

SIP Realm Configuration

When you configure digest authentication for SIP trunks, Cisco Unified CallManager challenges the identity of the SIP user agent that connects to the trunk every time the trunk sends a SIP request to Cisco Unified CallManager; the SIP user agent, in turn, can challenge the identity of Cisco Unified CallManager. For Cisco Unified CallManager to respond to the SIP user agent, you must configure the SIP realm for Cisco Unified CallManager.

For information on how to configure SIP realm for Cisco Unified CallManager, refer to the *Cisco Unified CallManager Security Guide*.
