

## Managing Server Status and Ports in a Cisco Unity Connection 10.x Cluster

---

The Cluster Management page in Cisco Unity Connection Serviceability lets you change the status of servers in a Unity Connection cluster, stop all ports on a server from taking new calls, and restart all ports on a server to take calls.

For the applicable procedures, see the “[Administering a Cisco Unity Connection 10.x Cluster](http://www.cisco.com/en/US/docs/voice_ip_comm/connection/10x/cluster_administration/guide/10xcu_ccagx.html)” chapter of the *Cluster Configuration and Administration Guide for Cisco Unity Connection Release 10.x* at [http://www.cisco.com/en/US/docs/voice\\_ip\\_comm/connection/10x/cluster\\_administration/guide/10xcu\\_ccagx.html](http://www.cisco.com/en/US/docs/voice_ip_comm/connection/10x/cluster_administration/guide/10xcu_ccagx.html).

### Note

---

The Unity Connection cluster feature is not supported for use with Cisco Unified Communications Manager Business Edition.
