

C Commands

This chapter describes the basic Cisco NX-OS system commands that begin with C.

cd

cd

To change the current working directory in the device file system, use the **cd** command.

cd [filesystem:] [//server/] directory

Syntax Description	filesystem:	(Optional) Name of the file system. Valid values are bootflash or volatile .
	/server	(Optional) Name of the server. Valid values are ///, //module-1/, //sup-1/, //sup-active/, or //sup-local/. The double slash (//) is required.
	directory	Name of the destination directory. The directory name is case sensitive.
Note	-	aces in the <i>filesystem://server/directory</i> string. Individual elements of this string are s (:) and slashes (/).
ommand Default	None	
ommand Modes	EXEC mode	
Command History	Release	Modification
	5.0(2)N1(1)	This command was introduced.
Jsage Guidelines	Use the pwd comm	nand to verify the current working directory.
xamples	_	vs how to change the current working directory on the current file system:
	switch# cd my-sci	ripts
		vs how to change the current working directory to another file system:
Related Commands	This example show	vs how to change the current working directory to another file system:

clear cli history

To clear the command history, use the clear cli history command.

clear cli history

This command has no	arguments or keywords.
None	
EXEC mode	
Release	Modification
5.0(2)N1(1)	This command was introduced.
Use the show cli histo command-line interfac	Pry command to display the history of the commands that you entered at the ce (CLI).
This example shows h	ow to clear the command history:
switch# clear cli h :	istory
Command	Description
show cli history	Displays the command history.
	None EXEC mode Release 5.0(2)N1(1) Use the show cli histo command-line interface This example shows h switch# clear cli has Command

clear cores

To clear the core files, use the **clear cores** command.

clear cores

- **Syntax Description** This command has no arguments or keywords.
- Command Default None

Command Modes EXEC mode

Command History	Release	Modification
	5.0(2)N1(1)	This command was introduced.

- **Usage Guidelines** Use the **show system cores** command to display information about the core files.
- **Examples** This example shows how to clear the core file: switch# clear cores

Related Commands	Command	Description
	show system cores	Displays the core filename.
	system cores	Configures the core filename.

clear debug-logfile

To clear the contents of the debug log file, use the **clear debug-logfile** command.

clear debug-logfile filename

show debug logfile

Syntax Description	filename	Name of the debug log file to clear.	
Command Default	None		
Command Modes	EXEC mode		
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
Examples	-	how to clear the debug log file: g-logfile syslogd_debugs	
Related Commands	Command	Description	
	debug logfile	Configures a debug log file.	
	debug logging	Enables debug logging.	

Displays the contents of the debug log file.

clear install failure-reason

To clear the reason for software installation failures, use the clear install failure-reason command.

clear install failure-reason

Syntax Description	This command has r	no arguments or keywords.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release 5.0(2)N1(1)	Modification This command was introduced.
Examples	_	s how to clear the reason for software installation failures:
Related Commondo	0	Description

Related Commands	Command	Description
	show install all	Displays status information for the software installation.

Review Draft -- Cisco Confidential

clear license

To uninstall a license, use the clear license command.

clear license filename

show license

Syntax Description	filename	Name of the license file to be uninstalled.	
Command Default	None		
Command Modes	EXEC mode		
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
Examples	-	s how to clear a specific license:	
	switch# clear lic	ense fm.lic	
Related Commands	Command	Description	

Displays license information.

clear user

To log out a particular user, use the **clear user** command.

clear user username

Syntax Description	username	Name of the user to be logged out.	
Command Default	None		
Command Modes	EXEC mode		
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
Examples	This example show switch# clear use	s how to log out a specific user: r admin	
Related Commands	Command	Description	
	show users	Displays the users currently logged on the switch.	

Review Draft -- Cisco Confidential

cli var name

To define a command-line interface (CLI) variable for a terminal session, use the **cli var name** command. To remove the CLI variable, use the **no** form of this command.

cli var name variable-name variable-text

no cli var name variable-name

Syntax Description	variable-name	Name of the variable. The name is alphanumeric, case sensitive, and has a maximum of 31 characters.
	variable-text	Variable text. The text is alphanumeric, can contain spaces, and has a maximum of 200 characters.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	5.0(2)N1(1)	This command was introduced.
Usage Guidelines	You can reference a \$(variable-name)	CLI variable using the following syntax:
	Instances where you Command scrip Filenames	can use variables include the following: ts
		e a variable in the definition of another variable.
	The Cisco NX-OS so	oftware provides a predefined variable, TIMESTAMP, that you can use to insert the mot change or remove the TIMESTAMP CLI variable.
	You cannot change the with the new definit	he definition of a CLI variable. You must remove the variable and then create it again ion.
Examples	This example shows	how to define a CLI variable:
•	-	ame testvar interface ethernet 1/3
	This example shows	how to reference a CLI variable:
	switch# show \$(te	stvar)

This example shows how to reference the TIMESTAMP variable: switch# copy running-config > bootflash:run-config-\$(TIMESTAMP).cnfg
This example shows how to remove a CLI variable:
switch# cli no var name testvar

Related Commands

;	Command	Description
	run-script	Runs command scripts.
	show cli variables	Displays the CLI variables.

clock protocol

To set the synchronization protocol for the clock to a protocol, use the **clock protocol** command. To remove the clock protocol, use the **no** form of this command.

clock protocol {none | ntp}

no clock protocol {none | ntp}

Syntax Description	none	Specifies that the clock can be set manually.
	ntp	Specifies that the clock be set to the Network Time Protocol (NTP).
mmand Default	None	
mmand Modes	Global configuration mo	ode
ommand History	Release	Modification
	5.1(3)N1(1)	This command was introduced.
sage Guidelines	This command does not	require a license.
kamples	This example shows how	w to set the synchronization protocol for the clock to NTP:
	<pre>switch# configure ter switch(config)# clock switch(config)#</pre>	
Related Commands	Command	Description
	show running-config	Displays the running system configuration information.

clock set

To manually set the clock on a Cisco Nexus 5000 Series switch, use the clock set command.

clock set time day month year

day Day of the month. The range is from 1 to 31. month Month of the year. The values are January, February, March, April, May, June, July, August, September, October, November, and December. year Year. The range is from 2000 to 2030. Command Default None EXEC mode EXEC mode Command History Release Modification 5.0(2)N1(1) This command was introduced. Use this command when you cannot synchronize the switch with an outside clock source, such as an NTF server.			
month Month of the year. The values are January, February, March, April, May, June, July, August, September, October, November, and December. year Year. The range is from 2000 to 2030. Command Default None Command Modes EXEC mode Command History Release Modification 5.0(2)N1(1) This command when you cannot synchronize the switch with an outside clock source, such as an NTF server. Examples This example shows how to manually configure the clock: switch# clock set 12:00:00 04 July 2008 Related Commands Command	Syntax Description	time	Time of day. The format is HH:MM:SS.

Review Draft -- Cisco Confidential

clock summer-time

To configure the summer-time (daylight saving time) offset, use the **clock summer-time** command. To revert to the default, use the **no** form of this command.

clock summer-time zone-name start-week start-day start-month start-time end-week end-day end-month end-time offset-minutes

no clock summer-time

Syntax Description	zone-name	Time zone string. The time zone string is a three-character string.	
	start-week	Week of the month to start the summer-time offset. The range is from 1 to 5.	
	start-day	Day of the month to start the summer-time offset. Valid values are Monday , Tuesday , Wednesday , Thursday , Friday , Saturday , or Sunday .	
	start-month	Month to start the summer-time offset. Valid values are January , February , March , April , May , June , July , August , September , October , November , and December .	
	start-time	Time to start the summer-time offset. The format is <i>HH:MM</i> .	
	end-week	Week of the month to end the summer-time offset. The range is from 1 to 5.	
	end-day	Day of the month to end the summer-time offset. Valid values are Monday , Tuesday , Wednesday , Thursday , Friday , Saturday , or Sunday .	
	end-month	Month to end the summer-time offset. Valid values are January , February , March , April , May , June , July , August , September , October , November , and December .	
	end-time	Time to end the summer-time offset. The format is HH:MM.	
	offset-minutes	Number of minutes to offset the clock. The range is from 1 to 1440.	
Command Default	None		
Command Modes	Global configuration	n mode	
	Interface configurat	ion mode	
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
Examples	This example shows how to configure the offset for summer-time or daylight saving time:		
	<pre>switch(config)# clock summer-time PDT 1 Sunday March 02:00 5 Sunday November 02:00 60</pre>		
	This example shows how to revert to the default offset for summer-time:		
	-	o clock summer-time	

Related Commands	Command	Description
	show clock	Displays the clock summer-time offset configuration.

Review Draft -- Cisco Confidential

clock timezone

To configure the time zone offset from Coordinated Universal Time (UTC), use the **clock timezone** command. To revert to the default, use the **no** form of this command.

clock timezone zone-name offset-hours offset-minutes

no clock timezone

Syntax Description	zone-name	Zone name. The name is a 3-character string for the time zone acronym (for example, PST or EST).	
	offset-hours	Number of hours offset from UTC. The range is from –23 to 23.	
	offset-minutes	Number of minutes offset from UTC. The range is from 0 to 59.	
Command Default	None		
Command Modes	Global configuratio Interface configurat		
Command History	Release	Modification	
	5.0(2)N1(1)	This command was introduced.	
Usage Guidelines	Use this command	to offset the device clock from UTC.	
Examples	This example show	s how to configure the time zone offset from UTC:	
-	switch(config)# clock timezone PST -8 0		
	This example shows how to revert the time zone offset to the default:		
	switch(config)# no clock timezone		
Related Commands	Common d	Description	
Related Commands	Command	Description	
	show clock	Displays the clock time.	

configure session

To create or modify a configuration session, use the **configure session** command.

configure session *name*

Syntax Description	name	Name of the session. The name is a case-sensitive, alphanumeric string up to 63 characters.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	5.0(2)N1(1)	This command was introduced.
Examples	This example shows ho	w to create a configuration session:
	<pre>switch# configure ses switch(config-s)#</pre>	ssion MySession
Related Commands	Command	Description
	show configuration session	Displays information about the configuration sessions.

configure terminal

To enter configuration mode, use the **configure terminal** command.

	configure terminal	node, use the configure terminal command.
Syntax Description	This command has no a	rguments or keywords.
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
	5.0(2)N1(1)	This command was introduced.
	switch(config)#, indicat return to EXEC mode, t	figure terminal command, the system prompt changes from switch# to ting that the switch is in configuration mode. To leave configuration mode and type end or press Ctrl-Z . the configuration that you have made, use the show running-config command.
Examples	This example shows how to enter configuration mode:	
	switch# configure ter switch(config)#	minal
Related Commands	Command	Description
	copy running-config startup-config	Saves the running configuration as the startup configuration file.
	end	Ends your configuration session by exiting to EXEC mode.
	exit (global)	Exits from the current configuration mode to the next highest configuration mode.
	show running-config	Displays the current running configuration.

сору

To copy any file from a source to a destination, use the **copy** command.

copy source-url destination-url

Syntax Description		
	source-url	Location URL (or variable) of the source file or directory to be copied. The source can be either local or remote, depending upon whether the file is being downloaded or uploaded.
		For more information, see the "Usage Guidelines" section.
	destination-url	Destination URL (or variable) of the copied file or directory. The destination can be either local or remote, depending upon whether the file is being downloaded or uploaded.
		For more information, see the "Usage Guidelines" section.
Command Default	The default name f	for the destination file is the source filename.
Command Modes	EXEC mode	
Command History	Release	Modification
	5.0(2)N1(1)	This command was introduced.
	5.0(2)N2(1)	Support for this command was introduced on external Universal Serial Bus (USB) Flash memory devices.
Usage Guidelines	location to another file system URL, w (such as a local me You can enter on th	d allows you to copy a file (such as a system image or configuration file) from one location. The source and destination for the file is specified using a Cisco NX-OS which allows you to specify a local or remote file location. The file system being used smory source or a remote server) determines the syntax used in the command. The command line all necessary source- and destination-URL information and the
	username to use, or you can enter the copy command and have the CLI prompt you for any missing information.	
		r you can enter the copy command and have the CLI prompt you for any missing
	information. The entire copying	process may take several minutes, depending on the network conditions and the size ers from protocol to protocol and from network to network.
	information. The entire copying of the file, and diff	process may take several minutes, depending on the network conditions and the size
	information. The entire copying of the file, and diff The colon characte	process may take several minutes, depending on the network conditions and the size ers from protocol to protocol and from network to network.
	information. The entire copying of the file, and diff The colon characte	process may take several minutes, depending on the network conditions and the size for from protocol to protocol and from network to network. (i) is required after the file system URL prefix keywords (such as bootflash). for ftp: , scp: , sftp: , and tftp: , the server is either an IPv4 address or a hostname.

L

Review Draft -- Cisco Confidential

The following tables list URL prefix keywords by the file system type. If you do not specify a URL prefix keyword, the switch looks for a file in the current directory.

Table 1 lists URL prefix keywords for local writable storage file systems. Table 2 lists the URL prefix keywords for remote file systems. Table 3 lists the URL prefix keywords for nonwritable file systems.

 Keyword
 Source or Destination

 bootflash:[//server/]
 Source or destination URL for boot flash memory. The server argument value is module-1, sup-1, sup-active, or sup-local.

 volatile:[//server/]
 Source or destination URL of the default internal file system. Any files or directories stored in this file system will be erased when the switch reboots. The server argument value is module-1, sup-1, sup-active, or sup-local.

 Table 1
 URL Prefix Keywords for Local Writable Storage File Systems

Keyword	Source or Destination	
ftp:	Source or destination URL for a FTP network server. The syntax for this alias is as follows:	
	ftp:[//server][/path]/filename	
scp:	Source or destination URL for a network server that supports Secure Shell (SSH) and accepts copies of files using the secure copy protocol (scp). The syntax for this alias is as follows:	
	<pre>scp:[//[username@]server][/path]/filename</pre>	
sftp:	Source or destination URL for an SSH FTP (SFTP) network server. The syntax for this alias is as follows:	
	<pre>sftp:[//[username@]server][/path]/filename</pre>	
tftp:	Source or destination URL for a TFTP network server. The syntax for this alias is as follows:	
	tftp:[//server[:port]][/path]/filename	

Table 2 URL Prefix Keywords for Remote File Systems

Table 3 URL Prefix Keywords for Special File Systems

Keyword	Source or Destination	
core:	Local memory for core files. You can copy core files from the core file system.	
debug:	Local memory for debug files. You can copy core files from the debug file system.	
log:	Local memory for log files. You can copy log files from the log file system.	
modflash:	External memory for mod files. You can copy mod files from modflash file system.	
system:	Local system memory. You can copy the running configuration to or from the system file system. The system file system is optional when referencing the running-config file in a command.	

Keyword	Source or DestinationSource or destination URL for the external Universal Serial Bus (USB) Flash memory devices. You can copy the kickstart and system image to bootflash.	
usb1:		
	Note This is applicable only to the Cisco Nexus 5500 Series switches.	
volatile:	Local volatile memory. You can copy files to or from the volatile file system All files in the volatile memory are lost when the physical device reloads.	

Table 3 URL Prefix Keywords for Special File Systems (continued)

This section contains usage guidelines for the following topics:

- Copying Files from a Server to Bootflash Memory, page 24
- Copying a Configuration File from a Server to the Running Configuration, page 24
- Copying a Configuration File from a Server to the Startup Configuration, page 24
- Copying the Running or Startup Configuration on a Server, page 24

Copying Files from a Server to Bootflash Memory

Use the **copy** *source-url* **bootflash:** command (for example, **copy tftp**:*source-url* **bootflash:**) to copy an image from a server to the local bootflash memory.

Copying a Configuration File from a Server to the Running Configuration

Use the **copy** {**ftp:** | **scp:** | **sftp:** | **tftp:** }*source-url* **running-config** command to download a configuration file from a network server to the running configuration of the device. The configuration is added to the running configuration as if the commands were typed in the CLI. The resulting configuration file is a combination of the previous running configuration and the downloaded configuration file. The downloaded configuration file has precedence over the previous running configuration.

You can copy either a host configuration file or a network configuration file. Accept the default value of *host* to copy and load a host configuration file containing commands that apply to one network server in particular. Enter *network* to copy and load a network configuration file that contains commands that apply to all network servers on a network.

Copying a Configuration File from a Server to the Startup Configuration

Use the **copy** {**ftp:** | **scp:** | **sftp:** | **tftp:** }*source-url* **startup-config** command to copy a configuration file from a network server to the switch startup configuration. These commands replace the startup configuration file with the copied configuration file.

Copying the Running or Startup Configuration on a Server

Use the **copy running-config** {**ftp:** | **scp:** | **sftp:** | **tftp:**}*destination-url* command to copy the current configuration file to a network server that uses FTP, scp, SFTP, or TFTP. Use the **copy startup-config** {**ftp:** | **scp:** | **stfp:** | **tftp:**}*destination-url* command to copy the startup configuration file to a network server.

You can use the copied configuration file copy as a backup.

Examples

This example shows how to copy a file within the same directory: switch# copy file1 file2

This example shows how to copy a file to another directory: switch# copy file1 my-scripts/file2
This example shows how to copy a file to another file system:
switch# copy file1 bootflash:
This example shows how to copy a file to another supervisor module:
switch# copy file1 bootflash://sup-1/file1.bak
This example shows how to copy a file from a remote server:
switch# copy scp://192.168.1.1/image-file.bin bootflash:image-file.bin
This example shows how to copy the kickstart and system image to bootflash:

Command	Description
cd	Changes the current working directory.
delete	Delete a file or directory.
dir	Displays the directory contents.
move	Moves a file.
pwd	Displays the name of the current working directory.
	cd delete dir move

copy running-config startup-config

To save the running configuration to the startup configuration file so that all current configuration details are available after a reboot, use the **copy running-config startup-config** command.

copy running-config startup-config

Syntax Description	This command has no arguments or keywords.	
Command Default	None	
Command Modes	EXEC mode	
Command History	Release	Modification
,	5.0(2)N1(1)	This command was introduced.
Usage Guidelines <u>Note</u>		he configuration that you have made, use the show startup-config command. running-config startup-config command, the running and the startup copies identical.
Examples	This example shows how	v to save the running configuration to the startup configuration:
	switch# copy running-	
Related Commands	Command	Description
neidleu commalius	show running-config	Displays the currently running configuration.
	show startup-config	Displays the startup configuration file.
	snow startup-colling	Displays the startup configuration me.
