## CONTENTS

### New and Changed Information i

### Preface v

Audience	v
Organization	v
Document Conventions	vi
Related Documentation	vii
Documentation Feedback	viii
Obtaining Documentation and Submitting a Service Request	ix

### A Commands MPLS-1

accept-lifetime	MPLS-2
address-family	MPLS-4
advertise-labels	MPLS-6
affinity (LSP attribute configuration mode)	MPLS-8
affinity (TE interface configuration mode)	MPLS-10
allowas-in	MPLS-11
area	MPLS-12
as-override	MPLS-14
authentication challenge	MPLS-15
authentication key-chain	MPLS-17
authentication lifetime	MPLS-18
authentication type	MPLS-19
authentication window-size	MPLS-20
autoroute announce	MPLS-21
auto-bw (LSP attribute configuration mode)	MPLS-22
auto-bw (TE interface configuration mode)	MPLS-24
auto-bw timers	MPLS-26
autonomous-system	MPLS-27

Text Part Number:

**B Commands** **MPLS-29**

backoff **MPLS-30**  
 backup-bw **MPLS-31**  
 bandwidth (LSP attribute configuration mode) **MPLS-32**  
 bandwidth (TE interface configuration mode) **MPLS-34**  
 bfd interval **MPLS-35**  
 bfd slow-timer **MPLS-37**  
 bridge-domain **MPLS-38**

**C Commands** **MPLS-39**

cbts-member tunnel-te **MPLS-40**  
 class **MPLS-42**  
 class-map **MPLS-43**  
 control-word **MPLS-45**  
 copy running-config startup-config **MPLS-46**

**D Commands** **MPLS-47**

demand-circuit **MPLS-48**  
 destination **MPLS-49**  
 device ospf **MPLS-50**  
 disable-peer-as-check **MPLS-51**  
 discovery hello **MPLS-52**  
 discovery targeted-hello **MPLS-54**

**E Commands** **MPLS-57**

echo revision **MPLS-58**  
 echo vendor-extension **MPLS-59**  
 encapsulation dot1q **MPLS-60**  
 encapsulation mpls **MPLS-61**  
 exclude-address **MPLS-62**  
 exp **MPLS-63**  
 explicit-null **MPLS-64**  
 explicit-path **MPLS-66**

**F Commands** **MPLS-67**

fast-reroute (TE interface configuration mode) **MPLS-68**  
 fast-reroute backup-prot-preempt optimize-bw **MPLS-70**  
 fast-reroute timers promotion **MPLS-71**

feature bfd **MPLS-72**  
feature bgp **MPLS-73**  
feature evc **MPLS-74**  
feature isis **MPLS-75**  
feature mpls l3vpn **MPLS-76**  
feature mpls ldp **MPLS-77**  
feature mpls traffic-engineering **MPLS-78**  
feature mvpn **MPLS-79**  
feature ospf **MPLS-80**  
feature-set mpls **MPLS-81**  
forwarding-adjacency **MPLS-82**  
from **MPLS-83**

**G Commands** **MPLS-85**

graceful-restart **MPLS-86**

**H Commands** **MPLS-89**

holdtime **MPLS-90**

**I Commands** **MPLS-91**

import **MPLS-92**  
index **MPLS-94**  
inherit port-profile **MPLS-95**  
internetworking **MPLS-96**  
interface ethernet **MPLS-98**  
interface pseudowire **MPLS-99**  
interface tunnel-te **MPLS-101**  
install feature-set mpls **MPLS-102**  
ip prefix-list **MPLS-103**  
ip rsvp **MPLS-105**  
ip rsvp authentication challenge **MPLS-106**  
ip rsvp authentication key-chain **MPLS-107**  
ip rsvp authentication lifetime **MPLS-108**  
ip rsvp authentication type **MPLS-109**  
ip rsvp authentication window-size **MPLS-110**  
ip rsvp signalling dscp **MPLS-111**  
ip rsvp signalling hello dscp **MPLS-112**

ip rsvp signalling hello reroute **MPLS-113**  
 ip rsvp signalling hello reroute state-timeout refresh misses **MPLS-114**  
 ip rsvp signalling hello reroute state-timeout refresh interval **MPLS-115**  
 ip unnumbered loopback **MPLS-116**  
 isis metric **MPLS-117**  
**MPLS-118**

**K Commands** **MPLS-119**

key **MPLS-120**  
 key chain **MPLS-121**  
 key-string **MPLS-122**

**L Commands** **MPLS-123**

l2vpn vfi context **MPLS-124**  
 l2vpn xconnect context **MPLS-125**  
 label allocate global **MPLS-127**  
 link-management timers **MPLS-128**  
 list (LSP attribute configuration mode) **MPLS-130**  
 list (TE explicit-path configuration mode) **MPLS-131**  
 load-interval **MPLS-132**  
 lockdown **MPLS-133**  
 logging lsp **MPLS-134**  
 logging neighbor-changes **MPLS-135**  
 logging password configuration **MPLS-136**  
 logging password rollover **MPLS-137**  
 logging tunnel **MPLS-138**  
 lsp attribute **MPLS-139**

**M Commands** **MPLS-141**

match **MPLS-142**  
 maximum routes **MPLS-143**  
 mdt asm-use-shared-tree **MPLS-145**  
 mdt data **MPLS-146**  
 mdt data bidir-enable **MPLS-147**  
 mdt default **MPLS-148**  
 mdt enforce-bgp-mdt-safi **MPLS-149**  
 mdt mtu **MPLS-150**

mdt pim hello-interval    **MPLS-151**

## New and Changed Information

---

This chapter provides release-specific information for each new and changed feature in the *Cisco Nexus 7000 Series NX-OS MPLS Command Reference*. The latest version of this document is available at the following Cisco website:

[http://www.cisco.com/en/US/docs/switches/datacenter/sw/6\\_x/nx-os/mpls/command/reference/mpls\\_cr.html](http://www.cisco.com/en/US/docs/switches/datacenter/sw/6_x/nx-os/mpls/command/reference/mpls_cr.html)

To check for additional information about Cisco NX-OS Release 6.2(2), see the *Cisco NX-OS Release Notes* available at the following Cisco website:

[http://www.cisco.com/en/US/docs/switches/datacenter/sw/6\\_2/nx-os/release/notes/6x\\_nx-os\\_release\\_note.html](http://www.cisco.com/en/US/docs/switches/datacenter/sw/6_2/nx-os/release/notes/6x_nx-os_release_note.html)

Table 1 summarizes the new and changed features for the *Cisco Nexus 7000 Series NX-OS MPLS Command Reference*, and tells you where they are documented.

**Table 1**      **New and Changed Features for Release 6.2(2)**

Feature	Description	Changed in Release
MPLS	Added the following configuration commands to various chapter in the book: <b>allowas-in</b> <b>as-override</b> <b>autonomous-system</b> <b>bridge-domain</b> <b>control-word</b> <b>demand-circuit</b> <b>device ospf</b> <b>disable-peer-as-check</b> <b>echo revision</b> <b>echo vendor-extension</b> <b>encapsulation dot1q</b> <b>feature evc</b> <b>inherit port-profile</b> <b>internetworking</b> <b>interface pseudowire</b> <b>l2vpn xconnect context</b> <b>l2vpn vfi context</b> <b>member encapsulation mpls</b> <b>member</b> <b>member pseudowire</b> <b>member vfi</b> <b>mpls ldp graceful-restart</b> <b>port-profile type pseudowire</b> <b>redundancy</b> <b>remote link failure notification</b> <b>rewrite ingress tag push dot1q symmetric</b> <b>rewrite ingress tag translate 1-to-1 dot1q symmetric</b> <b>send-community extended</b> <b>signaling protocol none</b> <b>soo</b> <b>state enabled</b> <b>switchport allowed vlan</b> <b>update-source loopback</b> <b>vpn</b>	6.2(2)

**Table 1** New and Changed Features for Release 6.2(2) (continued)

Feature	Description	Changed in Release
MPLS	<p>Added the following show commands:</p> <ul style="list-style-type: none"> <li><b>show bridge-domain</b></li> <li><b>show forwarding</b></li> <li><b>show ethernet service instance</b></li> <li><b>show ethernet service instance id interface ethernet</b></li> <li><b>show ethernet service instance interface ethernet</b></li> <li><b>show forwarding</b></li> <li><b>show l2vpn atom</b></li> <li><b>show l2vpn atom vc detail</b></li> <li><b>show l2vpn service xconnect all</b></li> <li><b>show l2vpn service vfi</b></li> <li><b>show l2vpn vfi</b></li> <li><b>show mpls ldp neighbor graceful-restart</b></li> <li><b>show run mpls ldp all</b></li> </ul>	6.2(2)

# Preface

---

This preface describes the audience, organization, and conventions of the *Cisco Nexus 7000 Series NX-OS MPLS Command Reference*. It also provides information on how to obtain related documentation.

This chapter includes the following sections:

- [Audience, page v](#)
- [Organization, page v](#)
- [Document Conventions, page vi](#)
- [Related Documentation, page vii](#)
- [Documentation Feedback, page viii](#)
- [Obtaining Documentation and Submitting a Service Request, page ix](#)

## Audience

This publication is for experienced users who configure and maintain Cisco NX-OS devices.

## Organization

This reference is organized as follows:

Chapter Title	Description
<a href="#">A Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with A.
<a href="#">B Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with B.
<a href="#">C Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with C.
<a href="#">D Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with D.
<a href="#">E Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with E.
<a href="#">F Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with F.
<a href="#">G Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with G.
<a href="#">H Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with H.
<a href="#">I Commands</a>	Describes the Cisco NX-OS MPLS commands that begin with I.

Chapter Title	Description
K Commands	Describes the Cisco NX-OS MPLS commands that begin with K.
L Commands	Describes the Cisco NX-OS MPLS commands that begin with L.
M Commands	Describes the Cisco NX-OS MPLS commands that begin with M.
N Commands	Describes the Cisco NX-OS MPLS commands that begin with N.
P Commands	Describes the Cisco NX-OS MPLS commands that begin with P.
R Commands	Describes the Cisco NX-OS MPLS commands that begin with R.
S Commands	Describes the Cisco NX-OS MPLS commands that begin with S.
Show Commands	Describes the Cisco NX-OS MPLS commands that begin with show.
T Commands	Describes the Cisco NX-OS MPLS commands that begin with T.
V Commands	Describes the Cisco NX-OS MPLS commands that begin with V.

## Document Conventions

Command descriptions use these conventions:

Convention	Description
<b>boldface font</b>	Commands and keywords are in boldface.
<i>italic font</i>	Arguments for which you supply values are in italics.
[ ]	Elements in square brackets are optional.
[ x   y   z ]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.

Screen examples use these conventions:

screen font	Terminal sessions and information that the switch displays are in screen font.
<b>boldface screen font</b>	Information you must enter is in boldface screen font.
<i>italic screen font</i>	Arguments for which you supply values are in italic screen font.
< >	Nonprinting characters, such as passwords, are in angle brackets.
[ ]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

This document uses the following conventions:

**Note** Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

**Caution**

---

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

---

**Tip**

---

Means *the following information will help you solve a problem*.

---

## Documentation Feedback

To provide technical feedback on this document, or to report an error or omission, please send your comments to [nexus7k-docfeedback@cisco.com](mailto:nexus7k-docfeedback@cisco.com). We appreciate your feedback.

# Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.

## A Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with A.

accept-lifetime

# accept-lifetime

To configure the accept lifetime of a key, use the **accept-lifetime** command. To return to the default setting, use the **no** form of this command.

```
accept-lifetime {start-time | local start-time} {duration seconds | end-time | infinite}
no accept-lifetime {start-time | local start-time} {duration seconds | end-time | infinite}
```

Syntax Description	
<i>start-time</i>	Time to start. hh:mm:ss is the time format. The range is from 0 to 23: 0 and from 59: 0 to 59. The maximum size is 8 alphanumeric characters.
<b>local</b> <i>start-time</i>	Specifies the time in the local time zone. hh:mm:ss is the time format.
<b>duration</b>	Sets the key lifetime duration as follows: <ul style="list-style-type: none"> <li>Enter the number of days from 1 to 31.</li> <li>Enter the name of the month.</li> <li>Enter the year from the present to 2035.</li> </ul>
<i>seconds</i>	Seconds. The range is from 1 to 2147483646 seconds.
<i>end-time</i>	Time to stop.
<b>infinite</b>	Allows the lifetime period to never expire.

Defaults	None
Command Modes	Keychain key configuration mode
Supported User Roles	network-admin vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

Usage Guidelines	If you enter the <b>no accept-lifetime</b> command, the associated password is valid for authenticating incoming TCP segments.  This command requires the MPLS Services license.
------------------	--

Examples	This example shows how to configure the accept lifetime of a key:
	<pre>switch# configure terminal switch(config)# key chain keychain1 switch(config-keychain)# key 10 switch(config-keychain-key)# accept-lifetime 10:00:00 Jan 13 2010 10:00:00 Jun 13 2010</pre>

```
switch(config-keychain-key) #
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**address-family**

# address-family

To configure an address family type that pertains to BGP, use the **address-family** command. To return to the default setting, use the **no** form of this command.

```
address-family {ipv4 {multicast | unicast}} {ipv6 {multicast | unicast | labeled unicast }} {vpnv4 | vpv6 {unicast }}
no address-family {ipv4 {multicast | unicast}} {ipv6 {multicast | unicast | labeled unicast }} {vpnv4 | vpv6 {unicast }}
```

Syntax Description	<b>ipv4</b> Specifies an IPv4 address family.
<b>ipv6</b>	Specifies an IPv6 address family.
<b>multicast</b>	Specifies a multicast address family.
<b>unicast</b>	Specifies a unicast address family.
<b>vpnv4</b>	Specifies IPv4 VPN address family.
<b>vpnv6</b>	Specifies IPv6 VPN address family.
<b>unicast</b>	Specifies a unicast sub address family.

**Defaults** None

**Command Modes** Router BGP configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** VPNV4 and VPKV6 options require MPLS Services license.

**Examples** This example shows how to configure IPV4 multicast address family:

```
switch# configure t
switch(config)# router bgp 1
switch(config-router)# address-family ipv4 multicast
switch(config-router-af)#

```

This example shows how to configure IPV6 unicast address family:

```
switch# configure t
switch(config)# router bgp 1
```

```
switch(config-router)# address-family ipv6 unicast  
switch(config-router-af)#{/pre>
```

This example shows how to configure unicast sub address family:

```
switch# configuration t  
switch(config)# router bgp 1  
switch(config-router)# address-family VPNv4 unicast  
switch(config-router-af)#{/pre>
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**advertise-labels**

# advertise-labels

To configure label advertisements, use the **advertise-labels** command. To return to the default setting, use the **no** form of this command.

**advertise-labels [for prefix-list [to prefix-list] | interface interface number]**

**no advertise-labels [for prefix-list [to prefix-list] | interface interface number]**

<b>Syntax Description</b>	<b>for</b> (Optional) Specifies the prefix list controls on destination prefixes. <b>prefix-list</b> Name of the prefix list. <b>to</b> (Optional) Specifies the prefix list controls on Label Distribution Protocol (LDP) peers. <b>interface</b> (Optional) Specifies the interface address. <b>interface-number</b> Interface number.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	To block label advertisements to the rest of the LDP peers, use the <b>no advertise-labels</b> command.  This command requires the MPLS Services license.
-------------------------	---

<b>Examples</b>	This example shows how to configure the device to advertise the label on destination prefixes:
-----------------	--

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# advertise-labels for p1
switch(config-ldp)#

```

This example shows how to configure the device to advertise the label for designated destination prefixes to designated LDP peers:

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# advertise-labels for p1 to peer1
switch(config-ldp)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**affinity (LSP attribute configuration mode)**

# affinity (LSP attribute configuration mode)

To configure attribute flags for links that comprise a label switched path (LSP), use the **affinity** command.

**affinity [mask value]**

<b>Syntax Description</b>	<table border="0"> <tr> <td><b>mask</b></td><td>(Optional) Link attribute to be checked. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.</td></tr> <tr> <td><b>value</b></td><td>Attribute values required for links carrying this tunnel. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.</td></tr> </table>	<b>mask</b>	(Optional) Link attribute to be checked. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.	<b>value</b>	Attribute values required for links carrying this tunnel. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.
<b>mask</b>	(Optional) Link attribute to be checked. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.				
<b>value</b>	Attribute values required for links carrying this tunnel. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.				

<b>Defaults</b>	Value default is 0x00000000 Mask default is 0x0000ffff
-----------------	---

<b>Command Modes</b>	LSP attributes configuration mode
----------------------	-----------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	The following holds true for all tunnel-te commands that can be specified both in "TE interface configuration mode" or path-option command line or "LSP attribute configuration mode":  If a setting is specified for an LSP, either via the path-option command directly or by assigning an LSP attribute list to a path-option, takes precedence for that specific path-option.  If no setting is specified for an LSP, then the LSP path-option inherits any setting specified in the tunnel-te configuration mode: affinity, auto-bw, priority, record-route, protection/fast-reroute.  This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure attribute flags for links that comprise an LSP:
-----------------	---

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# lsp attributes 1
switch(config-lsp-attr)# affinity 0x0101 mask 0x0303
```

**Related Commands**

Command	Description
<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering protocol (MPLS-TE).

**affinity (TE interface configuration mode)**

# affinity (TE interface configuration mode)

To configure attribute flags for links that comprise a label switched path (LSP), use the **affinity** command.

**affinity [mask value]**

<b>Syntax Description</b>	<table border="0"> <tr> <td><b>mask</b></td><td>(Optional) Link attribute to be checked. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.</td></tr> <tr> <td><b>value</b></td><td>Attribute values required for links carrying this tunnel. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.</td></tr> </table>	<b>mask</b>	(Optional) Link attribute to be checked. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.	<b>value</b>	Attribute values required for links carrying this tunnel. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.
<b>mask</b>	(Optional) Link attribute to be checked. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.				
<b>value</b>	Attribute values required for links carrying this tunnel. A 32-bit decimal number. Valid values are from 0x0 to 0xFFFFFFFF, representing 32 attributes (bits), where the value of an attribute is 0 or 1.				

<b>Defaults</b>	Value default is 0x00000000 Mask default is 0x0000ffff
-----------------	---

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure attribute flags for links that comprise an LSP:
<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# affinity 0X0101 mask 0X0303 switch(config-if-te)# </pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# allowas-in

To allow an autonomous system (AS) path with the provider edge (PE) AS number (ASN) a specified number of times, use the **allowas-in** command.

**allowas-in** *number*

<b>Syntax Description</b>	<i>number</i>	Specified number to allow the AS path. The range is from 1 to 10.
---------------------------	---------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-router-vrf-neighbor-af mode
----------------------	------------------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to allow an AS path with the PE ASN a specified number of times:
-----------------	---

```
switch# configure terminal
switch(config)# feature bgp
switch(config)# router bgp 1.1
switch(config-router)# vrf vpn1
switch(config-router-vrf)# neighbor 209.165.201.1 remote-as 1.2
config-router-vrf-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# neighbor 33.0.1.63 remote-as 100
switch(config-router-vrf-neighbor)# address-family ipv4 unicast
switch(config-router-vrf-neighbor-af)# allowas-in 3
switch(config-router-vrf-af)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>address-family ipv4 unicast</b>	Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.
	<b>neighbor</b>	Adds an entry to the BGP or multiprotocol BGP neighbor table for this VRF.

# area

To configure the sham link on the provider edge (PE) interface within a specified Open Shortest Path First (OSPF) area and with the loopback interfaces specified by the IP addresses as endpoints, use the **area** command. To return to the default setting, use the **no** form of this command.

**area area-id sham-link source-address destination-address**

**no area area-id sham-link source-address destination-address**

<b>Syntax Description</b>	<table border="0"> <tr> <td><i>area-id</i></td><td>Area ID as an integer or IP address.</td></tr> <tr> <td><b>sham-link</b></td><td>Specifies the sham link and its parameters.</td></tr> <tr> <td><b>virtual-link</b></td><td>Specifies a virtual link and its parameters.</td></tr> <tr> <td><i>source-address</i></td><td>Source address.</td></tr> <tr> <td><i>destination-address</i></td><td>Destination address.</td></tr> </table>	<i>area-id</i>	Area ID as an integer or IP address.	<b>sham-link</b>	Specifies the sham link and its parameters.	<b>virtual-link</b>	Specifies a virtual link and its parameters.	<i>source-address</i>	Source address.	<i>destination-address</i>	Destination address.
<i>area-id</i>	Area ID as an integer or IP address.										
<b>sham-link</b>	Specifies the sham link and its parameters.										
<b>virtual-link</b>	Specifies a virtual link and its parameters.										
<i>source-address</i>	Source address.										
<i>destination-address</i>	Destination address.										

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Router configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the maximum number of routes that can be stored in the virtual routing and forwarding (VRF) route table:
	<pre>switch# configure t switch(config)# feature ospf switch(config)# router ospf p1 switch(config-router)# timer throttle lsa 0 50 500 switch(config-router)# vrf vpn1 switch(config-router-vrf)# area 1 sham-link 10.2.1.1 10.2.1.2 switch(config-router-vrf)# </pre>

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**as-override**

# as-override

To specify to override the autonomous system number (ASN) when sending an update, use the **as-override** command.

**as-override**

**Syntax Description** This command does have any arguments or keywords.

**Defaults** None

**Command Modes** config-router-vrf-neighbor-af mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to specify to override the ASN when sending an update:

```
switch# configure terminal
switch(config)# feature bgp
switch(config)# feature-set mpls
switch(config)# feature mpls 13vpn
switch(config)# feature bgp
switch(config)# router bgp 1.1
switch(config-router)# neighbor 209.165.201.1 remote-as 1.2
config-router-vrf-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# send-community extended
switch(config-router-neighbor-af)# vrf 2hub
switch(config-router-vrf-neighbor)# address-family ipv4 unicast
switch(config-router-vrf-neighbor-af)# as-override
switch(config-router-vrf-af)#

```

# authentication challenge

Command	Description
<b>address-family ipv4 unicast</b>	Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.
<b>allowas-in</b>	Allows duplicate autonomous system number (ASN) in the AS path. Configure this parameter in the VPN address family configuration mode at the PE spokes and at the neighbor mode at the PE hub.

To perform a challenge or response handshake with the new Resource Reservation Protocol (RSVP) neighbors, use the **authentication challenge** command. To disable global authentication, use the **no** form of this command.

**authentication [neighbor address *ip-address*] challenge**

**no authentication [neighbor address *ip-address*] challenge**

<b>Syntax Description</b>	<b>neighbor</b> (Optional) Specifies the RSVP neighbor. <b>address <i>ip-address</i></b> (Optional) Specifies the RSVP neighbor address.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	RSVP configuration mode
----------------------	-------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to perform a challenge handshake with the new RSVP neighbors: <pre>switch# configure terminal switch(config)# ip rsvp switch(config-ip-rsvp)# authentication neighbor 1.1.1.1 challenge switch(config-ip-rsvp)# </pre>
-----------------	--

<b>Related Commands</b>	
-------------------------	--

**■ authentication challenge**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# authentication key-chain

To activate the Resource Reservation Protocol (RSVP) cryptographic authentication for a neighbor, use the **authentication key-chain** command. To disable global authentication, use the **no** form of this command.

**authentication [neighbor address *ip-address*] key-chain *key-chain-name***

**no authentication [neighbor address *ip-address*] key-chain *key-chain-name***

Syntax Description	<b>neighbor</b> (Optional) Specifies the RSVP neighbor. <b>address <i>ip-address</i></b> (Optional) Specifies the RSVP neighbor address. <b><i>key-chain-name</i></b> Key chain name.
--------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	RSVP configuration mode
----------------------	-------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

Command History	Release	Modification
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the authentication password keychain:
<pre>switch# configure terminal switch(config)# ip rsvp switch(config-ip-rsvp)# authentication neighbor 1.1.1.1 key-chain key1 switch(config-ip-rsvp)# </pre>	

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**authentication lifetime**

# authentication lifetime

To control how long the Resource Reservation Protocol (RSVP) maintains security associations with a neighbor, use the **authentication lifetime** command. To revert to the default lifetime, use the **no** form of this command.

**authentication [neighbor address *ip-address*] lifetime *hh:mm:ss***

**no authentication [neighbor address *ip-address*] lifetime *hh:mm:ss***

**Syntax Description**

<b>neighbor</b>	(Optional) Specifies the RSVP neighbor.
<b>address <i>ip-address</i></b>	(Optional) Specifies the RSVP neighbor address.
<b><i>hh:mm:ss</i></b>	Lifetime value in seconds. The range is from 30 to 86400 seconds.

**Defaults**

30 minutes

**Command Modes**

RSVP configuration mode

**SupportedUserRoles**

network-admin  
vdc-admin

**Command History**

<b>Release</b>	<b>Modification</b>
5.2(1)	This command was introduced.

**Usage Guidelines**

This command requires the MPLS Services license.

**Examples**

This example shows how to specify the maximum lifetime of a neighbor authentication state:

```
switch# configure terminal
switch(config)# ip rsvp
switch(config-ip-rsvp)# authentication neighbor 1.1.1.1 lifetime 60
switch(config-ip-rsvp)#

```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# authentication type

To configure the algorithm used to generate cryptographic signatures messages for a neighbor, use the **authentication type** command. To revert to the default type, use the **no** form of this command.

**authentication [neighbor address *ip-address*] type {md5 | sha-1}**

**no authentication [neighbor address *ip-address*] type {md5 | sha-1}**

Syntax Description	<b>neighbor</b> (Optional) Specifies the Resource Reservation Protocol (RSVP) neighbor. <b>address</b> (Optional) Specifies the RSVP neighbor address. <i>ip-address</i> RSVP neighbor address. <b>md5</b> Specifies the Rivest, Shamir, and Adleman (RSA) Message Digest 5 hash algorithm. <b>sha-1</b> Specifies the National Institute of Standards and Technology (NIST) Secure Hash Algorithm 1.	
Defaults	md5	
Command Modes	RSVP configuration mode	
SupportedUserRoles	network-admin vdc-admin	
Command History	Release	Modification
	5.2(1)	This command was introduced.
Usage Guidelines	This command requires the MPLS Services license.	
Examples	This example shows how to specify the MD5 authentication algorithm: <pre>switch# configure terminal switch(config)# ip rsvp switch(config-ip-rsvp)# authentication neighbor 1.1.1.1 type md5 switch(config-ip-rsvp)# </pre>	
Related Commands#	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 authentication window-size

# authentication window-size

To configure the tolerance for the window size for an out-of-sequence message, use the **authentication window-size** command. To revert to the default type, use the **no** form of this command.

```
authentication [neighbor address ip-address] window-size value
no authentication [neighbor address ip-address] window-size value
```

<b>Syntax Description</b>	<b>neighbor</b> (Optional) Specifies the Resource Reservation Protocol (RSVP) neighbor. <b>address ip-address</b> (Optional) Specifies the RSVP neighbor address. <b>value</b> Maximum number of messages allowed in a window. The range is from 1 to 64.
---------------------------	---

<b>Defaults</b>	1
-----------------	---

<b>Command Modes</b>	RSVP configuration mode
----------------------	-------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	Use <b>authentication window-size</b> command to specify the tolerance for an out-of-sequence messages for a neighbor or globally.  This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the tolerance for an out-of-sequence message for a neighbor:
<pre>switch# configure terminal switch(config)# ip rsvp switch(config-ip-rsvp)# authentication neighbor 1.1.1.1 window-size 1 switch(config-ip-rsvp)#</pre>	

<b>Related Commands#</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# autoroute announce

To announce the traffic-engineering tunnel to an Interior Gateway Protocol (IGP), use the **autoroute announce** command. To restore the system to its default condition, use the **no** form of this command.

**autoroute announce**

**no autoroute announce**

---

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

---

<b>Defaults</b>	None
-----------------	------

---

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

---

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

---

<b>Examples</b>	This example shows how to announce the tunnel to IGP:
<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# autoroute announce switch(config-if-te)# </pre>	

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

---

**auto-bw (LSP attribute configuration mode)**

# auto-bw (LSP attribute configuration mode)

To configure the automatic bandwidth configuration, use the **auto-bw** command.

**auto-bw [frequency *secs*] [max-bw *kbps*] [min-bw *kbps*] [collect-bw]**

**no auto-bw [frequency *secs*] [max-bw *kbps*] [min-bw *kbps*] [collect-bw]**

Syntax Description	
<b>frequency</b>	(Optional) Specifies the interval between bandwidth adjustments.
<i>secs</i>	(Optional) Seconds. The range is from 300 to 604800 seconds.
<b>max-bw</b>	(Optional) Specifies the maximum automatic bandwidth, in kbps, for this path option.
<i>kbps</i>	(Optional) Kilobits per second. The range is from 0 to 4294967295.
<b>min-bw</b>	(Optional) Specifies the minimum automatic bandwidth, in kbps, for this path option.
<b>collect-bw</b>	(Optional) Collects the output rate information for the path option but does not adjust the bandwidth of the path option.

---

**Defaults**

If the command is entered with no optional keywords, automatic bandwidth adjustment for the LSP is enabled, with adjustments made every 24 hours and with no constraints on the bandwidth adjustments made. If the collect-bw keyword is entered, the bandwidth is sampled but not adjusted, and the other options, if any, are ignored. If the collect-bw keyword is not entered and some, but not all of the other keywords are entered, the defaults for the keywords not entered are: frequency, every 24 hours; min-bw, unconstrained (0); max-bw, unconstrained.

---

<b>Command Modes</b>	LSP attribute configuration mode
----------------------	----------------------------------

---

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	The following conditions apply for all traffic-engineering tunnel (TE) commands that can be specified both in TE interface configuration mode, <b>path-option</b> command line or LSP attribute configuration mode:
-------------------------	---

- If a setting is specified for a label switched path (LSP) either via the **path-option** command directly or by assigning an LSP attribute list to a path option, this setting takes precedence for that specific path option.

- If no setting is specified for an LSP, then the LSP/path option inherits any setting specified in the tunnel-te configuration mode such as affinity, auto-bw, priority, record-route, protection/fast-reroute.

The **bandwidth** command configures the initial tunnel bandwidth, which is adjusted by the auto bandwidth mechanism.

This command requires the MPLS Services license.

## Examples

This example shows how to configure the automatic bandwidth configuration:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# lsp attributes 1
switch(config-lsp-attr)# auto-bw
```

## Related Commands

Command	Description
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

## ■ auto-bw (TE interface configuration mode)

### **auto-bw (TE interface configuration mode)**

To configure the automatic bandwidth configuration, use the **auto-bw** command. To restore the system to its default condition, use the **no** form of this command.

**auto-bw** [*frequency secs*] [**max-bw kbps**] [**min-bw kbps**] [**collect-bw**]

**no auto-bw [frequency *secs*] [max-bw *kbytes/sec*] [min-bw *kbytes/sec*] [collect-bw]**

Syntax Description	<b>frequency</b> (Optional) Specifies the interval between bandwidth adjustments.
<i>secs</i>	(Optional) Seconds. The range is from 300 to 604800 seconds.
<b>max-bw</b>	(Optional) Specifies the maximum automatic bandwidth, in kbps, for this path option.
<i>kbps</i>	(Optional) Kilobits per second. The range is from 0 to 4294967295.
<b>min-bw</b>	(Optional) Specifies the minimum automatic bandwidth, in kbps, for this path option.
<b>collect-bw</b>	(Optional) Collects the output rate information for the path option but does not adjust the bandwidth of the path option.

## **Defaults**

If the command is entered with no optional keywords, automatic bandwidth adjustment for the LSP is enabled, with adjustments made every 24 hours and with no constraints on the bandwidth adjustments made. If the collect-bw keyword is entered, the bandwidth is sampled but not adjusted, and the other options, if any, are ignored. If the collect-bw keyword is not entered and some, but not all of the other keywords are entered, the defaults for the keywords not entered are: frequency, every 24 hours; min-bw, unconstrained (0); max-bw, unconstrained.

### **Command History**

<b>Release</b>	<b>Modification</b>
5.2(1)	This command was introduced.

## **Usage Guidelines**

The **bandwidth** command configures the initial tunnel bandwidth, which is adjusted by the auto bandwidth mechanism.

This command requires the MPLS Services license.

---

## Examples

This example shows how to enable automatic bandwidth adjustment for the tunnel and controls how the bandwidth for a tunnel is adjusted:

```
switch# configure terminal
switch(config)# interface tunnel-te 1
switch(config-if-te)# auto-bw max-bw 2000 min-bw 1000
switch(config-if-te)#{/pre>
```

Related Commands	Command	Description
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# auto-bw timers

To enable automatic bandwidth adjustment on a platform and begin sampling the output rate for tunnels that have been configured for automatic bandwidth adjustment, use the **auto-bw timers** command. To restore the system to its default condition, use the **no** form of this command.

**auto-bw timers [frequency seconds]**

**no auto-bw timers [frequency seconds]**

<b>Syntax Description</b>	<b>frequency</b> (Optional) Specifies how often tunnel-te output rates should be sampled. <b>seconds</b> (Optional) Interval in seconds, for sampling the output rate of each tunnel configured for automatic bandwidth. The range is 1 through 604800. The recommended value is 300.
---------------------------	--

**Defaults** When the optional **frequency** keyword is not specified, the sampling interval is 300 seconds (5 minutes).

**Command Modes** Traffic engineering global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** The **bandwidth** command configures the initial tunnel bandwidth, which is adjusted by the auto bandwidth mechanism.

This command requires the MPLS Services license.

**Examples** This example shows how to enable automatic bandwidth adjustment on a platform that has been configured for automatic bandwidth adjustment:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# auto-bw timers frequency 600
switch(config-te)#

```

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

# autonomous-system

To specify the autonomous system number (ASN) for this address family for the customer site, use the **autonomous-system** command.

**autonomous-system *as-number***

<b>Syntax Description</b>	<i>as-number</i>	AS number. The AS number can be a 16-bit integer or a 32-bit integer in the form of a higher 16-bit decimal number and a lower 16-bit decimal number in the xx.xx format.
---------------------------	------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-router-vrf mode
----------------------	------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the ASN for an address family for a customer site:
<pre>switch# configure terminal switch(config)# router eigrp Test1 switch(config-router)# vrf vpn1 switch(config-router-vrf)# address-family ipv4 unicast switch(config-router-vrf-af)# redistribute bgp 1.0 route-map BGPMap switch(config-router-vrf-af)# autonomous-system 1.3</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>address-family ipv4 unicast</b>	Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.
	<b>send-community extended</b>	Specifies that a community's attribute should be sent to a BGP neighbor.

■ autonomous-system

## B Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with B.

**backoff**

# backoff

To configure session setup delay parameters for the Label Distribution Protocol (LDP) backoff mechanism, use the **backoff** command. To return to the default setting, use the **no** form of this command.

**backoff initial-backoff max-backoff**

**no backoff**

<b>Syntax Description</b>	<i>initial-backoff</i> Initial backoff value in seconds. The range is from 5 to 2147483. <i>max-backoff</i> Maximum backoff value in seconds. The range is from 5 to 2147483.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to setup delay parameters for the LDP backoff mechanism:
-----------------	---

```
switch(config)# mpls ldp configuration
switch(config-ldp)# backoff 30 240
switch(config-ldp) #
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# backup-bw

To specify whether this tunnel-te, when used as a backup tunnel, should provide bandwidth protection, and how much, use the **backup-bw** command. To restore the system to its default condition, use the **no** form of this command.

**backup-bw bandwidth**

**no backup-bw**

<b>Syntax Description</b>	<i>bandwidth</i> Amount of allocatable backup bandwidth. The range is from 1 to 4294967295.				
<b>Defaults</b>	None				
<b>Command Modes</b>	TE interface configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to associate the bandwidth with a backup tunnel:</p> <pre>switch# configure terminal switch(config)# interface tunnel-te 2 switch(config-if-te)# backup-bw 1000 switch(config-if-te)# </pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>interface tunnel-te</b></td><td>Configures the traffic engineering (TE) interface.</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.
<b>Command</b>	<b>Description</b>				
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.				

---

**bandwidth (LSP attribute configuration mode)**

To configure the label switched path (LSP) bandwidth, use the **bandwidth** command. To restore the system to its default condition, use the **no** form of this command.

**bandwidth *kbps***

**no bandwidth**

---

<b>Syntax Description</b>	<b><i>kbps</i></b>	Number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.
---------------------------	--------------------	---

---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LSP attribute configuration mode
----------------------	----------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	The following conditions apply for all tunnel engineering (TE) commands that can be specified both in "TE interface configuration mode; path-option command line, or LSP attribute configuration mode:
-------------------------	--

- If a setting is specified for a label switched path (LSP), either via the path-option command directly or by assigning an LSP attribute list to a path-option, takes this setting precedence for that specific path option.
- If no setting is specified for an LSP, then the LSP/path-option inherits any setting specified in the tunnel-te configuration mode: affinity, auto-bw, priority, record-route, protection/fast-reroute.

The **bandwidth** command configures the initial tunnel bandwidth, which is adjusted by the auto bandwidth mechanism.

This command requires the MPLS Services license.

---

<b>Examples</b>	This example shows how to configure the LSP bandwidth:
-----------------	--

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# lsp attributes 1
switch(config-lsp-attr)# bandwidth 5000
```

**Related Commands**

Command	Description
<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

---

**bandwidth (TE interface configuration mode)**

# bandwidth (TE interface configuration mode)

To configure the bandwidth for a Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel, use the **bandwidth** command. To restore the system to its default condition, use the **no** form of this command.

**bandwidth *bandwidth***

**no bandwidth**

<b>Syntax Description</b>	<i>bandwidth</i>	Bandwidth in kilobits per second. The range is from 1 to 4294967295.
---------------------------	------------------	--

<b>Defaults</b>	0
-----------------	---

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the bandwidth for a MPLS TE tunnel:
	<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# bandwidth 250 switch(config-if-te)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# bfd interval

To set the Bidirectional Forwarding Detection (BFD) intervals for this interface, use the **bfd interval** command. To restore the system to its default condition, use the **no** form of this command.

**bfd interval milliseconds min\_rx milliseconds multiplier interval-multiplier**  
**no bfd interval**

<b>Syntax Description</b>	<p><b>milliseconds</b> TX interval in milliseconds, which is the required rate at which control packets can be received. The range is from 50 to 999 milliseconds.</p> <p><b>min_rx</b> Specifies minimum RX interval, which is the desired rate for transmitting control packets. The range is from 50 to 999 milliseconds.</p> <p><b>multiplier</b> Specifies the detect multiplier for BFD sessions.</p> <p><b>interval-multiplier</b> Multiplier interval. The range is from 1 to 50 milliseconds.</p>
---------------------------	--

<b>Defaults</b>	Interval milliseconds-50 Min_rx_50 Multiplier interval-multiplier-3
-----------------	---

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to set the BFD intervals:
	<pre>switch# configure terminal switch# configure terminal switch(config)# interface ethernet 2/2 switch(config-if)# bfd interval 100 min_rx 100 multiplier 4</pre>

■ **bfd interval**

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# bfd slow-timer

To configure the slow mode timer for sessions, use the **bfd slow-timer** command. To restore the system to its default condition, use the **no** form of this command.

**bfd slow-timer** *milliseconds*

**no bfd slow-timer** *milliseconds*

<b>Syntax Description</b>	<i>milliseconds</i>	Slow rate timer in milliseconds. The range is from 1000 to 30000 milliseconds.
<b>Defaults</b>	None	
<b>Command Modes</b>	Global configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure the slow mode timer for sessions:	
	<pre>switch# configure terminal switch(config)# bfd slow-timer 1000 switch(config)# </pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**bridge-domain**

# bridge-domain

To enter bridge-domain configuration mode and configure a bridge domain, use the **bridge-domain** command. To remove the bridge-domain configurations, use the **no** form of this command.

**bridge-domain** *domain-id*

**no bridge-domain** *domain-id*

<b>Syntax Description</b>	<i>domain-id</i>	Bridge-domain ID. The range is defined by the system-bridge-domain configuration.
---------------------------	------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	Removing the bridge-domain configuration does not remove the underlying VLAN. If a VLAN is associated with a bridge domain, you cannot remove the VLAN without first removing the bridge domain. To remove the underlying VLAN, use the <b>no vlan</b> command after you remove the bridge domain.
-------------------------	--

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to enter bridge-domain configuration mode and configure a bridge domain:
-----------------	---

```
switch# configure terminal
switch(config)# bridge-domain 10
switch(config)#
switch#
```

This example shows how to remove the bridge-domain configuration including port associations:

```
switch(config)# no bridge-domain 10
switch(config)#
switch#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>system bridge-domain</b>	Identifies the IDs that are available for bridge-domain configurations.

## C Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with C.

---

 cbts-member tunnel-te

## cbts-member tunnel-te

To configure a class-based tunnel selection (CBTS) tunnel interface type, use the **cbts-member tunnel-te** command. To restore the system to its default condition, use the **no** form of this command.

**cbts-member tunnel-te *number***

**no cbts-member tunnel-te *number***

<b>Syntax Description</b>	<i>number</i> Tunnel interface number. The range is from 0 to 65503.				
<b>Defaults</b>	None				
<b>Command Modes</b>	TE Interface configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th> <th><b>Modification</b></th> </tr> </thead> <tbody> <tr> <td>5.2(1)</td> <td>This command was introduced.</td> </tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				

**Usage Guidelines** You cannot configure the traffic engineering (TE) commands on these class-based tunnel selection (CBTS) member tunnels (**auto-bw**; **backup-bw**; **description**; **destination**; **fowarding-adjacency**; **inherit**; **source**).

All the tunnel-te configured commands, except for exp and path-option, are inherited by the CBTs-member LSP when they are configured on the tunnel headend interface. If the command is entered independently of or on the CBTs-member LSP, it takes precedence and overrides the config on the tunnel headend interface for that CBTs-member LSP. When the configuration is removed from the cbts-member LSP, the configuration on the tunnel headend interface is inherited by the CBTs-member LSP.

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to configure a CBTS tunnel interface type:
	<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# cbts-member tunnel-te 251 switch(config-cbts-member)</pre>

**Related Commands**

Command	Description
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# class

To specify the class name of the policy that you want to create or change, use the **class** command. To return to the default setting, use the **no** form of this command.

```
class [type qos] {class-map-name | class-default}
```

```
no class [type qos] {class-map-name | class-default}
```

<b>Syntax Description</b>	<table border="1"> <tr> <td><b>type</b></td><td>(Optional) Specifies the type of class.</td></tr> <tr> <td><b>qos</b></td><td>(Optional) Specifies the match on a QoS class.</td></tr> <tr> <td><i>class-map-name</i></td><td>Name of the class to configure or modify the policy. The maximum size is 40 alphanumeric characters.</td></tr> <tr> <td><b>class-default</b></td><td>Specifies a predefined class to which traffic is directed if that traffic does not match any of the match criteria in the configured class maps.</td></tr> </table>	<b>type</b>	(Optional) Specifies the type of class.	<b>qos</b>	(Optional) Specifies the match on a QoS class.	<i>class-map-name</i>	Name of the class to configure or modify the policy. The maximum size is 40 alphanumeric characters.	<b>class-default</b>	Specifies a predefined class to which traffic is directed if that traffic does not match any of the match criteria in the configured class maps.
<b>type</b>	(Optional) Specifies the type of class.								
<b>qos</b>	(Optional) Specifies the match on a QoS class.								
<i>class-map-name</i>	Name of the class to configure or modify the policy. The maximum size is 40 alphanumeric characters.								
<b>class-default</b>	Specifies a predefined class to which traffic is directed if that traffic does not match any of the match criteria in the configured class maps.								

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Class-map configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.0(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	<p>This example shows how to specify the class name of the policy that you want to create or change:</p> <pre>switch# configure terminal switch(config)# policy-map type qos policy1 switch(config-pmap-qos)# class class2 switch(config-pmap-c-qos) #</pre>
-----------------	--

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# class-map

To configure a class map, use the **class-map** command. To return to the default setting, use the **no** form of this command.

```
class-map [type qos] [match-all] [match-any] class-map-name
no class-map [type qos] [match-all] [match-any] class-map-name
```

<b>Syntax Description</b>	<table border="0"> <tr> <td><b>type</b></td><td>(Optional) Specifies the type of the class map.</td></tr> <tr> <td><b>qos</b></td><td>(Optional) Specifies the QoS class.</td></tr> <tr> <td><b>match-all</b></td><td>(Optional) Specifies logical AND for all match statements under this class map.</td></tr> <tr> <td><b>match-any</b></td><td>(Optional) Specifies logical OR for all match statements under this class map.</td></tr> <tr> <td><i>class-map-name</i></td><td>Class-map name. The maximum size is case-sensitive, alphanumeric 40 characters.</td></tr> </table>	<b>type</b>	(Optional) Specifies the type of the class map.	<b>qos</b>	(Optional) Specifies the QoS class.	<b>match-all</b>	(Optional) Specifies logical AND for all match statements under this class map.	<b>match-any</b>	(Optional) Specifies logical OR for all match statements under this class map.	<i>class-map-name</i>	Class-map name. The maximum size is case-sensitive, alphanumeric 40 characters.
<b>type</b>	(Optional) Specifies the type of the class map.										
<b>qos</b>	(Optional) Specifies the QoS class.										
<b>match-all</b>	(Optional) Specifies logical AND for all match statements under this class map.										
<b>match-any</b>	(Optional) Specifies logical OR for all match statements under this class map.										
<i>class-map-name</i>	Class-map name. The maximum size is case-sensitive, alphanumeric 40 characters.										

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Class-map configuration mode
----------------------	------------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.0(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the logical AND for all match statements under this class map:
-----------------	--

```
switch# configure terminal
switch(config)# class-map type qos match-all class-2
switch(config-cmap-qos)#
```

This example shows how to specify the logical OR for all match statements under this class map:

```
switch# configure terminal
switch(config)# class-map type qos match-any class-2
switch(config-cmap-qos)#
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# control-word

To enable the control word support, use the **control-word** command.

```
control-word { exclude | include }
```

<b>Syntax Description</b>	<b>exclude</b> Specifies to exclude the control word in the pseudowire packet. <b>include</b> Specifies to include the control word in the pseudowire packet.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-if-pseudowire mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

**Usage Guidelines** A device can receive a packet with or without the control word and the control word capability is negotiated with the peer. However, the device cannot generate a sequence number in the control word if the control word is added to the ingress device.

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to enable the control word support:
-----------------	--

```
switch# configure terminal
switch(config)# interface pseudowire 12
switch(config-if-pseudowire)# control-word include
switch(config-if-pseudowire)#+
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface pseudowire</b>	Enters interface pseudowire configuration mode and configures a static pseudowire logical interface.

---

copy running-config startup-config

# copy running-config startup-config

To copy the running configuration to the startup configuration, use the **copy running-config startup-config** command.

**copy running-config startup-config**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** Global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** When you disable the MPLS Label Distribution Protocol (LDP) on the device, no LDP commands are available.

This command requires the MPLS Services license.

---

**Examples** This example shows how to copy the running configuration to the startup configuration:

```
switch(config)# copy running-config startup-config
[#####] 100%
switch(config)#
```

---

Related Commands	Command	Description
	<b>show running-config interface</b>	Displays information about the interface configuration.

---

## D Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with D.

---

**demand-circuit**

# demand-circuit

To specify the sham link as a demand circuit (DC) by the Open Shortest Path First (OSPF) in order to reduce the traffic flow over the sham link, use the **demand-circuit** command.

## **demand-circuit**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** config-device-vrf-slink mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to specify the sham link as a DC by the OSPF in order to reduce the traffic flow over the shamlink:

```
switch# configure terminal
switch(config)# feature-set mpls
switch(config)# feature mpls l3vpn
switch(config)# feature ospf
switch(config)# device ospf test1
switch(config-device)# vrf vpn1
switch(config-device-vrf)# area 1 sham-link 10.2.1.1 10.2.1.2
switch(config-device-vrf-slink)# demand circuit
switch(config-device-vrf-slink)#

```

Related Commands	Command	Description
	<b>area</b>	Configures the sham link on the PE interface within a specified OSPF area and with the loopback interfaces specified by the IP addresses (source and destination) as endpoints.
	<b>feature mpls l3vpn</b>	Enables the MPLS Layer 3 VPN feature.
	<b>feature-set mpls</b>	Enables the MPLS feature-set.

# destination

To configure the destination for the tunnel-te interface, use the **destination** command. To restore the system to its default condition, use the **no** form of this command.

**destination ip-address**

**no destination**

<b>Syntax Description</b>	<i>ip-address</i>	IP address is in dotted decimal notation.
<b>Defaults</b>	None	
<b>Command Modes</b>	TE interface configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure the destination for the tunnel:  switch# <b>configure terminal</b> switch(config)# <b>interface tunnel-te 1</b> switch(config-if-te)# <b>destination 10.1.1.4</b> switch(config-if-te)#	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

---

 device ospf

# device ospf

To enable Open Shortest Path First (OSPF) and enter device configuration mode, use the **device ospf** command.

**device ospf** *instance-tag*

<b>Syntax Description</b>	<i>instance-tag</i>	Instance-tag. It can be any case-sensitive, alphanumeric string up to 20 characters.
---------------------------	---------------------	--

---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

---

<b>Examples</b>	This example shows how to enable OSPF and enter device configuration mode:
	<pre>switch# configure terminal switch(config)# feature-set mpls switch(config)# feature mpls l3vpn switch(config)# feature ospf switch(config)# device ospf test1 switch(config)#</pre>

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>feature mpls l3vpn</b>	Enables the MPLS Layer 3 VPN feature.
	<b>feature-set mpls</b>	Enables the MPLS feature-set.

# disable-peer-as-check

To disable checking the peer autonomous system number (ASN) during route advertisement, use the **disable-peer-as-check** command.

## disable-peer-as-check

**Syntax Description** This command does have any arguments or keywords.

**Defaults** None

**Command Modes** config-router-vrf-neighbor-af mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to disable checking the peer ASN during a route advertisement:

```
switch# configure terminal
switch(config)# feature bgp
switch(config)# feature-set mpls
switch(config)# feature mpls l3vpn
switch(config)# feature bgp
switch(config)# router bgp 1.1
switch(config)# neighbor 33.0.1.63 remote-as 100
config-router-vrf-neighbor)# address-family ipv4 unicast
switch(config-router-neighbor-af)# neighbor 33.0.1.63 remote-as 100
switch(config-router-vrf-neighbor)# address-family ipv4 unicast
switch(config-router-vrf-neighbor-af)# disable-peer-as-check
switch(config-router-vrf-af)#

```

## Related Commands

Command	Description
<b>address-family ipv4 unicast</b>	Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.

**■ disable-peer-as-check**

Command	Description
<b>allowas-in</b>	Allows duplicate autonomous system number (ASN) in the AS path. Configure this parameter in the VPN address family configuration mode at the PE spokes and at the neighbor mode at the PE hub.
<b>neighbor</b>	Adds an entry to the BGP or multiprotocol BGP neighbor table for this VRF.

# discovery hello

To configure the hold time or interval for directly connected neighbors, use the **discovery hello** command. To return to the default setting, use the **no** form of this command.

**discovery hello {holdtime seconds | interval seconds}**

**no discovery hello {holdime | interval}**

<b>Syntax Description</b>	<b>holdtime</b> Specifies the period of time that a discovered LDP neighbor is remembered without receipt of an LDP hello message from the neighbor. <b>interval</b> Specifies the interval in seconds between the sending of consecutive hello messages. <b>seconds</b> Hold time in Seconds. The range is from 1 to 65535 seconds.
---------------------------	--

**Defaults**      Default holdtime is 15 seconds, interval is 5 seconds

**Command Modes**      LDP configuration mode

**SupportedUserRoles**      network-admin  
vdc-admin

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

**Usage Guidelines**      When you disable the Multiprotocol Label Switching Label Distribution Protocol (LDP) on the device, no LDP commands are available.

This command requires the MPLS Services license.

**Examples**      This example shows how to configure the LDP discovery hello holdtime:

```
switch(config)# mpls ldp configuration
switch(config-ldp)# discovery hello holdtime 10
switch(config-ldp)#

```

This example shows how to configure the LDP discovery hello interval:

```
switch(config)# mpls ldp configuration
switch(config-ldp)# discovery hello interval 10
switch(config-ldp)#

```

■ **discovery hello**

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# discovery targeted-hello

To configure the router to respond to requests for targeted-hello messages from all neighbors or from neighbors specified by the optional prefix list or configure the hold time or interval for neighbors that are not directly connected, use the **discovery targeted-hello** command. To return to the default setting, use the **no** form of this command.

```
discovery targeted-hello {accept [from prefix-list] | holdtime seconds | interval seconds}  
no discovery targeted-hello {accept [from prefix-list] | holdtime seconds | interval seconds}
```

## Syntax Description

<b>accept</b>	Specifies to accept targeted hellos.
<b>from</b>	(Optional) Specifies the prefix list from which you can specify acceptable targeted hello sources
<i>prefix-list</i>	(Optional) Name of the prefix list.
<b>holdtime</b>	Specifies the period of time that a discovered Label Distribution Protocol (LDP) neighbor is remembered without receipt of an LDP hello message from the neighbor
<b>interval</b>	Specifies the period of time between the sending of consecutive hello messages.
<i>seconds</i>	Hold time in seconds. The range is from 1 to 65535.

## Defaults

Default value for holdtime is 90 seconds.

Default value for interval is 10 seconds.

## Command Modes

LDP configuration mode

## SupportedUserRoles

network-admin  
vdc-admin

## Command History

Release	Modification
5.2(1)	This command was introduced.

## Usage Guidelines

This command requires the MPLS Services license.

## Examples

This example shows how to configure the LDP discovery targeted hello holdtime:

```
switch(config)# mpls ldp configuration
switch(config-ldp)# discovery targeted-hello holdtime 1
switch(config-ldp)#

```

**discovery targeted-hello**

This example shows how to configure the LDP discovery targeted hello interval:

```
switch(config)# mpls ldp configuration
switch(config-ldp)# discovery targeted-hello interval 1
switch(config-ldp)#{/pre>
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

## E Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with E.

echo revision

# echo revision

To specify the revision number of the echo packet's default values, use the **echo revision** command.

**echo revision{3 | 4}**

<b>Syntax Description</b>	<b>3</b> Specifies the draft-ietf-mpls-ping-03 (Revision 2). <b>4</b> Specifies RFC 4379 compliant (default).
---------------------------	--

<b>Defaults</b>	4
-----------------	---

<b>Command Modes</b>	config-mpls mode
----------------------	------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires an MPLS license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the revision number of the echo packet's default values:
-----------------	--

```
switch# configure terminal
switch (config)# mpls oam
switch(config)# echo revision 3
switch(config)#

```

<b>Related Commandss</b>	<b>Command</b>	<b>Description</b>
	<b>mpls oam</b>	Enters MPLS OAM configuration mode and customizes the default behavior of echo packets.

# echo vendor-extension

To send the Cisco-specific type, length, value (TLV) extension, use the **echo vendor-extension** command.

## **echo vendor-extension**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** config-mpls mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command requires an MPLS license.

**Examples** This example shows how to send the Cisco-specific type, length, value (TLV) extensions with echo packets:

```
switch# configure terminal
switch (config)# mpls oam
switch(config)# echo revision 3
switch(config)# echo vendor-extension
switch(config)#
```

Related Commands	Command	Description
	<b>echo revision</b>	Specifies the revision number of the echo packet's default values.
	<b>mpls oam</b>	Enters MPLS OAM configuration mode and customizes the default behavior of echo packets.

**encapsulation dot1q**

# encapsulation dot1q

To configure the matching criteria for mapping dot1q frames on an ingress interface to this interface, use the **encapsulation dot1q** command.

**encapsulation dot1q *vlan-id***

<b>Syntax Description</b>	<i>vlan-id</i>	VLAN ID. The range is from 2 to 967.
---------------------------	----------------	--------------------------------------

<b>Defaults</b>	Deencapsulated
-----------------	----------------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	The subinterfaces between the customer-edge (CE) and provide edge (PE) routers that are running Ethernet over MPLS (EoMPLS) must be in the same subnet. All other subinterfaces and backbone devices do not need to be in the same subnet.
-------------------------	--

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to configure the matching criteria for mapping dot1q frames on an ingress interface to this interface:
-----------------	---

```
switch# configure terminal
switch(config)# interface ethernet 4/0/0.1
switch(config-if)# encapsulation dot1q 100
switch(config-if)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>internetworking</b>	Specifies the type of pseudowire and the type of traffic that can flow across the network
	<b>l2vpn xconnect context</b>	Enters Xconnect configuration mode and establishes a Layer 2 VPN (L2VPN) context for identifying the two members in a VPWS, multi segment pseudowire, or local connect service.

# encapsulation mpls

To specify the Multiprotocol Label Switching (MPLS) encapsulation for a pseudowire port profile, use the **encapsulation mpls** command.

## encapsulation mpls

**Syntax Description** This command does not have any arguments or keywords.

**Defaults** None

**Command Modes** config-if- prof configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to specify the MPLS encapsulation for a pseudowire port profile:

```
switch# configure terminal
switch(config)# port-profile type pseudowire AToM
switch(config-if-prof)# encapsulation mpls
switch(config-pseudowire-mpls)#
```

Related Commands	Command	Description
	<b>interface pseudowire</b>	Enters interface pseudowire configuration mode and configures a static pseudowire logical interface.
	<b>port-profile type pseudowire</b>	Enters interface port-profile configuration mode and configures a pseudowire port profile.
	<b>state enabled</b>	Enables the interface port profile.

---

 exclude-address

# exclude-address

To specify an IP address while configuring a traffic engineering (TE) explicit-path that TE should avoid using while calculating the label switched path (LSP), use the **exclude-address** command.

**exclude-address** *ip-address*

<b>Syntax Description</b>	<i>ip-address</i>	Link address or a node address (a node's TE router-ID).
---------------------------	-------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Explicit-path configuration mode
----------------------	----------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	Both primary and backup tunnel paths can be dynamic or explicit and they do not have to use the <b>exclude-address</b> . Because backup tunnels must avoid the protected link or node, you should use the <b>exclude-address</b> command.
-------------------------	---

When using the **exclude-address** command to specify the path for a backup tunnel, you must exclude an interface IP address to avoid a link (for creating a next-hop [NHOP] backup tunnel), or a router ID address to avoid a node (for creating an next-next-hop [NNHOP] backup tunnel).

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to specify an address to exclude while configuring an explicit-path:
-----------------	---

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# explicit-path name avoid-protected-link
switch(config-te-expl-path)# exclude-address 3.3.3.3
1: exclude-address 3.3.3.3
switch(config-te-expl-path) #
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# exp

To configure the EXP bits that are forwarded over the member tunnel, use the **exp** command.

```
exp [list-of-exp-values] [default]
```

<b>Syntax Description</b>	<p><i>list -of-exp-values</i> EXP bits allowed for the interface. Enter up to eight EXP values separated by spaces. Values range from 0 to 7. The default is the EXP values that were not configured or a specific member tunnel.</p>
<b>default</b>	(Optional) Specifies the default tunnel number.

<b>Defaults</b>	The member tunnel will forward the packets with the EXP bits that are not being forwarded by other member tunnels that are part of the same bundle.
-----------------	---

<b>Command Modes</b>	cbts-member configuration mode
----------------------	--------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	You cannot configure the following traffic engineering (TE) commands on a class-based tunnel selection (CBTS) member tunnels ( <b>auto-bw</b> ; <b>autoroute</b> ; <b>backup-bw</b> ; <b>description</b> ; <b>destination</b> ; <b>fowarding adjacency</b> ; <b>inherit</b> ; <b>source</b> ).
-------------------------	--

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to configure the EXP bits that are forwarded over the member tunnel:
<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# cbts-member tunnel-te 251 switch(config-cbts-member)# exp 5</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

■ explicit-null

# explicit-null

To configure an advertised explicit null label in place of an implicit null label, use the **explicit-null** command. To return to the default setting, use the **no** form of this command.

**explicit-null [for prefix-list | to prefix-list | for prefix-list to prefix-list]**

**no explicit-null [for prefix-list | to prefix-list | for prefix-list to prefix-list]**

<b>Syntax Description</b>	<b>for</b> (Optional) Specifies the prefix list that specifies the controls on destination prefixes. <b>prefix-list</b> (Optional) Prefix list. <b>to</b> (Optional) Specifies the access list that specifies the controls on Label Distribution Protocol (LDP) peers.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure an explicit null label on an egress Label Switching Router (LSR), which causes that LSR to advertise the explicit null label to all adjacent MPLS routers:
-----------------	--

```
switch(config-ldp) # explicit-null
switch(config-ldp) #
```

This example shows how to configure an explicit null label and specify the **for** keyword with a prefix list:

```
switch(config-ldp) # explicit-null for prefix-list
switch(config-ldp) #
```

This example shows how to configure an explicit null label and specify the **to** keyword with a prefix list:

```
switch(config-ldp) # explicit-null to prefix-list
switch(config-ldp) #
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**explicit-path**

# explicit-path

To configure an IP explicit path to be used by tunnel-te label switched path (LSPs), or a path dynamically calculated from the TE topology database, use the **explicit-path** command. To restore the system to its default condition, use the **no** form of this command.

**explicit-path {name path-name | identifier number}**

**no explicit-path {name path-name | identifier number}**

**Syntax Description**

<b>name</b>	Specifies the explicit path by name.
<i>path-name</i>	Path name. The maximum size is 63 alphanumeric characters.
<b>identifier</b>	Specifies the explicit path by number.
<i>number</i>	Identifier number. The range is from 1 to 65535.

**Defaults**

None

**Command Modes**

TE configuration mode

**SupportedUserRoles**

network-admin  
vdc-admin

**Command History**

<b>Release</b>	<b>Modification</b>
5.2(1)	This command was introduced.

**Usage Guidelines**

This command requires the MPLS Services license.

**Examples**

This example shows how to configure the tunnel to use a named IP explicit path or a path dynamically calculated from the TE topology database:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# explicit-path name avoid-protected-link
switch(config-te-expl-path) #
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

## F Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with F.

---

 fast-reroute (TE interface configuration mode)

# fast-reroute (TE interface configuration mode)

To enable an Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel to request a backup tunnel to protect against a link or node failure, use the **fast-reroute** command. To restore the system to its default condition, use the **no** form of this command.

**fast-reroute [bw-protect] [node-protect]**

**no fast-reroute**

<b>Syntax Description</b>	<b>bw-protect</b> (Optional) Sets the bandwidth protection desired bit so that backup bandwidth protection is requested at each hop that the label switched path (LSP) traverses. <b>node-protect</b> (Optional) Sets the node protection desired bit so that node protection is requested at each hop the LSP traverses.
---------------------------	--

---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

---

<b>Examples</b>	This example shows how to specify bandwidth protection:
-----------------	---

```
switch# configure terminal
switch(config)# interface tunnel-te 1000
switch(config-if-te)# fast-reroute bw-protect
switch(config-if-te)#

```

This example shows how to specify node protection:

```
switch# configure terminal
switch(config)# interface tunnel-te 1000
switch(config-if-te)# fast-reroute node-protect
switch(config-if-te)#

```

---

Related Commands

Command	Description
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

---

---

 fast-reroute backup-prot-preempt optimize-bw

# fast-reroute backup-prot-preempt optimize-bw

To change the backup protection preemption algorithm from minimizing the number of label switched paths (LSPs) that are demoted to minimizing the amount of bandwidth that is wasted, use the **fast-reroute backup-prot-preempt** command.

**fast-reroute backup-prot-preempt optimize-bw**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** A minimum number of LSPs are preempted

---

**Command Modes** MPLS traffic engineering global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to change the backup protection preemption algorithm from minimizing the number of LSPs that are demoted to minimizing the amount of bandwidth that is wasted:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# fast backup-prot-preempt optimize-bw
switch(config-te)#

```

---

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering protocol (MPLS-TE).

---

# fast-reroute timers promotion

To specify how often the router considers switched a label switching path (LSP) to a new (better) backup tunnel if additional backup bandwidth becomes available, use the **fast-reroute timers promotion** command. To restore the system to its default condition, use the **no** form of this command.

**fast-reroute timers promotion sec**

**no fast-reroute timers promotion**

<b>Syntax Description</b>	<i>sec</i>	(Optional) Sets the interval, in seconds, between scans to determine if an LSP should use a new, better backup tunnel. Valid values are from 0 to 604800. A value of 0 disables promotions to a better LSP.
---------------------------	------------	---

**Defaults** The timer is running and is set to a frequency of every 300 seconds (5 minutes)

**Command Modes** TE configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure how often to scan for LSP backup promotion:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# fast-reroute timer promotion 10
switch(config-te)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering protocol (MPLS-TE).

**feature bfd**

# feature bfd

To enable Bidirectional Forwarding Detection (BFD) on the router Multiprotocol Label Switching (MPLS) traffic engineering (TE) link and node protection, use the **feature bfd** command. To disable the system to its default condition, use the **no** form of this command.

**feature bfd**

**no feature bfd**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to enable BFD on the device:

```
switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# feature bfd
Please disable the ICMP redirects on all interfaces
running BFD sessions using the command below

'no ip redirects '
switch(config)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# feature bgp

To enable the Border Gateway Protocol (BGP) feature, use the **feature bgp** command. To return to the default setting, use the **no** form of this command.

**feature bgp**

**no feature bgp**

---

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

---

<b>Defaults</b>	None
-----------------	------

---

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

---

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

---

<b>Examples</b>	This example shows how to enable BGP:
	<pre>switch# configure terminal switch(config)# feature bgp switch(config)# </pre>

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**feature evc**

# feature evc

To enable Ethernet virtual circuits (EVCs) on a Cisco NX-OS device, use the **feature evc** command. To disable EVC, use the **no** form of this command.

**feature evc**

**no feature evc**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** Global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	6.2.2	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to enable EVC on the Cisco NX-OS device:

```
switch# configure terminal
switch(config)# feature evc
```

This example shows how to disable EVC on the Cisco NX-OS device:

```
switch(config)# no feature evc
switch(config)#
```

---

**Related Commands**

---

Command	Description
<b>show feature</b>	Displays the status of features on a device.

# feature isis

To enable the Intermediate System-to-Intermediate System (IS-IS) feature, use the **feature isis** command. To return to the default setting, use the **no** form of this command.

**feature isis**

**no feature isis**

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

<b>Defaults</b>	Enable
-----------------	--------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable the IS-IS feature:
	<pre>switch(config-ldp)# configure terminal switch(config)# feature isis switch(config)#</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 feature mpls l3vpn

# feature mpls l3vpn

To enable the Multiprotocol Label Switching (MPLS) Layer 3 virtual private networks, use the **feature mpls l3vpn** command. To return to the default setting, use the **no** form of this command.

**feature mpls l3vpn**

**no feature mpls l3vpn**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** Per VDC

---

**Command Modes** Global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to enable the MPLS Layer 3 virtual private networks:

```
switch# configure terminal
switch(config)# install feature-set mpls
switch(config)# feature-set mpls
switch(config)# feature mpls l3vpn
```

---

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# feature mpls ldp

To enable the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) feature on the device, use the **feature mpls ldp** command. To return to the default setting, use the **no** form of this command.

**feature mpls ldp**

**no feature mpls ldp**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Per VDC

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** When you disable MPLS LDP on the device, no LDP commands are available.  
This command requires the MPLS Services license.

**Examples** This example shows how to enable IP over MPLS:

```
switch(config)# install feature-set mpls
switch(config)# feature-set mpls
switch(config)# feature mpls ldp
LAN_ENTERPRISE_SERVICES_PKG license not installed. ldp feature will be shut down
after grace period of approximately 115 day(s).
switch(config)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

feature mpls traffic-engineering

# feature mpls traffic-engineering

To enable Multiprotocol Label Switching (MPLS) traffic engineering (TE) on the device, use the **feature mpls traffic-engineering** command. To return to the default setting, use the **no** form of this command.

**feature mpls traffic-engineering**

**no feature mpls traffic-engineering**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** Per VDC

---

**Command Modes** Global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** Unless you enable MPLS TE on the device, no TE commands are available.

The user has to enter **feature** command to enable TE.

This command requires the MPLS Services license.

---

**Examples** This example shows how to enable MPLS TE:

```
switch(config)# install feature-set mpls
switch(config)# feature-set mpls
switch(config)# feature mpls traffic-engineering
switch(config)#
```

---

Related Commands	Command	Description
	<b>interface tunnel-te</b>	Configures the traffic-engineering (TE) interface.

# feature mvpn

To enable the Multiprotocol Label Switching (MPLS) multicast virtual private network (MVPN) feature on the device, use the **feature mvpn** command. To return to the default setting, use the **no** form of this command.

**feature mvpn**

**no feature mvpn**

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

<b>Defaults</b>	Enabled
-----------------	---------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>Supported User Roles</b>	network-admin vdc-admin

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable MVPN feature on the device:
-----------------	--

```
switch(config)# feature mvpn  
switch(config)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**feature ospf**

# feature ospf

To enable the Open Shortest Path First (OSPF) feature, use the **feature ospf** command. To disable this feature, use the **no** form of this command.

**feature ospf**

**no feature ospf**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Enable

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to enable information about the OSPF configuration:

```
switch(config)# feature ospf
switch(config)#
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# feature-set mpls

To enable the feature set Multiprotocol Label Switching (MPLS) information, use the **feature-set mpls** command. To disable this feature, use the **no** form of this command.

**feature-set mpls**

**no feature-set mpls**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Per VDC

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to enable the MPLS feature set information:

```
switch(config)# feature-set mpls
switch(config)#
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**forwarding-adjacency**

# forwarding-adjacency

To advertise a traffic engineering (TE) tunnel as a link in an Interior Gateway Protocol (IGP) network, use the **forwarding-adjacency** command. To return to the default setting, use the **no** form of this command.

**forwarding-adjacency [holdtime value]**

**no forwarding-adjacency**

<b>Syntax Description</b>	<b>holdtime</b> (Optional) Specifies the time, in milliseconds, that a TE tunnel waits after going down before informing the network. <b>value</b> (Optional) Hold time. The range is from 0 to 4294967295.
---------------------------	--

<b>Defaults</b>	Default value is 0
-----------------	--------------------

<b>Command Modes</b>	TE tunnel configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to advertise the TE tunnel as a link in an IGP network:
	<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# forwarding-adjacency holdtime 1 switch(config-if-te)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# from

To map the value from one number to another, use the **from** command.

**from** *number* **to** *number*

<b>Syntax Description</b>	<i>number</i>	Map number. The range is from 0 to 63.
<b>Defaults</b>	None	
<b>Command Modes</b>	Table map configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to map the value from one number to another (you can repeat this command up to 64 times):  <pre>switch# configure terminal switch(config)# table-map tablemap1 switch(config-tmap)# from 1 to 1 switch(config-tmap)# from 2 to 1 switch(config-tmap)# from 3 to 2 switch(config-tmap)# from 4 to 2 switch(config-tmap)# exit</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

■ from

## G Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with G.

**graceful-restart**

# graceful-restart

To configure the graceful restart timer, use the **graceful-restart** command. To return to the default setting, use the **no** form of this command.

```
graceful-restart [timers {forwarding-holding seconds | max-recovery seconds | neighbor-liveness seconds}]
```

```
no graceful-restart [timers {forwarding-holding seconds | max-recovery seconds | neighbor-liveness seconds}]
```

<b>Syntax Description</b>	<b>timers</b> (Optional) Specifies VPN routing. <b>forwarding-holding seconds</b> Specifies the forwarding state holding time. The range is from 30 to 600 seconds. <b>max-recovery seconds</b> Specifies the maximum recovery time. The range is from 15 to 600 seconds. <b>neighbor-liveness seconds</b> Specifies the neighbor lifetime. The range is from 5 to 300 seconds.
---------------------------	--

<b>Defaults</b>	Enable
-----------------	--------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	You must configure the MPLS VPN and VRFs before creating VRF-aware static labels. This command requires the MPLS Services license.
-------------------------	---

<b>Examples</b>	This example shows how to configure the graceful restart timer:
-----------------	---

```
switch(config-ldp)# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# graceful-restart timers forwarding-holding 30
switch(config-ldp)#

```

---

Related Commands

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

■ graceful-restart

## H Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with H.

**holdtime**

# holdtime

To configure how long a Label Distribution Protocol (LDP) session is maintained in the absence of LDP messages from the session peer, use the **holdtime** command. To return to the default setting, use the **no** form of this command.

**holdtime {seconds | infinite}**

**no holdtime**

**Syntax Description**

<b>seconds</b>	Hold time in seconds. The range is from 15 to 65535 seconds.
<b>infinite</b>	Specifies the LDP session holdtime.

**Defaults**

180 seconds

**Command Modes**

LDP configuration mode

**SupportedUserRoles**

network-admin  
vdc-admin

**Command History**

<b>Release</b>	<b>Modification</b>
5.2(1)	This command was introduced.

**Usage Guidelines**

This command requires the MPLS Services license.

**Examples**

This example shows how long an LDP session is maintained in the absence of LDP messages from the session peer:

```
switch(config)# mpls ldp configuration
switch(config-ldp)# holdtime 30
switch(config-ldp) #
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

## I Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with I.

**import**

# import

To import route-map based virtual routing and forwarding (VRF) and virtual router context, use the **import** command.

```
import {map [map-name | redist-bgp] | vrf default [maximum-prefix | map]}
```

**Syntax Description**

<b>map</b>	Specifies route-map based VRF import.
<i>map-name</i>	Name of the map. A map name can be a case-sensitive, alphanumeric character string with a maximum length of 63 characters.
<b>redist-bgp</b>	Specifies a known route-map name.
<b>vrf</b>	Specifies the virtual router context.
<b>default</b>	Specifies the default VRF name.
<i>maximum-prefix</i>	Maximum prefix. The range is from 1 to 2147483647.

**Defaults**

1000

**Command Modes**

Address family configuration

**SupportedUserRoles**network-admin  
vdc-admin**Command History**

<b>Release</b>	<b>Modification</b>
5.2(1)	This command was introduced.

**Usage Guidelines**

This command does not require the MPLS Services license.

**Examples**

This example shows how to import virtual router context:

```
switch# configure terminal
switch(config)# feature mpls l3vpn
switch(config)# vrf context vpn1
switch(config-vrf)# rd 1.2:1
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-af-ipv4)# route-target import 1:101
switch(config-vrf-af-ipv4)# maximum routes 3000
switch(config-vrf-af-ipv4)# import vrf default map redist-bgp
```

This example shows how to remove the virtual router context:  
 switch(config-vrf-af-ipv4)# no import vrf default map redist-bgp

---

Related Commands

Command	Description
<b>maximum routes</b>	Configure the maximum number of routes to be allowed in the routing table.
<b>route-target</b>	Create a route-target extended community for a VRF instance.

---

# index

To insert or modify a traffic engineering (TE) explicit path entry at a specific index, use the **index** command. To restore the system to its default condition, use the **no** form of this command.

**index index command**

**no index index command**

<b>Syntax Description</b>	<b>index</b> Index number. The range is from 1 to 65535. <b>command</b> Command that can be the <b>exclude-address</b> keyword or the <b>next-address</b> keyword.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	TE explicit path configuration mode
----------------------	-------------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to insert or modify a path entry at a specific index:
-----------------	--

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# explicit-path name link5
switch(config-te-explicit-path)# index 10 next-address 10.0.0.1
Explicit Path name link5:
    10: next-address 10.0.0.1
switch(config-te-explicit-path)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

# inherit port-profile

To apply an existing pseudowire port profile to an interface, use the **inherit port-profile** command.

**inherit port-profile** *profile-name*

<b>Syntax Description</b>	<i>profile-name</i>	Profile name. The string can be any alphanumeric string up to 63 characters.
---------------------------	---------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-if-pseudowire configuration mode
----------------------	---

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	An interface can inherit only an active pseudowire port profile. To enable a pseudowire port profile, use the <b>state enabled</b> command.
-------------------------	---

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to apply an existing port profile to an interface:
-----------------	---

```
switch# configure terminal
switch(config)# port-profile type pseudowire AToM
switch(config-if-prof)# encapsulation mpls
switch(config-pseudowire-mpls)# interface pseudowire 100
switch(config-if-prof)# inherit port-profile AToM
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface pseudowire</b>	Enters interface pseudowire configuration mode and configures a static pseudowire logical interface.
	<b>port-profile type pseudowire</b>	Enters interface port-profile configuration mode and configures a pseudowire port profile.
	<b>state enabled</b>	Enables the interface port profile.

# internetworking

To specify the type of pseudowire and the type of traffic that can flow across the network, use the **internetworking** command.

**internetworking {ethernet | vlan}**

<b>Syntax Description</b>	<b>ethernet</b> Specifies the Ethenet type. <b>vlan</b> Specified the VLAN type.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-xconnect configuration mode
----------------------	------------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command is required only if you are configuring a connection between two disparate attachment circuits.
-------------------------	--

- The internetworking type on a provider edge (PE) device must match the internetworking type on its peer PE device.
- The **ethernet** keyword causes Ethernet frames to be extracted from the attachment circuit and sent over the pseudowire. Ethernet end-to-end transmission is assumed. Attachment circuit frames that are not Ethernet are dropped.
- The **vlan** keyword allows the VLAN ID to be included as part of the Ethernet frame.

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to specify the type of pseudowire and the type of traffic that can flow across the network:
-----------------	--

```
switch# configure terminal
switch(config)# interface ethernet 4/0/0.1
switch(config-if)# encapsulation dot1q 100
switch(config-if)# 12vpn xconnect context Test1
switch(config-xconnect)# internetworking ethernet
switch(config-xconnect)#

```

Related Commands	Command	Description
	<b>l2vpn xconnect context</b>	Enters Xconnect configuration mode and establishes a Layer 2 VPN (L2VPN) context for identifying the two members in a VPWS, multi segment pseudowire, or local connect service.
	<b>member pseudowire</b>	Adds an active pseudowire to the XConnect context.

**interface ethernet**

# interface ethernet

To configure an Ethernet interface on which you are enabling the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP), use the **interface ethernet** command. To return to the default setting, use the **no** form of this command.

**interface ethernet** *slot/chassis number*

**no interface ethernet** *slot/chassis number*

<b>Syntax Description</b>	<i>slot/chassis number</i>	Slot or chassis number. The range is from 1 to 253.
---------------------------	----------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	When you disable the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) on the device, no LDP commands are available.
-------------------------	---

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to configure the Ethernet interface on which you are enabling MPLS LDP:
-----------------	--

```
switch(config)# interface ethernet 2/2
switch(config-if)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# interface pseudowire

To enter interface pseudowire configuration mode and configure a static pseudowire logical interface, use the **interface pseudowire** command. To delete the pseudowire interface and the associated configuration, use the **no** form of this command.

**interface pseudowire *pw-id***

**no interface pseudowire *pw-id***

<b>Syntax Description</b>	<i>pw-id</i>	Pseudowire ID. The range is from 1 to 200000. The range for a static pseudowire is from 1 to 8192.
---------------------------	--------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-if-pseudowire configuration mode
----------------------	---

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enter interface pseudowire configuration mode and configure a static pseudowire logical interface:
-----------------	--

```
switch# configure terminal
switch(config)# port-profile type pseudowire AToM
switch(config-if-prof)# encapsulation mpls
switch(config-pseudowire-mpls)# interface pseudowire 100
switch(config-if-prof)#

```

This example shows how to delete the pseudowire interface and the associated configuration:

```
switch(config-if-prof)# no interface pseudowire 100
switch(config-if-prof)#

```

**interface pseudowire**

Related Commands	Command	Description
	<b>port-profile type pseudowire</b>	Enters interface port-profile configuration mode and configures a pseudowire port profile.
	<b>port-profile type pseudowire</b>	Enters interface port-profile configuration mode and configures a pseudowire port profile.
	<b>state enabled</b>	Enables the interface port profile.

# interface tunnel-te

To configure a traffic engineering (TE) interface, use the **interface tunnel-te** command. To restore the system to its default condition, use the **no** form of this command.

**interface tunnel-te *number***

**no interface tunnel-te *number***

<b>Syntax Description</b>	<i>number</i>	Traffic engineering interface number. The range is from 0 to 65503.
<b>Defaults</b>	None	
<b>Command Modes</b>	Interface configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure a TE interface: <pre>switch# configure terminal switch(config)# interface tunnel-te 65 switch(config-if-te)#</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>None</b>	There are no related commands.

---

 ■ install feature-set mpls

# install feature-set mpls

To install feature set Multiprotocol Label Switching (MPLS), use the **install feature-set mpls** command. To restore the system to its default condition, use the **no** form of this command.

**install feature-set mpls**

**no install feature-set mpls**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** Only in default VDC

---

**Command Modes** Global Configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to install feature set MPLS:

```
switch# configure terminal
switch(config)# install feature-set mpls
feature set is installed already(0x40aa0011)
switch(config)#+
```

---

Related Commands	Command	Description
	<b>feature-set mpls</b>	Enables the feature set Multiprotocol Label Switching (MPLS).

# ip prefix-list

To create a prefix list for Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) label filtering, outbound filtering, or inbound filtering, use the **ip prefix-list** command. To return to the default setting, use the **no** form of this command.

```
ip prefix-list prefix-list {description description | seq number [deny network/length [eq eq-length | ge ge-length | le le-length] | permit network/length [eq eq-length | ge ge-length] | deny network/length [eq eq-length | ge ge-length | le le-length]]}
```

```
no ip prefix-list prefix-list {description description | seq number [deny network/length [eq eq-length | ge ge-length | le le-length] | permit network/length [eq eq-length | ge ge-length] | deny network/length [eq eq-length | ge ge-length | le le-length]]}}
```

## Syntax Description

<b>prefix-list</b>	Name of the prefix list. The prefix list can be up to 63 characters.
<b>description</b>	Specifies the description of the IP prefix list.
<i>description</i>	IP prefix list description. The maximum size is alphanumeric 90 characters.
<b>seq</b>	Specifies sequence number of an entry.
<i>number</i>	Sequence number. The range is from 1 to 4294967294.
<b>deny</b>	(Optional) Denies access for a matching condition.
<i>network/length</i>	Network address and the length of the network mask in bits. The network number can be any valid IP address or prefix. The bit mask can be a number from 0 to 32.
<b>eq</b>	(Optional) Specifies the equal to operator.
<i>eq-length</i>	Prefix length to be matched.
<b>ge</b>	(Optional) Specifies the greater than or equal to operator.
<i>ge-length</i>	Specifies the minimum prefix length to be matched.
<b>le</b>	(Optional) Specifies the less than or equal to operator.
<i>le-length</i>	Maximum prefix length to be matched.
<b>permit</b>	Specifies the permit access for a matching condition.

## Defaults

None

## Command Modes

Global configuration mode

## SupportedUserRoles

network-admin  
vdc-admin

## Command History

Release	Modification
5.2(1)	This command was introduced.

**ip prefix-list**

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to create an IP prefix list and specifies the prefixes permitted by the prefix list:

```
switch# configure terminal
switch(config)# ip prefix-list p1 permit 10.0.0.2/32 ge 10
switch(config)#
switch# configure terminal
switch(config)# ip prefix-list p1 permit 10.0.0.0/32
switch(config)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# ip rsvp

To configure information about the Resource Reservation Protocol (RSVP) information, use the **ip rsvp** command. To restore the system to its default condition, use the **no** form of this command.

**ip rsvp**

**no ip rsvp**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure RSVP information:

```
switch# configure terminal
switch(config)# ip rsvp
switch(config-ip-rsvp) #
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 ip rsvp authentication challenge

# ip rsvp authentication challenge

To configure the Resource Reservation Protocol (RSVP) to use a challenge handshake on an interface, use the **ip rsvp authentication challenge** command. To disable the authentication on an interface, use the **no** form of this command.

**ip rsvp authentication challenge**

**no ip rsvp authentication challenge**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

# ip rsvp authentication key-chain

To activate the Resource Reservation Protocol (RSVP) cryptographic authentication on an interface, use the **ip rsvp authentication key-chain** command. To disable the authentication on an interface, use the **no** form of this command.

**ip rsvp authentication key-chain *key-chain-name***

**no ip rsvp authentication key-chain *key-chain-name***

<b>Syntax Description</b>	<i>key-chain-name</i> Key chain name.				
<b>Syntax Description</b>	This command has no arguments or keywords.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Interface configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to activate RSVP cryptographic authentication on an interface:</p> <pre>switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# ip rsvp authentication key-chain key1 switch(config-if)#</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>mpls ldp configuration</b></td><td>Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).
<b>Command</b>	<b>Description</b>				
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).				

---

 ■ ip rsvp authentication lifetime

# ip rsvp authentication lifetime

To control how long the Resource Reservation Protocol (RSVP) maintains security associations on an interface, use the **ip rsvp authentication lifetime** command. To return to the default settings, use the **no** form of this command.

**ip rsvp authentication lifetime *hh:mm:ss***

**no ip rsvp authentication lifetime *hh:mm:ss***

---

<b>Syntax Description</b>	<i>hh:mm:ss</i>	Lifetime value in seconds. The range is from 30 to 86400 seconds.
---------------------------	-----------------	---

---

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

<b>Defaults</b>	30 minutes
-----------------	------------

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to control how long RSVP maintains security associations on an interface:
	<pre>switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# ip rsvp authentication key-chain key1 switch(config-if)#</pre>

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

# ip rsvp authentication type

To configure the algorithm used to generate cryptographic signature messages on an interface, use the **ip rsvp authentication type** command. To return to the default settings, use the **no** form of this command.

**ip rsvp authentication type {md5 | sha-1}**

**no ip rsvp authentication type {md5 | sha-1}**

<b>Syntax Description</b>	md5      Specifies the Rivest, Shamir, and Adleman (RSA) Message Digest 5 hash algorithm. sha-1      Specifies the National Institute of Standards and Technology (NIST) Secure Hash Algorithm 1.
---------------------------	--

**Syntax Description** This command has no arguments or keywords.

**Defaults** md5

**Command Modes** Interface configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure the algorithm used to generate cryptographic signatures messages on an interface:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# ip rsvp authentication type md5
switch(config-if)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 ■ ip rsvp authentication window-size

# ip rsvp authentication window-size

To configure the tolerance for an out-of-sequence message on an interface, use the **ip rsvp authentication window-size** command. To return to the default settings, use the **no** form of this command.

**ip rsvp authentication window-size** *value*

**no ip rsvp authentication window-size** *value*

<b>Syntax Description</b>	<i>value</i>	Maximum number of messages allowed in receive window. The range is from 1 to 64.
<b>Syntax Description</b>	This command has no arguments or keywords.	
<b>Defaults</b>	1	
<b>Command Modes</b>	Interface configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to specify the tolerance for an out-of-sequence message on an interface:	
	<pre>switch# configure terminal switch(config)# interface ethernet 2/1 switch(config-if)# ip rsvp authentication window-size 3 switch(config-if)# </pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# ip rsvp signalling dscp

To set a Differentiated Services Code Point (DSCP) for Resource Reservation Protocol (RSVP) signalling messages, use the **ip rsvp signalling dscp** command. To revert to the default settings, use the **no** form of this command.

**ip rsvp signalling dscp *value***

**no ip rsvp signalling dscp *value***

<b>Syntax Description</b>	<i>value</i>	DSCP value. The range is from 0 to 63.
<b>Defaults</b>	48.	
<b>Command Modes</b>	Interface configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to set the DSCP for RSVP signalling messages:	
	<pre>switch# configure terminal switch(config)# interface ethernet 6/1 switch(config-if)# ip rsvp signalling dscp 1 switch(config-if)#</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 ip rsvp signalling hello dscp

# ip rsvp signalling hello dscp

To set the differentiated services code point (DSCP) value that is in the IP header of the hello message, use the **ip rsvp signalling hello dscp** command. To revert to the default settings, use the **no** form of this command.

**ip rsvp signalling hello dscp *value***

**no ip rsvp signalling hello dscp *value***

<b>Syntax Description</b>	<b>value</b>	Differentiated Services Code Point (DSCP) value. The range is from 0 to 63.
---------------------------	--------------	---

<b>Defaults</b>	48.
-----------------	-----

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to set the DSCP value that is in the IP header of the hello message:
	<pre>switch# configure terminal switch(config)# interface ethernet 2/2 switch(config-if)# ip rsvp signalling hello dscp 1 switch(config-if)#</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# ip rsvp signalling hello reroute

To configure IP Resource reservation Protocol (RSVP) signalling hello reroute commands, use the **ip rsvp signalling hello reroute** command. To revert to the default settings, use the **no** form of this command.

**ip rsvp signalling hello reroute [override-graceful]**

**no ip rsvp signalling hello reroute [override-graceful]**

<b>Syntax Description</b>	<b>override-graceful</b>	Specifies to ignore the existence of the GR node neighbor for the Hello State Timer (HST) behavior.
<b>Defaults</b>	None	
<b>Command Modes</b>	Interface configuration mode	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	<p>This example shows how to configure IP RSVP signalling hello RSVP reroute commands:</p> <pre>switch# configure terminal switch(config)# interface ethernet 2/2 switch(config-if)# ip rsvp signalling hello reroute override-graceful switch(config-if)#</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

ip rsvp signalling hello reroute state-timeout refresh misses

# ip rsvp signalling hello reroute state-timeout refresh misses

To configure the number of consecutive missed hello message before a neighbor is declared down or unreachable for Hello State Timer (HST) functionality, use the **ip rsvp signalling hello reroute state-timeout refresh misses** command. To return to the default behavior, use the **no** form of this command.

**ip rsvp signalling hello reroute state-timeout refresh misses *value***

**no ip rsvp signalling hello reroute state-timeout refresh misses *value***

<b>Syntax Description</b>	<i>value</i>	Maximum number of messages allowed in the receive window. The range is from 1 to 64.
---------------------------	--------------	--

<b>Defaults</b>	4
-----------------	---

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the number of consecutive missed hello message before a neighbor is declared down or unreachable for HST functionality:
-----------------	---

```
switch# configure terminal
switch(config)# interface ethernet 2/2
switch(config-if)# ip rsvp signalling hello reroute state-timeout refresh misses 12
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# ip rsvp signalling hello reroute state-timeout refresh interval

To configure the interval in which Resource Reservation Protocol (RSVP) hello messages are sent to support the HST functionality, use the **ip rsvp signalling hello reroute state-timeout refresh interval** command. To return to the default settings, use the **no** form of this command.

**ip rsvp signalling hello reroute state-timeout refresh interval *time***

**no ip rsvp signalling hello reroute state-timeout refresh misses *time***

<b>Syntax Description</b>	<i>value</i>	Maximum number of messages allowed in the receive window. The range is from 1 to 64.
---------------------------	--------------	--

<b>Defaults</b>	2 seconds for HST. 200 milli seconds for fast-reroute.
-----------------	---

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	The same form of the command with the <b>fast-reroute</b> keyword may be used to configure the number of missed consecutive hello messages before a neighbor is declared down for fast reroute functionality in a future phase.
-------------------------	---

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to configure the interval in which RSVP hello message are sent to support the HST functionality:
-----------------	---

```
switch# configure terminal
switch(config)# interface ethernet 2/2
switch(config-if)# ip rsvp signalling hello reroute state-timeout refresh interval 12
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 ■ ip unnumbered loopback

# ip unnumbered loopback

To enable IP processing on an interface without assigning an explicit IP address to the interface, use the **ip unnumbered loopback** command. To restore the system to its default condition, use the **no** form of this command.

**ip unnumbered loopback *number***

**no ip unnumbered loopback *number***

<b>Syntax Description</b>	<i>number</i>	Virtual interface number. The range is from 0 to 1023.
---------------------------	---------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command is not effective until you configure the specified loopback with an IP address. This command does not require an MPLS Services license.
-------------------------	---

<b>Examples</b>	This example shows how to configure an interface as an unnumbered loopback:
	<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# ip unnumbered loopback 0 switch(config-if-te)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>tunnel-te interface</b>	Configures the traffic engineering (TE) interface.

# isis metric

To configure the Intermediate System-to-Intermediate System (IS-IS) metric for a tunnel interface to be used as a forwarding adjacency, use the **isis metric** command.

**isis metric metric-value {level-1 | level-2}**

<b>Syntax Description</b>	<table border="0"> <tr> <td><i>metric-value</i></td><td>Default metric. The range is from 0 to 16777215.</td></tr> <tr> <td><b>level-1</b></td><td>Specifies the metric to level 1 links.</td></tr> <tr> <td><b>level-2</b></td><td>Specifies the metric to level 2 links.</td></tr> </table>	<i>metric-value</i>	Default metric. The range is from 0 to 16777215.	<b>level-1</b>	Specifies the metric to level 1 links.	<b>level-2</b>	Specifies the metric to level 2 links.
<i>metric-value</i>	Default metric. The range is from 0 to 16777215.						
<b>level-1</b>	Specifies the metric to level 1 links.						
<b>level-2</b>	Specifies the metric to level 2 links.						

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	Specify the <b>isis metric</b> command with level-1 or level-2 to be consistent with the IGP level at which you are performing traffic engineering; otherwise, the metric default value is 10.
-------------------------	--

Use this command only if the IGP is IS-IS. If the IGP is OSPF, use the equivalent OSPF command.

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to configure the IS-IS metric for a tunnel interface to be used as a forwarding adjacency:
	<pre>switch# configure terminal switch(config)# interface tunnel-te 1 switch(config-if-te)# forwarding-adjacency switch(config-if-te)# isis metric 2 level-1 switch(config-if-te)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configure the traffic engineering interface.

## K Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with K.

**key**

To configure an authentication key on a keychain, use the **key** command. To return to the default setting, use the **no** form of this command.

**key** *key-id*

**no key** *key-id*

<b>Syntax Description</b>	<i>key-id</i> Key ID. The range is from 0 to 65535.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Keychain key configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to configure an authentication key on a keychain:</p> <pre>switch# configure terminal switch(config)# key chain keychain1 switch(config-keychain)# key 10 switch(config-keychain-key) #</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>mpls ldp configuration</b></td><td>Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).
<b>Command</b>	<b>Description</b>				
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).				

# key chain

To configure a group of authentication keys, use the **key chain** command. To return to the default setting, use the **no** form of this command.

**key chain** *keychain-name*

**no key chain** *keychain-name*

<b>Syntax Description</b>	<i>keychain-name</i> Key chain name. The maximum size is alphanumeric 32 characters.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Keychain configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to configure a group of authentication keys:</p> <pre>switch# configure terminal switch(config)# key chain keychain1 switch(config-keychain)# key 10 switch(config-keychain-key) #</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>mpls ldp configuration</b></td><td>Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).
<b>Command</b>	<b>Description</b>				
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).				

**key-string**

# key-string

To configure an authentication string for a key, use the **key-string** command. To return to the default setting, use the **no** form of this command.

**key-string** *key*

**no key-string** *key*

<b>Syntax Description</b>	<i>key</i>	Authentication string for a key. The key can be from 1 to 80 uppercase or lowercase alphanumeric characters. The first character cannot be a numeral.
---------------------------	------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Keychain key configuration mode
----------------------	---------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure an authentication string for a key:
<pre>switch# configure terminal switch(config)# key chain keychain1 switch(config-keychain)# key 10 switch(config-keychain-key)# key-string pwd1</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

## L Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with L.

## l2vpn vfi context

To establish a Layer 2 VPN (L2VPN) virtual forwarding interface (VFI) between two or more separate networks, use the **l2vpn vfi context** command. To delete the VFI and the associated configuration, use the **no** form of this command.

**l2vpn vfi context** *context-name*

**no l2vpn vfi context** *context-name*

<b>Syntax Description</b>	<i>context-name</i> VFI context name. The range is from 0 to 65535.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Global configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>6.2.2</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	6.2.2	This command was introduced.
Release	Modification				
6.2.2	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to establish an L2VPN VFI between two or more separate networks:</p> <pre>switch# configure terminal switch(config)# l2vpn vfi context vpls80 switch(config-l2vpn-vfi)#</pre> <p>This example shows how to delete the VFI and the associated configuration:</p> <pre>switch(config-l2vpn-vfi)# no l2vpn vfi context vpls80</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>member pseudowire</b></td><td>Binds a static pseudowire to this VFI.</td></tr> </tbody> </table>	Command	Description	<b>member pseudowire</b>	Binds a static pseudowire to this VFI.
Command	Description				
<b>member pseudowire</b>	Binds a static pseudowire to this VFI.				

# l2vpn xconnect context

To enter the Xconnect configuration mode and establish a Layer 2 VPN (L2VPN) context for identifying the two members in a Virtual Private Wire Service (VPWS), multi segment pseudowire, or local connect service, use the **l2vpn xconnect context** command. To delete the Xconnect context and the associated configuration, use the **no** form of this command.

**l2vpn xconnect context** *context-name*

**no l2vpn xconnect context** *context-name*

<b>Syntax Description</b>	<i>context-name</i>	Xconnect context name. The maximum range is 100 alphanumeric, case-sensitive characters.
<b>Defaults</b>	None	
<b>Command Modes</b>	Global configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.
<b>Usage Guidelines</b>	The context name argument is a unique per-interface identifier for this context. This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to enter Xconnect configuration mode and establish an L2VPN context for identifying the two members in a VPWS, multi segment pseudowire, or local connect service:  <pre>switch# configure terminal switch(config)# l2vpn xconnect context XCON1 switch(config-xconnect)# </pre> This example shows how to delete the Xconnect configuration:  <pre>switch(config-xconnect)# no l2vpn xconnect context XCON1 switch(config-xconnect)# </pre>	

**■ l2vpn xconnect context**

Related Commands	Command	Description
	<b>member pseudowire</b>	Adds an active pseudowire to the XConnect context.
	<b>remote link failure notification</b>	Enables AToM MPLS remote link failure notification and shutdown.

# label allocate global

To configure local label allocation filters for the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP), use the **label allocate global** command. To return to the default setting, use the **no** form of this command.

**label allocate global {all-routes | host-routers | prefix-list *prefix-list*}**

**no label allocate global {all-routes | host-routers | prefix-list *prefix-list*}**

<b>Syntax Description</b>	<b>all-routes</b> Specifies the allocation local labels for all routes. <b>host-routes</b> Specifies the allocation local labels for host routes only. <b>prefix-list</b> Specifies the prefix list for local label filtering. <i>prefix-list</i> IP prefix list.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure local label allocation filters for MPLS LDP:
	<pre>switch# configure terminal switch(config)# mpls ldp configuration switch(config-ldp)# label allocate global prefix-list p1 switch(config-ldp)#</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**link-management timers**

# link-management timers

To configure the link management hold timers, use the **link-management timers** command. To return to the default setting, use the **no** form of this command.

**link-management timers {bandwidth-hold sec | periodic-flooding sec}**

**no link-management timers**

<b>Syntax Description</b>	<b>bandwidth-hold</b>	Specifies the length of time that bandwidth is held for an RSVP path (setup) message while you wait for the corresponding RSVP Resv message to come back.
	<i>sec</i>	Seconds. The range is from 1 to 300 seconds.
	<b>period-flooding</b>	Specifies the link state information changes that do not trigger immediate action. For example, a change to the amount of allocated bandwidth that does not cross a threshold.
	<i>sec</i>	Seconds. The range is from 0 to 3600 seconds. A value of 0 turns off periodic flooding. If you set this value from 1 to 29, it is treated as 30.

**Defaults**

Bandwidth hold is 15 seconds

Periodic flooding is 60 seconds

**Command Modes**

TE configuration mode

**SupportedUserRoles**

network-admin  
vdc-admin

**Command History**

<b>Release</b>	<b>Modification</b>
5.2(1)	This command was introduced.

**Usage Guidelines**

This command requires the MPLS Services license.

**Examples**

This example shows how to configure the link management bandwidth hold timer:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# link management timers bandwidth-hold 200
switch(config-te)#

```

**Related Commands**

Command	Description
<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

**list (LSP attribute configuration mode)**

To display the contents of the label switched path (LSP) attribute list, use the **list** command.

**list**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** LSP attribute configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to display the content of the LSP attribute list:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# lsp attributes 1
switch(config-lsp-attr)# list
```

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

# list (TE explicit-path configuration mode)

To display the contents of the explicit-path entries, use the **list** command.

**list**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** TE explicit-path configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to display the content of the LSP attribute list:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# explicit-path name test
switch(config-lsp-attr)# list
```

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

**load-interval**

# load-interval

To configure the interval over which the input and output rates for the interface are averaged, use the **load-interval** command. To restore the system to its default condition, use the **no** form of this command.

**load-interval *seconds***

**no load-interval**

<b>Syntax Description</b>	<i>seconds</i>	Length of time for which data is used to compute load statistics. The value is a multiple of 30, from 120 to 300 (120, 150, 180, and so on).
---------------------------	----------------	--

<b>Defaults</b>	300
-----------------	-----

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	For a <b>tunnel-te</b> interface, the bandwidth command configures the initial tunnel bandwidth, which then can be adjusted by the auto bandwidth mechanism based on interface traffic statistics. The load-interval command specifies how often the interface traffic statistics are calculated.
-------------------------	---

<b>Examples</b>	This example shows how to configure the interval over which the input and output rates for the interface are averaged:
-----------------	--

```
switch# configure terminal
switch(config)# interface tunnel-te 1
switch(config-if-te)# load-interval 180
switch(config-if-te)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# lockdown

To disable reoptimization of the label switched path (LSP), use the **lockdown** command. To restore the system to its default condition, use the **no** form of this command.

**lockdown**

**no lockdown**

---

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

---

<b>Command Modes</b>	LSP attribute configuration mode
----------------------	----------------------------------

---

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

---

<b>Examples</b>	This example shows how to disable reoptimization of the LSP:
<pre>switch# configure terminal switch(config)# mpls traffic-eng configuration switch(config-te)# lsp attributes 1 switch(config-lsp-attr)# lockdown</pre>	

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

**logging lsp**

# logging lsp

To log label switched path (LSP) traps, use the **logging lsp** command. To return to the default setting, use the **no** form of this command.

**logging lsp {path-errors | preemption | reservation-errors | setups | teardowns} [prefix-list]**

**no logging lsp {path-errors | preemption | reservation-errors | setups | teardowns}**

<b>Syntax Description</b>	<b>path-errors</b> Specifies to log LSP path error traps. <b>preemption</b> Specifies to log LSP preemption traps. <b>reservation-errors</b> Specifies to log LSP reservation error traps. <b>setups</b> Specifies to log LSP establishment traps. <b>teardowns</b> Specifies to log LSP teardown traps. <i>prefix-list</i> (Optional) Prefix list.
---------------------------	--

<b>Command Modes</b>	TE configuration mode
----------------------	-----------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to log LSP path error traps:
	<pre>switch# configure terminal switch(config)# mpls traffic-eng configuration switch(config-te)# logging lsp path-errors prefix-list1 switch(config-te)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

# logging neighbor-changes

To log Label Distribution Protocol (LDP) neighbor state changes, use the **logging neighbor-changes** command. To return to the default setting, use the **no** form of this command.

**logging neighbor-changes**

**no logging neighbor-changes**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** LDP configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to log Label Distribution Protocol (LDP) neighbor state changes:

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# logging neighbor-changes
switch(config-ldp)#
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 logging password configuration

# logging password configuration

To enable the display of events related to password configuration changes, use the **logging password configuration** command. To return to the default setting, use the **no** form of this command.

**logging password configuration [rate-limit *number*]**

**no logging password configuration [rate-limit *number*]**

<b>Syntax Description</b>	<b>rate-limit</b> (Optional) Specifies rate limit logging. <b>number</b> (Optional) Messages per minute. The range is from 1 to 60 messages per minute.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable the display of events related to password changes:
-----------------	---

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# logging password configuration rate-limit 20
switch(config-ldp)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# logging password rollover

To enable password rollover events, use the **logging password rollover** command. To return to the default setting, use the **no** form of this command.

**logging password rollover [rate-limit *number*]**

**no logging password rollover [rate-limit *number*]**

<b>Syntax Description</b>	<b>rate-limit</b> (Optional) Specifies the rate limit logging. <b>number</b> (Optional) Messages per minute. The range is from 1 to 60 messages per minute.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable password rollover events:
	<pre>switch# configure terminal switch(config)# mpls ldp configuration switch(config-ldp)# logging password rollover rate-limit 10 switch(config-ldp)#</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**logging tunnel**

# logging tunnel

To configure the tunnel specific traps logging, use the **logging tunnel** command. To return to the default setting, use the **no** form of this command.

**logging tunnel {lsp-selection | path change} [prefix-list]**

**no logging tunnel {lsp-selection | path change}**

<b>Syntax Description</b>	<b>lsp-selection</b> Specifies the log tunnel LSP selection traps. <b>path change</b> Specifies the log tunnel LSP path change traps. <i>prefix-list</i> (Optional) Prefix list.
---------------------------	--

<b>Command Modes</b>	TE configuration mode
----------------------	-----------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the log tunnel LSP selection traps.
<pre>switch# configure terminal switch(config)# mpls traffic-eng configuration switch(config-te)# logging tunnel lsp-selection prefix-list1 switch(config-te)#</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

# lsp attribute

To configure an label switched path (LSP) attribute list, use the **lsp attribute** command.

**lsp attribute** *string*

<b>Syntax Description</b>	<i>string</i>	LSP attribute list that can be any case-sensitive, alphanumeric string up to 63 characters.
---------------------------	---------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	TE configuration mode
----------------------	-----------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure an LSP attribute list:
	<pre>switch# configure terminal switch(config)# mpls traffic-eng configuration switch(config-te)# lsp attribute 1 switch(config-lsp-attr)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

**Isp attribute**

## M Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with M.

**match**

# match

To configure a classification criteria, use the **match** command. To return to the default setting, use the **no** form of this command.

**match [not] mpls experimental topmost *exp-list***

**no match [not] mpls experimental topmost *exp-list***

<b>Syntax Description</b>	
<b>not</b>	(Optional) Negates this match result.
<b>mpls</b>	Specifies a match on the MPLS label.
<b>experimental</b>	Specifies a match on the MPLS experimental label.
<b>topmost</b>	Specifies a match on the MPLS topmost label.
<b><i>exp-list</i></b>	List that can contain values and ranges. The range is from 0 to 7.

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Class-map configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify that the packets should be matched (or not) on the 3-bit experimental (EXP) field in the outermost (topmost) MPLS label in the MPLS header:
-----------------	---

```
switch# configure terminal
switch(config)# class-map type qos match-all class-2
switch(config-cmap-qos)# match mpls experimental topmost 1
switch(config-cmap-qos)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# maximum routes

To configure the maximum number of routes that can be stored in the virtual routing and forwarding (VRF) route table, use the **maximum routes** command. To return to the default setting, use the **no** form of this command.

**maximum routes** *max-routes* [*threshold-value*] [**reinstall** *threshold-value*] | **warning-only**

**no maximum routes** *max-routes* [*threshold-value*] [**reinstall** *threshold-value*] | **warning-only**

Syntax Description	
<i>max-routes</i>	Maximum number of routes. The range is from 1 to 4294967295.
<i>threshold-value</i>	Threshold value at which to generate a warning message. The range is from 1 to 100.
<b>reinstall</b>	Reinstalls the previously rejected route that exceeded the maximum route limit.
<b>warning-only</b>	Generates a warning message if the maximum route limit is exceeded.

Defaults	None
----------	------

Command Modes	Address-family configuration mode
---------------	-----------------------------------

SupportedUserRoles	network-admin vdc-admin
--------------------	----------------------------

Command History	Release	Modification
	5.2(1)	This command was introduced.

Usage Guidelines	None.
------------------	-------

Examples	This example shows how to configure the maximum number of routes that can be stored in the VRF route table:
----------	---

```
switch# configure t
switch(config)# vrf context vpn1
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-af-ipv4)# maximum routes 10000
switch(config-vrf-af-ipv4)#

```

This example shows how to reinstall the previously rejected route that exceeded the maximum route limit:

```
switch# configure t
switch(config)# vrf context vpn1
```

**maximum routes**

```
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-af-ipv4)# maximum routes 10000 2 reinstall 2
switch(config-vrf-af-ipv4)#{/pre}
```

**Related Commands**

Command	Description
<b>address-family</b>	Configures the address family.

# mdt asm-use-shared-tree

To specify that a shared-tree [(\*,G)] entry should be created for a default multicast distribution tree (MDT) when the default MDT group is in PIM ASM mode, use the **mdt asm-use-shared-tree** command.

## **mdt asm-use-shared-tree**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Default MDT group is in PIM ASM mode.

**Command Modes** VRF configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure the shared-tree [(\*,G)] entry should be created for the default MDT when the default MDT group is in PIM ASM mode:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# vrf context vrf1
switch(config-vrf)# mdt asm-use-shared-tree
switch(config-vrf)#
```

Related Commands	Command	Description
	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.

# mdt data

To configure a range of group addresses that are used for data multicast distribution trees (MDTs), use the **mdt data** command.

**mdt data mdt -group-prefix [threshold threshold-value] [route-map policy-name]**

<b>Syntax Description</b>	
<i>mdt-group-prefix</i>	List of group range prefixes.
<b>threshold</b>	(Optional) Specifies the threshold in kilobits per second. The range is from 0 to 4294967.
<i>threshold-value</i>	Threshold in bytes per second when the stream is switched to the data MDT.
<b>route-map</b>	Specifies the route map for creating data MDTs. The map can be a case-sensitive alphanumeric string up to 63 characters.
<i>policy-name</i>	Policy file that defines which customer data streams should be considered for switching to the data MDT.

**Defaults** The default value for the threshold parameter is 100 kbps

**Command Modes** Configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure the the range of group address used for data MDTs:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# vrf context vrf1
switch(config-vrf)# mdt data 232.7.7.0/24 threshold 10 route-map rmap2mdt data
239.192.20.32 0.0.0.15 threshold 1
switch(config-vrf)#
switch#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.

# mdt data bidir-enable

To configure the range of group address used for data multicast distribution trees (MDTs), use the **mdt data bidir-enable** command.

**mdt data bidir-enable**

**no mdt data bidir-enable**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** Configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command allows the user to override the default behavior that is, create data MDTs for bidir routes as well.

This command requires the MPLS Services license.

---

**Examples** This example shows how to configure the the range of group addresses used for data MDTs:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# vrf context vrf1
switch(config-vrf)# mdt data bidir-enable
switch(config-vrf)#

```

---

Related Commands	Command	Description
	<b>show mvpn mdt route</b>	Displays the details of the default and the MDT route.

---

**mdt default**

## mdt default

To configure the default multicast distribution tree (MDT) for a virtual routing and forwarding (VRF), use the **mdt default** command. To return to the default settings, use the **no** form of the command.

**mdt default** *group-address*

**no mdt default** *group-address*

<b>Syntax Description</b>	<i>address</i>	IP multicast group address.
---------------------------	----------------	-----------------------------

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Configuration mode
----------------------	--------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the default MDT for a VRF:
-----------------	--

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# vrf context vrf1
switch(config-vrf)# mdt default 232.0.0.1
switch(config-vrf)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.

# mdt enforce-bgp-mdt-safi

To enforce the use of multicast distribution tree (MDT) subsequent address family identifiers (SAFI) for a virtual routing and forwarding instance (VRF), use the **mdt enforce-bgp-mdt-safi** command. To interoperate with peers that do not support MDT SAFI, use the **no** form of the command. When the **no** form is used, initially only the (\*,G) entry for the default MDT group is populated if it falls within the Any Source Multicast (ASM) range. Then later, based on traffic, the (S,G) entries are learned like regular ASM routes.

**mdt enforce-bgp-mdt-safi**

**no mdt enforce-bgp-mdt-safi**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Enabled

**Command Modes** VRF configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure MDT to interoperate with peers that do not support MDT SAFI:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# vrf context vrf1
switch(config-vrf)# no mdt enforce-bgp-mdt-safi
switch(config-vrf)#
```

Related Commands	Command	Description
	<b>show mvpn bgp mdt-safi</b>	Displays detailed information of the BGP advertisement for MVPN MDT SAFI.

**mdt mtu**

# mdt mtu

To configure the maximum transmission unit (MTU) associated with the multicast tunnel interfaces created for the default and data multicast distribution tree (MDT) groups, use the **mdt mtu** command.

**mdt mtu *mtu-size***

**no mdt mtu *mtu-size***

<b>Syntax Description</b>	<i>mtu-size</i>	MTU value. The range is from 576 to 65535.
---------------------------	-----------------	--

<b>Defaults</b>	1376
-----------------	------

<b>Command Modes</b>	Configuration mode
----------------------	--------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the maximum transmission unit (MTU) associated with the multicast tunnel interfaces created for the default and data MDT groups:
-----------------	--

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# vrf context vrf1
switch(config-vrf)# mdt mtu 600
switch(config-vrf)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.

# mdt pim hello-interval

To configure the hello interval used between peers, use the **mdt pim hello-interval** command.

**mdt ip pim hello-interval *interval***

**no mdt ip pim hello-interval *interval***

<b>Syntax Description</b>	<i>interval</i> Interval in milliseconds. The range is from 3000 to 18724286.				
<b>Defaults</b>	30000 milliseconds				
<b>Command Modes</b>	Configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to configure the hello interval used between peers:</p> <pre>switch# config t Enter configuration commands, one per line. End with CNTL/Z. switch(config)# vrf context vrf1 switch(config-vrf)# mdt pim hello-interval 30000 switch(config-vrf)#</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>show mvpn mdt route</b></td><td>Displays the detail of the default and the MDT route.</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.
<b>Command</b>	<b>Description</b>				
<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.				

---

 mdt pim jp-interval

## mdt pim jp-interval

To configure the PIM periodic interval associated with join or prune packet transmission over the default multicast distribution tree (MDT) tunnel interface, use the **mdt pim jp-interval** command. To return to the default settings, use the **no** form of the command.

**mdt pim jp-interval *interval***

**no mdt pim jp-interval *interval***

<b>Syntax Description</b>	<i>interval</i> Interval in seconds. The range is from 60000 to 18724286.				
<b>Defaults</b>	60000 milliseconds				
<b>Command Modes</b>	Configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	This example shows how to configure the PIM periodic interval associated join packet transmission over the default MDT tunnel interface:				
	<pre>switch# config t Enter configuration commands, one per line. End with CNTL/Z. switch(config)# vrf context vrf1 switch(config-vrf)# mdt pim jp-interval 60000 switch(config-vrf)#</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>show mvpn mdt route</b></td><td>Displays the detail of the default and the MDT route.</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.
<b>Command</b>	<b>Description</b>				
<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.				

# mdt source

To configure the interface that is used to set the multicast virtual private network (VPN) data multicast distribution tree (MDT) source address, use the **mdt source** command.

**mdt source *interface***

**no mdt source *interface***

<b>Syntax Description</b>	<i>interface</i>	Interface used to set the multicast VPN data multicast distribution tree (MDT) source address.
<b>Defaults</b>	None	
<b>Command Modes</b>	Configuration mode	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure the interface that is used to set the multicast VPN data multicast distribution tree (MDT) source address:	
	<pre>switch# config t Enter configuration commands, one per line. End with CNTL/Z. switch(config)# vrf context vrf1 switch(config-vrf)# mdt source interface switch(config-vrf)#</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show mvpn mdt route</b>	Displays the detail of the default and the MDT route.

**member**

# member

To add an active Ethernet AC, with or without an Ethernet Flow Point (EFP), to the context, use the **member** command. To delete the member configuration, use the **no** form of this command.

```
member interface-type {ip-address ip-address | ethernet slot/port-number | port-channel port-channel-number | pseudowire pw-id} [service-instance service-instance-id] [group group-name] [priority number]
```

```
no member interface-type {ip-address ip-address | ethernet slot/port-number | port-channel port-channel-number | pseudowire pw-id} [service-instance service-instance-id] [group group-name] [priority number]
```

## Syntax Description

<i>interface-type</i>	Interface type.
<b>ip-address</b> <i>ip-address</i>	Specifies the IPv4 or IPv6 address of the peer.
<b>ethernet</b> <i>slot/port-number</i>	Specifies the Ethernet IEEE 802.3z interface. The range for the slot is from 1 to 253.
<b>port-channel</b> <i>port-channel-number</i>	Specifies the port channel interface. The range for the port channel is from 1 to 4096.
<b>pseudowire</b> <i>pw-id</i>	Specifies the pseudowire interface. The pw-ID is a unique per-interface identifier for this pseudowire. The range is from 1 to 200000. The range for a static pseudowire is from 1 to 8192.
<b>service-instance</b>	(Optional) Specifies the service instance.
<i>service-instance-id</i>	Service instance ID. The <i>service-instance-id</i> is a unique per-interface identifier for the EFP. The valid range is from 1 to 4000.
<b>group</b>	(Optional) Specifies the group to which the member belongs.
<i>group-name</i>	Group name. The <i>group-name</i> can be a maximum of 31 alphanumeric characters.
<b>priority</b>	(Optional) Specifies the priority.
<i>number</i>	Priority number. The range is from 1 to 10, with 1 being the highest priority. The default is 0 and is higher than 1.

## Defaults

None

## Command Modes

config-xconnect configuration mode

## SupportedUserRoles

network-admin  
vdc-admin

## Command History

	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

**Usage Guidelines**

This command requires the MPLS Services license.

**Examples**

This example shows how to add an active Ethernet AC, with or without an EFP, to the context:

```
switch# configure terminal
switch(config)# interface ethernet 4/0/0.1
switch(config-if)# encapsulation dot1q 100
switch(config-if)# l2vpn xconnect context Test1
switch(config-xconnect)# internetworking ethernet
switch(config-xconnect)# member ethernet 4/0/0.1 service-instance 100
switch(config-xconnect)#

```

This example shows how to delete the member configuration:

```
switch(config-xconnect)# no member ethernet 4/0/0.1 service-instance 100
switch(config-xconnect)#

```

**Related Commands**

Command	Description
<b>internetworking</b>	Specifies the type of pseudowire and the type of traffic that can flow across the network
<b>l2vpn xconnect context</b>	Enters Xconnect configuration mode and establishes a Layer 2 VPN (L2VPN) context for identifying the two members in a VPWS, multi-segment pseudowire, or local connect service.

---

 member encapsulation mpls

# member encapsulation mpls

To specify the devices that form a point-to-point Layer 2 VPN (L2VPN) Virtual Forwarding Interface (VFI) connection, use the **member encapsulation mpls** command.

**member** *ip-address* **encapsulation mpls**

<b>Syntax Description</b>	<i>ip-address</i> IPv4 or IPv6 address.								
<b>Defaults</b>	None								
<b>Command Modes</b>	config-l2vpn-vfi mode								
<b>SupportedUserRoles</b>	network-admin vdc-admin								
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>6.2.2</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	6.2.2	This command was introduced.				
Release	Modification								
6.2.2	This command was introduced.								
<b>Usage Guidelines</b>	This command requires the MPLS Services license.								
<b>Examples</b>	<p>This example shows how to specify the devices that form a point-to-point L2VPN VFI connection:</p> <pre>sswitch# configure terminal switch(config)# l2vpn vfi context vpls80 switch(config-l2vpn-vfi)# description VFIforDualHome switch(config-l2vpn-vfi)# vpn 10 switch(config-l2vpn-vfi)# redundancy primary switch(config-l2vpn-vfi)# member 10.0.0.3 encapsulation mpls switch(config-l2vpn-vfi)# </pre>								
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>bridge domain</b></td><td>Enters bridge-domain configuration mode and configures a bridge domain.</td></tr> <tr> <td><b>l2vpn vfi context</b></td><td>Establishes a Layer 2 VPN (L2VPN) Virtual Forwarding Interface (VFI) between two or more separate networks.</td></tr> <tr> <td><b>vpn</b></td><td>Configures a Virtual Private Network (VPN) ID on a VFI context.</td></tr> </tbody> </table>	Command	Description	<b>bridge domain</b>	Enters bridge-domain configuration mode and configures a bridge domain.	<b>l2vpn vfi context</b>	Establishes a Layer 2 VPN (L2VPN) Virtual Forwarding Interface (VFI) between two or more separate networks.	<b>vpn</b>	Configures a Virtual Private Network (VPN) ID on a VFI context.
Command	Description								
<b>bridge domain</b>	Enters bridge-domain configuration mode and configures a bridge domain.								
<b>l2vpn vfi context</b>	Establishes a Layer 2 VPN (L2VPN) Virtual Forwarding Interface (VFI) between two or more separate networks.								
<b>vpn</b>	Configures a Virtual Private Network (VPN) ID on a VFI context.								

# member pseudowire

To add an active pseudowire to the XConnect context, use the **member pseudowire** command. To remove the active pseudowire configuration, use the **no** form of this command.

**member pseudowire pw-id [group group-name] [priority number]**

**no member pseudowire pw-id [group group-name] [priority number]**

Syntax Description	<p><b>pw-id</b> Pseudowire ID. The range is from 1 to 200000. The range for a static pseudowire is from 1 to 8192.</p> <p><b>group</b> (Optional) Specifies the group to which the member belongs.</p> <p><b>group-name</b> Group name. The <i>group-name</i> can be a maximum of 31 alphanumeric characters.</p> <p><b>priority</b> (Optional) Specifies the priority.</p> <p><b>number</b> Priority number. The range is from 1 to 10, with 1 being the highest priority. The default is 0 and is higher than 1.</p>
--------------------	--

Defaults	None
----------	------

Command Modes	config-xconnect mode
---------------	----------------------

SupportedUserRoles	network-admin vdc-admin
--------------------	----------------------------

Command History	Release	Modification
	6.2.2	This command was introduced.

Usage Guidelines	This command requires the MPLS Services license.
------------------	--

Examples	This example shows how to add an active pseudowire to the XConnect context:
----------	---

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# encapsulation mpls
switch(config-if)# no shutdown
switch(config-if)# 12vpn xconnect context redundancytest
switch(config-xconnect)# member ethernet 2/1 service-instance 1 group access-side
switch(config-xconnect)# member pseudowire 2 group access-side priority 1
```

This example shows how to remove the active pseudowire configuration:

```
switch(config-xconnect)# no member pseudowire 2 group access-side priority 1
```

**member pseudowire**

```
switch(config-xconnect) #
```

Related Commands	Command	Description
	<b>l2vpn xconnect context</b>	Enters Xconnect configuration mode and establishes a Layer 2 VPN (L2VPN) XConnect context for identifying the two members in a VPWS, multi segment pseudowire, or local connect service.

# member vfi

To bind a virtual forwarding interface (VFI) to a bridge domain, use the **member vfi** command.

**member vfi vfi-id**

<b>Syntax Description</b>	vfi-id	VFI ID. The VFI ID can be any alphanumeric, case-sensitive up to 100 characters.
<b>Defaults</b>	None	
<b>Command Modes</b>	config-bdomain mode	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to bind a VFI to this bridge domain:	
	<pre>switch# configure terminal switch(config)# bridge-domain 100 switch(config-bdomain)# member vfi vpls80 switch(config-bdomain)# </pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>bridge domain</b>	Enters bridge-domain configuration mode and configures a bridge domain.
	<b>l2vpn vfi context</b>	Establishes a Layer 2 VPN (L2VPN) Virtual Forwarding Interface (VFI) between two or more separate networks.
	<b>vpn</b>	Configures a Virtual Private Network (VPN) ID on a VFI context.

# mpls ip

To enable IP over Multiprotocol Label Switching (MPLS), use the **mpls ip** command.

**mpls ip**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Interface configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to enable IP over MPLS:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# interface ethernet 2/2
switch(config-if)# mpls ip
switch(config-if)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# mpls ip (TE configuration mode)

To enable the LDP over an MPLS TE tunnel, use the **mpls ip** command.

**mpls ip**

**Syntax Description** This command has no arguments and keywords.

**Defaults** None

**Command Modes** TE configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure the IP TTI propagation over MPLS:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# interface tunnel-te
switch(config-te)# mpls ip
switch(config-te)#
switch#
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 mpls ip default-route

# mpls ip default-route

To allow Multiprotocol Label Switching (MPLS) forwarding for the IP default route, use the **mpls ip default-route** command. To revert to the default settings, use the **no** form of the command.

**mpls ip default-route**

**no mpls ip default-route**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** LDP configuration interface mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to allow MPLS forwarding for the IP default route:

```
switch# config t
switch(config)# mpls ldp configuration
switch(config-ldp)# mpls ip default-route
switch(config-ldp) #
```

---

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

# mpls label range

To configure the Multiprotocol Label Switching (MPLS) label range for a static label assignment, use the **mpls label range** command. To return to the default setting, use the **no** form of this command.

**mpls label range min-value max-value [static min-static-value max-static-value]**

**no mpls label range min-value max-value [static min-static-value max-static-value]**

Syntax Description	
<i>min-value</i>	Minimum label value. The range is from 16 to 471804.
<i>max-value</i>	Maximum label value. The range is from 16 to 471804.
<b>static</b>	(Optional) Specifies the block of labels for static bindings.
<i>min-static-value</i>	Minimum static label value. The range is from 16 to 471804.
<i>max-static-value</i>	Maximum static label value. The range is from 16 to 471804.

Defaults	None
----------	------

Command Modes	Global configuration mode
---------------	---------------------------

SupportedUserRoles	network-admin vdc-admin
--------------------	----------------------------

Command History	Release	Modification
	5.2(5) and higher including 6.1(1)	Changed the maximum label value from 492286 to 471804.
	5.2(1)	This command was introduced.

Usage Guidelines	This command requires the MPLS Services license.
------------------	--

Examples	This example shows how to reserve a range of labels for static label assignment:
	<pre>switch# configure terminal switch(config)# mpls label range 200 100000 static 16 199 switch(config)# </pre>

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 mpls ldp autoconfig

# mpls ldp autoconfig

To enable Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) autoconfiguration for all level-1, all level-2, or all level-1 and level-2 IS-IS interfaces, use the **mpls ldp autoconfig** command. To return to the default setting, use the **no** form of this command.

**mpls ldp autoconfig {level-1 | level-1-2 | level-2}**

**no mpls ldp autoconfig {level-1 | level-1-2 | level-2}**

<b>Syntax Description</b>	<b>level-1</b> Specifies the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) autoconfiguration (AC) on IS-IS level-1 only. <b>level-1-2</b> Specifies the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) autoconfiguration (AC) on IS-IS level-1 and level-2. <b>level-2</b> Specifies the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) autoconfiguration (AC) on IS-IS level-2 only.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Router configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable MPLS LDP autoconfiguration for all level-1, all level-2, or all level-1 and level-2 IS-IS interfaces:
-----------------	--

```
switch# configure terminal
switch(config)# router isis p1
switch(config-router)# mpls ldp autoconfig level-1
switch(config-router)#

```

---

Related Commands

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

---

 mpls ldp autoconfig area

# mpls ldp autoconfig area

To enable Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) autoconfiguration for all Open Shortest Path First (OSPF) interfaces, use the **mpls ldp autoconfig area** command. To return to the default setting, use the **no** form of this command.

**mpls ldp autoconfig area *area-id***

**no mpls ldp autoconfig area *area-id***

<b>Syntax Description</b>	<i>area-id</i> Area ID as an integer or IP address. The range is from 0 to 4294967295.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Router configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable MPLS LDP autoconfiguration for all OSPF interfaces:
	<pre>switch# configure terminal switch(config)# p1 switch(config-router)# mpls ldp autoconfig area 10 switch(config-router)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# mpls ldp configuration

To configure the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP), use the **mpls ldp configuration** command.

## **mpls ldp configuration**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Enabled

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** When MPLS LDP is disabled on the device, no LDP commands are available.  
This command requires the MPLS Services license.

**Examples** This example shows how to configure MPLS LDP:

```
switch(config)# mpls ldp configuration
switch(config-ldp)#

```

Related Commands	Command	Description
	<b>mpls ldp sync</b>	Enables Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) synchronization for all IS-IS interfaces.

---

 mpls ldp discovery transport-address

# mpls ldp discovery transport-address

To configure the transport address that is advertised in the Label Distribution Protocol (LDP) discovery hello messages sent on an interface, use the **mpls ldp discovery transport-address** command. To return to the default setting, use the **no** form of this command.

**mpls ldp discovery transport-address {ip-address | interface}**

**no mpls ldp discovery transport-address {ip-address | interface}**

<b>Syntax Description</b>	<table border="0"> <tr> <td><b>ip-address</b></td><td>IP address that is advertised as the transport address.</td></tr> <tr> <td><b>interface</b></td><td>Specifies that the interface IP address be advertised as the transport address.</td></tr> </table>	<b>ip-address</b>	IP address that is advertised as the transport address.	<b>interface</b>	Specifies that the interface IP address be advertised as the transport address.
<b>ip-address</b>	IP address that is advertised as the transport address.				
<b>interface</b>	Specifies that the interface IP address be advertised as the transport address.				

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the transport address that is advertised in the LDP discovery hello messages sent on an interface:
-----------------	--

```
switch(config)# interface ethernet 6/1
switch(config-if)# mpls ldp discovery transport-address 209.165.200.225
switch(config-if)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# **mpls ldp graceful-restart**

To enable the switch to protect the Label Distribution Protocol (LDP) bindings and Multiprotocol Label Switching (MPLS) forwarding state during a disruption in service, use the **mpls ldp graceful-restart** command.

## **mpls ldp graceful-restart**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** config-ldp mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command does not require a license.

**Examples** This example shows how to enable the switch to protect the LDP bindings and MPLS forwarding state during a disruption in service:

```
switch# configure terminal
switch (config)# mpls ldp configuration
switch(config-ldp)# mpls ldp graceful-restart
switch(config-ldp)#

```

Related Commands	Command	Description
	<b>show mpls ldp graceful-restart</b>	Displays the graceful-restart parameters for a router's sessions with its LDP neighbors.

---

 mpls ldp igp autoconfig

# mpls ldp igp autoconfig

To enable the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) for the specified interface, use the **mpls ldp igp autoconfig** command. To return to the default setting, use the **no** form of this command.

**mpls ldp igp autoconfig**

**no mpls ldp igp autoconfig**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** Interface configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to enable MPLS LDP for the specified interface:

```
switch# configure terminal
switch(config)# interface ethernet 7/1
switch(config-if)# mpls ldp igp autoconfig
switch(config-if)#
```

---

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

# **mpls ldp igp sync**

To configure a delay time for Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) synchronization on the specified interface, use the **mpls ldp igp sync** command. To return to the default setting, use the **no** form of this command.

**mpls ldp igp sync [delay seconds]**

**no mpls ldp igp sync [delay seconds]**

<b>Syntax Description</b>	<b>delay</b> (Optional) Specifies LDP to IGP sync achieved notification delay time. <b>seconds</b> (Optional) Display in seconds. The range is from 5 to 60 seconds.
---------------------------	---

**Defaults** None

**Command Modes** Interface configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** The **no mpls ldp igr sync delay** command sets the delay time to 0 seconds but leaves the MPLS LDP and IGP synchronization enabled.

This command requires the MPLS Services license.

**Examples** This example shows how to configure a delay time for the MPLS LDP and IGP synchronization on the specified interface:

```
switch# configure terminal  
switch(config)# feature mpls ldp  
switch(config)# interface ethernet 6/1  
switch(config-if)# mpls ldp igp sync delay 30
```

Related Commands	Command	Description
	<b>mpls ldp sync</b>	Enables Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) synchronization for all IS-IS interfaces.

**mpls ldp sync**

## **mpls ldp sync**

To enable Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) and Interior Gateway Protocol (IGP) synchronization for all Open Shortest Path First (OSPF) interfaces, use the **mpls ldp sync** command. To return to the default setting, use the **no** form of this command.

**mpls ldp sync**

**no mpls ldp sync**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Router configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to enable MPLS LDP and IGP synchronization for all OSPF interfaces:

```
switch# configure terminal
switch(config)# p1
switch(config-router)# mpls ldp sync
```

Related Commands	Command	Description
	<b>mpls ldp igr sync</b>	Allows Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) Synchronization on this interface.

# mpls oam

To configure MPLS Operations and Management (OAM) for customizing the default behavior of echo packets, use the **mpls oam** command. To return to the default setting, use the **no** form of this command.

**mpls oam**

**no mpls oam**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Global configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure MPLS OAM:

```
switch# configure terminal
switch(config)# mpls oam
switch(conf-mpls-oam)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# mpls static binding ipv4

To configure the static binding of labels to IPv4 prefixes, use the **mpls static binding ipv4** command. To return to the default setting, use the **no** form of this command.

```
mpls static binding ipv4 prefix mask {label | input label | output nexthop {explicit-null | implicit-null | label}}
```

```
no mpls static binding ipv4 prefix mask {label | input label | output nexthop {explicit-null | implicit-null | label}}
```

<b>Syntax Description</b>	<table border="0"> <tr> <td><i>prefix mask</i></td><td>Destination prefix and mask.</td></tr> <tr> <td><i>label</i></td><td>Label value. The range is from 16 to 1048575492286.</td></tr> <tr> <td><b>input</b></td><td>Specifies the incoming local label.</td></tr> <tr> <td><b>output</b></td><td>Specifies the outgoing remote label.</td></tr> <tr> <td><i>nexthop</i></td><td>Destination next hop.</td></tr> <tr> <td><b>explicit-null</b></td><td>Specifies the IETF MPLS IPv4 explicit null label.</td></tr> <tr> <td><b>implicit-null</b></td><td>Specifies the IETF MPLS implicit null label.</td></tr> </table>	<i>prefix mask</i>	Destination prefix and mask.	<i>label</i>	Label value. The range is from 16 to 1048575492286.	<b>input</b>	Specifies the incoming local label.	<b>output</b>	Specifies the outgoing remote label.	<i>nexthop</i>	Destination next hop.	<b>explicit-null</b>	Specifies the IETF MPLS IPv4 explicit null label.	<b>implicit-null</b>	Specifies the IETF MPLS implicit null label.
<i>prefix mask</i>	Destination prefix and mask.														
<i>label</i>	Label value. The range is from 16 to 1048575492286.														
<b>input</b>	Specifies the incoming local label.														
<b>output</b>	Specifies the outgoing remote label.														
<i>nexthop</i>	Destination next hop.														
<b>explicit-null</b>	Specifies the IETF MPLS IPv4 explicit null label.														
<b>implicit-null</b>	Specifies the IETF MPLS implicit null label.														

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the static binding of labels to IPv4 prefixes:
	<pre>switch# configure terminal switch(config)# mpls ldp configuration switch(config)# mpls static binding ipv4 10.2.2.0 255.255.255.255 input 17 switch(config)# </pre>

---

Related Commands

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

---

 mpls static binding ipv4 vrf

# mpls static binding ipv4 vrf

To configure the Multiprotocol Label Switching (MPLS) static binding of labels to the IPv4 destination VPN routing prefix, use the **mpls static binding ipv4 vrf** command. To return to the default setting, use the **no** form of this command.

**mpls static binding ipv4 vrf vpn-name prefix mask {input label | label}**

**no mpls static binding ipv4 vrf vpn-name prefix mask {input label | label}**

<b>Syntax Description</b>	<table border="0"> <tr> <td><i>vpn-name</i></td><td>VPN name. The maximum size is alphanumeric 32 characters.</td></tr> <tr> <td><i>prefix-mask</i></td><td>Destination prefix and mask.</td></tr> <tr> <td><b>input</b></td><td>Specifies the incoming local label.</td></tr> <tr> <td><b>label</b></td><td>Label value.</td></tr> </table>	<i>vpn-name</i>	VPN name. The maximum size is alphanumeric 32 characters.	<i>prefix-mask</i>	Destination prefix and mask.	<b>input</b>	Specifies the incoming local label.	<b>label</b>	Label value.
<i>vpn-name</i>	VPN name. The maximum size is alphanumeric 32 characters.								
<i>prefix-mask</i>	Destination prefix and mask.								
<b>input</b>	Specifies the incoming local label.								
<b>label</b>	Label value.								

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	You must configure the MPLS VPN and VRFs before creating VRF-aware static labels.  This command requires the MPLS Services license.
-------------------------	---

<b>Examples</b>	This example shows how to configure static label bindings input and output labels for several prefixes:
<pre>switch# configure terminal switch(config)# mpls ldp switch(config-ldp)# mpls static binding ipv4 vrf vpn100 10.2.0.0 255.255.0.0 input 17 switch(config-ldp) #</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# mpls traffic-eng administrative-weight

To override the Interior Gateway Protocol (IGP) administrative weight (cost) of the link as used in traffic engineering (TE) path calculations, use the **mpls traffic-eng administrative-weight** command. To restore the system to its default condition, use the **no** form of this command.

**mpls traffic-eng administrative-weight *weight***

**no mpls traffic-eng administrative-weight *weight***

<b>Syntax Description</b>	<i>weight</i> TE administrative weight.				
<b>Defaults</b>	The TE link administrative weight defaults to the IGP cost of the link				
<b>Command Modes</b>	Interface configuration mode				
<b>Supported User Roles</b>	network-admin vdc-admin

---

 mpls traffic-eng area

# mpls traffic-eng area

To turn on the Multiprotocol Label Switching (MPLS) traffic engineering (TE) for the indicated Open Shortest Path First (OSPF) area, use the **mpls traffic-eng area** command. To return to the default setting, use the **no** form of this command.

**mpls traffic-eng area *area-id***

**no mpls traffic-eng area *area-id***

<b>Syntax Description</b>	<i>area-id</i> Area ID that can be a IP address or a positive integer.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Router configuration mode				
<b>Supported User Roles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th><th>Modification</th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	Release	Modification	5.2(1)	This command was introduced.
Release	Modification				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to turn on MPLS TE for the indicated OSPF area:</p> <pre>switch(config)# router ospf 100 switch(config-router)# mpls traffic-eng area 1 switch(config-router)# </pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th>Command</th><th>Description</th></tr> </thead> <tbody> <tr> <td><b>interface tunnel-te</b></td><td>Configures the traffic engineering (TE) interface.</td></tr> </tbody> </table>	Command	Description	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.
Command	Description				
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.				

# mpls traffic-eng attribute-flags

To set the user-defined interface attribute flags, use the **mpls traffic-eng attribute-flags** command. To return to the default setting, use the **no** form of this command.

**mpls traffic-eng attribute-flags value**

**no mpls traffic-eng attribute-flags**

<b>Syntax Description</b>	<i>value</i> Attribute flags. Typically entered in the range 0x0 - 0xffffffff.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Interface configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.

 mpls traffic-eng backup-path

# mpls traffic-eng backup-path

To assign one or more backup tunnels to a protected interface, use the **mpls traffic-eng backup-path** command. To restore the system to its default condition, use the **no** form of this command.

**mpls traffic-eng backup-path tunnel-te *interface number***

**no mpls traffic-eng backup-path tunnel-te *interface number***

<b>Syntax Description</b>	<b>tunnel-te</b> Specifies a traffic engineering (TE) interface. <i>interface number</i> Interface number. The range is from 0 to 65503.
---------------------------	---

---

**Defaults**

Enter this command on the interface to be protected (Link Protection), or on the interface whose downstream node is being protected (Node Protection). You can enter this command multiple times to select multiple backup tunnels for a given protected interface. An unlimited number of backup tunnels can be assigned to protect an interface. The only limitation is memory. By entering this command on a physical interface, LSPs using this interface (sending data out of this interface) can use the indicated backup tunnels if there is a link or node failure.

<b>Examples</b>	This example shows how to configure an MPLS backup for this interface:
-----------------	--

```
switch# configure terminal
switch(config)# interface ethernet 6/1
switch(config-if)# mpls traffic-eng bandwidth-path tunnel-te 1000
switch(config-if)#
```

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# mpls traffic-eng bandwidth

To allocate the Multiprotocol Label Switching (MPLS) traffic engineering (TE) bandwidth pool for the interface, use the **mpls traffic-eng bandwidth** command. To restore the system to its default condition, use the **no** form of this command.

**mpls traffic-eng bandwidth [interface-kbps | percent percentage]**

**no mpls traffic-eng tunnels**

<b>Syntax Description</b>	<i>interface-kbps</i> (Optional) Maximum amount of bandwidth (in kbps) that can be allocated by TE flows. The range is from 1 to 10000000. <i>percentage</i> (Optional) Specifies the maximum percentage of the link bandwidth that may be allocated by TE flows. <i>percentage</i> (Optional) The range is from 1 to 100.
---------------------------	--

## Defaults

If neither *interface-kbps* nor a *percentage* are specified, then the bandwidth pool size defaults to 75% of the interface's bandwidth.

## Command Modes

Interface configuration mode

## Supported User Roles

 mpls traffic-eng level

# mpls traffic-eng level

To configure the Multiprotocol Label Switching (MPLS) traffic engineering (TE) for Intermediate System-to-Intermediate System (IS-IS), use the **mpls traffic-eng level** command. To return to the default setting, use the **no** form of this command.

**mpls traffic-eng {level-1 | level-1-2 | level-2}**

**no mpls traffic-eng {level-1 | level-1-2 | level-2}**

<b>Syntax Description</b>	<b>level-1</b> Specifies MPLS TE on IS-IS level-1 only. <b>level-1-2</b> Specifies MPLS TE on IS-IS level-1 and level-2. <b>level-2</b> Specifies MPLS TE on IS-IS level-2 only.
---------------------------	--

<b>Defaults</b>	Enable
-----------------	--------

<b>Command Modes</b>	Router configuration mode
----------------------	---------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	You can enable MPLS for level-1, level-2 or level 1 and level-2 routers.  This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure MPLS TE for IS-IS:
-----------------	--

```
switch(config)# router isis p1
switch(config-router)# mpls traffic-eng level-1
switch(config-router)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>

## N Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with N.

**neighbor**

# neighbor

To configure neighbor parameters, use the **neighbor** command. To return to the default setting, use the **no** form of this command.

**neighbor ip-address {implicit-withdraw | labels accept prefix-list | targeted}**

**no neighbor ip-address implicit-withdraw | labels accept prefix-list | targeted}**

<b>Syntax Description</b>	<table border="0"> <tr> <td><i>ip-address</i></td><td>IP address for the Label Distribution Protocol (LDP) neighbor.</td></tr> <tr> <td><b>implicit-withdraw</b></td><td>Specifies the LDP Implicit Withdraw Label.</td></tr> <tr> <td><b>labels</b></td><td>Specifies the label binding exchange controls.</td></tr> <tr> <td><b>accept</b></td><td>Specifies the label bindings to accept.</td></tr> <tr> <td><i>prefix-list</i></td><td>Name of the prefix list.</td></tr> <tr> <td><b>targeted</b></td><td>Specifies the targeted session.</td></tr> </table>	<i>ip-address</i>	IP address for the Label Distribution Protocol (LDP) neighbor.	<b>implicit-withdraw</b>	Specifies the LDP Implicit Withdraw Label.	<b>labels</b>	Specifies the label binding exchange controls.	<b>accept</b>	Specifies the label bindings to accept.	<i>prefix-list</i>	Name of the prefix list.	<b>targeted</b>	Specifies the targeted session.
<i>ip-address</i>	IP address for the Label Distribution Protocol (LDP) neighbor.												
<b>implicit-withdraw</b>	Specifies the LDP Implicit Withdraw Label.												
<b>labels</b>	Specifies the label binding exchange controls.												
<b>accept</b>	Specifies the label bindings to accept.												
<i>prefix-list</i>	Name of the prefix list.												
<b>targeted</b>	Specifies the targeted session.												

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the prefix list to be used to filter label bindings for the specified LDP neighbor:
-----------------	---

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# neighbor 10.12.12.12 labels accept p1
switch(config-ldp)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

## P Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with P.

■ **password option**

# password option

To configure a Message Digest (MD5) password for Label Distribution Protocol (LDP) sessions with neighbors whose LDP router IDs are permitted by a specified prefix list, use the **password option** command. To return to the default setting, use the **no** form of this command.

**password option** *number* **for** *prefix-list* **key-chain** *keychain-name*

**no password option** *number*

<b>Syntax Description</b>	<table border="0"> <tr> <td><i>number</i></td><td>Order in which the prefix lists is evaluated when the device determines a neighbor password. The valid range is from 1 to 32767.</td></tr> <tr> <td><b>for</b></td><td>Specifies the prefix list control on LDP peers.</td></tr> <tr> <td><i>prefix-list</i></td><td>Prefix list for LDP peers.</td></tr> <tr> <td><b>key-chain</b></td><td>Specifies a key chain name.</td></tr> <tr> <td><i>keychain-name</i></td><td>Key chain name.</td></tr> </table>	<i>number</i>	Order in which the prefix lists is evaluated when the device determines a neighbor password. The valid range is from 1 to 32767.	<b>for</b>	Specifies the prefix list control on LDP peers.	<i>prefix-list</i>	Prefix list for LDP peers.	<b>key-chain</b>	Specifies a key chain name.	<i>keychain-name</i>	Key chain name.
<i>number</i>	Order in which the prefix lists is evaluated when the device determines a neighbor password. The valid range is from 1 to 32767.										
<b>for</b>	Specifies the prefix list control on LDP peers.										
<i>prefix-list</i>	Prefix list for LDP peers.										
<b>key-chain</b>	Specifies a key chain name.										
<i>keychain-name</i>	Key chain name.										

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure an MD5 password for LDP sessions with neighbors whose LDP router IDs are permitted by a specified prefix list:
-----------------	--

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# password option 1 for peer-prefix key-chain keychain1
switch(config-ldp) #
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# password required

To configure a Label Distribution Protocol (LDP) password when establishing a session between LDP peers, use the **password required** command. To return to the default setting, use the **no** form of this command.

**password required [for *prefix-list*]**

**no password required**

<b>Syntax Description</b>	<b>for</b> (Optional) Specifies a prefix list when establishing a session between a peers. <b><i>prefix-list</i></b> (Optional) Prefix list for LDP peers.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

**Examples** This example shows how to configure an LDP password when establishing a session between LDP peers:

```
switch# configure terminal
switch(config)# mpls ldp configuration
switch(config-ldp)# password required for password1
switch(config-ldp)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 path-option (TE interface configuration mode)

# path-option (TE interface configuration mode)

To configure a path option for a Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel, use the **path-option** command. To restore the system to its default condition, use the **no** form of this command.

**path-option [protect] *preference-number* {dynamic | explicit {identifier *id* | name *name*} [verbatim]} [lockdown] [bandwidth *kbps*] [attributes *listname*]**

**no path-option**

Syntax Description	<b>protect</b>	(Optional) Specifies a secondary path option to protect an already defined primary path option. Using this keyword will cause a second protected LSP to be signalled (if the path is available) and traffic will switch to this protected LSP if the primary LSP goes down.
	<i>preference-number</i>	Preference for this path option. When you configure multiple path options, lower numbered options are preferred. The range is from 1 to 1000.
	<b>dynamic</b>	Specifies the setup based on a dynamically calculated path.
	<b>explicit</b>	Specifies the setup based on a preconfigured path.
	<b>identifier</b>	Specifies an TE explicit path by number.
	<i>id</i>	Number of the TE explicit path. The ID range is from 1 to 65535.
	<b>name</b>	Specifies an TE explicit path by name.
	<i>name</i>	Name that is any case-sensitive, alphanumeric string.
	<b>verbatim</b>	(Optional) Bypasses the topology database verification process.
	<b>lockdown</b>	(Optional) Specifies that this is not a candidate for reoptimization.
	<b>bandwidth</b>	(Optional) Overrides the bandwidth configured on the tunnel or the attribute list. The kbps is the number of kilobits per second set aside for the path option.
	<i>kpls</i>	(Optional) Kilobits per second. The range is from 1 to 4294967295.
	<b>attributes</b>	(Optional) Specifies an LSP attribute list.
	<i>listname</i>	(Optional) LSP attribute list name. The listname is any case-sensitive, alphanumeric string up to 63 characters.
Defaults	None	
Command Modes	TE interface configuration mode	
Supported User Roles	network-admin vdc-admin	

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines**

You can configure multiple path options for a single tunnel. For example, there can be several explicit path options and a dynamic option for one tunnel. The path setup preference is for lower (not higher) numbers, so option 1 is preferred.

If you specify the **dynamic** keyword, the software checks both the physical bandwidth of the interface and the available TE bandwidth to be sure that the requested amount of bandwidth does not exceed the physical bandwidth of any link. To oversubscribe links, you must specify the **explicit** keyword. If you use the **explicit** keyword, the software checks only how much bandwidth is available on the link for TE; the amount of bandwidth that you configure is not limited to how much physical bandwidth is available on the link.

This command requires the MPLS Services license.

**Examples**

This example shows how to configure the tunnel to use a named TE explicit path and if that path is not available, then to fall back to a path dynamically calculated from the TE topology database:

```
switch# configure terminal
switch(config)# interface tunnel-te 1
switch(config-if-te)# path-option 10 explicit name Link5
switch(config-if-te)# path-option dynamic 20
switch(config-if-te)#

```

**Related Commands**

Command	Description
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

---

**path-selection metric (TE configuration mode)**

# path-selection metric (TE configuration mode)

To configure the metric type to use if a metric type is not explicitly configured for a Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel, use the **path-selection metric** command. To restore the system to its default condition, use the **no** form of this command.

**path-selection metric {igp | te}**

**no path-selection metric**

<b>Syntax Description</b>	<b>igp</b> Specifies the Interior Gateway Protocol (IGP) metric. <b>te</b> Specifies the traffic engineering (TE) metric.
---------------------------	--

<b>Defaults</b>	TE
-----------------	----

<b>Command Modes</b>	TE configuration mode
----------------------	-----------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

**Usage Guidelines** If you configure the TE path selection metric type, you should configure the MPLS TE administrative weight on each interface for which TE is enabled.

Use this command to specify the metric type to be used for traffic engineering (TE) tunnels for which the **tunnel path-selection metric** command has not been specified.

The metric type to be used for path calculation for a given tunnel is determined as follows:

- If you entered the **tunnel path-selection metric** command to specify a metric type for the tunnel, use that metric type.
- If you entered the TE configuration mode path-selection metric was entered to specify a metric type, use that metric type.
- If you did not do any of the above tasks, use the default (te) metric.

This command requires the MPLS Services license.

**Examples** This example shows how to configure the metric type to use if a metric type is not explicitly configured for an MPLS TE tunnel:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
```

```
switch(config-te)# path-selection metric te  
switch(config-te)#{
```

**Related Commands**

Command	Description
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

---

■ path-selection metric (TE interface configuration mode)

## path-selection metric (TE interface configuration mode)

To configure the metric type to be used if a metric type is not explicitly configured for an Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel, use the **path-selection metric** command. To restore the system to its default condition, use the **no** form of this command.

**path-selection metric {igp | te}**

**no path-selection metric**

<b>Syntax Description</b>	<b>igp</b> Specifies the Interior Gateway Protocol (IGP) metric. <b>te</b> Specifies the traffic engineering (TE) metric.
---------------------------	--

<b>Defaults</b>	TE
-----------------	----

<b>Command Modes</b>	TE interface configuration mode
----------------------	---------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

**Usage Guidelines** If you configure the TE path selection metric type, you should configure the MPLS TE administrative weight on each interface for which TE is enabled.

Use this command to specify the metric type to be used for traffic engineering (TE) tunnels for which the **tunnel path-selection metric** command has not been specified.

The metric type to be used for path calculation for a given tunnel is determined as follows:

- If you entered the tunnel path-selection metric command was entered to specify a metric type for the tunnel, use that metric type.
- If you entered the TE configuration mode path-selection metric was entered to specify a metric type, use that metric type.
- If you did not do any of the above tasks, use the default (te) metric.

This command requires the MPLS Services license.

**Examples** This example shows how to configure the metric type to use if a metric type is not explicitly configured for an MPLS TE tunnel:

```
switch# configure terminal
switch(config)# interface tunnel-te 1
```

```
switch(config-if-te)# path-selection metric te
switch(config-if-te)#{
```

**Related Commands**

Command	Description
<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

---

 path-selection overload allow

# path-selection overload allow

To allow overloaded nodes in Constrained Shortest Path First (CSPF), use the **path-selection overload allow** command. To return to the default setting, use the **no** form of this command.

**path-selection overload allow {head [middle [tail]] | middle [tail] | tail}**

**no path-selection overload allow**

Syntax Description	<b>head</b> Specifies that an overloaded node can still be used as a tunnel head in the traffic engineering (TE) constrained Shortest Path First (CSPF).
	<b>middle</b> (Optional) Specifies the overloaded middle node in the TE CSPF.
	<b>tail</b> (Optional) Specifies the overloaded tail node in the TE CSPF.

<b>Defaults</b>	None				
<b>Command Modes</b>	TE configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>5.2(1)</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	5.2(1)	This command was introduced.
Release	Modification				
5.2(1)	This command was introduced.				

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
<b>Examples</b>	<p>This example shows how to specify that an overloaded node can still be used as a tunnel head in the traffic engineering (TE) constrained Shortest Path First (CSPF):</p> <pre>switch# configure terminal switch(config)# mpls traffic-eng configuration switch(config-te)# path-selection overload allow head switch(config-te)# </pre>

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

# ping mpls

To test the Multiprotocol Label Switching (MPLS) label switched path (LSP) reachability, use the **ping mpls** command.

```
ping mpls {ipv4 destination-address/destination-mask-length | pseudowire ipv4-address vc-id | traffic-eng tunnel-te interface number}
```

Syntax Description	<b>ipv4</b> Specifies the target as an IPv4 address. <b>destination-address</b> Target Forwarding Equivalence Class (FEC) address. <b>destination-mask-length</b> Target FEC address with the mask length. <b>pseudowire</b> Specifies the target virtual channel (VC) as an IPv4 address and VC ID. <b>ipv4-address</b> IPv4 address. <b>vc-id</b> VC ID. The range is from 0 to 4294967295. <b>traffic-eng</b> Specifies as a traffic engineering (TE) tunnel interface. <b>tunnel-te</b> Specifies the TE interface. <b>interface number</b> TE interface number. The range is from 0 to 65503.
--------------------	--

**Defaults** None

**Command Modes** EXEC mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to specify the test MPLS LSP reachability:

```
switch# ping mpls pseudowire 1.2.3.4 200
LSP ping for VCCV is not supported
switch(config)#
```

This example shows how to specify an LDP IPv4 prefix FEC for validation:

```
switch# ping mpls ipv4 10.131.191.252/32 repeat 5 exp 5 verbose
Sending 5, 100-byte MPLS Echos to 10.131.191.252/32,
timeout is 2 seconds, send interval is 0 msec:
```

**ping mpls**

```

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'I' - unknown upstream index,
'X' - unknown return code, 'x' - return code 0

Type Ctrl-C to abort.
Q    size 100

Success rate is 0 percent (0/5)
Total Time Elapsed 6 ms
switch#

```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# ping mpls pseudowire

To target virtual circuit (VC) specified as an IPv4 address and VC ID, use the **ping mpls pseudowire** command.

**ping mpls pseudowire** *ipv4-address vc-id*

## Syntax Description

<i>ipv4-address</i>	IPv4 address.
<i>vc-id</i>	Virtual circuit ID. The range is from 1 to 4294967295.

## Defaults

None

## Command Modes

EXEC mode

## SupportedUserRoles

network-admin  
vdc-admin

## Command History

Release	Modification
6.2.2	This command was introduced.

## Usage Guidelines

This command requires an MPLS license.

## Examples

This example shows how to target a VC specified as an IPv4 address and VC ID:

```
switch# ping mpls pseudowire 33.0.1.63 100
```

## Related Commands

Command	Description
<b>mpls oam</b>	Targets a VC specified as an IPv4 address and VC ID

**police**

# police

To create a policy map to enforce a committed data rate of 256000 bits per second, use the **police** command. To return to the default setting, use the **no** form of this command.

```
police [cir] {x [bps | kbps | mbps | gbps] | percent x-percent} [[bc] bc [bytes | kbytes | mbytes | ms | us]] [pir y [bps | kbps | mbps | gbps] | percent y-percent] [[be] be [bytes | kbytes | mbytes | ms | us]] [conform conform-action [exceed exceed-action [violate violate-action]]]
```

```
no police [cir] {x [bps | kbps | mbps | gbps] | percent x-percent} [[bc] bc [bytes | kbytes | mbytes | ms | us]] [pir y [bps | kbps | mbps | gbps] | percent y-percent] [[be] be [bytes | kbytes | mbytes | ms | us]] [conform conform-action [exceed exceed-action [violate violate-action]]]
```

## Syntax Description

<b>cir</b>	(Optional) Specifies the committed information rate.
<i>x</i>	Committed information rate value. The range is from 1 to 800000000000.
<b>bps</b>	(Optional) Specifies the rate value in bits per second.
<b>kbps</b>	(Optional) Specifies the rate value in kilobits per second.
<b>mbps</b>	(Optional) Specifies the rate value in megabits per second.
<b>gbps</b>	(Optional) Specifies the rate value in gigabits per second.
<b>percent</b>	Specifies the rate as a percentage of the interface data rate.
<i>x-percent</i>	Percentage. The range is from 1 to 100.
<b>bc</b>	(Optional) Specifies the committed burst.
<i>bc</i>	Burst value. The range is from 1 to 536870912.
<b>bytes</b>	(Optional) Specifies the burst value in bits per second.
<b>kbytes</b>	(Optional) Specifies the burst value in kilobits per second.
<b>mbytes</b>	(Optional) Specifies the burst value in megabits per second.
<b>ms</b>	(Optional) Specifies burst value in milliseconds.
<b>us</b>	(Optional) Specifies the burst value in microseconds.
<b>pir</b>	(Optional) Specifies the peak information rate.
<i>y</i>	Value of the peak rate.
<i>y-percent</i>	Percentage. The range is from 1 to 100.
<b>be</b>	(Optional) Specifies extended burst.
<i>be</i>	Extended value. The range is from 1 to 536870912.
<b>conform</b>	(Optional) Specifies the conform action.
<i>conform-action</i>	(Optional) Conform action value.
<b>exceed-action</b>	(Optional) Specifies the exceed action.
<b>violate-action</b>	(Optional) Specifies the violate action.
<i>violate-action</i>	(Optional) Violate action value.

## Defaults

None

<b>Command Modes</b>	Class-map configuration mode

---

**priority (LSP attribute configuration mode)**

# priority (LSP attribute configuration mode)

To configure the label switched path (LSP) priority, use the **priority** command. To restore the system to its default condition, use the **no** form of this command.

**priority** *setup-priority* [*hold-priority*]

**no priority**

---

<b>Syntax Description</b>	<table border="0"> <tr> <td style="width: 30%;"><i>setup-priority</i></td><td>Setup priority. The range is from 0 to 7.</td></tr> <tr> <td><i>hold-priority</i></td><td>(Optional) Hold priority. The range is from 0 to 7.</td></tr> </table>	<i>setup-priority</i>	Setup priority. The range is from 0 to 7.	<i>hold-priority</i>	(Optional) Hold priority. The range is from 0 to 7.
<i>setup-priority</i>	Setup priority. The range is from 0 to 7.				
<i>hold-priority</i>	(Optional) Hold priority. The range is from 0 to 7.				

---

**Defaults** By default, the setup priority is 7. The value of hold priority is the same as the value of setup priority.

**Command Modes** LSP attribute configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** Use the *setup-priority* argument when signaling an LSP to determine which existing LSPs can be preempted. The range is from 0 to 7, where a lower number indicates a higher priority. Therefore, an LSP with a setup priority of 0 can preempt any LSP with a nonzero priority.

Use the *hold-priority* argument LSP to determine if an LSP should be preempted by other LSPs that are being signaled. The range is from 0 to 7, where a lower number indicates a higher priority.

The two priorities enables the signaling of an LSP with a low setup priority (so that the LSP does not preempt other LSPs during the setup) and a high hold priority (so that the LSP is not preempted after it is established). The setup priority and hold priority are typically configured to be equal; the setup priority cannot be higher (numerically smaller) than the hold priority.

This command requires the MPLS Services license.

---

**Examples** This example shows how to configure the LSP priority:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# lsp attributes 1
switch(config-lsp-attr)# priority 1 1
```

---

## S Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with S.

---

**send-community extended**

# send-community extended

To specify that a community's attribute should be sent to a Border Gateway Protocol (BGP) neighbor, use the **send-community extended** command.

## send-community extended

**Syntax Description** This command does not have any arguments or keywords.

**Defaults** None

**Command Modes** config-router-neighbor-af mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command does not require a license.

---

**Examples**

This example shows how to specify that a community's attributes should be sent to a BGP neighbor:::

```
switch# configure terminal
switch (config)# feature mpls l3vpn
switch(config)# feature bgp
switch(config)# route-map costMap permit 10
switch(config-route-map)# set extcommunity cost 1 100
switch(config)# router bgp 1.1
switch(config-router)# router-id 192.0.2.255
switch(config-router)# neighbor 192.0.2.1 remote-as 100
switch(config-router-neighbor)# address-family vpng4 unicast
switch(config-router-neighbor-af)# send-community extended
switch(config-router-neighbor-af)#

```

---

**Related Commands**

Command	Description
<b>address-family</b>	Enters address family configuration mode for configuring IP VPN sessions.
<b>neighbor</b>	Configures a neighbor and enters address family neighbor configuration mode. The IP address is an IPv4 or IPv6 address.

# send-lifetime

To configure the send lifetime of a key, use the **send-lifetime** command. To return to the default setting, use the **no** form of this command.

**send-lifetime {start-time | local start-time} {duration seconds | end-time | infinite}**

**no send-lifetime {start-time | local start-time} {duration seconds | end-time | infinite}**

## Syntax Description

<b>start-time</b>	Time to start. hh:mm:ss is the time format. The range is from 0 to 23: 0 and from 59: 0 to 59. The maximum size is 8 alphanumeric characters.
<b>local start-time</b>	Specifies the time in the local time zone. hh:mm:ss is the time format.
<b>duration</b>	Sets the send lifetime duration as follows: <ul style="list-style-type: none"> <li>• Enter the number of days from 1 to 31.</li> <li>• Enter the name of the month.</li> <li>• Enter the year from 1993 to 2035.</li> </ul>
<b>seconds</b>	Seconds. The range is from 1 to 2147483646 seconds.
<b>end-time</b>	Time to stop.
<b>infinite</b>	Allows the send lifetime period to never expire.

## Defaults

None

## Command Modes

Keychain key configuration mode

## SupportedUserRoles

network-admin  
vdc-admin

## Command History

Release	Modification
5.2(1)	This command was introduced.

## Usage Guidelines

If the no accept-lifetime value is defined, the associated receive password is valid for authenticating incoming TCP segments.

This command requires the MPLS Services license.

## Examples

This example shows how to configure the send lifetime of a key:

```
switch# configure terminal
switch(config)# key chain keychain1
switch(config-keychain)# key 10
switch(config-keychain-key)# send-lifetime 10:00:00 Jan 13 2010 10:00:00 Jun 13 2010
```

**send-lifetime**

```
switch(config-keychain-key) #
```

**Related Commands**

Command	Description

# session protection

To enable Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) session protection, use the **session protection** command. To return to the default setting, use the **no** form of this command.

**session protection [for *prefix-list*] [duration {seconds | infinite}]**

**no session protection [for *prefix-list*] [duration {seconds | infinite}]**

<b>Syntax Description</b>	<b>for</b> (Optional) Specifies the prefix list that should be protected. <b>prefix-list</b> (Optional) Prefix list for label switched path (LDP) peers. <b>duration</b> (Optional) Specifies the period to sustain the session protection after the loss has been discovered by the link discovery process. <b>seconds</b> (Optional) Holdup time in seconds. The range is from 30 to 2147483. <b>infinite</b> (Optional) Specifies to protect the session forever after the loss has been discovered by the link discovery process.
---------------------------	---

<b>Defaults</b>	None
<b>Command Modes</b>	LDP configuration mode
<b>SupportedUserRoles</b>	network-admin vdc-admin

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable MPLS LDP session protection:
	<pre>switch# configure terminal switch(config)# mpls ldp configuration switch(config-ldp)# session protection for prefix1 duration 100 switch(config-ldp)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

set

# set

To define a mapping of values between two quality of services (QoS) types, use the **set** command. To return to the default setting, use the **no** form of this command.

**set to-field from field table table-map-name**

**no set to-field from field table table-map-name**

Syntax Description	<b>to-field</b> EXP field on the outer (topmost) label ( <b>mpls-exp-topmost</b> ). <b>from-field</b> EXP field to be applied on all imposed labels ( <b>mpls-exp-imposition</b> ). <b>table</b> Specifies the table that defines the mapping from the input to the output. <b>table-map-name</b> Name of a system-defined table map or an existing table map.
--------------------	---

Defaults	None
----------	------

Command Modes	Class-map configuration mode
---------------	------------------------------

SupportedUserRoles	network-admin vdc-admin
--------------------	----------------------------

Command History	Release	Modification
	5.2(1)	This command was introduced.

Usage Guidelines	This command requires the MPLS Services license.
------------------	--

Examples	The following example shows how to define a mapping of values between two QoS:
	<pre>switch# configure terminal switch(config)# policy-map Policy1 switch(config-pmap-qos)# class Class2 switch(config-pmap-c-qos)# set cos mpls-exp-topmost table dscp-cos-mapset switch(config-pmap-c-qos)# end</pre>

Related Commands	Command	Description

 ■ **signalling hello graceful-restart**

# signalling hello graceful-restart

To enable node-based hellos for a graceful restart at the global level, use the **signalling hello graceful-restart** command. To disable the sending of hellos for a graceful restart, use the **no** form of this command.

**signalling hello graceful-restart**

**no signalling hello graceful-restart**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** ON

---

**Command Modes** RSVP configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to enable node-based hellos for a graceful restart at the global level:

```
switch(config)# ip rsvp
switch(config-ip-rsvp)# signalling hello graceful-restart
switch(config-ip-rsvp)#

```

 ■ **signalling initial-retransmit-delay**

# signalling initial-retransmit-delay

To configure the minimum amount of time that Resource Reservation Protocol (RSVP) waits for an acknowledgement before retransmitting the same message, use the **signalling initial-retransmit-delay** command. To return to the default settings, use the **no** form of this command.

**signalling initial-retransmit-delay *time***

**no signalling initial-retransmit-delay *time***

<b>Syntax Description</b>	<i>time</i>	Hello interval in seconds. The range is from 2000 to 300000.
<b>Defaults</b>	1 second	
<b>Command Modes</b>	RSVP configuration mode	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure the minimum amount time that RSVP waits for an acknowledgement before retransmitting the same message:	
	<pre>switch(config)# ip rsvp switch(config-ip-rsvp)# signalling initial-retransmit-delay 4 switch(config-ip-rsvp)#</pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# signalling patherr state-removal

To delete a path state automatically when forwarding a PATH-ERROR message, use the **signalling patherr state-removal** command. To return to the default settings, use the **no** form of this command.

**signalling patherr state-removal**

**no signalling patherr state-removal**

**Syntax Description** This command has no arguments or keywords.

**Defaults** Disabled

**Command Modes** RSVP configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to delete a path state automatically when forwarding a PATH-ERROR message:

```
switch(config)# ip rsvp
switch(config-ip-rsvp)# signalling patherr state-removal
switch(config-ip-rsvp)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

 ■ **signaling protocol none**

# signaling protocol none

To disable the signaling protocol and to use manually configured pseudowires, use the **signaling protocol none** command.

## signaling protocol none

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** Global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	6.2.2	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to disable the signaling protocol and to use manually configured pseudowires:

```
switch# configure terminal
switch(config)# mpls label range 17 199 static 200 500
switch(config)# interface pseudowire pw 123
switch(config-if-pseudowire)# signaling protocol none
switch(config-if-pseudowire)#

```

---

Related Commands	Command	Description
	<b>interface pseudowire</b>	Enters interface pseudowire configuration mode and configures a static pseudowire logical interface.

---

# signalling rate-limit

To rate limit the number of messages being sent to a neighboring router, use the **signalling rate-limit** command. To return to the default settings, use the **no** form of the command.

**signalling rate-limit {[interval msec] [limit messages]}**

**no signalling rate-limit {[interval msec] [limit messages]}**

<b>Syntax Description</b>	<table border="1"> <tr> <td><b>interval</b></td><td>(Optional) Specifies the scheduling interval.</td></tr> <tr> <td><b>msec</b></td><td>Interval in milliseconds. The range is from 250 to 2000.</td></tr> <tr> <td><b>limit</b></td><td>(Optional) Specifies the message limit per scheduling interval.</td></tr> <tr> <td><b>messages</b></td><td>Message limit value. The range is from 1 to 500.</td></tr> </table>	<b>interval</b>	(Optional) Specifies the scheduling interval.	<b>msec</b>	Interval in milliseconds. The range is from 250 to 2000.	<b>limit</b>	(Optional) Specifies the message limit per scheduling interval.	<b>messages</b>	Message limit value. The range is from 1 to 500.
<b>interval</b>	(Optional) Specifies the scheduling interval.								
<b>msec</b>	Interval in milliseconds. The range is from 250 to 2000.								
<b>limit</b>	(Optional) Specifies the message limit per scheduling interval.								
<b>messages</b>	Message limit value. The range is from 1 to 500.								

## Defaults

The default are as follows:

- Interval— The default is 1000.
- Limit— The default is 100.

<b>Command Modes</b>	RSVP configuration mode
----------------------	-------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to rate limit the number of messages that are being sent to a neighboring router:
	<pre>switch(config)# ip rsvp switch(config-ip-rsvp)# signalling rate-limit interval 300 switch(config-ip-rsvp)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 ■ **signalling refresh interval**

# signalling refresh interval

To configure how often the Resource Reservation Protocol (RSVP) state is refreshed, use the **signalling refresh interval** command. To return to the default settings, use the **no** form of this command.

**signalling refresh interval *time***

**no signalling refresh interval *time***

<b>Syntax Description</b>	<i>time</i>	Hello interval in seconds. The range is from 2000 to 300000.
<b>Defaults</b>	30 seconds	
<b>Command Modes</b>	RSVP configuration mode	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure how often the RSVP state is refreshed:  switch(config)# <b>ip rsvp</b> switch(config-ip-rsvp)# <b>signalling refresh interval 35</b> switch(config-ip-rsvp)#	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# signalling refresh misses

To configure the number of refresh messages that can be missed before the Resource Reservation Protocol (RSVP) determines that a state is to expire, use the **signalling refresh misses** command. To return to the default settings, use the **no** form of this command.

**signalling refresh misses *refresh-missed***

**no signalling refresh misses *refresh-missed***

<b>Syntax Description</b>	<i>time</i> Hello interval in seconds. The range is from 2000 to 300000.				
<b>Defaults</b>	4 seconds.				
<b>Command Modes</b>	RSVP configuration mode				
<b>SupportedUserRoles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.

<b>Examples</b>	<p>This example shows how to configure the number of refresh messages that can be missed before RSVP determines that a state is to expire:</p> <pre>switch(config)# ip rsvp switch(config-ip-rsvp)# signalling refresh misses 5 switch(config-ip-rsvp)#+</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>mpls ldp configuration</b></td><td>Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).
<b>Command</b>	<b>Description</b>				
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).				

---

 ■ **signalling refresh reduction**

# signalling refresh reduction

To enable the Resource Reservation Protocol (RSVP) refresh reduction, use the **signalling refresh reduction** command. To disable RSVP refresh reduction, use the **no** form of the command.

**signalling refresh reduction**

**no signalling refresh reduction**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** Enabled

---

**Command Modes** RSVP configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to enable RSVP refresh reduction:

```
switch(config)# ip rsvp
switch(config-ip-rsvp)# signalling refresh reduction
switch(config-ip-rsvp)#
```

---

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# signalling refresh reduction ack-delay

To configure the maximum amount of time the Resource Reservation Protocol (RSVP) holds on to an acknowledgement before sending it, use the **signalling refresh reduction ack-delay** command. To return to the default settings, use the **no** form of the command.

**signalling refresh reduction ack-delay *time***

**no signalling refresh reduction ack-delay *time***

<b>Syntax Description</b>	<i>time</i> Hello interval in seconds. The range is from 2000 to 300000.				
<b>Defaults</b>	0.25 second.				
<b>Command Modes</b>	RSVP configuration mode				
<b>Supported User Roles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.

 ■ **signalling refresh reduction bundle-max-size**

# signalling refresh reduction bundle-max-size

To configure the bundle maximum send message size, use the **signalling refresh reduction bundle-max-size** command. To return to the default settings, use the **no** form of the command.

**signalling refresh reduction bundle-max-size *value***

**no signalling refresh reduction bundle-max-size *value***

<b>Syntax Description</b>	<b>value</b>	Bundle size in bytes. The range is from 0 to 65000.
<b>Defaults</b>	4096 bytes	
<b>Command Modes</b>	RSVP configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to configure the bundle maximum send message size:  <pre>switch(config)# ip rsvp switch(config-ip-rsvp)# signalling refresh reduction bundle-max-size 30 switch(config-ip-rsvp)# </pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# SOO

To configure the Site of Origin (SOO) Border Gateway Protocol (BGP) extended community value, use the **soo** command.

**soo** *value*

<b>Syntax Description</b>	<i>value</i>	The value is in one of the following format: <ul style="list-style-type: none"><li>• autonomous system number (ASN)</li><li>• IP address</li></ul> The number ranges is from 0 to 65535 for a 2-byte ASN or 0 to 4294967295 for a 4-byte ASN.
---------------------------	--------------	---

<b>Defaults</b>	None
<b>Command Modes</b>	config-router--vrf-neighbor-af mode

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure the SOO BGP extended community value:
	<pre>switch# configure terminal switch(config)# feature bgp switch(config)# router bgp 1.1 switch(config-router)# vrf vpn1 switch(config-router-vrf)# neighbor 209.165.201.1 remote-as 1.2 config-router-vrf-neighbor)# address-family ipv4 unicast switch(config-router-neighbor-af)# neighbor 33.0.1.63 remote-as 100 switch(config-router-vrf-neighbor)# address-family ipv4 unicast switch(config-router-vrf-neighbor-af)# allowas-in 3 switch(config-router-vrf-af)# soo 1:1 switch(config-router-vrf-af)#</pre>

Related Commands	Command	Description
	<b>address-family ipv4 unicast</b>	Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.
	<b>allowas-in</b>	Allows duplicate autonomous system number (ASN) in the AS path. Configure this parameter in the VPN address family configuration mode at the PE spokes and at the neighbor mode at the PE hub.
	<b>neighbor</b>	Adds an entry to the BGP or multiprotocol BGP neighbor table for this VRF.

# state enabled

To enable a port profile, use the **state enabled** command.

**state enabled**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** config-if-prof mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to configure a VPN ID on a VFI context:

```
switch# configure terminal
switch(config)# port-profile type pseudowire Test1
switch(config-if-prof)# encapsulation mpls
switch(config-if-prof)# state enabled
switch(config-if-prof)#

```

Related Commands	Command	Description
	<b>encapsulation mpls</b>	Specifies MPLS encapsulation for this profile.
	<b>interface pseudowire</b>	Enters interface pseudowire configuration mode and configures a static pseudowire logical interface.
	<b>port-profile type pseudowire</b>	Enters interface port-profile configuration mode and configures a port profile.

---

 system bridge-domain

# system bridge-domain

To identify the IDs that are available for bridge-domain configurations, use the **system bridge-domain** command.

**system-bridge domain id [-id | -id,..., id-id]**

<b>Syntax Description</b>	<code>id</code> System bridge domain ID. The range is from 2 to 967. <code>-id</code> Last ID in a range of contiguous IDs. The hyphen (-) is required.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	The optional list of ID ranges are separated by commas (,). Do not type the ellipses (...). This command requires the MPLS Services license.
-------------------------	---

<b>Examples</b>	This example shows how to identify the IDs that are available for bridge-domain configurations:
<pre>switch# configure terminal switch(config)# system bridge-domain 10-50,100-500 switch(config)#</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>bridge-domain</b>	Enters bridge-domain configuration mode and configures a bridge domain.

# switchport allowed vlan

To allow a flow from the specified VLAN to pass through the trunk, use the **switchport allowed vlan** command.

**switchport allowed vlan *vlan-id***

<b>Syntax Description</b>	<i>vlan-id</i> VLAN ID. The range is from 1 to 4094.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	The VLAN ID must match the ID of the VLAN to which this virtual forwarding interface (VFI) is to be associated.
-------------------------	---

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to allow flow from the specified VLAN to pass through the trunk:
-----------------	---

```
switch# configure terminal
switch(config)# vlan 100
switch(config-vlan)# member vfi foo
switch(config-vlan)# exit
switch(config)# interface ethernet 2/1
switch(config-if)# switchport mode trunk
switch(config-if)# switchport allowed vlan 100
switch(config-if)#
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>member vfi</b>	

---

 update-source loopback

# update-source loopback

To specify the source address of the Border Gateway Protocol (BGP) session, use the **autonomous-system** command.

**update-source loopback {1| 0}**

<b>Syntax Description</b>	<i>as-number</i>	AS number. The ASN can be a 16-bit integer or a 32-bit integer in the form of a higher 16-bit decimal number and a lower 16-bit decimal number in the xx.xx format.
---------------------------	------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-router-vrf mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the source address of the BGP session:
-----------------	--

```
switch# configure terminal
switch(config)# feature bgp
switch(config)# router bgp 1.1
switch(config-router)# router-id 192.0.2.255
switch(config-router)# router-id 192.0.2.255
switch(config-router-vrf-af)# neighbor 209.165.201.1 remote-as
switch(config-router-vrf-af)# update-source loopback 0
```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>address-family ipv4 unicast</b>	Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes.
	<b>send-community extended</b>	Specifies that a community's attribute should be sent to a BGP neighbor.

## R Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with R.

**rd**

To create routing and forwarding tables, use the **rd** command. To return to the default setting, use the **no** form of this command.

**rd** *route-distinguisher*

**no rd** *route-distinguisher*

<b>Syntax Description</b>	<i>route-distinguisher</i> 8-byte value that is added to an IPv4 prefix to create a VPN IPv4 prefix.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to create routing and forwarding tables:
	<pre>switch# configure terminal switch(config)# vrf context vpn1 switch(config-vrf)# rd 1.2:1</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# record-route (LSP attribute configuration mode)

To record the route used by the label switched path (LSP), use the **record-route** command.

## **record-route**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** LSP attribute configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** The following holds true for all tunnel-te commands that can be specified both in "TE interface configuration mode" or path-option command line or "LSP attribute configuration mode":

If a setting is specified for an LSP, either via the path-option command directly or by assigning an LSP attribute list to a path-option, takes precedence for that specific path-option.

If no setting is specified for an LSP, then the LSP/path-option inherits any setting specified in the tunnel-te configuration mode: affinity, auto-bw, priority, record-route, protection/fast-reroute.

This command requires the MPLS Services license.

**Examples** This example shows how to record the route by LSP:

```
switch# configure terminal
switch(config)# mpls traffic-eng configuration
switch(config-te)# lsp attributes 1
switch(config-lsp-attr)# record-route
```

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

■ **record-route (TE interface configuration mode)**

# record-route (TE interface configuration mode)

To record the route used by the label switched path (LSP), use the **record-route** command.

**record-route**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** TE interface configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to record the route by LSP:

```
switch# configure terminal
switch(config)# interface tunnel-te 1
switch(config-if-te)# record-route
switch(config-if-te)#

```

Related Commands	Command	Description
	<b>interface tunnel-te</b>	Configures the traffic engineering (TE) interface.

# redistribute

To redistribute routes from one routing domain into another routing domain, use the **redistribute** command. To return to the default setting, use the **no** form of this command.

```
redistribute {bgp as | direct | {eigrp | ospf | rip} instance-tag | static} route-map map-name
no redistribute {bgp as | direct | {eigrp | ospf | rip} instance-tag | static} route-map map-name
```

Syntax Description	<b>bgp</b> Specifies the Border Gateway Protocol (BGP).
<i>as</i>	16-bit integer or a 32-bit integer in the form of a higher 16-bit decimal number and a lower 16-bit decimal number in xx.xx format.
<b>direct</b>	Specifies directly connected routes.
<b>eigrp</b>	Specifies the Enhanced Interior Gateway Routing Protocol (EIGRP).
<b>ospf</b>	Specifies the Open Shortest Path First (OSPF).
<b>rip</b>	Specifies the Routing Information Protocol (RIP).
<i>instance-tag</i>	Instance-tag that can be any case-sensitive, alphanumeric string up to 20 characters.
<b>static</b>	Specifies static routes.
<b>route-map</b>	Specifies the policy to constrain redistribution.
<i>map-name</i>	Name of the map that you used to redistributes routes from one routing domain into another routing domain. The name can be any case-sensitive, alphanumeric string up to 63 characters.

Defaults	None
----------	------

Command Modes	Route configuration mode
---------------	--------------------------

SupportedUserRoles	network-admin vdc-admin
--------------------	----------------------------

Command History	Release	Modification
	5.2(1)	This command was introduced.

Usage Guidelines	This command requires the MPLS Services license.
------------------	--

Examples	This example shows how to redistribute routes from one routing domain into another routing domain:
----------	--

```
switch# configure t
switch(config)# feature rip
```

**redistribute**

```
switch(config)# router rip test1
switch(config-router)# vrf vpn1
switch(config-router-vrf-af)# redistribute bgp 1.0 route-map bagpipe
switch(config-router-vrf-af)#{/pre>
```

**Related Commands**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# redistribute direct route-map

To redistribute directly connected routes using the Border Gateway Protocol (BGP), use the **redistribute direct route-map** command. To return to the default setting, use the **no** form of this command.

**redistribute direct route-map *map-tag***

**no redistribute direct route-map *map-tag***

<b>Syntax Description</b>	<i>map-tag</i> Map name that can be any case-sensitive, alphanumeric string up to 63 characters.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Address family configuration mode				
<b>Supported User Roles</b>	network-admin vdc-admin				
<b>Command History</b>	<table border="1"> <thead> <tr> <th><b>Release</b></th><th><b>Modification</b></th></tr> </thead> <tbody> <tr> <td>5.2(1)</td><td>This command was introduced.</td></tr> </tbody> </table>	<b>Release</b>	<b>Modification</b>	5.2(1)	This command was introduced.
<b>Release</b>	<b>Modification</b>				
5.2(1)	This command was introduced.				
<b>Usage Guidelines</b>	This command requires the MPLS Services license.				
<b>Examples</b>	<p>This example shows how to redistribute directly connected routes using BGP:</p> <pre>switch# configure t switch(config)# router bgp 1.1 switch(config-router)# vrf vpn1 switch(config-router-vrf)# address-family ipv4 unicast switch(config-router-vrf-af)# redistribute direct route-map directMap switch(config-vrf-af)#</pre>				
<b>Related Commands</b>	<table border="1"> <thead> <tr> <th><b>Command</b></th><th><b>Description</b></th></tr> </thead> <tbody> <tr> <td><b>mpls ldp configuration</b></td><td>Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).</td></tr> </tbody> </table>	<b>Command</b>	<b>Description</b>	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).
<b>Command</b>	<b>Description</b>				
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).				

---

■ **redistribute static route-map**

# redistribute static route-map

To redistribute static routes by using the Border Gateway Protocol (BGP), use the **redistribute static-map** command. To return to the default setting, use the **no** form of this command.

**redistribute static route-map *map-tag***

**no redistribute static route-map *map-tag***

---

<b>Syntax Description</b>	<i>map-tag</i>	Map name that can be any case-sensitive, alphanumeric string up to 63 characters.
---------------------------	----------------	---

---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Address family configuration mode
----------------------	-----------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to redistribute static routes using BGP:
<pre>switch# configure t switch(config)# router bgp 1.1 switch(config-router)# vrf vpn1 switch(config-router-vrf)# address-family ipv4 unicast switch(config-router-vrf-af)# redistribute static route-map StaticMap switch(config-vrf-af)# </pre>	

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

# redundancy

To configure a Layer 2 VPN (L2VPN) virtual forwarding interface (VFI) context as the primary or secondary node, use the **redundancy** command.

**redundancy {primary | secondary}**

<b>Syntax Description</b>	<b>primary</b> Specifies the context as a primary node. <b>secondary</b> Specifies the context as a secondary node.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-l2vpn-vfi mode
----------------------	-----------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure an L2VPN VFI context as the primary node:
<pre>switch# configure terminal switch(config)# l2vpn vfi context vpls80 switch(config-l2vpn-vfi)# description VFIforDualHome switch(config-l2vpn-vfi)# vpn 10 switch(config-l2vpn-vfi)# redundancy primary switch(config-l2vpn-vfi)# </pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>bridge domain</b>	Enters bridge-domain configuration mode and configures a bridge domain.
	<b>l2vpn vfi context</b>	Establishes a Layer 2 VPN (L2VPN) Virtual Forwarding Interface (VFI) between two or more separate networks.
	<b>vpn</b>	Configures a Virtual Private Network (VPN) ID on a VFI context.

---

remote link failure notification

# remote link failure notification

To enable Any Transport over MPLS (AToM) remote link failure notification and shutdown, use the **remote link failure notification** command. To disable remote link failure notification, use the **no** form of this command.

**remote link failure notification**

**no remote link failure notification**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** Global configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	6.2.2	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to enable AToM remote link failure notification and shutdown:

```
switch# configure terminal
switch(config)# 12vpn xconnect context XCON1
switch(config-xconnect)# remote link failure notification
```

This example shows how to disable the AToM remote link failure notification and shutdown:

```
switch(config-xconnect)# no remote link failure notification
switch(config-xconnect)#

```

---

Related Commands	Command	Description
	<b>12vpn xconnect context</b>	Enters Xconnect configuration mode and establishes a Layer 2 VPN (L2VPN) context for identifying the two members in a VPWS, multi-segment pseudowire, or local connect service.

---

# reoptimize events link-up

To reoptimize tunnels on link-up events, use the **reoptimize events link-up** command. To return to the default setting, use the **no** form of this command.

**reoptimize events link-up**

**no reoptimize events link-up**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** TE configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to reoptimize tunnels on link-up events:

```
switch# configure t
switch(config)# mpls traffic-eng configuration
switch(config-te)# reoptimize events link-up
switch(config-te)#

```

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

---

 reoptimize timers

# reoptimize timers

To configure Multiprotocol Label Switching (MPLS) traffic engineering reoptimize timers, use the **reoptimize timers** command. To return to the default setting, use the **no** form of this command.

**reoptimize timers {delay cleanup sec | installation sec | frequency sec}**

**no reoptimize timers {delay cleanup | installation | frequency}**

Syntax Description	<b>delay</b>	Specifies the delay reoptimization action.
	<b>cleanup</b>	Specifies to delay the cleanup of the reoptimized LSP.
	<i>sec</i>	Time in seconds to delay the cleanup of the replaced tunnel LSP. The range is from 0 to 60.
	<b>installation</b>	Specifies to delay the replacement of the current LSP by the reoptimized LSP.
	<i>sec</i>	Time in seconds to delay the replacement of the tunnel LSP. The range is from 0 to 3600.
	<b>frequency</b>	Specifies the interval between reoptimization scans.
	<i>sec</i>	Time in seconds between reoptimizations. The range is from 0 to 604800.

---

**Defaults**

The default are as follows:

- Delay cleanups— The default is 10.
- Installation— The default is 3.
- frequency— The default is 3600.

---

**Command Modes** TE configuration mode

---

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to delay the replacement of the current LSP by the reoptimized LSP:

```
switch# configure t
switch(config)# mpls traffic-eng configuration
switch(config-te)# reoptimize timers delay installation 3000
```

```
switch(config-te) #
```

Related Commands	Command	Description
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering Protocol (MPLS-TE).

**restart**

# restart

To gracefully restart the Resource Reservation Protocol (RSVP) process, use the **restart** command. To return to the default settings, use the **no** form of the command.

**restart rsvp**

**no restart rsvp**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** EXEC.

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to rate limit the number of messages that are sent to a neighboring router:

```
switch# restart rsvp
switch#
```

---

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# rewrite ingress tag push dot1q symmetric

To add one VLAN tag to the incoming dot1q frame and symmetrically apply the operation to the ingress and egress frames, use the **rewrite ingress tag push dot1q symmetric** command.

**rewrite ingress tag push dot1q *vlan-id* symmetric**

<b>Syntax Description</b>	<i>vlan-id</i> VLAN ID. The range is from 2 to 967.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-if-srv mode
----------------------	--------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	The VLAN ID must match the domain ID of the bridge domain to which this Ethernet Flow Point (EFP) is to be associated.
-------------------------	--

This command is supported only on an EFP that you configured with the **encapsulation default** command.

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to add one VLAN tag to the incoming dot1q frame and symmetrically apply the operation to the ingress and egress frames:
-----------------	--

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# no ip address 10.1.1.1 255.255.255.0
switch(config-if)# service instance 1 ethernet
switch(config-if-srv)# description EFP1forTest
switch(config-if-srv)# encapsulation dot1q 10
switch(config-if-srv)# rewrite ingress tag push dot1q 30 symmetric
switch(config-if-srv)#

```

■ **rewrite ingress tag push dot1q symmetric**

Related Commands	Command	Description
	<b>rewrite ingress tag translate 1-to-1 dot1q symmetric</b>	To rewrite one VLAN tag in the incoming dot1q frame and symmetrically apply the operation to the ingress and egress frames.
	<b>service instance</b>	Enters interface services configuration mode and configures an EFP on the interface.

# rewrite ingress tag translate 1-to-1 dot1q symmetric

To rewrite one VLAN tag in the incoming dot1q frame and symmetrically apply the operation to the ingress and egress frames, use the **rewrite ingress tag translate 1-to-1 dot1q symmetric** command.

**rewrite ingress tag translate 1-to-1 dot1q *vlan-id* symmetric**

<b>Syntax Description</b>	<i>vlan-id</i>	VLAN ID. The range is from 2 to 967.
---------------------------	----------------	--------------------------------------

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-if-srv mode
----------------------	--------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	The VLAN ID must match the domain ID of the bridge domain to which this Ethernet Flow Point (EFP) is to be associated.
-------------------------	--

This command is supported only on an EFP that you configured with the **encapsulation default** command.

This command requires the MPLS Services license.

<b>Examples</b>	This example shows how to rewrite one VLAN tag in the incoming dot1q frame and symmetrically apply the operation to the ingress and egress frames:
-----------------	--

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# no ip address 10.1.1.1 255.255.255.0
switch(config-if)# service instance 1 ethernet
switch(config-if-srv)# description EFP1forTest
switch(config-if-srv)# encapsulation dot1q 10
switch(config-if-srv)# rewrite ingress tag push dot1q 30 symmetric
switch(config-if-srv)# rewrite ingress tag translate 1-to-1 dot1q 20 symmetric
```

<b>Related Commands</b>	
-------------------------	--

■ **rewrite ingress tag translate 1-to-1 dot1q symmetric**

Command	Description
<b>rewrite ingress tag push dot1q symmetric</b>	Adds one VLAN tag to the incoming dot1q frame and symmetrically applies the operation to the ingress and egress frames.
<b>service instance</b>	Enters interface services configuration mode and configures an EFP on the interface.

# route-target

To create a route-target extended community for a virtual routing and forwarding (VRF) instance, use the **route target** command. To return to the default setting, use the **no** form of this command.

**route-target {import | export} route-target-ext-community**

**no route-target {import | export} route-target-ext-community**

Syntax Description	<b>import</b> Imports routing information from the target virtual private network (VPN) extended community. <b>export</b> Exports routing information to the target virtual private network (VPN) extended community. <b>route-target-ext-community</b> Route-target-extended community attributes that you can use to specify the VRF's list of import or export route-target extended communities. You can enter the route-target-ext-community argument as follows: <ul style="list-style-type: none"> <li>• 16-bit or 32-bit AS number: your 32-bit number, for example, 1.2:3</li> <li>• 32-bit IP address: your 16-bit number, for example, 192.0.2.1:1</li> </ul>
--------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Address family configuration mode
----------------------	-----------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

Command History	Release	Modification
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command does not require the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to create a route-target extended community for a VRF:
-----------------	---

```
switch# configure t
switch(config)# vrf context vpn1
switch(config-vrf)# address-family ipv4 unicast
switch(config-vrf-af)# route-target import 1:101
```

**route-target****Related Commands**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# router bgp

To configure a Border Gateway Protocol (BGP) process for an interface, use the **router bgp** command. To return to the default setting, use the **no** form of this command.

**router bgp *as-number***

**no router bgp *as-number***

<b>Syntax Description</b>	<i>as-number</i>	Number of an autonomous system that identifies the router to other BGP routers and tags that the routing information passed along. The AS number can be a 16-bit integer or a 32-bit integer in the form of a higher 16-bit decimal number and a lower 16-bit decimal number in xx.xx format.
<b>Defaults</b>	None	
<b>Command Modes</b>	Global configuration mode	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	<p>This example shows how to configure a BGP process for an interface:</p> <pre>switch(config)# <b>router bgp 1.1</b> switch(config-router)# </pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>tunnel-te interface</b>	Configures the traffic engineering (TE) interface.

---

 router isis

## router isis

To configure an Intermediate System-to-Intermediate System (IS-IS) routing process, use the **router isis** command. To return to the default setting, use the **no** form of this command.

**router isis *routing-process-tag***

**no router isis *routing-process-tag***

---

<b>Syntax Description</b>	<i>routing-process-tag</i>	Routing process tag. The maximum size is 20 alphanumeric characters.
---------------------------	----------------------------	--

---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Router configuration mode
----------------------	---------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

---

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure an IS-IS routing process:
	<pre>switch# configure terminal switch(config)# router isis p1 switch(config-router)# </pre>

---

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>tunnel-te interface</b>	Configures the traffic engineering (TE) interface.

---

# router ospf

To enable an Open Shortest Path First (OSPF) routing process, use the **router ospf** command. To return to the default setting, use the **no** form of this command.

**router ospf** *router-process-tag*

**no router ospf** *router-process-tag*

<b>Syntax Description</b>	<i>router-process-tag</i> Process name. The maximum size is 20 alphanumeric characters.
---------------------------	---

<b>Syntax Description</b>	This command has no arguments or keywords.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Router configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable an OSPF routing process:
	<pre>switch# configure terminal switch(config)# router ospf p1 switch(config-router)# </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>tunnel-te interface</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

**router rip**

# router rip

To enable the Routing Information Protocol (RIP), use the **router rip** command. To return to the default setting, use the **no** form of this command.

**router rip** *instance-tag*

**no router rip** *instance-tag*

<b>Syntax Description</b>	<i>instance-tag</i>	Instance tag that can be any case-sensitive, alphanumeric string up to 20 characters.
---------------------------	---------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to enable RIP:
<pre>switch# configure terminal switch(config)# switch(config)# feature rip switch(config)# router rip Test1 switch(config-router)#</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>tunnel-te interface</b>	Configures the traffic engineering (TE) interface.

# router-id

To configure the preferred interface for determining the Label Distribution Protocol (LDP) router ID, use the **router-id** command. To return to the default setting, use the **no** form of this command.

**router-id loopback *interface number* [force]**

**no router-id loopback *interface number* [force]**

<b>Syntax Description</b>	<b>loopback</b> Specifies the loopback interface. The interface could be Ethernet or any others. <i>interface number</i> Virtual interface number. The range is from 0 to 1023. <b>force</b> (Optional) Specifies to forcibly change the LDP router ID.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	LDP configuration mode
----------------------	------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the preferred interface for determining the LDP router ID:
	<pre>switch(config)# mpls ldp switch(config-ldp)# router-id loopback 2 switch(config-ldp)# </pre>

<b>Examples</b>	This example shows how to assign Ethernet 2/2 interface as the LDP router ID:
	<pre>switch# configure terminal switch(config)# mpls ldp switch(config-ldp)# router-id loopback 0 force </pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

■ router-id

## Show Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with Show.

---

■ **show bgp unicast neighbors vrf**

# show bgp unicast neighbors vrf

To display information about Border Gateway Protocol (BGP) neighbors, use the **show bgp unicast neighbors vrf** command.

**show bgp {ipv4 | ipv6} unicast neighbors vrf *vrf-name***

<b>Syntax Description</b>	<p><b>vrf-name</b> VRF name that is any case-sensitive, alphanumeric string up to 32 characters.</p>
<b>ipv4</b>	Specifies the IPv4 MPLS network.
<b>ipv6</b>	Specifies the IPv6 MPLS network.

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	EXEC mode
----------------------	-----------

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	EXEC mode
----------------------	-----------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to display information about OSPF:
-----------------	---

```
switch(config)# show ip ospf test1 vrf vpn1

Routing Process test1 with ID 0.0.0.0 VRF vpn1
Stateful High Availability enabled
Graceful-restart is configured
    Grace period: 60 state: Inactive
    Last graceful restart exit status: None
    Supports only single TOS(TOS0) routes
    Supports opaque LSA
    Administrative distance 110
    Reference Bandwidth is 40000 Mbps
    SPF throttling delay time of 200.000 msec,
        SPF throttling hold time of 1000.000 msec,
        SPF throttling maximum wait time of 5000.000 msec
    LSA throttling start time of 0.000 msec,
        LSA throttling hold interval of 5000.000 msec,
        LSA throttling maximum wait time of 5000.000 msec
    Minimum LSA arrival 1000.000 msec
    LSA group pacing timer 10 secs
    Maximum paths to destination 8
```

**show ip ospf**

```
Number of external LSAs 0, checksum sum 0
Number of opaque AS LSAs 0, checksum sum 0
Number of areas is 0, 0 normal, 0 stub, 0 nssa
Number of active areas is 0, 0 normal, 0 stub, 0 nssa
switch(config)#
```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# show ip ospf mpls ldp interface

To display the configuration status of the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Interior Gateway Protocol (IGP) synchronization on the Open Shortest Path First (OSPF) interfaces, use the **show ip ospf mpls ldp interface** command.

**show ip ospf mpls ldp interface [ethernet slot/port]**

<b>Syntax Description</b>	<b>ethernet</b> (Optional) Specifies an Ethernet interface. <b>slot/port</b> (Optional) Slot or chassis number. The range is from 1 to 253 characters.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to display the data MDT advertisements that this specified router has received:
	<pre>switch# show ip pim mdt receive vrf all MDT Data Groups Received List for vrf: vpn1 C-Source          C-Group          MDT Source        MDT Group        Uptime 10.0.0.1          232.1.1.1       11.0.0.1         225.1.1.1       2d17h switch#</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# show ip pim mdt send

To display the Protocol Independent Multicast (PIM) data multicast distribution tree (MDT) join send information, use the **show ip pim mdt send** command.

**show ip pim mdt send [detail] [vrf {vrf-name | all}]**

## Syntax Description

<b>detail</b>	(Optional) Displays the detailed information.
<b>vrf</b>	(Optional) Displays the virtual routing and forwarding (VRF) instance.
<i>vrf-name</i>	(Optional) VRF name. The maximum size is 32 alphanumeric characters.
<b>all</b>	(Optional) Displays the information for all VRFs.

## Defaults

None

## Command Modes

EXEC mode

## Supported User Roles

network-admin  
vdc-admin

## Command History

Release	Modification
5.2(1)	This command was introduced.

## Usage Guidelines

This command requires the MPLS Services license.

## Examples

This example shows how to display the data multicast distribution tree (MDT) join send information:

```
switch# show ip pim mdt send vrf all
MDT Data Groups Send List for vrf: vpn1
C-Source      C-Group      MDT Source      MDT Group      Uptime
  10.0.0.1    232.1.1.1    11.0.0.1       225.1.1.1    2d17h
switch#
```

## Related Commands

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 show ip prefix-list

# show ip prefix-list

To display the contents of all current IP prefix lists or of a specified prefix list, use the **show ip prefix-list** command.

**show ip prefix-list [prefix-list]**

<b>Syntax Description</b>	<i>prefix-list</i>	(Optional) Prefix list. The maximum length is 63 alphanumeric characters.
---------------------------	--------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Interface configuration mode

# show mpls interface detail

To display details about the configuration status of the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) on the interface, use the **show mpls interface detail** command.

## show mpls interface detail

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Interface configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how display details about the configuration status of MPLS LDP on the interface:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# show mpls interface detail
Interface Ethernet2/2:
    ldp enabled
    MPLS operational
    Label space id 0x10000001
    MPLS sub-layer Ethernet2/2-mpls layer(0x26000002)
Interface tunnel-te1:
    mpls te vif enabled
    MPLS is not operational
    Label space id 0x10000001
    MPLS sub-layer tunnel-te1-mpls layer(0x26000001)
switch(config)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 show mpls interfaces

# show mpls interfaces

To display the Multiprotocol Label Switching (MPLS) interfaces, use the **show mpls interfaces** command.

```
show mpls interfaces {detail | ethernet slot/port subinterface statistics | internal | loopback
                     virtual interface number statistics | port-channel port channel number sub interface statistics
                     | tunnel-te TE interface number statistics}
```

Syntax Description	
<b>detail</b>	Displays detailed information about the interface.
<b>ethernet</b>	Displays the Ethernet interface.
<i>slot/port</i>	Slot or port number. The range is from 1 to 253.
<i>subinterface</i>	Sub interface separator.
<b>statistics</b>	Displays the statistics information.
<b>internal</b>	Displays the internal information.
<b>loopback</b>	Displays the loopback interfaces.
<i>virtual interface number</i>	Virtual interface number. The range is from 0 to 1023.
<b>port-channel</b>	Port channel interface.
<i>port channel number</i>	Port channel number. The range is from 1 to 4096.
<b>tunnel-te</b>	Displays the traffic engineering interface.
<i>TE interface number</i>	Traffic engineering interface number. The range is from 0 to 65503.

  

Defaults	None
Command Modes	EXEC mode
Supported User Roles	network-admin vdc-admin

  

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to display the traffic engineering statistics interface information:

```
switch# show mpls interfaces tunnel-te 1 statistics
tunnel-te1
      MPLS disabled
switch#
```

**Related Commands**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 show mpls ip bindings

# show mpls ip bindings

To display the Multiprotocol Label Switching (MPLS) IP Label Information Base, use the **show mpls ip bindings** command.

```
show mpls ip bindings destination-prefix [advertisement-prefix-list | detail | local | local-label [number] | neighbor addr | remote-label [number] | summary]
```

Syntax Description	
<i>destination-prefix</i>	Destination prefix.
<b>advertisement-prefix-list</b>	(Optional) Displays the advertisement prefix list.
<b>detail</b>	(Optional) Displays the detailed information.
<b>local</b>	(Optional) Displays only locally assigned label values.
<b>local-label</b>	(Optional) Displays the locally assigned label values.
<i>number</i>	(Optional) Displays the label value. The range is from 1 to 2147483647.
<b>neighbor</b>	Displays the label from LDP neighbor.
<i>addr</i>	Neighbor IP address.
<b>remote-label</b>	(Optional) Displays remotely assigned label values.
<b>summary</b>	(Optional) Displays the summary information.

Defaults	None

```
switch# show mpls oam echo statistics

Cisco TLV version: RFC 4379 Compliant
Echo Reply return code distribution:
  x - No return code (0)          - 0
  M - Malformed Echo request (1)  - 0
  m - Unsupported TLVs (2)       - 0
  ! - Success (3)                - 0
  F - No FEC mapping (4)         - 0
  D - DS Map mismatch (5)        - 0
  I - Unknown Upstream Interface index (6) - 0
  U - Reserved (7)              - 0
  L - Labeled output interface (8) - 0
  B - Unlabeled output interface (9) - 0
  f - FEC mismatch (10)          - 0
```

■ **show mpls oam**

```
N - No label entry (11) - 0
P - No receive interface label protocol (12) - 0
p - Premature termination of LSP (13) - 0
X - Undefined return code - 0
Echo Requests: sent (0)/received (0)/timedout (0)/unsent (0)
Echo Replies: sent (0)/received (0)/unsent (0)
switch#
```

This example shows how to display the echo packet statistics summary:

```
switch# show mpls oam echo statistics summary
```

```
Cisco TLV version: RFC 4379 Compliant
Echo Requests: sent (0)/received (0)/timedout (0)/unsent (0)
Echo Replies: sent (0)/received (0)/unsent (0)
switch#
```

#### Related Commands

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# show mpls static binding ipv4

To display the Multiprotocol Label Switching (MPLS) configured static IPv4 labels, use the **show mpls static binding ipv4** command.

**show mpls static binding ipv4**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Interface configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to display the MPLS static IPv4 labels:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# mpls ldp configuration
switch(config-ldp)# show mpls static binding ipv4
switch(config-ldp)#

```

Related Commands	Command	Description
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

■ **show mpls static binding ipv4 vrf**

## show mpls static binding ipv4 vrf

To display the configured Multiprotocol Label Switching (MPLS) static virtual routing and forwarding (VRF) binding for IPv4, use the **show mpls static binding ipv4 vrf** command.

**show mpls static binding ipv4 vrf *vrf-name***

<b>Syntax Description</b>	<i>vrf-name</i>	VRF name. The maximum size is 32 alphanumeric characters.
---------------------------	-----------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Interface configuration mode
----------------------	------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	You must configure the MPLS VPN and VRFs before creating VRF-aware static labels. This command requires the MPLS Services license.
-------------------------	---

<b>Examples</b>	This example shows how to display the MPLS VRF static bindings for IPv4:  switch# <b>config t</b> Enter configuration commands, one per line. End with CNTL/Z. switch(config-ldp)# <b>show mpls static binding ipv4 vrf vrf100</b> ---need to get the output
-----------------	--

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# show mpls switching

To display the contents of the Multiprotocol Label Switching (MPLS) Unified Label Information Base (ULIB), use the **show mpls switching** command.

**show mpls switching {ip prefix | ipv6 prefix}**

<b>Syntax Description</b>	<i>ipv4-prefix</i> Specifies the IPv4 prefix or mask. <i>ipv6-prefix</i> Specifies the IPv6 prefix or mask.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	EXEC
----------------------	------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(5) and higher including 6.1(1)	Changed the command output.
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to display the MPLS label switching database:
-----------------	--

```
switch(config)# show mpls switching
Legend:
(P)=Protected, (F)=FRR active, (*)=more labels in stack.
In-Label Out-Label FEC name Out-Interface Next-Hop
VRF default
106 3 10.1.1.2/32 Eth2/19 19.20.0.2
106 None 10.1.1.2/32 Eth2/9 9.10.0.2
VRF vpn1
101 None 92.168.1.0/24 Eth2/26.1 110.0.1.2
VRF vpn2
100 None 92.168.2.0/24 Eth2/26.2 110.0.2.2
VRF vpn3
102 None 92.168.3.0/24 Eth2/26.3 110.0.3.2
VRF vpn4
103 None 92.168.4.0/24 Eth2/26.4 110.0.4.2

---

■ show mpls traffic-eng link-management

# show mpls traffic-eng link-management

To display the link management information, use the **show mpls traffic-eng link management** command.

```
show mpls traffic-eng link-management {admission-control [intfc] | advertisement |
    bandwidth-allocation [summary] [intfc] | igr-neighbors [igr-id isis nsapaddr | ospf ipaddr]
    | [ip ipaddr] | [intfc] | interfaces [intfc] | statistics [intfc] | summary [intfc]}
```

Syntax Description	
<b>admission-control</b>	Displays the link management admission control.
<i>intfc</i>	(Optional) Interface number.
<b>advertisement</b>	Displays the link management advertisements.
<b>bandwidth-allocation</b>	Specifies the link management bandwidth allocation.
<b>summary</b>	(Optional) Displays the link management summary.
<b>igr-neighbors</b>	Displays the link management IP neighbors.
<b>igr-id</b>	(Optional) Displays the link management Interior Gateway Protocol (IGP) neighbors by the IGP ID.
<i>isis</i>	Intermediate System-to-System (IS-IS) node ID.
<i>nsapaddr</i>	(Optional) Neighbors IP address.
<b>ospf</b>	(Optional) Displays the neighbors with the matching Open Shortest Path First (OSPF) node ID.
<i>ipaddr</i>	(Optional) Neighbor's IP address.
<b>ip</b>	(Optional) Displays the neighbor's IP address.
<b>interfaces</b>	Displays the link management traffic engineering interfaces.
<b>statistics</b>	Displays the link management traffic engineering statistics.
<b>summary</b>	Displays the link management summary.

  

<b>Defaults</b>	None

# show mpls traffic-eng topology

To display the traffic engineering (TE) topology, use the **show mpls traffic-eng topology** command.

```
show mpls traffic-eng topology [ipaddr | [area area | level-1 | level-2] igr-id isis nsap-address |
    ospf ip-address ] [brief]
```

## Syntax Description

<b>ipaddr</b>	Interface IP address.
<b>area</b>	Displays the restricted output to an OSPF area.
<b>area</b>	Open Shortest Path First (OSPF) area ID as a decimal value. The range is from 0 to 4294967295.
<b>level-1</b>	Displays the restricted output to an Intermediate System-to-System (IS-IS) level 1.
<b>level-2</b>	Displays the restricted output to an Intermediate System-to-System (IS-IS) level 2.
<b>igr-id</b>	Displays the topology based on the Interior Gateway Protocol (IGP) ID.
<b>isis</b>	Displays the topology based on the IS-IS IGP ID.
<b>nsap-address</b>	IP address.
<b>ospf</b>	Displays the trafficengineering topology based on the OSPF IGP ID.
<b>ip-address</b>	IP address.
<b>brief</b>	Displays the brief format.

```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show mpls traffic-eng link-management advertisements</b>	Displays the Multiprotocol Label Switching (MPLS) traffic engineering (TE) link management advertisements information.

# show mpls traffic-eng tunnels backup

To display if fast reroute backup protection is provided by the tunnels, use the **show mpls traffic-eng tunnels backup** command.

**show mpls traffic-eng tunnels backup**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** EXEC mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** The command allows you to verify the following:

- The backup tunnel exists—Verify that there is a backup tunnel that terminates at this label switched path (LSP) next-hop (NHOP) or next-next-hop (NNHOP). Look for the LSP's next-hop NHOP or NNHOP in the Dest field.
- The backup tunnel is up—Verify that the backup tunnel is up by looking for Up in the State field.
- The backup tunnel is associated with the LSP's interface—Verify that the interface for the LSP is allowed to use this backup tunnel. Look for the LSP's output interface in the protects field list.
- The backup tunnel has sufficient bandwidth—if you restrict the amount of bandwidth that a backup tunnel can hold, verify that the backup tunnel has sufficient bandwidth to hold the LSPs that would use this backup tunnel if there is a failure. The bandwidth of an LSP is defined by the line bandwidth at the headend of the LSP. To determine the available bandwidth on a backup tunnel, look at the cfg and inuse fields. If there is insufficient backup bandwidth to accommodate the LSPs that would use this backup tunnel if a failure occurs, create an additional backup tunnel or increase the backup bandwidth of the existing tunnel by using the **bandwidth** command.

This command requires the MPLS Services license.

To make a backup tunnel to be operational, the LSP must be reroutable. At the headend of the LSP, enter the **show run int tunnel tunnel-number** command. The output should include the **fast-reroute** command.

---

```
■ show mpls traffic-eng tunnels backup
```

**Examples**

This example shows how to display that fast reroute backup protection is provided by tunnels:

```
show# show mpls traffic-eng tunnels backup
LSP Head, tunnel-te2001, Admin: up, Oper: up
  Src 10.1.1.1, Dest 10.1.1.2, Instance 61
Fast Reroute Backup Provided:
  Protected i/fs: Eth2/2
  Protected lssps: 4999 Active lssps: 0
  Backup BW: any pool unlimited; inuse: 0 kbps
switch#
```

**Related Commands**

To display information about the Intermediate System-to-Intermediate System (IS-IS) configuration, use the **show running-config isis** command.

**show running-config isis**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Router configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to display information about the IS-IS configuration:

```
switch(config)# router isis
switch(config-router)# show running-config isis
!Command: show running-config isis
!Time: Sat Jul 2 05:38:15 2011

version 5.2(1)
feature isis

router isis 1
router isis 2
router isis 20
router isis p1
switch(config-router)#

```

**Related Commands**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 show running-config l3vm

# show running-config l3vm

To display the running configuration for the Layer 3 virtual machine (L3VM), use the **show running-config l3vm** command.

**show running-config l3vm**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None

---

**Command Modes** EXEC mode

---

**SupportedUserRoles** network-admin  
vdc-admin

---

Command History	Release	Modification
	5.2(1)	This command was introduced.

---

---

**Usage Guidelines** This command requires the MPLS Services license.

---

**Examples** This example shows how to display the running configuration for the Layer 3 virtual machine (L3VM):

```
switch# show running-config l3vm
switch# show running-config l3vm

!Command: show running-config l3vm
!Time: Sat May 28 23:58:35 2011

version 5.2(1)
vrf context vrf1
vrf context management

interface Ethernet8/1
  vrf member vrf1

switch#
```

---

Related Commands	Command	Description
	<b>show mpls forwarding statistics</b>	Displays the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) traffic forwarding statistics.

---

# show running-config mpls ldp

To display the configuration status of the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) on the device, use the **show running-config mpls ldp** command.

**show running-config mpls ldp**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** EXEC mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to display the running configuration status of MPLS LDP on the device:

```
switch# show running-config mpls ldp
!Command: show running-config mpls ldp
!Time: Mon Mar 14 01:49:48 2011

version 5.2(1)
feature mpls ldp

interface Ethernet8/1

---

**Related Commands**

Command	Description
<b>show mpls forwarding statistics</b>	Displays the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) traffic forwarding statistics.

---

---

```
■ show run mpls ldp all
```

## show run mpls ldp all

To display information about all of the running Label Distribution Protocol (LDP) sessions, use the **show run mpls ldp all** command.

```
show run mpls ldp all
```

**Syntax Description** This command does not have any arguments or keywords.

**Defaults** None

**Command Modes** Any command mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	6.2.2	This command was introduced.

**Usage Guidelines** This command does not require a license.

**Examples** This example shows how to display information about all of the running LDP sessions:

```
switch# show run mpls ldp all
switch #
```

Related Commands	Command	Description
	<b>show mpls ldp graceful-restart</b>	Displays graceful-restart sessions and session parameters.

# show running-config ospf

To display information about the Open Shortest Path First (OSPF) configuration, use the **show running-config ospf** command.

**show running-config ospf**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Command Modes** Router configuration mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to display information about the OSPF configuration:

```
switch(config)# router isis
switch(config-router)# show running-config ospf
!Command: show running-config ospf
!Time: Sat Jul  2 06:16:08 2011

version 5.2(1)
feature ospf

1
foo
p1
process-name
switch(config-router)#

```

**Related Commands**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 show running-config vrf

# show running-config vrf

To display virtual routing and forwarding (VRF) information, use the **show running-config vrf** command.

**show running-config vrf *vrf-name***

<b>Syntax Description</b>	<i>vrf-name</i>	VRF name.
---------------------------	-----------------	-----------

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	EXEC
----------------------	------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to display VRF information:
<pre>switch# show running-config vrf vrf1 !Command: show running-config vrf vrf1 !Time: Tue Mar 15 01:53:18 2011  version 5.2(1) address-family ipv4 unicast     maximum routes 2 switch#</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# show startup-config mpls traffic-eng

To display startup configuration for traffic engineering (TE), use the **show startup-config mpls traffic-eng** command.

**show startup-config mpls traffic-eng [all]**

<b>Syntax Description</b>	<b>all</b>	Displays the startup configuration with defaults.
<b>Defaults</b>	None	
<b>Command Modes</b>	EXEC	
<b>Supported User Roles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to display the startup configuration for TE:	
	<pre>switch# show startup-config mpls traffic-eng list port-channels: Communication could not be established with the process  !Command: show startup-config mpls traffic-eng !Time: Tue Apr 19 06:52:45 2011 !Startup config saved at: Mon Apr 18 20:15:25 2011  version 5.2(1) feature mpls traffic-eng  mpls traffic-eng configuration     fast-reroute timers promotion 4     link-management timers bandwidth-hold 200     logging lsp setups     path-selection overload allow head     reoptimize timers delay installation 3000     topology holddown sigerr 200     shutdown     lsp attributes 1 --More-- switch#</pre>	

■ **show startup-config mpls traffic-eng**

Related Commands	Command	Description
	<b>show running-config mpls traffic-eng</b>	Displays the configuration status of the Multiprotocol Label Switching (MPLS) traffic engineering (TE) on the device.

# show startup-config vrf

To display virtual routing and forwarding (VRF) startup system information, use the **show startup-config vrf** command.

**show startup-config vrf *vrf-name***

<b>Syntax Description</b>	<i>vrf-name</i>	VRF name.
---------------------------	-----------------	-----------

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	EXEC
----------------------	------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to display VRF startup system information:
-----------------	---

```
switch# show startup-config vrf1
!Command: show startup-config vrf vrf1
!Time: Tue Mar 15 01:58:31 2011

version 5.2(1)
vrf context vrf1
  address-family ipv4 unicast
    maximum routes 2

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

■ show vrf interface

## T Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with T.

**table-map**

# table-map

To configure a table map, use the **table-map** command. To return to the default setting, use the **no** form of this command.

**table-map** *table-map-name*

**no table-map** *table-map-name*

<b>Syntax Description</b>	<i>table-map-name</i>	Table map name. The maximum size is 40 alphanumeric characters.
---------------------------	-----------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Table map configuration mode
----------------------	------------------------------

<b>Supported User Roles</b>	network-admin vdc-admin
-----------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure a table map:
	<pre>switch# configure terminal switch(config)# table-map TableMap1 switch(config-tmap)</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# timers lsa-arrival

To configure the link-state advertisement (LSA) arrival time, use the **timer lsa-arrival** command. To return to the default setting, use the **no** form of this command.

**timers lsa-arrival *arrive-time***

**no timers lsa-arrival *arrive-time***

<b>Syntax Description</b>	<i>arrive-time</i>	Arrival time. The range is from 10 to 600000 milliseconds.
<b>Defaults</b>	1000	
<b>Command Modes</b>	Router configuration mode	
<b>SupportedUserRoles</b>	network-admin vdc-admin	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.
<b>Usage Guidelines</b>	This command requires the MPLS Services license.	
<b>Examples</b>	This example shows how to set the LSA arrival time:	
	<pre>switch# configure terminal switch(config)# feature ospf switch(config)# test1 bgp(config-router)# timers lsa-arrival 1200 bgp(config-router)# </pre>	
<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

---

 timers throttle lsa

## timers throttle lsa

To set rate limiting for link-state advertisement (LSA) generation, use the **timers throttle lsa** command. To return to the default setting, use the **no** form of this command.

**timers throttle lsa start-interval hold-interval max-interval**

**no timers throttle lsa start-interval hold-interval max-interval**

---

### Syntax Description

<i>start-interval</i>	Start interval. The range is from 0 to 5000 milliseconds.
<i>hold-interval</i>	Hold interval. The range is from 50 to 30000 milliseconds.
<i>max-interval</i>	Max interval. The range is from 50 to 30000 milliseconds.

---

### Defaults

The defaults are as follows:

- *start-interval*— The default is 0.
- *hold-interval*— The default is 5000.
- *max-interval*— The default is 5000.

---

### Command Modes

Router configuration mode

---

### SupportedUserRoles

network-admin  
vdc-admin

---

### Command History

Release	Modification
5.2(1)	This command was introduced.

---

### Usage Guidelines

This command requires the MPLS Services license.

---

### Examples

This example shows how to set rate limiting for LSA generation:

```
switch# configure terminal
switch(config)# feature ospf
switch(config)# test1
switch(config-router)# timers throttle lsa 1 500 600
switch(config-router)#

```

---

### Related Commands

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# topology

To configure the Multiprotocol Label Switching (MPLS) topology database, use the **topology** command.

**topology holddown sigerr sec**

<b>Syntax Description</b>	<b>holddown</b> Specifies the topology database hold down timers. <b>sigerr</b> Specifies the link hold down time for signalling errors. <b>sec</b> Holddown time in seconds. The range is from 0 to 300.
---------------------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	TE configuration mode
----------------------	-----------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to specify the link hold down time for signalling errors:
<pre>switch# configure terminal switch(config)# mpls traffic-eng configuration switch(config-te)# topology holddown sigerr 200 switch(config-te)# </pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Traffic Engineering protocol (MPLS-TE).

**traceroute mpls**

# traceroute mpls

To test the default path of the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) from source to destination, use the **traceroute mpls** command.

```
traceroute mpls {ipv4 target address | multipath ipv4 target address | traffic-eng tunnel-te interface number}
```

Syntax Description	
<b>ipv4</b>	Specifies the target IPv4 address.
<i>target address</i>	Target address.
<b>multipath ipv4</b>	Specifies the label switched path (LSP) multipath traceroute.
<b>traffic-eng</b>	Specifies the target traffic engineering (TE) tunnel interface.
<b>tunnel-te</b>	Specifies the TE interface.
<i>interface number</i>	TE interface number. The range is from 0 to 65503.

**Defaults** None

**Command Modes** EXEC mode

**SupportedUserRoles** network-admin  
vdc-admin

Command History	Release	Modification
	5.2(1)	This command was introduced.

**Usage Guidelines** This command requires the MPLS Services license.

**Examples** This example shows how to specify the target TE tunnel interface:

```
switch# traceroute mpls traffic-eng tunnel-te 1

Tracing MPLS TE Label Switched Path on , timeout is 2 seconds

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
      'L' - labeled output interface, 'B' - unlabeled output interface,
      'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
      'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
      'P' - no rx intf label prot, 'p' - premature termination of LSP,
      'R' - transit router, 'I' - unknown upstream index,
      'X' - unknown return code, 'x' - return code 0

Type Ctrl-C to abort.
0 0.0.0.0 MRU 0 [No Label]
```

```
Q 1 *
switch#
```

**Related Commands**

Command	Description
<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

■ traceroute mpls

## V Commands

---

This chapter describes the Cisco NX-OS Multiprotocol Label Switching commands that begin with V.

# vpn

To configure a virtual private network (VPN) ID on a Virtual Forwarding Interface (VFI) context, use the **vpn** command.

**vpn *vpn-id***

<b>Syntax Description</b>	<i>vpn-id</i>	VPN ID. The range is from 1 to 4294967295.
---------------------------	---------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	config-l2vpn-vfi mode
----------------------	-----------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	6.2.2	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to configure a VPN ID on a VFI context:
-----------------	--

```
switch# configure terminal
switch# configure terminal
switch(config)# l2vpn vfi context vpls80
switch(config-l2vpn-vfi)# description VFIforDualHome
switch(config-l2vpn-vfi)# vpn 10
switch(config-l2vpn-vfi)#

```

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>bridge domain</b>	Enters bridge-domain configuration mode and configures a bridge domain.
	<b>l2vpn vfi context</b>	Establishes a Layer 2 VPN (L2VPN) virtual forwarding interface (VFI) between two or more separate networks.

**vrf**

To display information for a virtual routing and forwarding (VRF) instance, use the **vrf** command. To return to the default setting, use the **no** form of this command.

**vrf vrf-name**

**no vrf vrf-name**

<b>Syntax Description</b>	<i>vrf-name</i> VRF name that is any case-sensitive alphanumeric string up to 32 characters.
---------------------------	--

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Router VRF configuration mode
----------------------	-------------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to display information about each VRF instance:
<pre>switch# configure t switch(config)# feature ospf switch(config)# Test1 switch(config-router)# timers throttle lsa 0 5000 5000 switch(config-router)# timers lsa-arrival 30 switch(config-router)# vrf vpn1 switch(config-router-vrf)#</pre>	

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# vrf context

To create a new virtual routing and forwarding (VRF) instance, use the **vrf context** command. To return to the default setting, use the **no** form of this command.

**vrf context** *vrf-name*

**no vrf context** *vrf-name*

<b>Syntax Description</b>	<i>vrf-name</i>	VRF name that can be any case-sensitive, alphanumeric string up to 20 characters.
---------------------------	-----------------	---

<b>Defaults</b>	None
-----------------	------

<b>Command Modes</b>	Global configuration mode
----------------------	---------------------------

<b>SupportedUserRoles</b>	network-admin vdc-admin
---------------------------	----------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	5.2(1)	This command was introduced.

<b>Usage Guidelines</b>	This command requires the MPLS Services license.
-------------------------	--

<b>Examples</b>	This example shows how to create a new VRF instance:
	<pre>switch# configure terminal switch(config)# vrf context blue switch(config-vrf) #</pre>

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls ldp configuration</b>	Configures the Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP).

# vrf member

To set virtual routing and forwarding (VRF) membership on an interface, use the **vrf member** command. To return to the default setting, use the **no** form of this command.

**vrf member** *vrf-name*

**no vrf member** *vrf-name*

<b>Syntax Description</b>	<i>vrf-name</i> VRF name. The maximum size is 32 alphanumeric characters.				
<b>Defaults</b>	None				
<b>Command Modes</b>	Interface configuration mode
