

Appendix A: Backing Up Files

Last Updated: September 7, 2010

Backup commands must be entered in the module EXEC mode while the system is offline. Consider performing the backup procedure at a time when the system is least active.

Note We recommend that you back up your configuration files whenever you make changes to the system or the application files. When you configure the backup server to back up files, you can also schedule nightly backups of the configuration.

Prerequisite

Configure your backup server. See *Cisco Video Management and Storage System CLI Administrator Guide* to configure your backup server.

Numbering Scheme for Backup Files

Five types of backup CLI requests are available: Cisco Video Management and Storage data only, Cisco Video Management and Storage module startup configuration only, Video Surveillance Management System (VSMS) data files only, Video Surveillance Operations Manager (VSOM) data files only, or back up all. However, the Cisco Video Management and Storage module data only files are not backed up.

- Data—No data is stored in the Cisco Video Management and Storage module; thus, there is no data to back up.
- Configuration—Backs up only the startup configuration. Use the **show startup** command in user EXEC mode to display the current startup configuration.
- All—Backs up startup configuration information. There are no Cisco Video Management and Storage module data only files; thus, only the VSMS and VSOM files are backed up.
- VSMS—Backs up Cisco Video Surveillance Media Server data files.
- VSOM—Backs up Cisco Video Surveillance Operations Manager data files.

The Cisco Video Management and Storage software automatically numbers and dates the backup files and identifies the revision number in a **backupid** field.

Numbering Scheme for Backup Files

When restoring the files, refer to the backup ID for the backup configuration file that you want to use. To see a list of startup configuration file backup IDs, use the **show backup server** command in user EXEC mode.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **backup server**
4. **exit**
5. **offline**
6. **backup category {all | configuration | data | VSMS | VSOM}**
7. **continue**
8. **show backup history**
9. **show backup server**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables the privileged EXEC command mode.
	Example: cvms-10-0-0-0> enable	
Step 2	configure terminal	Enters configuration mode.
	Example: cvms-10-0-0-0# configure terminal cvms-10-0-0-0(config)#	
Step 3	backup server	Configures the FTP/SFTP URL of the backup server.
	Example: cvms-10-0-0-0(config)# backup server url ftp://branch/vmbackups username admin password mainserver	
Step 4	exit	Exits configuration mode.
	Example: cvms-10-0-0-0(config)# exit cvms-10-0-0-0#	
Step 5	offline	Enters offline mode. All activities are terminated.
	Example: cvms-10-0-0-0# offline cvms-10-0-0-0(offline)#[/td>	

Command or Action	Purpose
Step 6 <code>backup category {all configuration data VSMS VSOM}</code>	Specifies backup and storage of the Cisco Video Management and Storage module startup configuration, Video Surveillance Media Server, Video Surveillance Operations Manager, or all files.
Example: <pre>cvmss-10-0-0-0 (offline) # backup category configuration</pre>	
Step 7 <code>continue</code>	Exits offline mode and returns to EXEC mode.
Example: <pre>cvmss-10-0-0-0 (offline) # continue</pre>	
Step 8 <code>show backup history</code>	Displays the backup and restore procedures and the success or failure of those attempts.
Example: <pre>cvmss-10-0-0-0 # show backup history</pre>	
Step 9 <code>show backup server</code>	Displays the backup files available on the backup server, the date of each backup, and the backup file ID.
Example: <pre>cvmss-10-0-0-0 # show backup server</pre>
