

# Show Commands

---

This chapter describes the Cisco NX-OS Border Gateway Protocol (BGP) **show** commands.

# show bgp

To display Border Gateway Protocol (BGP) routes, use the **show bgp** command.

```
show bgp {all | ipv4 {unicast | multicast} [addr | prefix [longer-prefixes]] [vrf vrf-name | all]}
```

|                    |                 |                                                                                                                                          |
|--------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | all             | Displays BGP information for all address families.                                                                                       |
|                    | ipv4            | Displays BGP information for the IPv4 address family.                                                                                    |
|                    | unicast         | Displays BGP information for the unicast address family.                                                                                 |
|                    | multicast       | Displays BGP information for the multicast address family.                                                                               |
|                    | addr            | (Optional) Network from the selected address family. The format is A.B.C.D for IPv4.                                                     |
|                    | prefix          | (Optional) Prefix from the selected address family. The format is A.B.C.D/length for IPv4.                                               |
|                    | longer-prefixes | (Optional) Displays the prefix and any more specific routes.                                                                             |
|                    | vrf vrf-name    | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
|                    | all             | (Optional) Specifies all VRF.                                                                                                            |
|                    |                 |                                                                                                                                          |

|                 |      |
|-----------------|------|
| Command Default | None |
|-----------------|------|

|               |                  |
|---------------|------------------|
| Command Modes | Any command mode |
|---------------|------------------|

|                 |             |                              |
|-----------------|-------------|------------------------------|
| Command History | Release     | Modification                 |
|                 | 5.0(3)N1(1) | This command was introduced. |

**Usage Guidelines**

Use the **show bgp** command to display information about BGP.

This command requires the LAN Enterprise Services license.

Examples

This example shows how to display an entry in the BGP table:

```
switch# show bgp ipv4 multicast
BGP routing table information for VRF default, address family IPv4 Multicast
BGP table version is 5, local router ID is 2.2.2.3
Status: s-suppressed, x-deleted, S-stale, d-dampened, h-history, *-valid, >-best
Path type: i-internal, e-external, c-confed, l-local, a-aggregate, r-redist
Origin codes: i - IGP, e - EGP, ? - incomplete, | - multipath
```

|             |          |        |        |        |      |
|-------------|----------|--------|--------|--------|------|
| Network     | Next Hop | Metric | LocPrf | Weight | Path |
| 192.168.1.3 | 0.0.0.0  |        | 100    | 32768  | i    |

```
switch#
```

**Related Commands**

| Command          | Description                      |
|------------------|----------------------------------|
| <b>clear bgp</b> | Clears entries in the BGP table. |

# show bgp community

To display Border Gateway Protocol (BGP) routes that match a community, use the **show bgp community** command.

```
show bgp {{ ip | ipv4 } { unicast | multicast } } community [as-number] [no-advertise] [no-export]
[no-export-subconfed] [exact-match]} [vrf vrf-name]
```

| Syntax Description         |  |                                                                                                                                                              |
|----------------------------|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>                  |  | Displays BGP information for the IPv4 address family.                                                                                                        |
| <b>ipv4</b>                |  | Displays BGP information for the IPv4 address family.                                                                                                        |
| <b>unicast</b>             |  | Displays BGP information for the unicast address family.                                                                                                     |
| <b>multicast</b>           |  | Displays BGP information for the multicast address family.                                                                                                   |
| <i>as-number</i>           |  | (Optional) AS number. The AS number can be a 16-bit integer or a 32-bit integer in the form of <higher 16-bit decimal number>.<lower 16-bit decimal number>. |
| <b>no-advertise</b>        |  | (Optional) Displays the no-advertise community.                                                                                                              |
| <b>no-export</b>           |  | (Optional) Displays the no-export community.                                                                                                                 |
| <b>no-export-subconfed</b> |  | (Optional) Displays the no-export-subconfed community.                                                                                                       |
| <b>exact-match</b>         |  | (Optional) Displays an exact match of the community.                                                                                                         |
| <b>vrf</b> <i>vrf-name</i> |  | (Optional) Specifies the virtual routing and forwarding (VRF) instance. The name can be any case-sensitive, alphanumeric string up to 32 characters.         |

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |

| Related Commands | Command                  | Description               |
|------------------|--------------------------|---------------------------|
|                  | <b>ip community-list</b> | Creates a community list. |

# show bgp community-list

To display Border Gateway Protocol (BGP) routes that match a community list, use the **show bgp community-list** command.

```
show bgp { {ip | ipv4} {unicast | multicast} } community-list commlist-name [exact-match] [vrf vrf-name]
```

| Syntax Description | <b>ip</b>                  | Displays BGP information for the IPv4 address family.                                                                                    |
|--------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <b>ipv4</b>                | Displays BGP information for the IPv4 address family.                                                                                    |
|                    | <b>unicast</b>             | Displays BGP information for the unicast address family.                                                                                 |
|                    | <b>multicast</b>           | Displays BGP information for the multicast address family.                                                                               |
|                    | <i>commlist-name</i>       | Name of a community-list. The commlist-name can be any case-sensitive, alphanumeric string up to 63 characters.                          |
|                    | <b>exact-match</b>         | (Optional) Displays an exact match of the communities.                                                                                   |
|                    | <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |

| Command Default | None |
|-----------------|------|
|-----------------|------|

| Command Modes | Any command mode |
|---------------|------------------|
|---------------|------------------|

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 5.2(1)N1(1) | This command was introduced. |

| Usage Guidelines | This command requires the LAN Enterprise Services license. |
|------------------|------------------------------------------------------------|
|------------------|------------------------------------------------------------|

| Examples | This example shows how to display the routes that match a community list:<br><pre>switch(config)# show bgp ip unicast community-list test1</pre> |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|

|                  | <b>ip community-list</b> | Creates a community list. |

# show bgp extcommunity

To display Border Gateway Protocol (BGP) routes that match an extended community, use the **show bgp extcommunity** command.

```
show bgp { {ip | ipv4} {unicast | multicast}} extcommunity 4byteas-generic {non-transitive |
transitive} [as4-number] [exact-match] [vrf vrf-name]
```

| Syntax Description     |  |                                                                                                                                                           |
|------------------------|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>              |  | Displays BGP information for the IPv4 address family.                                                                                                     |
| <b>ipv4</b>            |  | Displays BGP information for the IPv4 address family.                                                                                                     |
| <b>unicast</b>         |  | Displays BGP information for the unicast address family.                                                                                                  |
| <b>multicast</b>       |  | Displays BGP information for the multicast address family.                                                                                                |
| <b>4byteas-generic</b> |  | Displays the routes that match the generic specific extended communities.                                                                                 |
| <b>non-transitive</b>  |  | Displays the routes that match the nontransitive extended communities.                                                                                    |
| <b>transitive</b>      |  | Displays the routes that match the transitive extended communities.                                                                                       |
| <i>as4-number</i>      |  | AS number. The <i>as4-number</i> is a 32-bit integer in the form of a plaintext integer or <higher 16-bit decimal number>.<lower 16-bit decimal number> . |
| <b>exact-match</b>     |  | (Optional) Displays an exact match of the extended community.                                                                                             |
| <b>vrf vrf-name</b>    |  | (Optional) Specifies the virtual routing and forwarding (VRF) context name. The name can be any case-sensitive, alphanumeric string up to 32 characters.  |

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                  |

|                  | <b>ip extcommunity-list</b> | Creates an extended community list. |

# show bgp extcommunity-list

To display Border Gateway Protocol (BGP) routes that match an extended community list, use the **show bgp extcommunity-list** command.

```
show bgp {{ip | ipv4} {unicast | multicast}} extcommunity-list commlist-name [exact-match]
[vrf vrf-name]
```

| Syntax Description | <b>ip</b>                  | Displays BGP information for the IPv4 address family.                                                                                    |
|--------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <b>ipv4</b>                | Displays BGP information for the IPv4 address family.                                                                                    |
|                    | <b>unicast</b>             | Displays BGP information for the unicast address family.                                                                                 |

# show bgp neighbors

To display Border Gateway Protocol (BGP) neighbors, use the **show bgp neighbors** command.

**show bgp** {**ip** | **ipv4**} {**unicast** | **multicast**} **neighbors** [*addr* [**advertised-routes** | **flap-statistics** | **paths** | **received-routes** | **routes** [**advertised** | **dampened** | **received**]]] [**vrf** {**all** | *vrf-name*}]

## Syntax Description

|                            |                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>                  | Displays the IPv4 neighbor information.                                                                                                  |
| <b>ipv4</b>                | Displays the IPv4 neighbor information.                                                                                                  |
| <b>unicast</b>             | Displays the unicast neighbor information.                                                                                               |
| <b>multicast</b>           | Displays the multicast neighbor information.                                                                                             |
| <i>addr</i>                | IPv4 address. The format is x.x.x.x                                                                                                      |
| <b>advertised-routes</b>   | (Optional) Displays all the routes advertised to this neighbor.                                                                          |
| <b>flap-statistics</b>     | (Optional) Displays flap statistics for the routes received from this neighbor.                                                          |
| <b>paths</b>               | (Optional) Displays AS paths learned from this neighbor.                                                                                 |
| <b>received-routes</b>     | (Optional) Displays all the routes received from this neighbor.                                                                          |
| <b>routes</b>              | (Optional) Displays the routes received or advertised to or from this neighbor.                                                          |
| <b>advertised</b>          | (Optional) Displays all the routes advertised for this neighbor.                                                                         |
| <b>dampened</b>            | (Optional) Displays all dampened routes received from this neighbor.                                                                     |
| <b>received</b>            | (Optional) Displays all the routes received from this neighbor.                                                                          |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
| <b>all</b>                 | Specifies all VRF.                                                                                                                       |

## Command Default

None

## Command Modes

Any command mode

# show ip bgp

To display entries in the Border Gateway Protocol (BGP) table, use the **show ip bgp** command.

```
show ip bgp [ip-addr | ip-prefix [longer-prefixes]] [received-paths] [regex expression]  
[route-map map-name] [summary] [vrf vrf-name]
```

| Syntax Description | <i>ip-addr</i>                      | (Optional) Network from the BGP route table. The format is x.x.x.x.                                                                                  |
|--------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>ip-prefix</i>                    | (Optional) Prefix from the BGP route table. The format is x.x.x.x/length.                                                                            |
|                    | <b>longer-prefixes</b>              | (Optional) Displays the prefix and any more specific routes.                                                                                         |
|                    | <b>received-paths</b>               | (Optional) Displays paths stored for soft reconfiguration.                                                                                           |
|                    | <b>regex</b><br><i>expression</i>   | (Optional) Displays information that matches the regular expression.                                                                                 |
|                    | <b>route-map</b><br><i>map-name</i> | (Optional) Displays routes that match the route map. The map name can be any case-sensitive, alphanumeric string up to 63 characters.                |
|                    | <b>summary</b>                      | (Optional) Displays the summary of the routes.                                                                                                       |
|                    | <b>vrf</b> <i>vrf-name</i>          | (Optional) Specifies the virtual routing and forwarding (VRF) instance. The name can be any case-sensitive, alphanumeric string up to 32 characters. |

# show ip bgp all

To display the Border Gateway Protocol (BGP) entries for all address families, use the **show ip bgp all** command.

```
show ip bgp all [ip-addr | ip-prefix [longer-prefixes]] [filter-list list-name] [community-list
commlist-name [exact-match]] [flap-statistics] [nexthop-database] [received-paths]
[regexp expression][route-map map-name] [summary] [vrf {vrf-name | all}]
```

```
show ip bgp all community [comm-name] [{internet | no-advertise | no-export |
no-export-subconfed} | exact-match] [vrf {vrf-name | all}]
```

```
show ip bgp all extcommunity 4byteas-generic {non-transitive | transitive} [as4-number]
[exact-match] [vrf {vrf-name | all}]
```

```
show ip bgp all dampening {dampened-paths [regexp expression] | flap-statistics |
history-paths [regexp expression] | parameters} [vrf {vrf-name | all}]
```

```
show ip bgp all neighbors [ip-addr [advertised-routes | flap-statistics | paths | received-routes |
routes [advertised | dampened | received]]] [vrf {vrf-name | all}]
```

## Syntax Description

|                                               |                                                                                                                                                                                                                           |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-addr</i>                                | (Optional) Network from the BGP route table. The format is x.x.x.x.                                                                                                                                                       |
| <i>ip-prefix</i>                              | (Optional) Prefix from the BGP route table. The format is x.x.x.x/length.                                                                                                                                                 |
| <b>longer-prefixes</b>                        | (Optional) Displays the prefix and any more specific routes.                                                                                                                                                              |
| <b>filter-list</b>                            | (Optional) Displays BGP routes that match a filter list.                                                                                                                                                                  |
| <i>list-name</i>                              | Name of a filter list. The name can be any case-sensitive, alphanumeric string up to 63 characters.                                                                                                                       |
| <b>community-list</b><br><i>commlist-name</i> | (Optional) Display routes matching the community-list. The <i>commlist-name</i> can be any case-sensitive, alphanumeric string up to 63 characters.                                                                       |
| <b>exact-match</b>                            | (Optional) Displays an exact match of the communities.                                                                                                                                                                    |
| <b>flap-statistics</b>                        | Displays flap statistics for routes.                                                                                                                                                                                      |
| <b>nexthop-database</b>                       | (Optional) Displays the BGP next-hop database.                                                                                                                                                                            |
| <b>received-paths</b>                         | (Optional) Displays paths stored for soft reconfiguration.                                                                                                                                                                |
| <b>regexp</b> <i>expression</i>               | (Optional) Displays information that matches the regular expression.                                                                                                                                                      |
| <b>route-map</b> <i>map-name</i>              | (Optional) Displays routes that match the route map. The map name can be any case-sensitive, alphanumeric string up to 63 characters.                                                                                     |
| <b>summary</b>                                | (Optional) Displays the summary of the routes.                                                                                                                                                                            |
| <b>community</b><br><i>community-number</i>   | Displays BGP routes that match a community list.<br>(Optional) Community number. Valid value is a community number in the range from 1 to 4294967200, or <b>AA:NN</b> (autonomous system-community number/2-byte number). |
| <b>no-export</b>                              | (Optional) Displays routes with this community that are advertised to only peers in the same autonomous system or to only other subautonomous systems within a confederation.                                             |
| <b>no-advertise</b>                           | (Optional) Displays routes that are not advertise to any peer (internal or external).                                                                                                                                     |

|                                |                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>no-export-subconfed</b>     | (Optional) Displays routes that are part of the well-known community no-export-subconfed.                                                                            |
| <b>internet</b>                | (Optional) Displays routes that are part of the well-known community internet community.                                                                             |
| <b>extcommunity</b>            | Displays routes that match an extended community.                                                                                                                    |
| <b>4byteas-generic</b>         | (Optional) Displays the routes that match the generic specific extended communities.                                                                                 |
| <b>non-transitive</b>          | (Optional) Displays the routes that match the non-transitive extended communities.                                                                                   |
| <b>transitive</b>              | (Optional) Displays the routes that match the transitive extended communities.                                                                                       |
| <i>as4-number</i>              | (Optional) AS number. The <i>as4-number</i> is a 32-bit integer in the form of a plaintext integer or <higher 16-bit decimal number>.<lower 16-bit decimal number> . |
| <b>exact-match</b>             | (Optional) Displays an exact match of the extended community.                                                                                                        |
| <b>dampening</b>               | Displays all dampening information.                                                                                                                                  |
| <b>dampened-paths</b>          | (Optional) Displays all dampened paths.                                                                                                                              |
| <b>regex <i>expression</i></b> | (Optional) Display information that matches the regular expression.                                                                                                  |
| <b>history-paths</b>           | (Optional) Displays all history paths.                                                                                                                               |
| <b>parameters</b>              | (Optional) Displays all dampening parameters.                                                                                                                        |
| <b>neighbors</b>               | Displays all BGP neighbors.                                                                                                                                          |
| <b>advertised-routes</b>       | (Optional) Displays all the routes advertised to this neighbor.                                                                                                      |
| <b>flap-statistics</b>         | (Optional) Displays flap statistics for the routes received from this neighbor.                                                                                      |
| <b>paths</b>                   | (Optional) Displays AS paths learned from this neighbor.                                                                                                             |
| <b>received-routes</b>         | (Optional) Displays all the routes received from this neighbor.                                                                                                      |
| <b>routes</b>                  | (Optional) Displays the routes received or advertised to or from this neighbor.                                                                                      |
| <b>advertised</b>              | (Optional) Displays all the routes advertised for this neighbor.                                                                                                     |
| <b>dampened</b>                | (Optional) Displays all dampened routes received from this neighbor.                                                                                                 |
| <b>received</b>                | (Optional) Displays all the routes received from this neighbor.                                                                                                      |
| <b>vrf <i>vrf-name</i></b>     | (Optional) Specifies the virtual routing and forwarding (VRF) instance. The name can be any case-sensitive, alphanumeric string up to 32 characters.                 |
| <b>all</b>                     | (Optional) Specifies the VFR reserved all name.                                                                                                                      |

| 5.2(1)N1(1) | This command was introduced. |

**Usage Guidelines**

This command requires the LAN Enterprise Services license.

**Examples**

This example shows how to display the BGP entries for all address families:

```
switch# show ip bgp all
BGP routing table information for VRF default, address family IPv4 Multicast
BGP table version is 5, local router ID is 2.2.2.3
Status: s-suppressed, x-deleted, S-stale, d-dampened, h-history, *-valid, >-best
Path type: i-internal, e-external, c-confed, l-local, a-aggregate, r-redist
Origin codes: i - IGP, e - EGP, ? - incomplete, | - multipath
```

| Network       | Next Hop | Metric | LocPrf | Weight | Path |
|---------------|----------|--------|--------|--------|------|
| 192.168.1.3/2 | 0.0.0.0  |        | 100    | 32768  | i    |

```
switch#
```

This example shows how to display a summary of the state of the BGP route table:

```
switch# show ip bgp all summary
BGP summary information for VRF default, address family IPv4 Multicast
BGP router identifier 2.2.2.3, local AS number 102
BGP table version is 5, IPv4 Multicast config peers 2, capable peers 0
1 network entries and 1 paths using 104 bytes of memory
BGP attribute entries [1/124], BGP AS path entries [0/0]
BGP community entries [0/0], BGP clusterlist entries [0/0]
```

| Neighbor    | V | AS    | MsgRcvd | MsgSent | TblVer | InQ | OutQ | Up/Down  | State/PfxRcd |
|-------------|---|-------|---------|---------|--------|-----|------|----------|--------------|
| 10.0.0.100  | 4 | 64497 | 0       | 0       | 0      | 0   | 0    | 03:20:10 | Idle         |
| 192.168.1.3 | 4 | 0     | 0       | 0       | 0      | 0   | 0    | 01:51:38 | Idle         |

```
switch#
```

# show ip bgp community

To display Border Gateway Protocol (BGP) routes that match a community list, use the **show ip bgp community** command.

```
show ip bgp community {community-number} [{internet | no-advertise | no-export |  
no-export-subconfed}] [vrf {vrf-name | all}]
```

|------------------|------------------------------------------|---------------------------------------------------------------------------|
|                  | <b>set community</b>                     | Sets the attributes for BGP communities.                                  |
|                  | <b>show ip bgp community-list</b>        | Displays BGP routes that are permitted by the BGP community list.         |
|                  | <b>show ip bgp community exact-match</b> | Displays the routes that have exactly the same specified BGP communities. |

# show ip bgp community exact-match

To display routes that matches a specific Border Gateway Protocol (BGP) community, use the **show ip bgp community exact-match** command.

**show ip bgp community** *community-number* **exact-match** [**vrf** {**all** | *vrf-name*}]

## Syntax Description

|                            |                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>community-number</i>    | Community number. Valid value is a community number in the range from 1 to 4294967200, or <b>AA:NN</b> (autonomous system-community number/2-byte number). |
| <b>exact-match</b>         | Displays only routes that have exactly the same specified communities.                                                                                     |
| <b>all</b>                 | (Optional) Specifies the reserved all VRF.                                                                                                                 |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual routing and forwarding (VRF) instance. The name can be any case-sensitive, alphanumeric string up to 32 characters.       |

## Command Default

None

## Command Modes

Any command mode

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 5.2(1)N1(1) | This command was introduced. |

## Usage Guidelines

This command requires the LAN Enterprise Services license.

## Examples

This example shows how to display the routes that have exactly the same specified BGP communities:

```
switch# show ip bgp community 201 exact-match
```

# show ip bgp dampening

To display Border Gateway Protocol (BGP) dampening information, use the **show ip bgp dampening** command.

```
show ip bgp [ipv4 { unicast | multicast } | all] dampening { dampened-paths [regexp expression]
| flap-statistics | history-paths [regexp expression] | parameters } [vrf vrf-name]
```

| Syntax Description                 |                                                                                                                                          |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4</b>                        | (Optional) Displays BGP information for the IPv4 address family.                                                                         |
| <b>unicast</b>                     | Displays BGP information for the unicast address family.                                                                                 |
| <b>multicast</b>                   | Displays BGP information for the multicast address family.                                                                               |
| <b>all</b>                         | (Optional) Displays BGP information for all address families.                                                                            |
| <b>dampened-paths</b>              | Displays all dampened paths.                                                                                                             |
| <b>regexp</b><br><i>expression</i> | (Optional) Display information that matches the regular expression.                                                                      |
| <b>flap-statistics</b>             | Displays flap statistics for routes.                                                                                                     |
| <b>history-paths</b>               | Displays all history paths.                                                                                                              |
| <b>parameters</b>                  | Displays all dampening parameters.                                                                                                       |
| <b>vrf</b> <i>vrf-name</i>         | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |

|                  | <b>address-family (BGP router)</b> | Configures BGP parameters.           |
|                  | <b>dampening (BGP)</b>             | Configures the route flap dampening. |

# show ip bgp extcommunity

To display Border Gateway Protocol (BGP) routes that match an extended community, use the **show ip bgp extcommunity** command.

```
show ip bgp extcommunity generic {non-transitive | transitive} [as4-number] [exact-match]
[vrf vrf-name]
```

|                    |                            |                                                                                                                                                                      |
|--------------------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>generic</b>             | Displays the routes that match the generic specific extended communities.                                                                                            |
|                    | <b>non-transitive</b>      | Displays the routes that match the non-transitive extended communities.                                                                                              |
|                    | <b>transitive</b>          | Displays the routes that match the transitive extended communities.                                                                                                  |
|                    | <i>as4-number</i>          | (Optional) AS number. The <i>as4-number</i> is a 32-bit integer in the form of a plaintext integer or <higher 16-bit decimal number>.<lower 16-bit decimal number> . |
|                    | <b>exact-match</b>         | (Optional) Displays an exact match of the extended community.                                                                                                        |
|                    | <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters.                             |
|                    |                            |                                                                                                                                                                      |

# show ip bgp neighbors

To display Border Gateway Protocol (BGP) neighbors, use the **show ip bgp neighbors** command.

**show ip bgp neighbors** [*addr* [**advertised-routes** | **flap-statistics** | **paths** | **received-routes** | **routes** [**advertised** | **dampened** | **received**]]] [**vrf** {**all** | *vrf-name*}]

## Syntax Description

|                            |                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>addr</i>                | (Optional) IPv4 address. The format is x.x.x.x                                                                                           |
| <b>advertised-routes</b>   | (Optional) Displays all the routes advertised to this neighbor.                                                                          |
| <b>flap-statistics</b>     | (Optional) Displays flap statistics for the routes received from this neighbor.                                                          |
| <b>paths</b>               | (Optional) Displays AS paths learned from this neighbor.                                                                                 |
| <b>received-routes</b>     | (Optional) Displays all the routes received from this neighbor.                                                                          |
| <b>routes</b>              | (Optional) Displays the routes received or advertised to or from this neighbor.                                                          |
| <b>advertised</b>          | (Optional) Displays all the routes advertised for this neighbor.                                                                         |
| <b>dampened</b>            | (Optional) Displays all dampened routes received from this neighbor.                                                                     |
| <b>received</b>            | (Optional) Displays all the routes received from this neighbor.                                                                          |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
| <b>all</b>                 | (Optional) Specifies all VRF.                                                                                                            |

## Command Default

None

## Command Modes

Any command mode

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 5.2(1)N1(1) | This command was introduced. |

## Usage Guidelines

This command requires the LAN Enterprise Services license.

## Examples

This example shows how to display the BGP neighbors:

```
switch(config)# show ip bgp neighbors
```

|                 |                                                                  |
|-----------------|------------------------------------------------------------------|
| <b>Examples</b> | This example shows how to display the BGP paths in the database: |
|-----------------|------------------------------------------------------------------|

```
switch(config)# show ip bgp paths
Address      Hash Refcount      Metric Path
0x5a5e46bc 2001          1          0 i
switch#
```

|                         |                              |                                                                                                    |
|-------------------------|------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>               | <b>Description</b>                                                                                 |
|                         | <b>maximum-paths</b>         | Controls the maximum number of parallel routes that the Border Gateway Protocol (BGP) can support. |
|                         | <b>show ip bgp</b>           | Displays the BGP table information.                                                                |
|                         | <b>show ip bgp neighbors</b> | Displays BGP neighbor information.                                                                 |

# show ip bgp peer-policy

To display Border Gateway Protocol (BGP) peer policy template information, use the **show ip bgp peer-policy** command.

**show ip bgp peer-policy** *name*

|                    |             |                                                                                                      |
|--------------------|-------------|------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>name</i> | Name of a BGP template. The name can be any case-sensitive, alphanumeric string up to 63 characters. |
|--------------------|-------------|------------------------------------------------------------------------------------------------------|

|                 |      |

|                  | <b>inherit peer-template</b> | Inherits a peer template for a neighbor. |
|                  | <b>template peer</b>         | Configures a peer template.              |

# show ip bgp prefix-list

To display Border Gateway Protocol (BGP) routes that match a prefix list, use the **show ip bgp prefix-list** command.

**show ip bgp prefix-list** *list-name* [**exact-match**] [**vrf** *vrf-name*]

|                    |                            |                                                                                                                                          |
|--------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>list-name</i>           | Name of a prefix list. The commlist-name can be any case-sensitive, alphanumeric string up to 63 characters.                             |
|                    | <b>exact-match</b>         | (Optional) Displays an exact match of the filter.                                                                                        |
|                    | <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |

|                 |      |
|-----------------|------|

| Related Commands | <b>Command</b>        | <b>Description</b>                                                        |
|                  | <b>maximum-prefix</b> | Controls the number of prefixes that can be received from a BGP neighbor. |

# show ip bgp received-paths

To display the routes received from a Border Gateway Protocol (BGP) peer, use the **show ip bgp received-paths** command.

```
show ip bgp received-paths [vrf vrf-name | all]
```

|                    |                     |                                                                                                                                          |
|--------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | vrf <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
|                    | all                 | (Optional) Specifies all VRF.                                                                                                            |

|                 |      |

# show ip bgp route-map

To display the Border Gateway Protocol (BGP) route maps from the BGP table, use the **show ip bgp route-map** command.

**show ip bgp route-map** *route-map-name* [**vrf** *vrf-name* | **all**]

## Syntax Description

|                            |                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-map-name</i>      | Route map name.                                                                                                                          |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
| <b>all</b>                 | (Optional) Specifies all VRF.                                                                                                            |

## Command Default

None

## Command Modes

Any command mode

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 5.2(1)N1(1) | This command was introduced. |

## Usage Guidelines

This command requires the LAN Enterprise Services license.

## Examples

This example shows how to display the BGP route maps from the BGP table:

```
switch(config)# show ip bgp route-map
```

## Related Commands

| Command             | Description                          |
|---------------------|--------------------------------------|
| <b>route-map</b>    | Creates route maps.                  |
| <b>clear ip bgp</b> | Clear BGP routes from the BGP table. |

# show ip bgp summary

To display the status of all Border Gateway Protocol (BGP) connections, use the **show ip bgp summary** command.

**show ip bgp summary** [*vrf vrf-name* | **all**]

## Syntax Description

|                            |                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the virtual router context (VRF) name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
| <b>all</b>                 | (Optional) Specifies all VRF.                                                                                                            |

## Command Default

None

## Command Modes

Any command mode

## Command History

| Release     | Modification                 |
|-------------|------------------------------|
| 5.2(1)N1(1) | This command was introduced. |

## Usage Guidelines

This command requires the LAN Enterprise Services license.

## Examples

This example shows how to display the status of BGP connections:

```
switch(config)# show ip bgp summary
```

| Related Commands | Command        | Description                   |
|                  | ip prefix-list | Configures a BGP prefix list. |

# show mac-list

To display the entries in a MAC list, use the **show mac-list** command.

**show mac-list** [*name*]

| Syntax Description | <i>name</i> (Optional) MAC list name. The name can be any case-sensitive, alphanumeric string up to 32 characters. |
|--------------------|--------------------------------------------------------------------------------------------------------------------|
|--------------------|--------------------------------------------------------------------------------------------------------------------|

| Command Default | No match values are defined. |
|-----------------|------------------------------|
|-----------------|------------------------------|

| Command Modes | Any command mode |
|---------------|------------------|
|---------------|------------------|

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 5.2(1)N1(1) | This command was introduced. |

| Usage Guidelines | This command requires the LAN Enterprise license. |
|------------------|---------------------------------------------------|
|------------------|---------------------------------------------------|

| Examples | <p>This example shows how to display information about the Red MAC list:</p> <pre>switch(config)# show mac-list Red</pre> |
|----------|---------------------------------------------------------------------------------------------------------------------------|
|----------|---------------------------------------------------------------------------------------------------------------------------|

| Related Commands | Command               | Description                          |
|------------------|-----------------------|--------------------------------------|
|                  | <b>mac-list</b>       | Creates a MAC list.                  |
|                  | <b>match mac-list</b> | Matches a MAC address in a MAC list. |

# show vrf

To display the virtual routing and forwarding (VRF) instances, use the **show vrf** command.

**show vrf**

|                    |                                                                                                                                                                                                  |                              |  |  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|--|--|
| Syntax Description | This command has no arguments or keywords.                                                                                                                                                       |                              |  |  |

|                        | 5.2(1)N1(1)    | This command was introduced. |

|                         |                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | By default, this command displays the detailed information of the default VRF and management VRF. This command does not require a license. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | This example shows how to display the detailed information of VRF instances configured on the switch: |
|-----------------|-------------------------------------------------------------------------------------------------------|

```
switch# show vrf detail
VRF-Name: default, VRF-ID: 1, State: Up
    Table-ID: 0x80000001, AF: IPv6, Fwd-ID: 0x80000001, State: Up
    Table-ID: 0x00000001, AF: IPv4, Fwd-ID: 0x00000001, State: Up

VRF-Name: management, VRF-ID: 2, State: Up
    Table-ID: 0x80000002, AF: IPv6, Fwd-ID: 0x80000002, State: Up
    Table-ID: 0x00000002, AF: IPv4, Fwd-ID: 0x00000002, State: Up

switch#
```

|                         |                    |                             |
|-------------------------|--------------------|-----------------------------|
| <b>Related Commands</b> | <b>Command</b>     | <b>Description</b>          |
|                         | <b>vrf</b>         | Configures a VRF instance.  |
|                         | <b>vrf context</b> | Creates a VRF instance.     |
|                         | <b>vrf member</b>  | Adds an interface to a VRF. |

# show vrf interface

To display the virtual routing and forwarding (VRF) information for interfaces, use the **show vrf interface** command.

**show vrf interface** [*mgmt mgmt-number* | *vlan vlan-ID*]

|                           |                                |                                                                                                              |
|---------------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>mgmt</b> <i>mgmt-number</i> | (Optional) Displays the management interfaces that are added to a VRF. The management interface number is 0. |
|                           | <b>vlan</b> <i>vlan-ID</i>     | (Optional) Displays the VLAN interfaces that are added to a VRF. The VLAN interface range is from 1 to 4094. |

|                        |                |
|------------------------|----------------|
| <b>Command Default</b> | All interfaces |
|------------------------|----------------|

|                      |           |
|----------------------|-----------|
| <b>Command Modes</b> | EXEC mode |
|----------------------|-----------|

|                        |                |                              |
|------------------------|----------------|------------------------------|
| <b>Command History</b> | <b>Release</b> | <b>Modification</b>          |
|                        | 5.2(1)N1(1)    | This command was introduced. |

|                         |                                          |
|-------------------------|------------------------------------------|
| <b>Usage Guidelines</b> | This command does not require a license. |
|-------------------------|------------------------------------------|

|                 |                                                                                      |
|-----------------|--------------------------------------------------------------------------------------|
| <b>Examples</b> | This example shows how to display the VRF information for all configured interfaces: |
|-----------------|--------------------------------------------------------------------------------------|

```
switch# show vrf interface
Interface          VRF-Name          VRF-ID
Vlan1              default           1
Vlan5              default           1
loopback1          default           1
mgmt0              management        2
switch#
```

This example shows how to display the VRF information for management interfaces:

```
switch# show vrf interface mgmt 0
Interface          VRF-Name          VRF-ID
mgmt0              management        2
switch#
```

This example shows how to display the VRF information for VLAN interfaces:

```
switch# show vrf interface vlan 1
Interface          VRF-Name          VRF-ID
Vlan1              default           1
switch#
```
