

Cisco Unified CallManager Assistant Configuration Wizard

With the Cisco Unified CallManager Assistant Configuration Wizard, Unified CallManager Assistant configuration takes less time and eliminates errors. The partitions, calling search spaces, route point, and translation pattern automatically get created when the administrator successfully runs and completes the configuration wizard. The wizard also creates BAT templates for the Unified CallManager Assistant manager phone, the Unified CallManager Assistant assistant phone, and all other user phones. The administrator can use the BAT templates to configure the managers, assistants, and all other users. Refer to the *Cisco Unified CallManager Bulk Administration Guide*.

The Cisco Unified CallManager Assistant Configuration Wizard provides windows for each configuration parameter. The windows provide the administrator with preconfigured information. If the administrator prefers to use other configuration information (for example, partition names), the administrator can change the preconfigured information to the appropriate information.

For more information on how to use the Cisco Unified CallManager Assistant Configuration Wizard, refer to the [Cisco Unified CallManager Assistant Configuration Wizard](#) in the *Cisco Unified CallManager Features and Services Guide*.
