

I Commands

This chapter describes the Cisco NX-OS unicast Routing Information Base (RIB) and the Forwarding Information Base (FIB) commands that begin with I.

ip load-sharing address

To configure the load-sharing algorithm used by the unicast Forwarding Information Base (FIB), use the **ip load-sharing address command**. To restore the default, use the **no** form of this command.

ip load-sharing address {destination port destination | source-destination [port source-destination]} [universal-id *seed*]

no ip load-sharing address {destination port destination | source-destination [port source-destination]} [universal-id *seed*]

Syntax Description	destination port destination	Sets the load-sharing algorithm based on the destination address and port.	
	source-destination	Sets the load-sharing algorithm based on the source and destination address.	
	port source-destination	(Optional) Sets the load-sharing algorithm based on the source and destination address and port address.	
	universal-id seed	(Optional) Sets the random seed for the load sharing hash algorithm. The range is from 1 to 4294967295.	
Command Default	Destination address and port a	uddress	
Command Modes	Global configuration mode		
Command History	Release Moo	dified	
	5.2(1)N1(1) Thi	s command was introduced.	
Usage Guidelines		ress command to set the load-sharing algorithm that the unicast FIB uses l-cost paths in the Routing Information Base (RIB).	
Examples	This example shows how to set the load-sharing algorithm to use the source and destination address: switch(config)# ip load-sharing address source-destination		
Rolatod Commanda	Command	Description	
Related Commands	Command	Description	
Related Commands	Command show ip load-sharing show routing hash	Description Displays the load-sharing algorithm. Displays the path the RIB and FIB select for a source/destination pair.	

ip route

To configure a static route, use the **ip route** command. To remove the static route, use the **no** form of this command.

ip route ip-prefix/mask {[interface] next-hop} [preference] [tag id]

no ip route *ip-prefix/mask* {[*interface*] *next-hop*} [*preference*] [**tag** *id*]

Syntax Description	ip-prefix/mask	IP prefix and prefix mask. The format is x.x.x.x/length. The length is 1 to 32.	
	interface	(Optional) Interface on which all packets are sent to reach this route. Use ? to	
		display a list of supported interfaces.	
	next-hop	IP address of the next hop that can be used to reach that network. You can	
		specify an IP address and an interface type and interface number. The format	
		is x.x.x.x/length. The length is 1 to 32.	
	preference	(Optional) Route preference that is used as the administrative distance to this route. The range is from 1 to 255. The default is 1.	
	tag id	(Optional) Assigns a route tag that can be used to match against in a route map. The range is from 0 to 4294967295. The default is 0.	
Command Default	None		
Command Modes	Global configuration	on mode	
Command History	Release	Modified	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Static routes have a default administrative distance of 1. If you want a dynamic routing protocol to tak precidence over a static route, you must configure the static route preference argument to be greater tha the administrative distance of the dynamic routing protocol. For example, routes derived with the Enhanced Interior Gateway Routing Protocol (EIGRP) have a default administrative distance of 100. The have a static route that would be overridden by an EIGRP dynamic route, you should specify an administrative distance greater than 100.		
	the administrative of Enhanced Interior (have a static route	tatic route, you must configure the static route preference argument to be greater than distance of the dynamic routing protocol. For example, routes derived with the Gateway Routing Protocol (EIGRP) have a default administrative distance of 100. To that would be overridden by an EIGRP dynamic route, you should specify an

For example, routes derived with the Gateway Routing Protocol (EIGRP) have a default administrative distance of 100. To that would be overridden by an EIGRP dynamic route, you should specify an ance greater than 100.	
Examples	the administrative of Enhanced Interior (have a static route to administrative dista This example show 192.168.1.1/32, rea switch(config)# i	tatic route, you must configure the static route preference argument to be greater than distance of the dynamic routing protocol. For example, routes derived with the Gateway Routing Protocol (EIGRP) have a default administrative distance of 100. To that would be overridden by an EIGRP dynamic route, you should specify an ance greater than 100. The show to create a static route for destinations with the IP address prefix the through the next-hop address 10.0.0.2: The proute 192.168.1.1/32 10.0.0.2 The show to assign a tag to the previous example so that you can configure a route map	

This example shows how to choose a preference of 110. In this case, packets for prefix 10.0.0.0 are routed to a router at 172.31.3.4 if dynamic route information with an administrative distance less than 110 is not available.

```
switch# configure terminal
switch(config)# ip route 10.0.0.0/8 172.31.3.4 110
switch(config)#
```

Related Commands	Command	Description
	match tag	Matches the tag value associated with a route.
