

# **T** Commands

This chapter describes the Cisco NX-OS Open Shortest Path First (OSPF) commands that begin with T.

### timers Isa-arrival (OSPF)

To set the minimum interval in which the software accepts the same link-state advertisement (LSA) from Open Shortest Path First (OSPF) neighbors, use the **timers lsa-arrival** command. To return to the default, use the **no** form of this command.

timers lsa-arrival milliseconds

no timers lsa-arrival

the LSA. We recommend that you keep the <i>milliseconds</i> value of the <b>timers lsa-arrival</b> command less than or equal to the neighbors' <i>hold-interval</i> value of the <b>timers throttle lsa</b> command. This command requires the LAN Base Services license.	Syntax Description	milliseconds	Minimum delay (in milliseconds) that must pass between acceptance of the same LSA arriving from neighbors. The range is from 10 to 600,000 milliseconds. The default is 1000 milliseconds.	
VRF configuration mode         Command History       Release       Modification         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the timers Isa arrival command to configure the minimum interval for accepting the same LSA. The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the software drops the LSA.         We recommend that you keep the milliseconds value of the timers Isa-arrival command less than or equal to the neighbors' hold-interval value of the timers throttle Isa command. This command requires the LAN Base Services license.         Examples       This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds switch(config)# router ospf 1 switch(config-router)# timers Isa-arrival 2000 switch(config-router)#         Related Commands       Command       Description show JOSPF information.	Command Default	1000 milliseconds		
Release       Modification         5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the timers Isa arrival command to configure the minimum interval for accepting the same LSA. The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the software drops the LSA. We recommend that you keep the milliseconds value of the timers Isa-arrival command less than or equal to the neighbors' hold-interval value of the timers throttle Isa command. This command requires the LAN Base Services license.         Examples       This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds switch(config+router)# timers Isa-arrival 2000 switch(config-router)#         Related Commands       Command       Description show ip ospf         Displays OSPF information.       Displays OSPF information.	Command Modes	-		
5.2(1)N1(1)       This command was introduced.         Usage Guidelines       Use the timers Isa arrival command to configure the minimum interval for accepting the same LSA. The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the software drops the LSA. We recommend that you keep the milliseconds value of the timers Isa-arrival command less than or equal to the neighbors' hold-interval value of the timers throttle Isa command. This command requires the LAN Base Services license.         Examples       This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds switch(config) # router ospf 1 switch(config-router) # timers Isa-arrival 2000 switch(config-router) #         Related Commands       Command Description Show ip ospf         Displays OSPF information.       Displays OSPF information.

equal to the neighbors' hold-interval value of the timers throttle lsa command.         This command requires the LAN Base Services license.         Examples         This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds         switch(config) # router ospf 1         switch(config-router) # timers lsa-arrival 2000         switch(config-router) #         Related Commands         Command       Description         show ip ospf       Displays OSPF information.	Usage Guidelines	The same LSA is an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID. If an instance of the same LSA arrives sooner than the interval that is set, the software drops		
Examples       This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds         switch(config)# router ospf 1       switch(config-router)# timers lsa-arrival 2000         switch(config-router)#       Description         Related Commands       Command       Description         show ip ospf       Displays OSPF information.				
switch(config)# router ospf 1 switch(config-router)# timers 1sa-arrival 2000 switch(config-router)#         Related Commands         Command       Description show ip ospf         Displays OSPF information.		This command req	uires the LAN Base Services license.	
switch(config-router)# timers lsa-arrival 2000         switch(config-router)#         Related Commands         Command       Description         show ip ospf       Displays OSPF information.	Examples	This example shows how to set the minimum interval for accepting the same LSA at 2000 milliseconds:		
<b>show ip ospf</b> Displays OSPF information.		switch(config-ro	uter)# <b>timers lsa-arrival 2000</b>	
	Related Commands	Command	Description	
timers throttle lsa Sets rate-limiting values for LSAs being generated.		show ip ospf	Displays OSPF information.	
		timers throttle ls	a Sets rate-limiting values for LSAs being generated.	

## timers Isa-group-pacing (OSPF)

To change the interval at which Open Shortest Path First (OSPF) link-state advertisements (LSAs) are collected into a group and refreshed, checksummed, or aged, use the **timers lsa-group-pacing** command. To return to the default, use the **no** form of this command.

timers lsa-group-pacing seconds

no timers lsa-group-pacing

Syntax Description	seconds	Time (in seconds) in the interval in which LSAs are grouped and refreshed, checksummed, or aged. The range is from 1 to 1800 seconds. The default value is 240 seconds.	
Command Default	The default inter-	val for this command is 240 seconds. OSPF LSA group pacing is enabled by default.	
Command Modes	Router configura	tion mode	
	VRF configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
	LSAs. The default settings for OSPF packet pacing timers are suitable for the majority of OSPF deployments. Do not change the packet pacing timers unless you have tried all other options to meet OSPF packet flooding requirements. You should try summarization, stub area usage, queue tuning, and buffer tuning before changing the default flooding timers. There are no guidelines for changing timer values; each OSPF deployment is unique and should be considered on a case-by-case basis.		
	OSPF packet flooding requirements. You should try summarization, stub area usage, queue tuning, and buffer tuning before changing the default flooding timers. There are no guidelines for changing timer		
	refreshes in large topologies. The group timer controls the interval used for group refreshment of LSAs; however, this timer does not change the frequency that individual LSAs are refreshed (the default refresh rate is every 30 minutes).		
	The duration of the LSA group pacing is inversely proportional to the number of LSAs that the router is handling. For example, if you have about 10,000 LSAs, you should decrease the pacing interval. If you have a very small database (40 to 100 LSAs), you should increase the pacing interval to 10 to 20 minutes.		
	This command re	equires the LAN Base Services license.	
Examples	_	ows how to configure OSPF group packet-pacing updates between LSA groups to occur prvals for OSPF routing process 1:	
	<pre>switch(config)# router ospf 1</pre>		

#### switch(config-router)# timers lsa-group-pacing 60

Related Commands

ands	Command	Description	
	copy running-config	Saves the configuration changes to the startup configuration	
	startup-config	file.	
	show ip ospf	Displays general information about OSPF routing processes.	

### timers throttle Isa (OSPF)

To set rate-limiting values for Open Shortest Path First (OSPF) link-state advertisement (LSA) generation, use the **timers throttle lsa** command. To return to the default values, use the **no** form of this command.

timers throttle lsa start-time hold-interval max-time

no timers throttle lsa

Syntax Description	start-time	Start time (in milliseconds) that is used to calculate the subsequent rate limiting times for LSA generation. The range is from 0 to 5000 milliseconds. The default value is 0 milliseconds.
	hold-interval	Incremental time (in milliseconds) that is used to calculate the subsequent rate limiting times for LSA generation. The range is from 50 to 30,000 milliseconds. The default value is 5000 milliseconds.
	max-time	Maximum time (in milliseconds) that is used to calculate the subsequent rate limiting times for LSA generation. The range is from 50 to 30,000 milliseconds. The default value is 5000 milliseconds.
Command Default	<i>start-time:</i> 0 milli <i>hold-interval:</i> 500 <i>max-time:</i> 5000 m	00 milliseconds
Command Modes	Router configuration	
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines		rottle lsa command to rate-limit LSA generation. quires the LAN Base Services license.
Examples	This example show	ws how to customize OSPF LSA throttling:
	<pre>switch(config)# switch(config-ro switch(config-ro</pre>	puter)# timers throttle 1sa 50 5000 6000

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays information about OSPF routing processes.
	timers lsa arrival	Sets the minimum interval at which the software accepts the same LSA from OSPF neighbors.

### timers throttle spf (OSPF)

To set the shortest-path first (SPF) best-path schedule initial delay time and the minimum hold between SPF best-path calculation for Open Shortest Path First (OSPF), use the **timers throttle spf** command. To turn off SPF throttling, use the **no** form of this command.

timers throttle spf spf-start spf-hold spf-max-wait

no timers throttle spf spf-start spf-hold spf-max-wait

Syntax Description	spf-start	Initial SPF schedule delay in milliseconds. The range is from 1 to 600,000 milliseconds.	
	spf-hold	Minimum hold time between two consecutive SPF calculations. The range is from 1 to 600,000 milliseconds.	
	spf-max-wait	Maximum wait time between two consecutive SPF calculations. The range is from 1 to 600,000 milliseconds.	
Command Default	SPF throttling is 1	not set.	
Command Modes	Router configuration mode		
	VRF configuration mode		
Command History	Release	Modification	
	5.2(1)N1(1)	This command was introduced.	
Usage Guidelines	Use the <b>timers throttle spf</b> command to set the SPF timers.		
	The first wait interval between SPF calculations is the amount of time in milliseconds specified by the <i>spf-start</i> argument. Each consecutive wait interval is two times the current hold level in milliseconds until the wait time reaches the maximum time in milliseconds as specified by the <i>spf-maximum</i> argument. Subsequent wait times remain at the maximum until the values are reset or an LSA is received between SPF calculations.		
Examples	This example shows how to configure a router configured with the start, hold, and maximum interval values for the <b>timers throttle spf</b> command set at 5, 1,000, and 90,000 milliseconds:		
	<pre>switch(config)# switch(config-ro switch(config-ro</pre>	outer)# timers throttle spf 5 1000 90000	

Related Commands	Command	Description
	copy running-config startup-config	Saves the configuration changes to the startup configuration file.
	show ip ospf	Displays information about OSPF routing processes.
	timers lsa arrival	Sets the minimum interval at which the software accepts the same LSA from OSPF neighbors.
	timers throttle lsa	Sets the rate limit for generating LSAs.

## transmit-delay (OSPF virtual link)

To set the estimated time required to end a link-state update packet on the interface, use the **transmit-delay** command. To return to the default, use the **no** form of this command.

transmit-delay seconds

no transmit-delay

Syntax Description	seconds	Time (in seconds) required to send a link-state update. The range is from 1 to 65535 seconds. The default is 1 second.
Command Default	1 second	
Command Modes	Router configurat	ion mode
	VRF configuratio	n mode
Command History	Release	Modification
	5.2(1)N1(1)	This command was introduced.
Usage Guidelines	propagation delay	<b>-delay</b> command in virtual link configuration to account for the transmission and vs for the virtual link. quires the LAN Base Services license.
Examples	This example sets the retransmit delay value to 3 seconds: <pre>switch(config)# router ospf 201 switch(config-router)# area 22 virtual-link 192.0.2.1 switch(config-router-vlink)# transmit-delay 3</pre>	
Related Commands	Command show ip ospf	<b>Description</b> Displays general information about Open Shortest Path First (OSPF)
		routing instances.
