

Directory Issues

In this release of Cisco Unified CallManager:

- There is no embedded DC Directory
- There is no plug-in for AD/ND
- There is no schema extension on the Customer Directory when integrating with AD/ND
- User information is always stored in the Informix Database
- Cisco products do not store any data in the customer directory
- Cisco products are fully functional even when the customer directory is not reachable
- User information is populated in the database using a standard LDAP connector (Cisco DirSync)
- Products always access the database for user information and never access the Customer Directory

Alarms are routed to Event Logs (Syslog) and SNMP traps. Use RTMT to view/collect the log files
