail vlan

Syntax Description	vlan-id	Specify a VLAN in the range of 1 to 4094.		
Defaults	No restricted VLAN is configured.			
Command Modes	Interface configuration			
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines	-	e a restricted VLAN on ports configured as follows: default) mode		
	-			
	 auto mode for authorization You should enable re-authentication. The ports in restricted VLANs do not receive re-authentication requests if it is disabled. To start the re-authentication process, the restricted VLAN must receive a link-down event or an Extensible Authentication Protocol (EAP) logoff event from the port. If a host is connected through a hub, the port might never receive a link-down event when that host is disconnected and, as a result, might not detect any new hosts until the next re-authentication attempt occurs. 			
	message is sent to	fails authentication, the port is moved to a restricted VLAN, and an EAP <i>success</i> o the supplicant. Because the supplicant is not notified of the actual authentication ht be confusion about this restricted network access. An EAP success message is sent		
	 If the EAP success message is not sent, the supplicant tries to authenticate every 60 seconds (th default) by sending an EAP-start message. Some hosts (for example, devices running Windows XP) cannot implement DHCP until they rece an EAP success message. 			
	success message f	ht cache an incorrect username and password combination after receiving an EAP from the authenticator and re-use that information in every re-authentication. Until the the correct username and password combination, the port remains in the restricted		
	Internal VLANs u	used for Layer 3 ports cannot be configured as restricted VLANs.		

You cannot configure a VLAN to be both a restricted VLAN and a voice VLAN. If you do this, a syslog message is generated.

When a restricted VLAN port is moved to an unauthorized state, the authentication process restarts. If the supplicant fails the authentication process again, the authenticator waits in the held state. After the supplicant has correctly re-authenticated, all IEEE 802.1x ports are reinitialized and treated as normal IEEE 802.1x ports.

When you reconfigure a restricted VLAN as a different VLAN, any ports in the restricted VLAN are also moved, and the ports stay in their currently authorized state.

When you shut down or remove a restricted VLAN from the VLAN database, any ports in the restricted VLAN are immediately moved to an unauthorized state, and the authentication process restarts. The authenticator does not wait in a held state because the restricted VLAN configuration still exists. While the restricted VLAN is inactive, all authentication attempts are counted so that when the restricted VLAN becomes active, the port is immediately placed in the restricted VLAN.

The restricted VLAN is supported only in single host mode (the default port mode). For this reason, when a port is placed in a restricted VLAN, the supplicant's MAC address is added to the MAC address table, and any other MAC address that appears on the port is treated as a security violation.

Examples

This example shows how to configure a restricted VLAN on port 1:

Switch# configure terminal

```
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# dot1x auth-fail vlan 40
Switch(config-if)# end
Switch(config)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x auth-fail max-attempts [max-attempts]	Configures the number of authentication attempts allowed before assigning a supplicant to the restricted VLAN.
	show dot1x [interface interface-id]	Displays IEEE 802.1x status for the specified port.

dot1x control-direction

Use the **dot1x control-direction** interface configuration command to enable the IEEE 802.1x authentication with the wake-on-LAN (WoL) feature and to configure the port control as unidirectional or bidirectional. Use the **no** form of this command to return to the default setting.

dot1x control-direction {both | in}

no dot1x control-direction

Syntax Description	both	Enable bidirectional control on port. The port cannot receive packets from or send packets to the host.	
	in	Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.	
Defaults	The port is in bidire	ectional mode.	
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
•	12.2(40)EX2	This command was introduced.	
	For more information about WoL, see the "Using IEEE 802.1x Authentication with Wake-on-LAN" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter in the software configuration guide.		
Examples	-	s how to enable unidirectional control: # dot1x control-direction in	
	This example shows how to enable bidirectional control:		
	Switch(config-if)# dot1x control-direction both		
	You can verify your settings by entering the show dot1x all privileged EXEC command.		
	The show dot1x all privileged EXEC command output is the same for all switches except for the port names and the state of the port. If a host is attached to the port but is not yet authenticated, a display similar to this appears:		
	Supplicant MAC 00 AuthSM State = CO BendSM State = ID PortStatus = UNAU	NNECTING LE	

If you enter the **dot1x control-direction in** interface configuration command to enable unidirectional control, this appears in the **show dot1x all** command output:

```
ControlDirection = In
```

If you enter the **dot1x control-direction in** interface configuration command and the port cannot support this mode due to a configuration conflict, this appears in the **show dot1x all** command output:

ControlDirection = In (Disabled due to port settings)

Related Commands	Command	Description
	<pre>show dot1x [all interface interface-id]</pre>	Displays control-direction port setting status for the specified interface.

dot1x critical (global configuration)

Use the **dot1x critical** global configuration command on the switch stack or on a standalone switch to configure the parameters for the inaccessible authentication bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. To return to default settings, use the **no** form of this command.

dot1x critical {eapol | recovery delay milliseconds}

no dot1x critical {eapol | recovery delay}

Syntax Description	eapol		Specify that the switch sends an EAPOL-Success message when the switch puts the critical port in the critical-authentication state.
	recovery delay	nilliseconds	Set the recovery delay period in milliseconds. The range is from 1 to 10000 milliseconds.
Defaults			APOL-Success message to the host when the switch successfully y putting the critical port in the critical-authentication state.
	The recovery del	ay period is 10	000 milliseconds (1 second).
Command Modes	Global configura	tion	
Command History	Release Modification		
	12.2(40)EX2	This comn	nand was introduced.
Usage Guidelines			ify that the switch sends an EAPOL-Success message when the switch cal-authentication state.
	Use the recovery delay <i>milliseconds</i> keyword to set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The default recovery delay period is 1000 milliseconds. A port can be re-initialized every second.		
	command. To con	figure the acc	cation bypass on a port, use the dot1x critical interface configuration tess VLAN to which the switch assigns a critical port, use the dot1x configuration command.
Examples	-		200 as the recovery delay period on the switch:
	Switch# dot1x c		
	You can verify your configuration by entering the show dot1x privileged EXEC command.		

Related Commands	Command	Description
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature, and configures the access VLAN for the feature.
	show dot1x	Displays IEEE 802.1x status for the specified port.

dot1x critical (interface configuration)

Use the **dot1x critical** interface configuration command on the switch stack or on a standalone switch to enable the inaccessible-authentication-bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. You can also configure the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state. To disable the feature or return to default, use the **no** form of this command.

dot1x critical [recovery action reinitialize | vlan vlan-id]

no dot1x critical [recovery | vlan]

Syntax Description	recovery action reinitialize	Enable the inaccessible-authentication-bypass recovery feature, and specify that the recovery action is to authenticate the port when an authentication server is available.
	vlan vlan-id	Specify the access VLAN to which the switch can assign a critical port. The range is from 1 to 4094.
Defaults	The inaccessible-authentication	a-bypass feature is disabled.
	The recovery action is not conf	igured.
	The access VLAN is not config	gured.
Command Modes	Interface configuration	
Command History	Release Modificati	ion
	12.2(40)EX2 This com	nand was introduced.
Usage Guidelines		which the switch assigns a critical port when the port is in the
Usage Guidelines	critical-authentication state, use type of port, as follows:	
Usage Guidelines	critical-authentication state, use type of port, as follows:If the critical port is an acc	which the switch assigns a critical port when the port is in the e the vlan <i>vlan-id</i> keywords. The specified type of VLAN must match the
Usage Guidelines	critical-authentication state, use type of port, as follows:If the critical port is an accIf the critical port is a private of the critical port is a port of the critical port of the critica	which the switch assigns a critical port when the port is in the e the vlan <i>vlan-id</i> keywords. The specified type of VLAN must match the ess port, the VLAN must be an access VLAN.
Usage Guidelines	 critical-authentication state, use type of port, as follows: If the critical port is an acc If the critical port is a privation of the critical port is a route. If the critical port is a route. If the client is running Window. 	which the switch assigns a critical port when the port is in the e the vlan <i>vlan-id</i> keywords. The specified type of VLAN must match the ess port, the VLAN must be an access VLAN. ate VLAN host port, the VLAN must be a secondary private VLAN.

You can configure the inaccessible authentication bypass feature and the restricted VLAN on an IEEE 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, the switch changes the port state to the critical authentication state, and it remains in the restricted VLAN.

You can configure the inaccessible bypass feature and port security on the same switch port.

Examples

This example shows how to enable the inaccessible authentication bypass feature on port 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# dot1x critical
Switch(config-if)# end
Switch(config)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x default

Use the **dot1x default** interface configuration command on the switch stack or on a standalone switch to reset the IEEE 802.1x parameters to their default values.

dot1x default

Syntax Description	This command has no arguments or keywords.			
Defaults	These are the default values:			
	• The per-port IEEE 802.1x protocol enable state is disabled (force-authorized).			
	• The number of seconds between re-authentication attempts is 3600 seconds.			
	• The periodic re-authentication is disabled.			
	• The quiet period is 60 seconds.			
	• The retransmission time is 30 seconds.			
	• The maximum retransmission number is 2 times.			
	• The host mode is single host.			
	• The client timeout period is 30 seconds.			
	• The authentication server timeout period is 30 seconds.

dot1x fallback

Use the **dot1xfallback** interface configuration command on the switch stack or on a standalone switch to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the **no** form of this command.

dot1x fallback fallback-profile

no dot1x fallback

Syntax Description	fallback-profile	Specify a fall authentication	back profile for clients that do not support IEEE 802.1x n.
Defaults	No fallback is enab	led.	
Command Modes	Interface configura	tion	
Command History	Release	Modification	
	12.2(40)EX2	This command wa	as introduced.
Usage Guidelines	You must enter the entering this comm	-	auto interface configuration command on a switch port before
Examples	This example shows how to specify a fallback profile to a switch port that has been configured for IEEE 802.1x authentication:		
	Switch(config)# i Switch(config-if)	on commands, one .nterface gigabite # dot1x fallback .lback-profile)# e	profile1
	You can verify you command.	r settings by enterin	g the show dot1x [interface <i>interface-id</i>] privileged EXEC
Related Commands	Command		Description
	show dot1x [inter	face interface-id]	Displays IEEE 802.1x status for the specified port.
	fallback profile		Create a web authentication fallback profile.
	ip admission		Enable web authentication on a port
	ip admission nam	e proxy http	Enable web authentication globally on a switch

dot1x guest-vlan

Use the **dot1x guest-vlan** interface configuration command on the switch stack or on a standalone switch to specify an active VLAN as an IEEE 802.1x guest VLAN. Use the **no** form of this command to return to the default setting.

dot1x guest-vlan vlan-id

no dot1x guest-vlan

Syntax Description	vlan-id	Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094.	
Defaults	No guest VLAN is	configured.	
Command Modes	Interface configura	tion	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	You can configure	a guest VLAN on one of these switch ports:	
	 A static-access port that belongs to a nonprivate VLAN. A private-VLAN port that belongs to a secondary private VLAN. All the hosts connected to t switch port are assigned to private VLANs, whether or not the posture validation was success. The switch determines the primary private VLAN by using the primary- and secondary-private-VLAN associations on the switch. 		
	For each IEEE 802.1x port on the switch, you can configure a guest VLAN to provide limited services to clients (a device or workstation connected to the switch) not running IEEE 802.1x authentication. These users might be upgrading their systems for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.		
	When you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.		
	The switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is reset upon loss of link.		
		at failed authentication access to the network, you can use a restricted VLAN by auth-fail vlan <i>vlan-id</i> interface configuration command.	

Any number of non-IEEE 802.1x-capable clients are allowed access when the switch port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on IEEE 802.1x ports in single-host or multiple-hosts mode.

You can configure any active VLAN except an Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (**dot1x timeout quiet-period** and **dot1x timeout tx-period** interface configuration commands). The amount to decrease the settings depends on the connected IEEE 802.1x client type.

The switch supports *MAC authentication bypass*. When it is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified. For more information, see the "Using IEEE 802.1x Authentication with MAC Authentication Bypass" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.

Examples

This example shows how to specify VLAN 5 as an IEEE 802.1x guest VLAN:

Switch(config-if) # dot1x guest-vlan 5

This example shows how to set 3 as the quiet time on the switch, to set 15 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request, and to enable VLAN 2 as an IEEE 802.1x guest VLAN when an IEEE 802.1x port is connected to a DHCP client:

```
Switch(config-if)# dot1x timeout quiet-period 3
Switch(config-if)# dot1x timeout tx-period 15
Switch(config-if)# dot1x guest-vlan 2
```

This example shows how to enable the optional guest VLAN behavior and to specify VLAN 5 as an IEEE 802.1x guest VLAN:

```
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# dot1x guest-vlan 5
```

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x	Enables the optional guest VLAN supplicant feature.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x host-mode

Use the **dot1x host-mode** interface configuration command on the switch stack or on a standalone switch to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port that has the **dot1x port-control** interface configuration command set to **auto**. Use the **no** form of this command to return to the default setting.

dot1x host-mode {multi-host | single-host}

no dot1x host-mode [multi-host | single-host]

Syntax Description	multi-host	Enable multiple-hosts mode on the switch.	
	single-host	Enable single-host mode on the switch.	
Defaults	The default is single-host mode.		
Command Modes	Interface configura	ation	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	Use this command to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to an IEEE 802.1x-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network. Before entering this command, make sure that the dot1x port-control interface configuration command is set to auto for the specified port.		
Examples	authentication on a Switch(config)# Switch(config)# Switch(config-if Switch(config-if	This example shows how to enable IEEE 802.1x authentication globally, to enable IEEE 802.1x authentication on a port, and to enable multiple-hosts mode: Switch(config)# dot1x system-auth-control Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# dot1x port-control auto Switch(config-if)# dot1x host-mode multi-host You can verify your settings by entering the show dot1x [interface interface-id] privileged EXEC command.	
Related Commands	Command	Description	
	show dot1x [inter	rface interface-id] Displays IEEE 802.1x status for the specified port.	

dot1x initialize

Use the **dot1x initialize** privileged EXEC command on the switch stack or on a standalone switch to manually return the specified IEEE 802.1x-enabled port to an unauthorized state before initiating a new authentication session on the port.

dot1x initialize [interface interface-id]

Syntax Description	interface <i>interface-id</i> (C	Optional) Port to be initialized.	
Defaults	There is no default setting.		
Command Modes	Privileged EXEC		
Command History	Release Mod	ification	
	12.2(40)EX2 This	command was introduced.	
Usage Guidelines	Use this command to initialize the IEEE 802.1x state machines and to set up a fresh environment for authentication. After you enter this command, the port status becomes unauthorized. There is not a no form of this command.		
xamples	This example shows how to manually initialize a port:		
	Switch# dot1x initialize interface gigabitethernet2/0/2 You can verify the unauthorized port status by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.		
Related Commands	Command	Description	
	<pre>show dot1x [interface interface</pre>	<i>ce-id</i>] Displays IEEE 802.1x status for the specified port.	

dot1x mac-auth-bypass

Use the **dot1x mac-auth-bypass** interface configuration command on the switch stack or on a standalone switch to enable the MAC authentication bypass feature. Use the **no** form of this command to disable MAC authentication bypass feature.

dot1x mac-auth-bypass [eap]

no dot1x mac-auth-bypass

Syntax Description	eap(Optional) Configure the switch to use Extensible Authentication Protocol (EAP) for authentication.			
Defaults	MAC authentication bypass is disabled.			
Command Modes	Interface configuration			
Command History	Release Modification			
	12.2(40)EX2This command was introduced.			
Usage Guidelines	Unless otherwise stated, the MAC authentication bypass usage guidelines are the same as the IEEE 802.1x authentication guidelines. If you disable MAC authentication bypass from a port after the port has been authenticated with its M	1AC		
	address, the port state is not affected. If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.			
	If the port is in the authorized state, the port remains in this state until re-authorization occurs.			
	If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant and uses IEEE 802.1x authentication (not MAC authentication bypass) to authorize the interface.			
	Clients that were authorized with MAC authentication bypass can be re-authenticated.			
	For more information about how MAC authentication bypass and IEEE 802.1x authentication interact, see the "Understanding IEEE 802.1x Authentication with MAC Authentication Bypass" section and the "IEEE 802.1x Authentication Configuration Guidelines" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.			

Examples This example shows how to enable MAC authentication bypass and to configure the switch to use EAP for authentication:

Switch(config-if)# dot1x mac-auth-bypass eap

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x max-reauth-req

Use the **dot1x max-reauth-req** interface configuration command on the switch stack or on a standalone switch to set the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state. Use the **no** form of this command to return to the default setting.

dot1x max-reauth-req count

no dot1x max-reauth-req

Syntax Description	<i>count</i> Number of times that the switch restarts the authentication process before the port changes to the unauthorized state. The range is 0 to 10.		
Defaults	The default is 2 times.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		efault value of this command only to adjust for unusual circumstances such as ic behavioral problems with certain clients and authentication servers.	
Examples	This example shows how to set 4 as the number of times that the switch restarts the authentication process before the port changes to the unauthorized state:		
	Switch(config-if)# dot1x max-reauth-req 4		
	You can verify your settin command.	ngs by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC	
Related Commands	Command	Description	
	dot1x max-req	Sets the maximum number of times that the switch forwards an EAP frame (assuming that no response is received) to the authentication server before restarting the authentication process.	
	dot1x timeout tx-period	Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.	
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.	

dot1x max-req

Use the **dot1x max-req** interface configuration command on the switch stack or on a standalone switch to set the maximum number of times that the switch sends an Extensible Authentication Protocol (EAP) frame from the authentication server (assuming that no response is received) to the client before restarting the authentication process. Use the **no** form of this command to return to the default setting.

dot1x max-req count

no dot1x max-req

Syntax Description	count	Number of times that the switch resends an EAP frame from the authentication server before restarting the authentication process. The range is 1 to 10.	
Defaults	The default is 2 times.		
Command Modes	Interface configuration	1	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	•	e default value of this command only to adjust for unusual circumstances such as cific behavioral problems with certain clients and authentication servers.	
Examples	-	ow to set 5 as the number of times that the switch sends an EAP frame from the the client before restarting the authentication process:	
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.		
Related Commands	Command	Description	
	dot1x timeout tx-per	iod Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.	
	<pre>show dot1x [interfac interface-id]</pre>	e Displays IEEE 802.1x status for the specified port.	

dot1x pae

Use the **dot1x pae** interface configuration command on the switch stack or on a standalone switch to configure the port as an IEEE 802.1x port access entity (PAE) authenticator. Use the **no** form of this command to disable IEEE 802.1x authentication on the port.

dot1x pae authenticator

no dot1x pae

ce configuration se 40)EX2	E 802.1x PAE authenticator, and IEEE 802.1x authentication is disabled on the Modification This command was introduced.	
se 40)EX2	Modification

	ce configuration ticator. After the peration is disab xample shows he (config-if)# r in verify your se and dot1x	

dot1x port-control

Use the **dot1x port-control** interface configuration command on the switch stack or on a standalone switch to enable manual control of the authorization state of the port. Use the **no** form of this command to return to the default setting.

dot1x port-control {auto | force-authorized | force-unauthorized}

no dot1x port-control

Syntax Description	auto	Enable IEEE 802.1x authentication on the port and cause the port to change to the authorized or unauthorized state based on the IEEE 802.1x authentication exchange between the switch and the client.	
	force-authorized	Disable IEEE 802.1x authentication on the port and cause the port to transition to the authorized state without an authentication exchange. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client.	
	force-unauthorized	Deny all access through this port by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.	
Defaults	The default is force-a	uthorized.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		able IEEE 802.1x authentication on the switch by using the dot1x global configuration command before enabling IEEE 802.1x authentication on a	
	The IEEE 802.1x standard is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports.		
	You can use the auto keyword only if the port is not configured as one of these:		
	• Trunk port—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.		
	• Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.		

	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.
Related Commands	Command	Description
	You can verify your settings by entering command.	g the show dot1x [interface <i>interface-id</i>] privileged EXEC
	Switch(config)# interface gigabitet Switch(config-if)# dot1x port-contr	
Examples	This example shows how to enable IEE	E 802.1x authentication on a port:
	global configuration command. To disat	tication on the switch, use the no dot1x system-auth-control ole IEEE 802.1x authentication on a specific port or to return to rt-control interface configuration command.
	IEEE 802.1x authentication on a po IEEE 802.1x authentication is disab	d Remote SPAN (RSPAN) destination ports—You can enable ort that is a SPAN or RSPAN destination port. However, bled until the port is removed as a SPAN or RSPAN destination. ntication on a SPAN or RSPAN source port.
	EtherChannel as an IEEE 802.1x po	are a port that is an active or a not-yet-active member of an ort. If you try to enable IEEE 802.1x authentication on an ge appears, and IEEE 802.1x authentication is not enabled.
	(VLAN Query Protocol [VQP]) por	o enable IEEE 802.1x authentication on a dynamic-access rt, an error message appears, and IEEE 802.1x authentication is a IEEE 802.1x-enabled port to dynamic VLAN assignment, an AN configuration is not changed.

dot1x re-authenticate

Use the **dot1x re-authenticate** privileged EXEC command on the switch stack or on a standalone switch to manually initiate a re-authentication of the specified IEEE 802.1x-enabled port.

dot1x re-authenticate [interface interface-id]

Syntax Description	interface interface-id	(Optional) Stack switch number, module, and port number of the interface to re-authenticate.	
Defaults	There is no default settin	g.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		nd to re-authenticate a client without waiting for the configured number of entication attempts (re-authperiod) and automatic re-authentication.	
Examples	This example shows how to manually re-authenticate the device connected to a port:		
	Switch# dot1x re-authe	enticate interface gigabitethernet2/0/1	
Related Commands	Command	Description	
	dot1x reauthentication	Enables periodic re-authentication of the client.	
	dot1x timeout reauth-p	Sets the number of seconds between re-authentication attempts.	

dot1x reauthentication

Use the **dot1x reauthentication** interface configuration command on the switch stack or on a standalone switch to enable periodic re-authentication of the client. Use the **no** form of this command to return to the default setting.

dot1x reauthentication

no dot1x reauthentication

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** Periodic re-authentication is disabled.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage GuidelinesYou configure the amount of time between periodic re-authentication attempts by using the dot1x
timeout reauth-period interface configuration command.

Examples	This example shows how to disable periodic re-authentication of the client:
----------	---

Switch(config-if) # no dot1x reauthentication

This example shows how to enable periodic re-authentication and to set the number of seconds between re-authentication attempts to 4000 seconds:

Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x re-authenticate	Manually initiates a re-authentication of all IEEE 802.1x-enabled ports.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x timeout

Use the **dot1x timeout** interface configuration command on the switch stack or on a standalone switch to set IEEE 802.1x timers. Use the **no** form of this command to return to the default setting.

dot1x timeout {quiet-period seconds | ratelimit-period seconds | reauth-period {seconds |
 server} | server-timeout seconds | supp-timeout seconds | tx-period seconds}

no dot1x timeout {quiet-period | reauth-period | server-timeout | supp-timeout | tx-period}

Syntax Description	quiet-period seconds	Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535.	
	ratelimit-period seconds	Number of seconds that the switch ignores Extensible Authentication Protocol over LAN (EAPOL) packets from clients that have been successfully authenticated during this duration. The range is 1 to 65535.	
	reauth-period {seconds	Set the number of seconds between re-authentication attempts.	
	server}	The keywords have these meanings:	
		• <i>seconds</i> —Sets the number of seconds from 1 to 65535; the default is 3600 seconds.	
		• server —Sets the number of seconds as the value of the Session-Timeout RADIUS attribute (Attribute[27]).	
	server-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the authentication server. The range is 30 to 65535.	
	supp-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the IEEE 802.1x client. The range is 30 to 65535.	
	tx-period seconds	Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65535.	
Defaults	These are the default settin	gs:	
	reauth-period is 3600 seconds.		
	quiet-period is 60 seconds	3.	
	tx-period is 5 seconds.		
	supp-timeout is 30 seconds.		
	server-timeout is 30 seconds.		
	rate-limit is 1 second.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	

Usage Guidelines		ault value of this command only to adjust for unusual circumstances such as behavioral problems with certain clients and authentication servers.			
	The dot1x timeout reauth	1-period interface configuration command affects the behavior of the switch eriodic re-authentication by using the dot1x reauthentication interface			
	• • •	e switch does not accept or initiate any authentication requests. If you want e time to the user, enter a number smaller than the default.			
	-	d is set to 0 (the default), the switch does not ignore EAPOL packets from essfully authenticated and forwards them to the RADIUS server.			
Examples	This example shows how t between re-authentication	o enable periodic re-authentication and to set 4000 as the number of seconds attempts:			
	Switch(config-if)# dot1 Switch(config-if)# dot1	x reauthentication x timeout reauth-period 4000			
	-	o enable periodic re-authentication and to specify the value of the attribute as the number of seconds between re-authentication attempts:			
	Switch(config-if)# dot1 Switch(config-if)# dot1	x reauthentication x timeout reauth-period server			
	This example shows how t	o set 30 seconds as the quiet time on the switch:			
	Switch(config-if)# dot1x timeout quiet-period 30				
	This example shows how to set 45 seconds as the switch-to-authentication server retransmission time:				
	Switch(config)# dot1x timeout server-timeout 45				
	This example shows how t request frame:	o set 45 seconds as the switch-to-client retransmission time for the EAP			
	Switch(config-if)# dot1	x timeout supp-timeout 45			
	-	o set 60 as the number of seconds to wait for a response to an e from the client before re-transmitting the request:			
	Switch(config-if)# dot1	x timeout tx-period 60			
	This example shows how to set 30 as the number of seconds that the switch ignores EAPOL packets from successfully authenticated clients:				
	Switch(config-if)# dot1x timeout ratelimit-period 30				
	You can verify your settings by entering the show dot1x privileged EXEC command.				
Related Commands	Command	Description			
	dot1x max-req	Sets the maximum number of times that the switch sends an EAP-request/identity frame before restarting the authentication process.			
	dot1x reauthentication	Enables periodic re-authentication of the client.			

Displays IEEE 802.1x status for all ports.

show dot1x

dot1x violation-mode

Use the **dot1x violation-mode** interface configuration command on the switch stack or on a standalone switch to configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.

dot1x violation-mode {shutdown | restrict | protect}

no dot1x violation-mode

Syntax Description	shutdown	Error disables the port or the virtual port on which a new unexpected MAC address occurs.		
	restrict	Generates a syslog error when a violation error occurs.		
	protect	Silently discards packets from any new MAC addresses. This is the default setting.		
Defaults	By default, dot1x	violation-mode protect is enabled.		
Command Modes	Interface configura	ition		
Command History	Release	Modification		
	12.2(46)SE	This command was introduced.		
Examples	This example shows how to configure an IEEE 802.1x-enabled port as error disabled and to shut down when a new device connects to the port:			
	Switch(config-if)# dot1x violation-mode shutdown			
	This example shows how to configure an IEEE 802.1x-enabled port to generate a system error message and change the port to restricted mode when a new device connects to the port:			
	Switch(config-if)) # dot1x violation-mode restrict		
	This example show when it is connected	vs how to configure an IEEE 802.1x-enabled port to ignore a new connected device ed to the port:		
	Switch(config-if)	Switch(config-if) # dot1x violation-mode protect		
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.			

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

duplex

Use the **duplex** interface configuration command on the switch stack or on a standalone switch to specify the duplex mode of operation for a port. Use the **no** form of this command to return the port to its default value.

duplex {auto | full | half}

no duplex

Syntax Description	auto	Enable automatic duplex configuration; port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.	
	full	Enable full-duplex mode.	
	half	Enable half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.	
Defaults	The default is a	auto for Gigabit Ethernet ports.	
	You cannot con always full .	figure the duplex mode on 10-Gigabit Ethernet ports or on internal 1000 Mb/s ports; it is	
Command Modes	Interface config	guration	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	device does not	nernet ports, setting the port to auto has the same effect as specifying full if the attached t autonegotiate the duplex parameter.	
	connec	uplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is auto and the ted device is operating at half duplex. However, you cannot configure these interfaces to a in half-duplex mode.	
	Certain ports can be configured to be either full duplex or half duplex. Applicability of this command depends on the device to which the switch is attached.		
	settings. If one	the line support autonegotiation, we highly recommend using the default autonegotiation interface supports autonegotiation and the other end does not, configure duplex and speed ces; do use the auto setting on the supported side.	
	If the speed is s	to auto , the switch negotiates with the device at the other end of the link for the speed n forces the speed setting to the negotiated value. The duplex setting remains as	

configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to **auto**.

/Ì\ Caution

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.

Examples

This example shows how to configure an interface for full-duplex operation on a Catalyst Switch Module 3110:

```
Switch(config)# interface gigabitethernet1/0/17
Switch(config-if)# duplex full
```

You can verify your setting by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	show interfaces	Displays the interface settings on the switch.
	speed	Sets the speed on a 10/100 or 10/100/1000 Mb/s interface.

errdisable detect cause

Use the **errdisable detect cause** global configuration command on the switch stack or on a standalone switch to enable error-disabled detection for a specific cause or all causes. Use the **no** form of this command to disable the error-disabled detection feature.

- errdisable detect cause {all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | l2ptguard | link-flap | loopback | pagp-flap }
- no errdisable detect cause {all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | l2ptguard | link-flap | loopback | pagp-flap}

For the BPDU guard and port-security features, you can use this command to globally configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

When the per-VLAN error-disable feature is turned off and a BPDU guard violation occurs, the entire port is disabled. Use the **no** form of this command to disable the per-VLAN error-disable feature.

errdisable detect cause bpduguard shutdown vlan

no errdisable detect cause bpduguard shutdown vlan

Syntax Description	all	Enable error detection for all error-disabled causes.
	arp-inspection	Enable error detection for dynamic Address Resolution Protocol (ARP) inspection.
	bpduguard shutdown vlan	Enable per-VLAN error-disable for BPDU guard.
	dhcp-rate-limit	Enable error detection for DHCP snooping.
	dtp-flap	Enable error detection for the Dynamic Trunking Protocol (DTP) flapping.
	l2ptguard	Enable error detection for a Layer 2 protocol-tunnel error-disabled cause.
	link-flap	Enable error detection for link-state flapping.
	loopback	Enable error detection for detected loopbacks.
	pagp-flap	Enable error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.

Though visible in the command-line help strings, the **gbic-invalid**, **inline-power**, and **sfp-config-mismatch** keywords are not supported.

Command Default Detection is enabled for all causes.

Command Modes Global configuration

Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines	A cause (link-flap , dhcp-rate-limit , and so forth) is the reason for the error-disabled state. When a cause is detected on an interface, the interface is placed in an error-disabled state, an operational state that is similar to a link-down state.			
	When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.			
	If you set a recovery mechanism for the cause by entering the errdisable recovery global configuration command for the cause, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the shutdown and then the no shutdown commands to manually recover an interface from the error-disabled state.			
Examples	This example shows how to enable error-disabled detection for the link-flap error-disabled cause:			
	Switch(config) # errdisable detect cause link-flap			
	This command shows how to globally configure BPDU guard for per-VLAN error disable: Switch(config)# errdisable detect cause bpduguard shutdown vlan			
		tting by entering the show errdisable detect privileged EXEC command.		
Related Commands	Command	Description		
	show errdisable det	•		
	show interfaces stat	s err-disabled Displays interface status or a list of interfaces in the error-disabled state.		
	clear errdisable inte	face Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature		

errdisable detect cause small-frame

Use the **errdisable detect cause small-frame** global configuration command on the switch stack or on a standalone switch to allow any switch port to be error disabled if incoming VLAN-tagged packets are small frames (67 bytes or less) and arrive at the minimum configured rate (the threshold). Use the **no** form of this command to return to the default setting.

errdisable detect cause small-frame

no errdisable detect cause small-frame

Syntax Description This command has no arguments or keywords. Defaults This feature is disabled. **Command Modes** Global configuration **Command History** Release Modification 12.2(46)SE This command was introduced. **Usage Guidelines** This command globally enables the small-frame arrival feature. Use the small violation-rate interface configuration command to set the threshold for each port. You can configure the port to be automatically re-enabled by using the errdisable recovery cause small-frame global configuration command. You configure the recovery time by using the errdisable recovery interval interval global configuration command. **Examples** This example shows how to enable the switch ports to be put into the error-disabled mode if incoming small frames arrive at the configured threshold: Switch(config)# errdisable detect cause small-frame You can verify your setting by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	errdisable detect cause small-frame	Enables the recovery timer.
	errdisable recovery interval interval	Specifies the time to recover from the specified error-disabled state.
	show interfaces	Displays the interface settings on the switch, including input and output flow control.
	small-frame violation rate	Configures the rate (threshold) for incoming small frames to cause a port to be put into the error-disabled state.

errdisable recovery

Use the **errdisable recovery** global configuration command on the switch stack or on a standalone switch to configure the recover mechanism variables. Use the **no** form of this command to return to the default setting.

errdisable recovery {cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | l2ptguard | link-flap | loopback | pagp-flap | psecure-violation | security-violation | udld | vmps}} | { interval interval }

no errdisable recovery {cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | l2ptguard | link-flap | loopback | pagp-flap | psecure-violation | security-violation | udld | vmps}} | {interval interval}

Syntax Description	cause	Enable the error-disabled mechanism to recover from a specific cause.
	all	Enable the timer to recover from all error-disabled causes.
	bpduguard	Enable the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.
	arp-inspection	Enable the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.
	channel-misconfig	Enable the timer to recover from the EtherChannel misconfiguration error-disabled state.
	dhcp-rate-limit	Enable the timer to recover from the DHCP snooping error-disabled state.
	dtp-flap	Enable the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.
	l2ptguard	Enable the timer to recover from a Layer 2 protocol tunnel error-disabled state.
	link-flap	Enable the timer to recover from the link-flap error-disabled state.
	loopback	Enable the timer to recover from a loopback error-disabled state.
	pagp-flap	Enable the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.
	psecure-violation	Enable the timer to recover from a port security violation disable state.
	security-violation	Enable the timer to recover from an IEEE 802.1x-violation disabled state.
	udld	Enable the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.
	vmps	Enable the timer to recover from the VLAN Membership Policy Server (VMPS) error-disabled state.
	interval interval	Specify the time to recover from the specified error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds.
		Note The error-disabled recovery timer is initialized at a random differential from the configured interval value. The difference between the actual timeout value and the configured value can be up to 15 percent of the configured interval.

Note

Though visible in the command-line help strings, the **gbic-invalid**, **inline-power**, and **sfp-config-mismatch** keywords are not supported.

Defaults	Recovery is disabled for all causes.			
	The default recovery interval is 300 seconds.		600 seconds.	
Command Modes	Global configuration	n		
Command History	Release	Modifi	cation	
	12.2(40)EX2	This co	ommand was introduced.	
Usage Guidelines	A cause (all , bpduguard , and so forth) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.			
	When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.			
	If you do not enable the recovery for the cause, the interface stays in the error-disabled state until you enter the shutdown and the no shutdown interface configuration commands. If you enable the recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.			
	Otherwise, you must enter the shutdown and then the no shutdown commands to manually recover an interface from the error-disabled state.			
Examples	This example shows how to enable the recovery timer for the BPDU guard error-disabled cause: Switch(config)# errdisable recovery cause bpduguard This example shows how to set the timer to 500 seconds:			
	Switch(config)# errdisable recovery interval 500			
	You can verify your settings by entering the show errdisable recovery privileged EXEC command.			
Related Commands	Command		Description	
	show errdisable re	ecovery	Displays error-disabled recovery timer information.	
	show interfaces sta err-disabled	atus	Displays interface status or a list of interfaces in error-disabled state.	
	clear errdisable in	terface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.	

errdisable recovery cause small-frame

Use the **errdisable recovery cause small-frame** global configuration command on the switch stack or on a standalone switch to enable the recovery timer for ports to be automatically re-enabled after they are error disabled by the arrival of small frames. Use the **no** form of this command to return to the default setting.

errdisable recovery cause small-frame

no errdisable recovery cause small-frame

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** This feature is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(46)SE	This command was introduced.

Usage Guidelines This command enables the recovery timer for error-disabled ports. You configure the recovery time by using the errdisable **recovery interval** *interval* interface configuration command.

Examples This example shows how to set the recovery timer: Switch(config)# errdisable recovery cause small-frame

You can verify your setting by entering the show interfaces user EXEC command.

Related Commands Command Description errdisable detect cause small-frame Allows any switch port to be put into the error-disabled state if an incoming frame is smaller than the configured minimum size and arrives at the specified rate (threshold). show interfaces Displays the interface settings on the switch, including input and output flow control. small-frame violation rate Configures the size for an incoming (small) frame to cause a port to be put into the error-disabled state.

exception crashinfo

Use the **exception crashinfo** global configuration command on the switch stack or on a standalone switch to configure the switch to create the extended crashinfo file when the Cisco IOS image fails. Use the **no** form of this command to disable this feature.

exception crashinfo

no exception crashinfo

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** The switch creates the extended crashinfo file.
- Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines The basic crashinfo file includes the Cisco IOS image name and version that failed, and a list of the processor registers, and a stack trace. The extended crashinfo file includes additional information that can help determine the cause of the switch failure.

If you enter the **exception crashinfo** global configuration command on a stack master, it configures all the stack members to create the extended crashinfo file if the Cisco IOS image on the stack members fail.

Use the **no exception crashinfo** global configuration command to configure the switch to not create the extended crashinfo file.

 Examples
 This example shows how to configure the switch to not create the extended crashinfo file:

 Switch(config)# no exception crashinfo

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing
		page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_ command_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

fallback profile

Use the **fallback profile** global configuration command on the switch stack or on a standalone switch to create a fallback profile for web authentication. To return to the default setting, use the **no** form of this command.

fallback profile profile

no fallback profile

Syntax Description	profile	Specify the fallback profile for clients that do not support IEEE 802.1x authentication.	
Defaults	No fallback prof	ile is configured.	
Command Modes	Global configura	tion	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	-	file is used to define the IEEE 802.1x fallback behavior for IEEE 802.1x ports that do ants. The only supported behavior is to fall back to web authentication.	
	After entering the fallback profile command, you enter profile configuration mode, and these configuration commands are available:		
	• ip: Create an IP configuration.		
	• access-group: Specify access control for packets sent by hosts that have not yet been authenticated.		
	• admission: Apply an IP admission rule.		
Examples	This example sho	ows how to create a fallback profile to be used with web authentication:	
	<pre>Switch# configure terminal Switch(config)# ip admission name rule1 proxy http Switch(config)# fallback profile profile1 Switch(config-fallback-profile)# ip access-group default-policy in Switch(config-fallback-profile)# ip admission rule1 Switch(config-fallback-profile)# exit Switch(config)# interface gigabitethernet 1/0/1 Switch(config-if)# dot1x fallback profile1 Switch(config-if)# end</pre>		
	You can verify yo privileged EXEC	our settings by entering the show running-configuration [interface <i>interface-id</i>] C command.	

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	ip admission	Enable web authentication on a switch port
	ip admission name proxy http	Enable web authentication globally on a switch
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.
	show fallback profile	Display the configured profiles on a switch.

flowcontrol

Use the **flowcontrol** interface configuration command on the switch stack or on a standalone switch to set the receive flow-control state for an interface. When flow control **send** is operable and on for a device and it detects any congestion at its end, it notifies the link partner or the remote device of the congestion by sending a pause frame. When flow control **receive** is on for a device and it receives a pause frame, it stops sending any data packets. This prevents any loss of data packets during the congestion period.

Use the receive off keywords to disable flow control.

flowcontrol receive {desired | off | on}

The switches can receive, but not send, pause frames.

Syntax Description	receive	Set whether the interface can receive flow-control packets from a remote device.	
	desired	Allow an interface to operate with an attached device that is required to send	
		flow-control packets or with an attached device that is not required to but can send	
		flow-control packets.	
	off	Turn off the ability of an attached device to send flow-control packets to an interface.	
	on	Allow an interface to operate with an attached device that is required to send	
		flow-control packets or with an attached device that is not required to but can send	
		flow-control packets.	
Defaults	The default is	flowcontrol receive off.	
Command Modes	Interface conf	iguration	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	The switch do	bes not support sending flow-control pause frames.	
	Note that the on and desired keywords have the same result.		
	When you use the flowcontrol command to set a port to control traffic rates during congestion, you are		
	setting flow control on a port to one of these conditions:		
		n or desired : The port cannot send pause frames, but can operate with an attached device puired to or is able to send pause frames. The port can receive pause frames.	
		ff : Flow control does not operate in either direction. In case of congestion, no indication is he link partner, and no pause frames are sent or received by either device.	

Table 2-5 shows the flow control results on local and remote ports for a combination of settings. The table assumes that **receive desired** has the same results as using the **receive on** keywords.

Flow Control Settings		Flow Control Resolution		
Local Device Remote Device		Local Device	Remote Device	
send off/receive on	send on/receive on	Receives only	Sends and receives	
	send on/receive off	Receives only	Sends only	
	send desired/receive on	Receives only	Sends and receives	
	send desired/receive off	Receives only	Sends only	
	send off/receive on	Receives only	Receives only	
	send off/receive off	Does not send or receive	Does not send or receive	
send off/receive off	send on/receive on	Does not send or receive	Does not send or receive	
	send on/receive off	Does not send or receive	Does not send or receive	
	send desired/receive on	Does not send or receive	Does not send or receive	
	send desired/receive off	Does not send or receive	Does not send or receive	
	send off/receive on	Does not send or receive	Does not send or receive	
	send off/receive off	Does not send or receive	Does not send or receive	

Table 2-5 Flow Control Settings and Local and Remote Port Flow Control Resolution

Examples This example shows how to configure the local port to not support flow control by the remote port:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# flowcontrol receive off

You can verify your settings by entering the show interfaces privileged EXEC command.

Related Commands	Command	Description
	show interfaces	Displays the interface settings on the switch, including input and output flow control.

hw-module

Use the **hw-module** global configuration command on the switch stack or on a standalone switch to enable on-board failure logging (OBFL). Use the **no** form of this command to disable this feature.

hw-module module [switch-number] logging onboard [message level level]

no hw-module module [switch-number] logging onboard [message level]

Syntax Description	switch-number	(Optional) On the Catalyst Switch Module 3110, specify the switch number, which is the stack member number. If the switch is a standalone switch, the switch number is 1. If the switch is in a stack, the range is 1 to 9, depending on the switch member numbers in the stack.
		On the Catalyst Switch Module 3012, the switch number is always 1.
	message level level	(Optional) Specify the severity of the hardware-related messages that are stored in the flash memory. The range is from 1 to 7.

Defaults OBFL is enabled, and all messages appear.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

To ensure that the time stamps in the OBFL data logs are accurate, you should manually set the system clock, or configure it by using Network Time Protocol (NTP).

If you do not enter the **message level** *level* parameter, all the hardware-related messages generated by the switch are stored in the flash memory.

On a standalone switch, entering the **hw-module** *module* [*switch-number*] **logging onboard** [message level *level*] command is the same as entering the **hw-module** module logging onboard [message level *level*] command.

Entering the **hw-module module logging onboard** [**message level** *level*] on a stack master enables OBFL on all the stack members that support OBFL.

Examples This example shows how to enable OBFL on a switch stack and to specify that all the hardware-related messages on stack member 4 are stored in the flash memory when this command is entered on the stack master:

Switch(config)# hw-module module 4 logging onboard

This example shows how to enable OBFL on a standalone switch and to specify that only severity 1 hardware-related messages are stored in the flash memory of the switch:

Switch(config) # hw-module module 1 logging onboard message level 1

You can verify your settings by entering the show logging onboard privileged EXEC command.

Related Commands	Command	Description
	clear logging	Removes the OBFL data in the flash memory.
	show logging onboard	Displays OBFL information.

interface port-channel

Use the **interface port-channel** global configuration command on the switch stack or on a standalone switch to access or create the port-channel logical interface. Use the **no** form of this command to remove the port-channel.

interface port-channel port-channel-number

no interface port-channel port-channel-number

Syntax Description	port-channel-number	Port-channel number. The range is 1 to 48.
Defaults	No port-channel logical	interfaces are defined.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	physical port to a chann command. It automatica physical port. If you cre as the <i>port-channel-num</i>	nels, you do not have to create a port-channel interface first before assigning a nel group. Instead, you can use the channel-group interface configuration ally creates the port-channel interface when the channel group gets its first eate the port-channel interface first, the <i>channel-group-number</i> can be the same <i>nber</i> , or you can use a new number. If you use a new number, the channel-group creates a new port channel.
	You create Layer 3 port channels by using the interface port-channel command followed by the no switchport interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group.	
	Only one port channel i	n a channel group is allowed.
A		
<u></u> Caution	When using a port-chan ports that are assigned t	nnel interface as a routed port, do not assign Layer 3 addresses on the physical to the channel group.

Do not assign bridge groups on the physical ports in a channel group used as a Layer 3 port-channel interface because it creates loops. You must also disable spanning tree.

Follow these guidelines when you use the interface port-channel command:

- If you want to use the Cisco Discovery Protocol (CDP), you must configure it only on the physical port and not on the port-channel interface.
- Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE 802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Examples

This example shows how to create a port-channel interface with a port channel number of 5: Switch(config)# interface port-channel 5

You can verify your setting by entering the **show running-config** privileged EXEC or **show etherchannel** *channel-group-number* **detail** privileged EXEC command.

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command _reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

interface range

Use the **interface range** global configuration command on the switch stack or on a standalone switch to enter interface range configuration mode and to execute a command on multiple ports at the same time. Use the **no** form of this command to remove an interface range.

interface range {port-range | macro name}

no interface range {*port-range* | **macro** *name*}

Cuntou Decerintion					
Syntax Description	port-range	Port range. For a list of valid values for <i>port-range</i> , see the "Usage Guidelines" section.			
	macro name	Specify the name of a macro.			
Defaults	 This command has no default setting. Global configuration 				
Command Modes					
Command History	Release	Modification			
-	12.2(40)EX2	This command was introduced.			
Usage Guidelines	When you enter interface range configuration mode, all interface parameters you enter are attributed to all interfaces within the range.				
	For VLANs, you can use the interface range command only on existing VLAN switch virtual interfaces (SVIs). To display VLAN SVIs, enter the show running-config privileged EXEC command. VLANs not displayed cannot be used in the interface range command. The commands entered under interface range command are applied to all existing VLAN SVIs in the range.				
	All configuration changes made to an interface range are saved to NVRAM, but the interface range itself is not saved to NVRAM.				
	You can enter the interface range in two ways:				
	• Specifying up to five interface ranges				
	• Specifying a previously defined interface-range macro				
	All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs. However, you can define up to five interface ranges with a single command, with each range separated by a comma.				
	Valid values for <i>port-range</i> type and interface:				
	• vlan <i>vlan-ID</i> - <i>vlan-ID</i> , where VLAN ID is from 1 to 4094				
	• gigabitethernet stack member/module/{ <i>first port</i> } - { <i>last port</i> }, where module is always 0				
	tengigabite	thernet stack member/module/{ <i>first port</i> } - { <i>last port</i> }, where module is always 0			

For physical interfaces:

- stack member is the number used to identify the switch within the stack. The number ranges from 1 to 9 and is assigned to the switch the first time the stack member initializes.
- module is always 0
- the range is type stack member/0/number number (for example, gigabitethernet1/0/1 2)
- **port-channel** *port-channel-number port-channel-number*, where *port-channel-number* is from 1 to 48

When you use the **interface range** command with port channels, the first and last port channel number in the range must be active port channels.

When you define a range, you must enter a space between the first entry and the hyphen (-):

```
interface range gigabitethernet1/0/1 -2
```

When you define multiple ranges, you must still enter a space after the first entry and before the comma (,):

```
interface range gigabitethernet1/0/1 - 2, gigabitethernet1/0/1 - 2
```

You cannot specify both a macro and an interface range in the same command.

You can also specify a single interface in *port-range*. The command is then similar to the **interface** *interface-id* global configuration command.

For more information about configuring interface ranges, see the software configuration guide for this release.

Examples

This example shows how to use the **interface range** command to enter interface-range configuration mode to apply commands to two ports:

```
Switch(config)# interface range gigabitethernet1/0/1 - 2
Switch(config-if-range)#
```

This example shows how to use a port-range macro *macrol* for the same function. The advantage is that you can reuse *macrol* until you delete it.

```
Switch(config)# define interface-range macrol gigabitethernet1/0/1 - 2
Switch(config)# interface range macro macrol
Switch(config-if-range)#
```

Related Commands	Command	Description
	define interface-range	Creates an interface range macro.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command _reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

interface vlan

Use the **interface vlan** global configuration command on the switch stack or on a standalone switch to create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode. Use the **no** form of this command to delete an SVI.

interface vlan vlan-id

no interface vlan vlan-id

Syntax Description	vlan-id	VLAN number. The range is 1 to 4094.		
Defaults	The default VLAN interface is VLAN 1.			
Command Modes	Global configuration	n		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
	1	oonds to the VLAN-tag associated with data frames on an ISL or IEEE 802.1Q or the VLAN ID configured for an access port.		
 Note	When you create ar	NVI, it does not become active until it is associated with a physical port.		
	If you delete an SVI by entering the no interface vlan <i>vlan-id</i> command, the deleted interface is no longer visible in the output from the show interfaces privileged EXEC command.			
<u>_</u> Note	You cannot delete the VLAN 1 interface.			
		a deleted SVI by entering the interface vlan <i>vlan-id</i> command for the deleted face comes back up, but the previous configuration is gone.		
	The interrelationshi	ip between the number of SVIs configured on a switch or a switch stack and the		

The interrelationship between the number of SVIs configured on a switch or a switch stack and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.

Examples This example shows how to create a new SVI with VLAN ID 23 and to enter interface configuration mode: Switch(config)# interface vlan 23 Switch(config-if)# You can verify your setting by entering the show interfaces and show interfaces vlan vlan-id privileged EXEC commands.

Related Commands	Command	Description
	show interfaces vlan vlan-id	Displays the administrative and operational status of all
		interfaces or the specified VLAN.

ip access-group

Use the **ip access-group** interface configuration command on the switch stack or on a standalone switch to control access to a Layer 2 or Layer 3 interface. Use the **no** form of this command to remove all access groups or the specified access group from the interface.

ip access-group {access-list-number | name } {in | out }

no ip access-group [access-list-number | name] {**in** | **out**}

Syntax Description	<i>access-list-number</i> The number of the IP access control list (ACL). The range is 1 to 199 1300 to 2699.			
	name	The name of an IP ACL, specified in the ip access-list global configuration command.		
	in	Specify filtering on inbound packets.		
	outSpecify filtering on outbound packets. This keyword is valid only on Layer 3 interfaces.			
Defaults	No access list is applie	ed to the interface.		
Command Modes	Interface configuration	1		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines	You can apply named or numbered standard or extended IP access lists to an interface. To define an access list by name, use the ip access-list global configuration command. To define a numbered access list, use the access list global configuration command. You can used numbered standard access lists ranging from 1 to 99 and 1300 to 1999 or extended access lists ranging from 100 to 199 and 2000 to 2699.			
	You can use this command to apply an access list to a Layer 2 or Layer 3 interface. However, note these limitations for Layer 2 interfaces (port ACLs):			
	• You can only apply ACLs in the inbound direction; the out keyword is not supported for Layer 2 interfaces.			
	• You can only apply one IP ACL and one MAC ACL per interface.			
	• Layer 2 interfaces Port ACLs do not support logging; if the log keyword is specified in the IP ACL it is ignored.			
	• An IP ACL applied to a Layer 2 interface only filters IP packets. To filter non-IP packets, use the mac access-group interface configuration command with MAC extended ACLs.			

You can use router ACLs, input port ACLs, and VLAN maps on the same switch. However, a port ACL takes precedence over a router ACL or VLAN map:

- When an input port ACL is applied to an interface and a VLAN map is applied to a VLAN that the interface is a member of, incoming packets received on ports with the ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACLs exist in an switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
- When a VLAN map, output router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

You can apply IP ACLs to both outbound or inbound Layer 3 interfaces.

A Layer 3 interface can have one IP ACL applied in each direction.

You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

For standard inbound access lists, after the switch receives a packet, it checks the source address of the packet against the access list. IP extended access lists can optionally check other fields in the packet, such as the destination IP address, protocol type, or port numbers. If the access list permits the packet, the switch continues to process the packet. If the access list denies the packet, the switch discards the packet. If the access list has been applied to a Layer 3 interface, discarding a packet (by default) causes the generation of an Internet Control Message Protocol (ICMP) Host Unreachable message. ICMP Host Unreachable messages are not generated for packets discarded on a Layer 2 interface.

For standard outbound access lists, after receiving a packet and sending it to a controlled interface, the switch checks the packet against the access list. If the access list permits the packet, the switch sends the packet. If the access list denies the packet, the switch discards the packet and, by default, generates an ICMP Host Unreachable message.

If the specified access list does not exist, all packets are passed.

Examples

This example shows how to apply IP access list 101 to inbound packets on a port:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 101 in

You can verify your settings by entering the **show ip interface**, **show access-lists**, or **show ip access-lists** privileged EXEC command.

Related Commands

Command	Description
access list	Configures a numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands
ip access-list	Configures a named ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
show access-lists	Displays ACLs configured on the switch.
show ip access-lists	Displays IP ACLs configured on the switch. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
show ip interface	Displays information about interface status and configuration. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.

ip address

Use the **ip address** interface configuration command on the switch stack or on a standalone switch to set an IP address for the Layer 2 switch or an IP address for each switch virtual interface (SVI) or routed port on the Layer 3 switch. Use the **no** form of this command to remove an IP address or to disable IP processing.

ip address ip-address subnet-mask [secondary]

no ip address [*ip-address subnet-mask*] [**secondary**]

ntax Description	ip-address	IP address.
	subnet-mask	Mask for the associated IP subnet.
	secondary	(Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.
efaults	No IP address is def	fined.
ommand Modes	Interface configurat	ion
ommand History	Release	Modification
	12.2(40)EX2	This command was introduced.
sage Guidelines	Hosts can find subn	witch IP address through a Telnet session, your connection to the switch will be lost. et masks using the Internet Control Message Protocol (ICMP) Mask Request espond to this request with an ICMP Mask Reply message.
	You can disable IP p	processing on a particular interface by removing its IP address with the no ip address itch detects another host using one of its IP addresses, it will send an error message
	Secondary addresse	ional keyword secondary to specify an unlimited number of secondary addresses. s are treated like primary addresses, except the system never generates datagrams pdates with secondary source addresses. IP broadcasts and ARP requests are handled
		rface routes in the IP routing table.

interface fall into the same OSPF area as the primary addresses.

If your switch receives its IP address from a Bootstrap Protocol (BOOTP) or a DHCP server and you remove the switch IP address by using the **no ip address** command, IP processing is disabled, and the BOOTP or the DHCP server cannot reassign the address.

A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is not limited by software; however, the interrelationship between this number and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.

Examples	This example shows how to configure the IP address for the Layer 2 switch on a subnetted network:
	Switch(config)# interface vlan 1 Switch(config-if)# ip address 172.20.128.2 255.255.255.0
	This example shows how to configure the IP address for a port on the Layer 3 switch:
	Switch(config)# ip multicast-routing
	Switch(config)# interface gigabitethernet6/0/1
	Switch(config-if)# no switchport

Switch(config-if)# ip address 172.20.128.2 255.255.255.0

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_comma nd_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

ip admission

Use the **ip admission** interface configuration command to enable web authentication. You can also use this command in fallback-profile mode. Use the **no** form of this command to disable web authentication.

ip admission rule

no ip admission

Syntax Description	rule	Apply an IP admission rule to the interface.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	The ip admission c	ommand applies a web authentication rule to a switch port.	
Examples	This example shows how to apply a web authentication rule to a switchport:		
	Switch# configure terminal Switch(config)# interface gigabitethernet1/0/1 Switch(config-if)# ip admission rule1		
	This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.		
	Switch# configure terminal Switch(config)# fallback profile profile1 Switch(config)# ip admission name rule1 Switch(config)# end		
Related Commands	Command	Description	
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.	
	fallback profile	Enable web authentication on a port	
	ip admission name proxy http	Enable web authentication globally on a switch	

show ip admission	Displays information about NAC cached entries or the NAC configuration.
	For more information, see the Network Admission Control Software
	Configuration Guide on Cisco.com.

ip admission name proxy http

Use the **ip admission name proxy http** global configuration command to enable web authentication. Use the **no** form of this command to disable web authentication.

ip admission name *proxy http*

no ip admission name proxy http

Syntax Description	This command has no argum	ents or keywords.
--------------------	---------------------------	-------------------

- **Defaults** Web authentication is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines The **ip admission name proxy http** command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the **ip access-group in** and **ip admission** *web-rule* interface configuration commands to enable web authentication on a specific interface.

Examples

This example shows how to configure only web authentication on a switchport:

```
Switch# configure terminal
Switch(config) ip admission name http-rule proxy http
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 101 in
Switch(config-if)# ip admission rule
Switch(config-if)# end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switchport.

```
Switch# configure terminal
Switch(config)# ip admission name rule2 proxy http
Switch(config)# fallback profile profile1
Switch(config)# ip access group 101 in
Switch(config)# ip admission name rule2
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x fallback profile1
Switch(config-if)# end
```

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	fallback profile	Create a web authentication fallback profile.
	ip admission	Enable web authentication on a port
	show ip admission	Displays information about NAC cached entries or the NAC configuration. For more information, see the <i>Network Admission Control Software</i> <i>Configuration Guide</i> on Cisco.com.

ip arp inspection filter vlan

Use the **ip arp inspection filter vlan** global configuration command on the switch stack or on a standalone switch to permit or deny Address Resolution Protocol (ARP) requests and responses from a host configured with a static IP address when dynamic ARP inspection is enabled. Use the **no** form of this command to return to the default settings.

ip arp inspection filter arp-acl-name vlan vlan-range [static]

no ip arp inspection filter arp-acl-name vlan vlan-range [static]

Syntax Description	arp-acl-name	ARP access control list (ACL) name.
	vlan-range	VLAN number or range.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	static	(Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.
		If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.
Defaults Command Modes	Global configurat	ACLs are applied to any VLAN.
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	When an ARP ACL is applied to a VLAN for dynamic ARP inspection, only the ARP packets with IP-to-MAC address bindings are compared against the ACL. If the ACL permits a packet, the switch forwards it. All other packet types are bridged in the ingress VLAN without validation.	
	the switch denies	es a packet because of an explicit deny statement in the ACL, the packet is dropped. If a packet because of an implicit deny statement, the packet is then compared against bindings (unless the ACL is <i>static</i> , which means that packets are not compared against
	Use the arp acces clauses to the end	ss-list acl-name global configuration command to define the ARP ACL or to add

ExamplesThis example shows how to apply the ARP ACL static-hosts to VLAN 1 for dynamic ARP inspection:
Switch(config)# ip arp inspection filter static-hosts vlan 1

You can verify your settings by entering the show ip arp inspection vlan 1 privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP ACL.
	deny (ARP access-list configuration)	Denies an ARP packet based on matches against the DHCP bindings.
	permit (ARP access-list configuration)	Permits an ARP packet based on matches against the DHCP bindings.
	show arp access-list	Displays detailed information about ARP access lists.
	show inventory vlan vlan-range	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip arp inspection limit

Use the **ip arp inspection limit** interface configuration command on the switch stack or on a standalone switch to limit the rate of incoming Address Resolution Protocol (ARP) requests and responses on an interface. It prevents dynamic ARP inspection from using all of the switch resources if a denial-of-service attack occurs. Use the **no** form of this command to return to the default settings.

ip arp inspection limit {rate pps [burst interval seconds] | none}

no ip arp inspection limit

Syntax Description	rate pps	Specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 packets per second (pps).		
	burst interval seconds	(Optional) Specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15 seconds.		
	none	Specify no upper limit for the rate of incoming ARP packets that can be processed.		
Defaults		rusted interfaces, assuming that the network is a switched network with a host 15 new hosts per second.		
	The rate is unlimited on a	The rate is unlimited on all trusted interfaces.		
	The burst interval is 1 sec	cond.		
Command Modes	Interface configuration			
Command History	Release Mo	dification		
	12.2(40)EX2 Th	s command was introduced.		
Usage Guidelines		usted and untrusted interfaces. Configure appropriate rates on trunks to process ynamic ARP inspection-enabled VLANs, or use the none keyword to make the		
Usage Guidelines	packets across multiple d rate unlimited. After a switch receives n			
Usage Guidelines	 packets across multiple d rate unlimited. After a switch receives n number of burst seconds, Unless you explicitly con changes its rate limit to t interface retains the rate 	ynamic ARP inspection-enabled VLANs, or use the none keyword to make the nore than the configured rate of packets every second consecutively over a		

On the Catalyst Switch Module 3110, the rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

The rate of incoming ARP packets on EtherChannel ports equals the sum of the incoming rate of ARP packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on all the channel members.

Examples This example shows how to limit the rate of incoming ARP requests on a port to 25 pps and to set the interface monitoring interval to 5 consecutive seconds:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip arp inspection limit rate 25 burst interval 5

You can verify your settings by entering the **show ip arp inspection interfaces** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	show inventory interfaces	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.

ip arp inspection log-buffer

Use the **ip arp inspection log-buffer** global configuration command on the switch stack or on a standalone switch to configure the dynamic Address Resolution Protocol (ARP) inspection logging buffer. Use the **no** form of this command to return to the default settings.

ip arp inspection log-buffer {entries number | logs number interval seconds}

no ip arp inspection log-buffer {entries | logs}

Syntax Description	entries number	Number of entries to be logged in the buffer. The range is 0 to 1024.		
	logs number	Number of entries needed in the specified interval to generate system messages.		
	interval seconds	For logs <i>number</i> , the range is 0 to 1024. A 0 value means that the entry is placed in the log buffer, but a system message is not generated.		
		For interval <i>seconds</i> , the range is 0 to 86400 seconds (1 day). A 0 value means that a system message is immediately generated (and the log buffer is always empty).		
Defaults	When dynamic ARP inspection is enabled, denied or dropped ARP packets are logged.			
	The number of log	entries is 32.		
	The number of syst	tem messages is limited to 5 per second.		
	The logging-rate in	The logging-rate interval is 1 second.		
Command Modes	Global configuration	on		
Command History	Release	Modification		
•	12.2(40)EX2	This command was introduced.		
Usage Guidelines	A value of 0 is not	allowed for both the logs and the interval keywords.		
	divided by Y (X/Y) Y divided by X (Y/	val settings interact. If the logs <i>number</i> X is greater than interval <i>seconds</i> Y, X system messages are sent every second. Otherwise, one system message is sent every (X) seconds. For example, if the logs <i>number</i> is 20 and the interval <i>seconds</i> is 4, the system messages for five entries every second while there are entries in the log buffer		
	packets on the same	can represent more than one packet. For example, if an interface receives many e VLAN with the same ARP parameters, the switch combines the packets as one entry d generates a system message as a single entry.		
	for the show ip arg appears in place of entry. If you see thi	erflows, it means that a log event does not fit into the log buffer, and the output display p inspection log privileged EXEC command is affected. A in the output display all data except the packet count and the time. No other statistics are provided for the is entry in the display, increase the number of entries in the log buffer, or increase the		
	logging rate.			

On the Catalyst Switch Module 3110, the log buffer configuration applies to each stack member in a switch stack. Each stack member has the specified **logs** *number* entries and generates system messages at the configured rate. For example, if the interval (rate) is one entry per second, up to five system messages are generated per second in a five-member switch stack.

Examples This example shows how to configure the logging buffer to hold up to 45 entries:

Switch(config) # ip arp inspection log-buffer entries 45

This example shows how to configure the logging rate to 20 log entries per 4 seconds. With this configuration, the switch generates system messages for five entries every second while there are entries in the log buffer.

 $\texttt{Switch}(\texttt{config}) \ensuremath{\,\#}$ ip arp inspection log-buffer logs 20 interval 4

You can verify your settings by entering the **show ip arp inspection log** privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	clear ip arp inspection log	Clears the dynamic ARP inspection log buffer.
	ip arp inspection vlan logging	Controls the type of packets that are logged per VLAN.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

ip arp inspection trust

Use the **ip arp inspection trust** interface configuration command on the switch stack or on a standalone switch to configure an interface trust state that determines which incoming Address Resolution Protocol (ARP) packets are inspected. Use the **no** form of this command to return to the default setting.

ip arp inspection trust

no ip arp inspection trust

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** The interface is untrusted.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines The switch does not check ARP packets that it receives on the trusted interface; it simply forwards the packets.

For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the **ip arp inspection vlan logging** global configuration command.

Examples This example shows how to configure a port to be trusted:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip arp inspection trust

You can verify your setting by entering the **show ip arp inspection interfaces** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	show inventory interfaces	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

ip arp inspection validate

Use the **ip arp inspection validate** global configuration command on the switch stack or on a standalone switch to perform specific checks for dynamic Address Resolution Protocol (ARP) inspection. Use the **no** form of this command to return to the default settings.

ip arp inspection validate {[src-mac] [dst-mac] [ip [allow zeros]]}

no ip arp inspection validate [src-mac] [dst-mac] [ip [allow zeros]]

Cuntow Description		
Syntax Description	src-mac	Compare the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses.
		When enabled, packets with different MAC addresses are classified as invalid and are dropped.
	dst-mac	Compare the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses.
		When enabled, packets with different MAC addresses are classified as invalid and are dropped.
	ір	Compare the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses.
		Sender IP addresses are compared in all ARP requests and responses. Target IP addresses are checked only in ARP responses.
	allow-zeros	Modifies the IP validation test so that ARPs with a sender address of 0.0.0.0 (ARP probes) are not denied.
Defaults	No checks are	performed.
Command Modes	Global configu	iration
Command History	Release	Modification

e Guidelines You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables **src-mac** and **dst-mac** validations, and a second command enables IP validation only, the **src-mac** and **dst-mac** validations are disabled as a result of the second command.

The allow-zeros keyword interacts with ARP access control lists (ACLs) in this way:

- If you configure an ARP ACL to deny ARP probes, they are dropped even if the **allow-zero** keyword is specified.
- If you configure an ARP ACL that specifically permits ARP probes and configure the **ip arp inspection validate ip** command, ARP probes are dropped unless you enter the **allow-zeros** keyword.

The **no** form of the command disables only the specified checks. If none of the options are enabled, all checks are disabled.

Examples This example show how to enable source MAC validation: Switch(config)# ip arp inspection validate src-mac You can verify your setting by entering the show ip arp inspection vlan vlan-range privileged EXEC command.

Related Commands	Command	Description
	show inventory vlan	Displays the configuration and the operating state of dynamic ARP
	vlan-range	inspection for the specified VLAN.

ip arp inspection vlan

Use the **ip arp inspection vlan** global configuration command on the switch stack or on a standalone switch to enable dynamic Address Resolution Protocol (ARP) inspection on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip arp inspection vlan vlan-range

no ip arp inspection vlan vlan-range

Syntax Description	vlan-range	VLAN number or range.	
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.	
Defaults	ARP inspection is dis	sabled on all VLANs.	
Command Modes	Global configuration		
Command History	Release	Modification	
Commanu History	12.2(40)EX2	This command was introduced.	
Usage Guidelines		VLANs on which to enable dynamic ARP inspection. tion is supported on access ports, trunk ports, EtherChannel ports, or private VLAN	
Examples	This example shows	how to enable dynamic ARP inspection on VLAN 1:	
	Switch(config)# ip arp inspection vlan 1		
	You can verify your setting by entering the show ip arp inspection vlan <i>vlan-range</i> privileged EXEC command.		
Related Commands	Command	Description	
	arp access-list	Defines an ARP access control list (ACL).	
	show inventory vlan vlan-range	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.	

ip arp inspection vlan logging

ip arp inspection vlan logging

Use the **ip arp inspection vlan logging** global configuration command on the switch stack or on a standalone switch to control the type of packets that are logged per VLAN. Use the **no** form of this command to disable this logging control.

ip arp inspection vlan *vlan-range* logging {acl-match {matchlog | none} | dhcp-bindings {all | none | permit} | arp-probe}

no ip arp inspection vlan *vlan-range* logging {acl-match | dhcp-bindings | arp-probe}

Syntax Description	vlan-range	Specify the VLANs configured for logging.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	acl-match {matchlog none}	Specify that the logging of packets is based on access control list (ACL) matches.
		The keywords have these meanings:
		• matchlog —Log packets based on the logging configuration specified in the access control entries (ACE). If you specify the matchlog keyword in this command and the log keyword in the permit or deny ARP access-list configuration command, Address Resolution Protocol (ARP) packets permitted or denied by the ACL are logged.
		• none —Do not log packets that match ACLs.
	dhcp-bindings {permit all none}	Specify the logging of packets is based on Dynamic Host Configuration Protocol (DHCP) binding matches.
		The keywords have these meanings:
		• all —Log all packets that match DHCP bindings.
		• none —Do not log packets that match DHCP bindings.
		• permit —Log DHCP-binding permitted packets.
	arp-probe	Specify logging of packets permitted specifically because they are ARP probes.
Defaults	All denied or all dropp	ed packets are logged. ARP probe packets are not logged.
Command Modes	Global configuration	
Command History	Release M	Aodification
-	12.2(40)EX2 7	This command was introduced.

Usage Guidelines The term *logged* means that the entry is placed into the log buffer and that a system message is generated. The acl-match and dhcp-bindings keywords merge with each other; that is, when you configure an ACL match, the DHCP bindings configuration is not disabled. Use the no form of the command to reset the logging criteria to their defaults. If neither option is specified, all types of logging are reset to log when ARP packets are denied. These are the options: acl-match—Logging on ACL matches is reset to log on deny. dhcp-bindings—Logging on DHCP bindings keywords are specified, all denied packets are logged. The implicit deny at the end of an ACL does not include the log keyword. This means that when you use the static keyword in the ip arp inspection filter vlan global configuration command, the ACL overrides the DHCP bindings. Some denied packets might not be logged unless you explicitly specify the deny ip any mac any log ACE at the end of the ARP ACL.

Examples This example shows how to configure ARP inspection on VLAN 1 to log packets that match the **permit** commands in the ACL:

```
Switch(config)# arp access-list test1
Switch(config-arp-nacl)# permit request ip any mac any log
Switch(config-arp-nacl)# permit response ip any any mac any any log
Switch(config-arp-nacl)# exit
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog
```

You can verify your settings by entering the **show ip arp inspection vlan** *vlan-range* privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP ACL.
	clear ip arp inspection log	Clears the dynamic ARP inspection log buffer.
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.
	show inventory vlan <i>vlan-range</i>	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip dhcp snooping

Use the **ip dhcp snooping** global configuration command on the switch stack or on a standalone switch to globally enable DHCP snooping. Use the **no** form of this command to return to the default setting.

ip dhcp snooping

no ip dhcp snooping

Syntax Description This command has no arguments or key	ywords.
---	---------

- **Defaults** DHCP snooping is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines For any DHCP snooping configuration to take effect, you must globally enable DHCP snooping.

DHCP snooping is not active until you enable snooping on a VLAN by using the **ip dhcp snooping vlan** *vlan-id* global configuration command.

Examples	This example shows how to enable DHCP snooping:	
	Switch(config)# ip dhcp snooping	
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.	

Related Commands	Command	Description
	ip dhcp snooping vlan	Enables DHCP snooping on a VLAN.
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping binding

Use the **ip dhcp snooping binding** privileged EXEC command on the switch stack or on a standalone switch to configure the DHCP snooping binding database and to add binding entries to the database. Use the **no** form of this command to delete entries from the binding database.

ip dhcp snooping binding mac-address **vlan** vlan-id ip-address **interface** interface-id **expiry** seconds

no ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id

Syntax Description	mac-address	Specify a MAC address.
	vlan vlan-id	Specify a VLAN number. The range is 1 to 4094.
	ip-address	Specify an IP address.
	interface interface-id	Specify an interface on which to add or delete a binding entry.
	expiry seconds	Specify the interval (in seconds) after which the binding entry is no longer valid. The range is 1 to 4294967295.
Defaults	No default database is d	lefined.
Command Modes	Privileged EXEC	
Command History	Release Modi	ification
	12.2(40)EX2 This	command was introduced.
Usage Guidelines	In the DHCP snooping l address, an associated M binding applies, and the bindings.	n you are testing or debugging the switch. binding database, each database entry, also referred to a binding, has an IP MAC address, the lease time (in hexadecimal format), the interface to which the e VLAN to which the interface belongs. The database can have up to 8192
		nooping binding privileged EXEC command to display only the configured ip source binding privileged EXEC command to display the dynamically and addings.
Examples	This example shows how 1000 seconds on a port	w to generate a DHCP binding configuration with an expiration time of in VLAN 1:
	Switch# ip dhcp snoop gigabitethernet1/0/1	ping binding 0001.1234.1234 vlan 1 172.20.50.5 interface expiry 1000
	You can verify your setti binding privileged EXE	ings by entering the show ip dhcp snooping binding or the show ip dhcp source EC command.

Related Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	show ip dhcp snooping binding	Displays the dynamically configured bindings in the DHCP snooping binding database and the configuration information.
	show ip source binding	Displays the dynamically and statically configured bindings in the DHCP snooping binding database.

ip dhcp snooping database

Use the **ip dhcp snooping database** global configuration command on the switch stack or on a standalone switch to configure the DHCP snooping binding database agent. Use the **no** form of this command to disable the agent, to reset the timeout value, or to reset the write-delay value.

ip dhcp snooping database {{flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password]@]{hostname | host-ip}[/directory]/image-name.tar | rcp://user@host/filename | tftp://host/filename} | timeout seconds | write-delay seconds}

no ip dhcp snooping database [timeout | write-delay]

Syntax Description	flash[number]:/filename	Specify that the database agent or the binding file is in the flash memory.
		(Optional) Use the <i>number</i> parameter to specify the stack member number of the stack master. The range for <i>number</i> is 1 to 9.
	ftp://user:password@host/filename	Specify that the database agent or the binding file is on an FTP server.
	http://[[username:password]@] {hostname \ host-ip}[/directory] /image-name.tar	Specify that the database agent or the binding file is on an FTP server.
	rcp:// user@host/filename	Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.
	tftp://host/filename	Specify that the database agent or the binding file is on a TFTP server.
	timeout seconds	Specify (in seconds) how long to wait for the database transfer process to finish before stopping.
		The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.
	write-delay seconds	Specify (in seconds) the duration for which the transfer should be delayed after the binding database changes. The default is 300 seconds. The range is 15 to 86400.
Defaults	The URL for the database agent or bi	
Defaults	The URL for the database agent or bi The timeout value is 300 seconds (5 r	
Defaults		ninutes).
Defaults Command Modes	The timeout value is 300 seconds (5 r	ninutes).
	The timeout value is 300 seconds (5 r The write-delay value is 300 seconds	ninutes).

ip dhcp snooping binding

show ip dhcp snooping database

To ensure that the lease time in the database is accurate, we recommend that Network Time Protocol (NTP) is enabled and configured for these features: • NTP authentication • NTP peer and server associations NTP broadcast service NTP access restrictions • NTP packet source IP address If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP. Because both NVRAM and the flash memory have limited storage capacities, we recommend that you store a binding file on a TFTP server. You must create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can first write bindings to the binding file at that URL. Use the **ip dhcp snooping database flash**[number]:/filename command to save the DHCP snooping binding database in the stack master NVRAM. The database is not saved in a stack member NVRAM. If you set the **ip dhcp snooping database timeout** command to 0 seconds and the database is being written to a TFTP file, if the TFTP server goes down, the database agent continues to try the transfer indefinitely. No other transfer can be initiated while this one is in progress. This might be inconsequential because if the server is down, no file can be written to it. Use the **no ip dhcp snooping database** command to disable the agent. Use the **no ip dhcp snooping database timeout** command to reset the timeout value. Use the no ip dhcp snooping database write-delay command to reset the write-delay value. **Examples** This example shows how to store a binding file at an IP address of 10.1.1.1 that is in a directory called directory. A file named file must be present on the TFTP server. Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file This example shows how to store a binding file called *file01.txt* in the stack master NVRAM: Switch(config) # ip dhcp snooping database flash:file01.txt You can verify your settings by entering the show ip dhcp snooping database privileged EXEC command. **Related Commands** Command Description ip dhcp snooping Enables DHCP snooping on a VLAN.

The DHCP snooping binding database can have up to 8192 bindings.

Configures the DHCP snooping binding database.

Displays the status of DHCP snooping database agent.

Usage Guidelines

ip dhcp snooping information option

Use the **ip dhcp snooping information option** global configuration command on the switch stack or on a standalone switch to enable DHCP option-82 data insertion. Use the **no** form of this command to disable DHCP option-82 data insertion.

ip dhcp snooping information option

no ip dhcp snooping information option

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** DHCP option-82 data is inserted.
- **Command Modes** Global configuration

Command History	Release	Modification	
12.2(40)EX2		This command was introduced.	

Usage Guidelines You must globally enable DHCP snooping by using the **ip dhcp snooping** global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled and a switch receives a DHCP request from a host, it adds the option-82 information in the packet. The option-82 information contains the switch MAC address (the remote ID suboption) and the port identifier, **vlan-mod-port**, from which the packet is received (circuit ID suboption). The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

When the DHCP server receives the packet, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or a circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. When the client and server are on the same subnet, the server broadcasts the reply. The switch inspects the remote ID and possibly the circuit ID fields to verify that it originally inserted the option-82 data. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP host that sent the DHCP request.

Examples

This example shows how to enable DHCP option-82 data insertion:

 $\texttt{Switch}(\texttt{config}) \ \texttt{\texttt{ip}} \ \textbf{\texttt{dhcp}} \ \textbf{\texttt{snooping}} \ \textbf{information option}$

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping information option allow-untrusted

Use the **ip dhcp snooping information option allow-untrusted** global configuration command on an aggregation switch to configure it to accept DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. Use the **no** form of this command to return to the default setting.

ip dhcp snooping information option allow-untrusted

no ip dhcp snooping information option allow-untrusted

Syntax Description	This command has	no arguments or keywords.
Defaults	The switch drops D might be connected	PHCP packets with option-82 information that are received on untrusted ports that I to an edge switch.
Command Modes	Global configuration	on
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	the edge of your ne snooping, IP source aggregation switch packets with option	edge switch to which a host is connected to insert DHCP option-82 information at stwork. You might also want to enable DHCP security features, such as DHCP e guard, or dynamic Address Resolution Protocol (ARP) inspection, on an . However, if DHCP snooping is enabled on the aggregation switch, the switch drops a-82 information that are received on an untrusted port and does not learn DHCP for connected devices on a trusted interface.
	snooping on an agg command on the ag though the aggrega enable DHCP secur	o which a host is connected inserts option-82 information and you want to use DHCP gregation switch, enter the ip dhcp snooping information option allow-untrusted ggregation switch. The aggregation switch can learn the bindings for a host even tion switch receives DHCP snooping packets on an untrusted port. You can also rity features on the aggregation switch. The port on the edge switch to which the is connected must be configured as a trusted port.
Note		dhcp snooping information option allow-untrusted command on an aggregation untrusted device is connected. If you enter this command, an untrusted device might 2 information.

Examples

This example shows how to configure an access switch to not check the option-82 information in untrusted packets from an edge switch and to accept the packets:

Switch(config) # ip dhcp snooping information option allow-untrusted

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping information option format remote-id

Use the **ip dhcp snooping information option format remote-id** global configuration command on the switch stack or on a standalone switch to configure the option-82 remote-ID suboption. Use the **no** form of this command to configure the default remote-ID suboption.

ip dhcp snooping information option format remote-id [string ASCII-string | hostname]

no ip dhcp snooping information option format remote-id

Syntax Description	string ASCII-string	Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).
	hostname	Specify the switch hostname as the remote ID.
Defaults	The switch MAC address is the remo	ote ID.
Command Modes	Global configuration	
Command History	Release Modification	
	12.2(40)EX2 This comman	id was introduced.
Usage Guidelines	You must globally enable DHCP snooping by using the ip dhcp snooping global configuration command for any DHCP snooping configuration to take effect. When the option-82 feature is enabled, the default remote-ID suboption is the switch MAC address. This command allows you to configure either the switch hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.	
Note	If the hostname exceeds 63 character configuration.	rs, it will be truncated to 63 characters in the remote-ID
Examples	Switch(config)# ip dhcp snooping	te the option- 82 remote-ID suboption: information option format remote-id hostname ring the show ip dhcp snooping user EXEC command.
Related Commands	Command	Description
	ip dhcp snooping vlan information option format-type circuit-id string	
	show ip dhcp snooping	Displays the DHCP snooping configuration.

Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Command Reference

ip dhcp snooping limit rate

Use the **ip dhcp snooping limit rate** interface configuration command on the switch stack or on a standalone switch to configure the number of DHCP messages an interface can receive per second. Use the **no** form of this command to return to the default setting.

ip dhcp snooping limit rate rate

no ip dhcp snooping limit rate

Syntax Description	rate	Number of DHC 2048.	P messages an interface can receive per second. The range is 1 to
Defaults	DHCP snooping r	ate limiting is disa	bled.
Command Modes	Interface configur	ration	
Command History	Release	Modification	
	12.2(40)EX2	This comman	d was introduced.
Usage Guidelines	 interfaces, keep in of which might no higher value. If the rate limit is errdisable recover again when all the second second	n mind that trusted i ot be snooped) in th exceeded, the interf ery dhcp-rate-limi e causes have timed	trusted interfaces. If you want to configure rate limiting for trusted nterfaces might aggregate DHCP traffic on multiple VLANs (some he switch, and you will need to adjust the interface rate limits to a face is error-disabled. If you enabled error recovery by entering the t global configuration command, the interface retries the operation out. If the error-recovery mechanism is not enabled, the interface you enter the shutdown and no shutdown interface configuration
Examples	Switch(config-i	E)# ip dhcp snoop	ssage rate limit of 150 messages per second on an interface: ing limit rate 150 ring the show ip dhcp snooping user EXEC command.
Related Commands	Command		Description
	errdisable recov	ery	Configures the recover mechanism.
	show ip dhcp sn	ooping	Displays the DHCP snooping configuration.
	show ip dhcp sn	ooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping trust

Use the **ip dhcp snooping trust** interface configuration command on the switch stack or on a standalone switch to configure a port as trusted for DHCP snooping purposes. Use the **no** form of this command to return to the default setting.

ip dhcp snooping trust

no ip dhcp snooping trust

Syntax Description	This command has no arguments or keywords.
--------------------	--

Defaults DHCP snooping trust is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines Configure as trusted ports those that are connected to a DHCP server or to other switches or routers. Configure as untrusted ports those that are connected to DHCP clients.

Examples	This example shows how to enable DHCP snooping trust on a port:		
	Switch(config-if)# ip dhcp snooping trust		
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.		

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping verify

Use the **ip dhcp snooping verify** global configuration command on the switch stack or on a standalone switch to configure the switch to verify on an untrusted port that the source MAC address in a DHCP packet matches the client hardware address. Use the **no** form of this command to configure the switch to not verify the MAC addresses.

ip dhcp snooping verify mac-address

no ip dhcp snooping verify mac-address

Syntax Description This command has no arguments or keyword	ls.
---	-----

Defaults The switch verifies the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines In a service-provider network, when a switch receives a packet from a DHCP client on an untrusted port, it automatically verifies that the source MAC address and the DHCP client hardware address match. If the addresses match, the switch forwards the packet. If the addresses do not match, the switch drops the packet.

Examples This example shows how to disable the MAC address verification:

Switch(config)# no ip dhcp snooping verify mac-address

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.

ip dhcp snooping vlan

Use the **ip dhcp snooping vlan** global configuration command on the switch stack or on a standalone switch to enable DHCP snooping on a VLAN. Use the **no** form of this command to return to the default setting.

ip dhcp snooping vlan vlan-range

no ip dhcp snooping vlan vlan-range

Syntax Description	vlan vlan-rangeSpecify a VLAN range is 1 to 409		N ID or a range of VLANs on which to enable DHCP snooping. The 94.	
		IDs separated by	ingle VLAN ID identified by VLAN ID number, a series of VLAN commas, a range of VLAN IDs separated by hyphens, or a range parated by entering the starting and ending VLAN IDs separated	
Defaults	DHCP snooping is	s disabled on all V	LANs.	
Command Modes	Global configuration	on		
Command History	Release	Modification		
	12.2(40)EX2This command was introduced.			
Usage Guidelines	You must first glo	bally enable DHC	P snooping before enabling DHCP snooping on a VLAN.	
Examples	This example show	ws how to enable I	DHCP snooping on VLAN 10:	
	Switch(config)# ip dhcp snooping vlan 10			
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.			
Related Commands	Command		Description	
	show ip dhcp sno	ooping	Displays the DHCP snooping configuration.	
	show ip dhcp sno	oning hinding	Displays the DHCP snooping binding information.	

ip dhcp snooping vlan information option format-type circuit-id string

Use the **ip dhcp snooping vlan information option format-type circuit-id string** interface configuration command on the switch stack or on a standalone switch to configure the option-82 circuit-ID suboption. Use the **no** form of this command to configure the default circuit-ID suboption.

ip dhep snooping vlan vlan information option format-type circuit-id string ASCII-string

no ip dhcp snooping vlan vlan information option format-type circuit-id string

Syntax Description	vlan vlan	Specify the VLAN ID. The range is 1 to 4094.	
	string ASCII-strin	g Specify a circuit ID, using from 3 to 63 ASCII characters (no spaces).	
Defaults	The switch VLAN	and the port identifier, in the format vlan-mod-port , is the default circuit ID.	
Command Modes	Interface configura	tion	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	You must globally enable DHCP snooping by using the ip dhcp snooping global configuration command for any DHCP snooping configuration to take effect. When the option-82 feature is enabled, the default circuit-ID suboption is the switch VLAN and the port identifier, in the format vlan-mod-port . This command allows you to configure a string of ASCII characters to be the circuit ID.		
Note When configuring a large number of circuit IDs on a switch, consider the impact of lengthy strings on the NVRAM or flash memory. If the circuit-ID configurations, combined with ot exceed the capacity of the NVRAM or the flash memory, an error message appears.			
Examples	This example shows how to configure the option-82 circuit-ID suboption:		
	Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id string customerABC-250-0-0		
	You can verify you	r settings by entering the show ip dhcp snooping user EXEC command.	

The **show ip dhcp snooping user EXEC** command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.

Related Commands	Command	Description	
	ip dhcp snooping information option format remote-id	Configures the option-82 remote-ID suboption.	
	show ip dhcp snooping	Displays the DHCP snooping configuration.	

ip igmp filter

Use the **ip igmp filter** interface configuration command on the switch stack or on a standalone switch to control whether or not all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an Internet Group Management Protocol (IGMP) profile to the interface. Use the **no** form of this command to remove the specified profile from the interface.

ip igmp filter profile number

no ip igmp filter

Syntax Description	profile number	The IGMP profile number to be applied. The range is 1 to 4294967295.	
Defaults	No IGMP filters a	re applied.	
Command Modes	Interface configura	ation	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	You can apply IGMP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.		
	An IGMP profile can be applied to one or more switch port interfaces, but one port can have only one profile applied to it.		
Examples	This example show	ws how to apply IGMP profile 22 to a port:	
		interface gigabitethernet1/0/2)# ip igmp filter 22	
	You can verify you specifying an inter	ur setting by using the show running-config privileged EXEC command and by rface.	

Related Commands	Command	Description
	ip igmp profile	Configures the specified IGMP profile number.
	show ip dhcp snooping statistics	Displays the characteristics of the specified IGMP profile.
	show running-config interface <i>interface-id</i>	Displays the running configuration on the switch interface, including the IGMP profile (if any) that is applied to an interface. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

ip igmp max-groups

Use the **ip igmp max-groups** interface configuration command on the switch stack or on a standalone switch to set the maximum number of Internet Group Management Protocol (IGMP) groups that a Layer 2 interface can join or to configure the IGMP throttling action when the maximum number of entries is in the forwarding table. Use the **no** form of this command to set the maximum back to the default, which is to have no maximum limit, or to return to the default throttling action, which is to drop the report.

ip igmp max-groups {number | action {deny | replace}}

no ip igmp max-groups {*number* | **action**}

Syntax Description	number	The maximum number of IGMP groups that an interface can join. The range is 0 to 4294967294. The default is no limit.
	action deny	When the maximum number of entries is in the IGMP snooping forwarding table, drop the next IGMP join report. This is the default action.
	action replace	When the maximum number of entries is in the IGMP snooping forwarding table, replace the existing group with the new group for which the IGMP report was received.

Defaults

The default maximum number of groups is no limit.

After the switch learns the maximum number of IGMP group entries on an interface, the default throttling action is to drop the next IGMP report that the interface receives and to not add an entry for the IGMP group to the interface.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines

delines You can use this command only on Layer 2 physical interfaces and on logical EtherChannel interfaces. You cannot set IGMP maximum groups for routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group. Follow these guidelines when configuring the IGMP throttling action:

- If you configure the throttling action as **deny** and set the maximum group limitation, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out, when the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.
- If you configure the throttling action as **replace** and set the maximum group limitation, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected multicast entry with the received IGMP report.
- When the maximum group limitation is set to the default (no maximum), entering the **ip igmp max-groups** {**deny** | **replace**} command has no effect.

Examples This example shows how to limit to 25 the number of IGMP groups that a port can join:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip igmp max-groups 25

This example shows how to configure the switch to replace the existing group with the new group for which the IGMP report was received when the maximum number of entries is in the forwarding table:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip igmp max-groups action replace

You can verify your setting by using the **show running-config** privileged EXEC command and by specifying an interface.

Related Commands	Command	Description
	show running-config interface	Displays the running configuration on the switch interface, including
	interface-id	the maximum number of IGMP groups that an interface can join and
		the throttling action. For syntax information, select Cisco IOS
		Configuration Fundamentals Command Reference, Release 12.2 >
		File Management Commands > Configuration File Management
		Commands.

ip igmp profile

Use the **ip igmp profile** global configuration command on the switch stack or on a standalone switch to create an Internet Group Management Protocol (IGMP) profile and enter IGMP profile configuration mode. From this mode, you can specify the configuration of the IGMP profile to be used for filtering IGMP membership reports from a switchport. Use the **no** form of this command to delete the IGMP profile.

ip igmp profile profile number

no ip igmp profile profile number

Syntax Description	profile number	The IGMP profile number being configured. The range is 1 to 4294967295.	
Defaults	No IGMP profiles are defined. When configured, the default action for matching an IGMP profil deny matching addresses.		
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	 When you are in IGMP profile configuration mode, you can create the profile by using these commands: deny: specifies that matching addresses are denied; this is the default condition. exit: exits from igmp-profile configuration mode. 		
	• no: negates a command or resets to its defaults.		
	 permit: specifies that matching addresses are permitted. range: specifies a range of IP addresses for the profile. This can be a single IP address or a range with a start and an end address. 		
	When entering a range, enter the low IP multicast address, a space, and the high IP multicast address You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.		
Examples	This example show addresses:	ws how to configure IGMP profile 40 that permits the specified range of IP multicast	
	Switch(config-ig	<pre>ip igmp profile 40 mp-profile)# permit mp-profile)# range 233.1.1.1 233.255.255.255</pre>	

You can verify your settings by using the show ip igmp profile privileged EXEC command.

Related Commands	Command	Description
	ip igmp filter	Applies the IGMP profile to the specified interface.
	show ip dhcp snooping statistics	Displays the characteristics of all IGMP profiles or the specified IGMP profile number.

ip igmp snooping

Use the **ip igmp snooping** global configuration command on the switch stack or on a standalone switch to globally enable Internet Group Management Protocol (IGMP) snooping on the switch or to enable it on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping [vlan vlan-id]

no ip igmp snooping [**v**lan vlan-id]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.	
Defaults	IGMP snooping is g	globally enabled on the switch.	
	IGMP snooping is e	enabled on VLAN interfaces.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	When IGMP snooping is enabled globally, it is enabled in all the existing VLAN interfaces. When IGMP snooping is globally disabled, it is disabled on all the existing VLAN interfaces.		
	VLAN IDs 1002 to snooping.	1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
Examples	This example shows	s how to globally enable IGMP snooping:	
	Switch(config)# i	p igmp snooping	
	This example shows	s how to enable IGMP snooping on VLAN 1:	
	Switch(config)# i	p igmp snooping vlan 1	
	You can verify your	settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping querier

Use the **ip igmp snooping querier** global configuration command on the switch stack or on a standalone switch to globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. Use the **no** form of this command to return to the default settings.

- **ip igmp snooping querier** [**vlan** *vlan-id*] [**address** *ip-address* | **max-response-time** *response-time* | **query-interval** *interval-count* | **tcn query** [**count** *count* | **interval** *interval*] | **timer expiry** | **version** *version*]
- **no ip igmp snooping querier [vlan** *vlan-id*] [**address** | **max-response-time** | **query-interval** | **tcn query** { **count** *count* | **interval** *interval* } | **timer expiry** | **version**]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping and the IGMP querier function on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.
	address ip-address	(Optional) Specify a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.
	max-response-time response-time	(Optional) Set the maximum time to wait for an IGMP querier report. The range is 1 to 25 seconds.
	query-interval <i>interval-count</i>	(Optional) Set the interval between IGMP queriers. The range is 1 to 18000 seconds.
	tcn query[count <i>count</i> interval <i>interval</i>]	(Optional) Set parameters related to Topology Change Notifications (TCNs). The keywords have these meanings:
		• count —Set the number of TCN queries to be executed during the TCN interval time. The range is 1 to 10.
		• interval <i>interval</i> —Set the TCN query interval time. The range is 1 to 255.
	timer expiry	(Optional) Set the length of time until the IGMP querier expires. The range is 60 to 300 seconds.
	version version	(Optional) Select the IGMP version number that the querier feature uses.
		Select 1 or 2.
Defaults	The IGMP snooping que	rier feature is globally disabled on the switch.
Defaults	1 0 1	rier feature is globally disabled on the switch. P snooping querier disables itself if it detects IGMP traffic from a
Defaults Command Modes	When enabled, the IGMI	rier feature is globally disabled on the switch. P snooping querier disables itself if it detects IGMP traffic from a
	When enabled, the IGMI multicast-enabled device	rier feature is globally disabled on the switch. P snooping querier disables itself if it detects IGMP traffic from a

Usage Guidelines	Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a <i>querier</i> .
	By default, the IGMP snooping querier is configured to detect devices that use IGMP Version 2 (IGMPv2) but does not detect clients that are using IGMP Version 1 (IGMPv1). You can manually configure the max-response-time value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured and is set to zero).
	Non-RFC compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the max-response-time value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1.
	VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.
Examples	This example shows how to globally enable the IGMP snooping querier feature: Switch(config)# ip igmp snooping querier
	This example shows how to set the IGMP snooping querier maximum response time to 25 seconds: Switch(config)# ip igmp snooping querier max-response-time 25
	This example shows how to set the IGMP snooping querier interval time to 60 seconds: Switch(config)# ip igmp snooping querier query-interval 60
	This example shows how to set the IGMP snooping querier TCN query count to 25: Switch(config)# ip igmp snooping querier tcn count 25
	This example shows how to set the IGMP snooping querier timeout to 60 seconds: Switch(config)# ip igmp snooping querier timeout expiry 60
	This example shows how to set the IGMP snooping querier feature to version 2: Switch(config)# ip igmp snooping querier version 2
	You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping report-suppression

Use the **ip igmp snooping report-suppression** global configuration command on the switch stack or on a standalone switch to enable Internet Group Management Protocol (IGMP) report suppression. Use the **no** form of this command to disable IGMP report suppression and to forward all IGMP reports to multicast routers.

ip igmp snooping report-suppression

no ip igmp snooping report-suppression

Syntax Description	This command has n	o arguments or keywords.
--------------------	--------------------	--------------------------

Defaults IGMP report suppression is enabled.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage GuidelinesIGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports.This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression by entering the **no ip igmp snooping report-suppression** command, all IGMP reports are forwarded to all the multicast routers.

Examples

This example shows how to disable report suppression: Switch(config)# no ip igmp snooping report-suppression

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description

ip igmp snooping tcn flood

Use the **ip igmp snooping tcn flood** interface configuration command on the switch stack or on a standalone switch to specify multicast flooding as the Internet Group Management Protocol (IGMP) snooping spanning-tree Topology Change Notification (TCN) behavior. Use the **no** form of this command to disable the multicast flooding.

ip igmp snooping tcn flood

no ip igmp snooping tcn flood

Syntax Description	This command has no arguments or keywords.	

Defaults Multicast flooding is enabled on an interface during a spanning-tree TCN event.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines When the switch receives a TCN, multicast traffic is flooded to all the ports until two general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, the flooding might exceed the capacity of the link and cause packet loss.

You can change the flooding query count by using the **ip igmp snooping tcn flood query count** global configuration command.

Examples This example shows how to disable the multicast flooding on an interface:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no ip igmp snooping tcn flood

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
	ip igmp snooping tcn	Configures the IGMP TCN behavior on the switch.
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping vlan immediate-leave

Use the **ip igmp snooping immediate-leave** global configuration command on the switch stack or on a standalone switch to enable Internet Group Management Protocol (IGMP) snooping immediate-leave processing on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping vlan vlan-id immediate-leave

no ip igmp snooping vlan vlan-id immediate-leave

Syntax Description	vlan-id		snooping and the Immediate-Leave feature on the specified nge is 1 to 1001 and 1006 to 4094.
Defaults	IGMP immediate-leav	e processing is dis	abled.
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command	d was introduced.
Usage Guidelines	VLAN IDs 1002 to 10 snooping.	005 are reserved for	r Token Ring and FDDI VLANs and cannot be used in IGMP
			ave feature only when there is a maximum of one receiver on on is saved in NVRAM.
	The Immediate-Leave	feature is supporte	ed only with IGMP Version 2 hosts.
Examples	This example shows h	ow to enable IGM	P immediate-leave processing on VLAN 1:
	Switch(config)# ip	igmp snooping vla	an 1 immediate-leave
	You can verify your se	ettings by entering	the show ip igmp snooping privileged EXEC command.
Related Commands	Command		Description
	ip igmp snooping re	port-suppression	Enables IGMP report suppression.
	show ip igmp snoopi		Displays the snooping configuration.
	show ip igmp snoopi		Displays IGMP snooping multicast information.
	show ip igmp snoopi		Displays the IGMP snooping router ports.
	show ip igmp snoop		Displays the configuration and operation information for the IGMP querier configured on a switch.

ip igmp snooping vlan mrouter

Use the **ip igmp snooping mrouter** global configuration command on the switch stack or on a standalone switch to add a multicast router port or to configure the multicast learning method. Use the **no** form of this command to return to the default settings.

ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

no ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

Syntax Description	vlan-id	Enable IGMP snooping, and add the port in the specified VLAN as the multicast router port. The range is 1 to 1001 and 1006 to 4094.		
	interface interface-id	Specify the next-hop interface to the multicast router. The keywords have these meanings:		
		 gigabitethernet <i>interface number</i>—a Gigabit Ethernet IEEE 802.3z interface. tengigabitethernet <i>interface number</i>—a 10-Gigabit Ethernet IEEE 802.3z interface. port-channel <i>interface number</i>—a channel interface. The range is 0 to 48. 		
	learn {cgmp pim-dvmrp}	Specify the multicast router learning method. The keywords have these meanings:		
		• cgmp —Set the switch to learn multicast router ports by snooping on Cisco Group Management Protocol (CGMP) packets.		
		• pim-dvmrp —Set the switch to learn multicast router ports by snooping on IGMP queries and Protocol-Independent Multicast-Distance Vector Multicast Routing Protocol (PIM-DVMRP) packets.		
Defaults	By default, there are no multicast router ports.			
	The default learning me	thod is pim-dvmrp —to snoop IGMP queries and PIM-DVMRP packets.		
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines				
Usage Guidelines	VLAN IDs 1002 to 100 snooping.	5 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP		
Usage Guidelines	snooping.	5 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP od is useful for reducing control traffic.		

ExamplesThis example shows how to configure a port as a multicast router port:
Switch(config)# ip igmp snooping vlan 1 mrouter interface gigabitethernet1/0/2
This example shows how to specify the multicast router learning method as CGMP:
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp
You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description
	ip igmp snooping report-suppression	Enables IGMP report suppression.
	show ip igmp snooping	Displays the snooping configuration.
	show ip igmp snooping groups	Displays IGMP snooping multicast information.
	show ip igmp snooping mrouter	Displays the IGMP snooping router ports.
	show ip igmp snooping querier	Displays the configuration and operation information for the IGMP querier configured on a switch.

ip igmp snooping vlan static

Use the **ip igmp snooping static** global configuration command on the switch stack or on a standalone switch to enable Internet Group Management Protocol (IGMP) snooping and to statically add a Layer 2 port as a member of a multicast group. Use the **no** form of this command to remove ports specified as members of a static multicast group.

ip igmp snooping vlan vlan-id static ip-address interface interface-id

no ip igmp snooping vlan vlan-id static ip-address interface interface-id

Suntax Description				
Syntax Description	vlan-id	Enable IGMP snooping on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.		
	ip-address	Add a Layer 2 port as a member of a multicast group with the specified group IP address.		
	interface interface-id	Specify the interface of the member port. The keywords have these meanings:		
		• gigabitethernet <i>interface number</i> —a Gigabit Ethernet IEEE 802.3z interface.		
		• tengigabitethernet <i>interface number</i> —a 10-Gigabit Ethernet IEEE 802.3z interface.		
		• port-channel <i>interface number</i> —a channel interface. The range is 0 to 48.		
Defaults	By default, there are no	ports statically configured as members of a multicast group.

ip snap forwarding

L

Use the **ip snap forwarding** global configuration command on the switch stack or on a standalone switch to enable forwarding of IP Version 4 (IPv4) and IP Version 6 (IPv6) frames with Subnetwork Access Protocol (SNAP) encapsulation. Use **no** form of this command to disable forwarding of these frames.

ip snap forwarding

no ip snap forwarding

Syntax Description This command has no arguments or keywords.

Defaults The switch does not forward IPv4 and IPv6 frames with SNAP encapsulation.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines Use the **ip snap forwarding** global configuration command to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation.

If a switch that is joining the stack does not support forwarding of IPv4 and IPv6 frames with SNAP encapsulation, all the switches in the stack do not forward the IPv4 and IPv6 frames, and this forwarding feature is disabled.

 Examples
 This example shows how to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation:

 Switch(config)# ip snap forwarding

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_comm and_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

ip source binding

Use the **ip source binding** global configuration command on the switch stack or on a standalone switch to configure static IP source bindings on the switch. Use the **no** form of this command to delete static bindings.

ip source binding mac-address vlan vlan-id ip-address interface interface-id

no source binding mac-address vlan vlan-id ip-address interface interface-id

Syntax Description mac-address Specify a MAC address. vlan vlan-id Specify a VLAN number. The range is from 1 to 4094. ip-address Specify an IP address. interface interface-id Specify an interface on which to add or delete an IP source b Defaults No IP source bindings are configured.	vinding.		
ip-address Specify an IP address. interface interface-id Specify an interface on which to add or delete an IP source b	inding.		
interface <i>interface-id</i> Specify an interface on which to add or delete an IP source b	vinding.		
	oinding.		
Defaults No IP source bindings are configured.			
Command Modes Global configuration			
Command History Release Modification			
12.2(40)EX2 This command was introduced.			
Usage Guidelines A static IP source binding entry has an IP address, its associated MAC address, and its as number. The entry is based on the MAC address and the VLAN number. If you modify changing only the IP address, the switch updates the entry instead creating a new one.			
Examples This example shows how to add a static IP source binding:	This example shows how to add a static IP source binding:		
Switch(config)# ip source binding 0001.1234.1234 vlan 1 172.20.50.5 interfac gigabitethernet1/0/1	Switch(config)# ip source binding 0001.1234.1234 vlan 1 172.20.50.5 interface gigabitethernet1/0/1		
This example shows how to add a static binding and then modify the IP address for it:	This example shows how to add a static binding and then modify the IP address for it:		
Switch(config)# ip source binding 0001.1357.0007 vlan 1 172.20.50.25 interfa gigabitethernet1/0/1 Switch(config)# ip source binding 0001.1357.0007 vlan 1 172.20.50.30 interfa gigabitethernet1/0/1			
You can verify your settings by entering the show ip source binding privileged EXEC	command.		

Related Commands	Command	Description
	ip verify source	Enables IP source guard on an interface.
	show ip source binding	Displays the IP source bindings on the switch.
	show ip verify source	Displays the IP source guard configuration on the switch or on a specific interface.

ip ssh

	Use the ip ssh global configuration command on the switch stack or on a standalone switch to configure the switch to run Secure Shell (SSH) Version 1 or SSH Version 2. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the no form of this command to return to the default setting.
	ip ssh version [1 2]
	no ip ssh version [1 2]
Syntax Description	1 (Optional) Configure the switch to run SSH Version 1 (SSHv1).
	2 (Optional) Configure the switch to run SSH Version 2 (SSHv2).
Defaults	The default version is the latest SSH version supported by the SSH client.
Command Modes	Global configuration
Command History	Release Modification
	12.2(40)EX2This command was introduced.
Usage Guidelines	If you do not enter this command or if you do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.
	The switch supports an SSHv1 or an SSHv2 server. It also supports an SSHv1 client. For more information about the SSH server and the SSH client, see the software configuration guide for this release.
	A Rivest, Shamir, and Adelman (RSA) key pair generated by an SSHv1 server can be used by an SSHv2 server and the reverse.
Examples	This example shows how to configure the switch to run SSHv2: Switch(config)# ip ssh version 2
	You can verify your settings by entering the show ip ssh or show ssh privileged EXEC command.

Related Commands	Command	Description
	show ip ssh	Displays if the SSH server is enabled and displays the version and configuration information for the SSH server. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command References > Cisco IOS Security Command Reference, Release 12.2 > Other Security Features > Secure Shell Commands .
	show ssh	Displays the status of the SSH server. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command References > Cisco IOS Security Command Reference, Release 12.2 > Other Security Features > Secure Shell Commands .

ip verify source

Use the **ip verify source** interface configuration command on the switch stack or on a standalone switch to enable IP source guard on an interface. Use the **no** form of this command to disable IP source guard.

ip verify source [port-security]

no ip verify source

Syntax Description	port-security (Optional) Enable IP source guard with IP and MAC address filtering.		
		•	do not enter the port-security keyword, IP source guard with IP s filtering is enabled.
Defaults	IP source guard	is disabled.	
Command Modes	Interface config	uration	
Command History	Release	Modification	
	12.2(40)EX2	This command	d was introduced.
Usage Guidelines	To enable IP source guard with source IP address filtering, use the ip verify source interface configuration command.		
	To enable IP source guard with source IP and MAC address filtering, use the ip verify source port-security interface configuration command.		
	To enable IP souther the interface.	rce guard with so	ource IP and MAC address filtering, you must enable port security on
Examples	This example shows how to enable IP source guard with source IP address filtering: Switch(config-if)# ip verify source		
	This example shows how to enable IP source guard with source IP and MAC address filtering:		
	Switch(config-if)# ip verify source port-security		
	You can verify your settings by entering the show ip source binding privileged EXEC command.		
Related Commands	Command		Description
	ip source bindi	ng	Configures static bindings on the switch.
	show ip verify	source	Displays the IP source guard configuration on the switch or on a specific interface.

ipv6 access-list

Use the **ipv6 access-list** global configuration command on the switch stack or on a standalone switch to define an IPv6 access list and to place the switch in IPv6 access list configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list access-list-name

	no ipv6 access	-list access-list-name
Note		apported only if you have configured a dual IPv4 and IPv6 Switch Database () template on the switch.
Syntax Description	access-list-name	Name of the IPv6 access list. Names cannot contain a space or quotation mark or begin with a numeric.
Defaults	No IPv6 access list	is defined.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines		al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) n command and reload the switch.
	The ipv6 access-lis	t command is similar to the ip access-list command, but it is IPv6-specific.
Note	IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL an IPv6 ACL cannot share the same name.	
	for more information	access-list configuration) and permit (IPv6 access-list configuration) commands on on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer mation. See the "Examples" section for an example of a translated IPv6 ACL
Note	any any statements	s implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 as its last match conditions. The two permit conditions allow ICMPv6 neighbor ow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any

discovery. To disallow ICMPv6 neighbor discovery and to deny **icmp any any nd-na** or **icmp any any nd-ns**, there must be an explicit **deny** entry in the ACL. For the implicit **deny ipv6 any any** statement to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. You can apply inbound and outbound IPv6 ACLs to Layer 3 physical interfaces or switch virtual interfaces for routed ACLs, but only inbound IPv6 ACLs to Layer 2 interfaces for port ACLs.

Note

An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded by the switch and does not filter traffic generated by the switch.

Examples

This example puts the switch in IPv6 access list configuration mode and configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on an interface. The first ACL entry prevents all packets from the network FE80:0:0:2::/64 (packets that have the link-local prefix FE80:0:0:2 as the first 64 bits of their source IPv6 address) from leaving the interface. The second entry in the ACL permits all other traffic to leave the interface. The second entry is necessary because an implicit deny-all condition is at the end of each IPv6 ACL.

```
Switch(config)# ipv6 access-list list2
Switch(config-ipv6-acl)# deny FE80:0:0:2::/64 any
Switch(config-ipv6-acl)# permit any any
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter list2 out
```

```
Note
```

IPv6 ACLs that rely on the implicit deny condition or specify a **deny any any** statement to filter traffic should contain **permit** statements for link-local addresses to avoid the filtering of protocol packets. Additionally IPv6 ACLs that use **deny** statements to filter traffic should also use a **permit any any** statement as the last statement in the list.

Related Commands	Command	Description
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

ipv6 address dhcp

Use the **ipv6 address dhcp** interface configuration command on the switch stack or on a standalone switch to acquire an IPv6 address on an interface from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server. To remove the address from the interface, use the **no** form of this command.

ipv6 address dhcp [rapid-commit]

no ipv6 address dhcp [rapid-commit]

This command is available only if the switch stack or standalone switch is running the advanced IP services feature set and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.			
rapid-commit	(Optional) Allow two-message exchange method for address assignment.		
No default is defined	I.		
Interface configuration	on		
Release	Modification		
12.2(46)SE	This command was introduced.		
To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan } global configuration command, and reload the switch.			
The ipv6 address dhcp interface configuration command allows any interface to dynamically learn its IPv6 address by using the DHCP protocol.			
The rapid-commit keyword enables the use of the two-message exchange for address allocation and other configuration. If it is enabled, the client includes the rapid-commit option in a solicit message.			
This example shows how to acquire an IPv6 address and enable the rapid-commit option:			
Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# ipv6 address dhcp rapid-commit			
You can verify your settings by using the show ipv6 dhcp interface privileged EXEC command.			
Command	Description		
show ipv6 dhcp int	erface Displays DHCPv6 interface information.		
	services feature set a template on the switch rapid-commit No default is defined Interface configuration Release 12.2(46)SE To configure the dua vlan } global configur The ipv6 address dr IPv6 address by usin The rapid-commit k other configuration. This example shows Switch(config)# im Switch(config)# im Switch(config)# im Switch(config)# im		

ipv6 dhcp client request vendor

Use the **ipv6 dhcp client request** interface configuration command on the switch stack or on a standalone switch to configure an IPv6 client to request an option from a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server. To remove the request, use the **no** form of this command.

ipv6 dhcp client request vendor

no ipv6 dhcp client request vendor

•	
This command has no arguments or keywords.	
No default is defined.	
Interface configuration	
Release Modification	
12.2(46)SEThis command was introduced.	
To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 vlan } global configuration command, and reload the switch.	{default
Use the ipv6 dhcp client request vendor interface configuration to request a vendor-specific option. When enabled, the command is checked only when an IPv6 address is acquired from DHCP. If you enter the command after the interface has acquired an IPv6 address, it does not take effect until the next time the client acquires an IPv6 address from DHCP.	
This example shows how to enable the request vendor-specific option.	
Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# ipv6 dhcp client request vendor-specific	
Command Description	
ipv6 address dhcp Acquires an IPv6 address on an interface from DHCP.	
	This command has no arguments or keywords. No default is defined. Interface configuration Release Modification 12.2(46)SE This command was introduced. To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 vlan) global configuration command, and reload the switch. Use the ipv6 dhcp client request vendor interface configuration to request a vendor-spec When enabled, the command is checked only when an IPv6 address is acquired from DHCI the command after the interface has acquired an IPv6 address, it does not take effect until the client acquires an IPv6 address from DHCP. This example shows how to enable the request vendor-specific option. Switch(config)# interface gigabitethernet2/0/1 Switch(config)iiiip* ipv6 dhcp client request vendor-specific Command Description

ipv6 dhcp ping packets

Use the **ipv6 dhcp ping packets** global configuration command on the switch stack or on a standalone switch to specify the number of packets a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server sends to a pool address as part of a ping operation. To prevent the server from pinging pool addresses, use the **no** form of this command.

ipv6 dhcp ping packets number

no ipv6 dhcp ping packets

Note	This command is available only if the switch stack or standalone switch is running the advanced IP services feature set and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM template on the switch.		
Syntax Description	number	The number of ping packets sent before the address is assigned to a requesting client. The range is 0 to 10.	
Defaults	The default is 0.		
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(46)SE	This command was introduced.	
Usage Guidelines	•	al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default uration command, and reload the switch.	
	The DHCPv6 server pings a pool address before assigning the address to a requesting client. If the ping is unanswered, the server assumes, with a high probability, that the address is not in use and assigns the address to the requesting client.		
	Setting the <i>number</i> argument to 0 turns off the DHCPv6 server ping operation.		
Examples	This example specifies two ping attempts by the DHCPv6 server before further ping attempts stop: Switch(config)# ipv6 dhcp ping packets 2		

Related Commands	Command	Description
	clear ipv6 dhcp conflict	Clears an address conflict from the DHCPv6 server database.
	show ipv6 dhcp conflict	Displays address conflicts found by a DHCPv6 server, or reported through a DECLINE message from a client.

ipv6 dhcp pool

Use the **ipv6 dhcp pool** global configuration command on the switch stack or on a standalone switch to enter Dynamic Host Configuration Protocol for IPv6 (DHCPv6) pool configuration mode. Use the **no** form of this command to return to the default settings.

ipv6 dhcp pool poolname

no ipv6 dhcp pool poolname

Note	This command is available only if the switch stack or standalone switch is running the advanced IP services feature set and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	poolname	User-defined name for the DHCPv6 pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).	
Defaults	No default is defined.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(46)SE	The address prefix , lifetime , link-address , and vendor-specific keywords were added to the command sub-modes.	
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan } global configuration command, and reload the switch.		
	The ipv6 dhcp pool command enables the DHCPv6 pool configuration mode. These configuration commands are available:		
	• address prefix <i>IPv6-prefix</i> : sets an address prefix for address assignment. This address must be in hexadecimal, using 16-bit values between colons.		
	• lifetime <i>t1 t2</i> : sets a <i>valid</i> and a <i>preferred</i> time interval (in seconds) for the IPv6 address. The range is 5 to 4294967295 seconds. The valid default is 2 days. The preferred default is 1 day. The valid lifetime must be greater than or equal to the preferred lifetime. Specify infinite for no time interval.		
	• link-address <i>IPv6-prefix</i> : sets a link-address IPv6 prefix. When an address on the incoming interface or a link-address in the packet matches the specified IPv6-prefix, the server uses the configuration information pool. This address must be in hexadecimal, using 16-bit values between colons.		

- **vendor-specific**: enables the DHCPv6 vendor-specific configuration mode. These configuration commands are available:
 - vendor-id: enter a vendor-specific identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295.
 - **suboption** *number*: sets vendor-specific suboption number. The range is 1 to 65535. Enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.

After you create the DHCPv6 configuration information pool, use the **ipv6 dhcp server** interface configuration command to associate the pool with a server on an interface. However, if you do not configure an information pool, you still need to use the **ipv6 dhcp server** interface configuration command to enable the DHCPv6 server function on an interface.

When you associate a DHCPv6 pool with an interface, only that pool services requests on the associated interface. The pool also services other interfaces. If you do not associate a DHCPv6 pool with an interface, it can service requests on any interface.

Not using any IPv6 address prefix means that the pool only returns configured options.

The **link-address** keyword allows matching a link-address without necessarily allocating an address. You can match the pool from multiple relays by using multiple link-address configuration commands inside a pool.

Because a longest match is performed on either the address pool information or the link information, you can configure one pool to allocate addresses and another pool on a subprefix that only returns configured options.

Examples

This example shows how to configure a pool called engineering with an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool engineering
Switch(config-dhcpv6)# address prefix 2001:1000::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called testgroup with three link-address prefixes and an IPv6 address prefix:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool testgroup
Switch(config-dhcpv6)# link-address 2001:1001::0/64
Switch(config-dhcpv6)# link-address 2001:1002::0/64
Switch(config-dhcpv6)# link-address 2001:2000::0/48
Switch(config-dhcpv6)# address prefix 2001:1003::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called 350 with vendor-specific options:

```
Switch# configure terminal
Switch(config)# ipv6 dhcp pool 350
Switch(config-dhcpv6)# vendor-specific 9
Switch(config-dhcpv6-vs)# suboption 1 address 1000:235D::1
Switch(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone"
Switch(config-dhcpv6-vs)# end
```

Related Commands	Command	Description
	ipv6 dhcp server	Enables DHCPv6 service on an interface.
	show ipv6 dhcp pool	Displays DHCPv6 configuration pool information.

ipv6 dhcp server

Use the **ipv6 dhcp server** interface configuration command on the switch stack or on a standalone switch to enable Dynamic Host Configuration Protocol for IPv6 (DHCPv6) service on an interface. To disable DHCPv6 service on an interface, use the **no** form of this command.

ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]

no ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]

This command is available only if the switch stack or standalone switch is running the advanced IP services feature set and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	poolname	(Optional) User-defined name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).		
	automatic	(Optional) Enable the server to automatically determine which pool to use when allocating addresses for a client.		
	rapid-commit	(Optional) Allow two-message exchange method.		
	preference value	(Optional) The preference value carried in the preference option in the advertise message sent by the server. The range is from 0 to 255. The preference value default is 0.		
	allow-hint	(Optional) Specify whether the server should consider client suggestions in the SOLICIT message. By default, the server ignores client hints.		
Command Modes	Interface configuration			
Command History	Release	Modification		
	12.2(46)SE	The automatic keyword was added to the command.		
Usage Guidelines	The ipv6 dhcp server interface configuration command enables DHCPv6 service on a specified interface.			
	allocating addresses for determines if it was re packet was received for	ord enables the system to automatically determine which pool to use when or a client. When an IPv6 DHCP packet is received by the server, the server exceived from a DHCP relay or if it was directly received from the client. If the rom a relay, the server verifies the link-address field inside the packet associated at is closest to the client. The server matches this link-address against all address		

If the packet was directly received from the client, the server performs this same matching, but it uses all the IPv6 addresses configured on the incoming interface when performing the match. Once again, the server selects the longest prefix match.

The **rapid-commit** keyword enables the use of the two-message exchange.

If the **preference** keyword is configured with a value other than 0, the server adds a preference option to carry the preference value for the advertise messages. This action affects the selection of a server by the client. Any advertise message that does not include a preference option is considered to have a preference value of 0. If the client receives an advertise message with a preference value of 255, the client immediately sends a request message to the server from which the message was received.

If the **allow-hint** keyword is specified, the server allocates a valid client-suggested address in the solicit and request messages. The prefix address is valid if it is in the associated local prefix address pool and it is not assigned to a device. If the **allow-hint** keyword is not specified, the server ignores the client hint, and an address is allocated from the free list in the pool.

The DHCPv6 client, server, and relay functions are mutually exclusive on an interface. When one of these functions is already enabled and you try to configure a different function on the same interface, the switch returns one of these messages:

Interface is in DHCP client mode Interface is in DHCP server mode Interface is in DHCP relay mode

Examples This example enables DHCPv6 for the pool named testgroup:

Switch(config-if) # ipv6 dhcp server testgroup

Related Commands	Command	Description
	ipv6 dhcp pool	Configures a DHCPv6 pool and enters DHCPv6 pool configuration mode.
	show ipv6 dhcp interface	Displays DHCPv6 interface information.

ipv6 mld snooping

Use the **ipv6 mld snooping** global configuration command on the switch stack or on a standalone switch without keywords to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN. Use the **no** form of this command to disable MLD snooping on the switch or switch stack or the VLAN.

ipv6 mld snooping [vlan vlan-id]

no ipv6 mld snooping [**vlan** *vlan-id*]

	no ipvo iniu si		
Note	This command is supported only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	vlan vlan-id	(Optional) Enable or disable IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
Defaults	MLD snooping is g	lobally disabled on the switch.	
	MLD snooping is e VLAN snooping wi	nabled on all VLANs. However, MLD snooping must be globally enabled before ill take place.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	-	al IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) n command and reload the switch.	
	globally enable ML	ng is globally disabled, it is disabled on all the existing VLAN interfaces. When you D snooping, it is enabled on all VLAN interfaces that are in the default state onfiguration will override global configuration on interfaces on which MLD disabled.	
		s globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally sable it on individual VLANs.	
	VLAN numbers 100 in MLD snooping.	02 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

Examples	This example shows how to globally enable MLD snooping: Switch(config)# ipv6 mld snooping This example shows how to disable MLD snooping on a VLAN: Switch(config)# no ipv6 mld snooping vlan 11 You can verify your settings by entering the show ipv6 mld snooping user EXEC command.

ipv6 mld snooping vlan

ipv6 mld snooping vlan

Use the **ipv6 mld snooping vlan** global configuration command on the switch stack or on a standalone switch to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface. Use the **no** form of this command to reset the parameters to the default settings.

ipv6 mld snooping vlan *vlan-id* [**immediate-leave** | **mrouter interface** *interface-id* | **static** *ipv6-multicast-address* **interface** *interface-id*]

no ipv6 mld snooping vlan *vlan-id* [**immediate-leave** | **mrouter interface** *interface-id* | **static** *ip-address* **interface** *interface-id*]

Note

This command is supported only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	vlan vlan-id	Specify a VLAN number. The range is 1 to 1001 and 1006 to 4094.		
	immediate-leave	(Optional) Enable MLD Immediate-Leave processing on a VLAN		
		interface. Use the no form of the command to disable the Immediate		
		Leave feature on the interface.		
	mrouter interface	(Optional) Configure a multicast router port. The no form of the command removes the configuration.		
	static ipv6-multicast-address	(Optional) Configure a multicast group with the specified IPv6 multicast address.		
	interface interface-id	Add a Layer 2 port to the group. The mrouter or static interface can be a physical port or a port-channel interface in the range of 1 to 48.		
Command Default	MID snooping Immediate. Le	ave processing is disabled		
Sommand Denaut	MLD snooping Immediate-Leave processing is disabled.			
	By default, there are no static IPv6 multicast groups.			
	By default, there are no multic	cast router ports.		
Command Modes	Global configuration			
Command History	Release Mod	lification		
	12.2(40)EX2 This	s command was introduced.		
Usage Guidelines	•	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) global configuration command and reload the switch.		
	You should only configure the the VLAN. The configuration	Immediate-Leave feature when there is only one receiver on every port in is saved in NVRAM.		
	The static keyword is used for	configuring the MLD member ports statically.		

The configuration and the static ports and groups are saved in NVRAM.

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

Examples This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

Switch(config) # ipv6 mld snooping vlan 1 immediate-leave

This example shows how to disable MLD Immediate-Leave processing on VLAN 1:

Switch(config) # no ipv6 mld snooping vlan 1 immediate-leave

This example shows how to configure a port as a multicast router port:

Switch(config) # ipv6 mld snooping vlan 1 mrouter interface gigabitethernet1/0/2

This example shows how to configure a static multicast group:

Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface gigabitethernet1/0/2

You can verify your settings by entering the **show ipv6 mld snooping vlan** *vlan-id* user EXEC command.

ipv6 traffic-filter

Use the **ipv6 traffic-filter** interface configuration command on the switch stack or on a standalone switch to filter IPv6 traffic on an interface. The type and direction of traffic that you can filter depends on the feature set running on the switch stack. Use the **no** form of this command to disable the filtering of IPv6 traffic on an interface.

ipv6 traffic-filter access-list-name {in | out}

no ipv6 traffic-filter *access-list-name* {**in** | **out**}

This command is supported only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	access-list-name	Specify an IPv6 access name.
	in	Specify incoming IPv6 traffic.
	out	Specify outgoing IPv6 traffic.
		Note The out keyword is not supported for Layer 2 interfaces (port ACLs). If the switch stack is running the IP services or IP base feature set, the out keyword is not supported for Layer 3 interfaces.
Defaults	Filtering of IPv6 traff	fic on an interface is not configured.
Command Modes	Interface configuration	n
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	-	IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) command and reload the switch.
	You can use the ipv6 traffic-filter command on physical interfaces (Layer 2 or Layer 3 ports), Layer 3 port channels, or switch virtual interfaces (SVIs).	
	inbound traffic on La ACLs). If the switch s	running the advanced IP services feature set, you can apply an ACL to outbound or yer 3 interfaces (port ACLs), or to inbound traffic on Layer 2 interfaces (router stack is running the IP services or IP base feature set, you can apply ACLs only to traffic on Layer 3 interfaces. Switches running the IP services or IP base feature rt ACLs.
	· 1	4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, attached to the SVI of the port VLAN are ignored.

Examples	This example filters inbound IPv6 traffic on an IPv6-configured interface as defined by the access list named <i>cisco</i> : Switch (config)# interface gigabitethernet1/0/1 Switch(config-if)# no switchport Switch(config-if)# ipv6 address 2001::/64 eui-64 Switch(config-if)# ipv6 traffic-filter cisco in

	show ipv6 access-list	Displays the contents of all current IPv6 access lists.
	show ipv6 interface	Displays the usability status of interfaces configured for IPv6.

l2protocol-tunnel

Use the **l2protocol-tunnel** interface configuration command on the switch stack or on a standalone switch to enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel. You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets. Use the **no** form of this command to disable tunneling on the interface.

- l2protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] value] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] value]
- no l2protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]]

Syntax Description	l2protocol-tunnel	Enable point-to-multipoint tunneling of CDP, STP, and VTP packets.
	cdp	(Optional) Enable tunneling of CDP, specify a shutdown threshold for CDP, or specify a drop threshold for CDP.
	stp	(Optional) Enable tunneling of STP, specify a shutdown threshold for STP, or specify a drop threshold for STP.
	vtp	(Optional) Enable tunneling or VTP, specify a shutdown threshold for VTP, or specify a drop threshold for VTP.
	point-to-point	(Optional) Enable point-to point tunneling of PAgP, LACP, and UDLD packets.
	pagp	(Optional) Enable point-to-point tunneling of PAgP, specify a shutdown threshold for PAgP, or specify a drop threshold for PAgP.
	lacp	(Optional) Enable point-to-point tunneling of LACP, specify a shutdown threshold for LACP, or specify a drop threshold for LACP.
	udld	(Optional) Enable point-to-point tunneling of UDLD, specify a shutdown threshold for UDLD, or specify a drop threshold for UDLD.
	shutdown-threshold	(Optional) Set a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.
	drop-threshold	(Optional) Set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.
	value	Specify a threshold in packets per second to be received for encapsulation before the interface shuts down, or specify the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

Defaults

The default is that no Layer 2 protocol packets are tunneled.

The default is no shutdown threshold for the number of Layer 2 protocol packets.

The default is no drop threshold for the number of Layer 2 protocol packets.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	You must enter this c	ommand, with or without protocol types, to tunnel Layer 2 packets.
	If you enter this com	mand for a port channel, all ports in the channel must have the same configuration.
	propagated across the packets are encapsula	heling across a service-provider network ensures that Layer 2 information is e network to all customer locations. When protocol tunneling is enabled, protocol ted with a well-known Cisco multicast address for transmission across the network. Ich their destination, the well-known MAC address is replaced by the Layer 2 ss.
	You can enable Layer	2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.
	EtherChannels by em the service-provider s	network, you can use Layer 2 protocol tunneling to enhance the creation of ulating a point-to-point network topology. When protocol tunneling is enabled on witch for PAgP or LACP, remote customer switches receive the protocol data units tiate automatic creation of EtherChannels.
	topology. To decrease	of PAgP, LACP, and UDLD packets, you must have a point-to-point network the link-down detection time, you should also enable UDLD on the interface when of PAgP or LACP packets.
	You can enable point three protocols.	-to-point protocol tunneling for PAgP, LACP, and UDLD individually or for all
\wedge		
Caution		LD tunneling is only intended to emulate a point-to-point topology. An erroneous ads tunneled packets to many ports could lead to a network failure.
	received on an interfation the threshold is applied	threshold keyword to control the number of protocol packets per second that are ace before it shuts down. When no protocol option is specified with the keyword, ed to each of the tunneled Layer 2 protocol types. If you also set a drop threshold hutdown-threshold value must be greater than or equal to the drop-threshold value.
	entering the errdisab brought out of the err timed out. If the error	hreshold is reached, the interface is error-disabled. If you enable error recovery by ble recovery cause l2ptguard global configuration command, the interface is or-disabled state and allowed to retry the operation again when all the causes have r recovery mechanism is not enabled for l2ptguard , the interface stays in the ntil you enter the shutdown and no shutdown interface configuration commands.

Enter the **drop-threshold** keyword to control the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.

ExamplesThis example shows how to enable protocol tunneling for CDP packets and to configure the shutdown
threshold as 50 packets per second:
Switch(config-if)# 12protocol-tunnel cdp
Switch(config-if)# 12protocol-tunnel shutdown-threshold cdp 50This example shows how to enable protocol tunneling for STP packets and to configure the drop
threshold as 400 packets per second:
Switch(config-if)# 12protocol-tunnel stp
Switch(config-if)# 12protocol-tunnel drop-threshold stp 400This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and
to configure the PAgP drop threshold as 1000 packets per second:
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point udld
Switch(config-if)# 12protocol-tunn

Related Commands	Command	Description
	l2protocol-tunnel cos	Configures a class of service (CoS) value for all tunneled Layer 2 protocol packets.
	show errdisable recovery	Displays error-disabled recovery timer information.
	show l2protocol-tunnel	Displays information about ports configured for Layer 2 protocol tunneling, including port, protocol, class of service (CoS), and threshold.

l2protocol-tunnel cos

Use the **l2protocol-tunnel cos** global configuration command on the switch stack or on a standalone switch to configure class of service (CoS) value for all tunneled Layer 2 protocol packets. Use the **no** form of this command to return to the default setting.

l2protocol-tunnel cos value

no l2protocol-tunnel cos

Syntax Description	value	Specify CoS priority value for tunneled Layer 2 protocol packets. If a CoS value is configured for data packets for the interface, the default is to use this CoS value. If no CoS value is configured for the interface, the default is 5. The range is 0 to 7, with 7 being the highest priority.
Defaults		e CoS value configured for data on the interface. If no CoS value is configured, unneled Layer 2 protocol packets.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	When enabled, the tunn The value is saved in N	neled Layer 2 protocol packets use this CoS value.
Examples	-	ow to configure a Layer-2 protocol-tunnel CoS value of 7:
	Switch(config)# 12pro	otocol-tunnel cos 7
Related Commands	Command	Description
	show l2protocol-tunn	el Displays information about ports configured for Layer 2 protocol tunneling, including CoS.

lacp port-priority

Use the **lacp port-priority** interface configuration command on the switch stack or on a standalone switch to configure the port priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp port-priority priority

no lacp port-priority

Syntax Description	priority	Port priority for LACP. The range is 1 to 65535.
Defaults	The default is 3276	8.
Command Modes	Interface configurat	ion
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	The lacp port-priority interface configuration command determines which ports are bundled and which ports are put in hot-standby mode when there are more than eight ports in an LACP channel group. An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.	
Usage Guidelines	ports are put in hot- An LACP channel g and up to eight ports	roup can have up to 16 Ethernet ports of the same type. Up to eight ports can be active,
	eight ports in an LACP channel-group, the eight ports with the numerically lowest values (highest priority values) for LACP port priority are bundled into the channel group, and the lower-priority ports are put in hot-standby mode. If two or more ports have the same LACP port priority (for example, they are configured with the default setting of 65535) an internal value for the port number determines the priority.	
Note		orities are only effective if the ports are on the switch that controls the LACP link. -priority global configuration command for determining which switch controls the
	Use the show lacp i number values.	nternal privileged EXEC command to display LACP port priorities and internal port

For information about configuring LACP on physical ports, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

ExamplesThis example shows how to configure the LACP port priority on a port:
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# lacp port-priority 1000

You can verify your settings by entering the **show lacp** [*channel-group-number*] **internal** privileged EXEC command.

Related Commands Command

Command	Description
channel-group	Assigns an Ethernet port to an EtherChannel group.
lacp system-priority	Configures the LACP system priority.
<pre>show lacp [channel-group-number] internal</pre>	Displays internal information for all channel groups or for the specified channel group.

lacp system-priority

Use the **lacp system-priority** global configuration command on the switch stack or on a standalone switch to configure the system priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp system-priority priority

no lacp system-priority

Syntax Description	priority	System priority for LACP. The range is 1 to 65535.	
Defaults	The default is 3276	8.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	The lacp system-pi	riority command determines which switch in an LACP link controls port priorities.	
	An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel-group, the switch on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other switch (the noncontrolling end of the link) are ignored.		
	In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both switches have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the switch MAC address) determines which switch is in control.		
	The lacp system-priority command applies to all LACP EtherChannels on the switch.		
	Use the show etherchannel summary privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).		
		on about configuring LACP on physical ports, see the "Configuring EtherChannels" vare configuration guide for this release.	
Examples	-	s how to set the LACP system priority:	
		acp system-priority 20000	
	You can verify your	settings by entering the show lacp sys-id privileged EXEC command.	

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	lacp port-priority	Configures the LACP port priority.
	show lacp sys-id	Displays the system identifier that is being used by LACP.

link state group

Use the **link state group** interface configuration command to configure a port as a member of a link-state group. Use the **no** form of this command to remove the port from the link-state group.

link state group [number] {upstream | downstream}

no link state group [*number*] {**upstream** | **downstream**}

Syntax Description	number	(Optional) Specify the link-state group number. The group number can be 1 to 10. The default is 1.	
	upstream	Configure a port as an upstream port for a specific link-state group.	
	downstream	Configure a port as a downstream port for a specific link-state group.	
Defaults	The default group is	s group 1.	
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
-	12.2(40)EX2	This command was introduced.	
	number is 1.		
Usage Guidelines	downstream interfac number is 1. To enable link-state	group interface configuration command to configure a port as an upstream or ce for the specified link-state group. If the group number is omitted, the default group tracking, create a <i>link-state group</i> , and specify the interfaces that are assigned to the n interface can be an aggregation of ports (an EtherChannel), a single physical port	
	in access or trunk mode, or a routed port. In a link-state group, these interfaces are bundled together. The <i>downstream interfaces</i> are bound to the <i>upstream interfaces</i> . Interfaces connected to servers are referred to as downstream interfaces, and interfaces connected to distribution switches and network devices are referred to as upstream interfaces.		
	For more information about the interactions between the downstream and upstream interfaces, see the "Configuring EtherChannels and Link-State Tracking" chapter of the software configuration guide for this release.		
	Follow these guidelines to avoid configuration problems:		
	• An interface that is defined as an upstream interface cannot also be defined as a downstream interface in the same or a different link-state group. The reverse is also true.		
	• An interface cannot be a member of more than one link-state group.		
	• You can configure only ten link-state groups per switch.		

Examples

This example shows how to configure the interfaces as **upstream** in group 1:

Switch# configure terminal Switch(config)# interface port-channel 1 Switch(config-if)# link state group 1 upstream Switch(config-if)# end

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	link state track	Enables a link-state group.
	show link state group	Displays the link-state group information.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command _reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

link state track

Use the **link state track** user EXEC command to enable a link-state group. Use the **no** form of this command to disable a link-state group.

link state track [number]

no link state track [number]

Syntax Description	number	(Optional) Specify the link-state group number. The group number can be 1 to 10. The default is 1.
Defaults	Link-state tracking is dis	sabled for all groups.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines Examples		global configuration command to enable a link-state group. v enable link-state group 2: state track 2
	You can verify your setti	ngs by entering the show running-config privileged EXEC command.
Related Commands	Command	Description
	link state group	Configures an interface as a member of a link-state group.
	show link state group	Displays the link-state group information.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_comm and_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

location (global configuration)

Use the **location global configuration** command to configure location information for an endpoint. Use the **no** form of this command to remove the location information.

location {admin-tag string | civic-location identifier id | elin-location string identifier id}

no location {admin-tag string | civic-location identifier id | elin-location string identifier id}

Syntax Description	admin-tag	Configure administrative tag or site information.
	civic-location	Configure civic location information.
	elin-location	Configure emergency location information (ELIN).
	identifier id	Specify the ID for the civic location or the elin location. The ID range is 1 to 4095.
	string	Specify the site or location information in alphanumeric format.
Defaults	This command has	no default setting.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	location configurati information. Use the no lldp me location TLV. The lo	 bocation civic-location identifier <i>id</i> global configuration command, you enter civic on mode. In this mode, you can enter the civic location and the postal location d-tlv-select location information interface configuration command to disable the bocation TLV is enabled by default. For more information, see the "Configuring LLDP hapter of the software configuration guide for this release.
Examples	This example shows	s how to configure civic location information on the switch:
	Switch(config-civ. Switch(config-civ. Switch(config-civ. Switch(config-civ. Switch(config-civ. Switch(config-civ.	<pre>ic)# primary-road-name "Cisco Way" ic)# city "San Jose" ic)# state CA ic)# building 19 ic)# room C6 ic)# county "Santa Clara" ic)# country US</pre>
	You can verify your	r settings by entering the show location civic-location privileged EXEC command.

This example shows how to configure the emergency location information location on the switch: Switch (config)# location elin-location 14085553881 identifier 1

You can verify your settings by entering the show location elin privileged EXEC command.

Related Commands	Command	Description
	location (interface configuration)	Configures the location information for an interface.
	show location	Displays the location information for an endpoint.

location (interface configuration)

Use the **location interface** command to enter location information for an interface. Use the **no** form of this command to remove the interface location information.

location {additional-location-information *word* | civic-location-id *id* | elin-location-id *id*}

no location {additional-location-information word | civic-location-id id | elin-location-id id}

		~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~	
Syntax Description	additional-location-information	Configure additional information for a location or place.	
	civic-location-id	Configure global civic location information for an interface.	
	elin-location-id	Configure emergency location information for an interface.	
	id	Specify the ID for the civic location or the elin location. The ID range is 1 to 4095.	
	word	Specify a word or phrase that provides additional location information.	
Defaults	This command has no default setting	g.	
Command Modes	Interface configuration		
Command History	Release Modificat	ion	
	12.2(40)EX2 This com	mand was introduced.	
Usage Guidelines	-	eation-id <i>id</i> interface configuration command, you enter civic mode, you can enter the additional location information.	
Examples	These examples show how to enter civic location information for an interface:		
	Switch(config-if)# interface gigabitethernet1/0/1 Switch(config-if)# location civic-location-id 1 Switch(config-if)# end		
	Switch(config-if)# interface gigabitethernet2/0/1 Switch(config-if)# location civic-location-id 1 Switch(config-if) # end		
	You can verify your settings by entering the show location civic interface privileged EXEC command.		
	This example shows how to enter emergency location information for an interface:		
	Switch(config)# interface gigabitethernet2/0/2 Switch(config-if)# location elin-location-id 1 Switch(config-if)# end		
	V		

You can verify your settings by entering the show location elin interface privileged EXEC command.

Related Commands	Command	Description
	location (global configuration)	Configures the location information for an endpoint.
	show location	Displays the location information for an endpoint.

logging file

Use the **logging file** global configuration command on the switch stack or on a standalone switch to set logging file parameters. Use the **no** form of this command to return to the default setting.

logging file *filesystem:filename* [*max-file-size* | **nomax** [*min-file-size*]] [*severity-level-number* | *type*]

no logging file *filesystem:filename* [*severity-level-number* | *type*]

Syntax Description	filesystem:filename	Alias for a flash file system. Contains the path and name of the file that contains the log messages.
		The syntax for the local flash file system on the stack member or the stack master: flash:
		From the stack master, the syntax for the local flash file system on a stack member: flash member number
	max-file-size	(Optional) Specify the maximum logging file size. The range is 4096 to 2147483647.
	nomax	(Optional) Specify the maximum file size of 2147483647.
	min-file-size	(Optional) Specify the minimum logging file size. The range is 1024 to 2147483647.
	severity-level-number	(Optional) Specify the logging severity level. The range is 0 to 7. See the <i>type</i> option for the meaning of each level.
	type	(Optional) Specify the logging type. These keywords are valid:
		• emergencies —System is unusable (severity 0).
		• alerts —Immediate action needed (severity 1).
		• critical —Critical conditions (severity 2).
		• errors —Error conditions (severity 3).
		• warnings—Warning conditions (severity 4).
		• notifications —Normal but significant messages (severity 5).
		• informational —Information messages (severity 6).
		• debugging —Debugging messages (severity 7).

Defaults

The minimum file size is 2048 bytes; the maximum file size is 4096 bytes.

The default severity level is 7 (debugging messages and numerically lower levels).

Command Modes Global configuration

Release	Modification	
12.2(40)EX2	This command was introduced.	
standalone switch, and i stack master fails, the lo	odule 3110, the log file is stored in ASCII text format in an internal buffer on a in the case of a switch stack, on the stack master. If a standalone switch or the g is lost unless you had previously saved it to flash memory by using the logging al configuration command.	
On the Catalyst Switch Module 3012, the log file is stored in ASCII text format in an internal buffer on the switch. You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. If the switch fails, the log is lost unless you had previously saved it to flash memory by using the logging file flash : <i>filename</i> global configuration command.		
After saving the log to flash memory by using the logging file flash : <i>filename</i> global configuration command, you can use the more flash : <i>filename</i> privileged EXEC command to display its contents.		
The command rejects the minimum file size if it is greater than the maximum file size minus 1024; the minimum file size then becomes the maximum file size minus 1024.		
Specifying a <i>level</i> causes messages at that level and numerically lower levels to be displayed.		
This example shows how to save informational log messages to a file in flash memory: Switch(config)# logging file flash:logfile informational		
	ting by entering the show running-config privileged EXEC command.	
Command	Description	
show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_comma nd_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate	
	12.2(40)EX2 On a Catalyst Switch M standalone switch, and i stack master fails, the lo file flash: <i>filename</i> glob On the Catalyst Switch the switch. mac access-group

Use the **mac access-group** interface configuration command on the switch stack or on a standalone switch to apply a MAC access control list (ACL) to a Layer 2 interface. Use the **no** form of this command to remove all MAC ACLs or the specified MAC ACL from the interface. You create the MAC ACL by using the **mac access-list extended** global configuration command.

mac access-group {*name*} **in**

no mac access-group {*name*}

Syntax Description	name	Specify a named MAC access list.		
	in	in Specify that the ACL is applied in the ingress direction. Outbound ACLs are not supported on Layer 2 interfaces.		
Defaults	No MAC ACL	is applied to the interface.		
Command Modes	Interface config	guration (Layer 2 interfaces only)		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Haaga Cuidalinaa	Vou con onniu i	MAC ACL s only to increase Loyer 2 interfaces. You connect annly MAC ACL s to Loyer 2		
Usage Guidelines	You can apply MAC ACLs only to ingress Layer 2 interfaces. You cannot apply MAC ACLs to Layer 3 interfaces.			
	On Layer 2 interfaces, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC access lists. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP ACL and a MAC ACL to the interface. You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface.			
	If a MAC ACL is already configured on a Layer 2 interface and you apply a new MAC ACL to the interface, the new ACL replaces the previously configured one.			
	If you apply an ACL to a Layer 2 interface on a switch, and the switch has an input Layer 3 ACL or a VLAN map applied to a VLAN that the interface is a member of, the ACL applied to the Layer 2 interface takes precedence.			
	When an inbound packet is received on an interface with a MAC ACL applied, the switch checks the match conditions in the ACL. If the conditions are matched, the switch forwards or drops the packet, according to the ACL.			
	If the specified ACL does not exist, the switch forwards all packets.			
	For more information about configuring MAC extended ACLs, see the "Configuring Network Security with ACLs" chapter in the software configuration guide for this release.			

Examples This example shows how to apply a MAC extended ACL named *macacl2* to an interface:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mac access-group macacl2 in

You can verify your settings by entering the **show mac access-group** privileged EXEC command. You can see configured ACLs on the switch by entering the **show access-lists** privileged EXEC command.

Related Commands	Command	Description
	show access-lists	Displays the ACLs configured on the switch.
	show mac access-group	Displays the MAC ACLs configured on the switch.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_com mand_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

mac access-list extended

Use the **mac access-list extended** global configuration command on the switch stack or on a standalone switch to create an access list based on MAC addresses for non-IP traffic. Using this command puts you in the extended MAC access-list configuration mode. Use the **no** form of this command to return to the default setting.

mac access-list extended name

no mac access-list extended name

Syntax Description	name Assign a name to the MAC extended access list.		
Defaults	By default, there are no MAC access lists created.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
	named MAC extend Entering the mac a	ed MAC extended ACLs to VLAN maps or to Layer 2 interfaces; you cannot apply led ACLs to Layer 3 interfaces. ccess-list extended command enables the MAC access-list configuration mode.	
	Entering the mac access-list extended command enables the MAC access-list configuration mode. These configuration commands are available:		
	• default : sets a command to its default.		
	• deny : specifies packets to reject. For more information, see the deny (MAC access-list configuration) MAC access-list configuration command.		
	• exit: exits from MAC access-list configuration mode.		
	• no : negates a command or sets its defaults.		
	• permit : specifies packets to forward. For more information, see the permit (MAC access-list configuration) command.		
	For more information release.	on about MAC extended access lists, see the software configuration guide for this	

Examples This example shows how to create a MAC named extended access list named *mac1* and to enter extended MAC access-list configuration mode:

Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)#

This example shows how to delete MAC named extended access list *mac1*:

Switch(config) # no mac access-list extended mac1

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Configures the MAC ACL (in extended MAC-access list configuration mode).
	permit (MAC access-list configuration)	
	show access-lists	Displays the access lists configured on the switch.
	vlan access-map	Defines a VLAN map and enters access-map configuration mode where you can specify a MAC ACL to match and the action to be taken.

mac address-table aging-time

Use the **mac address-table aging-time** global configuration command on the switch stack or on a standalone switch to set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated. Use the **no** form of this command to return to the default setting. The aging time applies to all VLANs or a specified VLAN.

mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]

no mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]

Syntax Description	0	This value disables aging. Static address entries are never aged or removed from	
•,	·	the table.	
	10-1000000	Aging time in seconds. The range is 10 to 1000000 seconds.	
	vlan vlan-id	(Optional) Specify the VLAN ID to which to apply the aging time. The range is 1 to 4094.	
Defaults	The default is 300	seconds.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		continuously, increase the aging time to record the dynamic entries for a longer time.	
	Increasing the time can reduce the possibility of flooding when the hosts send again.		
	If you do not speci	fy a specific VLAN, this command sets the aging time for all VLANs.	
Examples	This example show	vs how to set the aging time to 200 seconds for all VLANs:	
	Switch(config)# m	nac address-table aging-time 200	
	You can verify you command.	ar setting by entering the show mac address-table aging-time privileged EXEC	
Related Commands	Command	Description	
	show mac address	s-table aging-time Displays the MAC address table aging time for all VLANs or the specified VLAN.	

mac address-table learning vlan

mac address-table learning vlan

Use the **mac address-table learning** global configuration command to enable MAC address learning on a VLAN. This is the default state. Use the **no** form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

mac address-table learning vlan vlan-id

no mac address-table notification vlan vlan-id

Syntax Description	vlan-id	The VLAN ID range is 1 to 4094. It cannot be an internal VLAN.
Defaults	By default, MAC a	address learning is enabled on all VLANs.
Command Modes	Global configurati	ion
Command History	Release	Modification
	12.2(46)SE	This command was introduced.
Usage Guidelines	 When you control MAC address learning on a VLAN, you can manage the available MAC address ta space by controlling which VLANs, and therefore which ports, can learn MAC addresses. Before you disable MAC address learning, be sure that you are familiar with the network topology the switch system configuration. Disabling MAC address learning on a VLAN could cause flooding the network. For example, if you disable MAC address learning on a VLAN with a configured switt virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch is flooded in that VLAN domain. We recommend that you disable MAC address learning on a VLAN wan SVI. You cannot disable MAC address learning on a VLAN that the switch uses internally. If the VLAN that you enter in the no mac address-table learning vlan vlan-id command is an internal VLAN, the switch generates an error message and rejects the command. To view used internal VLANs, enter the show vlan internal usage privileged EXEC command. If you disable MAC address learning on a VLAN configured as a private VLAN primary or a second VLAN, the MAC address learning on a VLAN configured is a private VLAN. You cannot disable MAC address learning on a NLAN configured is a private VLAN primary or a second VLAN. 	
		C address learning on a VLAN that includes a secure port, MAC address learning is e secure port. If you later disable port security on the interface, the disabled MAC tate is enabled.

Examples This example shows how to disable MAC address learning on VLAN 2003: Switch(config)# no mac address-table learning vlan 2003 To display MAC address learning status of all VLANs or a specified VLAN, enter the show mac address-table learning [vlan vlan-id] command.

Related Commands	Command	Description
	show mac address-table learning	Displays the MAC address learning status on all VLANs or
		on the specified VLAN.

mac address-table move update

Use the **mac address-table move update** global configuration command on the switch stack or on a standalone switch to enable the MAC address-table move update feature. Use the **no** form of this command to return to the default setting.

mac address-table move update {receive | transmit}

no mac address-table move update {receive | transmit}

Syntax Description	receive	Specify that the switch processes MAC address-table move update messages.
	transmit	Specify that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up.
Command Modes	Global configuratio	on.
Defaults	By default, the MAC address-table move update feature is disabled.	
Command History	Release	Modification
-	12.2(40)EX2	This command was introduced.
	You can configure the access switch to send the MAC address-table move upda link goes down and the standby link comes up. You can configure the uplink process the MAC address-table move update messages.	
	process the MAC a	ddress-table move update messages.
Examples	This example show messages:	s how to configure an access switch to send MAC address-table move update
	Switch# configure Switch(conf)# mac Switch(conf)# end	address-table move update transmit
	This example show update messages:	s how to configure an uplink switch to get and process MAC address-table move
	Switch# configure Switch(conf)# mac Switch(conf)# end	address-table move update receive
	You can verify your command.	r settings by entering the show mac address-table move update privileged EXEC

Related	Commands
---------	----------

ommands	Command	Description
	clear mac address-table move update	Clears the MAC address-table move update global counters.
	debug matm move update	Debugs the MAC address-table move update message processing.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

mac address-table notification

Use the **mac address-table notification** global configuration command on the switch stack or on a standalone switch to enable the MAC address notification feature on the switch or the switch stack. Use the **no** form of this command to return to the default setting.

mac address-table notification [history-size value] | [interval value]

no mac address-table notification [history-size | interval]

history-size value	(Optional) Configure the maximum number of entries in the MAC notification history table. The range is 0 to 500 entries.
interval value	(Optional) Set the notification trap interval. The switch or the switch stack sends the notification traps when this amount of time has elapsed. The range is 0 to 2147483647 seconds.
By default, the MAC a	ddress notification feature is disabled.
The default trap interv	al value is 1 second.
The default number of	entries in the history table is 1.
Global configuration

	interval <i>value</i> By default, the MAC a The default trap interv The default number of

Examples This example shows how to enable the MAC address-table notification feature, set the interval time to 60 seconds, and set the history-size to 100 entries:

```
Switch(config)# mac address-table notification
Switch(config)# mac address-table notification interval 60
Switch(config)# mac address-table notification history-size 100
```

You can verify your settings by entering the **show mac address-table notification** privileged EXEC command.

Related Commands	Command	Description
	clear mac address-table notification	Clears the MAC address notification global counters.
	show mac address-table notification	Displays the MAC address notification settings on all interfaces or on the specified interface.
	snmp-server enable traps	Sends the SNMP MAC notification traps when the mac-notification keyword is appended.
	snmp trap mac-notification	Enables the SNMP MAC notification trap on a specific interface.

mac address-table static

Use the **mac address-table static** global configuration command on the switch stack or on a standalone switch to add static addresses to the MAC address table. Use the **no** form of this command to remove static entries from the table.

mac address-table static mac-addr vlan vlan-id interface interface-id

no mac address-table static *mac-addr* **vlan** *vlan-id* [**interface** *interface-id*]

Syntax Description	mac-addr	Destination MAC address (unicast or multicast) to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.	
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. The range is 1 to 4094.	
	interface interface-id	Interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels.	
Defaults	No static addresses are co	nfigured.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Examples	1	to add the static address c2f3.220a.12f4 to the MAC address table. When a N 4 with this MAC address as its destination, the packet is forwarded to the	
	Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet6/0/1		
	You can verify your settin	g by entering the show mac address-table privileged EXEC command.	
Related Commands	Command	Description	

mac address-table static drop

Use the **mac address-table static drop** global configuration command on the switch stack or on a standalone switch to enable unicast MAC address filtering and to configure the switch to drop traffic with a specific source or destination MAC address. Use the **no** form of this command to return to the default setting.

mac address-table static mac-addr vlan vlan-id drop

no mac address-table static mac-addr vlan vlan-id

Syntax Description	mac-addr	Unicast source or destination MAC address. Packets with this MAC address are dropped.
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
Defaults	Unicast MAC ad destination MAC	ldress filtering is disabled. The switch does not drop traffic for specific source or C addresses.
Command Modes	Global configura	ation
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	Follow these gui	idelines when using this feature:
-	Multicast M	AC addresses, broadcast MAC addresses, and router MAC addresses are not supported. are forwarded to the CPU are also not supported.
	the switch e	unicast MAC address as a static address and configure unicast MAC address filtering, ither adds the MAC address as a static address or drops packets with that MAC address, n which command was entered last. The second command that you entered overrides the nd.
	interface-id	e, if you enter the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface global configuration command followed by the mac address-table static <i>mac-addr d</i> drop command, the switch drops packets with the specified MAC address as a source on.
	command fo	the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop global configuration ollowed by the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface <i>interface-id</i> he switch adds the MAC address as a static address.

s that have a source or destination address of c2f3.220a.12f4. When a packet is received in 4 with this MAC address as its source or destination, the packet is dropped:			
n(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop			
This example shows how to disable unicast MAC address filtering:			
(config)# no mac address-table static c2f3.220a.12f4 vlan 4			
In verify your setting by entering the show mac address-table static privileged EXEC command.

Related Commands	Command	Description
	show mac address-table static	Displays only static MAC address table entries.

macro apply

Use the **macro apply** interface configuration command on the switch stack or on a standalone switch to apply a macro to an interface or to apply and trace a macro configuration on an interface.

macro {**apply** | **trace**} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]

Syntax Description	apply	Apply a macro to the specified interface.		
	trace	Use the trace keyword to apply a macro to an interface and to debug the macro.		
	macro-name	<i>ne</i> Specify the name of the macro.		
	parameter value	(Optional) Specify unique parameter values that are specific to the interface. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.		
Defaults	This command has	s no default setting.		
Command Modes	Interface configura	ition		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines		acro trace <i>macro-name</i> interface configuration command to apply and show the an interface or to debug the macro to find any syntax or configuration errors.		
		because of a syntax error or a configuration error when you apply a macro, the macro the remaining commands to the interface.		
	When creating a macro that requires the assignment of unique values, use the parameter value keywords to designate values specific to the interface.			
	Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.			
	Some macros might contain keywords that require a parameter value. You can use the macro apply <i>macro-name</i> ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.			
		efault Smartports macros embedded in the switch software. You can display these mmands they contain by using the show parser macro user EXEC command.		

Follow these guidelines when you apply a Cisco-default Smartports macro on an interface:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro** name *macro-name* user EXEC command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter** *value* keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to an interface, the macro name is automatically added to the interface. You can display the applied commands and macro names by using the **show running-configuration interface** *interface-id* user EXEC command.

A macro applied to an interface range behaves the same way as a macro applied to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

You can delete a macro-applied configuration on an interface by entering the **default interface** *interface-id* interface configuration command.

After you have created a macro by using the **macro name** global configuration command, you can apply it to an interface. This example shows how to apply a user-created macro called **duplex** to an interface:

Switch(config-if) # macro apply duplex

To debug a macro, use the **macro trace** interface configuration command to find any syntax or configuration errors in the macro as it is applied to an interface. This example shows how troubleshoot the user-created macro called **duplex** on an interface:

```
Switch(config-if)# macro trace duplex
Applying command...`duplex auto'
%Error Unknown error.
Applying command...`speed nonegotiate'
```

This example shows how to display the Cisco-default **cisco-desktop** macro and how to apply the macro and set the access VLAN ID to 25 on an interface:

```
Switch# show parser macro cisco-desktop
Macro name : cisco-desktop
Macro type : default
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
switchport port-security maximum 1
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
```

switchport port-security aging type inactivity

macro global

Use the **macro global** global configuration command on the switch stack or on a standalone switch to apply a macro to a switch or to apply and trace a macro configuration on a switch.

macro global {apply | trace} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]

Syntax Description	apply	Apply a macro to the switch.		
	trace	Apply a macro to a switch and to debug the macro.		
	macro-name	Specify the name of the macro.		
	parameter value	(Optional) Specify unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.		
Defaults	This command has	s no default setting.		
Command Modes	Global configuration	on		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines	macros running on If a command fails	acro trace <i>macro-name</i> global configuration command to apply and to show the a switch or to debug the macro to find any syntax or configuration errors. because of a syntax error or a configuration error when you apply a macro, the macro		
	continues to apply the remaining commands to the switch.			
	When creating a macro that requires the assignment of unique values, use the parameter <i>value</i> keywords to designate values specific to the switch.			
	Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.			
	Some macros might contain keywords that require a parameter value. You can use the macro global apply <i>macro-name</i> ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.			
	There are Cisco-default Smartports macros embedded in the switch software. You can display these macros and the commands they contain by using the show parser macro user EXEC command.			

Follow these guidelines when you apply a Cisco-default Smartports macro on a switch:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro** name *macro-name* user EXEC command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter** *value* keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to a switch, the macro name is automatically added to the switch. You can display the applied commands and macro names by using the **show running-configuration** user EXEC command.

You can delete a global macro-applied configuration on a switch only by entering the **no** version of each command contained in the macro.

Examples

After you have created a new macro by using the **macro name** global configuration command, you can apply it to a switch. This example shows how see the **snmp** macro and how to apply the macro and set the hostname to test-server and set the IP precedence value to 7:

```
Switch# show parser macro name snmp
Macro name : snmp
Macro type : customizable
#enable port security, linkup, and linkdown traps
snmp-server enable traps port-security
snmp-server enable traps linkup
snmp-server enable traps linkdown
#set snmp-server host
snmp-server host ADDRESS
#set SNMP trap notifications precedence
snmp-server ip precedence VALUE
```

Switch(config) # macro global apply snmp ADDRESS test-server VALUE 7

To debug a macro, use the **macro global trace** global configuration command to find any syntax or configuration errors in the macro when it is applied to a switch. In this example, the **ADDRESS** parameter value was not entered, causing the snmp-server host command to fail while the remainder of the macro is applied to the switch:

```
Switch(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

Displays the macro definition for all macros or for the specified

Related Commands	Command	Description

	macro apply	Applies a macro on an interface or applies and traces a macro on an interface.		
	macro description	Adds a description about the macros that are applied to an interface.		
	macro global	Applies a macro on a switch or applies and traces a macro on a switch.		
	macro name	Creates a macro.		

macro name

Use the **macro name** global configuration command on the switch stack or on a standalone switch to create a configuration macro. Use the **no** form of this command to delete the macro definition.

macro name macro-name

no macro name macro-name

Syntax Description	macro-name	Name of the macro.	
Defaults	This command ha	as no default setting.	
Command Modes	Global configurat	tion	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		tain up to 3000 characters. Enter one macro command per line. Use the @ character to se the # character at the beginning of a line to enter comment text within the macro.	
	You can define mandatory keywords within a macro by using a help string to specify the keywords. Ent # macro keywords word to define the keywords that are available for use with the macro. You can ent up to three help string keywords separated by a space. If you enter more than three macro keywords, on the first three are shown.		
		case sensitive. For example, the commands macro name Sample-Macro and macro acro will result in two separate macros.	
	 When creating a macro, do not use the exit or end commands or change the command mode by using interface interface-id. This could cause commands that follow exit, end, or interface interface-id to execute in a different command mode. The no form of this command only deletes the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied. You can delete a macro-applied configuration on an interface by entering the default interface interface-id interface configuration command. Alternatively, you can create an anti-macro for an existing macro that contains the no form of all the corresponding commands in the original macro. Then apply the anti-macro to the interface. 		
	created macro over	a macro by creating a new macro with the same name as the existing macro. The newly erwrites the existing macro but does not affect the configuration of those interfaces on al macro was applied.	

Examples

This example shows how to create a macro that defines the duplex mode and speed:

```
Switch(config)# macro name duplex
Enter macro commands one per line. End with the character `@'.
duplex full
speed auto
@
```

This example shows how create a macro with **# macro keywords**:

```
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
@
```

This example shows how to display the mandatory keyword values before you apply the macro to an interface:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# macro apply test ?
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID ?
WORD Value of first keyword to replace
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace
```

Command	Description
macro apply	Applies a macro on an interface or applies and traces a macro on an interface.
macro description	Adds a description about the macros that are applied to an interface.
macro global	Applies a macro on a switch or applies and traces a macro on a switch
macro global description	Adds a description about the macros that are applied to the switch.
show parser macro	Displays the macro definition for all macros or for the specified macro.

match (access-map configuration)

Use the **match** access-map configuration command on the switch stack or on a standalone switch to set the VLAN map to match packets against one or more access lists. Use the **no** form of this command to remove the match parameters.

match {**ip** address {*name* | *number*} [*name* | *number*] [*name* | *number*]...} | {**mac** address {*name*} [*name*] [*name*]...}

no match {**ip address** {*name* | *number*} [*name* | *number*] [*name* | *number*]...} | {**mac address** {*name*} [*name*] [*name*]...}

Syntax Description	ip address	Set the access map to match packets against an IP address access list.
	mac address	Set the access map to match packets against a MAC address access list.
	name	Name of the access list to match packets against.
	number	Number of the access list to match packets against. This option is not valid for MAC access lists.
Defaults	The default act	ion is to have no match parameters applied to a VLAN map.
Command Modes	Access-map co	nfiguration
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	You enter acces	ss-map configuration mode by using the vlan access-map global configuration command
		one access list name or number; others are optional. You can match packets against one lists. Matching any of the lists counts as a match of the entry.
	1	configuration mode, use the match command to define the match conditions for a VLAN a VLAN. Use the action command to set the action that occurs when the packet matches
	the conditions.	
	Packets are ma	tched only against access lists of the same protocol type; IP packets are matched against and all other packets are matched against MAC access lists.
	Packets are main IP access lists,	tched only against access lists of the same protocol type; IP packets are matched against and all other packets are matched against MAC access lists. AC addresses can be specified for the same map entry.

Examples This example shows how to define and apply a VLAN access map *vmap4* to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list *al2*.

```
Switch(config)# vlan access-map vmap4
Switch(config-access-map)# match ip address al2
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan filter vmap4 vlan-list 5-6
```

You can verify your settings by entering the show vlan access-map privileged EXEC command.

Related Commands	Command	Description
	access-list	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	action	Specifies the action to be taken if the packet matches an entry in an access control list (ACL).
	ip access list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	mac access-list extended	Creates a named MAC address access list.
	show vlan access-map	Displays the VLAN access maps created on the switch.
	vlan access-map	Creates a VLAN access map.

match (class-map configuration)

Use the **match** class-map configuration command on the switch stack or on a standalone switch to define the match criteria to classify traffic. Use the **no** form of this command to remove the match criteria.

no match {access-group *acl-index-or-name* | **input-interface** *interface-id-list* | **ip dscp** *dscp-list* | **ip precedence** *ip-precedence-list*}

Syntax Description	access-group acl-index-or-name	Number or name of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.
	input-interface <i>interface-id-list</i>	Specify the physical ports to which the interface-level class map in a hierarchical policy map applies. This command can only be used in the child-level policy map and must be the only match condition in the child-level policy map. You can specify up to six entries in the list by specifying a port (counts as one entry), a list of ports separated by a space (each port counts as an entry), or a range of ports separated by a hyphen (counts as two entries).
	ip dscp dscp-list	List of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly-used value.
	ip precedence <i>ip-precedence-list</i>	List of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly-used value
Defaults	No match criteria are o	defined.
Command Modes	Class-map configuration	on
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines		is used to specify which fields in the incoming packets are examined to classify P access group or the MAC access group matching to the Ether Type/Len are

match {access-group *acl-index-or-name* | input-interface *interface-id-list* | ip dscp *dscp-list* | ip precedence *ip-precedence-list*}

If you enter the **class-map** {**match-all** | **match-any**} *class-map-name* global configuration command, you can enter these **match** commands:

• match access-group *acl-name*

e The ACL must be an extended named ACL.

- match input-interface interface-id-list
- match ip dscp dscp-list
- match ip precedence ip-precedence-list

You cannot enter the match access-group acl-index command.

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-all** and **match-any** keywords are equivalent.

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries.

Examples

This example shows how to create a class map called *class2*, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
```

This example shows how to create a class map called *class3*, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using *acl1*:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config) # class-map match-all class4
Switch(config-cmap) # match input-interface gigabitethernet2/0/1 gigabitethernet2/0/2
Switch(config-cmap) # exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet2/0/1 - gigabitethernet2/0/5
Switch(config-cmap)# exit

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	show class-map	Displays quality of service (QoS) class maps.

mdix auto

Use the **mdix auto** interface configuration command on the switch stack or on a standalone switch to enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the **no** form of this command to disable auto-MDIX.

mdix auto

no mdix auto

Syntax Description	This command has n	o arguments or keywords.
Defaults	Auto-MDIX is enabl	led.
Command Modes	Interface configurati	on
Command History	Release	Modification
-	12.2(40)EX2	This command was introduced.
Usage Guidelines	so that the feature op When auto-MDIX (a interfaces, link up oc	to-MDIX on an interface, you must also set the interface speed and duplex to auto berates correctly. and autonegotiation of speed and duplex) is enabled on one or both of connected ccurs, even if the cable type (straight-through or crossover) is incorrect. borted on all 10/100 and 10/100/1000 Mb/s interfaces.
Examples	Switch# configure Switch(config)# in Switch(config-if)# Switch(config-if)# Switch(config-if)# Switch(config-if)#	terface gigabitethernet1/0/1 speed auto duplex auto mdix auto end
	•	perational state of auto-MDIX on the interface by entering the show controllers <i>interface-id</i> phy privileged EXEC command.

Related Commands	Command	Description
	show controllers ethernet-controller interface-id phy	Displays general information about internal registers of an interface, including the operational state of auto-MDIX.

mls qos

Use the **mls qos** global configuration command on the switch stack or on a standalone switch to enable quality of service (QoS) for the entire switch. When the **mls qos** command is entered, QoS is enabled with the default parameters on all ports in the system. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

mls qos

no mls qos

Syntax Description	This command has no arguments or keywords.

DefaultsQoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified
(the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in
pass-through mode (packets are switched without any rewrites and classified as best effort without any
policing).

When QoS is enabled with the **mls qos** global configuration command and all other QoS settings are set to their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted. The default ingress and egress queue settings are in effect.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines QoS must be globally enabled to use QoS classification, policing, mark down or drop, queueing, and traffic shaping features. You can create a policy-map and attach it to a port before entering the **mls qos** command. However, until you enter the **mls qos** command, QoS processing is disabled.

Policy-maps and class-maps used to configure QoS are not deleted from the configuration by the **no mls qos** command, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To re-enable QoS with the previous configurations, use the **mls qos** command.

Toggling the QoS status of the switch with this command modifies (reallocates) the sizes of the queues. During the queue size modification, the queue is temporarily shut down during the hardware reconfiguration, and the switch drops newly arrived packets for this queue.

Examples This example shows how to enable QoS on the switch:

Switch(config) # mls qos

You can verify your settings by entering the show mls qos privileged EXEC command.

Related Commands	Command	Description
	show mls qos	Displays QoS information.

mls qos aggregate-policer

Use the **mls qos aggregate-policer** global configuration command on the switch stack or on a standalone switch to define policer parameters, which can be shared by multiple classes within the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to delete an aggregate policer.

mls qos aggregate-policer *aggregate-policer-name rate-bps burst-byte* **exceed-action** {**drop** | **policed-dscp-transmit**}

no mls qos aggregate-policer aggregate-policer-name

Syntax Description	aggregate-policer-name	Name of the aggregate policer referenced by the police aggregate policy-map class configuration command.
	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	When the specified rate is exceeded, specify that the switch change the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then send the packet.
Defaults	No aggregate policers are	defined.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	Define an aggregate police	er if the policer is shared with multiple classes.
	Policers for a port cannot l cannot be aggregated for p	be shared with other policers for another port; traffic from two different ports policing purposes.
	(255 user-configurable pol configurable policers supp constrained by the hardwa	ich controls more than one physical port, supports 256 policers on the switch licers plus 1 policer reserved for internal use). The maximum number of orted per port is 63. Policers are allocated on demand by the software and are re and ASIC boundaries. You cannot reserve policers per port (there is no be assigned to any policer).
	You apply an aggregate po policer across different po	licer to multiple classes in the same policy map; you cannot use an aggregate licy maps.

You cannot delete an aggregate policer if it is being used in a policy map. You must first use the **no police aggregate** *aggregate-policer-name* policy-map class configuration command to delete the aggregate policer from all policy maps before using the **no mls qos aggregate-policer** *aggregate-policer-name* command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Examples

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

Switch(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop Switch(config)# policy-map policy2 Switch(config-pmap)# class class1 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap)# class class2 Switch(config-pmap-c)# set dscp 10 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap-c)# exit Switch(config-pmap)# class class3 Switch(config-pmap-c)# trust dscp Switch(config-pmap-c)# police aggregate agg_policer2 Switch(config-pmap-c)# exit

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	police aggregate	Creates a policer that is shared by different classes.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

mls qos cos

Use the **mls qos cos** interface configuration command on the switch stack or on a standalone switch to define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port. Use the **no** form of this command to return to the default setting.

mls qos cos {*default-cos* | override}

no mls qos cos {*default-cos* | **override**}

Syntax Description	default-cos	Assign a default CoS value to a port. If packets are untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7.
	override	Override the CoS of the incoming packets, and apply the default CoS value on the port to all incoming packets.
Defaults	The default Co	S value for a port is 0.
	CoS override is	s disabled.
Command Modes	Interface config	guration
Command History	Release	Modification

mls qos dscp-mutation

mls qos dscp-mutation

Use the **mls qos dscp-mutation** interface configuration command on the switch stack or on a standalone switch to apply a Differentiated Services Code Point (DSCP)-to-DSCP-mutation map to a DSCP-trusted port. Use the **no** form of this command to return the map to the default settings (no DSCP mutation).

mls qos dscp-mutation dscp-mutation-name

no mls qos dscp-mutation dscp-mutation-name

Syntax Description	dscp-mutation-name	Name of the DSCP-to-DSCP-mutation map. This map was previously defined with the mls qos map dscp-mutation global configuration	
		command.	
Defaults	The default DSCP-to-I DSCP values.	DSCP-mutation map is a null map, which maps incoming DSCPs to the same	
Command Modes	Interface configuration	I	
Command History	Release	Modification	
· · · · · ·	12.2(40)EX2	This command was introduced.	
	domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a quality of service (QoS) administrative domain.With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS handles the packet with this new value. The switch sends the packet out the port with the new DSCP value.		
	You can configure multiple DSCP-to-DSCP-mutation maps on ingress ports.		
	You apply the map only to DSCP-trusted ports. If you apply the DSCP mutation map to an untrusted port, to class of service (CoS) or IP-precedence trusted port, the command has no immediate effect until the port becomes DSCP-trusted.		
Examples	-	ow to define the DSCP-to-DSCP-mutation map named <i>dscpmutation1</i> and to apply	
	the map to a port:		

This example show how to remove the DSCP-to-DSCP-mutation map name *dscpmutation1* from the port and to reset the map to the default:

Switch(config-if)# no mls gos dscp-mutation dscpmutation1

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands

Command	Description
mls qos map dscp-mutation	Defines the DSCP-to-DSCP-mutation map.

show mls qos maps	Displays QoS mapping information.

mls qos map

Use the **mls qos map** global configuration command on the switch stack or on a standalone switch to define the class of service (CoS)-to-Differentiated Services Code Point (DSCP) map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map. Use the **no** form of this command to return to the default map.

no mls qos map {cos-dscp | dscp-cos | dscp-mutation *dscp-mutation-name* | **ip-prec-dscp | policed-dscp}**

Syntax Description	cos-dscp dscp1dscp8	Define the CoS-to-DSCP map.
		For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to CoS values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.
	dscp-cos <i>dscp-list</i> to <i>cos</i>	Define the DSCP-to-CoS map.
		For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. The range is 0 to 63. Then enter the to keyword.
		For <i>cos</i> , enter a single CoS value to which the DSCP values correspond. The range is 0 to 7.
	dscp-mutation dscp-mutation-name in-dscp to out-dscp	Define the DSCP-to-DSCP-mutation map.
		For dscp-mutation-name, enter the mutation map name.
		For <i>in-dscp</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
		For <i>out-dscp</i> , enter a single DSCP value.
		The range is 0 to 63.
	ip-prec-dscp dscp1dscp8	Define the IP-precedence-to-DSCP map.
		For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.
	policed-dscp <i>dscp-list</i> to <i>mark-down-dscp</i>	Define the policed-DSCP map.
		For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
		For <i>mark-down-dscp</i> , enter the corresponding policed (marked down) DSCP value.
		The range is 0 to 63.

Defaults

Table 2-6 shows the default CoS-to-DSCP map:

Table 2-6	Default CoS-to-DSCP Map

CoS Value	DSCP Value
0	0
1	8
2	16
3	24
4	32
5	40
6	48
7	56

Table 2-7 shows the default DSCP-to-CoS map:

DSCP Value	CoS Value	
0–7	0	
8–15	1	
16–23	2	
24–31	3	
32–39	4	
40–47	5	
48–55	6	
56-63	7	

Table 2-7 Default DSCP-to-CoS Map

Table 2-8 shows the default IP-precedence-to-DSCP map:

Table 2-8 Default IP-Precedence-to-DSCP Map

IP Precedence Value	DSCP Value	
0	0	
1	8	
2	16	
3	24	
4	32	
5	40	
6	48	
7	56	

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines All the maps are globally defined. All the maps, except the DSCP-to-DSCP-mutation map, are applied to all ports. The DSCP-to-DSCP-mutation map is applied to a specific port.

Examples This example shows how to define the IP-precedence-to-DSCP map and to map IP-precedence values 0 to 7 to DSCP values of 0, 10, 20, 30, 40, 50, 55, and 60:

Switch# configure terminal Switch(config)# mls qos map ip-prec-dscp 0 10 20 30 40 50 55 60

This example shows how to define the policed-DSCP map. DSCP values 1, 2, 3, 4, 5, and 6 are marked down to DSCP value 0. Marked DSCP values that not explicitly configured are not modified:

```
Switch# configure terminal
Switch(config)# mls gos map policed-dscp 1 2 3 4 5 6 to 0
```

This example shows how to define the DSCP-to-CoS map. DSCP values 20, 21, 22, 23, and 24 are mapped to CoS 1. DSCP values 10, 11, 12, 13, 14, 15, 16, and 17 are mapped to CoS 0:

Switch# configure terminal Switch(config)# mls gos map dscp-cos 20 21 22 23 24 to 1 Switch(config)# mls gos map dscp-cos 10 11 12 13 14 15 16 17 to 0

This example shows how to define the CoS-to-DSCP map. CoS values 0 to 7 are mapped to DSCP values 0, 5, 10, 15, 20, 25, 30, and 35:

```
Switch# configure terminal
Switch(config)# mls gos map cos-dscp 0 5 10 15 20 25 30 35
```

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remain as specified in the null map):

```
Switch# configure terminal
Switch(config)# mls gos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 10
Switch(config)# mls gos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls gos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls gos map dscp-mutation mutation1 0 31 32 33 34 to 30
```

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description
	mls qos dscp-mutation	Applies a DSCP-to-DSCP-mutation map to a DSCP-trusted port.
	show mls qos maps	Displays quality of service (QoS) mapping information.

mls qos queue-set output buffers

Use the **mls qos queue-set output buffers** global configuration command on the switch stack or on a standalone switch to allocate buffers to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output qset-id buffers allocation1 ... allocation4

no mls qos queue-set output qset-id buffers

Syntax Description	<i>qset-id</i> ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.			
	allocation1 allocation4	Buffer space allocation (percentage) for each queue (four values for queues 1 to 4). For <i>allocation1</i> , <i>allocation3</i> , and <i>allocation4</i> , the range is 0 to 99. For <i>allocation2</i> , the range is 1 to 100 (including the CPU buffer). Separate each value with a space.		
Defaults	All allocation va the buffer space.	lues are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of

Usage Guidelines	Specify four allocation values, and separate each with a space.			
		according to the importance of the traffic; for example, give a large percentage of the ue with the highest-priority traffic.		
	-	Ferent classes of traffic with different characteristics, use this command with the mls qos at <i>qset-id</i> threshold global configuration command.		
Note		e default settings are suitable for most situations. You should change them only when ough understanding of the egress queues and if these settings do not meet your QoS		
F		ows how to map a port to queue-set 2. It allocates 40 percent of the buffer space to egress percent to egress queues 2, 3, and 4:		
Examples	queue 1 and 20 p	bereat to egress queues 2, 3, and 4.		

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description	
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.	
	queue-set	Maps a port to a queue-set.	
	show mls qos interface buffers	Displays quality of service (QoS) information.	
	show mls qos queue-set	Displays egress queue settings for the queue-set.	

mls qos queue-set output threshold

Use the **mls qos queue-set output threshold** global configuration command on the switch stack or on a standalone switch to configure the weighted tail-drop (WTD) thresholds, to guarantee the availability of buffers, and to configure the maximum memory allocation to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output *qset-id* **threshold** *queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold*

no mls qos queue-set output qset-id threshold [queue-id]

Syntax Description	qset-id	ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.
	queue-id	Specific queue in the queue-set on which the command is performed. The range is 1 to 4.
	drop-threshold1 drop-threshold2	Two WTD thresholds expressed as a percentage of the allocated memory of the queue. The range is 1 to 3200 percent.
	reserved-threshold	Amount of memory to be guaranteed (reserved) for the queue and expressed as a percentage of the allocated memory. The range is 1 to 100 percent.
	maximum-threshold	Enable a queue in the full condition to get more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped. The range is 1 to 3200 percent.

Defaults

When quality of service (QoS) is enabled, WTD is enabled.

Table 2-9 shows the default WTD threshold settings.

Table 2-9 Default Egress Queue WTD Threshold Settings

Feature	Queue 1	Queue 2	Queue 3	Queue 4
WTD drop threshold 1	100 percent	200 percent	100 percent	100 percent
WTD drop threshold 2	100 percent	200 percent	100 percent	100 percent
Reserved threshold	50 percent	100 percent	50 percent	50 percent
Maximum threshold	400 percent	400 percent	400 percent	400 percent

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines

Use the **mls qos queue-set output** *qset-id* **buffers** global configuration command to allocate a fixed number of buffers to the four queues in a queue-set.

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue-set to use more of the common pool when available, the maximum number of packets for each queue is still internally limited to 400 percent, or 4 times the allocated number of buffers. One packet can use one 1 or more buffers.

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Examples

This example shows how to map a port to queue-set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

```
Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# queue-set 2
```

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers	Allocates buffers to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays QoS information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos rewrite ip dscp

Use the **mls qos rewrite ip dscp** global configuration command on the switch stack or on a standalone switch to configure the switch to change (rewrite) the Differentiated Services Code Point (DSCP) field of an incoming IP packet. Use the **no** form of this command to configure the switch to not modify (rewrite) the DSCP field of the packet and to enable DSCP transparency.

mls qos rewrite ip dscp

no mls qos rewrite ip dscp

Syntax Description	This command has	no arguments or keywords.
Defaults	DSCP transparency	is disabled. The switch changes the DSCP field of the incoming IP packet.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines <u>Note</u>	enabled by using the in the incoming pac packet.	affects only the DSCP field of a packet at the egress. mls qos srr-queue input bandwidth

Use the **mls qos srr-queue input bandwidth** global configuration command on the switch stack or on a standalone switch to assign shaped round robin (SRR) weights to an ingress queue. The ratio of the weights is the ratio of the frequency in which the SRR scheduler dequeues packets from each queue. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input bandwidth weight1 weight2

no mls qos srr-queue input bandwidth

Syntax Description	weight1 weight2	Ratio of <i>weight1</i> and <i>weight2</i> determines the ratio of the frequency in which the SRR scheduler dequeues packets from ingress queues 1 and 2. The range is 1 to 100. Separate each value with a space.
Defaults	Weight1 and weight?	2 are 4 (1/2 of the bandwidth is equally shared between the two queues).
Command Modes	Global configuratio	n
Command History	Release	Modification
-	12.2(40)EX2	This command was introduced.
Usage Guidelines	mls qos srr-queue Then SRR shares th	tiority queue for its configured weight as specified by the bandwidth keyword in the input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global configuration command. The remaining bandwidth with both ingress queues and services them as specified by ared with the mls qos srr-queue input bandwidth <i>weight1 weight2</i> global mand.
		ingress queue is the priority queue by using the mls qos srr-queue input bal configuration command.
Examples	-	s how to assign the ingress bandwidth for the queues in the stack. Priority queueing shared bandwidth ratio allocated to queue 1 is $25/(25+75)$ and to queue 2 is
		ls qos srr-queue input priority-queue 2 bandwidth 0 ls qos srr-queue input bandwidth 25 75
	In this example, que often as queue 1.	eue 2 has three times the bandwidth of queue 1; queue 2 is serviced three times as

This example shows how to assign the ingress bandwidths for the queues in the stack. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps class of service (CoS) values to an ingress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue input dscp-map	Maps Differentiated Services Code Point (DSCP) values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns weighted tail-drop (WTD) threshold percentages to an ingress queue.
	show mls qos input-queue	Displays ingress queue settings.
	show mls qos interface queueing	Displays quality of service (QoS) information.

mls qos srr-queue input buffers

Use the **mls qos srr-queue input buffers** global configuration command on the switch stack or on a standalone switch to allocate the buffers between the ingress queues. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input buffers percentage1 percentage2

no mls qos srr-queue input buffers

Syntax Description	percentage1 percentage2	Percentage of buffers allocated to ingress queues 1 and 2. The range is 0 to 100. Separate each value with a space.
Defaults	Ninety percent of the	e buffers is allocated to queue 1, and 10 percent of the buffers is allocated to queue 2.
Command Modes	Global configuration	1
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	You should allocate	the buffers so that the queues can handle any incoming bursty traffic.
Examples	This example shows the buffer space to in	how to allocate 60 percent of the buffer space to ingress queue 1 and 40 percent of ngress queue 2:
	Switch(config)# ml	s qos srr-queue input buffers 60 40
	•••	settings by entering the show mls qos interface [<i>interface-id</i>] buffers or the show e privileged EXEC command.

mls qos srr-queue input priority-queue

Use the **mls qos srr-queue input priority-queue** global configuration command on the switch stack or on a standalone switch to configure the ingress priority queue and to guarantee bandwidth on the stack or internal ring if the ring is congested. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input priority-queue queue-id bandwidth weight

no mls qos srr-queue input priority-queue queue-id

Syntax Description	queue-id	Ingress queue ID. The range is 1 to 2.
Syntax Description	bandwidth weight	Bandwidth percentage of the stack or internal ring. The range is 0 to 40.
Defaults	The priority queue is q	ueue 2, and 10 percent of the bandwidth is allocated to it.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	You should use the prio which needs minimum	prity queue only for traffic that needs to be expedited (for example, voice traffic, delay and jitter).
		uaranteed part of the bandwidth on the stack or internal ring, which reduces the eavy network traffic on an oversubscribed ring or stack (when there is more traffic carry, and the queues are full and dropping frames).
	The amount of bandwidth that can be guaranteed is restricted because a large value affects t stack and can degrade the stack performance.	
Shaped round robin (SRR) services the priority queue for its configured weight as bandwidth keyword in the mls qos srr-queue input priority-queue <i>queue-id</i> band configuration command. Then SRR shares the remaining bandwidth with both ing services them as specified by the weights configured with the mls qos srr-queue <i>weight1 weight2</i> global configuration command.		the mls qos srr-queue input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global d. Then SRR shares the remaining bandwidth with both ingress queues and fied by the weights configured with the mls qos srr-queue input bandwidth
	To disable priority que priority-que	ueing, set the bandwidth weight to 0, for example, mls qos srr-queue input <i>id</i> bandwidth 0 .

Examples This example shows how to assign the ingress bandwidths for the queues in the stack. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Related Commands	Command	Description

mls qos srr-queue input threshold

Use the **mls qos srr-queue input threshold** global configuration command on the switch stack or on a standalone switch to assign weighted tail-drop (WTD) threshold percentages to an ingress queue. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2

no mls qos srr-queue input threshold queue-id

Syntax Description	queue-id	ID of the ingress queue. The range is 1 to 2.
	threshold-percentage1 threshold-percentage2	Two WTD threshold percentage values. Each threshold value is a percentage of the total number of queue descriptors allocated for the queue. Separate each value with a space. The range is 1 to 100.
Defaults	When quality of service The two WTD thresholds	(QoS) is enabled, WTD is enabled. s are set to 100 percent.
Command Modes	Global configuration	
Command History	Release	Modification
-	12.2(40)EX2	This command was introduced.
Usage Guidelines	(CoS) or Differentiated S threshold 2. If threshold dropped until the thresho be queued and sent as log	eshold map or the DSCP-to-threshold map to decide which class of service Services Code Points (DSCPs) values are mapped to threshold 1 and to 1 is exceeded, packets with CoS or DSCPs assigned to this threshold are old is no longer exceeded. However, packets assigned to threshold 2 continue to ng as the second threshold is not exceeded.
	Each queue has two configurable (explicit) drop threshold and one preset (implicit) drop thresh You configure the CoS-to-threshold map by using the mls qos srr-queue input cos-map glob configuration command. You configure the DSCP-to-threshold map by using the mls qos srr input dscp-map global configuration command.	
Examples	are 50 percent and 100 p	to configure the tail-drop thresholds for the two queues. The queue 1 thresholds ercent, and the queue 2 thresholds are 70 percent and 100 percent:
	You can verify your setti	ngs by entering the show mls qos interface [<i>interface-id</i>] buffers or the show ivileged EXEC command.

Related Commands	Command	Description

	show mls qos interface buffers	Displays quality of service (QoS) information.

mls qos srr-queue output cos-map

Use the **mls qos srr-queue output cos-map** global configuration command on the switch stack or on a standalone switch to map class of service (CoS) values to an egress queue or to map CoS values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

mls qos srr-queue output cos-map queue *queue-id* {*cos1...cos8* | **threshold** *threshold-id cos1...cos8*}

no mls qos srr-queue output cos-map

Syntax Description	queue queue-id	Specify a queue number.
		For <i>queue-id</i> , the range is 1 to 4.
	cos1cos8	Map CoS values to an egress queue.
		For <i>cos1cos8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 7.
	threshold threshold-id cos1cos8	Map CoS values to a queue threshold ID.
		For <i>threshold-id</i> , the range is 1 to 3.
		For <i>cos1cos8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 7.

Defaults

Table 2-12 shows the default CoS output queue threshold map:

Table 2-12 Default Cos Output Queue Threshold Map

CoS Value	Queue ID-Threshold ID
0, 1	2-1
2, 3	3–1
4	4–1
5	1–1
6, 7	4–1

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines	The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
 Note	The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your quality of service (QoS) solution.
	You can assign two weighted tail-drop (WTD) threshold percentages to an egress queue by using the mls qos queue-set output <i>qset-id</i> threshold global configuration command.
	You can map each CoS value to a different queue and threshold combination, allowing the frame to follow different behavior.
Examples	This example shows how to map a port to queue-set 1. It maps CoS values 0 to 3 to egress queue 1 and to threshold ID 1. It configures the drop thresholds for queue 1 to 50 and 70 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped.
	Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 1 0 1 2 3 Switch(config)# mls qos queue-set output 1 threshold 1 50 70 100 200 Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# queue-set 1
	You can verify your settings by entering the show mls qos maps , the show mls qos interface [<i>interface-id</i>] buffers , or the show mls qos queue-set privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue output dscp-map	Maps Differentiated Services Code Point (DSCP) values to an egress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos queue-set output threshold	Configures the WTD thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays QoS information.
	show mls qos maps	Displays QoS mapping information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos srr-queue output dscp-map

Use the **mls qos srr-queue output dscp-map** global configuration command on the switch stack or on a standalone switch to map Differentiated Services Code Point (DSCP) values to an egress or to map DSCP values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

mls qos srr-queue output dscp-map queue *queue-id* {*dscp1...dscp8* | **threshold** *threshold-id dscp1...dscp8*}

no mls qos srr-queue output dscp-map

Syntax Description	queue queue-id	Specify a queue number.
		For <i>queue-id</i> , the range is 1 to 4.
	dscp1dscp8	Map DSCP values to an egress queue.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.
	threshold threshold-id	Map DSCP values to a queue threshold ID.
	dscp1dscp8	For <i>threshold-id</i> , the range is 1 to 3.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.

Defaults

Table 2-13 shows the default DSCP output queue threshold map:

Table 2-13 Default DSCP Output Queue Threshold Map

DSCP Value	Queue ID-Threshold ID
0–15	2-1
16–31	3–1
32–39	4-1
40–47	1–1
48-63	4-1

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelin	The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
ī	The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.
	You can assign two weighted tail-drop (WTD) threshold percentages to an egress queue by using the mls qos queue-set output <i>qset-id</i> threshold global configuration command.
	You can map each DSCP value to a different queue and threshold combination, allowing the frame to follow different behavior.
	You can map up to eight DSCP values per command.
Examples	This example shows how to map a port to queue-set 1. It maps DSCP values 0 to 3 to egress queue 1 and to threshold ID 1. It configures the drop thresholds for queue 1 to 50 and 70 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped.
	<pre>Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 1 0 1 2 3 Switch(config)# mls qos queue-set output 1 threshold 1 50 70 100 200 Switch(config)# interface gigabitethernet2/0/1 Switch(config-if)# queue-set 1</pre>
	You can verify your settings by entering the show mls qos maps , the show mls qos interface [<i>interface-id</i>] buffers , or the show mls qos queue-set privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue output cos-map	Maps class of service (CoS) values to an egress queue or maps CoS values to a queue and to a threshold ID.
	mls qos queue-set output threshold	Configures the WTD thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays quality of service (QoS) information.
	show mls qos maps	Displays QoS mapping information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos trust

Use the **mls qos trust** interface configuration command on the switch stack or on a standalone switch to configure the port trust state. Ingress traffic can be trusted, and classification is performed by examining the packet Differentiated Services Code Point (DSCP), class of service (CoS), or IP-precedence field. Use the **no** form of this command to return a port to its untrusted state.

mls qos trust [cos | device cisco-phone | dscp | ip-precedence]

no mls qos trust [cos | device | dscp | ip-precedence]

Syntax Description	cos	(Optional) Classify an ingress packet by using the packet CoS value. For an untagged packet, use the port default CoS value.
	device cisco-phone	(Optional) Classify an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.
	dscp	(Optional) Classify an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.
	ip-precedence	(Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.
Defaults	The port is not trusted	I. If no keyword is specified when the command is entered, the default is dscp .

Use this whether the port is trusted and which fields of the packet to use to classify traffic. ured with trust DSCP or trust IP precedence and the incoming packet is a non-IP SCP map is used to derive the corresponding DSCP value from the CoS value. The

Examples

The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cisco IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You must globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP phone. If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port and prevents misuse of a high-priority queue.

If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the **mls qos cos override** interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.

For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.

Classification using a port trust state (for example, **mls qos trust** [**cos** | **dscp** | **ip-precedence**] and a policy map (for example, **service-policy input** *policy-map-name*) are mutually exclusive. The last one configured overwrites the previous configuration.

This example shows how to configure a port to trust the IP precedence field in the incoming packet:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos trust ip-precedence

This example shows how to specify that the Cisco IP Phone connected on a port is a trusted device:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls gos trust device cisco-phone

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	mls qos cos	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
	mls qos dscp-mutation	Applies a DSCP-to DSCP-mutation map to a DSCP-trusted port.
	mls qos map	Defines the CoS-to-DSCP map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map.
	show mls qos interface	Displays QoS information.

mls qos vlan-based

Use the **mls qos vlan-based** interface configuration command on the switch stack or on a standalone switch to enable VLAN-based quality of service (QoS) on the physical port. Use the **no** form of this command to disable this feature.

mls qos vlan-based

no mls qos vlan-based

Syntax Description There are no arguments or keywords.

Defaults VLAN-based QoS is disabled.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines Before attaching a hierarchical policy map to a switch virtual interface (SVI), use the **mls qos vlan-based** interface configuration command on a physical port if the port is to be specified in the secondary interface level of the hierarchical policy map.

When you configure hierarchical policing, the hierarchical policy map is attached to the SVI and affects all traffic belonging to the VLAN. The individual policer in the interface-level traffic classification only affects the physical ports specified for that classification.

For detailed instructions about configuring hierarchical policy maps, see the "Classifying, Policing, and Marking Traffic by Using Hierarchical Policy Maps" section in the software configuration guide for this release.

Examples This example shows how to enable VLAN-based policing on a physical port:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos vlan-based

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface	Displays QoS information.

monitor session

Use the **monitor session** global configuration command on the switch stack or on a standalone switch to start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source or destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, and to limit (filter) SPAN source traffic to specific VLANs. Use the **no** form of this command to remove the SPAN or RSPAN session or to remove source or destination interfaces or filters from the SPAN or RSPAN session. For destination interfaces, the encapsulation options are ignored with the **no** form of the command.

- monitor session session_number destination {interface interface-id [, | -] [encapsulation
 replicate] [ingress { dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id }] } | {remote
 vlan vlan-id }
- monitor session session_number filter vlan vlan-id [, | -]
- **monitor session** *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}

no monitor session {*session_number* | **all** | **local** | **remote**}

no monitor session_number destination {interface interface-id [, | -] [encapsulation
replicate] [ingress {dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id}]} | {remote
vlan vlan-id}

no monitor session session_number filter vlan vlan-id [, | -]

no monitor session *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}

Syntax Description	session_number	Specify the session number identified with the SPAN or RSPAN session. The range is 1 to 66.
	destination	Specify the SPAN or RSPAN destination. A destination must be a physical port.
	interface <i>interface-id</i>	Specify the destination or source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For source interface , port channel is also a valid interface type, and the valid range is 1 to 48.
	encapsulation replicate	(Optional) Specify that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
		These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged.
	ingress	(Optional) Enable ingress traffic forwarding.
	dot1q vlan vlan-id	Accept incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
	isl	Specify ingress forwarding using ISL encapsulation.

untagged vlan vlan-id	Accept incoming packets with untagged encapsulation with the specified VLAN as the default VLAN.
vlan vlan-id	When used with only the ingress keyword, set default VLAN for ingress traffic.
remote vlan vlan-id	Specify the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.
	The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs).
,	(Optional) Specify a series of interfaces or VLANs, or separate a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.
•	(Optional) Specify a range of interfaces or VLANs. Enter a space before and after the hyphen.
filter vlan vlan-id	Specify a list of VLANs as filters on trunk source ports to limit SPAN source traffic to specific VLANs. The <i>vlan-id</i> range is 1 to 4094.
source	Specify the SPAN or RSPAN source. A source can be a physical port, a port channel, or a VLAN.
both, rx, tx	(Optional) Specify the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic.
source vlan vlan-id	Specify the SPAN source interface as a VLAN ID. The range is 1 to 4094.
all, local, remote	Specify all , local , or remote with the no monitor session command to clear all SPAN and RSPAN, all local SPAN, or all RSPAN sessions.

n	e	fa		lts	
L	C	a	u	แอ	

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

Command Modes Global configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage GuidelinesTraffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN.
Traffic routed to source ports or source VLANs cannot be monitored.

You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch or switch stack.

You can have a maximum of 64 destination ports on a switch or a switch stack.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports cannot be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A private-VLAN port cannot be configured as a SPAN destination port.

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the **port-channel** number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the **monitor session** *session_number* **filter vlan** *vlan-id* command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to act in these ways:

- When you enter **monitor session** *session_number* **destination interface** *interface-id* with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—**dot1q**, **isl**, or **untagged**.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate** with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate ingress**, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—dot1q, isl, or **untagged**. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

Switch(config) # monitor session 1 source interface gigabitethernet1/0/1 both Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2

This example shows how to delete a destination port from an existing local SPAN session:

Switch(config)# no monitor session 2 destination gigabitethernet1/0/2

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

Switch(config) # monitor session 1 filter vlan 100 - 110

This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.

```
Switch(config) # monitor session 1 source interface gigabitethernet1/0/1
Switch(config) # monitor session 1 source interface port-channel 2 tx
Switch(config) # monitor session 1 destination remote vlan 900
Switch(config) # end
```

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic.

Switch(config) # monitor session 10 source remote vlan 900 Switch(config)# monitor session 10 destination interface gigabitethernet1/0/2

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

Switch(config) # monitor session 2 destination interface gigabitethernet1/0/2 encapsulation dot1g ingress dot1g vlan 5

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic is untagged.

Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress untagged vlan 5

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN and RSPAN configurations on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Related Commands	Command	Description		
	remote-span	Configures an RSPAN VLAN in vlan configuration mode.		
	show monitor	Displays SPAN and RSPAN session information.		
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing		
		page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_co mmand_reference_list.html

mvr (global configuration)

Use the **mvr** global configuration command without keywords on the switch stack or on a standalone switch to enable the multicast VLAN registration (MVR) feature on the switch. Use the command with keywords to set the MVR mode for a switch, configure the MVR IP multicast address, set the maximum time to wait for a query reply before removing a port from group membership, and to specify the MVR multicast VLAN. Use the **no** form of this command to return to the default settings.

mvr [group *ip-address* [count] | mode [compatible | dynamic] | querytime value | vlan vlan-id]

no mvr [group *ip-address* | mode [compatible | dynamic] | querytime value | vlan vlan-id]

Syntax Description	group ip-address	Statically configure an MVR group IP multicast address on the switch.		
		Use the no form of this command to remove a statically configured IP multicast address or contiguous addresses or, when no IP address is entered, to remove all statically configured MVR IP multicast addresses.		
	count	(Optional) Configure multiple contiguous MVR group addresses. The range is 1 to 256; the default is 1.		
	mode	(Optional) Specify the MVR mode of operation.		
		The default is compatible mode.		
	compatible	Set MVR mode to provide compatibility with Catalyst 2900 XL and Catalyst 3500 XL switches. This mode does not allow dynamic membership joins on source ports.		
	dynamic	Set MVR mode to allow dynamic MVR membership on source ports.		
	querytime value	(Optional) Set the maximum time to wait for IGMP report memberships on a receiver port. This time applies only to receiver-port leave processing.When an IGMP query is sent from a receiver port, the switch waits for the default or configured MVR querytime for an IGMP group membership report before removing the port from multicast group membership.		
		The value is the response time in units of tenths of a second. The range is 1 to 100; the default is 5 tenths or one-half second.		
		Use the no form of the command to return to the default setting.		
	vlan vlan-id	(Optional) Specify the VLAN on which MVR multicast data is expected to be received. This is also the VLAN to which all the source ports belong. The range is 1 to 4094; the default is VLAN 1.		

Defaults MVR is disabled by default.

The default MVR mode is compatible mode.

No IP multicast addresses are configured on the switch by default.

The default group ip address count is 0.

The default query response time is 5 tenths of or one-half second.

The default multicast VLAN for MVR is VLAN 1.

Command Modes	Global configuratio	n		
Command History	Release	Modification		
-	12.2(40)EX2	This command was introduced.		
Usage Guidelines	A maximum of 256	MVR multicast groups can be configured on a switch.		
	Use the mvr group command to statically set up all the IP multicast addresses that will take part in MVR. Any multicast data sent to a configured multicast address is sent to all the source ports on the switch and to all receiver ports that have registered to receive data on that IP multicast address.			
	The mvr querytim	e command applies only to receiver ports.		
	When operating in c	compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.		
	MVR can coexist with IGMP snooping on a switch.			
	routing protocol wh enable MVR while	nd MVR cannot coexist on a switch. If you enable multicast routing and a multicast tile MVR is enabled, MVR is disabled and a warning message appears. If you try to multicast routing and a multicast routing protocol are enabled, the operation to celled with an Error message.		
Examples	This example shows	s how to enable MVR:		
	Switch(config)# m	vr		
	Use the show mvr j groups.	privileged EXEC command to display the current setting for maximum multicast		
	This example shows	s how to configure 228.1.23.4 as an IP multicast address:		
	Switch(config)# m	vr group 228.1.23.4		
	This example shows 228.1.23.1 to 228.1	s how to configure ten contiguous IP multicast groups with multicast addresses from .23.10:		
	Switch(config)# m	vr group 228.1.23.1 10		
	Use the show mvr members privileged EXEC command to display the IP multicast group addresses configured on the switch.			
	This example shows how to set the maximum query response time as one second (10 tenths):			
	Switch(config)# m	vr querytime 10		
	This example shows	s how to set VLAN 2 as the multicast VLAN:		
	Switch(config)# m	vr vlan 2		
	You can verify your	r settings by entering the show mvr privileged EXEC command.		

Related Commands	Command	Description
	mvr (interface configuration)	Configures MVR ports.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces with their type, status, and Immediate Leave configuration. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all ports that are members of an MVR multicast group; if the group has no members, its status is shown as Inactive.

mvr (interface configuration)

Use the mvr interface configuration command on the switch stack or on a standalone switch to configure a Layer 2 port as a multicast VLAN registration (MVR) receiver or source port, to set the Immediate Leave feature, and to statically assign a port to an IP multicast VLAN and IP address. Use the **no** form of this command to return to the default settings.

mvr [immediate | type { receiver | source } | vlan vlan-id group [ip-address]]

no mvr [**immediate** | **type** {**source** | **receiver**}] **vlan** *vlan-id* **group** [*ip-address*]]

Syntax Description	immediate	(Optional) Enable the Immediate Leave feature of MVR on a port. Use the no mvr immediate command to disable the feature.	
	type	(Optional) Configure the port as an MVR receiver port or a source port.	
		The default port type is neither an MVR source nor a receiver port. The no mvr type command resets the port as neither a source or a receiver port.	
	receiver	Configure the port as a subscriber port that can only receive multicast data. Receiver ports cannot belong to the multicast VLAN.	
	source	Configure the port as an uplink port that can send and receive multicast data for the configured multicast groups. All source ports on a switch belong to a single multicast VLAN.	
	vlan vlan-id group	(Optional) Add the port as a static member of the multicast group with the specified VLAN ID.	
		The no mvr vlan <i>vlan-id</i> group command removes a port on a VLAN from membership in an IP multicast address group.	
	ip-address	(Optional) Statically configure the specified MVR IP multicast group address for the specified multicast VLAN ID. This is the IP address of the multicast group that the port is joining.	
Defaults			
Deluans	A port is configured as neither a receiver nor a source. The Immediate Leave feature is disabled on all ports.		
	No receiver port is a member of any configured multicast group.		
Command Modes	Interface configuration	on	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	• •	source port if that port should be able to both send and receive multicast data bound ulticast groups. Multicast data is received on all ports configured as source ports.	

Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.

A port that is not taking part in MVR should not be configured as an MVR receiver port or a source port. A non-MVR port is a normal switch port, able to send and receive multicast data with normal switch behavior.

When Immediate Leave is enabled, a receiver port leaves a multicast group more quickly. Without Immediate Leave, when the switch receives an IGMP leave message from a group on a receiver port, it sends out an IGMP MAC-based query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP MAC-based query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency.

The Immediate Leave feature should be enabled only on receiver ports to which a single receiver device is connected.

The **mvr vlan group** command statically configures ports to receive multicast traffic sent to the IP multicast address. A port statically configured as a member of group remains a member of the group until statically removed. In compatible mode, this command applies only to receiver ports; in dynamic mode, it can also apply to source ports. Receiver ports can also dynamically join multicast groups by using IGMP join messages.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.

An MVR port cannot be a private-VLAN port.

Examples This example shows how to configure a port as an MVR receiver port:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mvr type receiver

Use the **show mvr interface** privileged EXEC command to display configured receiver ports and source ports.

This example shows how to enable Immediate Leave on a port:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mvr immediate
```

This example shows how to add a port on VLAN 1 as a static member of IP multicast group 228.1.23.4:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# mvr vlan1 group 230.1.23.4
```

You can verify your settings by entering the show mvr members privileged EXEC command.

Related Commands	Command	Description
	mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces or displays the multicast groups to which a receiver port belongs. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all receiver ports that are members of an MVR multicast group.

nsf

Use the **nsf** router configuration command on a switch stack or standalone switch to enable and configure Cisco nonstop forwarding (NSF) for Open Shortest Path First (OSPF) or Enhanced Interior Gateway Routing Protocol (EIGRP) routing. Use the **no** form of this command to disable NSF.

nsf [enforce global]

no nsf

This command is supported only on the Catalyst Switch Module 3110.

Syntax Description	enforce global	(Optional) Cancel OSPF NSF restart when non-NSF-aware neighbors are detected. These keywords are visible only in OSPF router configuration mode.	
Defaults	NSF is disabled.		
	The enforce global of	option is enabled (OSPF only).	
Command Modes	Router configuration	n (OSPF or EIGRP)	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines		s a router configuration command and affects all interfaces that are covered by the process. The switch supports Cisco NSF for OSPF and EIGRP protocols.	
		d and a stack master switchover is detected, the NSF-capable routers rebuild routing SF-aware or NSF-capable neighbors and do not wait for a restart.	
Examples	This example shows	how to enable OSPF NSF:	
	Switch(config)# ro Switch(config-rout	-	
	Use the show ip ospf privileged EXEC command to verify that OSPF NSF is enabled.		
	This example shows	how to enable EIGRP NSF:	
	Switch(config)# ro Switch(config-rout		
	Use the show ip pro	ptocols privileged EXEC command to verify that EIGRP NSF is enabled.	

Reference, Volume 2 of 3: Routing Protocols, Release 12.2 > EIGRE Commands and Cisco IOS IP Command Reference, Volume 2 of 3:	Related Commands	Command	Description
		router protocol-id number	Enables a routing process. Displays the current operating configuration. For syntax information, select Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2 > EIGRP Commands and Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2 > OSFP Commands.

pagp learn-method

Use the **pagp learn-method** interface configuration command on the switch stack or on a standalone switch to learn the source address of incoming packets received from an EtherChannel port. Use the **no** form of this command to return to the default setting.

pagp learn-method {aggregation-port | physical-port}

no pagp learn-method

Syntax Description	aggregation-port	Specify address learning on the logical port-channel. The switch sends packets to the source using any of the ports in the EtherChannel. This setting is the default. With aggregate-port learning, it is not important on which physical port the packet arrives.
	physical-port	Specify address learning on the physical port within the EtherChannel. The switch sends packets to the source using the same port in the EtherChannel from which it learned the source address. The other end of the channel uses the same port in the channel for a particular destination MAC or IP address.
Defaults	The default is aggreg	gation-port (logical port channel).
Command Modes	Interface configurati	on
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	The learn method m	ust be configured the same at both ends of the link.
 Note	provided in the cominiterface configuration	address learning only on aggregate ports even though the physical-port keyword is mand-line interface (CLI). The pagp learn-method and the pagp port-priority on commands have no effect on the switch hardware, but they are required for PAgP devices that only support address learning by physical ports, such as the h.
	as a physical-port les command and to set port-channel load-t	er to the switch is a physical learner, we recommend that you configure the switch arner by using the pagp learn-method physical-port interface configuration the load-distribution method based on the source MAC address by using the palance src-mac global configuration command. Use the pagp learn-method on command only in this situation.

Examples This example shows how to set the learning method to learn the address on the physical port within the EtherChannel:

Switch(config-if)# pagp learn-method physical-port

This example shows how to set the learning method to learn the address on the port-channel within the EtherChannel:

Switch(config-if)# pagp learn-method aggregation-port

You can verify your settings by entering the **show running-config** privileged EXEC command or the **show pagp** *channel-group-number* **internal** privileged EXEC command.

Related Commands	Command	Description
	pagp port-priority	Selects a port over which all traffic through the EtherChannel is sent.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command_ reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

pagp port-priority

Use the **pagp port-priority** interface configuration command on the switch stack or on a standalone switch to select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. Use the **no** form of this command to return to the default setting.

pagp port-priority priority

no pagp port-priority

Syntax Description	priority	A priority number ranging from 0 to 255.	
Defaults	The default is 128.		
Command Modes	Interface configurat	tion	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines The physical port with the highest priority that is operational and has membership in EtherChannel is the one selected for PAgP transmission.			
Note	The switch supports address learning only on aggregate ports even though the physical-port keyword is provided in the command-line interface (CLI). The pagp learn-method and the pagp port-priority interface configuration commands have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.		
	When the link partner to the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the pagp learn-method physical-port interface configuration command and to set the load-distribution method based on the source MAC address by using the port-channel load-balance src-mac global configuration command. Use the pagp learn-method interface configuration command only in this situation.		
Examples	This example show	s how to set the port priority to 200:	
	Switch(config-if)# pagp port-priority 200		
	You can verify your setting by entering the show running-config privileged EXEC command or the show pagp <i>channel-group-number</i> internal privileged EXEC command.		

Related Commands	Command	Description
	pagp learn-method	Provides the ability to learn the source address of incoming packets.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_command_r eference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

L

permit (ARP access-list configuration)

Use the **permit** Address Resolution Protocol (ARP) access-list configuration command to permit an ARP packet based on matches against the Dynamic Host Configuration Protocol (DHCP) bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access control list.

- permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac mac}]} [log]
- no permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]

Syntax Description	request	(Optional) Requests a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specify the sender IP address.
	any	Accept any IP or MAC address.
	host sender-ip	Accept the specified sender IP address.
	sender-ip sender-ip-mask	Accept the specified range of sender IP addresses.
	mac	Specify the sender MAC address.
	host sender-mac	Accept the specified sender MAC address.
	sender-mac sender-mac-mask	Accept the specified range of sender MAC addresses.
	response ip	Define the IP address values for the ARP responses.
	host target-ip	(Optional) Accept the specified target IP address.
	target-ip target-ip-mask	(Optional) Accept the specified range of target IP addresses.
	mac	Specify the MAC address values for the ARP responses.
	host target-mac	(Optional) Accept the specified target MAC address.
	target-mac target-mac-mask	(Optional) Accept the specified range of target MAC addresses.
	log	(Optional) Log a packet when it matches the ACE. Matches are logged if you also configure the matchlog keyword in the ip arp inspection vlan logging global configuration command.

Defaults There are

There are no default settings.

Command Modes ARP access-list configuration

Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	You can add permit cla	auses to forward ARP packets based on some matching criteria.	
Examples	-	ow to define an ARP access list and to permit both ARP requests and ARP with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:	
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end		
	You can verify your se	ttings by entering the show arp access-list privileged EXEC command.	
Related Commands	Command	Description	
	arp access-list	Defines an ARP access control list (ACL).	
	deny (ARP access-lis configuration)	t Denies an ARP packet based on matches against the DHCP bindings.	
	ip arp inspection filte	er vlan Permits ARP requests and responses from a host configured with a static IP address.	
		static if address.	

permit (IPv6 access-list configuration)

Use the **permit** IPv6 access list configuration command on the switch stack or on a standalone switch to set permit conditions for an IPv6 access list. Use the **no** form of this command to remove the permit conditions.

- permit {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence
 value] [time-range name]
- **no permit** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**routing**] [**sequence** *value*] [**time-range** *name*]

Internet Control Message Protocol

permit icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [routing] [sequence value] [time-range name]

Transmission Control Protocol

permit tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [routing] [sequence value] [syn] [time-range
 name] [urg]

User Datagram Protocol

permit udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [routing] [sequence value] [time-range name]

Although visible in the command-line help strings, the **flow-label** and **reflect** keywords are not supported on the Catalyst Switch Module 3110.

Although visible in the command-line help strings, the **flow-label**, **reflect**, and **routing** keywords are not supported on the Catalyst Switch Module 3012.

This command is supported only if your switch has a switch database management (SDM) dual IPv4 and IPv6 template configured.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp, esp, icmp, ipv6, pcp, sctp, tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the Catalyst Switch Module 3012 supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended unique identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	any	An abbreviation for the IPv6 prefix ::/0.
	host source-ipv6-address	The source IPv6 host address for which to set permit conditions.
		This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
		The range operator requires two port numbers. All other operators require one port number.
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Although the CLI help shows a prefix-length range of /0 to /128, the Catalyst Switch Module 3012 supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended unique identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	host	The destination IPv6 host address for which to set permit conditions.
	destination-ipv6-address	This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	dscp value	(Optional) Match a differentiated services codepoint value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

fragments	(Optional) Match noninitial fragmented packets where the fragment	
	extension header contains a nonzero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.	
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages logged to the console is controlled by the logging console command.)	
	The message includes the access list name and sequence number; whether the packet was permitted; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets permitted in the prior 5-minute interval.	
log-input	(Optional) Provide the same function as the log keyword, but the logging message also includes the receiving interface.	
routing	(Optional) Match packets with the routing extension header.	
	This keyword is supported only on the Catalyst Switch Module 3110.	
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.	
time-range name	(Optional) Specify the time range that applies to the permit statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.	
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by the ICMP message type. The type is a number from 0 to 255.	
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by the ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.	
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.	
ack	(Optional) Only for the TCP protocol: acknowledgment (ACK) bit set.	
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.	
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.	
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.	
psh	(Optional) Only for the TCP protocol: Push function bit set.	
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.	
rst	(Optional) Only for the TCP protocol: Reset bit set.	
syn	(Optional) Only for the TCP protocol: Synchronize bit set.	
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.

Command Modes	IPv6 access-list configuration

No IDv6 access list is defined

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines

Defaulto

nes The **permit** (IPv6 access-list configuration mode) command is similar to the **permit** (IPv4 access-list configuration mode) command, but it is IPv6-specific.

Use the **permit** (IPv6) command after the **ipv6 access-list** command to enter IPv6 access-list configuration mode and to define the conditions under which a packet passes the access list.

Specifying IPv6 for the *protocol* argument matches against the IPv6 header of the packet.

By default, the first statement in an access list is number 10, and the subsequent statements increment by 10.

You can add **permit**, **deny**, or **remark** statements to an existing access list without re-entering the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to show where it belongs.

See the **ipv6 access-list** command for more information on defining IPv6 ACLs.

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. The two **permit** conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny **icmp any any nd-na** or **icmp any any nd-ns**, there must be an explicit **deny** entry in the ACL. For the three implicit statements to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Both the *source-ipv6-prefix/prefix-length* and *destination-ipv6-prefix/prefix-length* arguments are used for traffic filtering (the source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination).

The switch supports IPv6 address matching for a full range of prefix-lengths.

The fragments keyword is an option only if the operator [port-number] arguments are not specified.

This is a list of ICMP message names:

beyond-scope
echo-reply
header

destination-unreachable echo-request hop-limit

mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures two IPv6 access lists named OUTBOUND and INBOUND and applies both access lists to outbound and inbound traffic on a Layer 3 interface. The first and second permit entries in the OUTBOUND list permit all TCP and UDP packets from network 2001:ODB8:0300:0201::/64 to leave the interface. The deny entry in the OUTBOUND list prevents all packets from the network FE80:0:0:0201::/64 (packets that have the link-local prefix FE80:0:0:0201 as the first 64 bits of their source IPv6 address) from leaving the interface. The third permit entry in the OUTBOUND list permits all ICMP packets to leave the interface.

The permit entry in the INBOUND list permits all ICMP packets to enter the interface.

```
Switch(config)#ipv6 access-list OUTBOUND
Switch(config-ipv6-acl)# permit tcp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# permit udp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# deny FE80:0:0:0201::/64 any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# exit
Switch(config-if)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter OUTBOUND out
Switch(config-if)# ipv6 traffic-filter INBOUND in
```

Note

Given that a **permit any any** statement is not included as the last entry in the OUTBOUND or the INBOUND access list, only TCP, UDP, and ICMP packets are permitted out of and into the interface (the implicit deny-all condition at the end of the access list denies all other packet types on the interface).

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

permit (MAC access-list configuration)

Use the **permit** MAC access-list configuration command on the switch stack or on a standalone switch to allow non-IP traffic to be forwarded if the conditions are matched. Use the **no** form of this command to remove a permit condition from the extended MAC access list.

- {permit | deny} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
 dst-MAC-addr mask} [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv |
 diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console |
 mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {permit | deny} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]

Though visible in the command-line help strings, appletalk is not supported as a matching condition.

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src-MAC-addr src-MAC-addr mask	Define a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
	host <i>dst-MAC-addr</i> <i>dst-MAC-addr</i> mask	Define a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		• <i>type</i> is 0 to 65535, specified in hexadecimal.
		• <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select an arbitrary class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message appears if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
		(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.	
	The <i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.	
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.	
mop-dump	(Optional) Select EtherType DEC-MOP Dump.	
msdos	(Optional) Select EtherType DEC-MSDOS.	
mumps	(Optional) Select EtherType DEC-MUMPS.	
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).	
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.	
vines-ip	(Optional) Select EtherType VINES IP.	
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite.	

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-14.

Table 2-14	IPX Filtering Criteria
------------	------------------------

IPX Encapsulation Type		
Cisco IOS Name	Novell Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes MAC access-list configuration

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

For more information about MAC-named extended access lists, see the software configuration guide for this release.

Examples This example shows how to define the MAC-named extended access list to allow NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

Switch(config-ext-macl)# permit any host 00c0.00a0.03fa netbios

This example shows how to remove the permit condition from the MAC-named extended access list: Switch(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000 netbios

This example permits all packets with Ethertype 0x4321:

Switch(config-ext-macl)# permit any any 0x4321 0

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Denies non-IP traffic to be forwarded if conditions are matched.
	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.
	show access-lists	Displays access control lists configured on a switch.

platform chassis-management

Use the **platform chassis-management** global configuration command to enable the protected-mode feature on the standalone switch or the switch stack. Use the **no** form of this command to disable protected mode.

platform chassis-management protected-mode

no platform chassis-management protected-mode

Syntax Description	protected-mode	Enable protected mode on the switch.
Defaults	Protected mode is disab	led; the Advanced Management Module (AMM) controls the switch.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	The protected-mode feature is supported only on standalone switches.Use protected mode to prevent the AMM from controlling the standalone switch.	
	Before you enter the platform chassis-management protected-mode global configuration command on the switch, you must enable protected mode on the AMM For information about enabling protected mode on the AMM, see the AMM documentation at this URL:	
	http://www-304.ibm.com/jct01004c/systems/support/supportsite.wss/brandmain?brandind=5000020	
	After entering the platform chassis-management protected-mode global configuration command on the switch, you must reboot the switch so that protected mode is operational.	
		erface with an IP address is not reachable from an external switch interface, the gement protected-mode command does not take effect after the switch reboots.
Examples	This example shows how to enable protected mode on the switch: Switch(config)# platform chassis-management protected-mode	
	You can verify your settings by entering the show platform summary user EXEC command.	
Related Commands	Command	Description
	show platform chassis	Displays information about the AMM.
	show platform chassis summary	Displays a summary of the AMM information.

police

Use the **police** policy-map class configuration command on the switch stack or on a standalone switch to define a policer for classified traffic. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove an existing policer.

police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]

no police *rate-bps burst-byte* [**exceed-action** {**drop** | **policed-dscp-transmit**}]

Syntax Description	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 1000000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	(Optional) When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	(Optional) When the specified rate is exceeded, specify that the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.
Defaults	No policers are defined.	
Command Modes	Policy-map class configu	uration
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	When configuring hierar secondary interface-leve	rchical policy maps, you can only use the police policy-map command in a
	The port ASIC device, which controls more than one physical port, supports 256 policers on the switch (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port. There is no guarantee that a port will be assigned to any policer.	
	To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.	
	Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the <i>burst-byte</i> option of the police policy-map class configuration command or the mls qos aggregate-policer global configuration command. You configure how quickly (the average rate) the tokens are removed from the bucket by using the <i>rate-bps</i> option of the police policy-map class configuration command or the mls qos aggregate-policer global configuration the <i>rate-bps</i> option of the police policy-map class configuration command or the mls qos aggregate-policer global configuration global configuration command. For more information, see the software configuration guide for this release.	

Examples This exa

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action drop
Switch(config-pmap-c)# exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Switch(config)# policy-map policy2
Switch(config-pmap)# class class2
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Command	Description
class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
mls qos map policed-dscp	Applies a policed-DSCP map to a DSCP-trusted port.
policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
show policy-map	Displays quality of service (QoS) policy maps.
trust	Defines a trust state for traffic classified through the class policy-map configuration or the class-map global configuration command.
	class mls qos map policed-dscp policy-map set show policy-map

police aggregate

Use the **police aggregate** policy-map class configuration command on the switch stack or on a standalone switch to apply an aggregate policer to multiple classes in the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove the specified policer.

police aggregate aggregate-policer-name

no police aggregate *aggregate-policer-name*

Syntax Description	aggregate-policer-nam	<i>ne</i> Name of the aggregate policer.
Defaults	No aggregate policers	are defined.
Command Modes	Policy-map class confi	iguration
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
(255 user-configurable policers plus 1 policer reserved for interna configurable policers supported per port is 63. Policers are allocat		which controls more than one physical port, supports 256 policers on the switch e policers plus 1 policer reserved for internal use). The maximum number of supported per port is 63. Policers are allocated on demand by the software and are dware and ASIC boundaries. You cannot reserve policers per port. There is no vill be assigned to any policer.
	You set aggregate policer parameters by using the mls qos aggregate-policer global configuration command. You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.	
	To return to policy-map use the end command.	p configuration mode, use the exit command. To return to privileged EXEC mode,
	You cannot configure a	aggregate policers in hierarchical policy maps.

command.

Examples This example shows how to define the aggregate policer parameters and to apply the policer to multiple classes in a policy map: Switch(config)# mls qos aggregate-policer agg_policer1 10000 1000000 exceed-action drop Switch(config) # policy-map policy2 Switch(config-pmap)# class class1 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap)# class class2 Switch(config-pmap-c)# set dscp 10 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap) # class class3 Switch(config-pmap-c)# trust dscp Switch(config-pmap-c)# police aggregate agg_policer2 Switch(config-pmap-c)# exit You can verify your settings by entering the show mls qos aggregate-policer privileged EXEC

 Displays the quality of service (QoS) aggregate policer configuration.

policy-map

Use the **policy-map** global configuration command on the switch stack or on a standalone switch to create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name

no policy-map *policy-map-name*

Syntax Description	policy-map-name	Name of the policy map.	
Defaults	No policy maps are de	fined.	
		s to set the Differentiated Services Code Point (DSCP) to 0 if the packet is an IP lass of service (CoS) to 0 if the packet is tagged. No policing is performed.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	After entering the policy-map command, you enter policy-map configuration mode, and these configuration commands are available:		
	• class : defines the classification match criteria for the specified class map. For more information, see the "class" section on page 2-42.		
	• description : describes the policy map (up to 200 characters).		
	• exit: exits policy-map configuration mode and returns you to global configuration mode.		
	• no : removes a previously defined policy map.		
	• rename : renames the current policy map.		
	To return to global configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Before configuring policies for classes whose match criteria are defined in a class map, use the policy-map command to specify the name of the policy map to be created, added to, or modified. Entering the policy-map command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.		
	To configure the match	s policies in a policy map only if the classes have match criteria defined for them. criteria for a class, use the class-map global configuration and match class-map ds. You define packet classification on a physical-port basis.	

Only one policy map per ingress port or SVI is supported. You can apply the same policy map to multiple physical ports or SVIs.

You can apply a nonhierarchical policy maps to physical ports or to SVIs. However, you can only apply a hierarchical policy map to SVIs.

A hierarchical policy map has two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on an SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI and are specified in the interface-level policy map.

In a primary VLAN-level policy map, you can only configure the trust state or set a new DSCP or IP precedence value in the packet. In a secondary interface-level policy map, you can only configure individual policers on physical ports that belong to the SVI.

After the hierarchical policy map is attached to an SVI, an interface-level policy map cannot be modified or removed from the hierarchical policy map. A new interface-level policy map also cannot be added to the hierarchical policy map. If you want these changes to occur, the hierarchical policy map must first be removed from the SVI.

For more information about hierarchical policy maps, see the "Policing on SVIs" section in the "Configuring QoS" chapter of the software configuration guide for this release.

Examples

This example shows how to create a policy map called *policy1*. When attached to the ingress port, it matches all the incoming traffic defined in *class1*, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

This example shows how to configure multiple classes in a policy map called *policymap2*:

```
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 100000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# set dscp 0 (no policer)
Switch(config-pmap-c)# exit
```

This example shows how to create a hierarchical policy map and attach it to an SVI:

```
Switch(config)# class-map cm-non-int
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# class-map cm-non-int-2
Switch(config-cmap)# match access-group 102
Switch(config-cmap)# exit
Switch(config)# class-map cm-test-int
Switch(config-cmap)# match input-interface gigabitethernet2/0/2 - gigabitethernet2/0/3
Switch(config-cmap)# exit
Switch(config-cmap)# exit
Switch(config)# policy-map pm-test-int
```

```
Switch(config-pmap)# class cm-test-int
Switch(config-pmap-c)# police 18000000 8000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map pm-test-pm-2
Switch(config-pmap)# class cm-non-int
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# set dscp 15
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# end
Switch(config-pmap-c)# end
Switch(config-cmap)# exit
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input pm-test-pm-2
```

This example shows how to delete *policymap2*:

Switch(config)# no policy-map policymap2

You can verify your settings by entering the **show policy-map** privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration command) for the specified class-map name.
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	service-policy	Applies a policy map to a port.
	show mls qos vlan	Displays the quality of service (QoS) policy maps attached to an SVI.
	show policy-map	Displays QoS policy maps.

port-channel load-balance

Use the **port-channel load-balance** global configuration command on the switch stack or on a standalone switch to set the load-distribution method among the ports in the EtherChannel. Use the **no** form of this command to return to the default setting.

port-channel load-balance {dst-ip | dst-mac | src-dst-ip | src-dst-mac | src-ip | src-mac}

no port-channel load-balance

Syntax Description	dst-ip	Load distribution is based on the destination host IP address.		
	dst-mac	Load distribution is based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent or different ports in the channel.		
	src-dst-ip	Load distribution is based on the source and destination host IP address.		
	src-dst-mac	Load distribution is based on the source and destination host MAC address.		
	src-ip	Load distribution is based on the source host IP address.		
	src-mac	Load distribution is based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.		
Defaults	The default is	src-mac.		
Command Modes	Global configu	uration		
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		
Usage Guidelines	For information about when to use these forwarding methods, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.			
Examples	This example	shows how to set the load-distribution method to dst-mac :		
Examples	-	shows how to set the load-distribution method to dst-mac : g) # port-channel load-balance dst-mac		

Related Commands	Command	Description
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/prod_comman d_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

priority-queue

Use the **priority-queue** interface configuration command to enable the egress expedite queue on a port. Use the **no** form of this command to return to the default setting.

priority-queue out

no priority-queue out

Syntax Description	out	Enable the egress expedite queue.	
Defaults	The egress expedite	queue is disabled.	
Command Modes	Interface configurat	ion	
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	affected because the bandwidth shape o	e the priority-queue out command, the shaped round robin (SRR) weight ratios are re is one fewer queue participating in SRR. This means that <i>weight1</i> in the srr-queue r the srr-queue bandwidth shape interface configuration command is ignored (not rulation). The expedite queue is a priority queue, and it is serviced until empty before serviced.	
	Follow these guideli their SRR weights:	ines when the expedite queue is enabled or the egress queues are serviced based on	
	• If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.		
	• If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.		
	• If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services the queue in shared mode.		
Examples	egress expedite que	how to enable the egress expedite queue when the SRR weights are configured. The ue overrides the configured SRR weights. hterface gigabitethernet1/0/2 # srr-queue bandwidth shape 25 0 0 0	
	Switch(config-if)	# srr-queue bandwidth share 30 20 25 25 # priority-queue out	

This example shows how to disable the egress expedite queue after the SRR shaped and shared weights are configured. The shaped mode overrides the shared mode.

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# no priority-queue out
```

You can verify your settings by entering the **show mls qos interface** *interface-id* **queueing** or the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface queueing	Displays the queueing strategy (SRR, priority queueing), the weights corresponding to the queues, and the CoS-to-egress-queue map.
	srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
	srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

private-vlan

Use the **private-vlan** VLAN configuration command on the switch stack or on a standalone switch to configure private VLANs and to configure the association between private-VLAN primary and secondary VLANs. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

private-vlan {association [add | remove] secondary-vlan-list | community | isolated | primary}

no private-vlan {association | community | isolated | primary}

Syntax Description	association	Create an association between the primary VLAN and a secondary VLAN.
	secondary-vlan-list	Specify one or more secondary VLANs to be associated with a primary VLAN in a private VLAN.
	add	Associate a secondary VLAN to a primary VLAN.
	remove	Clear the association between a secondary VLAN and a primary VLAN.
	community	Designate the VLAN as a community VLAN.
	isolated	Designate the VLAN as a community VLAN.
	primary	Designate the VLAN as a community VLAN.
Defaults	The default is to have r	no private VLANs configured.
Command Modes	VLAN configuration	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	6 61	vate VLANs, you must disable VTP (VTP mode transparent). After you configure hould not change the VTP mode to client or server.
	VTP does not propagate private-VLAN configuration. You must manually configure private VLANs on all switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private-VLAN traffic.	
	You cannot include VLAN 1 or VLANs 1002 to 1005 in the private-VLAN configuration. Extended VLANs (VLAN IDs 1006 to 4094) can be configured in private VLANs.	
	You can associate a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.	
	• A secondary VLA	N cannot be configured as a primary VLAN.
	items. Each item ca	<i>un_list</i> parameter cannot contain spaces. It can contain multiple comma-separated an be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The e isolated VLAN and multiple community VLANs.

• If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A **community** VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An **isolated** VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary vlan domain.

A **primary** VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The private-vlan commands do not take effect until you exit from VLAN configuration mode.

Do not configure private-VLAN ports as EtherChannels. While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For information about configuring host ports and promiscuous ports, see the **switchport mode private-vlan** command.

For more information about private-VLAN interaction with other features, see the software configuration guide for this release.

Examples

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan) # private-vlan primary
Switch(config-vlan)# exit
Switch(config) # vlan 501
Switch(config-vlan) # private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 502
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 503
Switch(config-vlan) # private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 20
Switch(config-vlan) # private-vlan association 501-503
Switch(config-vlan)# end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status** privileged EXEC command.

Related Commands	Command	Description
	show interfaces status	Displays the status of interfaces, including the VLANs to which they belong.
	show vlan private-vlan	Displays the private VLANs and VLAN associations configured on the switch or switch stack.
	switchport mode private-vlan	Configures a private-VLAN port as a host port or promiscuous port.

private-vlan mapping

Use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI) on the switch stack or on a standalone switch to create a mapping between a private-VLAN primary and secondary VLANs so that both VLANs share the same primary VLAN SVI. Use the **no** form of this command to remove private-VLAN mappings from the SVI.

private-vlan mapping {[add | remove] secondary-vlan-list}

no private-vlan mapping

Syntax Description	secondary-vlan-list	Specify one or more secondary VLANs to be mapped to the primary VLAN SVI.	
	add	(Optional) Map the secondary VLAN to the primary VLAN SVI.	
	remove	(Optional) Remove the mapping between the secondary VLAN and the primary VLAN SVI.	
Defaults	The default is to have n	no private VLAN SVI mapping configured.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(40)EX2	This command was introduced.	
Usage Guidelines	The switch must be in V	VTP transparent mode when you configure private VLANs.	
	The SVI of the primary VLAN is created at Layer 3.		
	Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.		
	The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.		
	Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.		
	A secondary VLAN can be mapped to only one primary SVI. IF you configure the primary VLAN as a secondary VLAN, all SVIs specified in this command are brought down.		
		ping between two VLANs that do not have a valid Layer 2 private-VLAN ng configuration does not take effect.	

Chapter 2 Cisco Catalyst Switch Module 3110 and 3012 for IBM BladeCenter Cisco IOS Commands

Examples

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

Switch# configure terminal Switch# interface vlan 18 Switch(config-if)# private-vlan mapping 20 Switch(config-vlan)# end

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

Switch# configure terminal Switch# interface vlan 20 Switch(config-if)# private-vlan mapping 303-305, 307 Switch(config-vlan)# end

You can verify your setting by entering the **show interfaces private-vlan mapping** privileged EXEC command.

Related Commands	Command	Description
	-	Display private-VLAN mapping information for the VLAN SVIs.
	mapping	

queue-set

Use the **queue-set** interface configuration command on the switch stack or on a standalone switch to map a port to a queue-set. Use the **no** form of this command to return to the default setting.

queue-set qset-id

no queue-set qset-id

Syntax Description	1	1	ach port belongs to a queue-set, which defines all the our egress queues per port. The range is 1 to 2.
Defaults	The queue-set ID is	1.	
Command Modes	Interface configuration		
Command History	Release	Modification	I
	12.2(40)EX2	This comma	nd was introduced.
Examples	This example shows how to map a port to queue-set 2: Switch(config)# interface gigabitethernet2/0/1		
	Switch(config-if) You can verify your EXEC command.		g the show mls qos interface [interface-id] buffers privileged
Related Commands	Command		Description
	mls qos queue-set	output buffers	Allocates buffers to a queue-set.
	mls qos queue-set		Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	show mls gos inter	e 1 ce	Displays quality of service (QoS) information.

radius-server dead-criteria

Use the **radius-server dead-criteria** global configuration command on the switch stack or on a standalone switch to configure the conditions that determine when a RADIUS server is considered unavailable or *dead*. Use the **no** form of this command to return to the default settings.

radius-server dead-criteria [time seconds [tries number] | tries number]

no radius-server dead-criteria [time seconds [tries number] | tries number]

Syntax Description	time seconds	(Optional) Set the time in seconds during which the switch does not need to get a valid response from the RADIUS server. The range is from 1 to 120 seconds.
	tries number	(Optional) Set the number of times that the switch does not get a valid response from the RADIUS server before the server is considered unavailable. The range is from 1 to 100.
Defaults	•	namically determines the <i>seconds</i> value that is from 10 to 60 seconds.
	The switch dy	namically determines the <i>tries</i> value that is from 10 to 100.
Command Modes	Global configu	iration
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
Usage Guidelines	• Use the ra seconds du	d that you configure the <i>seconds</i> and <i>number</i> parameters as follows: adius-server timeout <i>seconds</i> global configuration command to specify the time in uring which the switch waits for a RADIUS server to respond before the IEEE 802.1x ition times out. The switch dynamically determines the default <i>seconds</i> value that is from econds.
	times the s	adius-server retransmit <i>retries</i> global configuration command to specify the number of switch tries to reach the RADIUS servers before considering the servers to be unavailable. h dynamically determines the default <i>tries</i> value that is from 10 to 100.
		<i>ds</i> parameter is less than or equal to the number of retransmission attempts times the times before the IEEE 802.1x authentication times out.
	• The <i>tries</i> p	parameter should be the same as the number of retransmission attempts.
Examples	1	shows how to configure 60 as the time and 10 as the number of tries , the conditions that en a RADIUS server is considered unavailable
	Switch(config	y)# radius-server dead-criteria time 60 tries 10
	You can verify	your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	radius-server retransmit retries	Specifies the number of times that the switch tries to reach the RADIUS servers before considering the servers to be unavailable. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	radius-server timeout seconds	Specifies the time in seconds during which the switch waits for a RADIUS server to respond before the IEEE 802.1x authentication times out. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/pr od_command_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

radius-server host

Use the **radius-server host** global configuration command on the switch stack or on a standalone switch to configure the RADIUS server parameters, including the RADIUS accounting and authentication. Use the **no** form of this command to return to the default settings.

radius-server host *ip-address* [acct-port *udp-port*] [auth-port *udp-port*][test username *name* [idle-time *time*] [ignore-acct-port] [ignore-auth-port]] [key *string*]

no radius-server host ip-address

Syntax Description	ip-address	Specify the IP address of the RADIUS server.		
, ,	acct-port udp-port	(Optional) Specify the UDP port for the RADIUS accounting server. The		
		range is from 0 to 65536.		
	auth-port udp-port	(Optional) Specify the UDP port for the RADIUS authentication server. The range is from 0 to 65536.		
	key string	(Optional) Specify the authentication and encryption key for all RADIUS communication between the switch and the RADIUS daemon. The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.		
	test username name	(Optional) Enable automatic server testing of the RADIUS server status, and specify the username to be used.		
	idle-time time	(Optional) Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes.		
	ignore-acct-port (Optional) Disables testing on the RADIUS-server accounting port.			
	ignore-auth-port	(Optional) Disables testing on the RADIUS-server authentication port.		
Defaults	The UDP port for the R	ADIUS accounting server is 1646.		
	The UDP port for the R	RADIUS authentication server is 1645.		
	Automatic server testin	g is disabled.		
	The idle time is 60 minutes (1 hour).			
	When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.			
	The authentication and	encryption key (<i>string</i>) is not configured.		
Command Modes	Global configuration			
Command History	Release	Modification		
	12.2(40)EX2	This command was introduced.		

Usage Guidelines We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.

Use the **test username** *name* keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

You can configure the authentication and encryption key by using the **radius-server host** *ip-address* **key** *string* or the **radius-server key** {0 *string* | 7 *string* | *string*} global configuration command. Always configure the key as the last item in this command.

Examples

This example shows how to configure 1500 as the UDP port for the accounting server and 1510 as the UDP port for the authentication server:

Switch(config)# radius-server host 1.1.1.1 acct-port 1500 auth-port 1510

This example shows how to configure the UDP port for the accounting server and the authentication server, enable automated testing of the RADIUS server status, specify the username to be used, and configure a key string:

Switch(config)# radius-server host 1.1.1.2 acct-port 800 auth-port 900 test username
aaafail idle-time 75 key abc123

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	<pre>radius-server key {0 string 7 string string }</pre>	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	show running-config	Displays the operating configuration. For syntax information, use this link to the Cisco IOS Release 12.2 Command Reference listing page: http://www.cisco.com/en/US/products/sw/iosswrel/ps1835/pr od_command_reference_list.html Select the Cisco IOS Commands Master List, Release 12.2 to navigate to the command.

OL-12190-02

reload

Use the **reload** privileged EXEC command to reload the stack member and to put a configuration change into effect.

reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu]

This command is supported only on the Catalyst Switch Module 3110.

Syntax Description	LINE	Specify the reason for the reload.		
	at	Specify the time in hh:mm for the reload to occur.		
	cancel	Cancel the pending reload. Specify a time interval in mmm or hhh:mm for reloads to occur. Save the changes on the specified stack member and restart it.		
	in			
	slot stack-member-number			
	standby-cpu	Reload the standby route processor (RP).		
Defaults	Immediately reloads the stac	k member and puts a configuration change into effect.		
Command Modes	Privilege EXEC			
Command History	Release Mo	odification		
	12.2(40)EX2 Th	is command was introduced.		
Usage Guidelines		ch in the switch stack, and you enter the reload slot <i>stack-member-number</i> oted to save the configuration.		
Examples	This example shows how to r	reload the switch stack:		
	Switch(config)# reload System configuration has been modified. Save? [yes/no]: y Proceed to reload the whole Stack? [confirm] y			
	This example shows how to reload a specific stack member:			
	Switch(config)# reload slot 6 Proceed with reload? [confirm] y			
	This example shows how to r	reload a single-switch switch stack (there is only one member switch):		
	Switch(config)# reload slot 3 System configuration has been modified. Save? [yes/no]: y			

Proceed to reload the whole Stack? [confirm] ${\boldsymbol{y}}$

Related Commands	ls Command Description	
	switch priority	Changes the stack member priority value.
	switch renumber	Changes the stack member number.
	show switch	Displays information about the switch stack and its stack members.

remote command

Use the remote command privileged EXEC command to monitor all or specified stack members.

remote command {all | stack-member-number} LINE

This command is supported only on the Catalyst Switch Module 3110.

Syntax Description	all	Apply to all stack members.
	stack-member-number	Specify the stack member. The range is 1 to 9.
	LINE	Specify the command to execute.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(40)EX2	This command was introduced.
	to a specific stack memb	per or to the switch stack.
Fxamples	-	
Examples	This example shows how Switch(config)# remote Switch :1 :	ber or to the switch stack. It is to execute the undebug command on the switch stack: e command all undebug all
Examples	This example shows how Switch(config)# remote Switch :1 : 	v to execute the undebug command on the switch stack: e command all undebug all
Examples	This example shows how Switch(config)# remote Switch :1 : 	w to execute the undebug command on the switch stack: e command all undebug all g has been turned off
Examples	This example shows how Switch(config)# remote Switch :1 : 	w to execute the undebug command on the switch stack: e command all undebug all g has been turned off g has been turned off
Examples	This example shows how Switch(config)# remote Switch :1 : 	w to execute the undebug command on the switch stack: e command all undebug all g has been turned off g has been turned off
Examples	This example shows how Switch(config)# remote Switch :1 : 	w to execute the undebug command on the switch stack: e command all undebug all g has been turned off g has been turned off g has been turned off

Related Commands	Command	Description
	reload	Accesses a specific stack member.
	switch priority	Changes the stack member priority value.
	switch renumber	Changes the stack member number.
	show switch	Displays information about the switch stack and its stack members.

remote-span

Use the **remote-span** VLAN configuration command on the switch stack or on a standalone switch to configure a VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN. Use the **no** form of this command to remove the RSPAN designation from the VLAN.

remote-span

no remote-span

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

Defaults No RSPAN VLANs are defined.

Command Modes VLAN configuration (config-VLAN)

Command History	Release	Modification
	12.2(40)EX2	This command was introduced.

Usage Guidelines You can configure RSPAN VLANs only in config-VLAN mode (entered by using the **vlan** global configuration command), not the VLAN configuration mode entered by using the **vlan database** privileged EXEC command.

If VLAN Trunking Protocol (VTP) is enabled, the RSPAN feature is propagated by VTP for VLAN-IDs that are lower than 1005. If the RSPAN VLAN ID is in the extended range, you must manually configure intermediate switches (those in the RSPAN VLAN between the source switch and the destination switch).

Before you configure the RSPAN **remote-span** command, use the **vlan** (global configuration) command to create the VLAN.

The RSPAN VLAN has these characteristics:

- No MAC address learning occurs on it.
- RSPAN VLAN traffic flows only on trunk ports.
- Spanning Tree Protocol (STP) can run in the RSPAN VLAN, but it does not run on RSPAN destination ports.

When an existing VLAN is configured as an RSPAN VLAN, the VLAN is first deleted and then recreated as an RSPAN VLAN. Any access ports are made inactive until the RSPAN feature is disabled.

Examples

This example shows how to configure a VLAN as an RSPAN VLAN.

Switch(config)# **vlan 901** Switch(config-vlan)# **remote-span**

This example shows how to remove the RSPAN feature from a VLAN.

Switch(config)# **vlan 901** Switch(config-vlan)# **no remote-span**

You can verify your settings by entering the show vlan remote-span user EXEC command.

Related Commands	Command	Description
	monitor session	Enables Switched Port Analyzer (SPAN) and RSPAN monitoring on a port and configures a port as a source or destination port.
	vlan (global configuration)	Changes to config-vlan mode where you can configure VLANs 1 to 4094.

renew ip dhcp snooping database

Use the **renew ip dhcp snooping database** privileged EXEC command on the switch stack or on a standalone switch to renew the DHCP snooping binding database.

renew ip dhcp snooping database [{**flash**[*number*]:/*filename* | **ftp:**//*user*:*password*@*host*/*filename* | **nvram:**/*filename* | **rcp:**//*user*@*host*/*filename* | **tftp:**//*host*/*filename*}] [**validation none**]

Syntax Description	flash[number]:/filen(Optional) Specify that the database agent or the binding file is in the flash memory. Use the number parameter to specify the stack member number of stack master. The range for number is 1 to 9.		
	ftp:// user : password @host/filename	(Optional) Specify that the database agent or the binding file is on an FTP server.	
	nvram:/filename	(Optional) Specify that the database agent or the binding file is in the NVRAM.	
	rcp:// user@host/file name	(Optional) Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.	
	tftp://host/filename	(Optional) Specify that the database agent or the binding file is on a TFTP server.	
	validation none	(Optional) Specify that the switch does not verify the cyclic redundancy check (CRC) for the entries in the binding file specified by the URL.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release Modification		
	12.2(40)EX2 Th	is command was introduced.	
Usage Guidelines	If you do not specify a URL, the switch tries to read the file from the configured URL.		
Examples	This example shows how to renew the DHCP snooping binding database without checking CRC values in the file:		
Examples	in the file:		
Examples		cp snooping database validation none
