

# Cisco RF Gateway 1 Software Release Notes, Release 2.02.16

### **Overview**

#### Introduction

Software Release 2.02.16 contains enhancements enabling stream support for up to 32 PIDs and allowing pass through of non-remapped MPTS streams (with more than 32 PIDs). Release 2.02.16 retains DVB Simulcrypt Scrambling capability for the RF Gateway 1 platform and supports license-upgradeable data features and a user authentication feature for security of the RF Gateway 1 management interface.

### **Purpose**

The purpose of this document is to notify RF Gateway 1 users of the enhancements included in the current release and inform users of any special upgrade procedures needed for using Release 2.02.16

### **Audience**

This document is intended for system engineers or managers responsible for operating and/or maintaining this product.

### **Related Publications**

Refer to the following documents for additional information regarding hardware and software.

- Cisco RF Gateway 1 Configuration Guide, part number 4025112
- Cisco RF Gateway 1 System Guide, part number 4024958

### Safe Operation for Software Controlling Optical Transmission Equipment

If this document discusses software, the software described is used to monitor and/or control ours and other vendors' electrical and optical equipment designed to transmit video, voice, or data signals. Certain safety precautions should be observed when operating equipment of this nature.

For equipment specific safety requirements, refer to the appropriate section of the equipment documentation.

For safe operation of this software, refer to the following warnings.

#### **WARNINGS:**

- Ensure that all optical connections are complete or terminated before using this equipment to remotely control a laser device. An optical or laser device can pose a hazard to remotely located personnel when operated without their knowledge.
- Allow only personnel trained in laser safety to operate this software. Otherwise, injuries to personnel may occur.
- Restrict access of this software to authorized personnel only.
- Install this software in equipment that is located in a restricted access area.

## **Stream Management Enhancements**

The following miscellaneous bugs have been addressed in 2.02.16.

- Upon receiving streams with greater than 16 PIDs, the RF Gateway 1 was encountering issues resulting in a continuous reboot cycle. This is resolved with Release 2.02.16 where up to 32 PIDs are processed. When operating on non-remapped MPTS Pass-Through streams the RF Gateway 1 processes the input faithfully even for greater than 32 PIDs.
- The Advanced Settings page now allows choosing 16/32 PIDs per PMV (PID Multiplier Value). Refer to *Video Stream Map Configuration* in the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112.

# Miscellaneous Improvements

The following miscellaneous improvements have been made in release 2.02.16.

- MPEG processing capabilities are now improved to accurately detect insufficient bandwidth.
- RF Gateway 1 system file download capabilities are improved to allow CRC checks.

### **Known Issues**

The following list identifies known limitations planned to be resolved as part of an upcoming GA release.

- The RF Gateway 1 Web interface is not fully tested with IE-8 and FireFox-3.5 or newer. The RF Gateway 1 web management interface is tested with IE-6 or FireFox-2.0.0.14 and above. Use of Java 1.6.x is also recommended.
- The Summary page displays the unit rear panel with Conditional Access (CA) port enabled/disabled as green/grey. The CA port indication represents the on/off setting and does not represent actual link status.

- The database Restore feature in 2.02.16 requires disabling trap settings (in the restore from database file prior to release 2.01.09) before starting the restore procedure. This can be done before starting a restore configuration in 2.02.16. The procedure is needed to allow compatibility with the enhanced SNMP version 1 and 2 trap support in 2.02.16.
- SNMP community strings are provided in 2.02.16 to support SNMP v1 and v2 traps. Prior to release 2.01.09, there was a single community string applicable to all five trap receivers configurable for the operator. In release 2.02.11 and beyond, in addition to supporting SNMPv1 and v2 traps, each of the five trap receivers has a separate configurable trap community string. This may cause a possible loss of SNMP trap community strings during an upgrade or downgrade procedure. An operator should carefully verify their trap community strings when upgrading to 2.02.11 or later releases or downgrading from 2.02.11 or later releases, if they are being used.
- An upgrade to 2.02.16 from pre-2.01.09 automatically enables insertion of the Network PID into the PAT. If this is an issue in the user's system, it may be disabled on the System/System Configuration page.

## Licensing

After an upgrade to 2.02.16, a system license is required for the following features. Refer to Licensing in the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112.

- Data streams requiring use of the DOCSIS® Timing Interface
- DVB® Encryption

Most systems delivered with 1.02.20 or later using a data part number included a license file pre-installed at the factory. For these systems, an FTP transfer is not necessary.

All systems delivered prior to 1.02.20 and some systems delivered with 01.02.20 require a license file. This can be obtained from Cisco after an upgrade to 2.02.16. Contact your account representative for details on obtaining your license files.

**Note:** Performing an upgrade without a license file will generate an alarm, informing the user that a license file is not present. The unit continues to function until configuration changes are made. However, performing the upgrade may impact functionality of licensed features.

For systems requiring a license upgrade, a licensing capable RF Gateway 1 provides the operator with a new tree menu, located under the System tab, *License Management*. It provides an FTP mechanism to transfer license files to the device. It is recommended that the operator monitor the file transfer status using feedback from the FTP server.

## **Upgrade Information**

An RF Gateway 1 unit running release 1.02.20 can be upgraded directly to 2.02.16. Refer to Chapter 3, *General Configuration and Monitoring (Release Management)* of the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112, for more information. The RF Gateway 1 reboots automatically at the end of the upgrade process. However, when upgrading to 2.02.16 from 1.02.09, an intermediate step of using the bridge release 1.02.19 to arrive at 1.02.20 and finally 2.02.16 must be followed. The bridge release designated as 1.02.19 has been created to provide a secure and robust upgrade path. Releases 1.02.19 (bridge) and 1.02.20 (final) have identical user features and functionality. Refer to *Upgrade Procedure for Customers Running* 1.02.09 (on page 9).

#### **WARNING:**

Upgrading to 1.02.20 or above directly from 1.02.09 must not be attempted. This may cause the RF Gateway 1 to be non-operational.

Refer to Known Issues (on page 5) for SNMP related upgrade, downgrade and database restore considerations.

## **IP Port Configuration Changes**

There is a bug in 1.02.09 that causes the following IP port configuration parameters to have inverted values saved in the configuration file.

- Negotiation Mode (On/Off) one for each port (total 4)
- Redundancy Mode (Auto/Manual) one for each port pair (total 2)
- Revert Mode (Enable/Disable) one for each port pair (total 2)

For details on these parameters, see Chapter 3, *General Configuration and Monitoring* of the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112.

This bug has been corrected in the configuration file in 1.02.19. Upon upgrade to 1.02.19, these three parameters will appear to have changed value as seen in the *System/IP Network* page of the web GUI. As a result, the IP ports may not be configured properly for operation immediately after upgrade (after the subsequent reboot that follows activation).

See *Upgrade Procedure for Customers Running* **1.02.09** (on page 9).

## **Upgrade Procedure for Customers Running 1.02.09**

#### **WARNING:**

Upgrading to 2.02.16 directly from 1.02.09 must not be attempted. This may cause the RF Gateway 1 to become non-operational.

- 1 Before starting the upgrade, backup the system configuration. Refer to Chapter 3, *General Configuration and Monitoring (Configuration Backup)* of the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112. Name the file appropriately to identify it as a configuration that corresponds to 1.02.09. This file will be necessary later if the user decides to revert back to 1.02.09.
- **2** Record the IP port configuration parameters by saving a screen capture of the *System/IP Network* page. Refer to *Recording IP Port Configuration Settings* (on page 12).
- 3 Download and activate 1.02.19. Refer to Chapter 3, *General Configuration and Monitoring (Release Management)* of the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112. The RF Gateway 1 reboots automatically at the end of the upgrade process.
- 4 After reboot, display the *System/IP Network* page. Refer to *Displaying IP Port Configuration Settings* (on page 11).
- 5 Verify the IP port configuration parameters by checking them against those recorded in step 2 (prior to the upgrade as done in step 3). The Negotiation Mode, Redundancy Mode, and Revert Mode parameter values are inverted. Refer to *Displaying IP Port Configuration Settings* (on page 11). Change the differing parameter values to match those recorded before download and activation. Be sure to click **Apply** after making your changes.
- 6 Once step 5 is completed, save the configuration which includes the IP port configuration parameters. Going forward, these values will not change.
- 7 Validate/qualify/soak release 1.02.19 in its application to establish confidence the release is operating at the same level as 1.02.09. In the very unlikely event service is impacted by 1.02.19, reverting back to 1.02.09 may be done to reestablish operations. If reverting back to 1.02.09 is necessary, the IP port configuration parameters must be swapped back and the configuration saved in step 2 restored.

#### Upgrade Procedure for Customers Running 1.02.09

- 8 After satisfactory completion of step 7, upgrade from 1.02.19 to 1.02.20. These two releases have identical performance and behavior. Release 1.02.20 includes a boot code upgrade that readily supports future roadmap features/releases without the need for subsequent two-step bridge upgrade processes.
- 9 Download and activate 2.02.16. Refer to Chapter 3, *General Configuration and Monitoring (Release Management)* of the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112. The RF Gateway 1 reboots automatically at the end of the upgrade process.

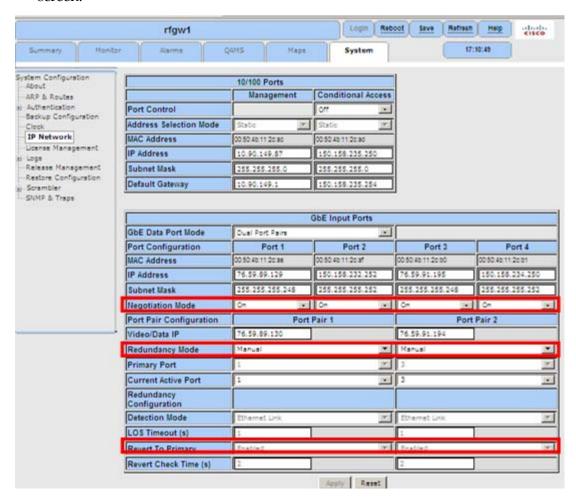

### **IP Port Configuration Parameter Settings**

See Chapter 3, *General Configuration and Monitoring* of the *Cisco RF Gateway 1 Configuration Guide*, part number 4025112 for specific details.

### **Displaying IP Port Configuration Settings**

Follow these instructions to display the *System/IP Network* page.

- 1 Launch your web browser.
- 2 In the IP Address field, enter the RF Gateway 1 IP address.
- 3 Click Enter.
- 4 Click the *System/IP Network* tab and review the IP settings. See the following screen.

### **Recording IP Port Configuration Settings**

Follow these instructions to record IP port configuration settings.

- 1 Navigate to the *System/IP Network* page.
- **2** Click the **Alt-PrtScrn** keys to copy the IP Network parameter settings to the clipboard.
- 3 Launch Microsoft Word (or WordPad if you don't have Microsoft Word) and paste the clipboard contents to page 1.
- 4 Save the Microsoft Word document as ipsettings.doc.

# For Information

## **Support Telephone Numbers**

This table lists the Technical Support and Customer Service numbers for your area.

Region	Centers	Telephone and Fax Numbers		
North America	Cisco Services	For Technical Support, call:		
	Atlanta, Georgia United States	■ Toll-free: 1-800-722-2009		
		<ul> <li>Local: 678-277-1120 (Press 2 at the prompt)</li> </ul>		
		For Customer Service, call:		
		■ Toll-free: 1-800-722-2009		
		Local: 678-277-1120 (Press <b>3</b> at the prompt)		
		Fax: 770-236-5477		
		Email: customer-service@cisco.com		
Europe,	Belgium	For Technical Support, call:		
Middle East,		■ Telephone: 32-56-445-197 or 32-56-445-155		
Africa		Fax: 32-56-445-061
