priority

priority: must be an integer between 0 and 3.
Default is 0.

Usage

Use this command to manage MTP3 messaging.

Example

```
mtp3-discard-priority 2
```

mtp3-max-slt-try

Configure maximum number of times to retry SLT (signaling link test).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-max-slt-try *retries*

default mtp3-max-slt-try

default

Resets the number of retries to the default value.

retries

retries: must be an integer between 1 to 65535.
Default is 10.

Usage

Use this command to troubleshoot MTP3 link mismatch.

Example

mtp3-max-slt-try *35*

mtp3-msg-priority

Configures the priority for sending MTP3 management messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-msg-priority *priority*

default mtp3-msg-priority

default

Resets the number of priority to the default value.

priority

priority: must be an integer from 0 to .
Default is 0.

Usage

Use this command to set the priority for sending MTP3 management messages.

Example

mtp3-msg-priority *3*

mtp3-msg-size

Configures the size of messages from layer 3 to layer 2..

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-msg-size *size*

default mtp3-msg-size

default

Resets the the size to the default value which is 4096 (for q.2140) or 272 (for MTP2)

size

size: must be an integer from 1 to 4096.

Usage

Use this command to set the maximum message size, in bytes.

Example

mtp3-msg-size *4096*

mtp3-p1-qlen

Configure the size for the MTP3 p1 queue length.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-p1-qlen *size*

default mtp3-p1-qlen

default

Resets the number of size of the priority 1 queue to the default value.

size

size: integer from 1 to 65535. Size should be less than MTP3 p2 qlen and p3 qlen.
Default is 1024.

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 1.

Example

mtp3-p1-qlen *128*

mtp3-p2-qlen

Configure the size of the priority 2 queue.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-p2-qlen *size*

default mtp3-p2-qlen

default

Resets the number of size of the priority 2 queue to the default value.

size

size: integer from 1 to 65535. Size should be less than MTP3 p3 qlen and greater than p1 qlen. Default is 1024.

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 2.

Example

mtp3-p2-qlen *256*

mtp3-p3-qlen

Configure the size of the priority 3 queue.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-p3-qlen *size*

default mtp3-p3-qlen

default

Resets the number of size of the priority 3 queue to the default value.

size

size: integer from 1 to 65535. Size should be greater than MTP3 p1 qlen and p2 qlen .
Default is 1024.

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 3.

Example

mtp3-p3-qlen *1024*

mtp3-test-pattern

Configures the character string for the test message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mtp3-test-pattern *pattern*

default mtp3-test-pattern

default

Resets the pattern to the default value.

pattern

pattern: 1 to 15 alphanumeric characters.
Default is SGSN-ORIGINATED.

Usage

Use this command to define a test pattern string for the signalling link test match (SLTM).

Example

mtp3-test-pattern *TEST1-HomeOffice*

priority

Configures the MTP3 Link Priority.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

priority *pri_value*

no priority

no

Removes the priority configuration.

pri_value

pri_value: 0 represents highest priority and 15 represents the lowest priority.

Usage

Use this command to configure the link priority within the MTP3 link set.

Example

priority *2*

signaling-link-code

Configures the signaling link code (SLC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

signaling-link-code *code*

no signaling-link-code

no

Removes the SLC configuration.

code

code: integer from 0 to 15.

Usage

Use this command to uniquely identify the signaling link to be used for MTP3 management messages.

Example

signaling-link-code *4*

sscf-nni-n1

Configures the SSCF NNI N1.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscf-nni-n1 *value*

no sscf-nni-n1

default

Removes the sscf-nni-n1 configuration.

value

value: integer from 1 to 65535.
Default is 1000.

Usage

Use this command to identify the network-to-node interface (NNI) between the MTP3 and SSCOP layers.

Example

sscf-nni-n1 *4064*

sscop-max-cc

Configure the maximum value for the SSCOP connection control (CC) state variable.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscop-max-cc *value*

no sscop-max-cc

default

Removes the sscop-max-cc configuration.

value

value: integer from 1 to 65535.
Default is 4.

Usage

Use this command as part of the configuration responsible for managing the SSCOP connection. This command sets the number of times retries.

Example

sscop-max-cc *256*

sscop-max-pd

Configures the maximum acceptable value for the SSCOP state variable VT(PD).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscop-max-pd *value*

no sscop-max-pd

default

Removes the **sscop-max-pd** configuration.

value

value: integer from 1 to 65535.
Default is 500.

Usage

Use this command to define the maximum number of data PDUs transmitted between POLL PDUs.

Example

sscop-max-pd *2500*

sscop-max-stat

Configures the maximum number of elements included in a status PDU.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sscop-max-stat *value*

no sscop-max-stat

default

Removes the **sscop-max-stat** configuration.

value

value: integer from 3 to 65535. This parameter should be an odd integer greater than or equal to 3. Default is 67.

Usage

Received in response to a POLL PDU, the STAT PDU includes information about the number of SD PDUs that have been received.

Example

sscop-max-stat *56000*

timeout

This command enables configuration of an array of signaling and flow control timers - for MTP, SSCF, and SSCOP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout *timer*

no timeout *timer*

---

no

Adding **no** to the **timeout** command removes the timer configuration.

---

timer

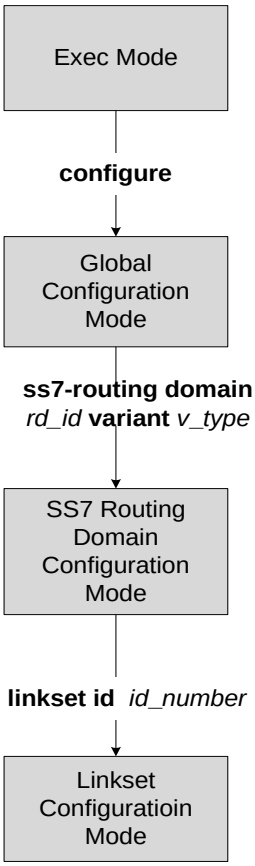
Repeat the command as needed to configure all required timers.

- **mtp3-tmr-t1** - mtp3 t1 timer, default value is 500ms
- **mtp3-tmr-t12** - mtp3 t12 timer, default value is 800ms
- **mtp3-tmr-t13** - mtp3 t13 timer, default value is 800ms
- **mtp3-tmr-t14** - mtp3 t14 timer, default value is 2000ms
- **mtp3-tmr-t17** - mtp3 t17 timer, default value is 800ms
- **mtp3-tmr-t2** - mtp3 t2 timer, default value is 700ms
- **mtp3-tmr-t22** - mtp3 t22 timer, default value is 180s
- **mtp3-tmr-t23** - mtp3 t23 timer, default value is 180s
- **mtp3-tmr-t24** - mtp3 t24 timer, default value is 500ms
- **mtp3-tmr-t3** - mtp3 t3 timer, default value is 500ms
- **mtp3-tmr-t31** - mtp3 t31 timer, default value is 5s
- **mtp3-tmr-t32** - mtp3 t32 timer, default value is 10s
- **mtp3-tmr-t33** - mtp3 t33 timer, default value is 20s
- **mtp3-tmr-t34** - mtp3 t34 timer, default value is 60s
- **mtp3-tmr-t4** - mtp3 t4 timer, default value is 500ms
- **mtp3-tmr-t5** - mtp3 t5 timer, default value is 500ms
- **mtp3-tmr-t7** - mtp3 t7 timer, default value is 1000ms
- **sscf-nni-tmr-t1** - sscf nni t1 timer. default value is 5s
- **sscf-nni-tmr-t2** - sscf nni t2 timer. default value is 30s
- **sscf-nni-tmr-t3** - sscf nni t2 timer. default value is 10ms
- **sscop-tmr-cc** - sscop cc timer. default value is 200ms

- **sscop-tmr-idle** - sscop idle timer (UNI 3.1 only). default value is 100ms
- **sscop-tmr-keep-alive** - sscop keep alive timer. default value is 100ms. For stability purposes, tmrKeepAlive >= tmrPoll and tmrKeepAlive < tmrNoResponse
- **sscop-tmr-no-rsp** - sscop no response timer. default value is 1.5s. For stability purposes, tmrNoResponse > tmrKeepAlive
- **sscop-tmr-poll** - sscop poll timer. default value is 100ms. For stability purposes, tmrPoll <= tmrKeepAlive

Chapter 143
Linkset Configuration Mode Commands

The Linkset configuration mode defines the MTP3 linkset parameters for a specific SS7 routing domain instance.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

adjacent-point-code

This command defines the point-code for the adjacent (next) network element in the SS7 network.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

adjacent-point-code *point-code*

no adjacent-point-code

point-code

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the adjacent-point-code configuration for this linkset in the SS7 routing domain

Important: Removing the linkset configuration will result in the termination of all of the links within the linkset.

Usage

Use this command to define the point-code for the adjacent element in the SS7 network.

Example

adjacent-point-code *6.202.7*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

link

This command creates an MTP3 link configuration for the SS7 linkset and enters the Link configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

link id *id* **[link-type [atm-broadband | highspeed-narrowband | lowspeed-narrowband]**

no link id *id*

no

Disables the specified link configuration.

Important: Removing the link configuration will result in the termination of traffic on the specified link.

#_octets

Sets the number of octets for the length of the LSSU.

id

This number uniquely identifies the link in the linkset.
id: an integer between 1 and 16.

link-type

Important: This keyword is not yet functional - the feature is still in development.

This keyword is applicable only to releases 8.1 and higher.
Identifies the signalling type for this link; options include:

- atm-broadband
- high speed-narrowband
- low speed-narrowband

Usage

Access the Link configuration mode to make changes to the configuration for a link.

Example

Access configuration for link 4.

link id *4*

self-point-code

This command defines the SS7 network point-code to identify this SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point-code*

no self-point-code

point-code

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the self-point-code configuration for this linkset in the SS7 routing domain.

Important: Removing the self-point-code will result in the termination of all traffic on this link.

Usage

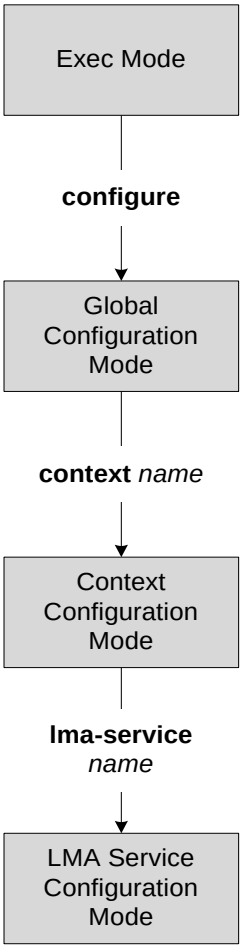
Use this command to define the SS7 point-code to identify this system.

Example

self-point-code *6.192.7*

Chapter 144
LMA Service Configuration Mode Commands

The LMA Service Configuration Mode is used to create and manage the Local Mobility Anchor configuration supporting Proxy Mobile IP on a PDN Gateway in an eHRPD and E-UTRAN/EPC network.



aaa accounting

Enables the LMA to send AAA accounting information for subscriber sessions.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] aaa accounting
```

default

Sets the command to the default condition of enabled.

no

Disables the ability of the LMA to send AAA accounting information.

Usage

Use this command to enable the LMA service to send all accounting data (start, stop, and interim) to the configured AAA servers.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the LMA service is configured using the **aaa accounting subscriber radius** command.

Example

The following command disables aaa accounting for the LMA service:

```
no aaa accounting
```

bind address

Binds the LMA service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product

P-GW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

ip_address

Specifies the IPv6 address of the interface configured as the S2a or S5/S8 interface. *ip_address* is specified in colon separated notation.

max-subscribers *num*

Default: 3000000
Specifies the maximum number of subscribers that can access this service on this interface. *num* must be configured to an integer between 0 and 3,000,000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the LMA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to an HSGW (S2a) or S-GW (S5/S8). Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *4551:0db8:85a3:08d3:3319:8a2e:0370:1344* to the LMA service and specifies that a maximum of *300,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers
300000
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

refresh-advice-option

Configures inclusion of a refresh advice option in the binding acknowledgement message sent by the LMA.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] refresh-advice-option
```

default

Returns the command setting to the default setting of disabled.

no

Disables the inclusion of the refresh advice option in the binding acknowledgement message sent by the LMA

Usage

Use this command to enable the LMA to include this option in a binding acknowledgment sent to the requesting MAG. The option provides a “hint” to the MAG of when it should refresh the binding.
As defined in RFC 3775 “Mobility Support in IPv6”, the binding refresh advice option can only be present in the binding acknowledgement sent from the mobile node's home agent in reply to a registration request. A refresh interval parameter determines the amount of time until the mobile node must send a new registration to the home agent to avoid de-registration and loss of session.

Important: Refer to the refresh-interval-percent and reg-lifetime commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

refresh-interval-percent

Configures percentage of the granted registration lifetime to be used in the refresh interval mobility option in a binding acknowledgement message sent by the LMA service.

Product

P-GW

Privilege

Administrator

Syntax

refresh-interval-percent *number*

defautl refresh-interval-percent

default

Resets the command value to the default setting of 75.

number

Default: 75
Sets the percent value for session lifetimes for this service.
number must be an integer value from 1 to 99.

Usage

Use this command to configure the amount of the granted registration lifetime to be used in the refresh interval mobility option in the binding acknowledgement message sent by the LMA service to the requesting MAG.
Refreshing a binding or registration is based on the granted registration lifetime. Since a refresh request must be within the granted range of a registration lifetime, this command provides a method of setting the interval of when a refresh request is sent.
As described in RFC 3775 “Mobility Support in IPv6”, if a binding refresh advice option is present in the binding acknowledgement, the refresh interval field in the option must be a value less than the binding lifetime (also returned in the binding acknowledgement). The mobile node then should attempt to refresh its registration at the shorter refresh interval. The home agent will still honor the registration for the lifetime period, even if the mobile node does not refresh its registration within the refresh period.

Important: Refer to the refresh-advice-option and reg-lifetime commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

Example

The following command sets the refresh interval percent to *90*:

```
refresh-interval-percent 90
```

reg-lifetime

Configures the Mobile IPv6 session registration lifetime for this service.

Product

P-GW

Privilege

Administrator

Syntax

reg-lifetime *seconds*

default reg-lifetime

default

Resets the command value to the default setting of 600.

seconds

Default: 600
Sets the time value for session lifetimes for this service.
seconds must be an integer value from1 to 262140.

Usage

Use this command to limit PMIPv6 lifetime on this service. If the PBU contains a lifetime shorter than what is specified, it is granted. If the lifetime is longer, then HA service will limit the granted lifetime to the configured value.

Important: Refer to the refresh-interval-percent and refresh-advice-option commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

Example

The following command sets the registration lifetime for Mobile IPv6 sessions using this service to *1200* seconds (20 minutes):

```
reg-lifetime 1200
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Product

P-GW

Privilege

Administrator

Syntax

revocation { enable | max-retransmission *number* **| retransmission-timeout** *msecs* **}**

default revocation { enable | max-retransmission | retransmission-timeout }

no revocation enable

default

Resets the keyword to its default value.

no

Disables revocation for this service.

enable

Default: disabled
Enables the MIP registration revocation feature for the LMA service. When enabled, if revocation is negotiated with a MAG and a MIP binding is terminated, the LMA can send a Revocation message to the MAG. This feature is disabled by default.

max-retransmission *number*

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer value from 0 through 10.

retransmission-timeout *msecs*

Default: 3000
The number of milliseconds to wait for a Revocation Acknowledgement from the MAG before retransmitting the Revocation message. *msecs* must be an integer value from 500 through 10000.

Usage

Use this command to enable or disable the MIP revocation feature on the LMA or to change settings for this feature.

Example

The following command sets the maximum number of retries for a Revocation message to *6*:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to *10*:

```
revocation retransmission-timeout 10
```

sequence-number-validate

Configures sequence number validation of the received MIPv6 control packets by the LMA service according to RFC 3775.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] sequence-number-validate
```

default

Resets the command value to the default setting of enabled.

no

Disables the feature.

Usage

Use this command to configure the sequence number validation of the received MIPv6 control packets (PBUs) by the LMA service. This feature validates MIPv6 control packets and insures that any incoming packets with a sequence number prior to the last number received is consider invalid.
If this service has no cache entry of the home address included in the PBU, it will accept any sequence value in the initial PBU from the mobile node.

setup-timeout

The maximum amount of time allowed for session setup.

Product

P-GW

Privilege

Administrator

Syntax

setup-timeout *seconds*

default setup-timeout

default

Resets the command value to the default setting of 60.

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session in this service. *seconds* must be an integer value from 1 through 1000000.

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

The following command sets the maximum time allowed for setting up a session to 5 minutes (300 seconds):

```
setup-timeout 300
```

timestamp-replay-protection

Designates timestamp replay protection scheme as per RFC 4285.

Product

P-GW

Privilege

Administrator

Syntax

timestamp-replay-protection tolerance *seconds*

[default | no] timestamp-replay-protection tolerance

default

Resets the command value to the default setting of 7.

no

Disables the timestamp replay protection feature.

seconds

Default: 7
Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds.
seconds must be an integer value between 0 and 65535.

Usage

Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.

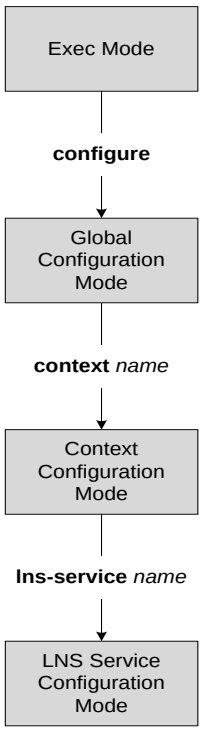
Example

The following command sets the acceptable difference for timestamps to 10 seconds:

```
timestamp-replay-protection tolerance 10
```

Chapter 145
LNS Service Configuration Mode Commands

The LNS Service Configuration Mode is used to create and manage L2TP services within contexts on the system. LNS services facilitate tunneling with peer LACs.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa accounting

Enables the sending of AAA accounting information by the LNS.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] aaa accounting
```

no

Disables this option.

Usage

Use this command to enable the sending of AAA accounting information by the LNS. By default this is enabled.

Example

The following command enables the sending of AAA accounting information by the LNS:

```
aaa accounting
```

authentication

Configures the type of subscriber authentication for PPP sessions terminated at the current LNS.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
authentication { { [ allow-noauth ] [ chap chap_priority ] [ mschap
mschap_priority ] [ pap pap_priority ] } | msid-auth }
```

allow-noauth

Default: Disabled
This option configures the LNS to allow PPP sessions access even though they have not been authenticated. This command issued by itself causes the LNS to not attempt authentication for any PPP sessions.
When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.
If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the PPP session.

chap *chap_priority*

Default: 1
This option configures the LNS to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the PPP session.
A *chap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
chap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
CHAP is enabled by default as the highest preference.

mschap *mschap_priority*

Default: Disabled
This option configures the LNS to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the PP session.
A *mschap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
mschap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.

pap *pap_priority*

Default: 2
This option configures the LNS to attempt to use the Password Authentication Protocol (PAP) to authenticate the PPP session.
A *pap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.

pap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference. PAP is enabled by default as the second highest preference.

msid-auth

Default: Disabled
This option configures the LNS to attempt to authenticate the PPP session based on the Mobile Station Identity (MSID).

Usage

Use to specify how the LNS service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.
The chassis is shipped from the factory with the LNS authentication options set as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

Important: At least one of the keywords must be used to complete the command.

Example
The following command configures the LNS service to allow no authentication for PPP sessions and would perform accounting using the default NAI-construct of username@domain:

```
authentication allow-noauth
```

The following command configures the system to attempt authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, when all attempts to authenticate the subscriber using these protocols failed, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```

avp map called-number apn

This command maps an incoming AVP to a GGSN APN for authentication and authorization of the call.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
{ default | no } avp map called-number apn
```

default

Disables mapping.

no

Disables mapping.

Usage

For LNS calls received through a LAC, the ICRQ message includes an APN name in the Called Number AVP. This mapping function enables a GGSN system to provide RADIUS authentication/authorization via a defined APN in place of an LNS configuration. If the mapped APN has not been defined within the GGSN configuration then the call will be rejected.

Example

Enter the following command to enable mapping:

```
avp map called-number apn
```

Enter the following command to disable mapping:

```
no avp map called-number apn
```

bind

This command assigns the IP address of an interface in the current context to the LNS service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
bind ip_address  [max-subscribers max_value ]
```

```
no bind ip_address
```

no

Unassign, or unbind, the local end point to the LNS service.

ip_address

The IP address of an interface in the current context. This must be a valid IPv4 address, using dotted-decimal notation.

max-subscribers *max_value*

Default: 10000
The maximum number of subscribers that can be connected to this service at any time. *max_value* must be an integer from 1 through 2500000.

Usage

Use this command to bind the IP address of an interface in the current context to the LNS service.

Example

The following command binds the current context interface IP address 192.168.100.10 to the current LNS service:

```
bind 192.168.100.10
```

The following command removes the binding of the IP address from the LNS service:

```
no bind
```

data sequence-number

Enables data sequence numbering for sessions that use the current LNS service. Data sequence numbering is enabled by default.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] data sequence-number
```

no

Disables data sequence numbering for sessions.

Usage

An L2TP data packet header has an optional data sequence numbers field. The data sequence number may be used to ensure ordered delivery of data packets. This command is used to re-enable or disable the use of the data sequence numbers for data packets.

Example

Use the following command to disable the use of data sequence numbering:

```
no data sequence-number
```

Use the following command to re-enable data sequence numbering:

```
data sequence-number
```

default

This command sets the specified LAC service parameter to its default value or setting.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default { authentication | data sequence-number | ip source-violation |
keepalive-interval | load-balancing | local-receive-window | max-retransmission
| max-session-per-tunnel | max-tunnel-challenge-length | max-tunnels | proxy-
lcp-authentication | retransmission-timeout-first | retransmission-timeout-max |
setup-timeout| single-port-mode | subscriber| trap all tunnel-authentication}
```

authentication

Sets the authentication parameters for PPP sessions to the following defaults:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

data sequence-number

Enables data sequence numbering for sessions.

ip source-violation

Sets the IP source violation parameters to the following defaults:

- drop-limit 10
- period 120 seconds
- reneg-limit 5

keepalive-interval

Sets the interval for send L2TP Hello keepalive if there is no control or data transactions to the default value of 60 secs.

local-receive-window

Sets the window size to be used for the local side for the reliable control transport to the default of 4.

max-retransmission

Sets the maximum number of retransmissions to the default of 5.

max-session-per-tunnel

Sets the maximum number of sessions per tunnel at any point in time to the default of 65535.

max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge to the default of 16 bytes.

max-tunnels

Sets the maximum number of tunnels for this service to the default of 32000.

proxy-lcp-authentication

Sets sending of proxy LCP authentication parameters to the LNS to the default state of enabled.

retransmission-timeout-first

Sets the first retransmit interval to the default of 1 second.

retransmission-timeout-max

Sets the maximum retransmit interval to the default of 8 seconds.

setup-timeout

Sets the maximum time allowed for session setup to the default of 60 seconds.

single-port-mode

Disables assignment of only port 1107 for incoming tunnels and allows dynamic assignment of ports.

subscriber

Sets the name of the default subscriber configuration to use.

tunnel-authentication

Sets tunnel authentication to the default state of enabled.

trap all

Generates all supported SNMP traps.

tunnel-switching

Sets the ability of the LNS to create subsequent tunnels to the default of enabled.

Usage

Use the default command to set LAC service parameters to their default states.

Example

Use the following command to set the keep alive interval to the default value of 60 seconds:

```
default keepalive-interval
```

Use the following command to set the maximum number of sessions per tunnel to the default value of 512:

```
default max-session-per-tunnel
```

ip source-violation

This command configures settings related to IP source-violation detection.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip source-violation { clear-on-valid-packet | drop-limit num | period secs |
reneg-limit num }

no ip source-violation clear-on-valid-packet
```

clear-on-valid-packet

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

drop-limit *num*

Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

period *secs*

Default: 120
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.
secs can be any integer value from 1 to1000000.

reneg-limit *num*

Default: 5
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDSNs a number of times during a handoff scenario.
This function operates in the following manner:

When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.
For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.
If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.
If at any time before the call is dropped, the configured source-violation period is exceeded, the counters for drop-limit is decremented by half and reneg-limit is decremented by 1. See period definition above.

Example
To set the maximum number of source violations before dropping a call to 100, enter the following command:**`ip source-violation drop-limit`** *`100`*

keepalive-interval

This command specifies the amount of time to wait before sending a Hello keep alive message.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

keepalive-interval *seconds*
no keepalive-interval

no

Disables the generation of Hello keep alive messages on the tunnel.

seconds

Default: 60
The number of seconds to wait before sending a Hello keep alive message. The number can be configured to any integer value from 30 to 2147483648.

Usage

Use this command to set the amount of time to wait before sending a Hello keep alive message or disable the generation of Hello keep alive messages completely. A keep alive mechanism is employed by L2TP in order to differentiate tunnel outages from extended periods of no control or data activity on a tunnel. This is accomplished by injecting Hello control messages after a specified period of time has elapsed since the last data or control message was received on a tunnel. As for any other control message, if the Hello message is not reliably delivered then the tunnel is declared down and is reset. The transport reset mechanism along with the injection of Hello messages ensures that a connectivity failure between the LNS and the LAC is detected at both ends of a tunnel.

Example

Use the following command to set the Hello keep alive message interval to 120 seconds:
keepalive-interval *120*
Use the following command to disable the generation of Hello keep alive messages:
no keepalive-interval

local-receive-window

Specifies the number of control messages the remote peer LAC can send before waiting for an acknowledgement.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

local-receive-window *integer*

integer

Default: 4
The number of control messages to send before waiting for an acknowledgement. The number can be configured to any integer value from 1 through 256.

Usage

Use this command to set the size of the control message receive window being offered to the remote peer LAC. The remote peer LAC may send the specified number of control messages before it must wait for an acknowledgment.

Example

The following command sets the local receive window to 10 control messages:
local-receive-window *10*

max-retransmission

Sets the maximum number of retransmissions of a control message to a peer before the tunnel and all sessions within it are cleared.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmission *integer*

integer

Default: 5
The maximum number of retransmissions of a control message to a peer. This value must be an integer from 1 through 10.

Usage

Each tunnel maintains a queue of control messages to be transmitted to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. If no peer response is detected after the number of retransmissions set by this command, the tunnel and all sessions within are cleared.
Use this command to set the maximum number of retransmissions that the LAC service sends before closing the tunnel and all sessions within. it.

Example

The following command sets the maximum number of retransmissions of a control message to a peer to 7:
max-retransmissions 7

max-session-per-tunnel

Sets the maximum number of sessions that can be facilitated by a single tunnel at any time.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
max-sessions-per-tunnel integer
```

integer

Default: 512
The maximum number of sessions. This value must be from 1 through 65535.

Usage

Use this command to set the maximum number of sessions you want to allow in a tunnel.

Example

The following command sets the maximum number of sessions in a tunnel to *5000*:

max-sessions-per-tunnel *5000*

max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge in bytes.The challenge is used for tunnel authentication purposes during tunnel creation.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-tunnel-challenge-length *bytes*

bytes

Default: 16
The number of bytes to set the maximum length of the tunnel challenge. This must be a value from 4 through 32.

Usage

Use this command to set the maximum length, in bytes, for the tunnel challenge that is used during tunnel creation.

Example

The following command sets the maximum length of the tunnel challenge to *32* bytes:
max-tunnel-challenge-length *32*

max-tunnels

The maximum number of tunnels that the current LNS service can support.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-tunnels *integer*

integer

Default: 32000
The maximum number of tunnels. This value must be an integer from 1 to 32000.

Usage

Use this command to set the maximum number tunnels that this LNS service can support at any one time.

Example

Use the following command to set the maximum number of tunnels for the current LNS service to *20000*:
max-tunnels *20000*

nai-construction domain

Designates the alias domain name to use for Network Access Identifier (NAI) construction.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

nai-construction domain *domain_name* { **@** | **%** | **-** | **** | **#** | **/** }
no nai-construction domain

no

Deletes the NAI construction domain alias.

domain_name **{ @ | % | - | \ | # | / }**

The desired domain name alias followed immediately by a separator from the valid list. *domain_name* must be a string of from 1 through 79 alphanumeric characters.

Usage

Use this command to specify the domain alias and separator to use for NAI construction. The specified domain name must be followed by a valid separator (@ | % | - | \ | # | /).

Example

To specify a domain alias of mydomain with a separator of @, enter the following command:
nai-construction domain *mydomain@*
To delete the current setting for the NAI construction domain alias, enter the following command:
no nai-construction domain

peer-lac

Adds a peer LAC address for the current LNS service. Up to 8 peer LACs can be configured for each LNS service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

peer-lac { *ip_address* | *ip_address/mask* } [**encrypted**] **secret** *secret* [**description** *text*]
no peer-lac *ip_address*

---

no peer-lac *ip_address*

Deletes the peer LAC IP address specified by *ip_address*. *ip_address* must be entered in standard IPv4 dotted decimal notation.

---

ip_address

The IP address of a specific peer LAC for the current LNS service. *ip_address* must be entered in standard IPv4 dotted decimal notation.

---

ip_address/mask

A network prefix and mask enabling communication with a group of peer LACs. *ip_address* is the network prefix expressed in dotted decimal notation.
mask is the number of bits that defines the prefix.

[encrypted]

Specifies the encrypted shared key between the LAC and the LNS service.
This keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

---

secret *secret*

Designates the secret which is shared between the current LNS service and the peer LAC. *secret* must be a string from 1 to 127 alpha and/or numeric characters and is case sensitive.

---

description *text*

Specifies the descriptive text to use to describe the specified peer LAC. *text* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters.

Usage

Use this command to add a peer LAC address for the current LNS service.
Specific peer LACs can be configured by specifying their individual IP addresses. In addition, to simplify configuration, communication with a group of peer LACs can be enabled by specifying a network prefix and a mask.

Example

The following command adds a peer LAC to the current LNS service with the IP address of 10.10.10.100, and specifies the shared secret to be 1b34nnf5d:
peer-lac *10.10.10.100* secret *1b34nnf5d*
The following command enables communication with up to 16 peer LACs on the 192.168.1.0 network each having a secret of abc123:
peer-lac *192.168.1.0/28* secret *abc123*
The following command removes the peer LAC with the IP address of 10.10.10.200 for the current LNS service:
no peer-lac *10.10.10.200*

proxy-lcp-authentication

Enables/disables proxy LCP authentication.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
proxy-lcp-authentication
no proxy-lcp-authentication
```

`no proxy-lcp-authentication`

Disables the processing of proxy LCP authentication parameters from the LAC.

`proxy-lcp-authentication`

Default: Enabled
Enables the processing proxy LCP authentication parameters from the LAC.

Usage

When enabled, if proxy LCP authentication parameters are received from the LAC and are acceptable, the LNS resumes the PPP session from the authentication phase and goes to the IPCP phase.
When disabled, PPP is always started from the LCP phase, ignoring and discarding any proxy LCP authentication parameters received from the LAC. Disable this feature in situations where accept proxy LCP Auth AVPs that the peer LAC sends should not be expected.

Example

Use the following command to disable the processing of proxy LCP authentication parameters from the LAC:
`no proxy-lcp-authentication`
Use the following command to re-enable the processing of proxy LCP authentication parameters from the LAC:
`proxy-lcp-authentication`

retransmission-timeout-first

Configures the initial timeout for the retransmission of control messages to the peer LAC.

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout-first *integer*

integer

Default: 1
The amount of time to wait before sending the first control message retransmission. This value is measured in seconds and must be an integer from 1 to 100.

Usage

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted.

Example

The following command sets the initial retransmission timeout to 3 seconds:
retransmission-timeout-first *3*

retransmission-timeout-max

Configures the maximum amount of time that can elapse before retransmitting control messages to the peer LAC.

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout-max *integer*

integer

Default: 8
The maximum time to wait before retransmitting control messages. If this limit is reached, the tunnel, and all sessions within it, is cleared. This value is measured in seconds and must be an integer in the range of 1 to 100.

Usage

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. This continues until the limit set by this command is reached. If this limit is reached, the tunnel, and all sessions within it, is cleared.

Example

Use the following command to set the maximum retransmission time-out to 10 seconds:
retransmission-timeout-max *10*

setup-timeout

Configures the maximum amount of time, in seconds, allowed for session setup.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

seconds

Default: 60
The maximum time to wait, in seconds, for the setup of a session. *seconds* must be an integer from 1 through 1000000.

Usage

This command controls the amount of time allowed for tunnel establishment with a peer LAC. If this timer is exceeeded the tunnel setup is aborted.

Example

The following command configures a maximum setup time of 120 seconds:
setup-timeout *120*

single-port-mode

When enabled, this command sets the LNS to use only the default local UDP port (port 1701) for the life of a tunnel.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
single-port-mode
no single-port-mode default single-port-mode
```

no

Disable single port mode

Usage

Use this command to control the L2TP LNS tunnel local UDP port assignment mode. If single-port-mode is enabled, the LNS-service uses the standard UDP port (port 1701) for the life of the incoming tunnel. Otherwise, it assigns a new local UDP port number for a tunnel when it responds to a tunnel create request received on the standard port number. This is done for load distributing the tunnel processing between multiple tasks within the system to increase the capacity and performance. Even though all L2TP LACs are required to support such dynamic port assignments during tunnel establishments, there exist some LACs that do not support port assignment other than port 1701. This single-port-mode feature can be enabled to support such LAC peers. This configuration must be applied for the LNS-Service before the **R_bind** command is executed.

Example

The following command enables single port mode for the current LNS service:

```
single-port-mode
```

trap

This command generates SNMP traps.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
trap all
no trap all
```

no

Disables SNMP traps.

Usage

Use this command to enable/disable all supported SNMP traps.

Example

To enable all supported SNMP traps, enter the following command;
trap all

tunnel-authentication

Enables/disables L2TP tunnel authentication for the LNS service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel-authentication
no tunnel-authentication
```

no

Disables tunnel authentication
Tunnel authentication is enabled by default.

Usage

When tunnel authentication is enabled, a configured shared secret is used to ensure that the LNS service is communicating with an authorized peer LAC. The shared secret is configured by the **R_peer-lac** command, the **R_tunnel l2tp** command in the Subscriber Configuration mode, or the **Tunnel-Password** attribute in the subscribers RADIUS profile.

Example

To disable tunnel authentication, use the following command:
no tunnel-authentication
To re-enable tunnel authentication, use the following command:
tunnel-authentication

tunnel-switching

Enables/disables the LNS service from creating tunnels to another LAC for an existing tunnel.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel-switching
no tunnel-switching
```

no

Disable tunnel switching.
Tunnel switching is enabled by default.

Usage

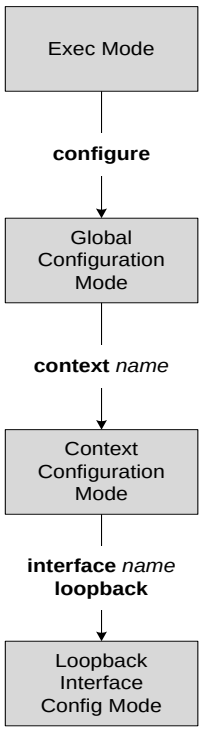
Tunnel switching is when the LNS has a tunnel connected to a LAC and creates a tunnel to a different LAC and routes the data from the original LAC through the new tunnel to the other LAC.

Example

To disable tunnel switching in the LNS, enter the following command;
no tunnel-switching

Chapter 146
Loopback Interface Configuration Mode Commands

The Loopback Interface Configuration Mode is used to create and manage loopback interfaces that provide IP addresses that are always available and reachable from any interface within the same given context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Configures the description text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text*
no description

no

Clears the description for the interface.

text

Specifies the descriptive text to use. *text* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

Usage

Set the description to provide useful information on the interface's primary function, services, end users, etc. Any information useful may be provided.

Example

description *sampleInterfaceDescriptiveText*

end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

ip address

Configures the IP options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip address {*ip_address ip_mask* **|** *ip_address***/***bitmask***} [secondary | srp-activate]**
no ip address ip_address

---

no

Deletes the specified IP address from the interface configuration.

---

address {*ip_address ip_mask* **|** *ip_address***/***bitmask***} [secondary | srp-activate]**

Configures the IP address and network mask for the interface.
ip_address ip_mask specifies an IP address and the subnet mask pair which is used to identify the IP address of the interface. *ip_address* must be specified using the standard IPv4 dotted decimal notation. Currently, the only value accepted for ip_mask is 255.255.255.255.
ip_address/net_mask : the IP address and the length in bits of the network mask. This must be an IP address entered in dotted decimal notation and a mask (192.168.1.0/32). Currently, the only value accepted for bit_mask is 32.
The **secondary** keyword is used to configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.
The **srp-activate** keyword activates the IP address for Interchassis Session Redundancy.

Usage

Create and manage loopback interfaces for the current context.

Example

The following command configures IP address to associate with the interface:
ip address *1.2.3.4 255.255.255.255*
The following command removes the associated IP address for the interface:
no ip address *1.2.3.4*

ip vrf

This command configures the IP VPN Routing/Forwarding instance for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vrf forwarding *vrf_name*
no vrf forwarding

no

Deletes the specified IP VPN routing/forwarding instance from the interface configuration.

vrf_name

Specifies the preconfigured IP VPN routing/forwarding instance name which is to be used with this interface. *vrf_name* must be a preconfigured VPN routing/forwarding instance name with **ip vrf forwarding** command in Context Configuration Mode.

Usage

Use this command to associate a preconfigured IP VPN Routing/Forwarding instance for the current interface.

Example

The following command associates a preconfigured IP routing/forwarding instance named *vrf_1* with this interface:
ip vrf forwarding *vrf_1*

ipv6 address

Configures the IPv6 options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ipv6address*ipv6_address ip_mask* **[srp-activate]**

no iv6paddress*ipv6_address*

no

Deletes the specified IPv6 address from the interface configuration.

address *ipv6_address ip_mask* **[srp-activate]**

Configures the IP address and network mask for the interface.
ipv6_address ip_mask specifies an IP address and the subnet mask pair which is used to identify the IPv6 address of the interface. *ipv6_address* must be specified using the standard IPv6 dotted decimal notation.
The **srp-activate** keyword activates the IPv6 address for Session Recovery.

Usage

Create and manage loopback interfaces for the current context and enable Session Redundancy Protocol (SRP) when appropriate.

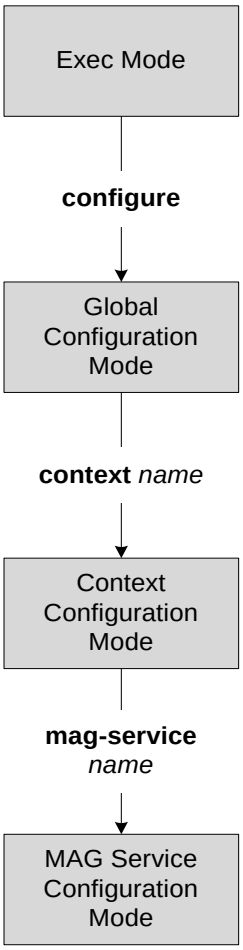
Example

The following command configures an IPv6 address to associate with the interface and enables SRP:

ipv6 address *2001:268:2008:b::1021/128* **srp-activate**

Chapter 147
MAG Service Configuration Mode Commands

The MAG Service Configuration Mode is used to create and manage a Mobility Access Gateway service in an HSGW (eHRPD network) or a P-MIP S-GW (LTE-SAE network). The MAG is the PMIP client and communicates with the Local Mobility Anchor (LMA) configured on a PDN Gateway.



bind address

Binds the service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

ip_address

Specifies the IPv6 address of the interface configured as the S5/S8 interface. *ip_address* is specified in colon separated notation.

max-subscribers *num*

Default: 1500000
Specifies the maximum number of subscribers that can access this service on this interface. *num* must be configured to an integer between 0 and 3000000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the MAG service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to/from a PDN gateway. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *4551:0db8:85a3:08d3:3319:8a2e:0370:1344* to the MAG service and specifies that a maximum of *300,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers
300000
```

encapsulation

Configures data encapsulation type to be used for specific MAG service.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

```
encapsulation { gre | ipip }

default encapsulation
```

default

Resets the encapsulation type to be used by this service to the default option of GRE.

{ gre | ipip }

gre: Specifies that GRE encapsulation is to be used for PMIPv6 tunnel data between the MAG and the LMA. This is the default for this command.
ipip: Specifies that IP-in-IP encapsulation is to be used for PMIPv6 tunnel data between the MAG and the LMA.

Usage

Use this command to select the encapsulation type to be used for PMIPv6 tunnel data between the MAG and the LMA.

Example

The following command sets the encapsulation data to IP-in-IP:

```
encapsulation ipip
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

information-element-set

Identifies the information element set of mobility options to be used in Proxy Binding Update (PBU) messages sent by the MAG to the LMA.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

```
information-element-set { custom1 | standard }

default information-element-set
```

default

Resets the command to the default value of "standard".

{ custom1 | standard }

custom1: Specifies that a custom set of mobility options to be used in proxy binding update messages that are sent in Vendor Specific Mobility Options. These options are:

- User Location Info
- Hardware Identifier
- Access Network Charging Identifier

standard: Specifies that a standard set of mobility options are to be used in proxy binding update messages. The 3GPP specification, 29.275 defines these as Protocol Configuration Options.

Usage

Use this command to identify the type of information element set of mobility options to be used in PBU messages sent form the MAG to the LMA. The mobility options can be either standards-based (3GPP 29.275) or custom (vendor-specific as defined by 3GPP 29.275).

Example

The following command identifies the information element set of mobility options to use in PBU messages as custom:

```
information-element-set custom1
```

max-retransmissions

Configures maximum number of retransmissions of Proxy MIP control messages to the LMA.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

max-retransmissions *num*

default max-retransmissions

default

Rests the maximum number of allowed retransmissions to the default value of 5.

num

Default: 5
Specifies the maximum number of times the MAG service will attempt to communicate with the LMA before it marks it as unreachable.
count can be configured to any integer value between 1 and 4294967295.

Usage

Use this command to limit the number of retransmissions to LMA before marking it as unreachable. If the value configured is reached, the call is dropped.

Example

The following command configures the maximum number of retransmissions for the MAG service to 3:

max-retransmissions *3*

reg-lifetime

Configures the Mobile IPv6 session registration lifetime for this service.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

reg-lifetime *seconds*

default reg-lifetime

default

Resets the command value to the default setting of 600.

seconds

Default: 600
Sets the time value for session lifetimes for this service.
seconds must be an integer value from1 to 262140.

Usage

Use this command to limit PMIPv6 lifetime on this service. If the PBA from the LMA contains a lifetime shorter or longer than what is specified, it is used instead.

Example

The following command sets the registration lifetime for Mobile IPv6 sessions using this service to *1200* seconds (20 minutes):

```
reg-lifetime 1200
```

renew-percent-time

Configures percentage of lifetime at which a registration renewal is sent to the LMA.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

renew-percent-time *percent*

default renew-percent-time

default

Resets the command to the default value of 75.

percent

Default: 75
Specifies the time when the registration renewal is sent to the LMA. *percent* is a percentage value of the registration lifetime and must be an integer value from 1 to 100.

Usage

Use this command to specify when a registration renewal is sent to the LMA for subscribers using this service.
If the registration lifetime is 600 seconds (10 minutes) and this command is set to 75 (percent), then the registration renewal message is sent after 450 seconds of the registration lifetime has expired.

Example

The following command sets the registration renewal time for subscribers using this service to 90 percent of the registration lifetime:

```
renew-percent-time 90
```

retransmission-policy

Configures the retransmission policy for Proxy MIP control message retransmissions.

Product

HSGW

Privilege

Administrator

Syntax

retransmission-policy { exponential-backoff | normal }

default retransmission-policy

default

Returns the command to its default setting of exponential-backoff.

{ exponential-backoff | normal }

Sets the retransmission timeout behavior for this service.
exponential-backoff: Specifies that the Proxy Binding Update retransmission uses an exponential backoff to increase the retransmission timeout for each retry.
normal: Specifies that the Proxy Binding Update retransmission uses the configured retransmission timeout value for all PBU retransmission retries.

Usage

Use this command to specify the retransmission policy for PMIP control messages.

Example

The following command sets the retransmission timeout policy for PMIP control packets to “normal”:

```
retransmission-policy normal
```

retransmission-timeout

Configures the maximum allowable time for the MAG service to wait for a response from the LMA before it attempts to communicate with the LMA again (if the system is configured to retry the LMA) or marks the LMA as unreachable.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

retransmission-timeout *time*

{ default | no } retransmission-timeout

default

Resets the timeout setting to the default value of 3.

no

Deletes a previously configured timeout value.

time

Default: 3 seconds (300)
Specifies the maximum allowable time, in milliseconds, for the MAG service to wait for a response from the LMA before it: a) attempts to communicate with the LMA again (if the system is configured to retry the LMA) or b) marks the LMA as unreachable.
time must be an integer value between 100 and 100000.

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the MAG services behavior when it does not receive a response from a particular LMA.

Example

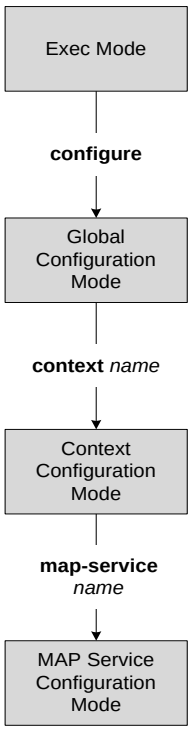
The following command configures a retransmission timeout value of 5 seconds:

retransmission-timeout *5*

Chapter 148
MAP Service Configuration Mode Commands

The MAP Service Configuration Mode is used to configure properties for Mobile Application Part (MAP) service.

Mobile Application Part (MAP) is a protocol which provides an application layer for the various nodes in the core mobile network and GPRS and UMTS core network to communicate with each other in order to provide services to mobile phone users. The MAP service provides the application-layer protocol support used to access the Home Location Register (HLR).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-protocol

Configures access protocol parameters for the MAP service as defined for a specific SCCP network instance.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

access-protocol sccp-network *sccp_id*

no access-protocol

sccp-network *sccp_id*

Specifies the ID number of the SCCP network to use for the SGSN connection.
sccp_id: Must be an integer from 1 to 16.

no

Removes the access protocol SCCP network instance ID from the configuration.

Usage

Use this command to associate access protocol parameters to a specific instance of the MAP service for an SCCP network.

Example

The following command associates the access protocols with the SCCP network ID #10:

access-protocol sccp-network *10*

application-context-name

Configure the operation timer(s) for one or more MAP application contexts.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

application-context-name *application* **operation-timer** *value*

default application-context-name *application* **operation-timer**

default

Resets the operation timers for all applications to system defaults.

application

Select one of the following applications to enable the application:

- **authentication-failure-report** : Sets the reporting operation timer for authentication failure. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **cancel-location** : Sets the cancel location operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **check-imei** : Sets the check-IMEI operation timer. The setting range for this timer is 15 to 30 seconds for releases 8.0 and 8.1 and 1 to 30 seconds for releases 9.0 and higher. The default setting is 15 seconds.
- **delete-subscriber-data** : Sets the delete subscriber data operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mo-fwd-sm** : Sets the operation timer for fowarding mobile-originated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ms-purge** : Sets the operation timer for MS-purge function. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mt-fwd-sm** : Sets the operation timer for fowarding mobile-terminated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ready-for-sm** : Sets the operation timer for the ready for SMS operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **send-authentication-info** : Sets the operation timer for the sending authentication information operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **stand-alone-insert-subscriber-data** : Sets the operation timer for the standalone insert subscriber data operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

- **ugl-insert-subscriber-data** : Sets the operation timer for the insert subscriber data portion of the update GPRS location operation. TThe setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **update-gprs-location** : Sets the operation timer for the update GPRS location operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

operation-timer*value*

Configures the operation timer for the selected application. Timer values are indicated above.

Usage

Repeat this command entering a different application each time to enable multiple applications.

Example

```
application-context-name stand-alone-insert-subscriber-data operation-timer
operation-timer 20
```

auth-vectors

Configures the number of authorization vectors to be requested from the home location register (HLR) during call setup to provide subscriber authentication.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

auth-vectors number-to-request *number*

default auth-vectors number-to-request

default

Resets the number of vectors requested from the HLR to the system default.

number-to-request *number*

number: Must be an integer from 1 to 5 to define the number of authorization vectors be requested from the HLR.
Default is 5.

Usage

Set the number of requests to be received from the HLR.

Example

auth-vectors number-to-request *4*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

equipment-identity-register

Defines the address of the equipment-identity-register (EIR) used by the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

equipment-identity-register { **isdn** *E.164_num* | **point code** *pt_code* } [**source-ssn** *ssn*| **check-imei-every-n-events***times*]

no equipment-identity-register { **isdn** *E.164_num* | **point code***pt_code* **}**

no

Deletes the EIR configuration.

isdn *number*

Enter the E.164 number of the EIR.
number: must be a string of 1 to 15 digits.

point code *pt_code*

Enter SS7 point code address of the EIR in dotted-decimal format according to variant settings:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- or a string of 1 to 11 characters

source-ssn *ssn*

Identifies the subsystem number (SSN) to be used.
ssn must be an integer from 1 to 255.

check-imei-every-n-events *times*

Configures the frequency with which a 'check IMEI' message is sent to the EIR. When set, the SGSN skips sending the 'check IMEI' message for the first N-1 received attach requests.
times must be an integer from 1 to 15.

Important: This feature must be enabled by enabling **verify-equipment-identity** in the **gmm retrieve-equipment-identity imei** command of the SGSN Operator Policy configuration mode.

Usage

Configure the identity of the EIR that the SGSN uses and the interaction parameters.

Example

```
equipment-identity-register point code 7.255.7
```

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

hlr

This command enters the configuration mode for the home location register (HLR). The HLR is a database containing the subscriber profile information for all mobile stations (MS) / user equipment (UE) connecting to a specific GPRS or UMTS core network.

Important: The commands and options for this mode are documented in the HLR Configuration Mode chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
hlr
```

policy

This command configures the Transaction Capabilities Application Part (TCAP) -specific MAP policy for either ANSI or ITU SS7 variants.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] policy tcap { use-received-destination-address | use-received-source-address }
```

use-received-destination-address

Selecting this keyword overwrites stored CG and CD addresses with a new address received in first TC CNT msg

use-received-source-address

Selecting this keyword instructs the MAP service to use the received source address for the dialog.

Usage

Use this command to determine how TCAP will handle MAP messages.

Example

```
policy tcap use-received-destination-address
```

short-message-service

This command enables and disables the short message service (SMS service) and provides access to the SMS service configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] short-message-service
```

no

Disables the SMS service.

Usage

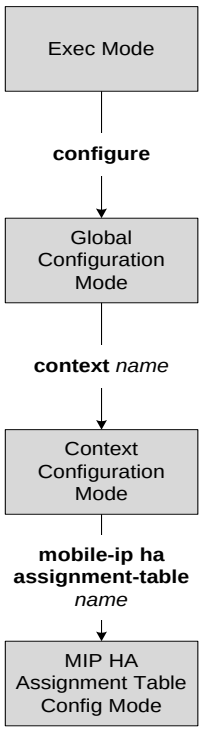
Enter the command to access the SMS service configuration mode to fine tune the SMS functionality.

Example

```
short-message-service
```

Chapter 149
MIP HA Assignment Table Configuration Mode Commands

The Mobile IP HA Assignment Table Configuration Mode is used to assign specific HA IP addresses to ranges of Mobile Node IP addresses.



end

Exits the current configuration mode and returns to the Exec mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Returns to the Exec mode.

exit

Exits the current configuration mode and returns to the Context configuration mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Context Configuration mode.

hoa-range

This command assigns ranges of Mobile Node (MN) IP addresses to specific Home agent IP addresses.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

hoa-range ip_address *ip_address2* **ha** *ip_address3*

no hoa-range *ip_address ip_address2 ha ip_address3*

no

Remove the specified Home Agent assignment from the assignment table.

ip_address ip_address2

Specifies a range of MN IP addresses. *ip_address* and *ip_address2* must be specified in either IPv4 dotted decimal notation or IPv6 colon notation.

ha *ip_address3*

Specifies the IP address of the Home Agent to assign to MNs that are within the specified range. *ip_address3* must be specified in either IPv4 dotted decimal notation or IPv6 colon notation.

Usage

Use this command to assign ranges of MN IP addresses to specific HAs.

Important: A maximum of 8 MIP HA assignment tables can be configured per context with a maximum of 8 MIP HA assignment tables across all contexts.

Important: A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

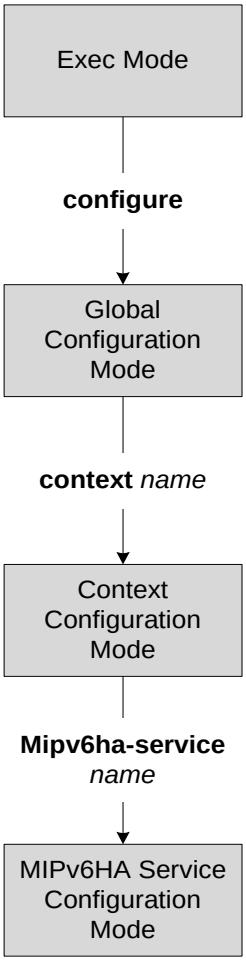
Example

The following command assigns any MN IP address that falls in the range of *192.168.100.0* through *192.168.101.0* to the HA with the IP address of *192.168.200.10*:

```
hoa-range 192.168.100.0 192.168.101.0 ha 192.168.200.10
```

Chapter 150
MIPv6HA Service Configuration Mode Commands

The MIPv6 HA Service Configuration Mode is used to create and manage MIPv6 access privileges.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa accounting

Configures the sending of subscriber session AAA accounting by the HA service.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting

no aaa accounting
```

Usage

Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers.
The chassis is shipped from the factory with the AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the aaa accounting subscriber radius command.

AAA accounting for the HA service can be disabled using the **no** version of the command.

Example

The following command disables aaa accounting for the HA service:

```
no aaa accounting
```

bind

Designates the address of the MIPv6HA service and specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

bind address *IPv6_address* **[max-subscribers** *count* **]**

no bind address

address

Specifies the IPv6 address (address) of the MIPv6HA service. The IPv6 *address* size is 128 bits. The preferred IPv6 address representation is: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx where each x is a hexadecimal digit representing 4 bits.

max-subscribers *count*

Default: 3000000
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to any integer value between 0 and 3,000,000.

default

Restore default values assigned for specified parameter.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
default { aaa | refresh-advice-option | refresh-interval-percent | reg-lifetime
| sequence-number-validate | setup-timeout | simul-bindings | subscriber |
timestamp-replay-protection }
```

aaa

Restores the aaa setting configured by the aaa command to its default of enabled.

refresh-advice-option

Restores the refresh-advice-option setting to its default of disabled.

refresh-interval-percent

Restores the refresh-interval-percent setting to its default of 75.

reg-lifetime

Restores the Mobile IP session registration lifetime setting configured by the reg-lifetime command to its default: 600 seconds.

sequence-number-validate

Restores the sequence-number-validate setting to its default of enabled.

setup-timeout

Restore the maximum amount of time allowed for setting up a session to the default: 60 seconds.

simul-bindings

Restores the simultaneous bindings setting to its default: 1.

subscriber

Configures settings for the default subscriber.

timestamp-replay-protection

Restores the timestamp-replay-protection scheme according to RFC 4285.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example

The following command is used to return the simultaneous bindings setting parameter to it's default value:

```
default simul-bindings
```

end

Exits the HA service configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the HA service configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

refresh-advice-option

Configures inclusion of refresh advice option in Binding Acknowledgement sent by Home Agent (HA).

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
refresh-advice-option
```

Usage

Includes the refresh advice option in the binding acknowledgements sent by the home agent. Default is disabled.

refresh-interval-percent

Configures percentage of the granted lifetime to be used in the refresh interval mobility option in Binding Acknowledgement sent by Home Agent (HA).

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

refresh-interval-percent *value*

value

value represents a percentage. Default is 75.

Usage

Use this command to configure the amount of the granted lifetime to be used in the refresh interval mobility option in Binding Acknowledgement sent by Home Agent (HA).

Example

The following command sets the refresh-interval-percent value to 50%:

```
refresh-interval-percent 50
```

reg-lifetime

Specifies the longest registration lifetime that the HA service will allow in any Registration Request message from the mobile node.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

reg-lifetime *time*

no reg-lifetime

no

Sets the registration lifetime to infinite.

time

Specifies the registration lifetime.
time is measured in seconds and can be configured to any integer value between 1 and 262140. Default is 600.

Usage

Use to limit a mobile nodes lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply.
The chassis is shipped from the factory with the registration lifetime set to 600 seconds.

Example

The following command configures the registration lifetime for the HA service to be 2400 seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIPv6 calls:

```
no reg-lifetime
```

sequence-number-validate

Configures sequence number validation of the received MIPV6 control packet by the Home Agent (HA) according to RFC 3775.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
sequence-number-validate
```

Usage

Use this command to configure the sequence number validation of the received MIPV6 control packet by the Home Agent (HA) as per RFC 3775. Default is enabled.

setup-timeout

The maximum amount of time allowed for session setup.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. must be an integer from 1 through 1000000. Default is 60 seconds.

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

To set the maximum time allowed for setting up a session to 5 minutes (300 seconds), enter the following command:

```
setup-timeout 300
```

simul-bindings

Specifies the maximum number of “care-of” addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

simul-bindings *number*

number

Configures maximum number of "care of" addresses that can be simultaneously bound for the same user as identified by their NAI and home address.
number can be configured to any integer value between 1 and 3. Default is 1.

Usage

The chassis is shipped from the factory with the simultaneous sessions set to 1.
Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address.
Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintains previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested.

Example

The following command configures the service to support up to 2 addresses per subscriber:

```
simul-bindings 2
```

timestamp-replay-protection tolerance

Designates timestamp replay protection scheme as per RFC 4285.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
timestamp-replay-protection tolerance
```

tolerance

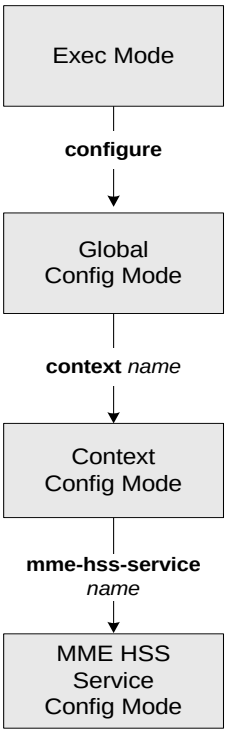
Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds. tolerance must be an integer between 0 and 65535. The default is 7 seconds.

Usage

Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.

Chapter 151
MME-HSS Service Configuration Mode Commands

The MME-HSS Service Configuration Mode is used to create and manage the HSS servers on Diameter protocol.



diameter dictionary

Specifies the Diameter Credit Control dictionary for the MME-HSS service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { custom1 | standard }

default diameter dictionary
```

default

Sets the dictionary to default for HSS service.

custom1

Default: Disabled
This keyword sets the Diameter dictionary to customer specific dictionary. This is a customer specific diameter dictionary.

standard

Default: Enabled
This keyword sets the Diameter dictionary to Standard dictionary. This is standard MME-HSS dictionary.

Usage

Use this command to select the Diameter dictionary for MME-HSS service.

Example

The following command sets the Diameter dictionary to IETF RFC 4006 specific:

```
diameter dictionary standard
```

diameter endpoint

This commands associates a preconfigured Diameter origin endpoint with this MME-HSS service to manage S6a interface between MME and HSS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] diameter endpoint`*`endpoint_name`* **`[-noconfirm]`**

`no`

Removes previously associated Diameter origin endpoint from this MME-HSS service.

`endpoint_name`

This is a preconfigured Diameter endpoint in Context configuration mode. The endpoint must be present in all Diameter messages and is the endpoint that originates the Diameter message.
`endpoint_name` must be an preconfigured diameter endpoint name.
If named endpoint is not configured earlier the system will create it and switch to the Diameter Endpoint Configuration mode in Context Configuration mode.

`-noconfirm`

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **`no diameter endpoint`** *`endpoint_name`* command the Diameter endpoint named *`endpoint_name`* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Use this command to associated a Diameter origin endpoint to create Diameter-based S6a interface in this MME-HSS service to provide AAA functionality to EPS bearer context.
If named endpoint is not configured earlier the system will create it and switch to the Diameter Endpoint Configuration mode in Context Configuration mode.
Refer Diameter Endpoint Configuration Mode Commands chapter for more information on Diameter endpoint configuration parameters.

Example

The following command associates the preconfigured Diameter endpoint hss_1 with this MME-HSS service for S6a interface support.

```
diameter endpoint hss_1
```

If named endpoint is not configured earlier the system will create it and switch to the Diameter Endpoint Configuration mode in Context Configuration mode and following prompt will appear:
[*context*]*host*(config-ctx-diameter)#

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

failure-handling

This command configures the failure handling behavior in the event of a failure with the MME-HSS service. It also defines the action on various error codes on Diameter interface during authentication or session activities.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

failure-handling {authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request} { diameter-result-code*start_error_code***[to***end_error_code***] | request-timeout } action {continue | retry-and-terminate | terminate }**

no failure-handling {authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request} diameter-result-code *start_error_code* **[to** *end_error_code***]**
default failure-handling {authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request} request-timeout

no

Removes the preconfigured failure handling procedures for MME calls in an MME-HSS service.

default

Sets the default action for failure handling procedure for MME calls in an MME-HSS service.
For default actions on Diameter result/error codes see Usage section of this section.

authentication-information-request

This keyword configures the MME-HSS service to handle the failures in Auth-Information-Request message.

check-identity-request

This keyword configures the MME-HSS service to handle the failures in Check-Identity-Information-Request message.

notify-request

This keyword configures the MME-HSS service to handle the failures in Notify-Request message.

purge-ue-request

This keyword configures the MME-HSS service to handle the failures in Purge-UE-Request message.

update-location-request

This keyword configures the MME-HSS service to handle the failures in Update-Location-Request message.

diameter-result-code *start_error_code* **[to** *end_error_code***]**

This keyword configures the MME-HSS service to handle the failures for various request message having specific single or range of Diameter result code in request message.
start_error_code specifies the individual error code on Diameter protocol and must be an integer from 3000 through 5999. This will be the starting of code if a range of error codes is specified with optional keyword **to** *end_error_code*.
to *end_error_code* is used to specify a range of error codes to handle by this command.
end_error_code specifies the end error code on Diameter protocol and must be an integer from 3000 through 5999.

request-timeout

This keyword configures the MME-HSS service to handle the failures for various request messages if response to that message is not received before timeout duration exhausted.

action {continue | retry-and-terminate | terminate}

This keyword specifies the action to be taken on failure of any message as policy of failure handling.

- continue: On receipt of any error, this action configuration will allow the MME-HSS service to continue with the session procedure without any interruption.
- retry-and-terminate: On receipt of any error, this action configuration will instruct the MME-HSS service to retry with the procedure. Sustem will retry up to the configured number of attempts and terminate the session/procedure if it received subsequent number of errors after retry attemps.
- terminate: This action configuration will allow the MME-HSS service to terminate the session procedure without any retry attemp on the event of any failure.

Usage

Use this command to configure the failure handling behavior in the event of a communication failure with the MME-HSS service.
Following are the default action for Diameter result codes:
For all protocol error codes 3000 to 3999 the default action is terminate. For all transient error codes 4000, 4001, 4004 to 4180, and 4182 to 4999 the default action is continue.
For transient error codes 4002, 4003, and 4181 the default action is retry.
For error code 4001 the default action is terminate.
For permanent error codes 5000 to 5999 the default action is terminate

Example

The following command will allow MME-HSS service to continue if any failure in Auth-Information-Request message occurred with Diameter error code *3050*:
failure-handling authentication-information-request **diameter-result-code** *3050* action continue

request timeout

This command configures the application request timeout between MME-HSS service and HSS node. The MME system will wait for this duration before retransmitting the request to corresponding HSS node.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

request timeout *dur*

[no | default] request timeout

no

Disables the configured application request timeout value.

default

Sets the application request time out duration to default value of 300 seconds.

dur

Default: 300 seconds
Specifies the application request timeout duration in seconds. The MME will wait for this duration before retrying the request with corresponding HSS.
dur must be an integer from 1 through 300.

Usage

Use this command to set the waiting period for MME-HSS service in seconds after which the request is deemed to have failed or system will resend the request.

Example

The following example configures the application request timeout duration to 300 seconds:
default request timeout

test

This command test the configured S6a interface between MME-HSS service and HSS server.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

test *s6a_inf_name*

[no | default] test

no

Removes the configured S6a test interface from this MME-HSS service.

default

Sets the S6a test interface to default interface configured from MME service.

s6a_inf_name

Specifies the name of the S6a interface which is to be used for testing the connectivity between MME and HSS node.
s6a_inf_name is a preconfigured interface for S6a reference on system and must be an alpha and/or numerical string of 1 through 63 characters.

Usage

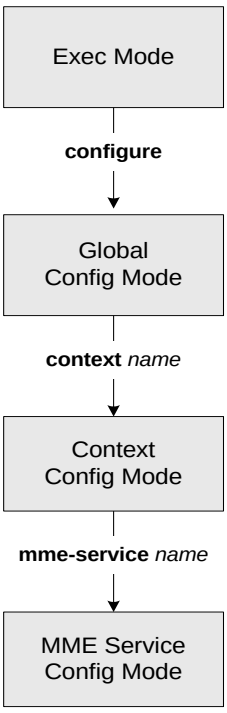
Use this command to set the S6a interface for testing between MME and HSSS node.

Example

The following command configures S6a test interface to *s6a_1*:
test *s6a_1*

Chapter 152
MME Service Configuration Mode Commands

The MME Service Configuration Mode is used to create and manage the LTE Mobility Management Entity (MME) services for LTE/SAE network. This service works in conjunction with MME-HSS Service and eGTP Service.



apn

This command associates/disassociates an Access Point Name (APN) templates to use in MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

apn*apn_name*

no apn*apn_name*

no

Disassociates a previously associated APN template with this MME service.

apn_name

Specifies the name for a pre-configured APN template to associate with this MME service.
apn_name is a pre-configured APN template name in a context. For more information on APN template configuration, Refer apn command in Context Configuration Mode Commands chapter.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no apn** *apn_name* command the APN named *apn_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Use this command to associate a pre-configured APN template with an MME service.
The APN is a logical name for a packet data network and/or a service that the SGSN/GGSN supports access to.
Multiple APN templates can be associated with an MME service.

Example

The following command associates an APN template called *isp1* to an MME service:

apn *isp1*

associate

This command associates/disassociates the supportive services like an Evolved GPRS Tunnelling Protocol (eGTP) service or an MME-HSS service with an MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

associate { egtp-service*egtp_svc_name* **| mme-hss-service** *hss_svc_name***} [context***ctx_name***]**

no associate { egtp-service | mme-hss-service }

no

Disassociates a previously associated eGTP service or MME-HSS service with this MME service.

egtp-service *egtp_svc_name*

Associates an eGTP service with MME service.
egtp_svc_name specifies the name for a pre-configured eGTP service in a context to associate with this MME service. For more information on eGTP service, refer egtp-service command in Context Configuration Mode Commands chapter.

mme-hss-service *hss_svc_name*

Associates an MME-HSS service with MME service.
hss_svc_name specifies the name for a pre-configured MME-HSS service in a context to associate with this MME service. For more information on MME HSS service, refer mme-hss-service command in Context Configuration Mode Commands chapter.

context *ctx_name*

Specifies the specific context name where eGTP or MME-HSS service is configured. If this keyword is omitted, the named eGTP or MME-HSS service must be exist in the same context as the MME service.
ctx_name is name of the configured context of the eGTP or MME-HSS service service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a pre-configured eGTP or MME-HSS service with an MME service.
The eGTP service provides eGTP-U and eGTP-C protocol interface support between EPS nodes. For more information on eGTP service and supported interface type, refer eGTP Service Configuration Mode Commands chapter in Command Line Interface Reference.

Important: Only one eGTP service can be associated to a service. The eGTP service should be configured prior to issuing this command.

The MME-HSS service provides S6a interface support on Diameter protocol between MME and HSS. For more information on MME-HSS service and other parameters, refer MME-HSS Service Configuration Mode Commands chapter in Command Line Interface Reference.

Important: Only one MME-HSS service can be associated to a service in this release. The eGTP service should be configured prior to issuing this command.

Caution: This is a critical configuration. The MME service can not be started without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Example

The following command associates a pre-configured eGTP service called *egtp1* in *dst_ctx* context to an MME service:

```
associate egtp-service egtp1 context dst_ctx
```

The following command associates a pre-configured MME-HSS service called *hss1* in the same context as MME service to an MME service:

```
associate mme-hss-service hss1
```

bind s1-mme

This command binds the MME service to a logical IP interface serving as the S1-MME interface.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

bind s1-mme address *address*
no bind address

no

Removes a previously configured IP address use for binding the SCTP (local bind address) to communicate with the eNodeBs using S1-MME interface.

address

Specifies the IP address (address) in IPv4 or IPv6 notation for the interface configured as an S1-MME interface.

Usage

Use this command to associate or tie the MME service to a specific logical IP address that will be used for binding the SCTP socket to communicate with the eNodeB using S1AP. A maximum of one IP address can be configured with this command for one MME service.
The MME passes the IP address during setting up the SCTP association with the eNodeB.

Caution: This is a critical configuration. The MME service can not be started without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the MME service to interact with eNodeB.
bind s1-mme address *192.168.3.1*
The following command disables a binding that was previously configured:
no bind s1-mme address

dns

This command associates/disassociates the Domain Name System (DNS) client service configured for DNS query in a context to select P-GW and S-GW in an MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

dns { pgw | sgw } [context*ctx_name***]**

no dns { pgw | sgw }

no

Disassociates a previously associated context having DNS client service configured for DNS query to select P-GW or S-GW with this MME service.

pgw

This keyword associates the named context with DNS client service for DNS query for selection of P-GW with MME service.

sgw

This keyword associates the named context with DNS client service for DNS query for selection of S-GW with MME service.

context *ctx_name*

This optional keyword associates the specific context name where DNS client service is configured to select P-GW and/or S-GW for this MME service. If this keyword is omitted DNS client service must be configured in the same context as MME service.
ctx_name is name of the configured context of the DNS client service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a pre-configured context where a DNS client service is configured with an MME service.
The DNS Client service configured in a context provides the DNS query support to locate P-GW or S-GW from and MME service. For more information on DNS Client service and support, refer DNS Client Service Configuration Mode Commands chapter in Command Line Interface Reference.
A maximum of one DNS client service for P-GW and one DNS client service for S-GW can be associated with an MME service.

Example

The following command associates a pre-configured context *dns_ctx1* where a DNS client service is configured for DNS query to P-GW from an MME service:

dns pgw context *dns_ctx1*

The following command associates a pre-configured context *dns_ctx2* where a DNS client service is configured for DNS query to S-GW from an MME service:

dns sgw context *dns_ctx2*

emm

This command defines the Evolved Mobility Management timer parameters like timeout durations for timers for the NAS message retransmission in MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

default emm {mobile-reachable-timeout | t3412-timeout | T3413-timeout | T3422-timeout | T3423-timeout | T3450-timeout | T3460-timeout | T3470-timeout }

no emm implicit-detach-timeout

default

Resets the specified timer timeout to the system default value.

no

Removes the specified EMM timeout definition from the configuration.

implicit-detach-timeout *detach_dur*

Default: 5640
Sets the timer timeout duration after which subscriber will implicitly detached from the network if there is no activity. Generally this timer value is 240 seconds (4 minutes) more than the timeout value of T3423 timer. This timer starts when mobile reachable timer expires while the network is in EMM-IDLE mode and ISR is activated and stops when NAS signalling connection established.
detach_dur is timeout duration in seconds and must be an integer from 1 through 12000.

mobile-reachable-timeout *mob_reach_dur*

Default: 5640
Sets the timeout timer duration after which reachability procedure will be discarded and reattempt starts.
mob_reach_dur is timeout duration in seconds and must be an integer from 1 through 12000.

t3412-timeout *t3412_dur*

Default: 5400
Sets the timeout duration for T3412 timer. This timer is used for periodic tracking area update (P-TAU). When this timer expires, the periodic tracking area updating procedure starts and the timer is set to its initial value for the next start.
This timer starts when the UE goes from EMM-CONNECTED to EMM-IDLE mode and stops when the UE enters EMM-CONNECTED mode.
t3412_dur is timeout duration in seconds and must be an integer from 1 through 11160.

T3413-timeout *t3413_dur*

Default: 10

Sets the timeout duration for T3413 timer. The timer starts when MME initiates the EPS paging procedure to the EMM entity in the network and requests the lower layer to start paging. This timer stops for the paging procedure when a response received from the UE.
t3413_dur is timeout duration in seconds and must be an integer from 1 through 20.

T3422-timeout *t3422_dur*

Default: 10
Sets the timeout duration for T3422 timer. This timer starts when MME initiates the detach procedure by sending a DETACH REQUEST message to the UE and stops upon receipt of the DETACH ACCEPT message.
t3422_dur is timeout duration in seconds and must be an integer from 1 through 20.

T3423-timeout *t3423_dur*

Default: 5400
Sets the timeout duration for T3423 timer. This timer starts when UE enters the EMM-DEREGISTERED state or when entering EMM-CONNECTED mode. It stops while the UE is in EMM-REGISTERED.NO-CELL-AVAILABLE state and Idle mode Signalling Reduction (ISR) is activated.
t3423_dur is timeout duration in seconds and must be an integer from 1 through 11160.

T3450-timeout *t3450_dur*

Default: 6
Sets the timeout duration for T3450 timer. This timer starts when MME initiates the Globally Unique Temporary Identifier (GUTI) reallocation procedure by sending a GUTI REALLOCATION COMMAND message to the UE and stops upon receipt of the GUTI REALLOCATION COMPLETE message.
This timer is also used for Tracking area update procedure.
t3450_dur is timeout duration in seconds and must be an integer from 1 through 20.

T3460-timeout *t3460_dur*

Default: 6
Sets the timeout duration for T3460 timer. The timers starts when the network initiates the authentication procedure by sending an AUTHENTICATION REQUEST message to the UE and stops upon receipt of the AUTHENTICATION RESPONSE message.
t3460_dur is timeout duration in seconds and must be an integer from 1 through 20.

T3470-timeout *t3470_dur*

Default: 6
Sets the timeout duration for T3470 timer. The MME starts this timer when the network initiates the identification procedure by sending an IDENTITY REQUEST message to the UE and stops upon receipt of the IDENTITY RESPONSE message.
t3470_dur is timeout duration in seconds and must be an integer from 1 through 20.

Usage

Use this command to set EMM timers.
Following tables describe the triggers and states for timers:

Table 28. EPS mobility management timers – UE side

Timer	State	Cause of Start	Normal Stop	On Expiry
T3402	• EMM-DEREGISTERED • EMM-REGISTERED	• At attach failure and the attempt counter is equal to 5. • At tracking area updating failure and the attempt counter is equal to 5.	• ATTACH REQUEST sent • TRACKING AREA UPDATE REQUEST sent	Initiation of the attach procedure or TAU procedure
T3410	EMM-REGISTERED-INITIATED	ATTACH REQUEST sent	• ATTACH ACCEPT received • ATTACH REJECT received	Start T3411 or T3402 as described in subclause 5.5.1.2.6
T3411	• EMM-DEREGISTERED. ATTEMPTING-TO-ATTACH • EMM-REGISTERED. ATTEMPTING-TO-UPDATE	• At attach failure due to lower layer failure, T3410 timeout or attach rejected with other EMM cause values than those treated in subclause 5.5.1.2.5. • At tracking area updating failure due to lower layer failure, T3430 timeout or TAU rejected with other EMM cause values than those treated in subclause 5.5.3.2.5.	• ATTACH REQUEST sent • TRACKING AREA UPDATE REQUEST sent	Retransmission of the ATTACH REQUEST or TRACKING AREA UPDATE REQUEST
T3412	EMM-REGISTERED	In EMM-REGISTERED, when EMM-CONNECTED mode is left.	• When entering state EMM-DEREGISTERED or • When entering EMM-CONNECTED mode.	Initiation of the periodic TAU procedure

Timer	State	Cause of Start	Normal Stop	On Expiry
T3416	• EMM-REGISTERED-INITIATED • EMM-REGISTERED • EMM-DEREGISTERED-INITIATED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-SERVICE-REQUEST-INITIATED	RAND and RES stored as a result of a UMTS authentication challenge	• SECURITY MODE COMMAND received • SERVICE REJECT received • TRACKING AREA UPDATE ACCEPT received • AUTHENTICATION REJECT received • AUTHENTICATION FAILURE sent • EMM-DEREGISTERED or EMM-NULL entered	Delete the stored RAND and RES
T3417	EMM-SERVICE-REQUEST-INITIATED	• SERVICE REQUEST sent • EXTENDED SERVICE REQUEST sent in case f and g in subclause 5.6.1.1	• Bearers have been set up • SERVICE REJECT received	Abort the procedure
T3417ext	EMM-SERVICE-REQUEST-INITIATED	• EXTENDED SERVICE REQUEST sent in case d in subclause 5.6.1.1 • EXTENDED SERVICE REQUEST sent in case e in subclause 5.6.1.1 and the CSFB response was set to “CS fallback accepted by the UE”.	• Inter-system change from S1 mode to A/Gb mode or Iu mode is completed • Inter-system change from S1 mode to A/Gb mode or Iu mode is failed • SERVICE REJECT received	Abort the procedure

Timer	State	Cause of Start	Normal Stop	On Expiry
T3418	• EMM-REGISTERED-INITIATED • EMM-REGISTERED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-DEREGISTERED-INITIATED • EMM-SERVICE-REQUEST-INITIATED	AUTHENTICATION FAILURE (EMM cause = #20 “MAC failure” or #26 “Non-EPS authentication unacceptable”) sent	AUTHENTICATION REQUEST received	On first expiry, the UE should consider the network as false
T3420	• EMM-REGISTERED-INITIATED • EMM-REGISTERED • EMM-DEREGISTERED-INITIATED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-SERVICE-REQUEST-INITIATED	AUTHENTICATION FAILURE (cause = #21 “synch failure”) sent	AUTHENTICATION REQUEST received	On first expiry, the UE should consider the network as false
T3421	EMM-DEREGISTERED-INITIATED	DETACH REQUEST sent	DETACH ACCEPT received	Retransmission of DETACH REQUEST

Timer	State	Cause of Start	Normal Stop	On Expiry
T3423	EMM-REGISTERED	T3412 expires while the UE is in EMM-REGISTERED.NO-CELL-AVAILABLE and ISR is activated.	• When entering state EMM-DEREGISTERED or • When entering EMM-CONNECTED mode.	Set TIN to "P-TMSI"
T3430	EMM-TRACKING-AREA-UPDATING-INITIATED	TRACKING AREA UPDATE REQUEST sent	• TRACKING AREA UPDATE ACCEPT received • TRACKING AREA UPDATE REJECT received	Start T3411 or T3402 as described in subclause 5.5.3.2.6
T3440	• EMM-REGISTERED-INITIATED • EMM-TRACKING-AREA-UPDATING-INITIATED • EMM-DEREGISTERED-INITIATED • EMM-SERVICE-REQUEST-INITIATED • EMM-REGISTERED	• ATTACH REJECT, DETACH REQUEST, TRACKING AREA UPDATE REJECT with any of the EMM cause values #11, #12, #13, #14 or #15 • SERVICE REJECT received with any of the EMM cause values #11, #12, #13 or #15 • TRACKING AREA UPDATE ACCEPT received after the UE sent TRACKING AREA UPDATE REQUEST in EMM-IDLE mode with no "active" flag	• Signalling connection released • Bearers have been set up	Release the signalling connection and proceed as described in subclause 5.3.1.2
T3442	EMM-REGISTERED	SERVICE REJECT received with EMM cause #39	TRACKING AREA UPDATE REQUEST sent	None
NOTE 1: The default value of this timer is used if the network does not indicate another value in an EMM signalling procedure.				
NOTE 2: The value of this timer is provided by the network operator during the attach and tracking area updating procedures.				
NOTE 3: The value of this timer may be provided by the network in the ATTACH ACCEPT message and TRACKING AREA UPDATE ACCEPT message. The default value of this timer is identical to the value of T3412.				
NOTE 4: The value of this timer is provided by the network operator when a service request for CS fallback is rejected by the network with EMM cause #39 "CS domain temporarily not available".				

Table 29. EPS mobility management timers – network side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3413	EMM-REGISTERED	Paging procedure initiated	Paging procedure completed	Network dependent
T3422	EMM-DEREGISTERED-INITIATED	DETACH REQUEST sent	DETACH ACCEPT received	Retransmission of DETACH REQUEST
T3450	EMM-COMMON-PROC-INIT	• ATTACH ACCEPT sent • TRACKING AREA UPDATE ACCEPT sent with GUTI • GUTI REALLOCATION COMMAND sent	• ATTACH COMPLETE received • TRACKING AREA UPDATE COMPLETE received • GUTI REALLOCATION COMPLETE received	Retransmission of the same message type, i.e. ATTACH ACCEPT, TRACKING AREA UPDATE ACCEPT or GUTI REALLOCATION COMMAND
T3460	EMM-COMMON-PROC-INIT	• AUTHENTICATION REQUEST sent • SECURITY MODE COMMAND sent	• AUTHENTICATION RESPONSE received • AUTHENTICATION FAILURE received • SECURITY MODE COMPLETE received • SECURITY MODE REJECT received	Retransmission of the same message type, i.e. AUTHENTICATION REQUEST or SECURITY MODE COMMAND
T3470	EMM-COMMON-PROC-INIT	IDENTITY REQUEST sent	IDENTITY RESPONSE received	Retransmission of IDENTITY REQUEST
Mobile reachable timer	All except EMM-DEREGISTERED	Entering EMM-IDLE mode	NAS signalling connection established	Network dependent, but typically paging is halted on 1st expiry
Implicit detach timer	All except EMM-DEREGISTERED	The mobile reachable timer expires while the network is in EMM-IDLE mode and ISR is activated	NAS signalling connection established	Implicitly detach the UE on 1st expiry
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				
NOTE 2: The value of this timer is network dependent.				

Table 30. EPS session management timers – UE side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3480	PROCEDURE TRANSACTION PENDING	BEARER RESOURCE ALLOCATION REQUEST sent	ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST received or MODIFY EPS BEARER CONTEXT REQUEST received or BEARER RESOURCE ALLOCATION REJECT received	Retransmission of BEARER RESOURCE ALLOCATION REQUEST
T3481	PROCEDURE TRANSACTION PENDING	BEARER RESOURCE MODIFICATION REQUEST sent	ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST received or MODIFY EPS BEARER CONTEXT REQUEST received or DEACTIVATE EPS BEARER CONTEXT REQUEST received or BEARER RESOURCE MODIFICATION REJECT received	Retransmission of BEARER RESOURCE MODIFICATION REQUEST
T3482	PROCEDURE TRANSACTION PENDING	An additional PDN connection is requested by the UE which is not combined in attach procedure	ACTIVE DEFAULT EPS BEARER CONTEXT REQUEST received or PDN CONNECTIVITY REJECT received	Retransmission of PDN CONNECTIVITY REQUEST
T3492	PROCEDURE TRANSACTION PENDING	PDN DISCONNECT REQUEST sent	DEACTIVATE EPS BEARER CONTEXT REQUEST received or PDN DISCONNECT REJECT received	Retransmission of PDN DISCONNECT REQUEST
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				

Table 31. EPS session management timers – Network side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3485	BEARER CONTEXT ACTIVE PENDING	• ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST sent • ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST sent	• ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT received or • ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT received or • ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT received or • ACTIVATE DEDICATED EPS BEARER CONTEXT REJECT received	Retransmission of the same message
T3486	BEARER CONTEXT MODIFY PENDING	MODIFY EPS BEARER CONTEXT REQUEST sent	• MODIFY EPS BEARER CONTEXT ACCEPT received or • MODIFY EPS BEARER CONTEXT REJECT received	Retransmission of MODIFY EPS BEARER CONTEXT REQUEST
T3489	PROCEDURE TRANSACTION PENDING	ESM INFORMATION REQUEST sent	ESM INFORMATION RESPONSE received	Retransmission of ESM INFORMATION REQUEST on 1st and 2nd expiry only
T3495	BEARER CONTEXT INACTIVE PENDING	DEACTIVATE EPS BEARER CONTEXT REQUEST sent	DEACTIVATE EPS BEARER CONTEXT ACCEPT received	Retransmission of DEACTIVATE EPS BEARER CONTEXT REQUEST
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				

This command can be repeated to set each timer as needed.
The retransmission of all type of NAS messages can be configured through **nas-max-retransmissions** command.

Example
The following command sets the timeout value for EPS paging procedure timer T3413 for 10 seconds.

```
emm t3413-timeout 10
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

encryption-algorithm-lte

This command configures the precedence for LTE encryption algorithms to use for security procedures through this MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
encryption-algorithm-lte priority1 {128-eea0 | 128-eea1 | 128-eea2}
[priority2 {128-eea0 | 128-eea1 | 128-eea2}] [priority3 {128-eea0 | 128-
eea1 | 128-eea2}]
default encryption-algorithm-lte
```

default

Sets the default LTE encryption algorithm for security procedures with configured priority *value*. Default configuration of LTE encryption algorithm is:

- priority1 with 128-eea0 encryption algorithm
- priority2 with 128-eea1 encryption algorithm
- priority3 with 128-eea2 encryption algorithm

priority1

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1. Least value has highest preference.

priority2

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2. Least value has highest preference.

priority3

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 3. Least value has highest preference.

128-eea0

Default: Enabled
This keyword sets the Null ciphering algorithm (128-EEA0) for LTE encryption as the encryption algorithm for security procedures.

128-eea1

Default: Disabled
This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EEA1) for LTE encryption as the encryption algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2.

128-eea2

Default: Disabled
This keyword sets the Advance Encryption Standard (AES) ciphering algorithm (128-EEA2) for LTE encryption as the encryption algorithm for security procedures.

Usage

Use this command to set the LTE encryption algorithms for security procedures to use with this MME service.

Caution: When this command is executed, all the existing priority to algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

Caution: Configuration of same algorithm to multiple priorities is prohibited.

Example

The following command sets the 128-EEA1 as the LTE encryption algorithm with priority 2 for security procedures with an MME service.

```
encryption-algorithm-lte priority2 128-eea1
```

esm

This command defines the Evolved Session Management timer parameters like timeout durations for timers for the retransmission of NAS messages in MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

default esm {t3485-timeout|T3495-timeout}

default

Resets the specified Evolved Session Management timer timeout to the system default value.

t3485-timeout *t3485_dur*

Default: 6
Sets the timeout duration for T3485 timer. This timer is used for default EPS bearer context activation procedure.
This timer starts when the MME sends ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message to UE and stops when receives ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT message from UE.
t3485_dur is timeout duration in seconds and must be an integer from 1 through 60.

T3495-timeout *t3495_dur*

Default: 6
Sets the timeout duration for T3485 timer. This timer is used for default EPS bearer context deactivation procedure.
This timer starts when the MME sends DEACTIVATE EPS BEARER CONTEXT REQUEST message to UE and stops when receives DEACTIVATE EPS BEARER CONTEXT ACCEPT or DEACTIVATE EPS BEARER CONTEXT REJECT message from UE.
t3495_dur is timeout duration in seconds and must be an integer from 1 through 60.

Usage

Use this command to set Evolved Session Management timers.
Following tables describe the triggers and states for timers:

Table 32. EPS session management timers – Network side

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)

Timer	State	Cause of Start	Normal Stop	On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)
T3485	BEARER CONTEXT ACTIVE PENDING	• ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST sent • ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST sent	• ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT received or • ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT received or • ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT received or • ACTIVATE DEDICATED EPS BEARER CONTEXT REJECT received	Retransmission of the same message
T3495	BEARER CONTEXT INACTIVE PENDING	DEACTIVATE EPS BEARER CONTEXT REQUEST sent	DEACTIVATE EPS BEARER CONTEXT ACCEPT received	Retransmission of DEACTIVATE EPS BEARER CONTEXT REQUEST
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.				

This command can be repeated to set each timer as needed.
The retransmission of all type of NAS messages can be configured through **nas-max-retransmissions** command.

Example
The following command sets the timeout value for default EPS bearer context activation procedure timer T3485 for 10 seconds.

```
esm t3485-timeout 10
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

imei

This command sets the mobile equipment identity (MEI) query criteria with different attributes like IMEI and IMEI-SV for UE related procedures.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
imei-query-type {none | imei | imei-sv}
default imei-query-type
```

default

Sets the UE query criteria to its default type of "none".

imei

This keyword sets the MEI query type to IMEI. International Mobile Equipment Identity (IMEI) will be used as criteria for MEI query with this MME service.

imei-sv

This keyword sets the MEI query type to IMEI-SV. International Mobile Equipment Identity (IMEI) and software version (SV) will be used as criteria for MEI query with this MME service.

none

This keyword sets the MEI query type to "none". Neither IMEI nor IMEI-SV will be used as criteria for MEI query with this MME service.

Usage

Use this command to MEI query criteria for UE related procedures with an MME service.
MME has to do following procedure with reference to MEI query:

- Retrieve MEI from UE during security mode procedure
- Store in local IMSI DB
- Send MEI to HSS in ULR
- Send MEI to SGW in Create Session Request
- monitor subscriber support using MEI as a key

Query type described with this command will be applicable for all above mentioned procedures.

Example

The following command sets the MEI query type to IMEI for UE related procedures:

```
imei-query-type imei
```

integrity-algorithm-lte

This command configures the precedence of LTE integrity algorithms to use for security procedures through this MME service. By default integrity algorithm is enabled on MME service, which cannot be disabled.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
default integrity-algorithm-lte
```

default

Removes the preconfigured integrity algorithm and sets the default LTE integrity algorithm for security procedures. Default configuration of LTE integrity algorithm is:

- priority1 with 128-eia1 integrity algorithm
- priority2 with 128-eia2 integrity algorithm

priority1

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1. This is the mandatory and default priority keyword.

priority2

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2.

128-eia1

Default: Disabled
This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EIA1) for LTE integrity as the integrity algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2.

128-eia2

Default: Enabled
This keyword sets the Advance Encryption Standard (AES) ciphering algorithm (128-EIA2) for LTE integrity as the integrity algorithm for security procedures.

Usage

Use this command to set the LTE integrity algorithms for security procedures to use with this MME service.

WARNING: Integrity algorithm is a mandatory aspect and can not be disabled in MME service.

Caution: When this command is executed, all the existing priority to algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

Caution: Configuration of same algorithm to multiple priorities is prohibited.

Example

The following command sets the AES ciphering algorithms (128-EIA2) as the LTE integrity algorithm with priority as *1* for security procedures with an MME service.

```
integrity-algorithm-lte priority1 128-eia2
```

location-reporting

This command enables the location reporting functionality for UE on MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] location-reporting
```

default

Disables the location reporting feature on MME service.

no

Disables the location reporting feature on MME service.

Usage

Use this command to enable/disable the UE location reporting feature on MME serivce.

Example

The following command sets the MME service to provide the location reporting functionality for UE:

```
location-reporting
```

max-bearers per-subscriber

This command specifies the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
max-bearers per-subscriber max_bearer
default max-bearers per-subscriber
```

default

Configures the maximum EPS bearers for a subscriber to use simultaneously to default value of 11.

max_bearer

Default: 11
Specifies the maximum number of EPS bearers for a subscriber may simultaneously use to access this MME service.
max_bearer can be configured to any integer value between 1 and 11.

Usage

Use this command to set the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Example

The following command specifies that a maximum of 6 simultaneous EPS bearers can be facilitated for a subscriber at any given time.

```
max-bearers per-subscriber 6
```

max-paging-attempts

This command configures the maximum number of paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

max-paging-attempt *max_paging_retry*
default max-paging-attempt

---

default

Configures the maximum number of retransmission of paging request to default value of 3.

---

max_paging_retry

Default: 3
Specifies the maximum number of paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed.
max_paging_retry can be configured to any integer value between 1 and 10.

Usage

Use this command to set the maximum number of paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed.

Example

The following command specifies that a maximum of 6 paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed for a subscriber at any given time.
max-paging-attempt *6*

max-pdns per-subscriber

This command specifies the maximum number of PDNs that a subscriber may simultaneously access through this MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
max-pdns per-subscriber max_pdn
default max-pdns per-subscriber
```

default

Configures the maximum PDNs for a subscriber simultaneously access through this MME service to default value of 3 PDNs.

max_pdn

Default: 3
Specifies the maximum number of PDNs that a subscriber may simultaneously access through this MME service.
max_pdn can be configured to any integer value between 1 and 11.

Usage

Use this command to set the maximum number of PDNs that a subscriber may simultaneously access through this MME service.

Example

The following command specifies that a maximum of 2 simultaneous PDNs can be accessed by a subscriber at any given time through this MME service.

```
max-pdns per-subscriber 6
```

mme-id

This command configures the MME identifier with an MME service. MME identifier is constructed with MME group ID and MME Code.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

mme-id group-id *grp_id* **mme-code** *mme_code*
no **mme-id**

no

Removes the configured MME identifier for this MME service.

Caution: Removing the MME identifier is a disruptive operation; the MME service shall be removed from the service.

group-id *grp_id*

Specifies the group identifier of for the group of which this MME is belongs to.
grp_id must be an integer value from 0 through 65535.

mme-code *mme_code*

Specifies the unique code for this MME service.
mme_code must be an integer value from 0through 255.

Usage

Use this command to set the MME identifier for this MME service. This MME identifier will be the identity of this MME in network.

Caution: Changing or removing the MME identifier is a disruptive operation; the MME service shall be re-started or removed from service.

Example

The following command configures the MME identifier with group id as *1025* and MME code as *101* for this MME service.
mme-id group-id *1025* **mme-code** *101*

nas-max-retransmission

This command sets the retransmission counter for all type of NAS messages in an MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

nas-max-retransmissions *nas_retrans_count*

default nas-max-retransmissions

default

Resets the retransmission counter to the system default value of 4.

nas_retrans_count

Default: 4
Sets the maximum number of retransmission of NAS messages permitted during any procedure after which activation procedure will be discarded.
nas_retrans_count is number of retransmission allowed and must be an integer from 1 through 10.

Usage

Use this command to set maximum number of retries allowed for any type of NAS messages.
NAS Messages send by the MME which require a response from the UE for procedure completion are retransmitted. Retransmission happens based on timer expiry. The timers are configured through **emm** and **esm** command. The NAS messages are retransmitted as per configuration, and if no response from the UE is received, the pending transaction is abandoned. If the transaction is a DETACH or PDN DISCONNECT REQUEST, the transaction is completed without further UE signaling.
The timeout duration configured through **emm** and **esm** command will be applicable between two retries.

Example

The following command sets the maximum number of retries allowed as 4 for all type of NAS messages in an MME service.

```
default nas-max-retransmissions
```

nri

This command specifies the Network Resource Identifier (NRI) stored in bit 17 to bit 23 of Globally Unique Temporary Identity (GUTI) to be retrieved by MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

nri length *length* **[value** *value***]**

no nri [value]

no

Removes the configured NRI value and location in GUTI for retrieval by this MME service.

length *length*

Specifies the length of bits to be used in the GUTI to retrieve NRI information. This starts from bit 23 to bit 17 of GUTI.
length must be an integer from 1 to 6.

value *value*

Specifies the value of NRI to retrieve from GUTI. This value should not exceed the maximum possible value for the specified bit length. For example, if length specified is 3 bit the value should not exceed 7 and if length specified is 5 the value should not exceed 31.
value must be an integer from 0 to 63.

Usage

Use this command to retrieve the NRI stored in GUTI bit 17 to bit 23.

Example

The following command specifies the length of NRI information as 5 bit and value to retrieve as 23 from GUTI:

```
nri length 5 value 23
```

pgw-address

This command configures the PDN Gateway (P-GW) address to use P-MIP protocol for S5 and S8 interface and other parameters with MME service. By default S5 and S8 use GTP protocol for this.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

pgw-address *address* **[s5-s8-protocol pmip] [weight** *value***]**
no pgw-address *address* **[s5-s8-protocol pmip]**

no

Removes a previously configured IP address of P-GW along with S5 and S8 interface of P-MIP protocol type and other parameters from this MME service.

address

Specifies the IP address of the P-GW.
address must be an IP address in IPv4 or IPv6 notation.

s5-s8-protocol pmip

Specifies that P-MIP type of protocol to use for S5 and S8 interfaces with P-GW. By default S5 and S8 interface uses GTP protocol.
pmip Sets the protocol to Proxy-MIP for S5 and S8 interface as by default GTP is the applicable protocol.

weight *value*

Assigns the weight to P-GW address to use as a preferred P-GW.
value must be an integer from 1 through 100. Lowest value has the least preference.

Usage

Use this command to configure the PDN Gateway (P-GW) addresses to use with MME service. This command also changes the default protocol or GTP to P-MIP for the S5 and S8 interface and weight to share the load between associated P-GWs. A maximum of 16 P-GW addresses can be configured with this command.
This command only changes the use of protocol in S5 and S8 interface. By default P-GW uses GTP protocol for S5 and S8 interfaces. By this command user can change the protocol to P-MIP for S5 and S8 interface.
When weight is used, the weights of the P-GW(s) (that are operational) are totaled and then weighted round-robin selection is used to distribute new default bearer context among the P-GW(s) according to their weights.

Example

The following command associates the P-GW IP address of *192.168.3.1* to the MME service with S5 and S8 protocol as P-MIP and weight as *90*.
pgw-address *192.168.3.1* **s5-s8-protocol pmip weight** *90*

The following command removes the above configured P-GW IP address and other parameters:
no pgw-address *192.168.3.1* **s5-s8-protocol pmip**

plmn-id

This command configures the Public Land Mobile Network (PLMN) identifier for this MME service. PLMN identifier is made of Mobile Country Code (MCC) and Mobile Network Code (MNC). A maximum of 16 PLMN id can be configured in an MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

plmn-id mcc *mcc_value* **mnc** *mnc_value*
no **plmn-id mcc** *mcc_value* **mnc** *mnc_value*

no

Removes the configured PLMN identifier for this MME service.

Caution: Removing the PLMN identifier is a disruptive operation; the MME service shall be re-started.

mcc *mcc_value*

Specifies the mobile country code (MCC) part of PLMN identifier.
mcc_value must be an integer value from 101 through 998.

mnc *mnc_value*

Specifies the mobile network code (MNC) part of PLMN identifier.
mcc_value must be an integer value from 01 through 99 or 100 through 998.

Usage

Use this command to set the PLMN identifier for this MME service.

Caution: Changing or removing the PLMN identifier is a disruptive operation; the MME service shall be re-started.

A maximum of 16 PLMN identifiers are supported for an MME service.

Example

The following command configures the PLMN identifier with MCC value as *102* and MNC value as *20* for this MME service.
plmn-id mmc *102* **mnc** *20*

policy idle-mode

This command configures the user-defined policies of session management for LTE subscriber in an MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
policy idle-mode detach {explicit | implicit}

       [default] policy idle-mode detach
```

default

Sets the policy of idle mode detach for a subscriber to its default behavior as implicit.

idle-mode detach

This keyword configures the IDLE mode detach behavior of a UE.

detach

This keyword defines the detach procedure while UE is in IDLE mode.

explicit

Default: disabled
This keyword enables the explicit detach while a UE is in IDLE mode. System will page UE before detach procedure started and then perform explicit detach procedure.

implicit

Default: Enabled
This keyword enables the implicit detach while a UE is in IDLE mode. System never send any message to UE before detach and performs explicit detach procedure immediately.

Usage

Use this command to set the user-defined policies for session management in this MME service.

Example

The following command sets the idle mode detach policy to explicit for a user in this MME service.

```
policy idle-mode detach explicit
```

policy overload

This command configures the traffic overload policy to control congestion in this service.

Product

MME

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to default behavior of reject.

drop

Default: Disabled
Specifies that the system is to drop the incoming packets with new session requests to avoid overload on MME node.

reject

Default: Enabled
This keyword configures the system to reject the new session/call request and responds with a reject message when threshold for allowed call session is crossed on MME node.

Usage

Use this command to set the user-defined policies for new call connection attempted during overload in an MME service.
Congestion policies at the service-level can be configured for service. When congestion control functionality is enabled at service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command sets the nw call connect policy to reject the new session/call request in an MME service.

```
policy overload reject
```

policy pdn-reconnection

This command configures the action by MME when a PDN connection request to an already connected APN is being processed by MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
policy pdn-reconnection {multiple | reject | restart}

       [default] policy pdn-reconnection
```

default

Sets the policy of PDN reconnection to its default behavior of reject.

multiple

Default: Disabled
This keyword allows multiple connections to a PDN with same APN and PDN Type. In this case, the existing connection is left unchanged, and the MME attempts to establish an additional connection to the PDN.

reject

Default: Enabled
This keyword configures set the action of MME to deny or reject the request, by sending a PDN connection reject command. This is the default behavior.

restart

Default: Disabled
This keyword deletes the existing connection and initiate an attempt to establish a new connection.

Usage

Use this command to set the user-defined policies for PDN reconnection attempt procedures initiated by UE in an MME service.
While a UE is attached, the UE can request connections to PDNs. The PDNs are identified by APN (Access Point Name) and PDN Type (ipv4, ipv6 or ipv4v6).
If the UE requests connection to a PDN for which a connection with the same APN name and PDN type already exists, the MME can; 1) deny or Reject the request, by sending a PDN connection reject command; 2) allow multiple connections to a PDN with same APN and PDN Type; or 3) delete the existing connection, and attempt to establish a new connection.

Example

The following command sets the PDN reconnect policy to delete the existing PDN and start the attempt to establish a new connection in an MME service.

```
policy pdn-reconnection restart
```

s1-mme sctp port

This command configures the source SCTP port that will be used for binding the SCTP socket to communicate with the eNodeB using S1AP with this MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
s1-mme sctp port port_num
default s1-mme sctp port
```

default

Sets the SCTP port to default value of 699 to communicate with the eNodeBs using S1-MME interface.

port_num

Specifies the SCTP port number to communicate with the eNodeBs using S1-MME interface.
port_num must be an integer between 1 through 65535.

Usage

Use this command to assign the SCTP port with SCTP socket to communicate with the eNodeB using S1AP. A maximum of one SCTP port can be associated with one MME service.

Example

The following command sets the default SCTP port number 699 for to interact with eNodeB using S1AP on S1-MME interface.

```
default s1-mme sctp port
```

setup-timeout

This command configures the timeout duration for call setup of MME calls in this MME service.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
setup-timeout dur
default setup-timeout
```

default

Sets the call setup timeout duration to default value of 60 seconds.

dur

Default: 60
Specifies the call setup timeout duration for MME calls after which attempt will be discarded.
dur must be an integer between 1 through 10000.

Usage

Use this command to configured the timeout duration in seconds to setup an MME call with an MME service. One this duration exhausted Call setup procedure will be discarded with this MME service.

Example

The following command sets the default setup timeout duration of 60 seconds for MME calls:

```
default setup-timeout
```

sgw-address

This command configures the Serving Gateway (S-GW) address to use P-MIP protocol for S5 and S8 interface and other parameters with MME service. By default S5 and S8 use GTP protocol for this.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

sgw-address *address* **[s5-s8-protocol pmip] [tai tac** *tac_value* **[mcc** *mcc_value* **mnc** *mnc_value* **]] [weight** *weight_value* **]**
no sgw-address *address* **[s5-s8-protocol pmip] [tai tac** *tac_value* **[mcc** *mcc_value* **mnc** *mnc_value* **]]**

no

Removes a previously configured IP address of S-GW along with S5 and S8 interface of P-MIP protocol type and other parameters from this MME service.

address

Specifies the IP address of the S-GW.
address must be an IP address in IPv4 or IPv6 notation.

s5-s8-protocol pmip

Specifies that P-MIP type of protocol to use for S5 and S8 interfaces with P-GW. By default S5 and S8 interface uses GTP protocol.
pmip Sets the protocol to Proxy-MIP for S5 and S8 interface as by default GTP is the applicable protocol.

tai tac *tac_value*

Specifies the tracking area identifier (TAI) for S-GW. It configures the Tracking Area Code (TAC) for S-GW in MME service.
tac_value must be an integer from 1 through 268435455.

mcc *mcc_value*

Specifies the mobile country code (MCC) part of tracking area identifier.
mcc_value must be an integer value from 101 through 998.

mnc *mnc_value*

Specifies the mobile network code (MNC) part of tracking area identifier.
mcc_value must be an integer value from 01 through 998.

weight *weight_value*

Assigns the weight to P-GW address to use as a preferred S-GW.
weight_value must be an integer from 1 through 100. Lowest value has the least preference.

Usage

Use this command to configure the Serving Gateway (S-GW) addresses to use with MME service along with tracking area Identifier and tracking area code. This command also configures the S5 and S8 interface protocol type and priority and weight to share the load between associated S-GWs. A maximum of 16 S-GW addresses can be configured with this command.

This command only changes the use of protocol in S5 and S8 interface. By default S-GW uses GTP protocol for S5 and S8 interfaces. By this command user can change the protocol to P-MIP for S5 and S8 interface.

When weight is used, the weights of the S-GW(s) (that are operational) are totaled and then weighted round-robin selection is used to distribute new default bearer context among the S-GW(s) according to their weights.

Example

The following command associates the S-GW IP address of *192.168.3.1* to the MME service with S5 and S8 protocol as P-MIP along with tracking area code as *20* and weight as *90*.

pgw-address *192.168.3.1* **s5-s8-protocol pmip tai tac** *20* **weight** *90*

The following command removes the above configured S-GW IP address, P-MIP protocol setting, and other parameters:

no sgw-address *192.168.3.1***s5-s8-protocol pmip tai tac** *20*

ue-db

This command configures the UE database which is maintained by MME as cache of EPS context per UE keyed by IMSI/GUTI to allow UE to attach by GUTI and reuse previously established security parameters. This cache will be maintained in each session manager where the first attach occurred for an UE.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

ue-db purge-timeout *dur_mins*

default ue-db purge-timeout

default

Resets the UE database purge timer timeout to the system default value of 10080 mins.

purge-timeout *dur_mins*

Default: 10080
Sets the timeout duration for MME to store UE database in cache memory.
This timer starts when UE goes in dormant.
dur_mins is timeout duration in minutes and must be an integer from 1 through 20160.

Usage

Use this command to set timeout duration for MME to hold UE database information in cache memory.
The MME DB acts as a cache for storing subscriber related information. This subscriber related information helps in reducing signaling traffic. The MME DB is a part of the Session Manager and interfaces between the Session Manager Application and Evolved Mobility Management Manager to provide access to the cached data.

Example

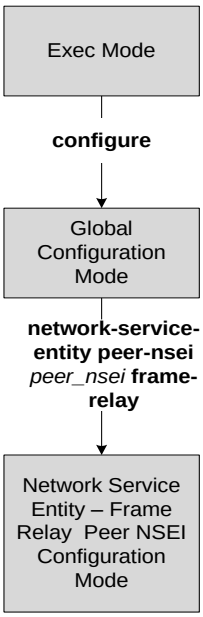
The following command configures the MME database cache timer to hold the UE information up to 7 days (10080 minutes) in MME Database.
default ue-db purge-timeout

Chapter 153
Network Service Entity - Peer NSEI Configuration Mode Commands

The Network Service Entity (NSE) - Peer NSEI configuration mode configures the Frame Relay parameters for the peer NSE. This mode is a sub-mode of the Global Configuration mode. This sub-mode provides the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS Frame Relay network connection.

Upon accessing this mode, the prompt should be similar to:

```
[local]asn5000(nse-fr-peer-nsei-2344)# where the 2344 represents a user-
defined instance.
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bssgp-timer

This command has been deprecated.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

ns-vc

This command creates a network service virtual circuit (NSVC) for this frame relay NSE and enters the configuration sub-mode to define the NSVC parameters. These parameters are described in the NSVC Configuration Mode chapter elsewhere in this CLI Reference Guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ns-vc id*ns-vc_id*

no

Removes the specified NSVC configuration.

id *ns-vc_id*

This keyword defines the NSVC configuration identifier.
ns-vc_id: Must be an integer from 0 to 65535

Usage

Access the NSVC configuration mode.

Example

Gain access to the NSVC configuration mode to change the 4th instance.

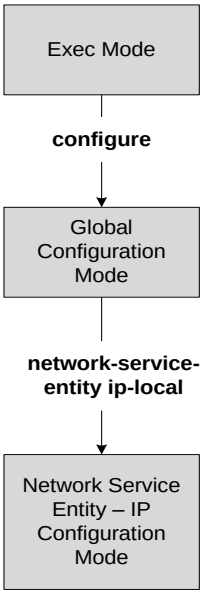
```
ns-vc id 4
```

Chapter 154
Network Service Entity- IP Local Configuration Mode Commands

The Network Service Entity (NSE) - IP Local configuration mode is a sub-mode of the Global Configuration mode. This sub-mode configures the local endpoint for NS/IP with the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt will appear in a manner similar to:

[local]asr5000(nse-ip-local)#



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

all-nsvc-failure-action

Configure how the SGSN handles the NSE when all NSVCs go down.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
all-nsvc-failure-action clear-nse

default all-nsvc-failure-action
```

default

By default, the NSE is not cleared if all NSVCs go down.

clear-nse

Instructs the SGSN to SGSN to clear NSE if all NSVCs to the BSC are down.

Usage

Enable the SGSN to clear NSE information when all NSVCs go down.

Example

```
all-nsvc-failure-action clear-nse
```

bssgp-timer

This command has been deprecated.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the global configuration mode.

max-ns-retransmissions

This command configures the maximum number of transmission retries counter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] max-ns-retransmissions { alive*count***| sns-proc***count***}**

default

Resets the specified counter configuration to the default value.

alive *count*

Sets the maximum number of alive retries.
count: Must be an integer between 0 and 10. Default is 3.

sns-proc *count*

Sets the maximum number of retries for the SNS procedure
count: Must be an integer between 0 and 5. Default is 3.

Usage

Sets the maximum for NS transmission retries.

Example

```
max-ns-retransmission alive 4
```

ns-timer

This command sets the network service (NS) counters for the SNS procedure and testing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ns-timer { sns-prov*timeout_val***| test***timeout_val***}**

default ns-timer { sns-prov | test }

default

Resets the selected timer configuration to its default value.

sns-prov *timeout_val*

Sets the SNS procedure timeout value in seconds.
timeout_val: Enter an integer from 1 to 10. Default is 5.

test *timeout_val*

Sets the test procedure timeout value in seconds.
timeout_val: Enter an integer from 1 to 60. Default is 30 seconds.

Usage

Set NS timers to help manage the NSE-IP connection.

Example

The following example sets the test timer to 4 seconds:

```
ns-timer test 4
```

nsvc-failure-action

This command enables and disables the sending of an NS-STATUS message with cause ‘ip-test fail’ when NSVC goes down.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nsvc-failure-action send-ns-status

default nsvc-failure-action

default

Resets the command configuration to its default value. The default action is not to send an NS-STATUS message. This is applicable only to NSVCs that are auto-learned and not configured.

send-ns-status

Enables the sending of the NS-STATUS message.

Usage

Use this command to enable or disable sending an NS-STATUS messages when an NSVC goes down.

Example

Enable sending of the message:

nsvc-failure-action send-ns-status

nsvl

This command creates and instance of a Network Service Virtual Link (NSVL) and enters the NSVL configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] nsvl instance *nsvl_id*

no

Removes the identified NSVL definition from the configuration.

nsvl_id

Identifies a specific NSVL. configuration instance.
nsvl_id: Must be an integer from 0 to 3.

Usage

Access the NSVL configuration mode.

Example

nsvl instance *2*

peer-network-service-entity

This command has been replaced by the Network Service Entity - Peer NSEI Frame Relay configuration mode.

retry-count

This command has been replaced by the **max-ns-retransmissions** command.

timer

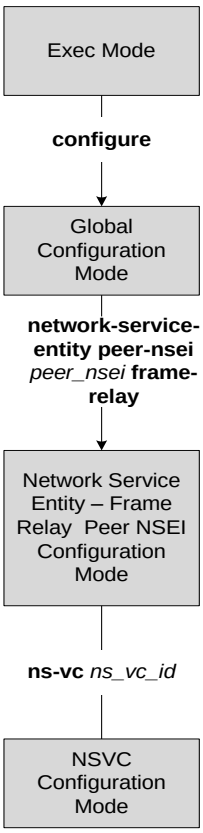
This command has been replaced by the **ns-timer** command.

Chapter 155
Network Service Virtual Connection Configuration Mode Commands

The Network Service Virtual Connection (NSVC) configuration mode is a sub-mode of the Network Service Entity (NSE) - Frame Relay Peer NSEI (NSE-FR for short) configuration mode. This sub-mode provides the commands and parameters to define the management functionality for a specific NSVC of the Gb interface between a BSS and an SGSN in a 2.5G GPRS frame relay network connection.

Upon accessing this mode, the prompt will appear similar to:

[local]asr5000(nse-fr-peer-nsei-2344-nsvci-2)# where the numerics are user-defined ids for the configuration instances.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

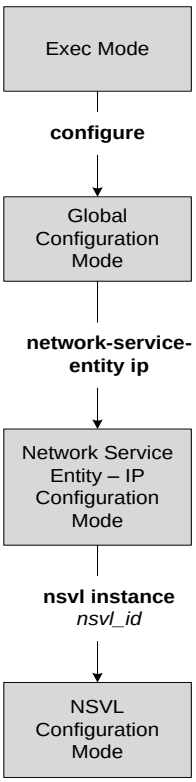
Returns to the network service entity - frame relay configuration mode.

Chapter 156
Network Service Virtual Link Configuration Mode Commands

The Network Service Virtual Link configuration mode is a sub-mode of the Network Service Entity - IP configuration mode. This sub-mode provides the commands and parameters to define the NSVL of the Gb interface between a BSS and an SGSN in a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt should appear similarly to the following:

[local]asr5000(nse-ip-local-nsvl-1)#



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Returns to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the network service entity - IP configuration mode.

nsvl-address

This command configures the IP address of the NSVL. end-point.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nsvl-address ip-address *ip_address* **context** *ctxt_name* **port** *port_num*

ip-address *ip_address*

Identifies the address of the NSVL.
ip_address: Must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.

context *ctxt_name*

Identifies the specific context associated with this NSVL address.
ctxt_name: Enter up to 79 alphanumeric characters.

port *port_num*

Specifies the UDP port to associate with the NSVL end-point.
port_num: Must be an integer from 1 to 65535.

Usage

Use this command to configure the IP address, context name and port number for the NSVL end-point.

Example

```
nsvl-address ip-address 1.1.1.1 context sgsn2 port 3735
```

weight

This command configures the signaling or data weight for NSVL.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

weight { data *data_weight* **| signaling** *signaling_weight* **}**

data *data_weight*

Defines the data weight for the NSVL.
data_weight: Must be an integer from 0 to 255. Default is 1.

signaling *signaling_weight*

Defines the signaling weight for the NSVL.
signaling_weight: Must be an integer from 0 to 255. Default is 1.

Usage

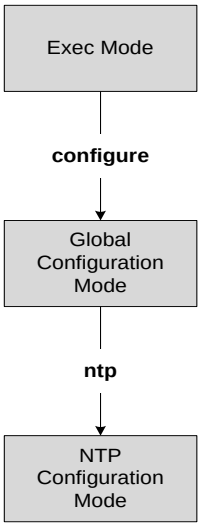
Configure the weight of the signaling or data for the NSVL.

Example

weight data *234*

Chapter 157
NTP Configuration Mode Commands

The Network Timing Protocol Configuration Mode is used to manage the NTP options for the entire system.



enable

Enables the use of the network timing protocol for updating the system clock.

Product

All

Privilege

Security Administrator, Administrator

Syntax

enable [*context*]

context

Default: local
Specifies the context for which NTP is to be enabled. *name* must refer to a previously configured context.

Usage

Set the NTP server to be used for the system. Only one NTP server may be active at any given time. If this command were issued in a different context followed by the current context, the prior context's NTP server would be disabled and the current context's NTP server would be used.
If any NTP server is enabled, the chassis system clock will be synchronized to the active NTP server which covers all contexts for timing synchronization.
The use of a given context for NTP server assignment is to inherit the domain and IP routing options of the configured context.

Example
enable *sampleContext*

end

Exits the NTP configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the NTP configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

server

Configures an NTP server for use by the local NTP client in synchronizing the system clock.

Product

All

Privilege

Security Administrator, Administrator

Syntax

server *ip_address* [**prefer**] [**version** *number*] [**minpoll** *poll_period*] [**maxpoll** *poll_period*]
no server *ip_address*

---

no

Indicates the server specified is to be removed from the list of NTP servers for clock synchronization.

---

ip_address

Specifies the IP address of the NTP server to allow for clock synchronization. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

---

prefer

Indicates the NTP server specified to be the preferred server. Only one server can be set to preferred. The preferred server is first contacted for clock synchronization.

Important: Use of the prefer keyword is not recommended.

---

version *number*

Default: 4
Specifies the network timing protocol version to use for server communications. *number* must be a value in the range from 1 to 4.

---

minpoll *poll_period*

Default:6
Specifies the minimum polling interval for NTP messages, in seconds, as a power of 2. *poll_period* is the power or exponent. For example, if you specify the number 10, the value is 2^10 and the resultant poll period is 1024 seconds. *poll_period* must be an integer from 6 through 17.

---

maxpoll *poll_period*

Default: 10
Specifies the maximum polling interval for NTP messages, in seconds, as a power of 2. *poll_period* is the power or exponent. For example, if you specify the number 10, the value is 2^10 and the resultant poll period is 1024 seconds. *poll_period* must be an integer from 6 through 17.

Usage

Configure the network timing protocol servers in the network as changes occur.

Important: Adding, removing, or modifying an NTP server configuration entry causes the NTP client to restart and restart the synchronization process with all configured NTP servers.

Example

The following command adds the NTP server with address *1.2.3.4* to the list of NTP servers.

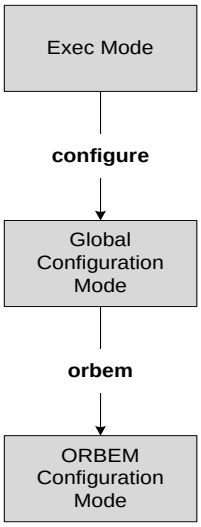
server *1.2.3.4*

The following marks the server with IP address 1.2.3.4 as the preferred NTP server.

server *1.2.3.4* **prefer**

Chapter 158
ORBEM Configuration Mode Commands

The ORB Element Manager Configuration Mode is used to manage the ORBEM server options for the current context.



activate

Activates/deactivates a client for the ORB element management system interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
active client id
no active client id
```

no

Indicates the client specified is to be deactivated. When omitted, the client is activated.

id *name*

Specifies the client to be activated. *name* must refer to a previously configured client.

Usage

Activate clients after they have been configured or deactivated by the system or by configuration.

Example

```
active client sampleClient
no active client sampleClient
```

client

Configures/removes a client from the ORB element manager system interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

client id *name* [**encrypted**] **password** *pwd*
no client id *name*

no

Indicates the client specified is to be removed from the configuration.

id *name*

Specifies the client to be configured. *name* must be from 1 to 10 alpha and/or numeric characters in length.

encrypted

Indicates password specified is encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *pwd*

Specifies the password for the client. *pwd* must be from 1 to 35 alpha and/or numeric characters.

Usage

Clients for ORB element manager access must be configured prior to being activated.

Example

The following commands set the password for client *sampleClient* specifying a plain text password and an encrypted password as well.
client id *sampleClient* **password** *secretPassword*
client id *sampleClient* **encrypted password** *f54gj801sd*
The following deletes *sampleClient* from the configuration.
no client id *sampleClient*

default

Restores the system default values for the option specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { **event-notif-iiop-port** | **event-notif-service filter** | **event-notif-siop-port** | **iiop-port** | **iop-address** | **max-attempt** | **session-timeout** | **siop-port** }

event-notif-iiop-port

Restores the port number for the inter-ORB event notifications to the system default: 7778.

event-notif-service filter

Restores the ORB Notification Service filter to its default behavior of sending all "error" level and higher events, and "info" level events for the orbs facility, CLI command logs, and license change logs.

event-notif-siop-port

Restores the port to use for secure socket layer inter-ORB event communication to the system default: 7777.

iiop-port

Restores the port number for the inter-ORB communications to the system default: 14132.

iop-address

Restores the IP address for the inter-ORB communications to the system default: IP address of current context.

max-attempt

Restores the maximum number of failed login attempts before which the client is deactivated to the system default: 3 attempts.

session-timeout

restores the amount of idle time (no activity) before a session is terminated to the system default: 300 seconds.

siop-port

Restores the secure socket layer I/O port for inter-ORB events to the system default: 14131.

Usage

Restore the ORB element manager options to a well known values, the system defaults.

Example

```
default event-notif-iiop-port
default max-attempt
```

end

Exits the ORBEM configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

event-notif-iiop-port

Configures the port number for the Internet inter-ORB event notifications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-iiop-port *number*

number

Default: 7778
Specifies the port number to use as a number between 1 and 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Event notification port configured is only used if the Internet inter-ORB transport is enabled via the **iiop-transport** command with the event notification service being enabled as well.

Example

event-notif-iiop-port *25466*

event-notif-service

Enables/disables the ORB Notification Service and allows the configuration of filters dictating which event notifications are sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-service [**filter** { **event-id** *event_id*[**to** *final_event_id*]| **facility** *event_facility* **level** *event_level* }]
no event-notif-service [**filter** { **event-id** *event_id*[**to** *final_event_id*]| **facility** *event_facility* **level** *event_level* }]

---

no

Indicates the event notification service is to be disabled.

---

filter

Allows the specification of a filter dictating which events the system sends notifications for.

---

event-id *event_id* **[to** *final_event_id* **]**

Specifies an event filter based on event identification (event ID) number.
event_id is a specific event ID to filter or is the initial event ID in range if the **to** keyword is used. It can be configured to any integer value between 1 to 100,000.
to allows the specification of a range of event IDs to filter. When used, *final_event_id* specifies the last event ID in the range to be filtered. It can be configured to any integer value between 1 to 100,000 but should be a value greater than the initial event ID.

---

facility *event_facility* **level** *event_level*

Specifies an event filter based on facility type and notification severity level.
event_facility specifies the facility type and can be any one of the following:

- **a10:** A10 interface facility
- **a11:** A11 interface facility
- **a11mgr:** A11 Manager facility
- **aaa-client:** AAA client facility
- **aaamgr:** AAA manager logging facility
- **aaaproxy:** AAA Proxy facility
- **acl-log:** Access Control List logging facility
- **acsctrl:** Active Charging Service (ACS) Controller facility
- **acsmgr:** Active Charging Service (ACS) Manager facility
- **alarmctrl:** Alarm Controller facility
- **all:** All facilities

- **asf:** Voice Application Server Framework logging facility
- **asfprt:** ASF Protocol Task (SIP) logging facility
- **asngwmgr:** ASN Gateway Manager facility
- **asnlrmgr:** ASN Paging/Location-Registry Manager facility
- **bgp:** Border Gateway Protocol (BGP) facility
- **cli:** CLI logging facility
- **cscf:** IMS/MMD CSCF
- **cscfmgr:** SIP CSCF Manager facility
- **csp:** Card Slot Port controller facility
- **css:** Content Service Selection (CSS) facility
- **css-sig:** Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctrl:** IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr:** IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dhcp:** DHCP facility (GGSN product only)
- **dhost:** Distributed Host logging facility
- **diameter:** Diameter endpoint logging facility
- **diameter-ecs:** ECS Diameter signaling facility
- **dpath:** IPSEC Data Path facility
- **drvctrl:** Driver Controller facility
- **evlog:** Event log facility
- **famgr:** Foreign Agent manager logging facility
- **gss-gcdr:** GTPP Storage Server GCDR facility
- **gtpc:** GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr:** GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp:** GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu:** GTP-U protocol logging facility (GGSN product only)
- h248prt: H.248 Protocol logging facility
- **hamgr:** Home Agent manager logging facility
- **hat:** High Availability Task (HAT) process facility
- **ims-authorizatn:** IMS Authorization Service facility
- **ip-arp:** IP Address Resolution Protocol facility
- **ip-interface:** IP interface facility
- **ip-route:** IP route facility
- **ipsec:** IP Security logging facility
- **ipsgmgr:** IP Services Gateway facility
- **ipsp:** IP Pool Sharing Protocol logging facility
- **l2tp-control:** L2TP control logging facility

- **l2tp-data:** L2TP data logging facility
- **l2tpdemux:** L2TP Demux Manager logging facility
- **l2tpmgr:** L2TP Manager logging facility
- **li:** Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
- **mobile-ip:** Mobile IP processes
- **mobile-ip-data:** Mobile IP data facility
- **multicast-proxy:** Multicast Proxy logging facility
- **netwstrg:** Network Storage facility
- **npuctrl:** Network Processor Unit Control facility
- **npumgr:** Network Processor Unit Manager facility
- **nsctrl:** Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr:** Charging Service Manager facility
- **nsproc:** Charging Service process facility
- **orbs:** Object Request Broker System logging facility
- **ospf:** OSPF logging facility
- **ppp:** PPP link and packet facilities
- **radius-acct:** RADIUS accounting logging facility
- **radius-auth:** RADIUS authentication logging facility
- **radius-coa:** RADIUS change of authorization and radius disconnect
- **rct:** Recovery Control Task logging facility
- **rdt:** Redirect Task logging facility
- **resmgr:** Resource Manager logging facility
- **rip:** RIP logging facility (RIP is not supported at this time.)
- **rohc:** RObust Header Compression facility
- **rsvp:** Reservation Protocol logging facility
- **sct:** Shared Configuration Task logging facility
- **sessctrl:** Session Controller logging facility
- **sessmgr:** Session Manager logging facility
- **sft:** Switch Fabric Task logging facility
- **sipcdprt:** Sip Call Distributor facility
- **sitmain:** System Initialization Task main logging facility
- **snmp:** SNMP logging facility
- **srdb:** Static Rating Database
- **srp:** Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsec:** SSH IP Security logging facility **stat:** Statistics logging facility
- stat: Statistics logging facility
- **system:** System logging facility

- **tacacsplus:** TACACS+ Protocol logging facility
- **threshold:** threshold logging facility
- **udr:** User detail record facility (used with the Charging Service)
- **user-data:** User data logging facility
- **user-l3tunnel:** User layer-3 tunnel logging facility
- **vpn:** Virtual Private Network logging facility
- **wimax-data:** WiMAX DATA
- **wimax-r6:** WiMAX R6

event_level **specifies the severity level of the event notification to filter and can be configured to one of the following:**

- critical : display critical events
- error : display error events and all events with a higher severity level
- warning : display warning events and all events with a higher severity level
- unusual : display unusual events and all events with a higher severity level
- info : display info events and all events with a higher severity level
- trace : display trace events and all events with a higher severity level
- debug : display all events

Usage

This command is used to enable or disable the ORB Notification Service. Additionally, it can be used to configure filters dictating which events are sent. This service is disabled by default.
Filters can be configured for a specific event identification number (event ID), a range of event IDs, or specific severity levels for events for particular facilities.
When no filters are configured and the service is enabled, the ORB Notification Service sends all "error" level and higher events, and "info" level events for the orbs facility, CLI command logs, and license change logs.
Multiple instance of this command can be executed to configure multiple filters.

Example

The following command enables the ORB Notification service:
event-notif-service
The following command disables the ORB Notification service:
no event-notif-service
The following command configures a filter for the ORB Notification Service allowing only event IDs 800 through 805 to be sent:
event-notif-service filter event-id *800* **to** *805*
The following command configures a filter for the ORB Notification Service allowing only "critical" level notifications for the A11 facility:
event-notif-service filter facility *a11* **level** *critical*

event-notif-siop-port

Configures the port to use for secure socket layer inter-ORB event communication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-siop-port *number*

number

Default: 7777
Specifies the port number to use as a number between 1 and 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications using SSL.

Example

event-notif-siop-port *25466*

exit

Exits the ORBEM configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

iiop-port

Configures the port number for the internet inter-ORB communications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] iiop-port *number*

no

Disables the iiop port.

number

Default: 14132
Specifies the port number to use as a number between 1 and 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Internet inter-ORB port is only used if the Internet inter-ORB transport is enabled via the **iiop-transport** command.

Example

iiop-port *25466*

iiop-transport

Enables/disables use of the Internet Inter-ORB Protocol for management across the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
iiop-transport
no iiop-transport
```

no

Indicates no internet inter-ORB protocol communication is to take place across the network.

Usage

Enable the transport of Internet Inter-ORB Protocol messages to support remote management across the network.
The chassis is shipped from the factory with the Internet Inter-ORB transport disabled.

Example

The following commands enable and disable the ORB-based management across the network, respectively.

```
iiop-transport
no iiop-transport
```

iop-address

Enables/disables use of the Internet Inter-ORB Protocol for management across the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

iop-address *ip_address*

ip_address

Specifies the IP address to use for inter-ORB communications for the current context. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Change the inter-ORB IP address when the IP address of the current context should not be used. The IP address of the local context may not be appropriate when the ORB configuration across nodes would cause conflicts with the IP addresses.
The chassis is shipped from the factory with the inter-ORB IP address defaulted to the IP address of the current context.

Example

iop-address *1.2.3.4*

max-attempt

Configures the maximum number of failed login attempts before which the client is deactivated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max-attempt *count*

count

Default: 3 attempts
Specifies the number of failed login attempts prior to deactivating a client. The value must be within the range of 1 through 10.

Usage

Adjust the maximum number of attempts to a smaller value to increase the security level of the system.

Example

max-attempt *3*

session-timeout

Configures the amount of idle time (no activity) before a client session is terminated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

session-timeout *seconds*

seconds

Default: 300 seconds
Specifies the number of seconds of idle time before a client session is terminated. The value must be in the range of 1 through 86400.

Usage

Reduce the session timeout when the maximum number of sessions allowed is frequently being reached. Setting this to a lower value will help release idle sessions faster to allow use by other clients.

Example

session-timeout *1800*

siop-port

Configures the secure socket layer I/O port for inter-ORB events.

Product

All

Privilege

Security Administrator, Administrator

Syntax

siop-port *number*

number

Default: 14131
Specifies the port number to use as a number between 1 and 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications.

Example
siop-port *25466*

ssl-auth-policy

Configures the secure socket layer peer authentication policy used by the ORBEM server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssl-auth-policy { **auth-none** | **auth-once** | **auth-once-fail** | **auth-peer** | **auth-peer-fail** }

auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail

Default: **auth-none**
auth-none: ORBEM server does not authenticate the peer
auth-once: ORBEM server authenticates the peer once (no fail)
auth-once-fail: ORBEM server authenticates the peer once (fail if no certificate)
auth-peer: ORBEM server authenticates the peer every time (no fail)
auth-peer-fail: ORBEM server authenticates the peer every time (fail if no certificate)

Usage

Use to configure the peer authentication policy used by the SSL transport of ORBEM.

Example

The following command sets the policy to authenticate the peer once without failure.
ssl-auth-policy auth-once

ssl-certificate

Defines the certificate to be used by the SSL transport of ORBEM.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssl-certificate { **string** *certificate* | **file** *url* }

string *certificate*

Specifies an ORBEM SSL certificate. *certificate* is a string of up to 4096 alpha and/or numeric characters.

file *url*

Default: /usr/ssl/certs/orbscert.pem
Specifies an ORBEM SSL certificate file and location. *url* is a string of up to 1024 alpha and/or numeric characters.

Usage

Use to configure the certificate to be used by the SSL transport of ORBEM. Note that if file option is used, the certificate content is read from the url and converted into quoted string.

Example

The following command defines the certificate cert3.pem file as being located in the /usr/ssl/certs directory:
ssl-certificate file /usr/ssl/certs/cert3.pem
The following command defines the certificate string (the string shown is abbreviated):
ssl-certificate string "-----BEGIN CERTIFICATE-----\n\

Privilege

Security Administrator, Administrator

Syntax

ssl-private-key { **string** *key* | **file** *url* }

string *key*

Specifies an ORBEM SSL private key. *key* is a string of up to 4096 alpha and/or numeric characters.

file *url*

Default: /usr/ssl/certs/orbscert.pem
Specifies the ORBEM SSL private key file location. T*url* is a string of up to 1024 alpha and/or numeric characters.

Usage

Use to configure the private key to be used by the SSL transport of ORBEM. Note that if file option is used, the private key is read from the url and converted into quoted string.

Example

The following command defines the private-key cert3.pem file as being located in the **/usr/ssl/certs** directory:
ssl-private-key file /usr/ssl/certs/cert3.pem
The following command defines the private-key string (the string shown is abbreviated):
ssl-private-key string "-----BEGIN RSA PRIVATE KEY-----\n\

MIICXQIBAAKBgQC6Dh79iaK/zZG/Kwme2XS6G8/n3/+sac6huxI1WNyammyYZKZp\n\

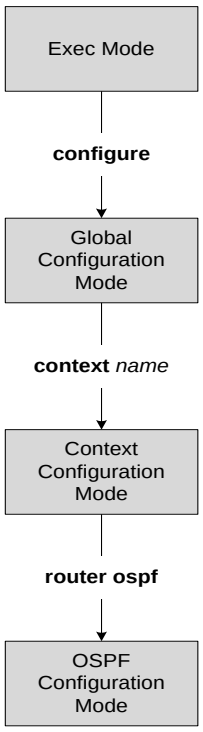
Chapter 159
OSPF Configuration Mode Commands

The OSPF Configuration sub-mode is used to configure the OSPF routing protocol. This mode includes commands that configure OSPF routing parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area authentication

Enables authentication for the specified OSPF area.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **authentication** [**message-digest**] **no area** { *ipaddress* | *decimal_value* } **authentication** [**message-digest**]

no

Disables authentication for the specified area.

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the area where authentication will be enabled.

decimal-value

The identification number of the area where authentication will be enabled. This must be an integer from 0 through 4294967295.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

Usage

Use this command to enable authentication of OPSF areas.

Example

The following command enables authentication for an OSPF area defined by the IP address *192.168.100.10* and the OSPF authentication type to MD5:
area *192.168.100.10* authentication message-digest

area default-cost

This command configures the default cost for an area.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **default-cost** *cost_value* **no area** { *ipaddress* | *decimal_value* } **default-cost** *cost_value*

no

Deletes the default cost for the area.

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the area.

decimal-value

The identification number of the area. This must be an integer from 0 through 4294967295.

cost_value

The default cost to be configured for the specified area. This must be an integer from 0 through 16777215.

Usage

Use this command to configure the default cost for an OSPF area.

Example

The following command sets the default cost for an OSPF area defined by the IP address *192.168.100.10* to *300*:
area *192.168.100.10* default-cost *300*

area nssa

Define an area as an NSSA (Not So Stubby Area) and configure OSPF parameters for it.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **nssa [default-information-originate]** [**no-redistribution** **no-summary]** [**translate-always]** [**translate-candidate]** [**translate-never]**

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the NSSA area.

decimal-value

The identification number of the NSSA area. This must be an integer from 0 through 4294967295.

default-information-originate

Originate default information to the NSSA area

no-redistribution

Do not redistribute external routes to the NSSA area

no-summary

Do not inject inter-area routes into NSSA

translate-always

Configure NSSA-ABR to always translate

translate-candidate

Configure NSSA-ABR for translate election (This is enabled by default.)

translate-never

Configure NSSA-ABR to never translate

Usage

Use this command to define NSSA areas.

Example

The following command defines the area designated by the IP address *192.168.100.10* as an NSSA area:

area *192.168.100.10* nssa

area stub

This command defines an area as a stub area.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **stub** [**no-summary**]

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the stub area.

decimal-value

The identification number of the stub area. This must be an integer from 0 through 4294967295.

no-summary

Disables (stops) the ABR from sending summary LSAs into the stub area.

Usage

Use this command to define an OPSF area as a stub area.

Example

The following command defines the OSPF area defined by the IP address *192.168.100.10* as a stub area:
area *192.168.100.10* stub

area virtual-link

This command configures a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address*

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the transit area.

decimal-value

The identification number of the transit area. This must be an integer from 0 through 4294967295.

router_id_address

The router id, in dotted-decimal notation, of the ABR to be linked to.

Usage

Use this command to create a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:
area *192.168.100.10* virtual-link *192.168.200.20*

area virtual link authentication

This command configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* { **message-digest** | **null** | **text** }

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the transit area.

decimal-value

The identification number of the transit area. This must be an integer from 0 through 4294967295.

router_id_address

The router id, in dotted-decimal notation, of the ABR to be linked to.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the authentication method for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to use no authentication:
area *192.168.100.10* virtual-link *192.168.200.2* null

area virtual-link authentication-key

This command configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **authentication-key** [**encrypted**] **password** *authentication_key*

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the transit area.

decimal-value

The identification number of the transit area. This must be an integer from 0 through 4294967295.

router_id_address

The router id, in dotted-decimal notation, of the ABR to be linked to.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to specify the authentication password for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates an authentication password of *123456* for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:
area *192.168.100.10* virtual-link *192.168.200.20* authentication-key password *123456*

area virtual link intervals

This command configures the interval or delay type, and the delay time in seconds, for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* [**dead-interval** *value*] [**hello-interval** *value*] [**retransmit-interval***value*] [**transmit-delay** *value*]

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the area.

decimal-value

The identification number of the transit area. This must be an integer from 0 through 4294967295.

router_id_address

The router id, in dotted-decimal notation, of the ABR to be linked to.

dead-interval *value*

The interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

The interval, in seconds before sending a hello packet. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

The interval, in seconds, that router should wait before retransmitting a packet. *value* must be an integer from 1 through 65535.

transmit-delay *value*

The interval, in seconds, that the router should wait before transmitting a packet. *value* must be an integer from 1 through 65535.

Usage

Use this command to set the intervals or delay types for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to *60* seconds:

area *192.168.100.10* virtual-link *192.168.200.20* retransmit-interval *60*

area virtual link message-digest-key

This command enables the use of MD5-based OSPF authentication for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **message-digest-key** *key_id* **md5** [**encrypted**] **password** *authentication_key*

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the transit area.

decimal-value

The identification number of the transit area. This must be an integer from 0 through 4294967295.

router_id_address

The router id, in dotted-decimal notation, of the ABR to be linked to.

message-digest-key key_id

Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted

Used this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to enable the use of MD5-based OSPF authentication for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*, sets the MD5 Key ID to *25*, and the password to *123456*:
area *192.168.100.10* virtual-link *192.168.200.20* message-digest-key *25* md5 password *123456*

capability graceful-restart

This command configures graceful-restart. By default, capability is set to enabled.

Product

PDFN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
capability graceful-restart
```

no capability graceful-restart

no

Disables capability graceful-restart.

Usage

Use this command to configure graceful-restart.

Example

The following command configure capability graceful-restart:
capability graceful-restart

default-information originate

This command creates a default external route into an OSPF routing domain.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-information originate [**always**] [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

always

Indicates that the route should always be advertised, regardless of whether the software has a default route or not.

metric *metric_value*

Sets the OSPF metric used in creating the default route. This must be an integer from 1 through 16777214.

metric-type { 1 | 2 }

Sets the default route metric type.
1 : Sets the OSPF external link type for default routes to Type 1.
2 : Sets the OSPF external link type for default routes to Type 2.

route-map *route_map_name*

Specifies the name of the default route-map to be use. This must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to set the default external route into an OSPF routing domain.

Example

The following command sets the default external route to originate from the routemap named *rmap1*:
default-information originate route-map *rmap1*

default metric

This command configures the default metric value for the OSPF routing protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-metric *metric_value*

metric-value

The metric value to set. This must be an integer from 1 through 16777214. The default metric value setting is 26385.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to *235*:
default-metric *235*

distance

This command configures the OSPF route administrative distances for all OSPF route types or based on specific route type.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

distance { *distance_value* | **ospf** { [**external** *distance_value*] [**inter-area** *distance_value*] [**intra-area** *distance_value*] } }

distance_value

is an integer, ranging from 1 to 255, that sets OSPF route administrative distances. The default distance value is 110.

ospf { [external *distance_value* **] [inter-area** *distance_value* **] [intra-area** *distance_value* **] }**

Set the distance value for the specified route type.
external *distance_value*: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
inter-area *distance_value*: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
intra-area *distance_value*: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

Usage

Use this command to set the administrative distance for OSPF routes.

Example

The following command sets the administrative distance for all OSPF route types to *30*:
distance *30*

distribute-list

This command enables the filtering of networks in outgoing routing updates.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

distribute-list *route_access_list* **out** { **connected** | **rip** | **static** }

route_access_list

The name of the OSPF route access list to use. This is an alphanumeric string up to 63 characters in length.

connected

Filter connected routes.

rip

Filter RIP routes. (RIP is not supported at this time.)

static

Filter static routes.

Usage

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

Example

The following command uses the route access list named *ral1* to filter outgoing routing updates for all connected routes:
distribute-list *ral1* out connected

end

Exits the NTP configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the NTP configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

ip vrf

This command configures the VRF instances for OSPF routing protocol.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vrf *vrf_name*

no ip vrf *vrf_name*

no

Disables the VRF instances and removes the configured VRF context association for OSPF routing.

vrf_name

vrf_name is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to configure the IP VRF forwarding also to associate the preconfigured VRF context with the specific tunnel interface.
This command creates and enters the OSPF VRF Configuration Mode if required to configure the VRF context instances for OSPF routing.

Example

The following command enables preconfigured VRF context instance *ospf_vrf1* for OSPF routing and enters the OSPF VRF Configuration mode:
ip vrf *ospf_vrf1*

neighbor

This command configures OSPF routers that interconnect to non-broadcast networks.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

neighbor *ip_address* [**poll-interval** *poll_interval_value*] [**priority** *priority_value*]

ip_address

The interface IP address of the OSPF neighbor. This must be an IP address entered in dotted-decimal notation.

poll-interval *poll_interval_value*

Default: 120
Set the number of seconds in the dead neighbor polling interval. This must be an integer from 1 through 65535

priority *priority_value*

Default: 0
Set the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the IP address specified. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage

Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of *192.168.100.10*:
neighbor *192.168.100.10*

network area

This command enables OSPF on an interface and defines the OSPF area for that network.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

network *network_ip_address*/*network_mask* **area** { *area_id* | *area_ip_address* }

network_ip_address/*network_mask*

The network address and mask that specify the interface on which OSPF will be enabled. This in entered in dotted-decimal notation, followed by the "/" and the mask. Example: 192.168.1.0/24.

area_id

The OSPF area identification number for the specified network. This must be an integer from 0 through 4294967295.

area_ip_address

The IP address of the OSPF area for the specified network. This must be entered in dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address *192.168.1.0* with a netmask of *24*:
network *192.168.1.0/24*

ospf graceful-restart

This command helps configure graceful-restart specific settings.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospf graceful-restart { grace-period *grace_period* **| helper { never | policy { only-reload | only-upgrade } }**

grace-period grace-period

OSPF graceful restart grace period (seconds) is the time in which OSPF restarts, it should be and integer between 1 to 1800. Default grace period is *60* seconds.

helper { never | policy }

Helps configure OSPF helper settings.
never: Specifies never as helper.
policy { only-reload | only-upgrade }: Allows ospf graceful-restart helper policy.

- only-reload: Allows ospf graceful-restart helper policy only-reload.
- only-upgradeAllows ospf graceful-restart helper policy only-upgrade.

Default is ospf graceful-restart grace-period.

Usage

Use this command to configure graceful-restart specific settings.

Example

The following command sets the graceful restart grace period to *60* seconds:
ospf graceful-restart grace-period *60*
ospf graceful-restart helper policy only-reload
ospf graceful-restart helper policy only-upgrade

ospf router-id

This command configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospf router-id *ip_address*

ip_address

The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:
ospf router-id *192.168.200.1*

passive-interface

This command enables the suppression of OSPF routing updates on the specific interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

passive-interface *interface_name*

interface_name

The name assigned to a logical interface within the specific context. An interface name can be from 1 through 79 alphanumeric characters.

Usage

Use this command to suppress router updates on an interface in the current context.

Example

The following command suppresses OSPF routing updates on the interface named *Intfc1*:
passive-interface *Intfc1*

redistribute

This command redistributes routes into OSPF. This means that any routes from another protocol are redistributed to OSPF neighbors using the OSPF protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

redistribute { **bgp** | **connected** | **rip** | **static** } [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

bgp

Specifies that BGP routes will be redistributed.

Important: BGP routing is only supported for use with the HA.

connected

Specifies that connected routes will be redistributed.

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

metric *metric_value*

Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

metric-type { 1 | 2 }

Default: 2
Sets route metric type that is applied to redistributed routes.
1 : Sets the OSPF external link type for routes to Type 1.
2 : Sets the OSPF external link type for routes to Type 2.

route-map *route_map_name*

Filter routes through the specified route map before redistribution. *route_map_name* specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that BGP routes should be redistributed:
redistribute bgp

refresh timer

This command adjusts the OSPF refresh timer.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

refresh timer *value*

value

Default: 10
The minimum amount of time, in seconds, to wait before refreshing an LSA. This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to *90* seconds:
refresh timer *90*

router-id

This command configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

router-id *ip_address*

ip_address
The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:
router-id *192.168.200.1*

timers spf

This command adjusts the SPF timers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

timers spf *delay_value hold_time_value*

delay_value

Default: 5
The delay time, in seconds, between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

hold_time_value

Default: 10
The hold time, in seconds, between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

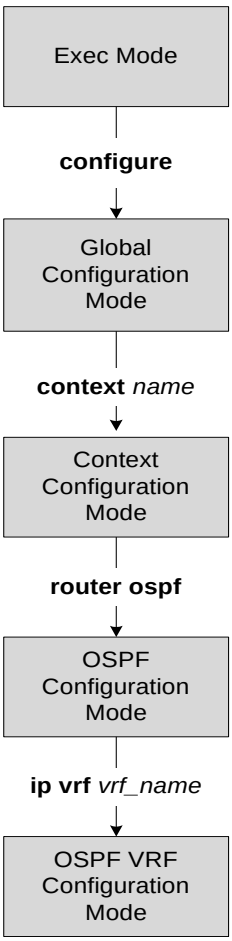
Use this command to set the SPF delay and hold timers for the current OSPF router process.

Example

The following command sets the delay timer to *15* and the hold timer to *15*:
timers spf *15 15*

Chapter 160
OSPF VRF Configuration Mode Commands

The OSPF VRF Configuration sub-mode is used to configure the virtual routing and forwarding (VRF) context instances for OSPF routing protocol. This mode includes commands that configure VRF instance for OSPF routing parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area

This command configures the various parameters, including authentication, area identification, virtual link id, delay/interval values for the specified OSPF area using specific VRF instance.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] area { ip_address | decimal_value } {authentication [ message-digest ] |
default-cost cost_value | nssa [default-information-originate] [no-
redistribution no-summary] [translate-always] [translate-candidate] [translate-
never] | stub [no-summary] | virtual-link router_ip_address [authentication
{message-digest | null | text}| authentication-key {encrypted password
encrypted_string | password password_string}| message-digest-key key_id md5
[encrypted password encrypted_string | password password_string]}} [dead-
interval] [hello-interval] [retransmit-interval] [transmit-delay]
```

no

Disables/removes configured parameters for the specified OSPF area using specific VRF instance.

ip_address

Specifies the IP address in IPv4 dotted-decimal notation, of the area where authentication will be enabled.

decimal_value

Specifies the identification number of the area where parameters to be configured. This must be an integer from 0 through 4294967295.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

default-cost *cost_value*

Sets the default cost for an OSPF area.
cost_value is the default cost to be configured for the specified area and must be an integer from 0 through 16777215.

nssa [default-information-originate] [no-redistribution no-summary] [translate-always] [translate-candidate] [translate-never]

Configures and defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.
default-information-originate: This optional keyword configures the OSPF VRF instances to originate default information to the NSSA area.
no-redistribution: This optional keyword configures the OSPF VRF instance to not to redistribute external routes to the NSSA area.

no-summary: This optional keyword configures the OSPF VRF instance to not to inject the inter-area routes into NSSA.
translate-always: This optional keyword configures the NSSA-ABR always to translate. By default this is disabled.
translate-candidate: This optional keyword configures the NSSA-ABR always to translate election. By default this is enabled.
translate-never: This optional keyword configures the NSSA-ABR never to translate. By default this is disabled.

---

stub [no-summary]

This keyword specifies an OSPF area as an stub area configures the NSSA-ABR never to translate. By default this is disabled.
no-summary: This optional keyword disables (stops) the ABR from sending summary LSAs into the stub area.

---

virtual-link *router_id*

Specifies the router identifier which provides a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.
router_id must be an IP address in IPv4 dotted-decimal notation of the ABR to be linked to.

---

authentication {message-digest | null | text}

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.
message-digest: Set the OSPF authentication type to use the message digest (MD) authentication method.
null: Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.
text: Set the OSPF authentication type to use the clear text authentication method.

---

authentication-key

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

---

message-digest-key *key_id*

Specifies the MD key identifier number for virtual link connection.
key_id must be an integer from 1 through 255.

---

md5

Sets the message digest to MD5 for virtual link connection.

[encrypted] password *passwd_string*

Specifies the password required for virtual link connection authentications. The keyword **password** is optional and if specified *passwd_string* must be from 1 to 63 alpha and/or numeric characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

dead-interval *value*

Specifies the dead interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Specifies the hello interval, in seconds before sending a hello packet. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Specifies the delay between retransmission, in seconds, that router should wait before retransmitting a packet. *value* must be an integer from 1 through 65535.

transmit-delay *value*

Specifies the interval, in seconds, that the router should wait before transmitting a packet. *value* must be an integer from 1 through 65535.

Usage

Use this command to configure/set the various network/connection/authentication parameters of OPSF areas using specific VRF instance.

Example

The following command enables authentication for an OSPF area defined by the IP address *192.168.100.10* and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

The following command sets the default cost for an OSPF area defined by the IP address *192.168.100.10* to *300*:
The following command defines the area designated by the IP address *192.168.100.10* as an NSSA area where translation of NSSA candidate is enabled by default:
area *192.168.100.10* **nssa**
The following command defines the OSPF area defined by the IP address *192.168.100.10* as a stub area:
area *192.168.100.10* **stub**
The following command creates a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:
area *192.168.100.10* **virtual-link** *192.168.200.20*
The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to use no authentication:
area *192.168.100.10* **virtual-link** *192.168.200.2* **null**
The following command creates an authentication password of *123456* for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:
area *192.168.100.10* **virtual-link** *192.168.200.20* **authentication-key password** *123456*
The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*, sets the MD5 Key ID to *25*, and the password to *123456*:
area *192.168.100.10* **virtual-link** *192.168.200.20* **message-digest-key** *25* **md5 password** *123456*
The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to *60* seconds:

area *192.168.100.10* **virtual-link** *192.168.200.20* **retransmit-interval** *60*

default-information originate

This command creates a default external route into an OSPF routing domain.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-informationoriginate [always] [metric*metric_value***] [metric-type {1 | 2}] [route-map***route_map_name***]**

always

Indicates that the route should always be advertised, regardless of whether the software has a default route or not.

metric *metric_value*

Sets the OSPF metric used in creating the default route. This must be an integer from 1 through 16777214.

metric-type {1 | 2}

Sets the default route metric type.
1: Sets the OSPF external link type for default routes to Type 1.
2: Sets the OSPF external link type for default routes to Type 2.

route-map *route_map_name*

Specifies the name of the default route-map to be use. This must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to set the default external route into an OSPF routing domain.

Example

The following command sets the default external route to originate from the routemap named *rmap1*:
default-information originate route-map *rmap1*

default metric

This command configures the default metric value for the OSPF routing protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-metric *metric_value*

metric-value

The metric value to set. This must be an integer from 1 through 16777214. The default metric value setting is 26385.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to *235*:
default-metric *235*

end

Exits the NTP configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the NTP configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

neighbor

This command configures OSPF routers that interconnect to non-broadcast networks.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

neighbor *ip_address* **[poll-interval** *poll_inter_value***] [priority** *priority_value***]**

ip_address

The interface IP address of the OSPF neighbor. This must be an IP address entered in dotted-decimal notation.

poll-interval *poll_inter_value*

Default: 120
Set the number of seconds in the dead neighbor polling interval. This must be an integer from 1 through 65535

priority *priority_value*

Default: 0
Set the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the IP address specified. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage

Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of *192.168.100.10*:
neighbor *192.168.100.10*

network area

This command enables OSPF on an interface and defines the OSPF area for that network.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

network*ip_address***/***ip_mask***area {***area_id*** | ***area_ip_address***}**

*ip_address***/***ip_mask*

The network address and mask that specify the interface on which OSPF will be enabled. This in entered in dotted-decimal notation, followed by the "/" and the mask. Example: 192.168.1.0/24.

area_id

The OSPF area identification number for the specified network. This must be an integer from 0 through 4294967295.

area_ip_address

The IP address of the OSPF area for the specified network. This must be entered in dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address *192.168.1.0* with a netmask of *24*:
network *192.168.1.0/24*

ospf router-id

This command configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospfrouter-id*ip_address*

ip_address

The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

ospf router-id *192.168.200.1*

passive-interface

This command enables the suppression of OSPF routing updates on the specific interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

passive-interface*interface_name*

interface_name

The name assigned to a logical interface within the specific context. An interface name can be from 1 through 79 alphanumeric characters.

Usage

Use this command to suppress router updates on an interface in the current context.

Example

The following command suppresses OSPF routing updates on the interface named *Intfc1*:

passive-interface *Intfc1*

redistribute

This command redistributes routes into OSPF. This means that any routes from another protocol are redistributed to OSPF neighbors using the OSPF protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

redistribute {bgp | connected | rip | static} [metric*value***] [metric-type {1 | 2}] [route-map***route_map_name* **]**

bgp

Specifies that BGP routes will be redistributed.

Important: BGP routing is only supported for use with the HA.

connected

Specifies that connected routes will be redistributed.

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this stage.)

static

Specifies that static routes will be redistributed.

metric *value*

Sets the OSPF metric used in the redistributed route.
value must be an integer from 1 through 16777214.

metric-type {1 | 2}

Default: 2
Sets route metric type that is applied to redistributed routes.
1: Sets the OSPF external link type for routes to Type 1.
2: Sets the OSPF external link type for routes to Type 2.

route-map *route_map_name*

Filter routes through the specified route map before redistribution. *route_map_name* specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that static routes should be redistributed in an OSPF area:

```
redistribute static
```

refresh timer

This command adjusts the OSPF refresh timer.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

refreshtimer*value*

value

Default: 10
The minimum amount of time, in seconds, to wait before refreshing an LSA. This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to *90* seconds:
refresh timer *90*

router-id

This command configures the router ID for the OSPF process.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

router-id*ip_address*

ip_address

The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:
router-id *192.168.200.1*

timers spf

This command adjusts the Shortest Path First (SPF) timers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

timersspf*delay_valuehold_time_value*

delay_value

Default: 5
The delay time, in seconds, between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

hold_time_value

Default: 10
The hold time, in seconds, between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

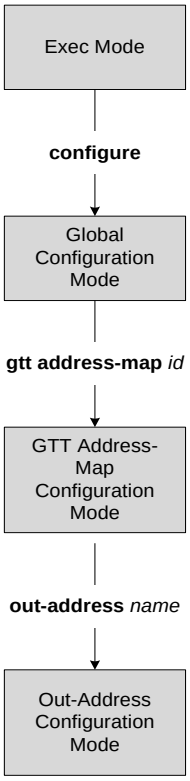
Use this command to set the SPF delay and hold timers for the current OSPF router process.

Example

The following command sets the delay timer to *15* and the hold timer to *15*:
timers spf *15 15*

Chapter 161
Out-Address Configuration Mode Commands

The Out-Address configuration mode provides the commands to configure the outgoing addresses for SCCP entities.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-address

Configures the SCCP short address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-address *gt_address*

gt_address

A string of 1 to 15 digits to define the GT-address

Usage

Define the GT-address

Example

gt-address *010405525397*

gt-format

The GT-format provides four formats that can be used during GTT.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-format *format_num*

format_num

1: Selects GT-format 1 options which include **nature-of-address** and **odd/even.** Once selected, the system enters GT-Format1 configuration mode.
2: Selects GT-format2 options which include **translation-type**. Once selected, the system enters GT-Format2 configuration mode.
3: Selects GT-format3 options which include **encoding-scheme**, **numbering-plan3** and **translation-type**. Once selected, the system enters GT-Format1 configuration mode.
4: Selects GT-format4 options which include **encoding-scheme**, **nature-of-address, numbering-plan,** and **translation-type**. Once selected, the system enters GT-Format4 configuration mode.

Usage

Select the a GT-format that include encoding-scheme as part of the GTT process.

Example

gt-format *3*

ni-indicator

Configures the National and International indicator to use during the GTT process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ni-indicator *ni_ind*

ni_ind

Select one of the following as the appropriate type of national indicator for the address structure:

- **national**
- **international**

Usage

Select the international indicator to be used for out-going addresses.

Example

ni-indicator *international*

point-code

Selects and configures the SS7-type point code for use with the out-going address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

point-code *pt_code*

pt_code

Enter 1 to 11 digits in the point code format predefined during variant selection of GTT association.

Usage

Define an ITU point code to be used for out-going address processing.

Example

`point-code 6.255.6`

routing-indicator

Selects the type of routing and the indicator to be included in the out-going message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

routing-indicator *routing_ind*

routing_ind

Select one of the following options:

- **gt**: Inserts an indicator that identifies routing based on global title.
- **ssn**: Inserts an indicator that identifies routing based on the subsystem number.

Usage

Select global title as the appropriate routing indicator.

Example

routing-indicator *gt*

ssf

Selects the subservice field as factor in the out-going address processing. **ssf** sets the network indicator in the subservice field for SS7 Message Signal Units (MSUs). The indicator carried in the message's routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the national - international.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ssf *sub_svc_fld*

sub_svc_fld

Select one of the following options:

- **international:** The network indicator identifies the message as international with a point code structure that does not match the national point code structure,
- **national:** The network indicator identifies the messages as having a national point code structure.
- **reserved:** Provides an alternate network indicator for national messages.
- **spare:** Provides an alternate network indicator for international messages.

Usage

Select the international NI for inclusion in out-going address subservice fields.

Example

`ssf international`

ssn

Selects the subsystem number to be included in the out-going message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ssn *sub_sys_num*

sub_sys_num

Enter an integer from 1 to 255.

Usage

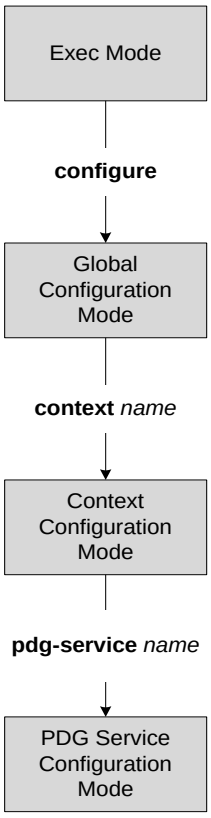
Use subsystem number 44 in the out-going address.

Example

`ssn 44`

Chapter 162
PDG Service Configuration Mode Commands

The PDG Service Configuration Mode is used to specify the properties required for the UEs in the WLAN (Wireless Local Access Network) to interface with the PDG/TTG.



aaa attribute

Sets the attributes that the system uses in AAA messages.

Product

TTG

Privilege

Security Administrator, Administrator

Syntax

aaa attribute { 3gpp-negotiated-qos-profile *string* **}**

no aaa attribute

3gpp-negotiated-qos-profile *string*

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling. *string* must be in the range of 1 to 31 characters.

no aaa attribute

Removes a previously configured AAA attribute.

Usage

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling.

Example

The following command specifies the 3GPP negotiated QoS profile to use during IMS emergency call handling:

aaa attribute 3gpp-negotiated-qos-profile *100*

associate sgtp-service

Identifies the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG. TTG functionality supports GTP-C (GTP control plane) messaging and GTP-U (GTP user data plane) messaging between the TTG and the GGSN over the Gn' interface.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

[no] associate sgtp-service *sgtp_service_name* **[context** *sgtp_context_name* **]**

no

Removes the service association definition from the configuration.

sgtp-service *sgtp_service_name*

Specifies which SGTP service configuration, by naming the SGTP service instance, to associate with this PDG service.
sgtp_service_name must be a string of 1 through 63 alpha and/or numeric characters with no spaces.

context *sgpt_context_name*

Defines the context in which the SGTP service was created. If no context is specified, the current context is used.
sgtp_context_name must be a string of 1 through 63 alpha and/or numeric characters with no spaces.

Usage

Use this command to associate the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG.

Example

The following command associates SGTP service *sgtp_service_1* with this PDG service:

associate sgtp-service *sgtp_service_1* **context** *sgtp_context_1*

certificate-selection

Configures the PDG/TTG to select the trusted certificate (and the private key for calculating the AUTH payload) to be included in the first IKE_AUTH message from the PDG/TTG based on the APN (Access Point Name). The selected certificate is associated with the APN included in the IDr payload of the first IKE_AUTH message from the UE.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
certificate-selection apn-based

    no certificate-selection
    default certificate-selection
```

certificate-selection apn-based

Selects a trusted certificate for the first IKE-AUTH message based on the APN.

no certificate-selection

Disables APN-based certificate selection and resumes sending a certificate bound to a crypto template.

default certificate-selection

Sets the default certificate selection method to a certificate bound to a crypto template.

Usage

Configures the PDG/TTG to select the trusted certificate to be included in the first IKE_AUTH message based on the APN.

Example

Use the following example to enable APN-based certificate selection:

```
certificate-selection apn-based
```

bind

Binds the PDG service IPv4 address to a crypto template and specifies the maximum number of sessions the PDG service supports.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

bind address *ipv4_address* **{ crypto-template** *string***} mode { ttg | pdg } [max-sessions** *number***]**

no bind

---

no bind

Removes a previously configured binding.

---

address

Specifies the IPv4 address of the PDG service with which the UE attempts to establish an IKEv2/IPSec tunnel. This address must be a valid IP address within the context.
This is a mandatory parameter.

---

crypto-template *string*

Specifies the name of the crypto template to be bound to the PDG service. This is the name of the IPSec policy to be used as a template for PDG/TTG subscriber session IPSec policies. The crypto template includes most of the IPSec and IKEv2 parameters for keepalive, lifetime, NAT-T, and cryptographic and authentication algorithms. There must be one crypto template per PDG service.
This is a mandatory parameter.
string is any value from 0 - 127 alpha and/or numeric characters.

---

mode { ttg | pdg }

Default: There is no default value.
Specifies whether the PDG service provides TTG or PDG functionality, as follows:

- In TTG mode, PDN connectivity is provided through the GGSN. PDG functionality is provided by the combined TTG and GGSN.
- In PDG mode, PDN connectivity and PDG functionality are provided directly through the PDG service.

This is a mandatory parameter.

Important: PDG mode is not supported in this software release.

Dependencies:
When you configure the PDG service to be in TTG mode, you must also configure the SGTP service using the **associate sgtp-service** command, as the TTG needs to connect with the GGSN to complete the PDG functionality.

The following behaviors occur when the PDG service operates in TTG mode:

- If the SGTP service associated with PDG service is not configured, the PDG service is not started.
- If the SGTP service associated with PDG service is not started, the PDG service is not started.
- If the SGTP service associated with PDG service is stopped, the PDG service is stopped.
- If the SGTP service associated with PDG service is re-started, the PDG service is re-started.
- If the SGTP service is not yet configured, whenever the SGTP service is started, the PDG service is started.

Note that starting or stopping the PDG service has no impact on the SGTP service.

max-sessions *number*

Default: 1000000
Specifies the maximum number of sessions to be supported by the PDG service.
number can be any integer value from 0 - 1000000.
If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

Usage

Use this command in PDG Service Configuration Mode to bind the IP address used as the connection point for establishing IKEv2/IPSec sessions to a crypto template. You can also use it to define the maximum number of sessions the PDG service supports.

Example

The following command binds a PDG service with an IP address of *1.2.3.4* to the crypto template *crypto_template_1*, sets the mode to TTG, and sets the maximum number of sessions to *500000*:

```
bind address 1.2.3.4 crypto-template crypto_template_1 mode ttg max-
sessions 500000
```

ip gnp-qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Gn' interface in the uplink direction.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ip gnp-qos-dscp { background *dscp*| **conversational***dscp*| **interactive***dscp*| **streaming***dscp*| **interactive [traffic-handling-priority***traffic_priority*] **{ allocation-retention-priority***allocation_retention_priority***} } +**

no ip gnp-qos-dscp { background*dscp*| **conversational***dscp*| **interactive***dscp*| **streaming***dscp*| **interactive [traffic-handling-priority***traffic_priority*] **{ allocation-retention-priority***allocation_retention_priority***} } +**

default ip gnp-qos-dscp

no

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

background *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.
dscp: Set the DSCP for the specified traffic class. See the *dscp* section below.

conversational *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

interactive [traffic-handling-priority *traffic_priority* **]**

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class. traffic_priority is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

allocation-retention-priority *allocation_retention_priority*

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile. *allocation-retention-priority* can be the integers 1, 2, or 3.
DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QOS profile.

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

`streaming` *`dscp`*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either in the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

`dscp`

Default:

- background: be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. *`dscp`* can be configured to any one of the following:

• af11: Assured Forwarding 11 per-hop-behavior (PHB)	• af33: Assured Forwarding 33 PHB
• af12: Assured Forwarding 12 PHB	• af41: Assured Forwarding 41 PHB
• af13: Assured Forwarding 13 PHB	• af42: Assured Forwarding 42 PHB
• af21: Assured Forwarding 21 PHB	• af43: Assured Forwarding 43 PHB
• af22: Assured Forwarding 22 PHB	• be: Best effort forwarding PHB
• af23: Assured Forwarding 23 PHB	• ef: Expedited forwarding PHB
• af31: Assured Forwarding 31 PHB	
• af32: Assured Forwarding 32 PHB	

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gn' interface(s).
The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be ef:
ip gnp-qos-dscp streaming *ef*
The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:
ip gnp-qos-dscp conversational *ef* **streaming** *ef* **interactive** *af22* **background** *af41*

ip qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Wu interface in the downlink direction.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp { backgrounddscp| conversationaldscp| interactivedscp|
streamingdscp| interactive [ traffic-handling-prioritytraffic_priority] {
allocation-retention-priorityallocation_retention_priority} } +

no ip qos-dscp { background dscp| conversationaldscp| interactivedscp|
streamingdscp| interactive [ traffic-handling-prioritytraffic_priority] {
allocation-retention-priorityallocation_retention_priority} } +

default ip qos-dscp
```

no

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

background *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.
dscp: Set the DSCP for the specified traffic class. See the *dscp* section below.

conversational *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

interactive [traffic-handling-priority *traffic_priority* **]**

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class. traffic_priority is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

allocation-retention-priority *allocation_retention_priority*

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile. *allocation-retention-priority* can be the integers 1, 2, or 3.
DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QOS profile.

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

`streaming` *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either in the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

dscp

Default:

- background: be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• af11: Assured Forwarding 11 per-hop-behavior (PHB)	• af33: Assured Forwarding 33 PHB
• af12: Assured Forwarding 12 PHB	• af41: Assured Forwarding 41 PHB
• af13: Assured Forwarding 13 PHB	• af42: Assured Forwarding 42 PHB
• af21: Assured Forwarding 21 PHB	• af43: Assured Forwarding 43 PHB
• af22: Assured Forwarding 22 PHB	• be: Best effort forwarding PHB
• af23: Assured Forwarding 23 PHB	• ef: Expedited forwarding PHB
• af31: Assured Forwarding 31 PHB	
• af32: Assured Forwarding 32 PHB	

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Wu interface(s).
The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be ef:

```
ip qos-dscp streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip qos-dscp conversational ef streaming ef interactive af22 background af41
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **period** *secs* **}**

default ip source-violation { drop-limit *num* **period** *secs* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Default: disabled
Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet.

drop-limit *num*

Default: 10
Sets the maximum number of allowed IP source violations within the detection period before dropping a call. If num is not specified, the value is set to the default value.
num can be any integer value from 1 to 1000000.

period *secs*

Default: 120
Sets the detection period in seconds for IP source violations. If secs is not specified, the value is set to the default value.
secs can be any integer value from 1 to1000000.

default ip source-violation { drop-limit *num* **period** *secs* **}**

Sets or restores the IP source violation detection defaults, as follows:
drop-limit: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.
period: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

no ip source-violation clear-on-valid-packet

The drop-limit counters are not reset upon receipt of a properly addressed packet.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.
This function operates in the following manner: When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment. For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

Example
The following command sets the drop limit to 15 and leaves the other values at their default values:
`ip source-violation drop-limit` ***`15`***

max-tunnels-per-ue

The maximum number of IKEv2/IPSec tunnels allowed per UE by the PDG/TTG. This maximum number is specified per PDG service.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

max-tunnels-per-ue *integer*

default max-tunnels-per-ue

integer

Default: 11
The maximum number of IKEv2/IPSec tunnels allowed per UE. This value must be an integer from 1 to 11.

default max-tunnels-per-ue

Sets the maximum number of IKEv2/IPSec tunnels allowed per UE to its default value, which is 11.

Usage

Use this command to set the maximum number of IKEv2/IPSec tunnels allowed per UE.

Example

Use the following command to set the maximum number of IKEv2/IPSec tunnels allowed per UE to *2*:

max-tunnels-per-ue *2*

plmn id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_number* **mnc** *mnc_number*

no plmn id mcc *mcc_number* **mnc** *mnc_number*

mcc *mnc_number*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to any integer value between 200 and 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

no plmn id mcc *mcc_number* **mnc** *mnc_number*

Removes a previously configured PLMN identifier for the PDG service.

Usage

The PLMN ID is included in the RAI (Routing Area Identity) field of the PDP Create Request messages sent to the GGSN. Multiple PDG services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each PDG service.

Example

The following command configures the PLMN identifier with an MCC of 462 and MNC of *2*:

plmn id mcc 462 mnc *02*

setup-timeout

Specifies the maximum time allowed to set up a session in seconds.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

setup-timeout integer

default setup-timeout

setup-timeout integer

Default: 60
Sets the session setup timeout value.
integer is a value in the range of 2 - 300 seconds.

default setup-timeout

Sets or restores the default session setup timer value to 60 seconds.

Usage

The PDG/TTG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.

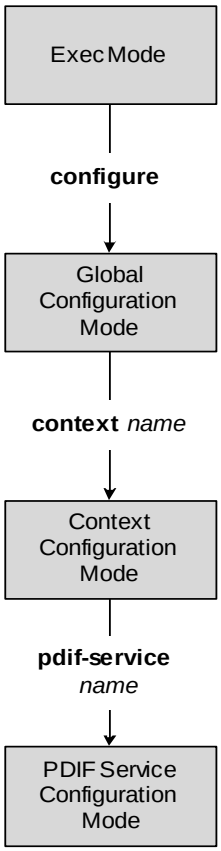
Example

The following command sets the session setup timeout value to the default value of 60 seconds:

default setup-timeout

Chapter 163
PDIF Service Configuration Mode Commands

The PDIF Service Configuration Mode is used to configure the properties required for a mobile station to interface with a PDIF.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa attribute

Sets the system attributes for AAA messages.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

aaa attribute { 3gpp2-bsid *string* **| 3gpp2-service-option** *integer* **| calling-station-id** *integer* **|3gpp2-serving-pcf**<*ip-address*> **}**

no aaa attribute

default aaa attribute 3gpp2-service-option *integer*

no

Removes a previously configured AAA attribute.

default

Returns the specified aaa attribute to the original default system settings.

3gpp2-bsid *string*

Specifies the base-station ID and consists of the SID + NID + CELLID.
string must contain 12 hexadecimal upper-case ASCII characters.

3gpp2-service-option *integer*

Default: 4095
Specifies the radius attribute value when sending authentication and accounting messages.
integer can be configured to any value in the range 0 - 32767

calling-station-id *integer*

Calling station phone number.
integer can be configured to any value from 1 - 15 numbers.

3gpp2-serving-pcf

Use this command to generate attribute values without creating a new ASR 5000 image.

Usage

If the RADIUS protocol is being used, accounting messages can be sent over a AAA interface to the RADIUS server.
3gpp2-serving-pcf attribute value (if configured) is sent in both RADIUS authentication and accounting messages. If the attribute value is not configured (or explicitly 'not configured' using no command), radius

attributes are still included with just type and length. This is because inclusion/exclusion of radius attributes are still controlled through the dictionary, not with CLI.

Example

The following command identifies the base station ID:

```
aaa attribute 3gpp2-bsid 0ab23289acb3
```

aaa authentication

Sets the aaa authentication for first and second phase authentication when multiple authentication is configured on the system.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

aaa authentication { { first-phase | second-phase } | { context-name *name* **aaa-group** *name* **} }**

no aaa authentication { first-phase | second-phase }

no aaa authentication { first-phase | second-phase }

Removes any existing authentication configuration.

first-phase context-name *name* **aaa-group** *name*

Specifies the context name and the aaa group name configured in the context for the first authentication phase.
context-name *name:* Context where aaa server group is defined. *name* must be a string of size 1-79.
aaa-group *name*: Name of the aaa-group to be used for authentication. *name* must be a string of size 1-63.

second-phase context-name *name* **aaa-group** *name*

Specifies the context name and the aaa group name configured in the context for the second authentication phase.
context-name *name:* Context where aaa server group is defined. *name* must be a string of size 1-79.
aaa-group *name*: Name of the aaa-group to be used for authentication. *name* must be a string of size 1-63.

Usage

Two phase-authentication happens in IKEv2 setup for setting up the IPSec session. The first authentication uses Diameter AAA EAP method and second authentication uses RADIUS AAA authentication. The same AAA context may be used for both authentications. PDIF service allows you to specify only a single AAA group, which could normally be used for the first authentication method.
A given AAA group only supports either Diameter or RADIUS authentication. If the NAI in the first authentication is different from NAI in the second authentication each NAI can point to a different domain profile in the PDIF. Each domain profile may be configured with each AAA group, one for Diameter and the other for RADIUS.

Example

Use the following to configure first-phase authentication for an aaa group named *aaa-10* in the pdif context:

first-phase context-name *pdif* **aaa-group** *aaa-10*

bind

Binds the service IP address to crypto template and configures the number of sessions the PDIF can support.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

bind address *address* **{ crypto-template** *string* **} [max-sessions** *number* **]**

no bind

no

Removes a previously configured binding.

address

Specifies the IP address of the service.

crypto-template *string*

Specifies the name of the crypto template to be bound to the service.
string is any value from 0 - 127 alpha and/or numeric characters.

max-sessions *number*

Default is 3000000
Specifies the maximum number of sessions to be supported by the service.
number can be any integer value from 0 - 3000000

Usage

Binds the IP address used as the connection point for establishing the IKEv2 sessions to the crypto template. It can also define the number of sessions the PDIF can support.

Example

The following command binds a service with the ip address *13.1.1.1* to the crypto template *T1* and sets the maximum number of sessions to *2000000*:

bind address *13.1.1.1* **crypto-template T1 max-sessions** *2000000*

default

Sets or restores the default condition for the selected parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default { { aaa attribute 3gpp2-service-option } | duplicate-session-detection |
hss { failure-handling mac-address-validation-failure | mac-address-validation |
update-profile } | ip source-violation { drop-limit | period } | setup-timeout |
subscriber name | username mac-address-stripping } }
```

aaa attribute 3gpp2-service-option

Configures the default value to 4095.

aaa authentication

duplicate-session-detection

Configures the default to be NAI-based.

hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile }

Configures the HSS server defaults:
failure-handling mac-address-validation-failure: By default, the MAC address is validated by IMS-Sh interface.
mac-address-validation: By default, validating the MAC address is disabled.
update-profile: By default, updating the PDIF profile is disabled.

ip source-violation (drop-limit | period }

Configures IP source-violation detection defaults.
drop-limit: Default number of ip source violations permitted in detection period before the call is dropped is10.
period: Default detection period is 120 seconds.

setup-timeout

Default call setup time limit is 60 seconds.

subscriber *name*

Configures the default subscriber name. *name* is a string of 1-127 characters.

username mac-address-stripping

Default is to disable stripping the MAC address from the username.

Usage

Configures the default settings for a given parameter.

Example

Use the following example to configure the default call setup time limit:

```
default setup-timeout
```

duplicate-session-detection

Configures the PDIF to detect duplicate call sessions using old IMSI or NAI addresses and clear old call information.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] duplicate-session-detection { imsi-based | nai-based }
```

no

Stops duplicate session detection.

default

Configures the default setting, which is NAI-based detection.

imsi-based

Configures the PDIF to detect duplicate call sessions based on the IMSI address.

nai-based

Configures the PDIF to detect duplicate call sessions based on the NAI address. This is the default setting.

Usage

If an MS leaves the Wi-Fi coverage area and subsequently comes back online, it may initiate a new session setup procedure. After both the device authentication with HSS and the subscriber authentication with AAA server are completed, PDIF runs the internal mechanism to see whether there was any other session bound with the same IMSI. If an old session is detected, PDIF starts clearing this old session by sending a proxy-MIP Deregistration request to the HA. PDIF resumes new session setup by sending a proxy-MIP registration request. When the old session is aborted, PDIF sends Diameter STR messages and RADIUS Acct STOP messages to corresponding AAA servers.
PDIF allows duplicate session detection based on either the NAI or IMSI addresses. When detecting based on NAI, it is the first-phase (device authentication) NAI that is used.

Example

The following command configures duplicate session detection to use IMSI addressing:

```
duplicate-session-detection imsi
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

hss

Configures the HSS server parameters.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
hss { failure-handling { { mac-address-validation-failure | update-profile }
action { terminate | continue } } | update-profile | mac-address-validation }

[ no | default ] hss { failure-handling | update-profile | mac-address-
validation }
```

no

Removes a previously configured HSS profile.

default

Resets the defaults for this command.

failure-handling mac-address-validation-failure

Configures the way the HSS server is to handle errors.
If HSS returns a list of MAC addresses and if PDIF fails to match the subscriber MAC address against the list, then the session is always terminated.

action { continue | terminate }

Configures the action to be performed depending on the failure type.
continue: Ignore a mac-address-validation-failure and continue the session.
terminate: Terminate the session on a mac-address-validation-failure.

mac-address-validation

Default: disabled
If mac-address-validation is enabled, the PDIF queries the HSS server for a list of MAC addresses associated with the Mobile Directory Number (MDN).

update-profile

Default: disabled.
Update the HSS server with the subscriber profile.

Usage

An HSS server is used to provide MAC address validation and store part of the subscriber profile. This command enables or disables validation and profile updates, and configures how the system responds to failures: terminate or continue a session.

An ims-sh-service and Diameter interface needs to be configured to communicate with the HSS server.

Example

The following example enables mac-address validation:

```
hss mac-address-validation
```

ims-sh-service

Associates the IMS-Sh-service parameters.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ims-sh-service name *name*

no ims-sh-service name *name*

no

Removes a previously configured IMS-Sh-service.

name

Names the IMS-Sh-service in the pdif-service context.

Usage

This command is used to name the IMS-Sh-service.

Example

The following command names the IMS-Sh-service ims1:

ims-sh-service name *ims1*

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { **clear-on-valid-packet** | **drop-limit** *num* | **period** *secs* }
no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

drop-limit *num*

Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

period *secs*

Default: 120
The length of time, in seconds, for a source violation detection period to last.
If *secs* is not specified, the value is set to the default.
secs can be any integer value from 1 to1000000.

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments the IP source-violation drop-limit counter and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the drop-limit counter to increment.
For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The period timer continues to count throughout this process.

Example

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

mobile-ip

Sets the MIP FA context for the specific PDIF service.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

mobile-ip foreign-agent context *string* **[fa-service** *string* **]**

no mobile-ip

no

Removes previously configured parameters.

foreign-agent context *string*

Provides the context name in which the FA is configured. *string* is any value in the range 1 - 79 alpha and/or numeric characters.

fa-service *string*

Designates the name of the FA service in the FA context. *string* is any value in the range 1 - 79 alpha and/or numeric characters.

Usage

Shows in which context the FA is located and names the FA service.

Example

This command configures MIP for the FA context named fa1:

mobile-ip foreign-agent context *fa1*

setup-timeout

Configures the maximum time allowed to set up a session.

Product

PDIF

Privilege

Security-Administrator, Administrator

Syntax

setup-timeout *integer*

default setup-timeout

default

Default session setup timer: 60 seconds.

setup-timeout *integer*

This command manually sets the session setup timer. *integer* is a value in the range 2 - 300 seconds.

Usage

PDIF clears both user session and tunnels if a call does not initiate successfully before the timer expires.

Example

The following command sets the setup-timeout to the default 30 seconds:

```
default setup-timeout
```

username

Configures mac-address-stripping on a username coming in from a mobile station session.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
username mac-address-stripping
```

```
[ default | no ] username mac-address-stripping
```

no

Returns the configuration to the default condition.

default

Configures the parameter default, which is disabled.

mac-address-stripping

Configures mac-address stripping from the Network Access Identifier (NAI).

Usage

When enabled, PDIF strips the MAC address from a mobile username NAI before sending to the RADIUS AAA server.

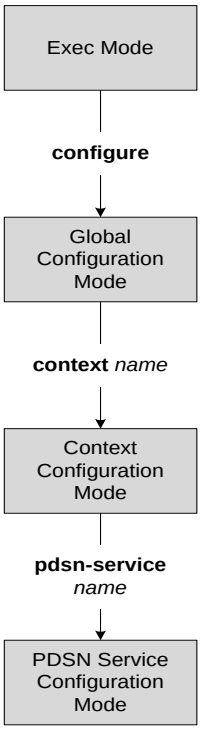
Example

The following example disables mac-address-stripping.

```
no username mac-address-stripping
```

Chapter 164
PDSN Service Configuration Mode Commands

The PDSN Service Configuration Mode is used to create and manage PDSN service instances for the current context.



aaa 3gpp2-service-option

Specifies the value for the 3gpp2-service option.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

aaa 3gpp2-service-option *number*

no aaa 3gpp2-service-option*number*

no

Disables the aaa 3gpp2-service option configuration.

Usage

Allows the configuration of a default service option value to be sent in accounting when service option values are not received from PCF. The PDSN will default the service option value to the configured value if the value is not specified by the PCF.

Example

The following command sets the service option to be *40*:

```
aaa 3gpp2-service-option 40
```

access-flow traffic-validation

if **access-flow traffic-validation** is enabled for the service and the subscriber then the flows are checked against the filter rules. If the packets does not match the filter rules, and N violations occur in K seconds, the rp connection is downgraded to best-effort flow, if it is not already a best-effort flow

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

access-flow traffic-validation threshold violations *limit* **interval** *seconds*

[no | default] access-flow traffic-validation

[no | default]

Disable traffic validation for the service.

threshold { [violations *limit*] **[interval** *seconds*]}

violations *limit*: Sets the parameters that determine traffic access violations. This is determined by setting the maximum number of violations within a set time period. must be an integer from 1 through 100000.
interval *seconds*: Sets the time interval, in seconds. must be an integer from 1 through 100000.

Usage

Use this command to enable traffic validation for the current PDSN service.

Example

The following command enables traffic validation for the current PDSN service and sets the limit allowed to *100* violations within *5* seconds:

```
access-flow traffic-validation threshold violations 100 interval 5
```

access-network

Configures access network parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

access-network { accounting identifier | realm *realm_name* **}**

accounting identifier

Configures accounting for the access-network. This value must be a string from 1 to 128 characters in length.

realm *realm_name*

Configures the realm for the access-network. *realm_name* must be a string from 1 to 128 characters in length.

Usage

Use this command to configure access-network parameters for accounting and realms.

Example

The following command creates an **access-network realm** named *realm2*.

```
access-network realm realm2
```

airlink bad-sequence-number

Configures PDSN behavior for airlink related parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

```
airlink bad-sequence-number {accept | deny [use-deny-code {poorly-formed-request
| unsupported-vendor-id}]}[no | default] airlink bad-sequence-number
```

[no | default]

Disables the deny of bad-sequence number and accept it.
It is the default behavior.

---

accept

Accepts the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It is the default behavior.

---

deny

Rejects the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It uses **poorly-formed-request** option by default to deny a request.

---

use-deny-code {poorly-formed-request | unsupported-vendor-id}

These are optional keywords that used with **deny** sub-command to deny the A11 RRQ messages that have either an unsupported vendor Id or A11 Requests with bad/poor formation.
unsupported-vendor-id denies request on the basis of vendor Id.
poorly-formed-request will deny the A11 request on the basis of request formation or structure. It is the default deny code for **deny** sub-command.

Usage

This command is used to configure the airlink parameters for A11 RRQs. .
When configured it denies the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.

Example

The following command would configure the system to deny all A11 RRQ messages having unsupported vendor Id or bad structure of message, including those having arilink sequence number less than or equal to a previously received sequence number:

```
airlink bad-sequence-number deny
```

allow alt-ppp

Allows proprietary modified versions of PPP type sessions to connect this PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
allow alt-ppp

no allow alt-ppp
```

no

Disables the allowed alternate PPP feature.

Usage

This command is used to deviate from standard PPP protocol and use a proprietary modified version of PPP with a pre-defined non-negotiable PPP parameters.
It is a vendor-specific licensed feature command.

always-on-indication

Enables/disables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
always-on-indication

no always-on-indication
```

no

Disables the sending of 3GPP2 Always On Indication messages.

Usage

This command is available when the 3GPP2 Always-On RP Extensions feature-use license is installed. When enabled, this command causes the PDSN service to include the Always On Indicators in the Normal Vendor Specific Extension (NVSE) part of an A11 Session Update message to the PCF. The indicator will only be sent for those subscriber sessions in which Always On functionality is enabled as determined after a successful authentication: the 3GPP2-Always-On attribute is set to a value of *1* (Active) for subscribers configured on a AAA server, or the always-on parameter is set for locally configured subscribers.
This functionality is enabled by default.

authentication

Configures the PDSN service authentication parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

authentication { { [allow-noauth] [chap *chap_priority* **] [mschap** *mschap_priority* **] [pap** *pap_priority* **] } | msid-auth }**

---

allow-noauth

Default: Disabled
This option configures the system to provide subscribers with network access even though they have not been authenticated. This command issued by itself would cause the system to not attempt to authenticate subscribers.
When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.
If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the subscriber.

---

chap *chap_priority*

Default: 1
This option configures the system to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber.
A *chap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
chap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
CHAP is enabled by default as the highest preference.

---

mschap *mschap_priority*

Default: Disabled
This option configures the system to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber.
A *mschap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
mschap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.

---

pap *pap_priority*

Default: 2
This option configures the system to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber.

A *pap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
pap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference. PAP is enabled by default as the second highest preference.

msid-auth

Default: Disabled
This option configures the system to attempt to authenticate the subscriber based on their Mobile Station Identity (MSID).

Usage

Use to specify how the PDSN service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.
The chassis is shipped from the factory with the authentication options set as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

Important: At least one of the keywords must be used to complete the command.

Example
The following command would configure the system to allow no authentication for subscribers and would perform accounting using the default NAI-construct of *username@domain*:

```
authentication allow-noauth
```

The following command would configure the system to attempt subscriber authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```

bind

Binds the PDSN service to a logical IP interface serving as the R-P interface. Specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bind address *address* **[max-subscribers** *count* **]**

no bind address *address* **max-subscribers** *max#*

no

Removes a previously configured binding.

address

Specifies the IP address (address) of the interface configured as the R-P interface. *address* is specified in dotted decimal notation.

max-subscribers *count*

Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to any integer value between 0 and 500,000.

Important: The maximum number of subscribers supported is dependant on the license key and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 500,000 total subscribers. Refer to the license key command for additional information.

Usage

Associate or tie the PDSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an R-P interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configure for use as R-P interfaces
- The maximum number of subscriber sessions that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-Tx or 1000Base-T) to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the PDSN service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

bcmcs

Sets the BCMCS group username and password for RADIUS access.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bcmcs [custom | flow-id *value { header-compression rohc { rohc-profile name name } }*| **grpusrname** *group_name* | **[encrypted] grppasswd** *group_passwd* | **ptt {destination-context disconnect-dscp-label rohc-profile-name}]**

---

custom

Customise the BCMCS configuration.

---

flow-id *value*

Set the BCMCS flow-id. This value must be a hex string between *0x1000* and *0xFFFFFFFF*.
Making this entry opens a new mode: bcmcs-flow-id.
header-compression rohc Configure ROHC parameters.
rohc-profile name name: Configure ROHC parameters name, name should be string of size 1 to 63.

---

grpusrname *group_name*

Sets the BCMCS group name for RADIUS access requests. This value must be a string from 1 to 127 characters in length.

[encrypted] grppasswd *group_passwd*

Set the BCMCS group password for RADIUS access requests. This value must be a string from 1 to 63 characters in length.
Password can be encrypted or clear.

---

ptt {destination-context *dest_name* | **disconnect-dscp-label** *dscp-label_value*| **mtu** | **rohc-profile-name** *profile_name* **}**

destination-context: Specify the intended destination context name. This value must be string of 1 to 79 characters in length.
disconnect-dscp-label: Configures the DSCP label to be present in the In Call Signalling packet based on which In Call Signalling and Media Flows will be disconnected. This value must be a Hexadecimal number between *0x0* and *0xF*.
mtu: Configures maximum transmission unit, This value must be ranging from 100 to 2000. Default is 1500.
rohc-profile-name: Profile name of the ROHC compresser and decompressor. This value should be a string of 1 to 63.

Usage

Use this command to set the BCMCS group username and password for RADIUS access requests.

Example

`bcmcs grpusername` *`group_name`*`bcmcs grppasswd` *`group_password`*

data-available-indicator

Enable sending Data Available Indicator extension in R-P Registration Reply.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
data-available-indicator

no data-available-indicator
```

no

Default: Disabled
Disable the sending of the Data Available Indicator extension in R-P Registration Reply.

Usage

Use this command to enable or disable the sending of the Data Available Indicator extension in R-P Registration Reply

Example

Use the following command to enable sending the Data Available Indicator extension in R-P Registration Reply:

```
data-available-indicator
```

Use the following command to disable sending the Data Available Indicator extension in R-P Registration Reply:

```
no data-available-indicator
```

data-over-signaling

Enable the data-over-signaling marking feature for A10 packets.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
data-over-signaling

no data-over signaling
```

no

Default: Enabled
Disable the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

Important: This is a customer-specific command.

Example

```
no data-over-signaling
```

default

Sets / Restores default value assigned for specified parameter.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
default { authentication | gre { checksum | checksum-verify | protocol-type |
sequence-numbers } | inter-pdsn-handoff mobility-event-indicator | ip {local-
port | source-violation {drop-limit | period | reneg-limit}} | lifetime | max-
retransmissions | pcf-monitor | policy { overload | service-option } |
registration-accept handoff session-disconnect-in-progress | registration-deny {
handoff  connection-setup-record-absent  | max-deny-reply-limit | new-call {
connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-
active | session-already-closed | session-already-dormant | terminate-session-
on-error | use-zero-gre-key | session-already-closed | terminate-session-on-
error | registration-discard { bad-extension | gre-key-change } | registration-
update wait-timeout | retransmission-timeout | service-option | setup-timeout }
```

`registration-update wait-timeout`

Sets the PDSN service to not wait before sending Registration-Update when PPP is terminated for an active RP session.

`authentication`

Sets/restores the authentication setting to their defaults which are as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap enabled with a priority of 3
- msid-auth disabled
- pap enabled with a priority of 2

`gre { checksum | checksum-verify | protocol-type | sequence-numbers }`

`checksum`: Disables the introduction of the checksum field in outgoing GRE packets.
`checksum-verify`: Disables verification of the GRE checksum (if present) in incoming GRE packets.
`protocol-type`: Restores the GRE protocol type the default protocol-type any
`sequence-numbers`: Restores the GRE sequence number parameters to the default sequence-numbers enabled

`inter-pdsn-handoff mobility-event-indicator`

Disables support for the Mobile Event Indicator during inter-PDSN handoffs.

ip local-port

Restores the ip local-port setting to its default value of 699.

ip source-violation {drop-limit | period | reneg-limit}

Sets the source violation parameters to the defaults or sets the defaults to the specified value as follows;

- **drop-limit**: Sets the number of source violations within a detection period before forcing a call disconnect to the default: 10.
- **period** : Sets the length of time, in seconds, for a source violation detection period to last to the default: 120 seconds.
- **reneg-limit** : Sets the number of source violations within a detection period before forcing a PPP renegotiation to the default: 5.

lifetime

Restores the lifetime setting to its default: 1800 seconds.

max-retransmissions

Restores the max-retransmissions setting to its default: 5.

pcf-monitor

Restores the PCF monitoring settings to the defaults.
Default interval: 900
Default num-retry: 5
Default timeout: 5

policy { overload | service-option }

Restores the policy overload and/or policy service-option setting to its default values as follows:

- overload disabled
- sequence-numbers enforced enabled

registration-accept handoff session-disconnect-in-progress

Resets the PDSN to deny registration requests when a handoff disconnect is still in progress.

registration-deny { handoff connection-setup-record-absent | max-deny-reply-limit | new-call { connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key

handoff connection-setup-record-absent

- **connection-setup-record-absent** Accept handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request.

max-deny-reply-limit: Resets the maximum number of retries of erroneous registration request message from PCF for a session before PDSN terminates the session. to the default. Default is 3.
new-call connection-setup-record-absent: Configures the PDSN not to reject calls that do not have the airlink connection setup record in the RRQ.
new-call reverse-tunnel-unavailable: Configures the PDSN not to reject calls if the GRE key for a user collides with that of another user.

session-already-active: disables the PDSN from denying RP renew and dereg requests for active R-P sessions.
session-already-closed: disables the PDSN from denying RP renew and dereg requests for absent R-P sessions.
session-already-dormant: disables the PDSN from denying RP renew and dereg requests for dormant R-P sessions.
terminate-session-on-error: Disables the PDSN from terminating a session if an erroneous registration request message is received for the session.
use-zero-gre-key: Configures the PDSN not to set the GRE key to zero (0) when denying a new R-P session.

registration-discard { bad-extension | gre-key-change }

bad-extension: Set the PDSn so that it does not immediately discard registration requests that have multiple vendor information elements of the same type.
gre-key-change: Sets the PDSN so that it does not discard Registration Requests that have a GRE key that is different than the one for the existing IMSI session.
handoff connection-setup-record-absent:Sets the PDSN so that it does not discard A11 Handoff requests that do not contain the Airlink Setup record.

registration-update wait-timeout

Sets the PDSN service to not wait before sending Registration-Update when PPP is terminated for an active RP session.

retransmission-timeout

Restores the retransmission-timeout setting to its default: 3 seconds.

service-option

Restores the service-option setting to its default list of service options as follows:

- 7: PCF specific
- 15: PCF specific
- 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
- 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
- 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
- 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
- 33: 3G High Speed Packet Data
- 59: PCF specific

setup-timeout

Restore the maximum amount of time allowed for setting up a session to the default of 60 seconds.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example

The following command is used to return the lifetime parameter to it's default value:

```
default lifetime
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the PDSN service from which to base the handling of all other subscriber sessions handled by the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

default subscriber*profile_name*

no default subscriber*profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* can be between 1 and 63 alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the PDSN service will use the information configured for the subscriber named default within the same context. This command allows for multiple PDSN services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the PDSN service to apply the rules configured for a subscriber named *user1* to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```

dormant-transition

Configures the PDSN behavior to terminate A10 session, when the PDSN receives the A11-RRQ (Type 4) before the session for the original MN is established completely.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] dormant-transition initial-session-setup
```

no

Terminates the A10 session, when PDSN receives the A11-RRQ (Type 4) before the original session established completely.

default

Keeps the A10 session live in case of A11-RRQ (Type 4) is received before the original session is established completely.

Usage

When the status of A10 session goes to dormant before the session for the original MN is established completely, the different MN may possibly send the A11-RRQ (Type 4) to the PDSN and PPP renegotiation may start.
This command is used to terminate the A10 session when the PDSN receives the A11-RRQ (Type 4) before the session for original MN is established completely.

Example

Following command is used to release the A10 session in case of receiving A11-RRQ (Type 4) before the original session is established completely:

```
no dormant-transition initial-session-setup
```

end

Exits the PDSN service configuration mode and returns to the Exec mode.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the PDSN service configuration mode and returns to the context configuration mode.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

fragment

It enables/disables fragmentation of PPP data.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
fragment ppp-data

[ no | default ] fragment ppp-data
```

no

Disables the fragmentation of ppp data.

default

Default enables ppp data fragmentation.

Usage

This command is to indicate to the RP module to NOT fragment PPP payloads being sent to the PCF, if the total packet size (PPP+GRE+IP) exceeds 1500 bytes.
Disabling fragmentation may cause the **sessmgr** to perform outer IP fragmentation of the outgoing packet, if the resulting packet exceeds the MED MTU.

gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

gre { checksum | checksum-verify | flow control | ip-header-dscp *value* **{ all-control-packets | setup-packets-only } | flow-control-timeout { *seconds* | msec** *milliseconds* **} action { resume-session | disconnect-session } | protocol-type { any | byte-stream | ppp } | reorder-timeout** *milliseconds* **| sequence-mode { none | reorder } | segmentation | sequence-numbers | threegppp2-ext-header qos-marking }**

```
no gre { checksum | checksum-verify | flow-control | ip-header-dscp |
segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }
```

```
default gre { checksum | checksum-verify | flow-control | ip-header-dscp |
protocol-type | segmentation | sequence-mode | sequence-numbers | threegppp2-
ext-headers qos-marking }
```

no

Disables the specified functionality.

default

Restores the specified parameter to its default setting.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

ip-header-dscp *value* **{ all-control-packets | setup-packets-only }**

Default: Disabled
Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- *value* : Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.
- **all-control-packets** : Dictates that the DSCP marking is to be provided in all GRE control packets.

- **setup-packets-only** : Dictates that the DSCP marking is to be provided only in GRE setup packets.

flow-control [action {disconnect-session | resume-session}] [timeout { *seconds* | msec *milliseconds* }]

Default: no gre flow-control
Enables 3GPP2 GRE flow control which causes the PDSN to send flow control enabled Normal Vendor Specific Extensions (NVSE) in A11 RRPs.
action {disconnect-session | resume-session}:
Specifies the action to be taken when timeout is reached:

- **disconnect-session** (default): Ends the session and releases the call.
- **resume-session**: Switches flow control to XON and resumes delivery of packets to the RAN.

timeout { *seconds* | **msec** *milliseconds* }
Sets the amount of time wait for an XON indicator from the RAN (after receiving an XOFF). Also sets the action to be taken if the timeout limit is reached.
Default: 10 seconds, disconnect-session
seconds: Specifies the amount of time in seconds before the timeout is reached. *seconds* must be an integer from 1 through 1000.
msec *milliseconds*: Specifies the amount of time in milliseconds before the timeout is reached. *milliseconds* must be an integer from 1 through 1000000.

protocol-type { any | byte-stream | ppp }

Specifies the protocol used fro GRE encapsulation that is acceptable to
any: Specifies that the PDSN service will accept GRE packets encapsulated using any protocol.
byte-stream: Specifies that the PDSN service will accept GRE packets only encapsulated using byte stream. Using byte stream encapsulation, PPP packets are framed at different intervals and sent.
ppp: Specifies that the PDSN service will accept GRE packets only encapsulated using the Point-to-Point Protocol (PPP). Using PPP encapsulation, PPP packets are framed at regular intervals and sent.

reorder-timeout

Default: 100
Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *milliseconds* must be an integer from 0 through 5000.

segmentation

Default: disabled
Enables GRE Segmentation for the PDSN service.

sequence-mode { none | reorder}

Default: none
Configures handling of incoming out-of-sequence GRE packets.
none: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
reorder: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:

- The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.

- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

sequence-numbers

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.

threegppp2-ext-headers qos-marking

When threegppp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the PDSN will include the qos optional data attribute in the GRE 3gpp2 extension header.
The **no** keyword, enables qos-marking in the gre header based on the tos value in the header.

Usage

The **gre protocol-type** command can be used to prevent the PDSN service from servicing PCFs that use a specific form of encapsulation.
Use the **no gre sequence-numbers** command to disable the inclusion of GRE sequence numbers in the A10 data path.
The chassis is shipped from the factory with the authentication options set as follows:

- **protocol-type any**
- sequence-numbers enabled

Example

Use this command to configure the PDSN service to exclude byte stream encapsulated GRE traffic:

```
gre protocol-type ppp
```

inter-pdsn-handoff mobility-event-indicator

Configures the PDSN to support the Mobility Event Identifier (MEI) during inter-PDSN handoffs. The presence of the Mobility Event Indicator (MEI) and Access Network Identifier (ANID) elements in a A11 handoff request represents an Inter-PDSN handoff.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
inter-pdsn-handoff mobility-event-indicator

no inter-pdsn-handoff mobility-event-indicator
```

no

Disables support for the MEI during inter-PDSN handoffs.

Usage

Use this command to configure support for the MEI during inter-PDSN handoffs.

Example

Use the following command to enable support for the MEI during inter-PDSN handoffs:

```
inter-pdsn-handoff mobility-event-indicator
```

ip header-compression rohc

This command enters PDSN Service ROHC Configuration Mode. The ROHC configuration mode lets you configure ROHC parameters that PDSN conveys to the PCF in the initial A11 RRP message before PPP authentication.

By default, ROHC is disabled for a PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression rohc

default ip header-compression rohc

no ip header-compression rohc
```

default

Set all PDSN Service ROHC Configuration Mode values back to the defaults and disable ROHC for this PDSN service.

no

Disable IP header compression for this PDSN Service.

Usage

Use this command to enter the PDSN Service ROHC Configuration Mode or disbale ROHC for the current PDSN service.

Example

The following command enters PDSN Service ROHC Configuration Mode:
ip header-compression rohc
The following command disables ROHC for the current PDSN service and sets all of the values for commands in PDSN Service ROHC Configuration Mode back to their default settings:

```
default ip header-compression rohc
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the R-P interfaces' IP socket.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ip local-port*number*

number

Default: 699
Specifies the UDP port number.
number can be any integer value between 1 and 65535.

Usage

Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the PDSN.

Important: The UDP port setting on the PCF must match the local-port setting for the PDSN service on the system in order for the two devices to communicate.

Example

Use the following command to specify a UDP port of *3950* for the PDSN service to use to communicate with the PCF on the R-P interface:

```
ip local-port 3950
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product

PDSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **| period** *secs* **| reneg-limit** *num* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

drop-limit *num*

Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

period *secs*

Default: 120
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.
secs can be any integer value from 1 to1000000.

reneg-limit *num*

Default: 5
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs PDSNs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.
For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.
If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.
If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by 1. If the reneg-limit counter equals zero, the drop-limit is decremented by half.

Example
The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

lifetime

Specifies the time that an A10 connection can exist before its registration is considered expired.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

lifetime *time*

no lifetime

no lifetime

Specifies that an A10 connection can exist for an infinite amount of time.

time

Default: 1800
Specifies the time that an A10 connection can exist before its registration is considered expired.
time is measured in seconds and can be configured to any integer value between 1 and 65534.

Usage

Set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, their connection will be terminated automatically.
Use the **no lifetime** command to delete a previously configured lifetime setting. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default lifetime** command.

Example

The following command specifies a time of *3600* seconds (1 hour) for subscriber sessions on this PDSN service:

lifetime *3600*

max-retransmissions

Configures the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions *count*

count

Specifies the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.
count can be configured to any integer value between 1 and 1,000,000.

Usage

If the value configured for the max-retransmissions is reached the call will be dropped.
The chassis is shipped from the factory with the Internet maximum number of retransmissions set to 5.

Example

The following command configures the maximum number of retransmissions for the PDSN service to *3*:

```
max-retransmissions 3
```

mobile-ip foreign-agent context

For Mobile IP support, specifies the context in which the FA service(s) are configured.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mobile-ip foreign-agent context *context_name* **[fa-service** *name***]**

no mobile-ip foreign-agent context *context_name* **[fa-service** *name***]**

context_name

Specifies the name of the previously configured context that facilitates the FA service(s). context_name must be between 1 and 79 alpha or numeric characters and is case sensitive.

[fa-service *name***]**

This optional keyword allows you to link the PDSN service to a particular FA service in the specified context. *name* is the name of the FA service to link to.

Usage

FA services on the system can be configured either in the same or different contexts from those facilitating PDSN services. When they are configured in separate contexts, this command configured with a PDSN service instructs the PDSN service to route traffic to the context facilitating the FA service.
Use the **no mobile-ip foreign-agent context** to delete a previously configured destination context.

Example

The following command instructs the PDSN service to use the context named FA-destination for FA functionality:

```
mobile-ip foreign-agent context fa-destination
```

msid length

Specifies the allowed configurable Mobile Station IDentifier (MSID) length.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] msid length [ min min_length ] max max_length
```

default

Specifies the default length of MSID (10 to 15) as per standard.

min *min_length*

Specifies the minimum length for MSID.
min_length is any Integer value between 10 to 15, but should be less than *max_length* specified with **max**.

max *max_length*

Specifies the maximum length for MSID.
max_length is any Integer value between 10 to 15, but should be more than *min_length* specified with **min**.

Usage

MSID length can be configured either in the standard length or different customized length form. This command is used to specify the allowed length of MSID.

Example

The following command specifies an MSID length between 12 and 15:

```
msid length min 12 max 15
```

nai-construction

Specifies a domain alias that will be used to represent the context which the PDSN service should use for AAA functionality.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
nai-construction domain alias

no nai-construction domain
```

domain *alias*

alias represents the "domain" name that you would like to associate with the context in which AAA functionality is configured. alias can be between 1 and 79 alpha and/or numeric characters and is case-sensitive.

Usage

Enabling NAI will be constructed for the subscriber in the event that their mobile station (MS) does not negotiate CHAP, PAP, or MSCHAP. If this option is selected, no further attempts will be made to authenticate the user. Instead, the constructed NAI will be used for accounting purposes.
The context specified by this command would be used to provide the communication with the RADIUS accounting server.
Use the **no nai-constructed domain** command to deleted a configured alias.

Important: This command should only be used if the PDSN service is configured to allow no authentication using the authentication allow-noauth command.

Additionally, the **aaa constructed-nai** command in the Context Configuration mode can be used to configure a password for constructed NAIs.

Example

The following command configured a domain alias of aaa_context for the PDSN service to use when an NAI is constructed for a subscriber session:

```
nai-construction domain aaa_context
```

new-call conflict

Enable or disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
new-call conflict terminate-session-old-pcf [no | default] new-call conflict
terminate-session-old-pcf
```

no

Disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

default

Enable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Usage

This configuration supports to enable or disable to send A11-RUPD to current PCF, when the system receives the A11-RRQ(Type1) from new PCF during the session exists.
If the configuration is **no new-call conflict terminate-session-old-pcf** system will not send registration update to old PCF on receiving a new call (A11-RRQ(Type1)) request for an existing active/dormant session.
The default behavior is to send registration updates.

Example

The following command configured a system to send a registration update on receiving an A11-RRQ (Type 1) request for an existing active/dormant session:

```
new-call conflict terminate-session-old-pcf
```

pcf-monitor

When this is enabled, the PDSN monitors all the PCFs that have sessions associated with it. The PDSN stops monitoring a PCF if it is determined to be down. Once a PCF is determined to be down, the PDSN tears down all sessions that correspond to the PCF and generates AAA Accounting Stop messages. All the PCFs that are connected to the PDSN service are monitored.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
pcf-monitor [ interval seconds | max-inactivity-time seconds | num-retry num |
timeout seconds ]

no pcf-monitor
```

pcf-monitor

Entering the command with no keywords enables the PCF monitoring function with all parameters set to the defaults.

no

Disables the pcf monitoring function.

interval *seconds*

Default: 900 seconds
Sets the amount of time to wait between ping request messages.
seconds must be an integer in the range from 60 through 3600.

max-inactivity-time *seconds*

Default: 120 seconds
The maximum amount of time (seconds) with no A10 traffic from a PCF before the ICMP-ping mechanism is triggered.
seconds must be an integer from 1 through 3600.

num-retry *num*

Default: 5
Sets the number of times that the PDSN retries to ping the PCF. When num-retry for a given PCF has been exhausted with no response, sessions that correspond to the non-responsive PCF are terminated and Accounting Stop records for each terminated session are generated.
num must be an integer in the range from 0 through 100.

timeout *seconds*

Default: 5 seconds
The amount of time to wait for a response before retrying.

seconds must be in the range from 1 through 10.

Usage

Use this command to enable the PDSN service to monitor the PCFs that have sessions associated with the PDSN service.

Example

The following command enables PCF monitoring with parameters set to the defaults:

```
pcf-monitoring
```

The following command enables PCF monitoring and sets the timeout to *10* seconds:

```
pcf-monitor timeout 10
```

The following command disables pcf-monitoring:

```
no pcf-monitor
```

pcf-session-id-change restart-ppp

This feature manages current session and PPP renegotiation on GRE-key change without any change in PCF/PANID/CANID. This command disables or enables the PPP renegotiation restart on receiving an RP registration request from the current PCF with GRE key (PCF session Id) change. With this command the PDSN aborts and restarts the call causing PPP renegotiation.

This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] pcf-session-id-change restart-ppp
```

no

Disables the pcf-session-id-change restart-ppp function.
With this option PDSN does not restart the PPP renegotiation on GRE key change from current PCF in an RP registration request, unless it indicates change in PCF/PANID/CANID.

default

Set the pcf-session-id-change function to the default state on enabled.

Usage

GRE key (PCF session ID) is sued to identify the data packet for a session and is negotiated through the A11 signaling messages between PCF and PDSN. By default PDSN aborts and restart the PPP renegotiation on receipt of any RP registration request with change in GRE key or PCF session Id.
With use of no pcf-session-id-change restart-ppp command PDSN is configured to disable the restart of call or PPP renegotiation on receipt of any RP registration request with changed GRE key, unless it has any PCF/ANID/CANID change. PDSN silently switches the GRE key for the session, retaining the existing PPP session.

Example

The following command disables the PPP renegotiation restart action on receipt of any RP RRQ with changed GRE key from same PCF/PANID/CANID.

```
no pcf-session-id-change restart-ppp
```

pdsn type0-tft attempt-inner-match

Configures a type0 traffic flow template (tft) to a type1 traffic flow template.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
pdsn type0-tft attempt-inner-match
```

```
no pdsn type0-tft attempt-inner-match
```

no

Disables the type0 tft match.

Usage

This CLI is used make PDSN match inner IP packets for an AIMS call. When enabled, the PDSN tries to match a type-0 tft to match both outer and inner packet, so that MN can use a Type-0 filter for HoA traffic which are tunneled.
This is disabled by default.

Example

The following command enables type0 tft:

```
pdsn type0-tft attempt-inner-match
```

peer-pcf

Configures settings for any PCF that has a connection with this PDSN.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

peer-pcf *ip_address* **bcmcs_framing { hdlc-like | segment-based }**

ip_address

ip_address must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.

bcmcs_framing { hdlc-like | segment-based }

Specifies the type of bcmcs_framing to use for this PCF connection.

- hdlc-like: applies HDLC-like framing for all BCMCS flows
- segment-based: applies segment-based framing for all BCMCS flows

Usage

Use this command to configure the settings for any PCF that is connected to this PDSN. You can also specify bcmcs framing settings to use for the connection.

Example

The following command configures the peer-pcf for an IP address of *131.2.3.4*:

```
peer-pcf 131.2.3.4
```

policy

Configures PDSN service policies.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

policy overload { redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] } | { reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

policy msid-match *msid_with_wildcards* **{ redirect address [weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] }**

policy pcf-zone-match *zone_number* **{ redirect** *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] }**

no policy { msid-match *msid_with_wildcards* **| overload [redirect** *address* **] | pcf-zone-match** *zone_number* **| rrq mei-from-current-pcf {suppress-ppp-restart} | service-option | unknown-cvse** *enforce* **}**

---

no policy { overload [redirect *address* **[** *address2...address16* **]] | rrq mei-from-current-pcf {suppress-ppp-restart} | service-option | unknown-cvse** *enforce* **}**

Deletes a previously set policy or removes a redirect IP address.
overload: This keyword without any options deletes the complete overload policy from the PDSN service.
overload redirect *address* [*address2 ... address16*]: deletes up to 16 IP addresses from the overload redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation
rrq mei-from-current-pcf suppress-ppp-restart: suppresses the PPP restart, when RRQ containing MEI comes from the current PCF. This is disabled by default.
service-option: Resets the PDSN service to accept calls that do not contain the service option(s) configured using the service option command.
unknown-cvse *enforce:* When unknown-cvse policy is enforced, PDSN will deny RRQs with unknown CVSEs (unknown vendor id, unknown app type or unknown app subtype) with an error code.
When disabled, PDSN will process the CVSE like an NVSE. If an unknown vendor-id, app-type or app-subtype is encountered during the processing of a CVSE, the entire CVSE will be ignored and rest of the RRQ will be processed.

---

policy overload { redirect *address* **[** *weight weight_num* **] [** *address2* **[weight** *weight_num* **] ...** *address16* **[weight** *weight_num* **]] } | { reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

Specifies how a PDSN service should handle an overload condition.
redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.
reject: This option will cause any overload traffic to be rejected. The PDSN will send an A11 Registration Reply Code of 82H (insufficient resources).
use-reject-code admin-prohibited: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code insufficient resources. This is the default behavior.
use-reject-code insufficient-resources: When this keyword is specified and traffic is rejected, the error code insufficient resources is returned instead of the error code admin prohibited.

---

policy msid-match *msid_with_wildcards* **{ redirect** *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **]** *... address16* **[weight** *weight_num* **]] }**

Specifies how a PDSN service should handle an incoming call that matches a list of wildcard MSIDs.
msid_with_wildcards: An MSID in which up to 16 digits have been replaced with the wildcard '$'. This defines the list of possible matches for incoming calls.
redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.
address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

---

policy pcf-zone-match *zone_number* **{ redirect** *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **]** *... address16* **[weight** *weight_num* **]] }**

Specifies how a PDSN service should handle an incoming call that matches a predefined zone number.
zone_number: An integer between 1 and 32 that defines the zone incoming calls must match for redirection.
redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.
address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

Usage

Policies can be implemented to dictate PDSN service behavior for various conditions such as overloading. The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.

The system automatically invokes the overload policy when an on-line software upgrade is started.

Use the **no policy** { **overload** | **service-option** } command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the **default policy** command.

The chassis is shipped from the factory with the policy options set as follows:

- overload disabled
- sequence-numbers enforced enabled

Caution: Incorrect configuration of the **policy msid-match** and **policy pcf-zone-match** keywords could result in sessions failing to be established. For example, if PDSN1 is configured to redirect sessions to PDSN2 while PDSN2 is configured to redirect sessions to PDSN1, a loop is created in which all sessions would fail to be connected. In addition, sessions will not be established if the PDSN to which the sessions are being redirected is unavailable.

Example

The following command configures the PDSN service to redirect traffic to two different destinations with weights of *1* and *10* respectively:

```
policy overload redirect 192.168.1.100 weight 1 192.168.1.200 weight 10
```

ppp

Sets PPP tunneling parameters for subscribers in the current PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ppp { tunnel-context *context_name* **| tunnel-type { l2tp | l2tp-secure | none } }**

no ppp tunnel-context

no

Clears the configured tunnel context entry.

tunnel-context *context_name*

The name of the context that has a LAC service configured to handle all tunnels from this PDSN service.

tunnel-type { l2tp | l2tp-secure | none }

l2tp: Force all subscriber sessions in this PDSN service to use L2TP tunneling.
l2tp-secure: Force all subscriber sessions in this PDSN service to use L2TP tunneling and use IPSEC to ensure a secure connection.
none: Do not force L2TP tunneling. This is the default.

Important: If the context specified by the **ppp tunnel-context** *context_name* command does not have a LAC service configured and **tunnel-type** is set to **l2tp** or **l2tp-secure**, the call is rejected.

Important: If the PPP tunnel context has not been set or has been cleared with the **no ppp tunnel-context** command and **tunnel-type** is set to **l2tp** or **l2tp-secure**, the context where the current PDSN service resides is used. If that context does not have a LAC service configured the call is rejected.

Usage

Use this command to enable or disable forced L2TP tunneling for all subscribers using this PDSN service. Also use this command to define which context defines the L2TP tunneling parameters.

Example

To set the tunnel context to the context named *context1* and enable forced L2TP tunneling, use the following commands;

```
ppp tunnel-context context1ppp tunnel-type l2tp
```

To enable forced L2TP tunneling with IPSEC security, use the following commands;

```
ppp tunnel-type l2tp-secure
```

To disable forced tunneling, use the following command;

```
ppp tunnel-type none
```

To clear the setting for the tunnel context, use the following command;

```
no ppp tunnel-context
```

qos-profile-id-mapping

This command creates the customized QoS profile identifier to QoS mapping for IMS authorization support through a Ty interface at the PDSN service level.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

qos-profile-id-mapping profile-id *id_num* **{ description** *desc* **| downlink-bw** *dl_bw* **| drop-rate** *drop_percentage* **| latency** *latency_duration* **| qos-class {class-A | class-B | class-C | class-D | class-E | calss-F } uplink-bw** *ul_bw* **}+**

[default | no] qos-profile-id-mapping profile-id *id_num*

default

Configures the specified QoS profile ID for QoS mapping with default values in this PDSN service.

no

Removes the configured QoS profile ID mapping in this PDSN service.

profile-id *id_num*

Specifies the profile identifier for QoS parameters to be used as the customized profile ID or modifies the QoS parameters in a profile ID (*id_num*) coming from RAN.
id_num must be an integer between 0 and 65535.

description *desc*

Specifies the user defined description for profile identifier.
desc must be an alpha and/or numeric string between 1 and 32 characters.

downlink-bw *dl_bw*

Default: 32
Specifies the downlink (towards the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
dl_bw must be an integer value between 0 and 100000.

drop-rate *drop_percentage*

Default: 0
Specifies the permitted packet drop rate in percentage for traffic flow to this QoS profile.
drop_percentage must be an integer value between 0 and 100.

latency *latency_duration*

Default: 1000
Specifies the permitted latency duration in milli-seconds for this QoS profile.
latency_duration must be an integer value between 0 and 1000.

qos-class {class-A | class-B | class-C | class-D | class-E | class-F }

Default: Class-C
Specifies the type of QoS class associated with this QoS profile
class-A: Specifies the A type of QoS class.
class-B: Specifies the B type of QoS class.
class-C: Specifies the C type of QoS class.
class-D: Specifies the D type of QoS class.
class-E: Specifies the E type of QoS class.
class-F: Specifies the F type of QoS class.

uplink-bw *ul_bw*

Default: 32
Specifies the uplink (from the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
ul_bw must be an integer value between 0 and 100000.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to define the values associated with the profile ID on the PDSN. This profile ID is used during the mapping to and from the authorized QoS to the QoS parameters for the A10 link. This mapping is required because the PDSN only knows the profile IDs and not the actual configured values for the profile ID in the RAN. Also this configuration allows the use of custom profile IDs for the subscribers.
If no values are defined with a QoS profile ID, the values from matching QoS profile ID from RAN will be applicable to the subscriber traffic.

Example

The following command sets the downlink bandwidth to *32* kbps, latency duration as *1000* ms, uplink bandwidth to *32* kbps, and QoS class to Class-C for the QoS profile ID *11* in a PDSN service:

```
default qos-profile-id-mapping profile-id 11
```

qos update

Use this command to set QoS update parameters for policy mismatches or wait timeouts.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

qos-update [policy-mismatch | wait-timeout *seconds* **action [drop-packets | disconnect-session | downgrade-to-best-effort]]**

policy-mismatch

PDSN raises a TFT violation if there is a QoS policy mismatch.

wait-timeout action [drop-packets | disconnect-session | downgrade-to-best-effort]

Sets the wait time for A11 RRQ for QoS changes. *seconds* must be an integer from 1 through 1000.
action: configures the action on the wait-timeout

- **disconnect-session**: Drops the call if the A11 RRQ has not been received for the QoS update. This includes all of the IP flows for the session.
- **downgrade-to-best-effort**: Drops packets if the A11 RRQ has not been received for the QoS update. Sends the forward traffic over best effort (flow FF or FE if available).
- **drop-packets**: Drops packets if the A11 RRQ has not been received for the QoS update.

Usage

This command provides a PDSN service level configurable to configure an action, if the PCF ignores the QoS Update request from PDSN. It sets the amount of time to wait and the action to take, if no RRQ is received before the timeout. The action can be to drop packets for the flow, disconnect the session or to downgrade to best effort.

Example

```
qos-update policy mismatch
```

The following command sets **wait-timeout** to *60* seconds and invokes **downgrade-to-best-effort** if the A11 RRQ has not been received for the QoS update:

```
qos-update wait-timeout 60 action downgrade-to-best-effort
```

registration-accept

When the PDSN is tearing down a session and the MN moves over to a new PCF and initiates a new session, the PDSN by default does not accept the handoff until it tears down the old session. This command allows the PDSN to accept registration requests when a handoff disconnect is in progress.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

registration-accept handoff session-disconnect-in-progress

no registration-accept handoff session-disconnect-in-progress

no

Disable accepting of registration requests when a handoff disconnect is still in progress.

Usage

Use this command to allow the PDSN service to accept registration requests when a handoff disconnect is still in progress.

Example

```
registration-accept handoff session-disconnect-in-progress
```

registration-ack-deny terminate-session-on-error

Configure the PDSN service to terminate an A11 session when a Registration ACK received from the PCF has an error status.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
registration-ack-deny terminate-session-on-error

no registration-ack-deny terminate-session-on-error
```

no

Disable terminating A11 sessions on a Registration ACK error from the PCF.

Usage

Use this command to enable the PDSN service to terminate A11 sessions on a Registration ACK error from the PCF.

Example

Use the following command to enable this functionality in the PDSN:

```
registration-ack-deny terminate-session-on-error
```

registration-deny

Configures parameters related to registration rejection.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
registration-deny { handoff  connection-setup-record-absent [ use-deny-code {
poorly-formed-request | reason-unspecified } | max-deny-reply-limit num |
mismatched-coa-source-address | new-call { connection-setup-record-absent |
reverse-tunnel-unavailable } | session-already-active | session-already-closed |
session-already-dormant | terminate-session-on-error | use-zero-gre-key

no registration-deny { handoff connection-setup-record-absent | max-deny-reply-
limit | mismatched-coa-source-address | new-call { connection-setup-record-
absent | reverse-tunnel-unavailable } | session-already-active | session-
already-closed | session-already-dormant | terminate-session-on-error | use-
zero-gre-key
```

no

Disables the specified option.

handoff connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified

This command configures the handoff behavior.
connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified }: When enabled the PDSN denies or discards handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request. Default is disabled. Default PDSN behavior is to accept such requests.
[use-deny-code { poorly-formed-request | reason-unspecified }: Sets the specified Registration Deny Code when denying a handoff because of a missing connection setup record.

max-deny-reply-limit *num*

Default: 3
Configures max number of retries of erroneous registration request message from PCF for a session before PDSN terminates the session. *num* can be from 1 to 10.

mismatched-coa-source-address

Default: disabled
Denies RP requests which have a care-of-address field that is different from the request source address.

new-call { connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified } | reverse-tunnel-unavailable }

connection-setup-record-absent: Configures the PDSN to reject calls that do not have the airlink connection setup record in the RRQ.
use-deny-code { **poorly-formed-request** | **reason-unspecified** } When rejecting calls that do not have the airlink setup record, use the the specified deny code.
reverse-tunnel-unavailable: Configures the PDSN to reject calls if the GRE key for a user collides with that of another user.

session-already-active

PDSN denies Registration requests for sessions that are already active with the error code “poorly formed request” .

session-already-closed

PDSN denies RP renew and dereg requests with error code 0x8E for absent R-P sessions.

session-already-dormant

PDSN denies Registration requests for sessions that are already dormant with the error code “poorly formed request” .

terminate-session-on-error

Default: Disabled.
Configures PDSN to terminate session if erroneous registration request message is received for the session.

use-zero-gre-key

Configures the PDSN to set the GRE key to zero (0) when denying a new R-P session.

Usage

Use this command to configure parameters relating to the rejection of registration requests.

Example

To reject calls that do not have the airlink setup record in the RRQ, enter the following command:

```
registration-deny new-call connection-setup-record-absent
```

To reject calls if the GRE key collides with that of another user, enter the following command:

```
registration-deny new-call reverse-tunnel-unavailable
```

To set the GRE key to 0 (zero) when a new R-P session is denied, enter the following command:

```
registration-deny new-call use-zero-gre-key
```

registration-discard

Configures the PDSN service to discard any Registration Request message containing multiple information elements of the same type or a different GRE key for existing IMSI session.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
registration-discard { bad-extension | gre-key-change | handoff connection-
setup-record-absent }

no registration-discard { bad-extension | gre-key-change | handoff connection-
setup-record-absent }
```

no

Disables the discarding of Registration request messages containing multiple information elements or different GRE keys.

bad-extension

Default: Disabled
Configures the PDSN to discard Registration Request message containing multiple information elements of same type.

gre-key-change

Default: Disabled
Configures PDSN to discard Registration Request message containing different GRE key for existing IMSI session. Default is disable

handoff connection-setup-record-absent

Default: Disabled
When enabled, discards A11 Handoff requests that do not contain the Airlink Setup record.

Usage

Use this command to configure the PDSN service to discard and Registration Requests that contain multiple information elements of the same type or discard Registration Requests that contain GRE keys that have different GRE keys for the existing IMSI session.

Example

To configure the PDSN service to discard of Registration Requests that have multiple information elements of the same type, enter the following command:

```
registration-discard bad-extension
```

To configure the PDSN service to discard registration Requests that contain a GRE key that is different than the existing one for the existing IMSI session, enter the following command:

```
registration-discard gre-key-change
```

registration-update

Configures registration update related parameters for the PDSN.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
registration-update { pdsn-code-nvse | wait-timeout secs }

no registration-update { pdsn-code-nvse | wait-timeout secs }
```

no

If this option is used with the **pdsn-code-nvse** keyword, then pdsn-code-nvse configuration is disabled.
If this option is used with the **wait-timeout** keyword, a separate A11 timer is not used. The PDSN waits for the ppp retransmit-timeout and then sends the A11 Update. If a value is provided, then the "ppp retransmit-timeout" is ignored and a separate A11 timeout is started immediately upon sending the LCP Term-Ack. The A11 Update is then sent when the timer expires.
A value of 0 sends the A11 Update immediately after sending the LCP Term-Ack.

pdsn-code-nvse

Adds the PDSN code NVSE in all A11 registration update messages.

secs

The number of seconds to wait. *secs* must be an integer in the range from 0 through 16.

wait-timeout

After the Mobile Node terminates a PPP session between the PDSN and the Mobile Node, the PDSN service waits for the specified time period to receive an A11 RRQ from the PCF before it sends out a Registration-Update to clear the Session from the PCF.

Usage

Use this command to configure registration update related
The **wait-tiimeout** keyword configures the PDSN to wait the specified amount of time before sending out a Registration-Update to clear the Session from the PCF.

Example

Use the following command to set the registration wait-timeout to *16* seconds:

```
registration-update wait-timeout 16
```

retransmission-timeout

Configures the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout *time*

no retransmission-timeout

time

Specifies the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.
time is measured in seconds and can be configured to any integer value between 1 and 1,000,000.

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the PDSN services behavior when it does not receive a response from a particular PCF.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of *5* seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

```
no retransmission-timeout
```

sdb-indication

Configures parameters pertaining to Short Data Burst (SDB) functionality.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

sdb-indication { echo-request | server-address *ipaddress/mask* **packet-length-range min** *min_range* **max** *max_range* **}**

no sdb-indication { echo-request | server-address *ipaddress/mask* **}**

no

Disables short-databurst indication.

echo-request

Default: Disabled
Enables the inclusion of the SDB indicator in the LCP Echo Request message(s).

server-address *ipaddress/mask*

Configures the IP address of the PTT server.
ipaddress is the IP address expressed in dotted decimal notation.
mask is the number of mask bits.

packet-length-range min *min_range* **max** *max_range*

Configures the packet length associated with the specified server.
min *min_range* configures the minimum packet length as an integer value between 1 and 65535.
max *max_range* configures the maximum packet length as an integer value between 1 and 65535.

Usage

This command controls the use of Short Data Burst functionality between the PDSN, PCF, and Push-to-Talk (PTT) servers.

Important: This command is for use with a customer-specific implementation and requires a valid Short Data Burst feature-use license to be installed.

Example

The following command configures a PTT server address of 192.168.1.200 with a mask of 16, a minimum packet size of 200, and a maximum packet size of 400:

```
sdb-indication server-address 192.168.1.200/16 packet-length-range min
200 max 400
```

service-option

If the service option policy is enabled, this command specifies the service options supported by the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

service-option *number*

no service-option *number*

number

Default: 7, 15, 22, 23, 24, 25, 33, 59, 67
Specifies a specific Service Option (SO) number that this PDSN service is allowed to support.
number can be configured to any integer value between 1 and 1000.

Usage

Use the service option command in conjunction with the policy service option enforce command to configure specific SO numbers that are supported. If a particular SO number is not configured, then any subscriber session received with that SO number will be rejected and an A11 Registration Reply Code of 86 (poorly formed request) will be sent.
By default, PDSN services are configured to support the following service option numbers:

- 7: PCF specific
- 15: PCF specific
- 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
- 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
- 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
- 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
- 33: 3G High Speed Packet Data
- 59: High Rate Packet Data
- 67: RP A10 connection

Important: Option 67 is used for auxiliary connections for Rev-A calls. PPP encapsulation of data packets does not flow over this service option connection. ROHC can be performed without PPP for this service option.

Use the **no service-option** *number* command to delete a previously configured service option. If after deleting the service option setting you desire to return the service option parameter to its default setting, use the **default service-option** command.

Example

The following command enables a service option of *12*:

```
service-option 12
```

The following command disables the default service option *59* :

```
no service-option 59
```

setup-timeout

The maximum amount of time allowed for session setup.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. *seconds* must be an integer from 1 through 1000000

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

Use the following command to set the maximum time allowed for setting up a session to *300* seconds:

```
setup-timeout 300
```

simple-ip allow

This command is used to disable or re-enable SImple-IP sessions from making a connection before authorization takes place.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[no|default] simple-ip allow
```

no

When a session attempts PPP authentication, it is assumed that it is a Simple-IP session and it is disconnected before the user is authenticated (RADIUS or local authentication). Also, if **allow-noauth** is enabled and PPP authentication is not performed, after IPCP the session is disconnected if it is discovered that it is a Simple-IP session.

default

Reset this command to allow Simple-IP sessions to connect.

Usage

Use this command to prevent Simple-IP sessions from connecting to a PDSN service.

Example

The following command configures the PDSN service so that it will reject any Simple-IP sessions:

```
no simple-ip allow
```

The following command configures the PDSN service to allow Simple-IP sessions:

```
simple-ip allow
```

spi

Configures the security parameter index (SPI) between the PDSN service and the PCF. This command also configures the redirection of call based on PCF zone.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

spi remote-address { *pcf_ip_address* | *ip_addr_mask_combo* } spi-number *number* { encrypted secret *enc_secret* | secret *secret* } [description *string*] [hash-algorithm { md5 | rfc2002-md5 }] [replay-protection { nonce | timestamp }] [timestamp-tolerance *tolerance*] [zone *zone_id*]

no spi remote-address *pcf_ip_address* spi-number *number*

---

remote-address { *pcf_ip_address* | *ip_addr_mask_combo* }

pcf_ip_address: Specifies the IP address of the PCF. pcf_ip_address is an IP address expressed in IP v4 dotted decimal notation.
ip_addr_mask_combo: Specifies the IP address of the PCF and specifies the IP address network mask bits. *ip_addr_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address must either be an IPv4 address expressed in dotted decimal notation or an IPv6 address expressed in colon notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

---

spi-number *number*

Specifies the SPI (number) which indicates a security context between the PCF and the PDSN in accordance with IOS 4.1 and RFC 2002.
number can be configured to any integer value between 256 and 4294967295.

---

encrypted secret *enc_secret* | **secret** *secret*

Configures the shared-secret between the PDSN service and the PCF. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key (enc_secret) between the PCF and the PDSN service. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
secret *secret*: Specifies the shared key (secret) between the PCF and the PDSN services. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

---

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { md5 | rfc2002-md5 }

Default: md5
Specifies the hash-algorithm used between the PDSN service and the PCF.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

replay-protection { nonce | timestamp }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the PDSN service.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

zone *zone_id*

Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.
zone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.

Usage

An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.

Important: The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.

Use the **no** version of this command to delete a previously configured SPI.
This command used with **zone** *zone_id* redirects all calls on the basis of PCF zone to the specific PDSN on the basis of parameters configured at policy pcf-zone-match command.

Example

The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command deletes the configured SPI of *400* for an PCF with an IP address of *172.100.3.200*:

```
no spi remote-address 172.100.3.200 spi-number 400
```

The following command creates the configured SPI of *400* for an PCF with an IP address of *172.100.3.200* and zone id as 11:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```

spi zone

Configures the security parameter index (SPI) between the PDSN service and the PCF with mapping between a zone number to a set of PDSNs per PDSN service to redirect call on the basis of PCF zone.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

spi zone *zone_id*

no spi zone *zone_id*

zone *zone_id*

Default: 60
Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.
zone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.

Usage

An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.
This PCF zone option is used for call redirection on the basis of PCF zone. When a new call arrives the PDSN, it checks whether the PCF, from which the call arrived, belongs to a particular zone. If

Important: The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.

Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command deletes the configured SPI of *400* for an PCF with an IP address of *172.100.3.200*:

```
no spi remote-address 172.100.3.200 spi-number 400
```

threshold a11-rrp-failure

Set an alarm or alert based on the number of A11 Registration Response failures for the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rrp-failure *high_thresh* **[clear** *low_thresh* **]**

no threshold a11-rrp-failure

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of A11 Registration Response failures is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of A11 Registration Response failures based on the following rules:

- **Enter condition:** Actual number of A11 Registration Response failures > High Threshold
- **Clear condition:** Actual number of A11 Registration Response failures £ Low Threshold

Example

The following command configures a number of A11 Registration Response failures threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rrp-failure 1000 clear 500
```

threshold a11-rrq-msg-discard

Set an alarm or alert based on the number of Discarded A11 Registration Requests for the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rrq-msg-discard *high_thresh* **[clear** *low_thresh* **]**

no threshold a11-rrq-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Requests is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Requests based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Requests > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Requests £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Requests threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rrq-msg-discard 1000 clear 500
```

tft-validation wait-timeout

This command configures the TFT validation wait timeout value for QoS changes. The QoS update timer triggers automatic QoS updates based on dynamic policies.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

tft-validation wait-timeout *seconds*

no tft-validation wait-timeout *seconds*

no

Removes the wait-timeout timer.

Usage

Configures the TFT validation wait time value for A11 RRQ for QoS changes. *seconds* must be an integer from 1 through 65535.

Example

Use the following command to set the TFT validation wait-timeout to *5* seconds:

```
tft-validation wait-timeout 5
```

threshold a11-rac-msg-discard

Set an alarm or alert based on the number of Discarded A11 Registration Acknowledgements for the PDSN service.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rac-msg-discard *high_thresh* **[clear** *low_thresh* **]**

no threshold a11-rac-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Acknowledgements is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Acknowledgements based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Acknowledgements > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Acknowledgements £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Acknowledgements threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rac-msg-discard 1000 clear 500
```

threshold all-ppp-send-discard

Set an alarm or alert for the PDSN service based on the number of packets that the PPP protocol processing layer internally discarded on transmit for any reason.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold all-ppp-send-discard *high_thresh* **[clear** *low_thresh***]**

no threshold all-ppp-send-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of discarded PPP send packets is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of discarded PPP send packets is based on the following rules:

- **Enter condition:** Actual number of discarded PPP send packets > High Threshold
- **Clear condition:** Actual number of discarded PPP send packets £ Low Threshold

Example

The following command configures a number of discarded PPP send packets threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold all-ppp-send-discard 1000 clear 500
```

threshold init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for the context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold init-rrq-rcvd-rate *high_thresh* **[clear** *low_thresh* **]**

no threshold init-rrq-rcvd-rate

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold

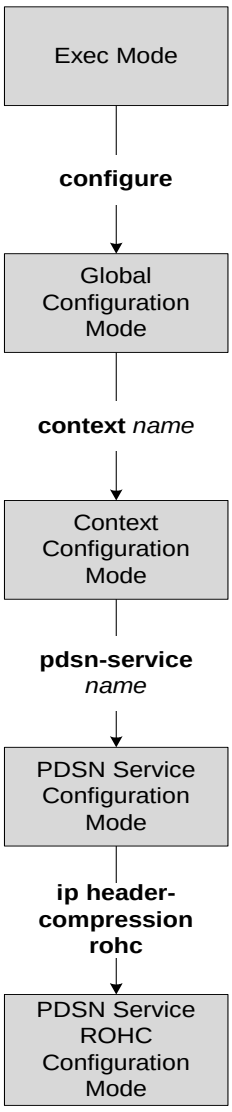
Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```

Chapter 165
PDSN Service RoHC Configuration Mode Commands

The PDSN Service RoHC Configuration Mode is used to configure RoHC (Robust Header Compression) parameters the PDSN service conveys to the PCF in the initial A11 RRP message before PPP authentication.



Important: The commands, keywords and variables in this mode are available dependent on platform type, product version, and installed license(s).

cid-mode

This command enters the RoHC Profile Compression Options Configuration mode. This mode allows you to configure options that apply during RoHC compression for the current RoHC profile.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
cid-mode { large | small } max-cid integer
default cid-mode
```

default

Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large

Use large packets with optional information for RoHC

small

This is the default packet size.
Use small RoHC packets.

max-cid *integer*

Default: 15
The highest context ID number to be used by the compressor. *integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

Usage

Use this command to set the RoHC packet size and define the maximum

Example

The following command sets large RoHC packet size and sets the maximum CID to 100:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:

```
default cid-mode
```

end

Returns the CLI prompt to the Exec mode.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits this configuration mode and returns to the PDSN Service configuration mode.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the PDSN Service configuration mode.

mrru

This command sets the size of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments. The size includes the CRC. If MRRU is negotiated to be 0, no segment headers are allowed on the channel.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mrru *num_octets*

default mrru

default

reset the value of this command to its default setting

num_octets

Default: 0
This is the number of octets for the maximum size of the largest reconstructed reception unit allowed. *num_octets* must be an integer from 0 through 65535.

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

```
mrru 1024
```

The following command resets the mrru size to its default of 0 octets:

```
default mrru
```

profile

This command specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }

default profile
```

default

Default: esp-ip rtp-udp udp-ip uncompressed-ip
This command sets the RoHC profile configuration back to its default setting.

esp-ip

This enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp

This enables RoHCProfile 0x0001 which is for RTP/UDP/IP compression

udp-ip

This enables RoHC Profile 0x0002 which is for UDP/IP compression, compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip

This enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage

Us this command to specify the RoHC header compression profiles to use.

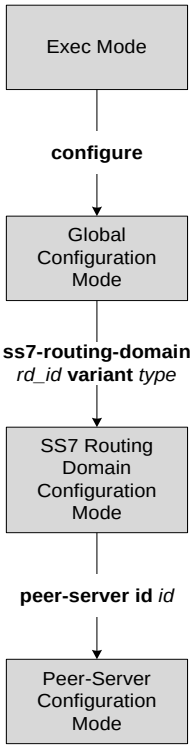
Example

The following command sets the profiles to use as esp-ip and rtp-udp:

```
profile esp-ip rtp-udp
```

Chapter 166
Peer-Server Configuration Mode Commands

The Peer-Server configuration mode provides the commands to define and manage the peer server configuration part of the SS7 routing on an SGSN.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

mode

Configures the operational mode of the peer-server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
mode ( loadshare | standby )
```

loadshare

Sets the peer-server to load share. This is the default.

standby

Sets the peer-server to be in standby mode.

Usage

Configure the operational mode of the peer-server.

Example

Configure the peer-server for standby mode.

```
mode standby
```

name

Defines the unique identification - the name - of the peer-server in the SS7 routing domain.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

name *name*

name

name must be a string of 1 to 64 alphanumeric characters to define a unique identification for the peer-server within the specific SS7 routing domain. Double quote must be used to create a name that includes spaces.

Usage

Create an easily remembered alphanumeric name for the peer-server.

Example

name "Berlin West"

psp

Creates the peer-server-process (PSP) instance and enters the PSP configuration mode. See the PSP Configuration Mode chapter in this guide for information on the configuration commands.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] psp instance id
```

id

id Uniquely identifies the specific peer-server-process configuration. The Id must be an integer from 1 to 4.

Usage

Use this command to define the peer-server-process (PSP) instance ID number for the SGSN configuration.

Example

```
psp instance 3
```

routing-context

Defines the ID of the routing context for the peer-server to use.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

routing-context *id*

id

id Uniquely identifies a specific routing context for the peer-server-process to use. The Id must be an integer from 1 to 65535.

Usage

Use this command to define routing contexts for the peer server.

Example

routing-context 15

self-point-code

This command defines the point-code to identify the SGSN as a peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point-code*

no self-point-code

point-code

Point-code is an SS7-type address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the self-point-code configuration for this linkset in the peer server.

Important: Removing the self-point-code will result in the termination of all traffic on this link.

Usage

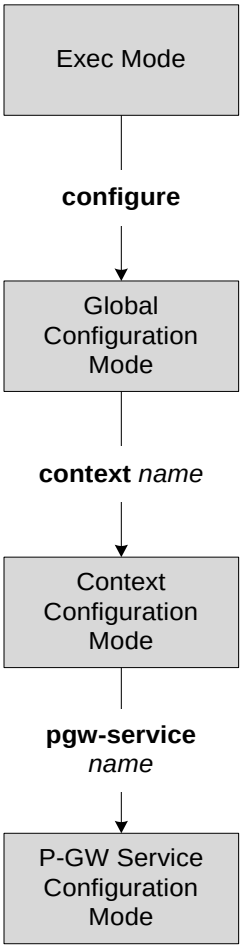
Use this command to define the point-code to identify the SGSN.

Example

self-point-code *6.192.7*

Chapter 167
P-GW Service Configuration Mode Commands

The P-GW (PDN Gateway) Service Configuration Mode is used to create and manage the relationship between specified services used for either GTP or PMIP network traffic.



associate

Associates the P-GW service with specific pre-configured services and/or policies configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

```
associate { egtp-service name [ lma-service name ] | lma-service name [ egtp-service name ] | qci-qos-mapping name }

no associate { egtp-service | lma-service | qci-qos-mapping }
```

no

Removes the selected association from this service.

{ egtp-service *name* **[lma-service** *name* **] | lma-service** *name* **[egtp-service** *name* **] }**

egtp-service *name* **[lma-service** *name* **]**: Specifies that the P-GW service is to be associated with an existing eGTP service within this context. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing eGTP service.
Configure an associated LMA service name to support handoffs between PMIPv6 and GTP. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing LMA service.
lma-service *name* **[egtp-service** *name* **]**: Specifies that the P-GW service is to be associated with an existing LMA service within this context. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing LMA service.
Configure an associated eGTP service name to support handoffs between PMIPv6 and GTP. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing eGTP service.

qci-qos-mapping *name*

Specifies that the P-GW service is to be associated with an existing QCI-QoS mapping configuration within this context. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing QCI-QoS mapping configuration.
QCI-Qos mapping is typically configured in a AAA context. Refer to the QCI-QoS Mapping Configuration Mode Commands chapter for more information.

Usage

Use this command to associate the P-GW service with other pre-configured services and/or policies configured in the same context.

Example

The following command associates this service with an eGTP service called *egtp1*:

```
associate egtp-service egtp1
```

authorize-with-hss

Identifies the function to use for subscriber authorization.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] authorize-with-hss
```

[default | no]

Resets the command to the default setting of "authorize locally" from an internal APN authorization configuration.

Usage

Use this command to specify that the system will use the S6b interface to acquire subscriber authorization from a 3GPP AAA server and the HSS.

dns-client context

Specifies the context to use where the DNS client resides to send DNS queries.

Product

P-GW

Privilege

Administrator

Syntax

dns-client context *name*

[default | no] dns-client context

default

Returns the command to the default setting of targeting the DNS client in the context where the P-GW service resides.

no

DNS query is disabled.

name

Specifies the name of the context where the DNS client is used for the resolution of PCSCF-FQDN received from S6b interface. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to specify the context where the DNS client resides to perform P-CSCF-FQDN resolution from the S6b interface.

Example

The following command identifies the *egress1* context as the context where the DNS client resides:

```
dns-client context egress1
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

fqdn

Configures a Fully Qualified Domain Name for this P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Product

P-GW

Privilege

Administrator

Syntax

fqdn host *domain_name* **realm** *realm_name*

[default | no] fqdn

default

Returns the command to the default setting of "null".

no

Remove the configured FQDN from this services configuration.

host*domain_name*

Specifies the domain name of the P-GW service. *domain_name* must be from 1 to 255 alpha and/or numeric characters.

realm*realm_name*

Specifies the realm name of the P-GW service. *realm_name* must be from 1 to 255 alpha and/or numeric characters.

Usage

Use this command to identify the P-GW service using an FQDN required when sending messages over the S6b interface to a 3GPP AAA server.

Example

The following command configures the FQDN for this P-GW service as *123abc.com* with a realm name of *all.com*:

```
fqdn host 123abc realm all.com
```

gx-li context

Configures the name of the context where lawful intercept packets are delivered to the lawful intercept server.

Product

P-GW

Privilege

Administrator

Syntax

gx-li context *name*

default gx-li context

default

Return the command to the default setting of the P-GW context (where this service resides).

name

Specifies the name of the context where the LI interface is configured for transmitting LI packets to an LI server. *name* must be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to specify the name of the context where the LI source address is configured to send packets to a LI server. By default, the P-GW context will be used.

Important: A LI source IP address and interface must be configured in the context specified by this command.

Example

The following command identifies the context to use for LI server traffic as *aaa3*:

```
gx-li context aaa3
```

newcall

Configures the P-GW to accept or reject requests for a static IP address if the address is already in use by another session.

Product

P-GW

Privilege

Administrator

Syntax

```
newcall duplicate-subscriber-requested-address { accept | reject }

no newcall duplicate-subscriber-requested-address
```

no

Returns the command to the default setting of "reject".

duplicate-subscriber-requested-address { accept | reject }

Default: reject
accept: Specifies that the old session with the requested address will be ended to accept the new session with the same address.
reject: Specifies that the new session requesting the same address will be rejected.

Usage

Use this command to configure the behavior of the P-GW service when receiving requests for static IP address already in use by other sessions.

Important: This command is only applicable to sessions using services supporting duplicate address abort. These services include HA, GGSN, and P-GW.

Example

The following command allows for the acceptance of requests for static IP addresses already in use by other sessions:

```
newcall duplicate-subscriber-requested-address accept
```

plmn id

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming, or belongs to this network.

Product

P-GW

Privilege

Administrator

Syntax

plmn id mcc *number* **mnc** *number* **[primary]**

mcc *number* **mnc** *number*

mcc *number*: Specifies the mobile country code (MCC) portion of the PLMN's identifier. *number* is the PLMN MCC identifier and must be an integer value between 100 and 999.
mnc *number*: Specifies the mobile network code (MNC) portion of the PLMN's identifier. *number* is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

primary

When multiple PLMN IDs are configured, the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute.

Usage

The PLMN identifier is used to aid the P-GW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *02*:

```
plmn id mcc 462 mnc 02
```

session-delete-delay

Configures a delay in terminating a session.

Product

P-GW

Privilege

Administrator

Syntax

session-delete-delay timeout [*msec*]

[default | no] session-delete-delay timeout

default

Resets the command to the default setting of 10000 msecs.

no

Disables the feature.

timeout *msec*

Default: 10000
Specifies the time to retain the session before terminating it. *msec* must be an integer from 1000 to 60000.

Usage

Use this command to set a delay to provide session continuity in case of break-before-make scenario.

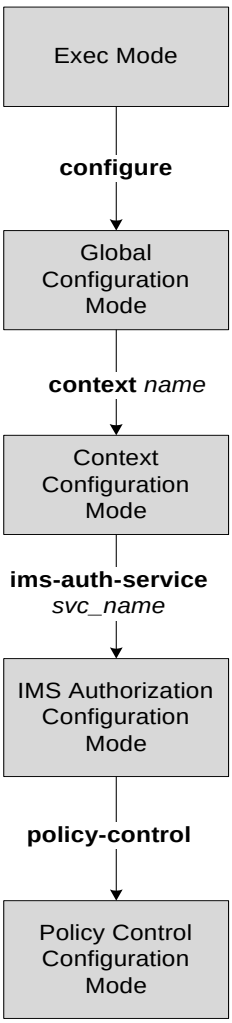
Example

The following command sets the session delete delay to the default setting of 10,000 msecs:

```
session-delete-delay timeout
```

Chapter 168
Policy Control Configuration Mode Commands

Policy Control Configuration mode is used to configure the Diameter dictionary, origin host, host table entry and host selection algorithm for IMS Authorization service.



apn-name-to-be-included

This command configures the APN name to be included in CCR Gx messages.

Product

GGSN, IPSG, PGW

Privilege

Security Administrator, Administrator

Syntax

```
apn-name-to-be-included { gn | virtual }

default apn-name-to-be-included
```

default

Applies the default setting for this command.
Default: **gn**

gn | virtual

Specifies which APN name must be sent in the Gx messages.
gn: Send the real APN name.
virtual: Send the virtual APN name if present, else send the real APN name.

Usage

Use this command to configure the APN name to be included in the CCR Gx messages to the PCRF—the real APN name or the virtual APN name.

Example

The following command configures sending the real APN name in Gx messages:

```
apn-name-to-be-included gn
```

custom-reauth-trigger

This command enables custom reauth event triggers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
custom-reauth-trigger { none | { preservation-changed | reactivation-changed } +
}

default custom-reauth-trigger
```

default

Configures the default setting for this command.

none

Disables all custom event triggers.
This is the default setting.

preservation-changed

Enables preservation-changed event trigger.

Important: This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

reactivation-changed

Enables reactivation-changed event trigger.

Important: This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

Usage

Use this command to enable/disable custom reauth event triggers.
It is recommended that the preservation-changed and reactivation-changed triggers both be enabled. As, when the bearer goes into preservation mode with the preservation-changed trigger, the reactivation-changed trigger must also be enabled for the bearer to get reactivated subsequently.
If only the preservation-changed trigger is enabled, and the bearer goes into preservation mode, the bearer will never get reactivated. The reactivation triggers will be ignored. If only the reactivation-changed trigger is enabled, reactivation of the already active bearer does not take place, and the reactivation triggers are ignored.

Example

The following command disables all custom event triggers:

```
custom-reauth-trigger none
```

diameter dictionary

Specifies the Diameter Policy Control Application dictionary for the IMS Authorization Service through Gx/Ty interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { Standard | dpca-custom1 | dpca-custom10 | dpca-custom11 |
dpca-custom12 | dpca-custom13 | dpca-custom14 | dpca-custom15 | dpca-custom16 |
dpca-custom17 | dpca-custom18 | dpca-custom19 | dpca-custom2 | dpca-custom20 |
dpca-custom3 | dpca-custom4 | dpca-custom5 | dpca-custom6 | dpca-custom7 | dpca-
custom8 | dpca-custom9 | gxa-3gpp2-standard | gxc-standard | pdsn-ty | r8-gx-
standard | std-pdsn-ty | ty-plus | ty-standard }

default diameter dictionary
```

default

Sets the Diameter dictionary to standard for Gx or Ty interface.

dpca-custom1

Custom-defined Diameter dictionary for the Gx interface.

dpca-custom2

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom3

Custom-defined Diameter dictionary for the Gx interface in conjunction with IP Services Gateway (IPSG).

dpca-custom4

Standard Diameter dictionary for 3GPP Rel. 7 Gx interface.

dpca-custom5

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom6 ... dpca-custom20

Custom-defined Diameter dictionaries.

gxa-3gpp2-standard

Gxa 3GPP2 standard dictionary.

gxc-standard

Gxc standard dictionary.

pdsn-ty

Custom-defined Diameter dictionary for Ty interface.

r8-gx-standard

R8 Gx standard dictionary.

standard

Default: Enabled for Gx support in 3GPP networks.
Standard Diameter dictionary for the 3GPP Rel. 6 Gx interface.

std-pdsn-ty

Default: Enabled for Ty support in 3GPP2 networks.
Standard Diameter dictionary for Ty interface.

ty-plus

Enhanced custom-defined Diameter dictionary for Ty interface.

ty-standard

Specifies standard Diameter dictionary for Ty attributes.

Usage

Use this command to specify the Diameter dictionary for IMS Authorization Service.

Example

The following command sets the **standard** dictionary for Diameter Policy Control functions in 3GPP network.

```
diameter dictionary standard
```

diameter host-select reselect

This command controls pacing of the reselection or switching of the PCRF after a change occurs in table configuration for an IMS Authorization Service.

Default: Disabled

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter host-select reselect subscriber-limit *subs_limit* **time-interval** *duration*

{ default | no } diameter host-select reselect

default

Applies the default setting for this command.
Sets the PCRF reselection or switching to default state.

no

Removes the configured PCRF reselection method and disables the reselection or switching of PCRF.

subscriber-limit *subs_limit*

Specifies the limit of subscribers to switch or reselect the PCRF for subscribers not more than *subs_limit* in time duration of *duration* second(s).
subs_limit must be an integer from 1 through 10000000.

time-interval *duration*

Specifies the time duration, in seconds, to reselect PCRF for subscribers not more than *subs_limit* in time duration of *duration* second(s).
duration must be an integer from 1 through 3600.

Usage

Use this command to specify the pacing of reselection or switching of the PCRF in an IMS authorization service..
In case IMS authorization session have been opened on certain PCRF on the basis of the current selection table, and the current active table configuration is changed, the IMSA starts selection procedure for the PCRF. Existing sessions on current PCRF from earlier table is required to close and reopened on the selected PCRF from the new table. This reselection periodicity is controlled by this command and it indicates the number of subscriber sessions *subs_limit* to be reselected or moved in *duration* seconds.
For example, if this command is configured with *100* subscribers and *2* seconds, then the system reselects the PCRF for no more than *100* subscribers per *2* seconds.

Example

The following command sets the system to reselect the new PCRF for no more than *1000* subscriber in *15* seconds:

```
diameter host-select reselect subscriber-limit 1000 time-interval 15
```

diameter host-select row-precedence

This command adds/appends rows with precedence to a Diameter host table or MSISDN prefix range table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter host-select row-precedence *precedence_value* **table { { { 1 | 2 } host** *host_name* **[realm** *realm_id* **] [secondary host** *host_name* **[realm** *realm_id***]] } | { prefix-table { 1 | 2 } msisdn-prefix-from** *msisdn_prefix_from* **msisdn-prefix-to** *msisdn_prefix_to* **host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **] algorithm { active-standby | round-robin }] } } [-noconfirm]**

no diameter host-select row-precedence *precedence_value* **table { { 1 | 2 } | prefix-table { 1 | 2 } }**

---

no diameter host-select row-precedence *precedence_value* **table { 1 | 2 }**

Removes the row with the specified precedence from the specified Diameter host table.

---

diameter host-select row-precedence *precedence_value* **table { 1 | 2 } host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **]]**

This command adds/appends a row in the specified Diameter host table.
In StarOS 8.0, a maximum of 16 rows can be added to a table. In StarOS 8.1 and later, a maximum of 128 rows can be added per table.
row-precedence *precedence_value*: Specifies precedence of the row in the Diameter host table.

Important: In StarOS 8.1 and later, *precedence_value* must be an integer from 1 through 128. In StarOS 8.0 and earlier, *precedence_value* must be an integer from 1 through 100.

---

table { 1 | 2 }: Specifies the Diameter host table to add/append the primary and secondary Diameter host addresses.
host *host_name*: Specifies the primary host name. *host_name* must be an alpha and/or numeric string of 1 through 127 characters in length.
realm *realm_id*: Specifies the primary realm ID. *realm_id* must be an alpha and/or numeric string of 1 through 127 characters in length.
secondary host *sec_host_name* **[realm** *sec_realm_id* **]**: Specifies the secondary host name and realm ID:
host *sec_host_name*: Specifies the secondary host name. *host_name* must be an alpha and/or numeric string of 1 through 127 characters in length.
realm *sec_realm_id*: Specifies the secondary realm ID. *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

no diameter host-select row-precedence *precedence_value* **table prefix-table { 1 | 2 } }**

Removes the row with the specified precedence from the specified MSISDN prefix range table.

diameter host-select row-precedence *precedence_value* **table prefix-table { 1 | 2 } msisdn-prefix-from** *msisdn_prefix_from* **msisdn-prefix-to** *msisdn_prefix_to* **host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **] algorithm { active-standby | round-robin }] [-noconfirm]**

Use this command to configure the MSISDN prefix range based PCRF selection mechanism for Rel. 7 Gx interface support, wherein the PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation.
This command adds a row in the specified MSISDN prefix range table. A maximum of 128 rows can be added per prefix range table.
row-precedence *precedence_value*: Specifies precedence of the row in the table.

Important: In StarOS 8.1 and later, *precedence_value* must be an integer from 1 through 128. In StarOS 8.0 and earlier, *precedence_value* must be an integer from 1 through 100.

prefix-table { 1 | 2 }: Specifies the MSISDN prefix range table to add the primary and/or secondary Diameter host addresses.
msisdn-prefix-from *msisdn_prefix_from*: For a range of MSISDNs, specifies the starting MSISDN.
msisdn-prefix-to *msisdn_prefix_to*: For a range of MSISDNs, specifies the ending MSISDN.

Important: To enable the Gx interface to connect to a specific PCRF for a range of MSISDNs/subscribers configure *msisdn_prefix_from* and *msisdn_prefix_to* with the starting and ending MSISDNs respectively. The MSISDN ranges must not overlap between rows. To enable the Gx interface to connect to a specific PCRF for a specific MSISDN/subscriber, configure both *msisdn_prefix_from* and *msisdn_prefix_to* with the same MSISDN.

host *host_name*: Specifies the primary host name. *host_name* must be an alpha and/or numeric string of 1 through 127 characters in length.
realm *realm_id*: Specifies the primary realm ID. *realm_id* must be an alpha and/or numeric string of 1 through 127 characters in length.
secondary host *sec_host_name* **[realm** *sec_realm_id* **]**: Specifies the secondary host name and realm ID: **host** *sec_host_name*: Specifies the secondary host name. *sec_host_name* must be an alpha and/or numeric string of 1 through 127 characters in length.
realm *sec_realm_id*: Specifies the secondary realm ID. *sec_realm_id* must be an alpha and/or numeric string of 1 through 127 characters in length.
algorithm { active-standby | round-robin }: Specifies the algorithm for selection between primary and secondary servers in the MSISDN prefix range table.
Default: **active-standby**
active-standby: Specifies selection of servers in the Active-Standby fashion.
round-robin: Specifies selection of servers in the Round-Robin fashion.

Important: The Round Robin algorithm for PCRF selection is effective only over a large number of PCRF selections, and not at a granular level.

-noconfirm

Specifies that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to add, update, or delete rows specified with a precedence from a Diameter host table or MSISDN prefix range table.
In the Rel. 7 Gx implementation, when the Gateway interworks with multiple PCRFs, the Gateway can configure the primary and secondary server based on the MSISDN-prefix range in the MSISDN prefix range table. Using this command, you can add a new prefix row into the MSISDN prefix table.
If a row with the precedence that you add already exists in a table, the existing prefix row is removed and the new row is inserted with the same precedence.

Example

The following command adds a row with precedence *12* in table **2** with primary host name as *star_ims1* and secondary host name as *star_ims2* to Diameter host table.

diameter host-select row-precedence *12* **table 2 host** *star_ims1* **secondary host** *star_ims2*

diameter host-select table

This command selects the Diameter host table or the MSISDN prefix range table, and the algorithm to select rows from the Diameter host table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter host-select table { { 1 | 2 } algorithm { ip-address-modulus [ prefer-
ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin } | prefix-table { 1 | 2 } }

{ default | no } diameter host-select table
```

default

Applies the default setting for this command.

no

Removes previous configuration.
When no table is selected, the system will not communicate with any PCRF for new sessions.

diameter host-select table { 1 | 2 } algorithm { ip-address-modulus | msisdn-modulus | round-robin }

table { 1 | 2 }: Specifies the Diameter host table to obtain the primary and secondary host name for PCRF.
algorithm { ip-address-modulus [prefer-ipv4 | prefer-ipv6] **| msisdn-modulus | round-robin }**: Specifies the algorithm to select the row from the Diameter host table.
Default: **round-robin**

- **ip-address-modulus** [prefer-ipv4 | prefer-ipv6]: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
- prefer-ipv4: Specifies that IPv4 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
- prefer-ipv6: Specifies that IPv6 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
- **msisdn-modulus**: This algorithm divides the MSISDN value in binary without the leading "+" of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
- **round-robin**: This algorithm rotates all rows in the active table for selection of the row in round-robin fashion. If no algorithm is specified this is the default behavior.

Important: The Round Robin algorithm is effective only over a large number of selections, and not at a granular level.

diameter host-select table prefix-table { 1 | 2 }

Specifies the MSISDN Prefix Range table to be used in case of MSISDN prefix range based PCRF discovery mechanism.

Usage

Use this command to configure the Diameter host table and row selection methods to select host name or realm for PCRF.

When this command is used to change which table the system should be using, user must re-determine which E-PDF the system should be using for each subscriber. If a different E-PDF results from the configuration change in the table, the system will wait for all of the IMS sessions for the subscriber to be no longer active and then the system either closes/opens Gx sessions with the old/new PDFs respectively, or the system deactivates the PDP contexts of the subscriber.

Here is an example of how row selection is configured for three hosts that the system will use for load-balancing. Operator can configure six rows in a table, as follows.

Modulo 6	Primary Host	Secondary Host
0	1	2
1	1	3
2	2	1
3	2	3
4	3	1
5	3	2

In the above table, the three hosts are named 1, 2, and 3. When all hosts are working, the load will be distributed among all the three hosts. If host 1 fails, then the load will be distributed between the remaining two hosts. In this scenario, the modulo 6 results of 2 and 4 will return rows that have primary hosts but no working back-up host.

In the Rel. 7 Gx implementation, the GGSN/PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation. The ip-address-modulus, msisdn-modulus, and round-robin algorithms are supported by the GGSN/PCEF for PCRF discovery. In addition, the active/standby and round-robin algorithms are used for selection between primary and secondary servers based on the MSISDN Prefix Range Table.

Example

The following command specifies **table 1** with **round-robin** algorithm to select the rows with host name for E-PDF in Diameter host table.

```
diameter host-select table 1 algorithm round-robin
```

diameter origin endpoint

This command binds the origin endpoint configured in Context Configuration mode to the IMS Authorization service for Diameter Policy Control Application (DPCA).

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *endpoint_name*

no diameter origin

no

Removes the binding of Diameter origin endpoint with IMS Authorization service.

endpoint *endpoint_name*

endpoint_name is the Diameter endpoint configured in Context Configuration Mode to bind with IMS authorization service, and must be an alpha/numeric string of 1 through 63 characters in length.

Usage

Use this command to bind a configured Diameter origin endpoint to the IMS Authorization service for DPCA. This IMS authorization service searches all system contexts until it finds one with a matching Diameter origin endpoint name specified.

Example

The following command binds a configured endpoint named test to the IMS authorization service:

diameter origin endpoint *test*

diameter request-timeout

This command configures the request-timeout setting for Diameter-IMSA Gx interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

diameter request-timeout *timeout*

default diameter request-timeout

default

Applies the default setting for this command.

timeout

Specifies the timeout period in seconds.
timeout must be an integer from 1 through 300.
Default: 10 seconds

Usage

Use this command to configure the request-timeout setting for Diameter-IMSA Gx interface.

Example

The following command configures the Diameter request-timeout setting to *20* seconds:

diameter request-timeout *20*

end

Exits the current mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

li-secret

This command configures an Lawful Intercept shared secret key value for LI session. This value needs to be the same between PCRF and PCEF for Lawful Interception to happen.

Product

MME, P-GW, S-GW

Privilege

Security Administrator, Administrator

Syntax

[no] li-secret [encrypted] key *key_value*

[no] li-secret

no

This keywords removes the configured secret key value for LI. This is the default mode.

encrypted

This keyword displays the secret value in an encrypted format and only **show configuration showsecrets** will make the secret value visible.

key *key_value*

This keyword configures a secret key value for Lawful Intercept shared secret key.
key_value must be an alphabetic and/or numeric string of size 1 to 128 characters.

Usage

Use this command to configure a **shared secret** key value with or without encryption. This value needs to be the same between PCRF and PCEF (network function srvice node) for Lawful Interception to happen. It this command is not configured, by default LI secret key will be used.
The command will display the secret value in an encrypted format and only **show configuration showsecrets** command will make the secret value visible.

Example

Following command sets the encrypted LI secret key to a value for LI session.

li-secret encrypted key*secret_key_value*

failure-handling

This command configures Diameter failure handling behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.0:

failure-handling { continue | retry-and-terminate | terminate | diameter-result-code { any-error | *result_code* } ccfh { continue | retry-and-terminate | terminate } [cc-request-type { initial-request | terminate-request | update-request }] }

no failure-handling diameter-result-code { any-error | integer *result_code* } [cc-request-type { initial-request | terminate-request | update-request }]

In StarOS 8.1 and later:

failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } { diameter-result-code { any-error | *result_code* [to *end_result_code*] } } { continue | retry-and-terminate | terminate }

no failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } [diameter-result-code { any-error | *result_code*[to *end_result_code*] }]

no

Disables previous failure-handling configuration.

continue

Specifies that in the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

retry-and-terminate

Specifies that in the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

terminate

Specifies that in the event of a failure the user session be terminated.

diameter-result-code { any-error | *result_code* [to *end_result_code*] }

Specifies failure handling behavior for any/specific result-code(s) to identify the type of failure and failure handling action for specific credit control request type.

any-error: Specifies failure handling behavior for those result-codes for which failure-handling behavior has not been specified.
result_code: Specifies a Diameter failure result code. *result_code* is the code returned for a failure handling action and must be an integer from 3000 through 4999.
to *end_result_code*: Use to specify a range of Diameter failure result codes. *end_result_code* must be an integer from 3000 through 4999, and must be greater than *result_code*.

continue | retry-and-terminate | terminate

As in StarOS 8.1 and later.
Specifies the credit control failure handling action.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

ccfh { continue | retry-and-terminate | terminate }

As in StarOS 8.0:
Specifies the credit control failure handling (CCFH) action with or without credit control request type.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

cc-request-type

As in StarOS 8.0:
This optional keyword defines the type of credit control request with failure result code and credit control failure handling action for a session.

- **any-request**: Specifies the request type as any request for a new session.
- **initial-request**: Specifies the request type as initial request for a new session.
- **terminate-request**: Specifies the request type as terminate request for a session.
- **update-request**: Specifies the request type as update request for an active session.

Usage

Use this command to configure the Diameter Policy Control Application (DPCA) failure handling behavior. When an unknown rulebase comes in CCA, changing of rulebase and failure handling is managed in the following manner:

- If the new and existing rulebases have the same CCA policy, then switch to the new rulebase is successful.
- If the new rulebase is valid and has CCA-enabled, in CCA-Initial/Update request, switch to the new rulebase is successful.

- If the new rulebase is valid and does NOT have CCA enabled, whereas the existing rulebase has credit enabled, or vice versa, in CCA-Initial/Update request:
  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
- If the new rulebase is invalid, in CCA-Initial/Update request:
  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Terminates on successful CCA-T, or terminates after successful/failed retry to secondary.
  - CCFH-TERMINATE: Terminates on successful/failed CCR-T to Primary.

The default failure handling behavior is:
failure-handling diameter-result-code any-error ccfh terminate

Example
The following command sets the DPCA failure handling to **retry-and-terminate** and return a result code of *3456* for credit control request type **initial-request**:
As in StarOS 8.0:

```
failure-handling diameter-result-code 3456 ccfh retry-and-terminate cc-request-type initial-request
```

As in StarOS 8.1 and later:

```
failure-handling cc-request-type initial-request diameter-result-code 3456 retry-and-terminate
```

reauth-trigger

This command specifies the trigger events to initiate re-authorization for a subscriber in IMS authorization service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] reauth-trigger { all | { an-gw-change | bearer-loss | bearer-
recovery | plmn-change | policy-failure | qos-change | rat-change | sgsn-change
| tft-change | tft-delete } + }
```

Default

Applies the default setting for this command.

all

Sets the IMS authorization service to initiate re-authorization process for a subscriber on all events listed in this command.

an-gw-change

Sets the IMS authorization service to initiate re-authorization process for a subscriber whose access network gateway changed.

bearer-loss

Sets the IMS authorization service to initiate re-authorization process for a subscriber on loss of bearer or service.

bearer-recovery

Sets the IMS authorization service to initiate re-authorization process for a subscriber when a bearer or service recovered after loss of bearer or service.

default-bearer-qos-change

Sets the IMS authorization service to initiate re-authorization process when QoS is changed and DEFAULT_EPS_BEARER_QOS_CHANGE event triggered for the default EPS bearer context of a subscriber in LTE network.

plmn-change

Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Public Land Mobile Network (PLMN) of subscriber.

policy-failure

Sets the IMS authorization service to initiate re-authorization process for a subscriber on failure of credit and charging policy for subscriber.

qos-change

Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Quality of Service level/rating of subscriber.

rat-change

Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Radio Access Type (RAT) of subscriber node.

sgsn-change

Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in SGSN for subscriber node.

tft-change

Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Traffic Flow Template (TFT) of subscriber session.

tft-delete

Sets the IMS authorization service to initiate re-authorization process for a subscriber when Traffic Flow Template (TFT) of subscriber session is deleted by a system administrative user.

Usage

Use this command to set the triggers to initiate QoS re-authorization process for a subscriber in IMS authorization service.

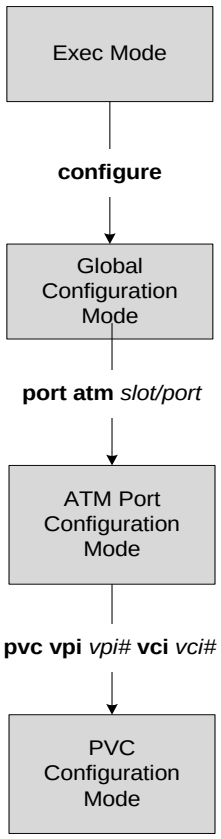
Example

Following command sets the re-authorization trigger to **bearer-loss**, so that re-authorization of subscriber session is initiated on loss of bearer.

```
reauth-trigger bearer-loss
```

Chapter 169
PVC Configuration Mode Commands

The Permanent Virtual Connection (PVC) configuration mode commands bind IP interfaces or SS7-Frame Relay links a PVC as well as configure PVC operational parameters for a specific port.



Important: The commands or keywords/variables that are available are dependent on platform type, version, and installed license(s).

bind

This command binds IP interface or SS7 link to the PVC.

Important: Prior to attempting the binding, the interface and context or the SS7 routing information and link must have been configured.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

bind { **interface** *interface_name context_name* | **link ss7-routing-domain** *rd_id* **linkset-id** *id* **link-id** *id*}

no bind { **interface***interface_name* | **link ss7-routing-domain** *rd_id* **linkset-id** *id* **link-id** *id*}

no

Removes the binding from the configuration.

interface_name

Defines the name of the virtual interface to be bound to the PVC. *interface_name* must be a unique string consisting of 1 to 79 alphanumeric characters.

context_name

Specifies the name of the context to be bound to the virtual interface. *context_name* must be a unique string consisting of 1 to 79 alphanumeric characters.

ss7-routing-domain *rd_id*

Identifies a specific SS7 routing domain. *rd_id* must be an integer from 1 to 12

linkset-id *id*

Identifies a specific linkset within the routing domain. *id*: must be an integer from 1 to 33

link-id *id*

Identifies a specific link within the linkset. *id*: must be an integer value 1 - 16

Usage

Use this command to bind the PVC to an interface or a specific link.

Example

bind ss7-routing-domain *1* **linkset-id** *23* **link-id** *2*

encapsulation aal5

Specify the data encapsulation type for the ATM adaptation layer 5 (AAL5) frames for the PVC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
encapsulation aal5 { llc-snap | vc-mux }
```

llc-snap

Frames protocol is identified in the AAL5 using logical link control (LLC) encapsulation.

vc-mux

Frames are not encapsulated and use virtual circuit multiplexing (VC-MUX) to identify the protocols used for the AAL5 frames.

Usage

Use this command to identify the protocol type for the circuit.

Example

```
encapsulation aal5 vc-mux
```

end

Exits the PVC configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the PVC configuration mode and returns to the ATM port configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the port configuration mode.

shaping

Specify the type of traffic shaping (rates) for this PVC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shaping { cbr pcr *prc_num* **| ubr pcr** *prc_num* **| ubr+ pcr** *prc_num* **mrc** *mrc_num* **| vbr pcr** *prc_num* **scr** *src_num* **mbs** *mbs_num* **}**

cbr

Constant bit rate
pcr - peak cell rate = cells per second
prc_num must be an integer from 75 to 1412830

ubr

Unspecified Bit Rate
pcr - peak cell rate = cells per second
prc_num must be an integer from 75 to 1412830

ubr+

Unspecified Bit Rate with Minimum Cell Rate.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recomment minRate is 75.
pcr - peak cell rate = cells per second
prc_num must be an integer from 75 to 1412830
mcr - minimum cell rate
mrc_num must be an integer from 75 to 1412830

vbr

Variable Bit Rate, NRT (not real time) type.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recomment minRate is 75.
pcr - peak cell rate = cells per second
prc_num must be an integer from 75 to 1412830
scr - sustained cell rate
src_num must be an integer from 75 to 1412830
mbs - maximum burst size
mbs_num must be an integer from 75 to 1412830

Usage

Use this command to configure the shaping for egress traffic on this PVC.

Example

shaping cbr pcr *56000*

shutdown

Disables/enables traffic over the current VLAN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shutdown

no shutdown

no

Enables the VLAN. When omitted the VLAN is shutdown.

Usage

Enables/ Disables specified port or card. Command action depends on mode issued from.hut down a VLAN. This command is necessary to bring a VLAN into service by enabling it via the **no** keyword.

Example

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

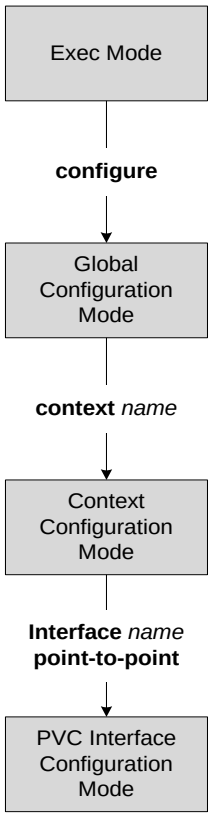
To enable a VLAN use the following command:

```
no shutdown
```

Chapter 170
PVC Interface Configuration Mode Commands

The PVC (permanent virtual connection) Interface configuration mode is used to create and manage the IP parameters for PVC interface(s) associated with an OLC (ATM-type) for a specific context.

All configuration information specified with these commands is displayed using the Exec mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Defines descriptive text to provide useful information about the current interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text: must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters, 79.

Example

description *"PVC12 connects server 1 to home office."*

end

Exits the PVC interface configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

ip

The commands in this section are used to configure the IP parameters for the PVC interface.

Important: Before configuring the OSPF parameters in this section, you need to enable OSPF using the router command and OSPF configuration sub-mode commands accessed in the Context configuration mode and documented in the Context Configuration Mode chapter of this Command Line Interface Reference.

ip access-group

This command identities the access control list (ACL to be associated with this PVC interface in this context.

Important: Prior to using this command, the access list must be created for this context with the **ip access-list** command in the Context configuration mode and then the ACL must be configured using the commands described in CLI chapter ACL Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip access-group *name* **{ in | out }**

no ip access-group *name* **{ in | out }**

no

Indicates the specified access group to be removed from the access list.

name

Specifies the access control list (ACL) rule to be added or removed from the group.
name is a string of 1 to 79 alpha and/or numeric characters with no spaces.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

in | out

in: specifies list is for in-bound access control.
out: specifies the list is for out-bound access control.

Important: Even though “in” or “out” can be specified, context-level ACL rules are automatically applied to both directions.

Usage

Use this command to add IP access lists configured for the same context to an IP access-group. The list can be configured to apply to all inbound and/or outbound traffic.

Example

The following adds ACL access-list-1 to the IP access-group associated with this PVC for this context.

```
ip access-group access-list-1 in
```

ip address

Defines the primary IP address and the network mask to be associated with this PVC interface for this context. This command can also be used to configure the secondary IP address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip address *ip_address ip_mask* **[secondary]**

no ipaddress *ip_address*

no

Removes the IP address information for this PVC from the configuration. It is not necessary to include the subnet mask with the command.
The command must first be issued with the secondary IP address if one exists and then re-issued with the primary IP address.

address *ip_address ip_mask*

Configures the IP address and the network mask for this PVC interface. The first time this command is entered, it automatically defines the primary IP address for this interface.
ip_address and *ip_mask* must be specified using the standard IPv4 or IPv6 dotted decimal notation.

secondary

secondary: Including this keyword indicates the IP address and subnet mask being defined are to be used as the secondary IP address for this PVC interface. This is referred to as multi-homing of the interface.

Usage

Configures or deletes the IPv4 or IPv6 addresses and subnet mask to be associated with this PVC.

Example

The following configures the secondary IP address to associate with the interface.

```
ip address 131.2.3.4 255.255.255.0 secondary
```

The following set of commands removes the primary IP address from the PVC interface configuration for this context.

no ip address *secondary address*

no ip address *primary address*

ip mtu

Configures the maximum transmission unit (MTU) to be supported on this interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip mtu *value*

no ip mtu

no

Disables and/or restores the option to the system default.

mtu *value*

Configures the maximum transmission unit in octets.
value: Enter an integer between 576 and 1600. Default is 1500.

Usage

Change the maximum transmission unit size to 1300.

Example

ip mtu *1300*

ip ospf authentication-key

This command configures the password or key to be used for OSPF (Open Shortest Path First) authentication with neighboring routers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospfauthentication-key [encrypted] password*auth_key*

no ip ospfauthentication-key

no

Deletes the authentication key.

encrypted

Enter this keyword if you are pasting a previously encrypted authentication key into the **password** *auth_key* for this command.

password *auth_key*

auth_key is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication key (password). This variable is entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

ip ospf authentication-key password *123abc*

Use the following command to delete the authentication key;

no ip ospf authentication-key

ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }
```

```
no ip ospf authentication-type { message-digest | null | text }
```

no

Disable this function.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```

ip ospf cost

This command configures the cost associated with sending a packet over this logical interface.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf cost *value*

no ip ospf cost

no

Disable this function.

value

Default: 10
The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

```
ip ospf cost 20
```

Use the following command to disable the cost setting;

```
no ip ospf cost
```

ip ospf dead-interval

This command configures the dead-interval and the delay time in seconds, for OSPF communications.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf dead-interval *value*

no ip ospf dead-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, that the router should wait. During this interval, if no packets are received then the system considers the neighboring router to be off-line. This interval is typically 4 times the duration of the hello-interval.
value must be an integer from 1 through 65535. Default: 40

Usage

Use this command to set the dead-intervals or delays for OSPF communications.

Example

To set the dead-interval to 100, use the following command;

ip ospf dead-interval *100*

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command'

no ip ospf dead-interval

ip ospf hello-interval

This command configures the delay time in seconds, for OSPF hello interval.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf hello-interval *value*

no ip ospf hello-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, between sending hello packets. This value is typically set to be 1/4 of the value of the **dead-interval**.
value must be an integer from 1 through 65535. Default: 10

Usage

Use this command to set the delays for the hello-interval.

Example

To set the hello-interval to 25, use the following command;

ip ospf hello-interval *25*

To delete the setting for the hello-interval and reset the hello-interval value to its default of 10, use the following command'

no ip ospf hello-interval

ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf message-digest-key *key_id* **md5** [**encrypted**] **password** *authentication_key*

no ip ospfmessage-digest-key *key_id*

no

Deletes the key.

message-digest-key key_id

Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

ip ospf message-digest-key *25* **md5 password** *123abc*

To delete the same key, enter the following command;

no ip ospf message-digest-key *25*

ip ospf network

Configures the OSPF network type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }
```

```
no ip ospf network
```

no

Disable this function.

broadcast

Sets the network type to broadcast.

non-broadcast

Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint

Sets the network type to point-to-multipoint.

point-to-point

Sets the network type to point-to-point.

Usage

Use this command to specify the OSPF network type.

Example

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```

ip ospf priority

This command designates the OSPF router priority.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf priority *value*

no ip ospf priority *value*

no

Disable this function.

value

The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

ip ospf priority *25*

To disable the priority, enter the following command:

no ip ospf priority

ip ospf retransmit-interval

This command configures the retransmit-interval and the delay time in seconds, for OSPF communications.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf dead-interval *value*

no ip ospf dead-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, between LSA (Link State Advertisement) retransmissions.
value must be an integer from 1 through 65535. Default: 5

Usage

Use this command to set the retransmit-intervals or delays for OSPF communications.

Example

To set the dead-interval to 25, use the following command;

ip ospf retransmit-interval *25*

ip ospf transmit-delay

This command configures the transmit-delay the OSPF communications parameters.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf transmit-delay *value*

no ip ospf transmit-delay

no

Deletes the value set and returns the value to its default.

transmit-delay *value*

The interval, in seconds, that the router should wait before transmitting a packet.
value must be an integer from 1 through 65535. Default: 1

Usage

Use this command to set the transmit-delay.

Example

To set the transmit delay to 5 seconds, use the following command;

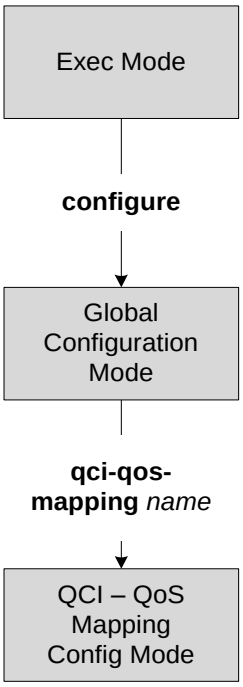
```
ip ospf transmit-delay 5
```

To delete the setting for the transmit-delay or reset the transmit-delay value to its default of 1, use the following command'

```
no ip ospf transmit-delay
```

Chapter 171
QCI - QoS Mapping Configuration Mode Commands

The QoS Class Index (QCI) to QoS Mapping Configuration Mode is used to map QoS Class Indexes to enforceable QoS parameters. Mapping can occur between the RAN and the Serving Gateway (S-GW), the Mobility Management Entity (MME), and/or the PDN Gateway (P-GW) in an LTE network or between the RAN and the eHRPD Serving Gateway (HSGW) in an eHRPD network.



end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

qci

Creates and maps QCI values to enforceable QoS parameters.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

qci *num*

[delay-class *num* **precedence-class** *num* **reliability-class** *num*

[downlink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }]**

[gbr]

[max-packet-delay *num* **max-error-rate** *num*

[non-gbr]

[uplink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }]**

[default | no] qci *num*

default

Resets the default values for the select QCI value.

no

Disables the selected QCI value.

num

Specifies the QCI value to be enabled. *num* must be an integer value between 1 and 32.
QCI values 1 through 9 are standard values. Only undefined values (10 through 32) can be defined.

Important: QCI values 1 through 9 are defined in the 3GPP Specification TS 23.203 “Policy and charging control architecture”.

delay-class *num* **precedence-class** *num* **reliability-class** *num*

delay-class *num*: Pre-release 8 value for configuring packet delay. *num* must be an integer value between 1 and 32.
precedence-class *num*: Pre-release 8 value for configuring packet precedence. *num* must be an integer value between 1 and 32.

reliability-class *num*: Pre-release 8 value for configuring packet reliability. *num* must be an integer value between 1 and 32.

---

downlink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }**

Configures parameters for downlink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datagram dscp-marking *hex*: Specifies that the UDP DSCP marking is to be defined by this keyword. *hex* must expressed as a hexadecimal value from 0x00 through 0x3F.
{ copy-inner | dscp-marking *hex* **}**

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.
- **dscp-marking** *hex*: Specifies that the DSCP marking is to be defined by this keyword. *hex* must expressed as a hexadecimal value from 0x00 through 0x3F.

gbr

Specifies that this QCI type is Guaranteed Bit Rate (GBR).

---

max-packet-delay *num* **max-error-rate** *num*

max-packet-delay *num*: Specifies the maximum packet delay in milliseconds that can be applied to the data with the QCI. *num* must be an integer value from 10 through 1000. Default is 10ms for QCI values greater than 9.
max-error-rate *num*: Specifies the maximum error loss rate of non-congestion related packet loss. *num* must be an integer value from 1 through 6 specifying 10-1 through 10-6. Default is 3 (or 10-3) for QCI values greater than 9.

Important: Defaults for QCI values less than 9 are defined in the 3GPP Specification TS 23.203 “Policy and charging control architecture”.

---

non-gbr

Specifies that this QCI type is non-Guaranteed Bit Rate (non-GBR).

---

uplink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }**

Configures parameters for uplink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datagram dscp-marking *hex*: Specifies that the UDP DSCP marking is to be defined by this keyword. *hex* must expressed as a hexadecimal value from 0x00 through 0x3F.
{ copy-inner | dscp-marking *hex* **}**

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.
- **dscp-marking** *hex*: Specifies that the DSCP marking is to be defined by this keyword. *hex* must expressed as a hexadecimal value from 0x00 through 0x3F.

Usage

Use this command to create and map QCI values to enforceable QoS parameters.

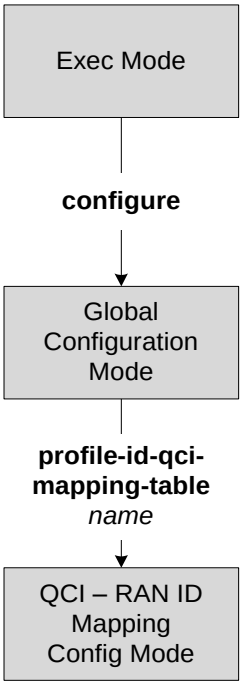
Example

The following command creates a QCI value of 15 and defines the uplink encapsulation header as using the DSCP marking from the encapsulated UDP header:

```
qci 15 uplink encaps-header copy-inner
```

Chapter 172
QCI - RAN ID Mapping Configuration Mode Commands

The QoS Class Index (QCI) Mapping Configuration Mode is used to map RAN profile IDs to QoS Class Indexes via the HRPD Serving Gateway (HSGW) in an eHRPD network.



end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

profile-id

Maps a QCI ID to a RAN profile ID and modifies data flow bit rate ranges.

Product

HSGW

Privilege

Administrator

Syntax

```
profile-id id qci num [ uplink { gbr rate [ mbr rate ] | mbr rate [ gbr rate ] }
downlink { gbr rate [ mbr rate ] | mbr rate [ gbr rate ] ]

no profile-id id
```

no

Removes the specified profile ID entry from this map.

id

Specifies the profile ID to which a QCI ID will be mapped. *id* must be an integer value from 1 to 65535.

qci *num*

Specifies the QCI number to which the profile ID will be mapped. *num* must be an integer value from 1 to 255.

uplink

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) setting that follow this keyword will be applied to the uplink data flow.

downlink

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) settings that follow this keyword will be applied to the downlink data flow.

gbr *rate*

Specifies the guaranteed bit rate for the uplink or downlink data flow. *rate* must be an integer value from 0 to 4294967295.

mbr *rate*

Specifies the maximum bit rate for the uplink or downlink data flow. *rate* must be an integer value from 0 to 4294967295.

Usage

Use this command to map a QCI ID to a RAN profile ID and, optionally, modify data flow bit rate ranges.

Example

The following command maps a QCI ID (*1*) to a profile ID (*10*) and sets the uplink guaranteed bite rate to *10000* and the downlink guaranteed bit rate to *20000*:

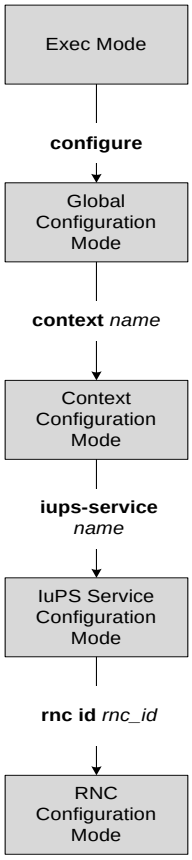
```
profile-id 10 qci 1 uplink gbr 10000 downlink gbr 20000
```

Chapter 173
Radio Network Controller (RNC) Configuration Mode Commands

The Radio Network Controller (for release 8.0) or RNC (for releases 8.1 and higher) configuration mode defines the parameters related to the SGSN connection with an RNC.

The command prompt for this mode will appear as:

```
[<context_name>]<hostname>(config-ctx-iups-service-rnc)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate-gtpu-bind-address

This command defines the GTP-U loopback address and associates (binds) this address with a particular interface (non-loopback) address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] associate-gtpu-bind-address *ip_address* **to-interface-address** *ip_address*

no

Removes the loopback address definition and interface association from the current RNC configuration.

ip_address

ip_address: Must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to setup a an association between a loopback address and a non-loopback address.

Example

associate-gtpu-bind-address *x.x.x.x* **to-interface-address** *y.y.y.y*

description

This command defines an alphanumeric string that is intended to provide descriptive information about the radio network controller (RNC). This is used for operator reference only.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current RNC configuration.

string

Specifies the alphanumeric string that is stored. must be from 1 through 255 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify an RNC.

description *"RNC1 Carrier2 Uganda"*

direct-tunnel

This command enables/disables the direct tunnel feature through the interface to the radio network controller (RNC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel not-permitted-by-rnc

default direct-tunnel
```

default

Sets the direct tunnel support on RNC to default mode; i.e. enabling direct tunnel.

not-permitted-by-rnc

Default: enabled
Disables the direct-tunnel support on radio network controller (RNC).

Usage

Use this command to disable/enable the direct-tunnel function on RNC.

Example

Following command disables the direct tunnel support on RNC:

```
direct-tunnel not-permitted-by-rnc
```

end

Exits the configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

lac

This command identifies a Local Area Concentrator (LAC) and a Remote Area Concentrator (RAC) and associates them with this RNC definition.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] lac lac_id rac rac_id
```

no

Deletes the LAC and RAC information from the system configuration.

lac_id

A unique numeric identifier for the LAC associated with the RNC.
lac_id must be an integer between 1 and 65535.

rac_id

A unique numeric identifier for the RLAC associated with the RNC.
rac_id must be an integer between 1 and 255.

Usage

Creates an association with a specific LAC and RAC.

Example

```
lac 545 rac 23
```

overload-action disable

This command maps an action to be taken if traffic reaches or exceeds defined levels.

The command can be re-entered multiple times to create definitions for each parameter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
overload-action disable { activate | attach | auth-challenge | modify-request |
paging-downlink-data | ptmsi-reallocation | service-request-data | sms }
traffic-level traffic-level

 [ no | default ] overload-action disable { activate | attach | auth-challenge |
modify-request | paging-downlink-data | ptmsi-reallocation | service-request-
data | sms }
```

no

Removes the defined overload action from configuration.

default

Resets the traffic level to the default level for the associated overload action.

activate traffic-level *traffic-level*

The system rejects new requests to activate PDP contexts if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 14

attach traffic-level *traffic-level*

The system rejects new requests for GPRS attach if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 15

auth-challenge traffic-level *traffic-level*

The system skips performing authentication challenges if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 4

modify-request *traffic-level*

The system rejects requests to modify a PDP context if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 12

paging-downlink-data traffic-level *traffic-level*

If the defined traffic-level is exceeded, then paging is not performed for data during downlinks if RABs are not available.
traffic-level: An integer 1 to 15.
Default: 11

ptmsi-reallocation traffic-level *traffic-level*

The system skips performing ptmsi-reallocation if the defined traffic-level is reached or exceeded.
traffic-level: An integer from 1 to 15.
Default: 4

service-request-data traffic-level *traffic-level*

The system rejects service requests to accept data and establish new RABs if the defined traffic-level is reached or exceeded.
traffic-level: An integer from 1 to 15.
Default: 10

sms traffic-level *traffic-level*

The system rejects SMS signaling if the defined traffic-level is reached or exceeded.
traffic-level: An integer 1 to 15.
Default: 8

Usage

Instruct the system to reject service requests to establish new RABs if the traffic level reaches 3.

Example

overload-action disable service-request-data traffic-level *3*

paging-non-searching-indication

This command instructs the SGSN to include the non-searching indicator flag in the page-request message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

paging-non-searching-indication { non-searching | searching }

[no | default] paging-non-searching-indication

no | default

This is the default. Entering no or default with this command disables the inclusion of the flag.

non-searching

Set the non-searching-indication to non-searching in the page-request message.

searching

Set the non-searching-indication to searching in the page-request message.

Usage

Use this command to determine which type of search indicator flag will be included in the page-request message.

Example

paging-non-seraching-indication non-searching

pointcode

Configures the point code of the RNC.

The access protocol that is part of the IuPS Service configuration mode must be configured prior to defining the RNC's point code.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] pointcode pt_code
```

no

Deletes the RNC's point code information from the system configuration.

pt_code

Point code in dotted-decimal format :

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- string of 1 to 11 characters

Usage

Use this command to identify the point code of the associated RNC.

Example

```
pointcode 1.234.2
```

rab-modify-procedure

This command configures how the RAB (radio access bearer) assignment procedure will be modified

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rab-modify-procedure { **normal-modify** | **release-and-establish** }

default rab-modify-procedure

default

Returns the configuration to the default setting for this command parameter.

normal-modify

Selects the normal RAB modify procedure.

release-and-establish

Instructs the system to release and establish the RAB procedure.

Usage

Set the procedure to establish the radio access bearer (RAB).

Example

rab-modify-procedure normal-modify

ranap paging-cause-ie

This command sets the paging cause value and either includes or suppresses the Paging Cause IE in responses to Paging Requests due to various sources. This command is available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ranap { **paging-cause-ie** { **all** | **background-data** [*value*] | **conversational-data** [*value*] | **gmm-signalling** [*value*] | **gs-signalling** [*value*] | **interactive-data** [*value*] | **sm-signalling** [*value*] | **sms-signalling** [*value*] | **streaming-data** [*value*] }

[**default** | **no**] **ranap** { **paging-cause-ie** { **all** | **background-data** | **conversational-data** | **gmm-signalling** | **gs-signalling** | **interactive-data** | **sm-signalling** | **sms-signalling** | **streaming-data** }

default

Resets the specific parameters value to default.

no

Suppresses the Paging Cause IE so that it is not included in responses to Paging Requests from respective sources.

all

Using **all** sets the action for the Paging Cause IE value for all paging due to all sources.

background-data [*value* **]**

Default: 3 (terminating background call)
Set the Paging Cause IE value for paging due to background data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

conversational-data [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to coversational data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gmm-signalling [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to gmm-signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gs-signalling [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to VLR Paging Request.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

interactive-data [*value*]

Default: 2 (terminating interactive call)
Set the Paging Cause IE value for paging due to interactive data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sm-signalling [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to SM signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sms-signalling [*value*]

Default: 4 (terminating low priority signaling)
Set the Paging Cause IE value for paging due to SMS signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

streaming-data [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to streaming data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

Usage

This command can be used to set the value (meaning) of the Paging Cause IE included in responses to Paging Requests or it can be used to suppress the inclusion of the Paging Cause IE in the responses. These actions can be configured for paging for all sources or for a specified source.
The following values are applicable to all Paging Cause IEs:

- **0** - Terminating conversational call
- **1** - Terminating streaming call
- **2** - Terminating interactive call
- **3** - Terminating background call
- **4** - Terminating low priority signaling
- **5** - Terminating high priority signaling

Example

Use the following command to set Paging Cause value to *3* for paging due to GMM signaling without affecting cause values for other sources:

```
ranap paging-cause-ie gmm-signalling 3
```

Use the following command to suppress the Paging Cause IE from all Paging Requests to the RNC:

```
no ranap paging-cause-ie all
```

Either of the following commands will cause the Paging Cause IE to be included in Paging Requests with the default value for SM signaling without affecting the cause for other sources:

```
ranap paging-cause-ie sm-signalling
```

```
default ranap paging-cause-ie sm-signalling
```

ranap signalling-indication-ie

This command enables/disables the inclusion of the Signaling Indication IE in either or both the RAB Assignment Request and/or the Relocation Request RANAP messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap signalling-indication-ie { rab-assignment-request [ relocation-request ] |
relocation-request [ rab-assignment-request ] }

no ranap signalling-indication-ie

default ranap signalling-indication-ie
```

no

Sets the configuration so that the SGSN never includes the IE.

default

Resets the configuration to the default - the SGSN includes the IE in the messages if preconditions are met (see Usage section).

rab-assignment-request | relocation-request

Including one or both of these keywords configures what type of RANAP message will include the IE.

Usage

The command enables the operator to determine whether the signalling indication information element is included in either or both the RAB Assignment Request and Relocation Request messages during the PDP context setup procedure.

For this command configuration to work so that the IE is included, two preconditions must be met:

- Received QoS traffic class for the context must be interactive
- Received QoS has a signalling indication value as optimized

When an RNC receives this IE, the RNC assumes that the customer is using IMS signaling and allocates massive amounts of bandwidth, potentially causing cell congestion. This command enables the operator to determine the usage of this IE which provides the operator with additional session management control.

Example

Use the following command to include the signalling indication IE in the RAB Assignment Request:

```
ranap signalling-indication-ie rab-assignment-request
```

release-compliance

This command allows the SGSN to support 3GPP release 6 HSPA or release 7 HSPA+.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
release-compliance { pre-release-7 | release-7 }

default release-compliance
```

default

Returns the configuration to the default value, which is **release-7**.

pre-release-7

Identifies 3GPP Release 6 (R6) as the release the RNC is compliant with.

release-7

Identifies 3GPP Release 7 (R7) as the release the RNC is compliant with.

Usage

Use this command to match the 3GPP release support by the RNC. As the 3GPP releases each support differing data rate options - R6 supports HSPA and R7 supports HSPA+ - then selecting the compliance is a method of preforming data rate management on a per RNC basis.

Example

Enable HSPA fallback to R6 compliance:

```
release-compliance pre-release-7
```

reset-resource

This command enables the operator to control message length by configuring the number of IuConIDs sent in each RANAP Reset Resource messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

reset-resource max-iuconid-per-msg *number*

default reset-resource max-iuconid-per-msg

default

Resets the number of Iu connection Ids included in the Reset Resource messages. Default is 250.

max-iuconid-per-msg *number*

Sets the number of Iu connection Ids to be included in the Reset Resource messages.
number: Integer from 1 to 250.
Default : 250

Usage

Id numbers for each Iu connection are included in the RANAP Reset Resource messages. Including this potentially long stream of numbers can make the message very long. With this command, the operator can control the size of the messages by controlling the number of Id messages included in the messages.

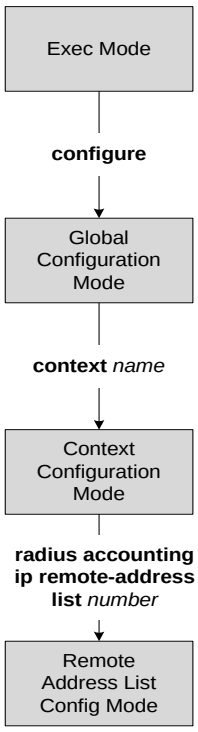
Example

Limit the number of Iu connection Ids to 30:

reset-resource max-iuconid-per-msg*30*

Chapter 174
Remote Address List Configuration Mode Commands

The Remote Address List Configuration Mode is used to configure address lists for the Remote Address-based Accounting feature on a per-context basis.



address

This command configures addresses for the Remote Address List.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

address *ip_address* **netmask** *subnet*

noaddress *ip_address* **netmask** *subnet*

no

Removes a previously configured address.

address *ip_address*

Specifies the IP address of the remote device.
ip_address is the IPv4 address expressed in dotted-decimal notation.

netmask *subnet*

Specifies the subnet mask of the remote device.
subnet is the netmask expressed in dotted-decimal notation.

Usage

Use this command to configure remote address lists for use with the Remote Address-based accounting feature. A maximum of 10 address can be configured per list.

Example

The following command adds an IP address of *192.168.100.1* with a subnet mask of *255.255.255.0* to the list:

address *192.168.100.1* **netmask** *255.255.255.0*

end

This command exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

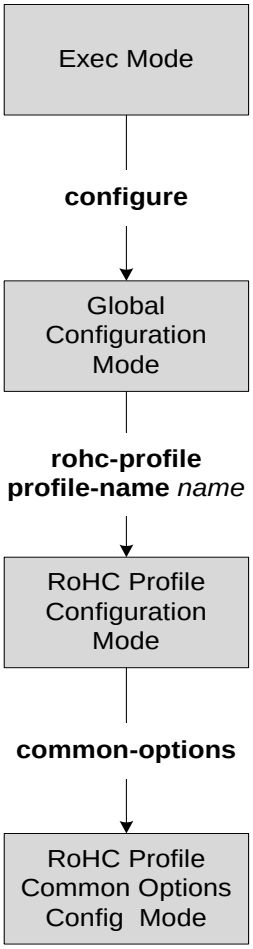
exit

Usage

Use this command to return to the parent configuration mode.

Chapter 175
RoHC Profile Common Options Configuration Mode Commands

The RoHC Profile Common Options Configuration Mode is used to set timers that, upon expiration, release header compression contexts.



delay-release-hc-context-timer

Sets a delay in releasing RoHC contexts allowing for context continuation during intra-gateway handoffs.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

delay-release-hc-context-timer *seconds*

no delay-release-hc-context-timer

no

Removes previously configured value for this command. No value disables the feature.

seconds

Specifies the number of seconds the system delays before releasing the header compression context. *seconds* must be an integer value from 0 to 65535.

Usage

Use this command to set a delay in releasing a header compression context. THis command is necessary when employing RoHC and mobility. Typically, when an RP connection is released, the header compression context is also released immediately. However, in mobility situations, such as intra-PDSN handoffs, the header compression context should be preserved. Adding a delay to cover the handoff time allows the context to be maintained.
A header compression context contains the compression/decompression configuration and statistics for the session.

Example

The following command sets the header compression release delay to 20 seconds:

```
delay-release-hc-context-timer 20
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

inactive-traffic-release-hc-context-timer

Set an inactivity timer that is checked when inactivity is detected on an SO67 A10 bearer connection with negotiated RoHC parameters. If the inactivity continues to the end of the configured time, the header compression context is released.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

inactive-traffic-release-hc-context-timer *seconds*

no inactive-traffic-release-hc-context-timer

no

Removes previously configured value for this command. No value disables the feature.

seconds

Specifies the time, in seconds, the system waits for activity on the bearer channel before releasing the header compression context. *seconds* must be an integer value from 1 to 65535.

Usage

Use this command to set a timer that is started upon detecting inactivity on the bearer channel. Upon expiry, the header compression context is released. Enable this feature to allow for efficient memory utilization.

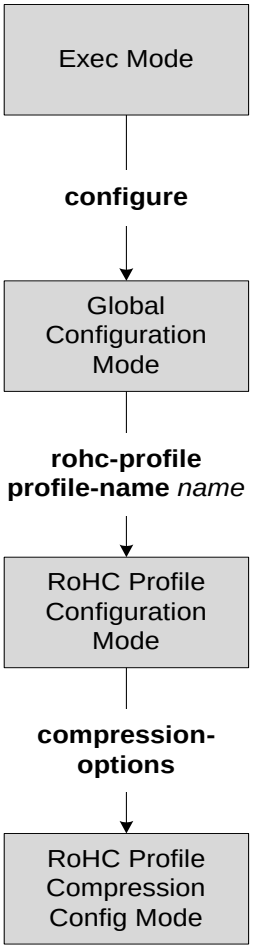
Example

The following command sets the bearer channel inactivity timer to 60 seconds:

```
inactive-traffic-release-hc-context-timer 60
```

Chapter 176
RoHC Profile Compression Configuration Mode Commands

The RoHC Profile Compression Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor parameters. RoHC is not supported on GGSN.



Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).

context-timeout

Context timeout in seconds.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

context-timeout *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Default: 20 seconds
The context timeout value in seconds. *seconds* must be an integer from 0 through 100.

Usage

Use this command to set the context timeout.

Example

The following command sets the context timeout to 10 seconds:

context-timeout-period *10*

end

Returns the CLI prompt to the Exec mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits this configuration mode and returns to the previous mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ipid-history-size

The number of IP-IDs of previously sent packets to store. An IP ID is a 16-bit header field that stores IPv4 Identification information.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

ipid-history-size *number*

default ipid-history-size

default

Returns the command to its default value.

number

Default: 8
The number of IP IDs to store. *number* must be an integer from 1 through 32.

Usage

Use this command to set the number of IP IDs to store in the history.

Example

The following command sets the history size to 24 IP-IDs:

```
ipid-history-size 24
```

max-jitter-cd

The upper boundary of jitter expected on the communication channel between the compressor and decompressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

max-jitter-cd *num_ms*

default max-jitter-cd

default

Returns the command to its default value.

num_ms

Default: 150
The number of milliseconds for the maximum jitter setting. *num_ms* must be an integer from 0 through 999999999.

Usage

Use this command to set the maximum amount of jitter allowed on the communication channel between compressor and decompressor.

Example

The following command sets the jitter limit to 1000ms (1 second):

```
max-jitter-cd 1000
```

max-sliding-window

The width of the sliding window for W-LSB (Windows-based Least Significant Bits) encoded values.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

max-sliding-window *size*

default max-sliding-window

default

Returns the command to its default value.

size

Default: 6
Set the size of the sliding window. *size* must be an integer from 1 through 1000.

Usage

Use this command to set the size of the sliding window used to compute jitter for W-LSB encoded values.

Example

The following command sets the sliding window size to 500:

```
max-sliding-window 500
```

multiple-ts-stride

Enables or disables the use of repeated transmission of RTS_STRIDE for timer-based compression.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ no ] multiple-ts-stride
```

no

Disables the use of repeated transmission of RTS_STRIDE for time-based compression.

multiple-ts-stride

Enables the repeated transmission of RTS_STRIDE for timer-based compression.

Usage

Use this command to enable or disable a gateway's ability to repeatedly transmit RTS_STRIDE for timer-based compression.

new-context-blocking-time

Time period in seconds for blocking the establishment of new contexts after the compressor has received a feedback reject.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

new-context-blocking-time *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Default: 20 seconds
The context blocking time in seconds. *seconds* must be an integer from 0 through 100.

Usage

Use this command to set the context blocking time after the compressor has received a feedback reject.

Example

The following command sets the context blocking time to 10 seconds:

```
new-context-blocking-time 10
```

num-pkts-ts

The number packets per RTP timestamp (TS).

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-pkts-ts *num_pkts*

default num-pkts-ts

default

Returns the command to its default value.

num_pkts

Default: 6
The number of packets for the timestamp. *num_pkts* must be an integer from 0 through 999.

Usage

Use this command to set the number of packets for each RTP timestamp (TS).

Example

The following command sets the number of packets per timestamp to 50:

```
num-pkts-ts 50
```

num-pkts-u-mode

The number packets sent when operating in U-Mode (unidirectional mode).

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-pkts-u-mode *num_pkts*

default num-pkts-u-mode

default

Returns the command to its default value.

num_pkts

Default: 1
The number of packets sent in U-Mode. *num_pkts* must be an integer from 0 through 999.

Usage

Use this command to set the number of packets sent when in U-Mode.

Example

The following command sets the number of packets for U-Mode to 50:

```
num-pkts-u-mode 50
```

num-updates-ir

This command configures the number of IR (Initiation and Refresh state) updates.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-updates-ir *num_pkts*

default num-updates-ir

default

Returns the command to its default value.

num_pkts

Default: 4
The number of packets sent in U-Mode. *num_pkts* must be an integer from 0 through 999.

Usage

Use this command to set the number of packets sent when in U-Mode.

Example

The following command sets the number of packets for U-Mode to 50:

```
num-updates-ir 50
```

optimistic-repeats

For transition from the FO (First Order) to the SO (Second Order) state, the compressor should be confident that the decompressor has all the parameters needed to decompress according to a fixed pattern.The compressor obtains its confidence about decompressor status by sending several packets with the same information according to the lower compression state. If the decompressor receives any of these packets, it is in sync with the compressor. This command defines the number of repeated packets to send to the decompressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

optimistic-repeats *num_pkts*

default optimistic-repeats

default

Returns the command to its default value.

num_pkts

Default: 6
The number of packets to repeat with the same information to assure synchronization with the decompressor. *num_pkts* must be an integer from 0 through 10.

Usage

Use this command to set the number of packets to repeat to the decompressor to assure synchronization before transition states.

Example

The following command sets the number of repeated packets to 5:

```
optimistic-repeats 5
```

rtp-sn-p

The value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

f(v_ref, k). Let f(v_ref, k) = [v_ref - p, v_ref + (2^k - 1) - p]

Where p is an integer.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p *p_value*

default rtp-sn-p

default

Returns the command to its default value.

p_value

Default: 6
The number to use for the value of p in the RTP SN calculation. *p_value* must be an integer from 0 through 999.

Usage

Use this command to set the value to use for p when performing the RTP SN calculation.

Example

The following command sets the value of p to 100:

```
rtp-sn-p 100
```

rtp-sn-p-override

Allow an override of p in RTP SN calculation. This is disabled by default.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] rtp-sn-p-override
```

default

Returns the command to its default value of disabled.

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to enable an override of p in RTP SN calculation.

Example

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```

rtp-time-stride

This command sets the time interval used for one TS (RTP Time Stamp) stride. This is used when timer-based encoding is enabled.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-time-stride *num_ms*

default rtp-time-stride

default

Returns the command to its default value.

num_ms

Default: 20
The number of milliseconds to to use for TS_STRIDE. *num_ms* must be an integer from 0 through 999999999.

Usage

Use this command to set the length of the TS_STRIDE in milliseconds.

Example

The following command sets TS_STRIDE to 100ms:

```
rtp-time-stride 100
```

rtp-ts-deviation

This command sets the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-ts-deviation *percentage*

default rtp-ts-deviation *percentage*

default

Returns the command to its default value.

percentage

Default: 25
Specifies the maximum percentage of deviation allowed for input RTP packets for timer-based compression. *percentage* must be an integer value from 0 through 100.

Usage

Use this command to set the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Example

The following command sets the time increment to 1000:

```
rtp-ts-deviation 25
```

rtp-ts-stride

Amount by which TS (RTP time stamp) is incremented. This is used for Scaled RTP TS encoding.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-ts-stride *num_ms*

default rtp-ts-stride

default

Returns the command to its default value.

num_ms

Default: 160
The number of milliseconds to to use incrementing TS. *num_ms* must be an integer from 0 through 999999999.

Usage

Use this command to set the amount by which TS is incremented for Scaled RTP TS encoding.

Example

The following command sets amount by which TS is incremented to 100ms:

```
rtp-ts-stride 100
```

sliding-window-ts

DescriptionThe sliding window used to compute jitter.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

sliding-window-ts *size*

default sliding-window-ts

default

Returns the command to its default value.

size

Default: 4
Set the size of the sliding window. *size* must be an integer from 1 through 1000.

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```

total-jitter-ipv4

The total jitter experienced after compression for IPV4.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

total-jitter-ipv4 *time*

default total-jitter-ipv4

default

Returns the command to its default value.

time

Default: 270
Specifies the time interval to use in milliseconds. *time* must be an integer from 0 through 999999999.

Usage

Use this command to set the jitter limit after compression.

Example

The following command sets the jitter after compression limit to 900ms:

```
total-jitter-ipv4 900
```

total-jitter-ipv6

The total jitter experienced after compression for IPV6.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

total-jitter-ipv6 *time*

default total-jitter-ipv6

default

Returns the command to its default value.

time

Default: 580
Specifies the time interval to use in milliseconds. *time* must be an integer from 0 through 999999999.

Usage

Use this command to set the jitter limit after compression.

Example

The following command sets the jitter after compression limit to 900 ms:

```
total-jitter-ipv6 900
```

unimode-timeout-to-fo-state

The time period in seconds before falling back to the FO (First Order) state.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

unimode-timeout-to-fo-state *num_ms*

default unimode-timeout-to-fo-state

default

Returns the command to its default value.

num_ms

Default: 3
Timeout period in seconds. *num_ms* must be an integer from 0 through 10.

Usage

Use this command to set the timeout before falling back to the FO state when in Unimode.

Example

The following command sets the fall back timeout to 3 seconds:

```
unimode-timeout-to-fo-state 3
```

unimode-timeout-to-ir-state

The time period in seconds before falling back to the IR (Initiation and Refresh) state.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

unimode-timeout-to-ir-state *num_ms*

default unimode-timeout-to-ir-state

default

Returns the command to its default value.

num_ms

Default: 5
Timeout period in seconds. *num_ms* must be an integer from 0 through 20.

Usage

Use this command to set the timeout before falling back to the IR state when in Unimode.

Example

The following command sets the fall back timeout to 3 seconds:

```
unimode-timeout-to-ir-state 3
```

use-calculated-rtp-time-stride

This command overrides the configured value of rtp-time-stride with a calculated value.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-calculated-rtp-time-stride
```

default

Returns the command to its default value of enabled.

no

Disables the use of calculated RTP time stride override.

Usage

This command overrides the configured value of rtp-time-stride with a calculated value.

Example

The following command overrides the configured value of rtp-time-stride.

```
use-calculated-rtp-time-stride
```

use-calculated-rtp-ts-stride

This command overrides the configured value of rtp-ts-stride with a calculated value.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-calculated-rtp-ts-stride
```

default

Returns the command to its default value of enabled.

no

Disables the use of calculated RTP TS time stride override.

Usage

This command overrides the configured value of rtp-ts-stride with a calculated value.

Example

The following command overrides the configured value of rtp-ts-stride.

```
use-calculated-rtp-ts-stride
```

use-ipid-override

Enable and disable overriding the IP-ID (IPv4 Identification header field).

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-ipid-override
```

default

Returns the command to its default value of disabled.

no

Disables the IP-ID override.

Usage

Use this command to enable overriding the IP-ID.

Example

The following command enables the IP-ID override feature:

```
use-ipid-override
```

The following command disables the IP-ID override feature:

```
no use-ipid-override
```

The following command also disables the IP-ID override feature:

```
default use-ipid-override
```

use-optimized-talkspurt

Disable and enable the use of optimized talkspurt.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-optimized-talkspurt
```

default

Returns the command to its default value of enabled.

no

Disable the use of optimized talkspurt.

Usage

Use this command to enable and disable the use of optimized talkspurt

Example

The following command enables the use of optimized talkspurt:

```
use-optimized-talkspurt
```

The following command disables the use of optimized talkspurt:

```
no use-optimized-talkspurt
```

use-optimized-transience

Enable or disable the use of optimized transience.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-optimized-transience
```

default

Returns the command to its default value of enabled.

no

Disables the use of optimized transience.

Usage

Use this command to enable or disable the use of optimized transience.

Example

The following command enables the use of optimized transience.

```
use-optimized-transience
```

The following command disables the use of optimized transience.

```
no use-optimized-transience
```

use-timer-based-compression

Enables timer-based compression of the RTP time stamp (TS) at the compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-timer-based-compression
```

default

Returns the command to its default value of enabled.

no

Disables the use of timer-based compression.

Usage

Use this command to enable or disable the use of timer-based compression.

Example

The following command enables the use of timer-based compression.

```
use-timer-based-compression
```

The following command disables the use of timer-based compression.

```
no use-timer-based-compression
```

use-uncomp-profile

Uses the Uncompressed Profile (0x0000) if required at the compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

[default | no] useS-uncomp-profile

default

Returns the command to its default value of disabled.

no

Disables the use of the Uncompressed Profile.

Usage

Use this command to enable or disable the use of the Uncompressed Profile.

Example

The following command enables the use of the Uncompressed Profile.

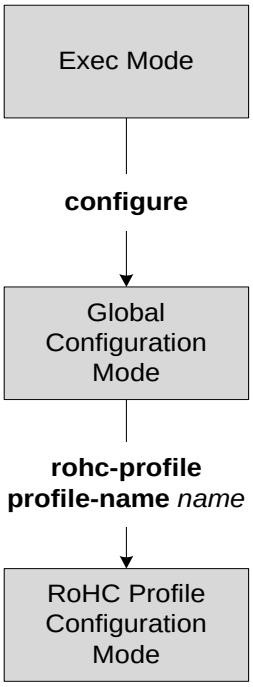
```
use-uncomp-profile
```

The following command disables the use of the Uncompressed Profile.

```
no use-uncomp-profile
```

Chapter 177
RoHC Profile Configuration Mode Commands

The RoHC Profile Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor and Decompressor parameters. The profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured. RoHC is not supported on GGSN.



Important: The availability of commands, keywords and variables in this mode is dependent on platform type, product version, and installed license(s).

common-options

Enters the RoHC Profile Common Options Configuration Mode where inactivity and delay timers are set to support dynamic header compression contexts and context preservation during handoffs.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] common-options
```

default

Reset all parameters in the RoHC Profile Common Options Configuration Mode to default values.

Usage

Use this command to enter the RoHC Profile Common Options Configuration Mode where parameters for maintaining header compression contexts and inactivity timers can be configured.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-common)#
RoHC Profile Common Options Configuration Mode commands are defined in the RoHC Profile Common Options Configuration Mode Commands chapter.

compression-options

Enters the RoHC Profile Compression Options Configuration Mode allowing configuration of options applied during RoHC compression for the current RoHC profile.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] compression-options
```

default

Reset all options in the RoHC Profile Compression Configuration Mode to their default values.

Usage

Use this command to enter RoHC Profile Compression Configuration Mode to set the compression options that are used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-comp)#
RoHC Profile Compression Options Configuration Mode commands are defined in the RoHC Profile Compression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Compression Options Configuration Mode:

```
compression-options
```

The following command sets all compression options to their default values:

```
default compression-options
```

decompression-options

Enters the RoHC Profile Decompression Options Configuration Mode allowing configuration of options applied during RoHC decompression for the current RoHC profile.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[default ] decompression-options
```

default

Reset all options in the RoHC Profile Decompression Options Configuration Mode to their default values.

Usage

Use this command to enter RoHC Profile Decompression Options Configuration Mode to set the decompression options used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-decomp)#
RoHC Profile Decompression Options Configuration Mode commands are defined in the RoHC Profile Decompression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Decompression Options Configuration Mode:

```
decompression-options
```

The following command sets all decompression options to their default values:

```
default decompression-options
```

end

Returns the CLI prompt to to the Exec mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits this configuration mode and returns to the previous mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

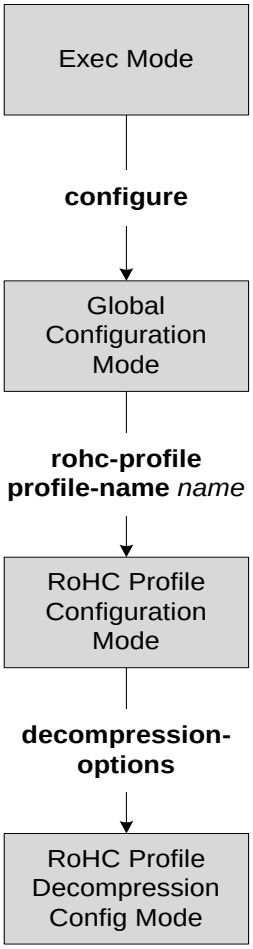
```
exit
```

Usage

Return to the previous mode.

Chapter 178
RoHC Profile Decompression Configuration Mode Commands

The RoHC Profile Decompression Configuration Mode is used to configure RoHC (Robust Header Compression) Decompressor parameters.



Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).

accept-delayed-pkts

Accepts delayed packets

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] accept-delayed-pkts
```

default

Returns the command to its default value of disabled.

Usage

This command helps reduce packet loss during context repair.

Example

Use the following command to enable the system to accept delayed packets:

```
accept-delayed-pkts
```

context-timeout

Ensures that no expired contexts are used for data compression.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

context-timeout *seconds*

default] context-timeout

default

Returns the command to its default value.

seconds

Default: 20 seconds
The context timeout value in seconds. *seconds* must be an integer from 0 through 100.

Usage

The RoHC stack should periodically clean up expired contexts and release memory in case there is no data activity for the call on this context. The context cleanup period is internally calculated to be set to half of the value of the *context-timeout* value. This will ensure that no expired contexts are used for data compression.

Example

The following command sets the context-timeout parameter to 30 seconds:

context-timeout *30*

crc-errors-fo

This command sets the limits for when a NACK message is sent when in the FO (First Order) state. A NACK is sent when out of a specified number of packets a specified number of them have CRC errors.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

crc-errors-fo-k *num_errors*

crc-errors-fo-n *num_packts*

default crc-errors-fo-k

default crc-errors-fo-n

default

Returns the command to its default value.

crc-errors-fo-k *num_errors*

Default: 1
The number of received packets within a specified number of received packets that triggers the sending of a NACK. *num_errors* must be an integer from 1 through 10.

Important: *num_errors* must be less than or equal to the value specified with the crc-errors-fo-n command.

crc-errors-fo-n *num_packts*

Default: 1
The number of packets to check for CRC errors. *num_packts* must be an integer from 1 through 10.

Usage

Use this command to set the parameters that trigger sending a NACK message when in the FO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the FO state, use the following commands:

```
crc-errors-fo-k 4crc-errors-fo-n 10
```

crc-errors-so

This command sets the limits for when a NACK message is sent when in the SO (Second Order) state. A NACK is sent when out of a specified number of packets a specified number of them have CRC errors.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

crc-errors-so-k *num_errors*

crc-errors-so-n *num_packets*

default crc-errors-so-k

default crc-errors-so-n

default

Returns the command to its default value.

crc-errors-so-k *num_errors*

Default: 1
The number of received packets within a specified number of received packets that triggers the sending of a NACK. *num_errors* must be an integer from 0 through 10.

Important: *num_errors* must be less than or equal to the value specified with the crc-errors-so-n command.

crc-errors-so-n *num_packets*

Default: 1
The number of packets to check for CRC errors. *num_packets* must be an integer from 1 through 10.

Usage

Use this command to set the parameters that trigger sending a NACK message when in the SO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the SO state, use the following commands:

```
crc-errors-so-k 4crc-errors-so-n 10
```

end

Returns the CLI prompt to to the Exec mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the this configuration mode and returns to the previous mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

nack-limit

Sets the number of unsuccessful decompressions allowed before a NACK is sent.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

nack-limit *limit*

default nack-limit

default

Returns the command to its default value.

limit

Default: 0
Specifies the number of unsuccessful decompressions allowed. *limit* must be an integer from 0 through 20.

Usage

Use this command to set the maximum number of unsuccessful decompressions before a NACK message is sent.

Example

The following command sets the number of unsuccessful decompressions allowed to 10:

```
nack-limit 10
```

optimistic-mode-ack

When this is enabled, if a type 2 IR-DYN packet is successfully decompressed, an optional ACK is sent in U-mode.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

[default | no] optimistic-mode-ack

default

Returns the command to its default value of enabled.

no

Disables the sending of the optional ACK.

Usage

Use this command to enable and disable the sending of an optional ACK in U-mode when a type 2 IR-DYN packet is successfully decompressed.

Example

To enable the sending of the optional ACK, enter the following command:

```
optimistic-mode-ack
```

To disable the sending of the optional ACK, enter the following command:

```
no optimistic-mode-ack
```

optimistic-mode-ack-limit

When enabled, this command sets the number of packets to send ACKs for.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

optimistic-mode-ack-limit *num_pkts*

default optimistic-mode-ack-limit

default

Returns the command to its default value.

num_pkts

Default: 3
The number of packets to send ACKs for . *num_pkts*must be an integer from 0 through 20.

Usage

Use this command to set the number of packets to send the optional ACK for when a type 2 IR-DYN packet is successfully decompressed.

Example

Enter the following command to set the number of packets to send and ACK for to 6:

```
optimistic-mode-ack-limit 6
```

Use the following command to set the number of packets to send an ACK for back to the default of 3:

```
default optimistic-mode-ack-limit
```

piggyback-wait-time

The time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

piggyback-wait-time *m_secs*

default piggyback-wait-time

default

Returns the command to its default value.

m_secs

Default: 80ms
Specifies the time in milliseconds to wait for a feedback packet to be picked up. *m_secs* must be an integer value from 0 through 1000.

Usage

Use this command to set the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Example

The following command sets the wait time to 120 ms:

```
piggyback-wait-time 120
```

preferred-feedback-mode

Specifies the preferred feedback mode to use between the compressor and the decompressor

Product

HSGW, PDSN

Privilege

Administrator

Syntax

preferred-feedback-mode { bidirectional-optimistic | bidirectional-reliable | unidirectional }

default preferred-feedback-mode

default

Default: bidirectional-optimistic
Returns the command to its default setting.

bidirectional-optimistic

This mode is similar to the Unidirectional mode, with the exception of a feedback channel used to send error recovery requests from the decompressor to compressor.

bidirectional-reliable

Reliable mode makes extensive use of a feedback channel to avoid packet loss from context invalidation. A secure reference model is used instead of the optimistic approach used in the other modes. With the secure reference model, the confidence of the compressor depends on acknowledgements from the decompressor for every context updating packet.
Periodically the compressor sends context updating packets repeatedly until an acknowledgement is received from the decompressor.

unidirectional

Packets are sent in only one direction, from the compressor to the decompressor.

Usage

Use this command to specify the preferred feedback method to use between the compressor and the decompressor for the current RoHC profile.

Example

Use the following command to set the preferred feedback mode to bidirectional-reliable:

```
preferred-feedback-mode bidirectional-reliable
```

rtp-sn-p

The value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

f(v_ref, k). Let f(v_ref, k) = [v_ref - p, v_ref + (2^k - 1) - p]

Where p is an integer.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p *value*

default rtp-sn-p

default

Returns the command to its default value.

value

Default:
Specifies the number to use for the value of p in the RTP SN calculation. *value* must be an integer from 0 through 999.

Usage

Use this command to set the value to use for p when performing the RTP SN calculation.

Example

The following command sets the RTP Sequence Number integer “p” value to 100:

```
rtp-sn-p 100
```

rtp-sn-p-override

Allow an override of p in RTP SN calculation. This is disabled by default.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] rtp-sn-p-override
```

default

Returns the command to its default value of disabled.

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to allow an override of p in RTP SN calculations.

Example

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```

sliding-window-ts

Computes jitter as described in RFC 3095,[4.5.4]

Product

HSGW, PDSN

Privilege

Administrator

Syntax

sliding-window-ts *size*

default sliding-window-ts

default

Returns the command to its default value.

size

Default: 4
Set the size of the sliding window. *size* must be an integer from 1 through 1000.

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```

use-clock-option

Controls usage of RoHC clock option. The clock option informs the compressor of the clock resolution of the decompressor. This is needed to allow the compressor to estimate the jitter introduced by the clock of the decompressor when doing timer-based compression of the RTP timestamp.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-clock-option
```

default

Returns the command to its default value of enabled.

no

Disable use of the RoHC clock option.

Usage

Use this command to enable and disable the use of the RoHC clock option.

Example

The following command enables RoHC clock option usage:

```
use-clock-option
```

The following command disables RoHC clock option usage:

```
no use-clock-option
```

use-crc-option

Controls usage of the RoHC crc option. The CRC option contains an 8-bit CRC computed over the entire feedback payload, without the packet type and code octet, but including any CID fields,

Product

HSGW, PDSN

Product

Administrator

Syntax

`[ default | no ] use-crc-option`

`default`

Returns the command to its default value of enabled.

`no`

Disable use of the CRC option.

Usage

Use this command to enable and disable the use of the RoHC CRC option.

Example

The following command enables RoHC CRC option usage:

```
use-crc-option
```

The following command disables RoHC CRC option usage:

```
no use-crc-option
```

use-feedback

Controls use of the feedback channel. A feedback channel sends error recovery requests and (optionally) acknowledgments of significant context updates from the decompressor to the compressor.

Product

HSGW, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] use-feedback
```

default

Returns the command to its default value of disabled.

no

Disable use of the feedback channel.

Usage

Use this command to enable and disable the use of the RoHC feedback channel.

Example

The following command enables RoHC feedback channel usage:

```
use-feedback
```

The following command disables RoHC feedback channel usage:

```
no use-feedback
```

use-jitter-option

Controls usage of RoHC jitter option. The jitter option allows the decompressor to report the maximum jitter it has observed

Product

HSGW, PDSN

Privilege

Administrator

Syntax

[default | no] use-jitter-option

default

Returns the command to its default value of enabled.

no

Disable use of the jitter option.

Usage

Use this command to enable and disable the use of the RoHC jitter option.

Example

The following command enables RoHC jitter option usage:

```
use-jitter-option
```

The following command disables RoHC jitter option usage:

```
no use-jitter-option
```

use-reject-option

Controls usage of RoHC reject option. The reject option informs the compressor that the decompressor does not have sufficient resources to handle the flow.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-reject-option
```

default

Returns the command to its default value of disabled.

no

Disable use of the reject option.

Usage

Use this command to enable and disable the use of the RoHC reject option.

Example

The following command enables RoHC reject option usage:

```
use-reject-option
```

The following command disables RoHC reject option usage:

```
no use-reject-option
```

use-sn-not-valid-option

Controls usage of the RoHC SN not valid option. The sn-not-valid option indicates that the SN of the feedback is not valid. A compressor must not use the SN of the feedback to find the corresponding sent header when this option is present.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

`[ default | no ] use-sn-not-valid-option`

`default`

Returns the command to its default value of enabled.

`no`

Disable use of the sn-not-valid option.

Usage

Use this command to enable and disable the use of the RoHC sn not valid option.

Example

The following command enables RoHC sn not valid option usage:

```
use-sn-not-valid-option
```

The following command disables RoHC sn not valid option usage:

```
no use-sn-not-valid-option
```

use-sn-option

Controls usage of RoHC sn option. The sn option provides 8 additional bits of SN (Sequence Number. Usually RTP Sequence Number.)

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-sn-option
```

default

Returns the command to its default value of enabled.

no

Disable use of the sn option.

Usage

Use this command to enable and disable the use of the RoHC sn option.

Example

The following command enables RoHC sn option usage:

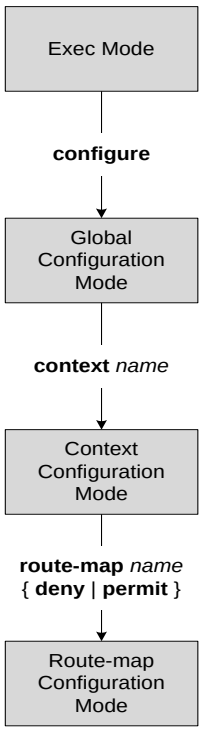
```
use-sn-option
```

The following command disables RoHC sn option usage:

```
no use-sn-option
```

Chapter 179
Route-map Configuration Mode Commands

The Route-Map Configuration sub-mode is used for the OSPFv2 and BGP-4 routing protocols. This mode includes commands that configure matching rules and set actions to perform on matched routes.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

match as-path

Match an AS path access list

Product

HA

Privilege

Security Administrator, Administrator

Syntax

match as-path *AS_list*
no match interface *AS_list*

no

Disables matching the specified AS path access list.

AS_list

Specifies the name of an AS path access list for matching. *AS_list* must be from 1 to 79 alphanumeric characters in length.

Usage

This command is used for BGP-4 routing to specify an AS path access list to be matched. Refer to the **ip as-path access-list** command for more information.

Example

To match entries in an AS path access list named *ASlist1*, enter the following command;
match as-path *ASlist1*

match interface

Specifies the next-hop interface name of a route to be matched.

Product

All

Privilege

Security Administrator, Administrator

Syntax

match interface *interface-name*
no match interface *interface-name*

no

Disables matching the specified interface name.

interface-name

Specifies the name of the virtual interface for matching. This variable can be from 1 to 79 alphanumeric characters in length.

Usage

Use this command to specify the next hop interface name for routes to be matched.

Example

To match routes that have the next hop interface specified as *Interface123*, enter the following command:
match interface *Interface123*
To disable matching routes that have the next hop interface specified as *Interface123*, enter the following command:
no match interface *Interface123*

match ip address

This command matches routes with entries in a route-access-list or prefix-list.

Product

All

Privilege

Security Administrator, Administrator

Syntax

match ip address { **prefix-list** | **route-access-list** } *list_name*
no match ip address { **prefix-list** | **route-access-list** } *list_name*

no

Disable matching from the specified prefix list or route access list.

prefix-list

This command matches any routes with entries in a prefix-list.

route-access-list

This command matches any routes with entries in a route-access-list

list_name

The name of the IP prefix list or IP route access-list. This variable can be a string from 1 to 63 alphanumeric characters in length.

Usage

Use this command to match routes specified in a route-access-list or prefix-list.

Example

To match routes that are specified in a prefix list named *Prefix100*, enter the following command:
match ip address prefix-list *Prefix100*
To disable matching routes that are specified in a prefix list named *Prefix100*, enter the following command:
no match ip address prefix-list *Prefix100*

match ip next-hop

This command matches next-hop IP addresses with entries in specified standard prefix-list or route-access-list.

Product

All

Privilege

Security Administrator, Administrator

Syntax

match ip address next-hop { **prefix-list** | **route-access-list** } *list_name*
no match ip address next-hop { **prefix-list** | **route-access-list** } *list_name*

prefix-list

This command matches any routes that have a next-hop router address that has an entry in the specified prefix list.

route-access-list

This command matches any routes that have a next-hop router address that has an entry in the specified route-access-list.

list_name

The name of the IP prefix-list or IP route-access-list. This variable is a string from 1 through 63 alphanumeric characters in length.

Usage

Use this command to match next-hop IP addresses that have entries in the specified prefix-list or route-access-list.

Example

To match next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:
match ip address next-hop prefix-list *Prefix100*
To disable matching next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:
no match ip address next-hop prefix-list *Prefix100*

match metric

This command matches routes that have the specified route metric.

Product

All

Privilege

Security Administrator, Administrator

Syntax

match metric *metric_value*
no match metric *metric_value*

no

Disables matching of the specified route metric.

metric_value

This is the route metric to match. This must be an integer ranging from 0 through 4294967295.

Usage

Use this command to match routes that have the specified route metric.

Example

To match routes with the route metric of *1200*, enter the following command:
match metric *1200*
To disable matching routes with a route metric of *1200*, enter the following command:
no match metric *1200*

match origin

This command matches the origin code learned from BGP. This command is for route maps that are used with BGP routing only.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
match origin {egp | igp | incomplete}
no match origin {egp | igp | incomplete}
```

no

Disables matching of the origin code.

egp

Match origins learned from learned from the External Gateway Protocol (EGP)

igp

Match origins learned from learned from the local Interior Gatewway Protocol (IGP)

incomplete

Match origins with unknown heritage.

Usage

Use this command to match origin codes for BGP routing.

Example

To match origin codes learned from EGP, enter the following command:
match origin egp

match route-type external

Match external OSPF routes of the specified type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

match route-type external { **type-1** | **type-2** }
no match route-type external { **type-1** | **type-2** }

type-1

Only match type-1 external routes.

type-2

Only match type-2 external routes.

Usage

Use this command to match external routes of a specific type.

Example

The following command matches all external routes that are type-2:
match route-type external type-2
The following command disables matching external routes that are type-2:
no match route-type external type-2

match tag

This command matches routes with the specified route tag value.

Product

All

Privilege

Security Administrator, Administrator

Syntax

match tag *tag_value*
no match tag *tag_value*

no

Disable matching routes with the specified route tag value.

tag_value

The route tag value to match. This must be an integer from 0 through 4294967295.

Usage

Use this command to match routes that have the specified route tag value.

Example

Use the following command match routes that have a route tag value of *1234*:
match tag *1234*
Use the following command to disable matching routes that have a route tag value of *1234*:
no match tag *1234*

set as-path

Modify an AS path for a route by adding the specified AS numbers to the front of the path.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
set as-path prepend ASN
no set as-path prepend ASN
```

no

Disable prepending the AS path. Any previously set prepends are removed.

prepend

Prepends the autonomous system path.

ASN

AS number(s) to be prepended to the AS path. You can specify up to 16 different AS numbers to be prepended in the order specified. Each AS number must be separated by a space. *ASN* must be an integer from 1 through 65535.

Usage

Use this command to add up to 16 specified AS numbers to the front of the AS path.

Example

The following command prepends the AS numbers *100*, *200*, and *1000* to matching AS paths:
set as-path prepend *100 200 1000*

set ip next-hop

Set the IP address that is applied as the next hop for routes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

set ip next-hop *ip_address*
no set ip next-hop *ip_address*

no

Disable the specified next hop address.

ip_address

This is the IP address of the next hop to which packets are output.

Usage

Use this command to set the IP address that is used as the next hop for routes.

Example

To set the next hop for routes to the IP address *192.168.2.100*, use the following command:
set ip next-hop *192.168.2.100*
To disable setting the next hop for routes to the IP address *192.168.2.100*, use the following command:
no set ip next-hop *192.168.2.100*

set metric

This command sets the route metric for matched routes to the specified value.

Product

All

Privilege

Security Administrator, Administrator

Syntax

set metric *metric_value*
no set metric *metric_value*

metric_value

This is the metric value that is set for routes. This must be an integer from 1 through 4294967295.

Usage

Use this command to set the route metric for matched routes.

Example

To set the route metric to *12345*, use the following command;
set metric *12345*
To disable setting the route metric to *12345*, enter the following command;
no set metric *12345*

set metric-type

This command sets the route metric type to either Type-1 or Type-2 in the AS-external-LSA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
set metric-type { type-1 | type-2 }
no set metric-type { type-1 | type-2 }
```

type-1

Set the route metric to external type-1.

type-2

Set the route metric to external type-2

Usage

Use this command to set the route metric to either external type-1 or external type-2.

Example

To set the route metric to type-1, enter the following command:
set metric type-1
To disable setting the metric to type, enter the following command:
no set metric type-1

set origin

This command sets the BGP origin code to the specified value. This command is for route maps that are used with BGP routing only.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
set origin {egp | igp | incomplete}
no set origin {egp | igp | incomplete}
```

no

Disables setting the origin code.

egp

Set the origin code to specify that the path is from a remote External Gateway Protocol (EGP) system.

igp

Set the origin code to specify that the path is from a local Interior Gateway Protocol (IGP) system.

incomplete

Set the origin code to specify that the path is from an unknown system.

Usage

Use this command to set a specified origin code for BGP.

Example

To the origin code to EGP, enter the following command:
set origin egp

set tag

This command sets the route tag value for matched routes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
set tag tag_value
no set tag tag_value
```

no

Disable setting the route tag to the specified value.

tag_value

The route tag value to set. This must be an integer from 0 through 4294967295.

Usage

Use this command to set the route tag value that is applied to all matched routes.

Example

To set the route tag value to *12345*, enter the following command:
set tag *12345*
To disable setting the route tag value to *12345*, enter the following command:
no set tag *12345*

set weight

Set the weight in the routing table for matching routes to the specified value.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

set weight *value*
no set weight *value*

no

Disable setting the routing weight value.

value

The weight in the routing table to assign. must be an integer from 1 through 4294967295.

Usage

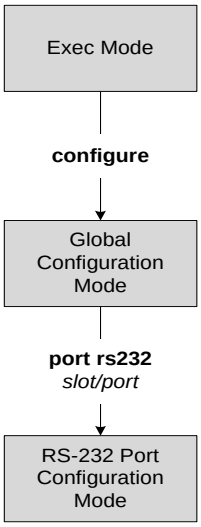
Use this command to set the routing table weight on matched routes.

Example

The following command sets the routing table weight for matched routes to *1000*:
set weight *1000*

Chapter 180
RS-232 Port Configuration Mode Commands

The RS-232 Port Configuration Mode is used to manage the RS-232 ports on the SPIO cards.



default

Restores the port's default speed and communication mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { **preferred slot** | **terminal** { **all** | **databits** | **flowcontrol** | **parity** | **speed** | **stopbits** }

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

terminal { all | databits | flowcontrol | parity | speed | stopbits }

Sets the terminal settings for the rs-232 port to their default settings.
all: Restore all settings to their default values.
databits: Restore the databits setting to its default value of 8.
flowcontrol: Restore the flowcontrol setting to its default value of none.
parity: Restore the parity setting to its default value of none.
speed: Restore the speed setting to its default value of 9600.
stopbits: Restore the stopbits setting to its default value of 1.

Usage

Restores port-level parameters to their default values.

Example

The following command restores all terminal settings to their default values:
default terminal all

end

Exits the port configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the port configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Product

PDSN, FA, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
preferred slot slot#
no preferred slot slot#
```

no

Disables revertive, or auto-recovery, operation for selected port.

slot#

Identifies the physical chassis slot where the SPIO card is installed.

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

preferred slot *24*

snmp trap link-status

Enables/disables the generation of an SNMP trap for link status changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status
no snmp trap link-status
```

no

Disables the sending of traps for link status changes.

Usage

Enable link status change traps when a monitoring facility can use the information or if there are trouble shooting activities are in progress.

Example

```
snmp trap link-status
no snmp trap link-status
```

terminal

Configures the console port on the SPIO.

Product

All

Privilege

Security Administrator, Administrator

Syntax

terminal { **carrierdetect** { **off** | **on** } | **databits** { **7** | **8** } | **flowcontrol** { **hardware** | **none** } | **parity** { **even** | **none** | **odd** } | **speed** { **115200** | **19200** | **38400** | **57600** | **9600** } | **stopbits** { **1** | **2** } }

carrierdetect { off | on }

Default:
Specifies whether or not the console port is to use carrier detect when connecting to a terminal.

databits { 7 | 8 }

Default: 8
Specifies the number of data bits used to transmit and receive characters.

flowcontrol { hardware | none }

Default: none
Specifies how the flow of data is controlled between the SPIO and a terminal.

parity { even | none | odd }

Default: none
Specifies the type of error checking used on the port.
even - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none - Disables error checking.
odd - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Default: 9600
Specifies the flow of data in bits per second between the console port and terminal.

stopbits { 1 | 2 }

Default: 1
Specifies the number of stop bits between each transmitted character.

Usage

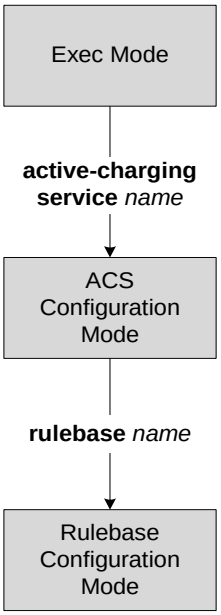
Sets the SPIO's console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.
terminal carrierdetect off databits 7 flowcontrol hardware parity even speed 115200 stopbits 1

Chapter 181
Rulebase Configuration Mode Commands

The Rulebase Configuration Mode is used to create and manage Active Charging Service Rulebase configurations.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action priority

This command configures the action priority for a ruledef / group-of-ruledefs in the rulebase.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

no action priority *action_priority*

no

Removes the previously configured action priority from this rulebase.

priority *action_priority*

Specifies a priority for the specified ruledef / group-of-ruledefs in this rulebase.
The priority controls the ordering of the instance of the CLI command. Lower numbered priorities are examined first. Up to 2048 instances may be configured, totaled among all rulebases.
action_priority must be an integer from 1 through 65535.

dynamic-only

Default: disabled
Enables matching of dynamic rules with static rules for this action priority on a flow.
The dynamic-only option causes the configuration to be defined, but not enabled. If enabled, the action associated with this option will not be matched against a flow until it is enabled from a dynamic charging interface like Gx. Gx can disable or enable this action entry in the rulebase using Gx messages.

static-and-dynamic

Default: enabled
The static-and-dynamic option causes the configuration to be defined and enabled, and allows a dynamic protocol (such as, the Gx-interface) to disable or re-enable the configuration.

Important: When R7 Gx is enabled, “static-and-dynamic” rules behave exactly like “dynamic-only” rules. I.e. they must be activated explicitly by the PCRF. When Gx is not enabled, “static-and-dynamic” rules behave exactly like static rules.

timedef *timedef_name*

Important: This keyword is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Associates the specified time definition with the ruledef/group-of-ruledefs. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.

timedef_name must be the name of a timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
A timedef can be used with several ruledefs/group-of-ruledefs. When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

Important: The time considered for timedef matching is the system's local time.

ruledef *ruledef_name*

Assigns the specified ruledef to this rulebase.
ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the specified ruledef does not exist, there will be no ruledef triggers for this action priority within this rulebase.

Important: If the ruledef specified here is deleted or is not configured, the system accepts it without applying any ruledef under current rulebase for this action priority.

group-of-ruledefs *group_name*

Assigns the specified group-of-ruledefs to this rulebase.
group_name must be the name of an existing group-of-ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.
When a group-of-ruledefs is specified, if any of the ruledefs within the group matches, the specified charging-action is performed, any more of the action instances are not processed.

Important: If the group-of-ruledefs specified here is deleted or is not configured, the system accepts it without applying any ruledefs under current rulebase for this action priority.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be the name of an existing charging action, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the specified charging action does not exist, there will be no charging action triggers for this action priority within this rulebase.

Important: If the charging action specified here is deleted or not configured, the system accepts it without applying any charging action under current rulebase for this action priority.

monitoring-key *monitoring_key*

Associates the specified monitoring-key with ruledefs for usage monitoring.
monitoring_key must be an integer from 1 through 4000000000.

description *description*

Adds specified text to the rule and action.
description must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure action priorities for ruledefs / group-of-ruledefs in a rulebase.
This CLI command can be entered multiple times to specify multiple ruledefs and charging actions. The ruledefs are examined in priority order, until a match is found and the corresponding charging action is applied.

Example

The following command assigns a rule and action with the action priority of *23*, a ruledef of *test*, and a charging action of *test1* to the current rulebase:

action priority ***23*** **ruledef** ***test*** **charging-action** ***test1***

bandwidth default-policy

This command configures the default bandwidth policy for the current rulebase.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

bandwidth default-policy *policy*

no bandwidth default-policy

no

Removes previously configured default bandwidth policy.

policy

Specifies the default bandwidth policy to be configured for the current rulebase.
policy must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the default bandwidth policy for the current rulebase. This bandwidth policy will be used for subscribers using this rulebase for whom in the APN/Subscriber Configuration Mode the **default active-charging bandwidth-policy** command is configured, or no bandwidth policy is configured.

Example

The following command configures a bandwidth policy named *standard* for the rulebase:
bandwidth default-policy *standard*

billing-records

This command configures the type of billing to be performed for subscriber sessions.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
billing-records { egcdr | radius | rf | udr udr-format udr_format_name } +
no billing-records
```

no

Deletes the current billing-records configuration.

egcdr

Generates an enhanced G-CDR (eG-CDR) and/or UDR with specified format on the occurrence of an interim trigger condition at the end of a subscriber session, or an SGSN-to-SGSN handoff.

radius

Generates postpaid RADIUS accounting records at the start and end of a subscriber session, and on the occurrence of an interim trigger condition. RADIUS accounting records are generated for each content ID.

Important: In the GGSN, if in the APN configuration the "accounting-mode" is set to "none", the system continues to send ACS-generated RADIUS accounting messages. In the PDSN, if in the subscriber default configuration the "accounting-mode" is set to "none", the system does not send any RADIUS accounting messages (including ACS accounting messages).

rf

Enables Rf accounting.

udr udr-format *udr_format_name*

Generates UDRs with specified format on the occurrence of an interim trigger condition, at the end of a subscriber session or ahandoff.
udr_format_name must be the name of an existing UDR format, and must be a string of 1 through 63 characters in length.

+

Indicates that more than one of the keywords can be entered in a single command.

Usage

Use this command to generate enhanced G-CDRs (eG-CDRs), RADIUS CDRs and/or UDRs for billing records. The format of eG-CDRs for the default GTPP group is controlled by the **inspector** command in the Context Configuration Mode.
If, in the APN configuration, the "accounting-mode" is set as default (GTPP), and in the rulebase configuration "billing-records egcdr" is configured, both G-CDRs and eG-CDRs are generated if configured.
If, in the APN, the accounting-mode is set to "none" G-CDRs will not be generated.

Example
The following command sets the billing record to UDR with UDR format named *udr_format1*:
billing-records udr udr-format *udr_format1*

cca diameter requested-service-unit

This command configures Diameter specific AVPs in Requested-Service-Unit group AVP with DCCA Credit Control Requests (CCRs).

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca diameter requested-service-unit sub-avp { time cc-time *duration* **| units cc-service-specific-units** *charging_unit* **| volume { cc-input-octets** *bytes* **| cc-output-octets** *bytes* **| cc-total-octets** *bytes* **} + }**

no cca diameter requested-service-unit sub-avp

no

Disables the Diameter AVP configuration for DCCA CCRs.

time cc-time *duration*

Specifies requested service unit for charging time duration in seconds in included sub-AVP.
duration specifies charging time in seconds and must be an integer from 1 through 4,294,967,295.

units cc-service-specific-units *charging_unit*

Specifies requested service unit by service specific units in bytes/packets in included sub-AVP.
charging_unit specifies service-specific charging unit and must be an integer from 1 through 4,000,000,000.

volume { cc-input-octets *bytes* **| cc-output-octets** *bytes* **| cc-total-octets** *bytes* **} +**

Specifies requested service unit for charging octets by input, output and total volume in included sub-AVP.
cc-input-octets: Specifies input charging octets.
cc-output-octets: Specifies output charging octets.
cc-total-octets: Specifies total charging octets.
bytes: Specifies volume in bytes, and must be an integer from 1 to 4,000,000,000.
+: More than one of the above keywords can be entered within a single command.

Usage

Use this command to include sub-AVPs based on time, volume, and service specific unit in Requested-Service-Unit group AVP with CCRs through Gy interface.

Example

The following command sets the time based sub-AVP with charging duration of 45 seconds in Requested-Service-Unit group AVP on DCCA CCRs:

```
cca diameter requested-service-unit sub-avp time cc-time 45
```

cca quota

This command is used to set various time and threshold-based quotas in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ no | default } cca quota { holding-time content-id *cont_id* **| retry-time }**

holding-time *holding_time*

Specifies the value for the Quota Holding Time (QHT). QHT is used with both time-based and volume-based quotas.
holding_time must be an integer from 1 to 4000000000.
After *holding_time* seconds has passed without user traffic, the quota is reported back and the charging stops until new traffic starts.

content-id *cont_id*

Specifies the content ID (Rating group AVP) to use for the Quota holding time for this rulebase.
cont_id is the specified content id for credit control service in an active charging service and must be an integer from 0 through 4,294,967,295.

retry-time *retry_time* **[max-retries** *retries* **]**

Default: 60
Specifies the retry time in seconds for the quota request.
retry_time must be an integer from 0 to 86400. To disable this assign 0.
This defines the maximum frequency at which the CC application tries to obtain quota for a subscriber passing traffic for a category with no/exhausted quota.
For a subscriber not passing traffic, the CC application will not try to obtain quota (except once at session start time, if so configured). i.e. the quota request from the no quota state is sent in response to user packets only, never based on a timer.
When subscriber hits a charging action that is a flow redirect, operator can optionally specify that this redirection shall clear the retry-time timer.
This allows the immediately following chargeable user traffic to trip a quota request, even if it would otherwise have been subject to the retry time limit. Such configuration allows quite large value for retry-time in quota charging or top up scenario.
max-retries *retries* option configures the maximum number of retries allowed for blacklisted categories. This option has default value of maximum retries of 65535 retries.
retries must be an integer from 1 through 65535. To disable this assign 0.

Usage

Use this command to set the prepaid credit control quotas.
cca quota retry time allows operator to set the amount of time that the ACS waits before it retries the prepaid server for a content id for which quota was exausted earlier.

When server sends the quota holding time (QHT) it has highest priority to use that QHT irrespective of the value configured in rulebase or Credit Control Application configuration mode. QHT configured here has second priority for the content ID (rating group) configured here.
In case of QHT is not available from server and rulebase configuration mode, the QHT values configured at Credit Control Application configuration mode is used.

Example
The following command sets the prepaid credit control request retry time to *30* sec.:
cca quota retry-time *30*
The following command sets the system to use the QHT from Credit Control Application mode:
no cca quota holding-time content-id *content_id*
The following command sets the system to ignore the QHT from Credit Control Application mode:
default cca quota holding-time content-id *content_id*
The following command sets the prepaid credit control request retry time to *60* seconds and maximum numbers of retries to *65535*.
default cca quota retry-time max-retries

cca quota time-duration algorithm

This command is used to define the algorithm used to compute time duration for prepaid credit control application quotas in the rulebase service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cca quota time-duration algorithm { consumed-time seconds [ plus-idle ] |
continuous-time-periods seconds | parking-meter seconds } [ content-id
content_id ]

default cca quota time-duration algorithm

no cca quota time-duration algorithm { consumed-time | continuous-time-periods |
parking-meter } [ content-id content_id ]
```

no

Removes the previously configured quota time-duration algorithm.

default

Sets the default configurations.

consumed-time *seconds*

Default: 0 (disabled)
Specifies the Quota Consumption Time (QCT) in seconds. QCT is used with active time-based quotas and to determine chargeable time envelopes for the purposes of consuming time quota.
Time envelope is the basis for reporting active usage. For each time envelope, the quota consumption includes the last QCT (duration between first packet and last packet + QCT).
seconds must be an integer from 1 through 4,294,967,295.

plus-idle

Defines the idle time for QCT.
When used along with **consumed-time** it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods *seconds*

Default: 0 (disabled)
Specifies the charging quota continuous period in seconds.
The Continuous Time Periods (CTP) mechanism constructs a time-envelopes out of consecutive base time intervals in which traffic has occurred up to and including a base time interval which contains no traffic. As with Quota-Consumption-Time envelopes, the end of an envelope can only be determined “retrospectively”. Again, as with Quota-Consumption-Time, the envelope for CTP includes the last base time interval, i.e. the one which contained no traffic.

seconds must be an integer from 1 through 4294967295.

parking-meter *seconds*

Default: 0 (disabled)
Specifies the Parking Meter (PM) period, in seconds, for particular rating group.
This mechanisms utilizes time quota, but instead of consuming linearly—once a decision to consume has been taken—the granted quota is consumed discretely in "chunks" of the base time interval at the start of each base time interval. Traffic is then allowed to flow for the period of the consumed quota.
The time interval seconds defines the length of the Parking Meter. A time-envelope corresponds to exactly one PM (and thus to one base time interval).
seconds must be an integer from 1 through 4294967295.

content-id *content_id*

Specifies the content ID (Rating group AVP) to use for the CCA Quota time duration algorithm selection in this rulebase.
content_id is the specified content ID for credit control service in an active charging service, and must be an integer from 1 through 65535.

session-time

Specifies the session period in seconds. This is the default setting.

Usage

Use this command to set the various time charging algorithms/schemes for prepaid credit control charging.
If operator chooses **parking-meter** *seconds* style charging, then time is billed in *seconds* chunks.

Example

The following command sets time duration to *400* seconds for prepaid credit control time duration algorithm:
cca quota time-duration algorithm consumed-time ***400***

cca radius accounting

This command specifies the accounting interval duration for RADIUS prepaid service parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] cca radius accounting interval *interval*

no

Removes previously configured RADIUS accounting interval in the rulebase.

interval *interval*

Default: 0 (Disabled).
Specifies the time interval, in seconds, between accounting actions.
interval must be an integer from 0 through 3600.

Usage

Use this command to specify the RADIUS accounting interval between accounting of a prepaid subscriber. The same parameters are applicable for RADIUS server group.

Example

The following command defines RADIUS accounting interval of *20* seconds for RADIUS prepaid service in a rulebase.

cca radius accounting interval ***20***

cca radius charging

This command specifies the charging context where RADIUS parameters are configured.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

[no] cca radius charging context *vpn_context* **[group** *group_name* **]**

no

Removes the previously configured RADIUS charging context in a rulebase.

context *vpn_context*

Specifies the charging context where RADIUS prepaid charging are configured.
vpn_context is an alpha and/or numeric string of 1 through 63 characters in length.

group *group_name*

Specifies the RADIUS server group name configured for RADIUS prepaid charging parameters.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to specify the RADIUS charging context where RADIUS prepaid charging parameters are configured. The same parameters are applicable for RADIUS server group.

Example

The following command defines RADIUS charging context *prepaid_rad1* for RADIUS prepaid charging in a rulebase:

cca radius charging context *prepaid_rad1*

cca radius user-password

This command specifies the RADIUS prepaid service subscriber's user password parameters in a Rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] cca radius user-password [encrypted] password *password*

no

Removes the previously configured RADIUS prepaid service user password in a rulebase.

[encrypted] password *password*

Specifies the password to use for the user being given privileges for prepaid services within the current rulebase. The **encrypted** keyword indicates that the password specified uses encryption.
password without encryption must be an alpha and/or numeric string of 1 through 63 characters, and when encrypted must be alpha and/or numeric string of 1 through 127 characters in length.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use this command to specify the RADIUS user password for prepaid services within the current rulebase.

Example

The following command defines the user password *user_123* without encryption for a prepaid service subscriber with RADIUS charging in a rulebase.

cca radius user-password password *user_123*

charging-rule-optimization

This command enables and sets the charging rule-optimization level for rule matching in a rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
charging-rule-optimization { high | low | medium }

default charging-rule-optimization
```

default

Sets the default charging rule search and matching optimization level.
Default: Low

high

Enables the highest efficient rule-searching organization with high memory utilization.

low

Enables minimally efficient rule-searching organization with minimal memory utilization.

medium

Enables moderately efficient rule-searching organization with medium memory utilization.

Usage

Use this command to specify the amount of internal optimization that is done for improved performance when evaluating each instance of the **action** CLI command.

Example

The following command specifies the highest optimization level for rule search and matching in a rulebase.

```
charging-rule-optimization high
```

constituent-policies

This command configures the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies. The combination of the values of all three policies will uniquely identify a rulebase associated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
constituent-policies { bandwidth-policy bandwidth_policy | cbb-policy cbb_policy
| firewall-policy fw_policy | fw-and-nat-policy fw_nat_policy  }+

no constituent-policies
```

no

Removes the previous configuration.

bandwidth-policy *bandwidth_policy*

Specifies the Bandwidth policy.
bandwidth_policy specifies the bandwidth policy name, and must be a string of 1 through 63 characters in length.

cbb-policy *cbb_policy*

Specifies the CBB policy.
cbb_policy specifies the CBB policy name, and must be a string of 1 through 63 characters in length.

firewall-policy *fw_policy*

Important: This keyword is customer-specific.

Specifies the Firewall policy.
fw_policy specifies the Firewall policy name, and must be a string of 1 through 63 characters in length.

fw-and-nat-policy *fw_nat_policy*

Important: This keyword is customer specific, and is only available in StarOS 8.1.

Specifies the Firewall-and-NAT policy.
fw_nat_policy specifies the Firewall-and-NAT policy name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies that will identify a rulebase. The combination of the values of all three policies will uniquely identify a rulebase associated.

Example

The following command configures the constituent Bandwidth policy named *test123*:

constituent-policies bandwidth-policy *test123*

content-filtering category policy-id

This command configures the Content Filtering Category Policy Identifier for Policy-based Content Filtering support in a rulebase.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id [*cf_policy_id* **]**

no

Removes the Content Filtering Category Policy configuration from the rulebase.
In StarOS 8.1 and later, optionally the policy ID can be specified. If the specified policy ID is invalid, or is not configured in the rulebase, an error message is displayed. If no policy ID is specified, whatever policy is configured, if any, is removed from the rulebase.

category policy-id *cf_policy_id*

Configures the specified Content Filtering Category Policy in the current rulebase.
cf_policy_id must be the ID of an existing Content Filtering Category Policy, and must be an integer from 1 through 4294967295.

Important: In case the specified Content Filtering Category Policy does not exist, all packets will be passed regardless of the categories/actions determined for such packets.

Important: The category policy ID configured using the **category policy-id** *cf_policy_id* command in the APN/Subscriber Configuration mode prevails over this configuration.

Usage

Use this command to configure the Content Filtering Category Policy ID for Policy-based Content Filtering support in a rulebase.
The Content Filtering Category Policy is created/deleted in the Active Charging Service Configuration mode, and is configured in the Content Filtering Policy Configuration mode.

Example

The following command configures the policy ID *101* in the rulebase:
content-filtering category policy-id ***101***

content-filtering flow-any-error

This command configures allowing/discarding of Content Filtering packets in case of ACS error scenarios.

Product

ECS, CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering flow-any-error { deny | permit }

default content-filtering flow-any-error
```

default

Configures the default setting.
Default: Permit

deny

Configures Content-Filtering flow-any-error as Deny.
All the denied packets will be accounted by "discarded-flow-content-id" configuration in the Content Filtering Policy ID Configuration Mode. I.e. this very content ID will be used to generate UDRs for the denied packets in case of Content Filtering.

permit

Configures Content-Filtering flow-any-error as Permit.

Usage

Use this command to allow/discard content filtering packets in case of ACS error scenarios.

Example

The following command allows content filtering packets in case of ACS error:

```
content-filtering flow-any-error permit
```

content-filtering mode

This command enables the specified Content Filtering mode within a rulebase.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering mode { category { static-only | static-and-dynamic } | server-group *cf_server_group* **}**

no content-filtering mode

---

no

Removes/disables a previously configured content filtering mode in this rulebase.
It implies that content filtering in not to be performed for this rulebase.
This is the default mode.

---

category { static-and-dynamic | static-only }

This keyword specifies the category-based content filtering mode.
static-only Configures Content Filtering mode as Static only. Compares all URLs agains internal database to determine the category or categories of the requested content.
Use of this category-based content filtering support requires configuration of the **require active-charging** content-filtering category CLI command in the Global Configuration mode.
static-and-dynamic Configures Content Filtering mode as Static-and-Dynamic, wherein first static rating of the URL is performed, and only if the static rating fails to find a match dynamic rating of the content that the server returns is performed.

Important: Before enabling static-and-dynamic rating in the rulebase, it must be enabled at the global level as the resources required for dynamic rating are allocated at the global level. To enable static-and-dynamic rating at the global level, in the Global Configuration Mode, use the **require active-charging content-filtering category static-and-dynamic** CLI command.

---

server-group *cf_server_group*

This keyword enables and configures the CFSG mode within a rulebase to manage an external content filtering server with an ICAP client system.
cf_server_group specifies the name of a pre-configured unique content filtering server group in Content Configuration Mode, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If this keyword is used every ACS attempt to establish TCP connections to every server in the named group.

Usage

Use this command to enable and apply the content filtering mode with in a rulebase to manage a content filtering server with an ICAP client system.

Example

The following command enables the content filtering mode for external content filtering server group *CF_Server1* with in this rulebase.

content-filtering mode server-group *CF_Server1*

The following command enables the category based static and dynamic content filtering mode for with in this rulebase.

content-filtering mode category static-and-dynamic

dynamic-rule

This command configures the order of comparing the dynamic rules to static rules for the flow.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dynamic-rule order { always-first | first-if-tied }

no dynamic-rule order
```

no

Removes the previously configured dynamic rule comparing order for this rulebase.

order { always-first | first-if-tied }

This command configures the way in which rules are selected for matching from dynamic rules list (per subscriber) and static rules list (from rulebase).

- **always-first**: If this option is configured, then all the dynamic rules are matched against the flow prior to any static rule.
- **first-if-tied** : If this option is configured, then rules are matched against the flow based on their priority with condition that dynamic rules match before a static rule of the same priority.

Usage

Use this command to configure the way in which rules are selected up for matching from dynamic rules list (per subscriber) and static rules list (from rulebase).

Example

The following command configures to match all dynamic rules against the flow prior to any static rule:

```
dynamic-rule order always-first
```

edr suppress-zero-byte-records

This command disables/enables the creation of EDRs when there is no data for the flows.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] edr suppress-zero-byte-records
```

no

Disables the suppression of zero-byte EDRs.

default

Sets the default configuration.
Default: **no edr suppress-zero-byte-records**

Usage

Use this command to disable/enable the creation of EDRs that are empty. The situation where there is a zero-byte EDR would typically be possible when two successive EDRs are generated for a flow. This CLI command suppresses the second such EDR for the flow.

Example

The following command disables the creation of zero-byte EDRs:

```
edr suppress-zero-byte-records
```

edr transaction-complete

This command configures the generation of an EDR on the completion of a transaction.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

edr transaction-complete http edr-format *edr_format*

{ default | no } edr transaction-complete

default

Sets the default configuration.
Default: same as **no edr transaction-complete**

no

Disables the generation of EDR on transaction completion.

http

Specifies EDR generation on transaction completion for HTTP protocol.

edr-format *edr_format*

Specifies the EDR format name.
edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the generation of an EDR on the completion of a transaction. In this release EDR generation is supported only for HTTP protocol.

Example

The following command configures the generation of EDRs on the completion of transactions for HTTP protocol specifying the EDR format as *test123*:

edr transaction-complete http edr-format *test123*

edr voip-call-end

This command enables generating Event Data Record (EDR) on the completion of voice calls.

Product

ECS, P2P

Privilege

Security Administrator, Administrator

Syntax

edr voip-call-end edr-format *edr_format_name*

{ default | no } edr voip-call-end

default

Configures the default setting.
Default: **no edr voip-call-end**

no

Specifies to disable EDR generation on the completion of a voice call.

edr-format *edr_format_name*

Specifies EDR format name.
edr_format_name must be an existing EDR format's name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to enable generating EDR on the completion of voice calls. This facilitates P2P voice duration reporting.

Example

The following command specifies generating EDR on completion of voice calls using the EDR format *test13*:
edr voip-call-end edr-format *test13*

egcdr inactivity-meter

DescriptionThis command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed performs no function. Use **`egcdr threshold interval`** *`interval`* **`[ regardless-of-other-triggers ]`** command for this functionality.

egcdr service-data-flow

This command assigns volume or interval threshold values to the interim Service Data Flow Containers in Flow Based Charging (FBC).

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

egcdr service-data-flow threshold { interval *interval* **| volume { downlink | total | uplink }** *bytes* **}**

{ no | default } egcdr service-data-flow threshold { interval | volume }

no

Removes the previously configured eG-CDR service data flow threshold for FBC.

default

Disables the egcdr service data flow threshold settings for FBC.

interval *interval*

Specifies the time interval (in seconds) for closing the eG-CDR if the minimum time duration thresholds for service data flow containers satisfied in flow based charging. This option is disabled by default. *interval* must be an integer from 60 through 400,00,000.

volume

Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs to service data flow container in FBC.

- **downlink** *bytes* - Sets the limit for the number of octets downlink after which the eG-CDR is closed. *bytes* (in bytes) must be an integer from 10,000 through 400000000. Default is 400,000,000.
- **total** *bytes* - Sets the limit for the total number of octets (uplink+downlink) after which the eG-CDR is closed. *bytes* (in bytes) must be an integer from 10,000 through 400,000,000. This configuration is disabled by default.
- **uplink** *bytes* - Sets the limit for the number of octets uplink after which the eG-CDR is closed. *bytes* (in bytes) must be an integer from 10,000 through 400,000,000. Default is 400,000,000.

Usage

Use this command to specify an eG-CDR threshold to generate it and write it to eG-CDR in service data flow container during flow based charging (FBC).

Example

The following command sets an eG-CDR threshold interval of *6000* seconds:

egcdr service-data-flow threshold interval *interval 6000*

egcdr tariff

This command sets the eG-CDR tariff time information to close and open new eG-CDR.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

[no] egcdr tariff minute *minute* **hour** *hour*

no

Removes the previously configured eG-CDR tariff.

minute *minute*

Specifies the minute in a specified hour.
minute must be an integer from 0 through 59.

hour *hour*

Specifies the hour of the day. *hour* must be an integer from 0 through 23.

Usage

Use this command to specify an eG-CDR tariff time. Up to 4 different time-of-day may be configured. When any tariff time reached the current eG-CDR will be closed and a new eG-CDR will be opened.

Example

The following command defines an eG-CDR tariff for the 23rd minute of the 22nd hour of the day:
egcdr tariff minute *23* hour *22*

egcdr threshold

This command sets the eG-CDR volume or interval values to generate the interim eG-CDRs and write them to eG-CDR file.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

```
egcdr threshold { interval interval [ regardless-of-other-triggers ] | volume {
downlink | total | uplink } bytes }

{ no | default } egcdr threshold { interval | volume }
```

no

Removes previously configured eG-CDR threshold.

default

Disables the egcdr threshold settings.

interval *interval* **[regardless-of-other-triggers]**

Specifies the time interval (in seconds) for closing the eG-CDR if the minimum time duration thresholds are satisfied. This option is disabled by default.
interval must be an integer from 60 to 40000000.
regardless-of-other-triggers: This option enables the eG-CDR generation at the fixed time interval irrespective of any other eG-CDR triggers that may have happened in between.

volume

Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs.

- **downlink** *bytes* - Sets the limit for the number of octets downlink after which the eG-CDR is closed. *bytes* (in bytes) must be an integer from 100,000 through 4,000,000,000. Default is 4,000,000,000.
- **total** *bytes* - Sets the limit for the total number of octets (uplink+downlink) after which the eG-CDR is closed. *bytes* (in bytes) must be an integer from 100,000 through 4,000,000,000. This configuration is disabled by default.
- **uplink** *bytes* - Sets the limit for the number of octets uplink after which the eG-CDR is closed. *bytes* (in bytes) must be an integer from 100,000 through 4,000,000,000. Default is 4,000,000,000.

Usage

Use this command to specify an eG-CDR threshold to generate it and write it to eG-CDR file.

Example

The following command defines an eG-CDR threshold interval of *600* seconds:

egcdr threshold interval *600*

egcdr time-duration algorithm

This command is used to define the algorithm used to compute the duration for time utilization in eG-CDR for specific Rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
egcdr time-duration algorithm { consumed-time con_time [ plus-idle ] |
continuous-time-periods ctp_seconds | parking-meter seconds }

{ default | no } egcdr time-duration algorithm
```

no

Removes the previously configured eG-CDR time-duration algorithm.

default

Sets default time duration value to time duration algorithm for eG-CDR generation.

consumed-time *con_time* **[plus-idle]**

Default: 0 (disabled)
Defines the actual consumption time in seconds. This is used to determine the actual used chargeable time envelopes for the purposes of consuming time quota.
Time envelope is the basis for reporting active usage. For each time envelope, the time consumption includes the time duration between arrival of last packet and first packet only.
con_time must be an integer from 1 through 4,294,967,295.
plus-idle: Defines the idle time between arrival of two packets to include in time usage record in eG-CDR.
When used along with **consumed-time** it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods *ctp_time*

Defines the continuous time period to compute the usage record in eG-CDR.
ctp_time sets the audition in seconds to start a counter on arrival of first packet and there after include only that period in charging in which one or more packets arrived. The period where no packets arrived or traffic detected no usage will be computed. *ctp_time* must be an integer from 1 through 4294967295.

parking-meter *seconds*

Defines the parking meter (PM) period in seconds.
Parking meter is the method with which the usage time is set in the content-id containers in eG-CDRs. When a parking meter value is set, the user is charged for time in increments of the value set. For example; if the parking meter value is set to 300 seconds (5 minutes) and the subscriber only uses one minute, the charge is for 5 minutes.
seconds must be an integer from 1 through 4294967295.

Usage

Use this command to set the various time charging algorithms/schemes for time usage in eG-CDR.
For example, packets arrive at times T1, T2, T3 and T4. Then the typical time usage might be computed to be T4 – T1. However, if say there is an idle period between times T2 and T3, then system will compute the time usage to be (T2 – T1) + (T4 – T3).
consumed-time in above scenario calculates the time duration as (T2 – T1) + (T4 – T3) where **consumed-time** with **plus-idle** calculates the time duration as (T2-T1)+I + (T4 – T3)+I or (T4-T1).

Example

The following command sets consumed time duration to *400* seconds:
egcdr time-duration algorithm consumed-time *400*

end

Returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

Exits the Rulebase Configuration Mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to change to the parent configuration mode.

extract-host-from-uri

If the host field is not present in HTTP/WSP header, this command will extract host from URI, and store it in the host field.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
extract-host-from-uri { http | wsp + )

{ default | no } extract-host-from-uri
```

default

Configures the default setting.
Default: **no extract-host-from-uri**

no

Removes the previous extract-host-from-uri configuration for all protocols.

http | wsp

Specifies protocol(s) for extract-host-from-uri configuration.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

If the host field is not present in HTTP/WSP header, this command will extract host from URI, and store it in the host field to enable “http host” and “wsp host” rule matches using the stored value.

Important: Applying the **extract-host-from-uri** command a second time will overwrite the previous configuration. For example, if you apply the command **extract-host-from-uri http wsp http**, and then apply the command **extract-host-from-uri http wsp**, extraction of host from URI will happen only for WSP analyzer.

Example

The following command configures extraction of host from URI for both HTTP and WSP protocols:
extract-host-from-uri http wsp

fair-usage

This command configures a waiver on top of average available memory credits per session for the Fair Usage feature.

Product

ECS, CF, FW, NAT, P2P

Privilege

Security Administrator, Administrator

Syntax

fair-usage session-waiver-percent *waiver_percent*

default fair-usage session-waiver-percent

default

Configures the default setting.
Default: 20 percent

session-waiver-percent *waiver_percent*

Specifies the Fair Usage session waiver above average available memory for subscribers using the rulebase. *waiver_percent* must be an integer from 0 through 1000.

Usage

Use this command to configure a waiver on top of average available memory credits per session as a rulebase configuration.

Example

The following command configures the Fair Usage Session Waiver setting to *25*percent:

fair-usage session-waiver-percent *25*

firewall dos-protection

This command configures protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | port-scan | tcp-window-containment | source-router | teardrop | winnuke }

default firewall dos-protection
```

no

Disables protection for subscribers from all or specified DoS attack(s).

default

Disables protection from all DOS attacks.

all

Enables protection against all DoS attacks supported by the Stateful Firewall service.

flooding { icmp | tcp-syn | udp }

Enables protection against specified flooding attack:

- **icmp**: Enables protection against ICMP Flood attack
- **tcp-syn**: Enables protection against TCP Syn Flood attack
- **udp**: Enables protection against UDP Flood attack

ftp-bounce

Enables protection against FTP Bounce attacks.
In an FTP Bounce attack, an attacker is able to use the PORT command to request access to ports indirectly through a user system as an agent for the request. This technique is used to port scan hosts discreetly, and to access specific ports that the attacker cannot access through a direct connection.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

In an IP Unaligned Timestamp attack, certain operating systems crash if they receive a frame with the IP timestamp option that is not aligned on a 32-bit boundary.

`mime-flood`

Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks.
In a MIME Flood attack an attacker sends huge amount of MIME headers which consumes a lot of memory and CPU usage.

`port-scan`

Enables protection against Port Scan attacks.

`tcp-window-containment`

Enables protection against TCP sequence number out-of-range attacks.
In a Sequence Number Out of Range attack the attacker sends packets with out-of-range sequence numbers forcing the system to wait for missing sequence packets.

`source-router`

Enables protection against IP Source Route IP Option attacks.
Source routing is an IP option mainly used by network administrators to check connectivity. When an IP packet leaves a system, its path through various networks to its destination is controlled by the routers and their current configuration. Source routing provides a means to override the control of the routers. Strict source routing specifies the path through all the routers to the destination. The same path in reverse is used to return responses. Loose source routing allows the attacker to spoof both an address and sets the loose source routing option to force the response to return to the attacker's network.

`teardrop`

Enables protection against Teardrop attacks.
In a Teardrop attack, overlapping IP fragments are exploited causing the TCP/IP fragmentation re-assembly to improperly handle overlapping IP fragments.

`winnuke`

Enables protection against WIN-NUKE attacks.
This is a type of Nuke denial-of-service attack against networks consisting of fragmented or otherwise invalid ICMP packets sent to the target, achieved by using a modified ping utility to repeatedly send this corrupt data, thus slowing down the affected computer until it comes to a complete stop.
The WinNuke exploits the vulnerability in the NetBIOS handler and a string of out-of-band data sent to TCP port 139 of the victim machine causing it to lock up and display a Blue Screen of Death.

Usage

Use this command to enable firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: The DoS attacks are detected only in the downlink direction.

Example

The following command enables protection from all supported DoS attacks in the Inline Firewall Service:

```
firewall dos-protection all
```

firewall flooding

This command configures Firewall protection from Packet Flooding attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit packets } |
{ sampling-interval interval } }

default firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit } |
{ sampling-interval } }
```

default

Sets the specified firewall flooding configuration to the default value.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling interval for all protocols.

sampling-interval *interval*

Specifies the flooding sampling interval, in seconds.
interval must be an integer from 1 through 60.
Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more that 1000 ICMP packets per sampling interval:

`firewall flooding protocol icmp packet limit *1000*`

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only "suspected" malicious packets are limited and not "legitimate" packets.

`firewall flooding protocol udp packet limit *1000*`

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval.

`firewall flooding protocol tcp-syn packet limit *1000*`

The following command specifies a flooding sampling interval of 1 second:

`firewall flooding sampling-interval *1*`

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall icmp-destination-unreachable-message-threshold *messages* **then-block-server**

{ default | no } firewall icmp-destination-unreachable-message -threshold

default

Sets the default configuration.
Default: No limit

no

Removes the previous configuration.

messages

Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of 10 ICMP error messages:
firewall icmp-destination-unreachable-message-threshold *10* then-block-server

firewall max-ip-packet-size

This command configures the maximum IP packet size (after IP reassembly) allowed over firewall.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall max-ip-packet-size *packet_size* **protocol { icmp | non-icmp }**

default firewall max-ip-packet-size protocol { icmp | non-icmp }

default

Sets the maximum IP packet size configuration to the default value.
Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt Attack” and “Ping-Of-Death Attack”.

Example

The following command allows a maximum packet size of *60000* for ICMP protocol:

firewall max-ip-packet-size *60000* protocol icmp

firewall mime-flood

This command configures firewall protection from MIME Flood attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Sets the specified firewall MIME flood configuration to the default setting.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

firewall mime-flood http-headers-limit *100*

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

firewall mime-flood max-http-header-field-size *1000*

firewall no-ruledef-matches

This command configures the default action for packets when no Firewall Ruledef matches.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, use the **access-rule no-ruledef-matches** command available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

firewall no-ruledef-matches { downlink | uplink } action { deny [charging-action *charging_action* **] | permit [bypass-nat | nat-realm** *nat_realm* **] }**

default firewall no-ruledef-matches { downlink | uplink } action

default

Configures the default action for packets with no Firewall ruledef match.
Default: uplink direction: permit, downlink direction: deny

downlink | uplink

Specifies the packet type:
downlink: Downlink packets with no Firewall ruledef match.
uplink: Uplink packets with no Firewall ruledef match.

action { deny [charging-action *charging_action* **] | permit [bypass-nat | nat-realm** *nat_realm* **] }**

Specifies the default action for packets with no Firewall ruledef match.
permit [bypass-nat | nat-realm *nat_realm* **]**: Permit packets. Optionally specify:

Important: The **bypass-nat** keyword is only available in StarOS 8.3 and later.

- **bypass-nat**: Specifies to bypass Network Address Translation (NAT).
- **nat-realm** *nat_realm*: Specifies a NAT realm to be used for performing NAT on subscriber packets. *nat_realm* must be an alpha and/or numeric string of 1 through 31 characters in length.

Important: If neither **bypass-nat** or **nat-realm** are configured, NAT is performed if the **nat policy nat-required** CLI command is configured with the **default-nat-realm** option.

deny [charging-action *charging_action* **]**: Deny specified packets.

Optionally, a charging action can be specified. *charging_action* must be the name of a charging action, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the default action to be taken on packets with no Firewall ruledef matches. If, for deny action, the optional charging action is configured, the action taken depends on what is configured in the charging action. For the firewall rule, the "flow action", "billing action", and "content ID" of the charging action will be used to take action. If flow exists, flow statistics are updated.
Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Firewall ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **firewall priority** configuration.
- If no firewall ruledef matches, the packet is allowed or dropped as per the **no-ruledef-matches** configuration.

For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command.

Example

The following command sets Firewall to permit downlink packets with no ruledef matches:

```
firewall no-ruledef-matches downlink action permit
```

firewall policy

This command enables/disables Stateful Firewall support for all subscribers using this rulebase.

Important: In StarOS 8.0, this command is available in the APN/Subscriber Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

default

Sets the default firewall support setting for all subscribers using this rulebase.
Default: Disabled

no

Disables firewall support for all subscribers using this rulebase.

firewall-required

Enables firewall support for all subscribers using this rulebase.

Usage

Use this command to enable/disable firewall support for all subscribers using this rulebase.

Example

The following command enables Stateful Firewall support:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support:

```
no firewall policy
```

firewall priority

This command adds and specifies the priority and type of a firewall ruledef in the rulebase, and allows to configure a single or range of ports to be allowed on the server for auxiliary/data connections.

Important: In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, use the **access-rule priority** command available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

firewall priority *priority* [dynamic-only | static-and-dynamic] firewall-ruledef *firewall_ruledef* **{ { deny [charging-action** *charging_action* **] } | { permit [nat-realm** *nat_realm* **| [trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **} direction { both | reverse | same }]] }**
}

no firewall priority *priority*

no

Removes the previously configured firewall ruledef priority from the rulebase.

priority

Specifies the firewall ruledef's priority in the rulebase.
priority must be unique, and must be an integer from 1 through 65535.

[dynamic-only | static-and-dynamic] firewall-ruledef *firewall_ruledef*

Specifies the firewall ruledef to add to the rulebase. Optionally, the firewall ruledef type can be specified.
dynamic-only: Firewall Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
static-and-dynamic: Firewall Static and Dynamic Ruledef—Predefined ruledef that can be disabled/enabled by the policy server, and is enabled by default.
firewall_ruledef must be the name of a predefined firewall ruledef, and must be a string of 1 through 63 characters in length.

deny [charging-action *charging_action* **]**

Denies packets if the rule is matched. An optional charging action can be specified. If a packet matches the deny rule, action is taken as configured in the charging action. For firewall ruledefs, only the terminate-flow action is applicable, if configured in the specified charging action.
charging_action must be a string of 1 through 63 characters in length.

permit [nat-realm *nat_realm* **| [bypass-nat] [trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **}]]**

Permits packets.
nat-realm *nat_realm*: Specifies the NAT realm to be used for performing NAT on subscriber packets matching the firewall ruledef.
If the NAT realm is not specified, then NAT will be bypassed. That is, NAT will not be applied on subscriber packets that are matching a firewall ruledef with no NAT realm name configured.
nat_realm specifies the NAT realm name, and must be a string of 1 through 31 characters in length.
bypass-nat: Specifies that packets bypass Network Address Translation (NAT).

Important: If the **nat-realm** is not configured, NAT is performed if the **nat policy nat-required** CLI command is configured with the **default-nat-realm** option.

trigger open-port { *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **}**: Permits packets if the rule is matched, and allows the creation of data flows for firewall. Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.
aux_port_number: Specifies the number of auxiliary ports to open for traffic, and must be an integer from 1 through 65535.
range *start_port_number* to *end_port_number*: Specifies the range of ports to open for subscriber traffic.
start_port_number must be an integer from 1 through 65535. This is the start of the port range and must be less than *end_port_number*.
end_port_number must be an integer from 1 through 65535. This is the end of the port range and must be greater than *start_port_number*.

direction { both | reverse | same }

Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.
both: Provides the trigger to open port for traffic in either direction of the control connection.
reverse: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
same: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add firewall ruledefs to the rulebase and configure the priority, type, and port triggers. Port trigger configuration is optional. Port trigger can be configured only if a rule action is permit.
The rulebase specifies the firewall rules to be applied on the calls. The ruledefs within a rulebase have priorities, based on which priority matching is done. Once a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association which matches the rule.
Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.
Once a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.

- If the content ID is configured, UDR information is updated.
- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For firewall ruledefs, only the terminate-flow action is applicable if configured in the specified charging action.

For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command.
The GGSN can dynamically activate/deactivate dynamic firewall ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the rulebase is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example
The following command assigns a priority of *10* to the firewall ruledef *fw_rule1*, adds it to the rulebase, and permits port trigger to be used for the rule to open ports in the range of *100* to *200* in either direction of the control connection:
firewall priority *10* firewall-ruledef *fw_rule1* permit trigger open-port range *100* to *200* direction both
The following command configures the firewall ruledef *fw_rule2* as a dynamic ruledef:
firewall priority *7* dynamic-only firewall-ruledef *fw_rule2* deny

firewall tcp-first-packet-non-syn

This command configures the action to take on TCP flow starting with a non-syn packet.

Important: In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-first-packet-non-syn { drop | reset }

default firewall tcp-first-packet-non-syn
```

`default`

Sets the default action setting.
Default: drop

`drop | reset`

Specifies the action to take on TCP flow starting with a non-syn packet.
`drop`: Drops the packet or session
`reset`: Sends reset

Usage

Use this command to configure action to take on TCP flow starting with a non-syn packet.

Example

The following command configures action to take on TCP flow starting with a non-syn packet to drop:

```
firewall tcp-first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command configures action to take on TCP idle timeout expiry.

Important: In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-idle-timeout-action { drop | reset }

default firewall tcp-idle-timeout-action
```

default

Sets the default action setting.
Default: reset

drop | reset

Specifies the action to take on TCP timeout expiry.
drop: Drops the packet or session
reset: Sends reset

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Important: This command is only available in StarOS 8.3 and later. In StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-reset-message-threshold *messages* **then-block-server**

{ default | no } firewall tcp-reset-message-threshold

default

Configures the default setting.
Default: The same as **no firewall tcp-reset-message-threshold**

no

Removes the previous configuration.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to *10*:

firewall tcp-reset-message-threshold *10* then-block-server

firewall tcp-syn-flood-intercept

This command enables and configures the TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-syn-flood-intercept { mode { none | watch [aggressive] } | watch-timeout *intercept_watch_timeout* **}**

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default

Sets the default values of TCP intercept parameters for SYN Flood DoS protection.

mode { none | watch [aggressive] }

Specifies the TCP SYN flood intercept mode:

- **none**: Disables TCP SYN flood intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks.
The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the TCP intercept watch timeout setting to *5* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 5
```

flow any-error

This command specifies the charging action to be used for packets dropped by Firewall due to any error conditions.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

flow any-error charging-action *charging_action*

default flow any-error

default

Configures the default action for packets dropped by Firewall due to any errors.
Default: Update the flow stats if flow is available

charging-action *charging_action*

Specifies the charging action based on which accounting action is taken on packets dropped by Firewall due to any errors.

Important: The charging action specified here should preferably not be used for action on packets dropped due to firewall ruledef match or no-match (in the **firewall priority** and **firewall no-ruledef-matches** commands) and the content ID within the charging action must be unique so that dropped counts will not interfere with other content IDs.

charging_action must be the name of a charging action, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the charging action for packets dropped by Firewall due to any error conditions, such as, a packet being inappropriate based on the state of the protocol of the packet's session, or Firewall DoS protection causing the packet to be discarded, and so on.
For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For a packet dropped due to any error condition after data session is created, the charging action used is the one configured in the **flow any-error charging-action** command.
If the charging action applied on a packet is the one specified in the **flow any-error charging-action** command, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.

- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Example

The following command specifies the charging action *test2* for accounting action on packets dropped/discarded by Firewall due to any error:

flow any-error charging-action *test2*

flow control-handshaking

This command specifies how to charge for the control traffic associated with an application.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
flow control-handshaking { charge-to-application { [ all-packets ] [ initial-packets ] [ mid-session-packets ] [ tear-down-packets ] } | charge-separate-from-application }

default flow control-handshaking

no flow control-handshaking [ charge-to-application ]
```

`no flow control-handshaking [ charge-to-application ]`

Removes the previous flow control-handshaking configuration. The control packets will use whatever content-id is determined by the normal use of the action CLI commands.
In this command, the optional keyword **`charge-to-application`** is deprecated and has no effect.

`default flow control-handshaking`

Configures the default setting.
Default: The same as **`no flow control-handshaking`**.

`charge-to-application`

This keyword configures the charging action to include the flow control packets either during initial handshaking only or specified control packets during session for charging.

`all-packets`

Specifies that the initial setup packets will wait until the application has been determined before assigning the content-id, and all mid-session ACK packets, as well as, the final tear-down packets will use that content-id.

`initial-packets`

Specifies that only the initial setup packets will wait for content-id assignment.

`mid-session-packets`

Specifies that the ACK packets after the initial setup will use the application's or content-id assignment.

`tear-down-packets`

Specifies that the final tear-down packets (TCP or WAP) will use the application's or content-id assignment.

charge-separate-from-application

This keyword configures the charging action to separate the charging of the initial control packets or all subsequent control packets from regular charging.

Usage

Use this command to configure how to charge for the control traffic associated with an application ruledef. Applications like HTTP use TCP to set up and tear down connections before the HTTP application starts. This CLI command controls whether the packets that set up and tear down the connections should use the same content ID as the application's flow.
In normal mode 3-way handshake TCP packets (SYN, SYN-ACK, and ACK) and closing or intermittent packets (FIN, RST, etc.) directed and charged based on configured matched rules. This command makes the system to wait for the start and stop of layer 7 packet flow and content ID and charge the initial, intermittent, and closing TCP packets as configured to the same matching rules and content ID as of the flow.
This CLI command also affects applications that do not use TCP but use other methods for control packets, e.g., WAP where WTP/UDP may be used to set up and tear down connection-oriented WSP.

Example

Following command enables the charging for initial TCP handshaking control packets and wait for content-id of data traffic flow:

```
flow control-handshaking charge-to-application initial-packets
```

The following command enables charging all mid-session ACKs as well as tear-down packets to application:

```
flow control-handshaking charge-to-application mid-session-packets tear-down-packets
```

flow end-condition

This command sets the end condition of the session flows related to a user session and triggers the EDR generation.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
flow end-condition { { content-filtering | normal-end-signaling | timeout + } |
{ { hagr | handoff | session-end } [ flow-overflow ] + } [ url-blacklisting ] }
edr edr_format

no flow end-condition
```

no

Removes the previously configured end condition of the EDR flow related to a user session.

content-filtering

Specifies to create an EDR with format named *edr_format* when category-based content filtering application action leads to a flow end. Possible Content-filtering actions redirect-url, terminate-flow, content-insert.

hagr

Specify to create an EDR with format named *edr_format* when flow ended due to session handoff according to Interchassis Session Recovery support.

handoff

Specify to create an EDR with format named *edr_format* when flow ended due to hand-off. Whenever a handoff occurs, ACS closes the EDRs for all current flows using the EDR format *edr_format*, and begin new statistics collection for the flows for the EDRs that will be generated when the flows actually end.

normal-end-signaling

Specifies the flow end condition as normal when a flow end is signaled normally like detecting FIN and ACK for a TCP flow, or a WSP-DISCONNECT terminating a connection-oriented WSP flow over UDP) and create an EDR for the flow using the EDR format *edr_format*.

session-end

Specify to create an EDR when a subscriber session ends. By this option ACS creates an EDR with format named *edr_format* for every flow that has had any activity since last EDR was created for the flow on session end.

timeout

Specify to create an EDT with format named *edr_format* when a flow ends or deleted due to a timeout condition.

flow-overflow

Important: This keyword is only available in StarOS 8.3 and later. And, is only applicable when used with the **hagr**, **handoff**, and **session-end** keywords.

Specifies generation of flow-overflow EDR for conditions that affect the callline. If any of the specified end-conditions that affect subscriber information stored at ACS (i.e. callline) is configured the "flow-overflow" EDR is generated.

url-blacklisting

Specifies to create an EDR with format named *edr_format* when URL Blacklisting application action leads to a flow end.

+

More than one of the keywords can be entered within a single command.

edr *edr_format*

Specifies the EDR format name to record EDR in specified flow end condition.
edr_format is a pre-configured format, and must be a unique alpha and/or numeric string 1 through 63 characters in length.

Usage

Use this command to enable or disable the capturing of EDRs based on flow end condition.

Example

The following command defines the end condition as handoff for flow and creates an EDR with as per format named *EDR_format1*:

flow end-condition handoff edr-format *EDR_format1*

flow limit-across-applications

This command limits the total number of simultaneous flows per Subscriber/APN sent to a rulebase regardless of the flow type, or limit flows based on the protocol type under the Session Control feature.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

flow limit-across-applications { *limit* | non-tcp *limit* | tcp *limit* }

no flow limit-across-applications [non-tcp | tcp]

no

Removes previously configured flow limit related to a rulebase.

limit

Specifies the maximum number of flows across all applications for a rulebase.
limit must be an integer from 1 through 4000000000.
Default: No limits

non-tcp *limit*

Specifies the maximum limit of non-TCP type flows.
limit must be an integer from 1 through 4000000000.
Default: No limits

tcp *limit*

Specifies the maximum limit of TCP flows.
limit must be an integer from 1 through 4000000000.
Default: No limits

Usage

Use this command to limit the total number of flows allowed for a rulebase regardless of flow type, or limit flows based on the protocol—non-TCP (connection-less) or TCP (connection-oriented).
If a subscriber attempts to exceed these limits system discards the packets of new flow. This limit processing of this command has following aspects for UDP, TCP, ICMP and some of the exempted flows:
UDP/ICMP: System waits for the flow timeout before updating the counter and removing it from the count of number of flows.
TCP: After a TCP flow ends, system waits for a short period of time to accommodate the retransmission of any missed packet from one end. TCP flows those are ended, but are still in wait period for timeout are exempted for this limit processing.
Exempted flows: System exempts all the other flows specified with the **flow limit-for-flow-type** command in the Charging Action Configuration Mode set to **no**.

Example

The following command defines the maximum number of *200000* flows for a rulebase:

flow limit-across-applications *200000*

fw-and-nat default-policy

This command configures the default Firewall-and-NAT policy for an ACS Rulebase.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later. This command must be used to configure the Policy-based Firewall-and-NAT feature.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat default-policy *fw_nat_policy*

no fw-and-nat default-policy

no

Removes the previously configured Firewall-and-NAT policy configured for the current rulebase.

fw_nat_policy

Specifies the Firewall-and-NAT policy name.
fw_nat_policy must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the default Firewall-and-NAT policy for an ACS rulebase.
This policy is used for a subscriber only if:

- In the APN/subscriber configuration modes, the **default fw-and-nat policy** command is configured.
- Or, a policy to use is not received from the AAA/OCS.

For more information, see the *Personal Stateful Firewall Administration Guide*.

Example

The following command configures a Firewall-and-NAT policy named *standard* to the rulebase:
fw-and-nat default-policy *standard*

ip reassembly-timeout

This command configures how long to hold onto IP fragments for reassembly, while waiting for the complete packet to arrive.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

ip reassembly-timeout *timeout_duration*

default ip reassembly-timeout

default

Sets the timeout timer to 5000 milliseconds.

timeout_duration

Specifies the user configured value to timeout timer to hold fragmented packets before reassembly. *timeout_duration* is the duration, in milliseconds, and must be an integer from 100 through 30000.

Usage

Use this command to configure duration for timeout timer to hold IP fragmented packets before reassembly is needed.
IP fragmented packet are retained, until either all fragmented packets have been received or the configured timeout has expired for the oldest fragment. If all fragments have been received, a temporary complete packet is reconstructed for analysis. Then all fragments are forwarded in order from first to last. If all fragments are not received, the fragments will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.

Example

The following command sets the timeout timer to *15000* milliseconds:

ip reassembly-timeout *15000*

ip reset-tos

This command enables the system to reset the IP Type of Service (ToS) value to zero.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ip tos-reset
```

default

Sets the default configuration.
Default: Do not reset the ToS to zero

no

Removes the previous configuration.

Usage

Use this command to reset the ToS field of any packet after it reaches ECS, or to broaden the range of values that are used in the ToS field in the IP header of any packet.

nat binding-record

Configures the NAT binding record generation setting.

Important: This command is only available in StarOS 8.3. In StarOS 9.0 this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat binding-record edr-format *edr_format* **[port-chunk-allocation] [port-chunk-release] +**

{ default | no } nat binding-record

default

Configures the default setting.
Default: port-chunk-release

no

Deletes the previous NAT binding record configuration.

edr-format *edr_format*

Specifies the EDR format name.
edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

port-chunk-allocation

Specifies generating NAT bind record when a port chunk is allocated.

port-chunk-release

Specifies generating NAT bind record when a port chunk is released.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure the NAT binding record generation setting.

Example

The following command configures an EDR format named *test123* and specifies generating NAT binding record when a port chunk is allocated, and when a port chunk is released:

nat binding-record edr-format *test123* port-chunk-allocation port-chunk-release

nat policy

This command enables/disables Network Address Translation (NAT) processing for all subscribers using this rulebase.

Important: In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Important: Before enabling NAT processing for a subscriber, Firewall must be enabled for the subscriber. See the firewall policy CLI command.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat policy nat-required [default-nat-realm *realm_name* **]**

{ default | no } nat policy

default

Sets the default NAT processing setting for all subscribers using this rulebase.
Default: Disabled

no

Disables NAT processing for all subscribers using this rulebase.

nat-required

Enables NAT processing for all subscribers using this rulebase.

default-nat-realm *realm_name*

Important: This keyword is only available in StarOS 8.3 and later.

Specifies the default NAT realm to be used if one is not already configured.
realm_name must be an alpha and/or numeric string of 1 through 31 characters in length.

Important: Including the default NAT realm, a maximum of three NAT realms are supported.

Usage

Use this command to enable/disable NAT processing for all subscribers using this rulebase.

Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms defined in the rule priority lines within the rulebase. See the firewall priority CLI command.
NAT enable/disable status in the rulebase can be changed any time, however the changed NAT status will not be applied for active calls using the rulebase. The new NAT status is only applied to new calls.

Example
The following command enables NAT processing:
```
nat policy nat-required
```
The following command disables NAT processing:
```
no nat policy
```

nat suppress-aaa-update

This command suppresses the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens.

Important: This command is customer-specific. For more information please contact your local service representative. In StarOS 9.0, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat suppress-aaa-update call-termination

default nat suppress-aaa-update
```

default

Configures the default setting.
Default: No suppression of AAA updates

Usage

Use this command to suppress the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NAT bind updates are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

Example

The following command suppresses the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens:

```
nat suppress-aaa-update call-termination
```

p2p dynamic-flow-detection

This command enables the P2P analyzer to detect P2P applications configured for the Active Charging service.

Product

P2P

Privilege

Security Administrator, Administrator

Syntax

```
p2p dynamic-flow-detection

{ default | no } p2p dynamic-flow-detection
```

default

Configures the default setting.
Default: **no p2p dynamic-flow-detection**

no

Disables detecting P2P applications with the P2P analyzer.

Usage

Use this command to set up dynamic-flow detection. This allows the P2P analyzer to detect the P2P applications configured for the Active Charging service.

post-processing priority

This command configures the post-processing priority and action to be taken on the specified ruledef in the rulebase.

Important: This command is only available in StarOS 8.3 and later.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

post-processing priority *priority* **{ group-of-ruledefs** *group_name* **| ruledef** *ruledef_name* **} charging-action** *charging_action_name* **[description** *description* **]**

no post-processing priority *priority*

priority *priority*

Specifies priority for the ruledef/group-of-ruledefs in the rulebase.
priority must be an integer from 1 through 65535, and must be unique.

group-of-ruledefs *group_name*

Assigns the specified group-of-ruledefs to the rulebase.
group_name must be the name of a group-of-ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: The group-of-ruledefs specified must be configured for post-processing. See the **group-of-ruledefs-application** CLI command in the Group-of-Ruledefs Configuration mode.

ruledef *ruledef_name*

Assign the specified ruledef to the rulebase.
ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: The ruledef specified must be configured for post-processing. See the **rule-application** CLI command in the Ruledef Configuration mode.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be an alpha and/or numeric string of 1 through 63 characters in length.

description *description*

Specifies optional description for this configuration.
description must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure the post-processing priority and action to be taken on a ruledef in the rulebase.

Example

The following command configures the ruledef named *test_ruledef* with a priority of *10*, and the charging action named *test_ca* for post processing:

post-processing priority *10* ruledef *test_ruledef* charging-action *test_ca*

post-processing dynamic

This command configures specified ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs enabling to differentiate between normal post-processing rules from pre-configured ones. Default: Disabled

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

post-processing dynamic { group-of-ruledefs *group_name* **| ruledef** *ruledef_name* **}**
charging-action *charging_action* **[description** *description* **]**

no post-processing dynamic { group-of-ruledefs *group_name* **| ruledef** *ruledef_name* **}**

no

Removes the specified post-processing dynamic configuration.

group-of-ruledefs *group_name*

Assigns the specified group-of-ruledefs to the current rulebase.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

ruledef *ruledef_name*

Assigns the specified ruledef to the current rulebase.
ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length.

charging-action *charging_action*

Specifies charging action.
charging_action must be an alpha and/or numeric string of 1 through 63 characters in length.

description *description*

Specifies optional description for this configuration.
description must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure specific ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs enabling to differentiate between normal post-processing rules from the pre-configured ones. This makes possible enabling/disabling ruledefs/groups-of-ruledefs entry from external server.

Example

The following command specifies the ruledef named *test_rule* as a dynamic post-processing ruledef configured with the charging action *ca13* and a description of *testing*:

post-processing dynamic ruledef *test_rule* charging-action *ca13* description *testing*

qos-renegotiate timeout

This command configures the timeout setting for the Quality of Service (QoS) Renegotiation feature.

Important: This command is controlled by the dynamic-qos-renegotiation license.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-renegotiate timeout *timeout*

no qos-renegotiate timeout

no

Disables timeout setting if previously configured.

timeout *timeout*

Specifies the timeout period for QoS Renegotiation feature in this rulebase.
timeout must be the timeout period, in seconds, and must be an integer from 0 through 4294967295.
If set to 0, timeout is disabled.

Usage

Use this command to configure timeout setting for the QoS Renegotiation feature.

Example

The following command sets the QoS renegotiate timeout period to 1000 seconds:
qos-renegotiate timeout *1000*

radius threshold

This command sets the interval and volume thresholds to generate the interim RADIUS CDRs and write them to CDR file for ECS postpaid billing.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius threshold { interval *interval* **| volume total** *volume* **}**

{ no | default } radius threshold { interval | volume total }

no

Removes the previously RADIUS threshold configuration.

default

Configures the default settings.

interval *interval*

Default: Disabled
Specifies the time interval (in seconds) for generating RADIUS interim accounting requests. This option is disabled by default. *interval* must be an integer from 60 through 40000000.

volume total *volume*

Default: Disabled
Specifies the limit for the total number of octets (uplink+downlink) after which a stop-start pair will be sent to RADIUS.
volume must be an integer from 100,000 to 4,000,000,000.

Usage

Use this command to specify a time interval threshold to generate interim RADIUS CDRs and write it to RADIUS CDR file for postpaid billing.

Example

The following command defines a time threshold interval of *600* seconds for RADIUS CDRs:
radius threshold interval *600*

route priority

This command controls routing of packets to protocol analyzers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

route priority *route_priority* **ruledef** *ruledef_name* **analyzer { dns | file-transfer | ftp-control | ftp-data | http | imap | mms | p2p | pop3 | pptp | rtcp | rtp | rtsp | sdp | secure-http | sip [advanced] | smtp | tftp | wsp-connection-less | wsp-connection-oriented } [description** *description* **]**

no route priority *route_priority*

---

no

Removes the specified route configuration from the current rulebase.

---

priority *route_priority*

Specifies the route priority for the ruledef in the current rulebase.
route_priority must be an integer from 1 through 65535.
Lower numbered priorities are examined first. Up to 1024 instances can be configured across all rulebases.

---

ruledef *ruledef_name*

Specifies the ruledef to evaluate packets to determine the analyzer.
ruledef_name specifies the name of an existing ruledef configured for the route application using the **rule-application** command in the Ruledef Configuration Mode.

---

analyzer

Specifies the analyzer for the ruledef, and must be one of the following:

- **dns**: Route to DNS protocol analyzer.
- **file-transfer**: Route to file analyzer.
- **ftp-control**: Route to FTP control protocol analyzer.
- **ftp-data**: Route to FTP data protocol analyzer.
- **http**: Route to HTTP protocol analyzer.
- **imap**: Route to IMAP protocol analyzer.
- **mms**: Route to MMS protocol analyzer.
- **p2p**: Route to the P2P protocol analyzer.
- **pop3**: Route to POP3 protocol analyzer.
- **pptp**: Route to PPTP protocol analyzer.
- **rtcp**: Route to RTCP protocol analyzer.

- **rtp**: Route to RTP protocol analyzer.
- **rtsp**: Route to RTSP protocol analyzer.
- **sdp**: Route to SDP protocol analyzer.
- **secure-http**: Route to secure HTTP protocol analyzer.
- **sip [advanced]**: Route to SIP protocol analyzer.

  For SIP calls to work with NAT/Stateful Firewall, a SIP ALG is required to do payload translation of SIP packets and pin-hole (dynamic flow) creation for media packets. A SIP routing rule must to be configured for routing the packets to the SIP ALG for processing. If the optional keyword **advanced** is configured, the packets matching the routing rule will be routed to SIP ALG for processing and not to ECS SIP analyzer. If not configured, then packets will be routed to ECS SIP analyzer for processing.

  Also, see **firewall nat-alg** CLI command in the ACS Configuration Mode.
- **tftp**: Route to TFTP protocol analyzer.
- **smtp**: Route to SMTP protocol analyzer.
- **wsp-connection-less**: Route to WSP connection-less protocol analyzer.
- **wsp-connection-oriented**: Route to WSP connection-oriented protocol analyzer.

Important: To route packets to the P2P analyzer, the ruledef should have rules to match all IP packets. Otherwise, the analyzer may not detect all P2P traffic.

Important: Use the **show active-charging analyzer statistics** command in the Exec Mode to see the list of supported analyzers.

description *description*

Enables to add a description to the rule and action for later reference in saved configuration file. *description* must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Instances of this CLI command control which packets are routed to which protocol analyzers. Packets sent to Active Charging are always passed through the IP protocol analyzer. This CLI command controls which higher layer analyzers are also invoked.

Analyzer	Common ways to route to the analyzer
ip	All IPv4 packets are automatically routed here.
icmp	All IPv4 packets with IP protocol = ICMP (1) are automatically routed here.
tcp	All IPv4 packets with IP protocol = TCP (6) are automatically routed here.
udp	All IPv4 packets with IP protocol = UDP (17) are automatically routed here.
dns	UDP destination port or source port is DNS (53).
http	TCP destination port or source port is HTTP (80).

Analyzer	Common ways to route to the analyzer
secure-http	TCP destination port or source port is HTTPS (443). Note that HTTP may use the CONNECT method (see RFC 2817), in which case, the subscriber will be upgraded with transport layer security, but the traffic to/from the chassis will still be HTTP and be passed through the http rather than the secure-http analyzer (assuming that routing to the http analyzer has been configured).
wsp	UDP destination port or source port is connection-less WSP (9200) or connection-oriented WSP (9201).
wtp	Packets are automatically routed here, if you specified "wsp-connection-oriented" as described above.
wap2	TCP destination port or source port of the carrier-specific port number for WAP-2 (e.g. one carrier uses 8799); or, send all HTTP traffic to the **wap2** analyzer if the carrier does not use a special port number.
ftp	TCP destination port or source port is FTP control (21) or FTP data (20); or, ftp analyzer (for FTP control packets) dynamically detected an FTP data flow over TCP (tcp dynamic-flow = ftp-data).
file-transfer	FTP and the command name is **retr** or **stor**; or, HTTP and the request method is **get** or **post**.
mms	WSP content type is application/vnd.wap.**mms**-message; or, WSP uri contains "**mms**"; or, HTTP content type is application/vnd.wap.mms-message; or, HTTP uri contains "**mms**".
sip	UDP destination port or source port is SIP (5060).
sdp	RTSP or SIP content type is application/sdp
smtp	TCP destination port or source port is SMTP (25).
imap	TCP destination port or source port is IMAP (143).
pop3	TCP destination port or source port is POP3 (110).
rtp and **rtcp**	RTSP has embedded RTP/RTCP payloads (you need to enable RTP dynamic flow detection to catch those flows); or, RTSP or SDP (for SDP within SIP) creates an RTP/RTCP flow over UDP (in addition to enabling the aforementioned dynamic flow detection, you must make sure that UDP packets are routed to the UDP analyzer) or, RTP/RTCP uses predefined UDP port numbers (e.g. default UDP port numbers of 5004/5005).
rtsp	TCP destination port or source port is RTSP (554).
p2p	Use the **p2p dynamic-flow-detection** CLI command to enable detection of the different P2P applications specified by the **p2p application** CLI command; that will cause every TCP or UDP packet to be automatically routed here

Example

The following command assigns a route and rule action with the route priority of 23, a ruledef of *test*, and an analyzer *test_analyzer* with description as *route_test1* to the current rulebase:

route priority *23* ruledef *test* analizer *test_analyzer* description *route_test1*

rtp dynamic-flow-detection

This command enables the RTSP and SDP analyzers to detect the start/stop of RTP and RTCP flows.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] rtp dynamic-flow-detection
```

no

Disables the previous RTP dynamic flow detection configuration.

default

Sets the default RTP dynamic flow detection configuration.
Default: **no rtp dynamic-flow-detection**

Usage

Use this command to enable the RTSP and SDP analyzer to detect the start/stop of RTP and RTCP flows. This command is used in conjunction with the **route priority** command.

Example

The following command enables RTP dynamic flow detection:

```
rtp dynamic-flow-detection
```

ruledef-parsing

This command configures whether to consider/ignore the port number embedded in the application header (for example, the ":80" in www.starentnetworks.com:80) when comparing the ruledef expressions to the packet contents.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ruledef-parsing ignore-port-numbers-embedded-in-application-headers
analyzers { http rtsp sip wsp }

default ruledef-parsing
```

no

Disables the previous configuration.

default

Sets the default configuration.
Default: **no ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers { http rstp sip wsp }**—not ignoring port numbers that are embedded in application headers

ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }

Specifies to ignore the port numbers present in application header.
Specifies analyzers for which port number must be ignored.

Usage

Use this command to make the HTTP, RTSP, SIP, and WSP analyzer ignore port numbers embedded in application headers.

Example

The following command makes the HTTP analyzer in the current rulebase ignore port numbers embedded in application headers:

```
ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers
http
```

tcp 2msl-timeout

This command configures how long to retain the TCP flow after the FIN has been acknowledged.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

tcp 2msl-timeout*seconds*

{ default | no } tcp 2msl-timeout

default

Sets the default setting.
Default: 2 seconds

no

Disables the timeout and sets the system to delete the flow immediately upon seeing the FIN be acknowledged.

seconds

The period of time, in seconds, to keep the TCP flow.
seconds must be an integer from 1 through 20.

Usage

Use this command to configures how long to retain the TCP flow after the FIN has been acknowledged. Acknowledgment to the FIN is not guaranteed to be received by the destination, then the FIN could be resent and re-acknowledged. In this scenario, it is desirable to still have the flow, so that the re-sends do not create a new flow.

Example

The following command sets the timeout to 4 seconds:
tcp 2msl-timeout *4*

tcp check-window-size

This command enables/disables TCP window-size check.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] tcp check-window-size
```

default

Sets the default setting.
Default: enabled, i.e. packets after the erroneous packet (with size > receiver's window size) will hit tcp-error ruledef.

no

Disables the window-size check, and will continue with normal L7 parsing.

Usage

Use this command to enable/disable TCP window-size check for packets out of TCP window.

Example

The following command enables TCP window-size check:

```
tcp check-window-size
```

tcp mss

This command configures the TCP Maximum Segment Size (MSS) in TCP SYN packets.

Important: This command is only available in StarOS 8.1 and later releases.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
tcp mss tcp_mss { add-if-not-present | limit-if-present } +
{ default | no } tcp mss
```

default

Removes the previously configured setting.

no

Removes the previously configured setting.

tcp_mss

Specifies the TCP MSS value.
tcp_mss must be an integer from 496 through 65535.

add-if-not-present

Adds the TCP MSS if not present in the packet.

limit-if-present

Limits the TCP MSS if present in the packet.

Usage

Using this command, TCP MSS can be limited if already present in the TCP SYN packets. If there are no errors detected in IP header/TCP mandatory header and there are no mem allocation failures, TCP optional header is parsed. If TCP MSS is present in the optional header and its value is greater than the configured MSS value, the value present in the TCP packet is replaced with the configured one.
If the TCP optional header is not present in the SYN packet and there are no errors in already present TCP header, the TCP MSS value configured will be inserted while sending the current packet out.

Example

The following command limits the TCP maximum segment size to *3000*, and if not present adds it to the packets:

```
tcp mss 3000 limit-if-present add-if-not-present
```

tcp out-of-order-timeout

Description This command has been deprecated, and is replaced by the tcp packets-out-of-order command.

tcp packets-out-of-order

This command configures processing of TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
tcp packets-out-of-order { timeout duration_ms | transmit [ after-reordering |
immediately ] }

default tcp packets-out-of-order { timeout | transmit }
```

timeout *duration_ms*

Default: 5000 milliseconds
Specifies the timeout period for re-assembly of TCP out-of-order packets. *duration_ms* is the timeout period in milliseconds, and must be an integer from 100 through 30000.

transmit [after-reordering | immediately]

Configures the TCP out-of-order segment behavior after buffering a copy.

- **after-reordering**: Sends the TCP out-of-order segment after all packets are received and successfully reordered. If reordering is not successful due to a timeout, the received packets are forwarded without being passed through the protocol analyzers. If memory allocation fails or the received packet is partial retransmitted data, the packet will be forwarded immediately without being passed through the protocol analyzers, except for the IP analyzer.
- **immediately**: Sends the TCP out-of-order segment immediately after buffering a copy. The packets are transmitted as they are received without any in-line services or charging action processing, but also a copy of each packet is held onto. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is done, and then the last packet is forwarded.

Default: **immediately**

Usage

This command configures how to process TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Example

The following command sets the timeout timer to *10000* milliseconds:

```
tcp packets-out-of-order timeout 10000
```

timestamp rounding

This command enables the configuration of timestamp rounding in an EDR or eG-CDR.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
timestamp rounding { edr | egcdr ) { ceiling | floor | round-off }

{ no | default } timestamp rounding { edr | egcdr )
```

no | default

Default: **round-off**
Sets the default setting for timestamp rounding.

edr

Perform the timestamp rounding for EDRs.

egcdr

Perform the timestamp rounding for eG-CDRs.

ceiling

If the fractional part of the seconds is greater than 0, then this keyword adds 1 to the number of seconds and discard the fraction.

floor

This keyword always discards the fractional part of the second.

round-off

This keyword sets the fractional part of the seconds to nearest integer value. If fractional value is greater than or equal to 0.5, it adds 1 to the number of seconds and discards the fractional part of second.

Usage

Use this command to configure the timestamp rounding setting.
The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., 2 – 1 = 1).
This command may be repeated for each type of EDR or eG-CDR.

Example

The following command sets the EDR timestamp to nearest integer value second; i.e. 34:12.23 to 34:12.00:

```
timestamp rounding edr round-off
```

transport-layer-checksum

This command enables/disables checksum verification for TCP and UDP packets.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] transport-layer-checksum verify-during-packet-inspection [ tcp | udp ]

default transport-layer-checksum
```

no

Disables the checksum calculation for the specified packet type.

default

Sets the default configuration.
Default: **transport-layer-checksum verify-during-packet-inspection**—to perform the checksum verification calculation on all TCP and UDP packets.

[tcp | udp]

Specifies that either TCP or UDP packets should be verified or not verified.
If neither of these keywords is specified the command applies to both TCP and UDP packets.

Usage

Use this command to disable or enable performing checksum verification calculations on TCP or UDP packets.
If the checksum is not verified, the packets will go through the TCP/UDP analyzers (and deeper analyzers, if so configured with the **route** CLI command) regardless of the value of the TCP/UDP checksum.
If the checksum is verified, only packets with good checksums will go through the TCP/UDP analyzers (and deeper analyzers, if so configured).

Example

The following command disables checksum verification calculations on all TCP and UDP packets:

```
no transport-layer-checksum verify-during-packet-inspection
```

udr threshold

This command defines and enables the threshold limit to generate User Detail Records (UDRs) that provide Comma Separated Value (CSV) records written periodically in a fixed schema designed to reflect a total billable quantity.

Product

All

Privilege

Security Administrator, Administrator

Syntax

udr threshold { interval *interval* **| volume { downlink** *bytes* **[uplink***bytes***] | total***bytes***| downlink***bytes***[uplink***bytes***] }}**

default udr threshold { interval | volume }

no udr threshold { interval | volume { downlink [uplink] | total | uplink [downlink] } }

no

Removes the previous configuration.

default

Sets the default configuration.
Default: **no udr threshold interval**; **no udr threshold volume**—disables the UDR threshold settings.

interval *interval*

Default: 0 (Disabled)
Specifies the time interval in seconds for closing the UDR if the minimum time duration thresholds are satisfied. This option is disabled by default.
interval must be an integer from 60 through 40000000.

volume

Specifies the uplink/downlink volume octet counts for the generation of the interim UDRs.

- **downlink** *bytes*: Sets the limit for the number of octets downlink after which the UDR is closed. *bytes* (in bytes) must be an integer from 100,000 to 4,000,000,000. Default is 4,000,000,000.
- **total** *bytes*: Sets the limit for the total number of octets (uplink+downlink) after which the UDR is closed. *bytes* (in bytes) must be an integer from 100,000 to 4,000,000,000. By default, this configuration is disabled.
- **uplink** *bytes*: Sets the limit for the number of octets uplink after which the UDR is closed. *bytes* (in bytes) must be an integer from 100,000 through 4,000,000,000. Default is 4,000,000,000.

UDR records are generated whenever either threshold is reached.

Usage

Use this command to enable the thresholds for generation of UDRs.

Example

The following command specifies that UDR records should be generated every 10 minutes (*600* seconds):

udr threshold interval *600*

udr trigger

Use this command to assign first packet trigger to interim UDRs—for generating UDR for first packet hit per rating group/content ID.

Important: This command is only available in StarOS 8.3 and later.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udr trigger first-hit-content-id

default udr trigger
```

no

Disables assigning first packet trigger to interim UDRs.

default

Configures the default setting.
Default: Disabled

first-hit-content-id

Specifies interim UDR generation on first packet hit per rating group/content ID.

Usage

This command enables generating UDR for first packet hit per rating group/content ID. Generation of UDR will be triggered when this CLI command is present in the rulebase.

Example

The following command assigns first packet trigger to interim UDRs, for generating UDR for first packet hit per rating group/content ID:

```
udr trigger first-hit-content-id
```

url-blacklisting action

This command enables/disables URL Blacklisting functionality for the rulebase, and configures the action to be taken when a URL matches one in the URL Blacklist.

Product

ECS, CF

Privilege

Security Administrator, Administrator

Syntax

url-blacklisting action { discard | redirect-url *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **}** [edr]

{ default | no } url-blacklisting action

[default | no] url-blacklisting action

Disables the URL Blacklisting feature for this rulebase.

discard

Configures URL Blacklisting discard action.

redirect-url *url*

Configures URL Blacklisting redirect-url action.
url specifies the redirect URL/URI. *url* must be a fully qualified URL/URI, and must be a string of 1 through 1023 characters in length.

terminate-flow

Configures URL Blacklisting terminate-flow action.

www-reply-code-and-terminate-flow *reply_code*

Configures URL Blacklisting terminate-flow action with reply code.
reply_code specifies the reply code, and must be an integer from 100 through 599.

Usage

Use this command to enable/disable URL Blacklisting functionality, and configure the EDRs to be generated on Blacklisting match and the action to be taken.

Example

The following command enables URL Blacklisting functionality, and configures the terminate-flow action with reply code 300:

url-blacklisting action www-reply-code-and-terminate-flow *300*

The following command disables URL Blacklisting feature in the rulebase:

no url-blacklisting action

url-preprocessing

This command enables/disables a group-of-prefixed-urls for preprocessing.

Important: This command is customer specific. For more information, please contact your local service representative.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] url-preprocessing bypass group-of-prefixed-urls` *`group_name`*

`no`

Removes configuration for the specified group-of-prefixed-urls.

`group_name`

Specifies the group-of-prefixed-urls name.
`group_name` must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to enable/disable a group-of-prefixed-urls. Multiple groups can be be enabled.

Example

The following command enables looking for prefixed URLs of the group-of-prefixed-urls named *`test5`*:

`url-preprocessing bypass group-of-prefixed-urls` ***`test5`***

wtp out-of-order-timeout

Description This command has been deprecated, and is replaced by the wtp packets-out-of-order command.

wtp packets-out-of-order

This command configures how to process WTP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
wtp packets-out-of-order { out-of-order-timeout timeout | transmit [ after-
reordering | immediately ] }

default wtp packets-out-of-order { out-of-order-timeout | transmit }
```

default

Configures the default setting.

out-of-order-timeout *timeout*

Specifies the maximum duration for which WTP out-of-order packets are retained, in milliseconds, before reassembly is needed.
timeout is the timeout duration in milliseconds, and must be an integer from 100 through 30000.
Default: 5000 milliseconds

transmit [after-reordering | immediately]

Specifies the WTP out-of-order segment behavior after buffering a copy:
after-reordering: Send WTP out-of-order segment after it becomes ordered
immediately: Send WTP out-of-order segment immediately after buffering a copy
Default: **immediately**

Usage

Use this command to configure TCP out-of-order segment options.
If out-of-order-timeout is specified, out-of-order packets are retained, until either all packets have been received or the configured timeout has expired for the oldest packet. If all packets have been received, a temporary complete packet is reconstructed for analysis. Then all packets are forwarded in order from first to last. If all packets are not received, the packets will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.
If **after-reordering** transmitting is specified, the packets are held onto and reordered. After successfully reordering the packets, they are processed in the proper order. If reordering is not successful due to timeout (wtp out-of-order-timeout), the received packets are forwarded without being passed through the protocol analyzers.
If **immediately** is specified, the packets are transmitted as they are received without any in-line services or Charging Action processing, however a copy of each packet is retained. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is undertaken, and then the last packet is forward (unless otherwise configured by the in-line services or Charging Action).

Example

The following command sets the timeout timer to *10000* milliseconds:

wtp out-of-order-timeout *10000*

xheader-encryption

This command configures X-Header Encryption feature parameters.

Important: This command is license dependent. For more information, please contact your local sales representative.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

xheader-encryption { certificate-name *certificate_name* **| re-encryption period** *period* **}**

default xheader-encryption re-encryption period

no xheader-encryption { certificate-name | re-encryption }

default

Configures the default setting.
Default: no re-encryption

no

Removes the previously configured setting for the specified parameter.

certificate-name *certificate_name*

Specifies name of the encryption certificate to be used for X-Header Encryption feature.
certificate_name must be the name of a certificate, and must be an an alpha and/or numeric string of 1 through 63 characters in length.

re-encryption *period*

Specifies how often to re-generate the encryption keys.
period specifies the re-encryption time period in minutes, and must be an integer from 1 through 10000.

Usage

Use this command to configure the X-Header Encryption feature's certificate and re-encryption parameters.

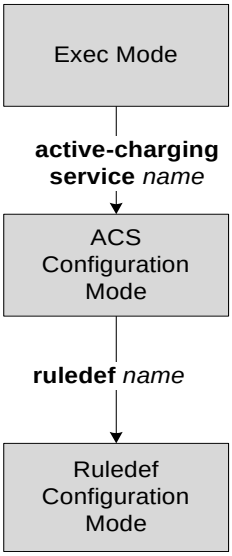
Example

The following command configures the X-Header Encryption feature to use the certificate named *testcert*:
xheader-encryption certificate-name *testcert*

Chapter 182
Ruledef Configuration Mode Commands

The Ruledef Configuration Mode is used to create and manage ACS rule definitions.

Important: Up to 10 rule matches can be configured in one ruledef.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bearer

The following commands define rules for analyzing traffic based on the bearer channel:

bearer 3gpp apn

This command defines a rule definition to analyze and charge user traffic based on APN of the bearer flow.

Important: This command is only available in StarOS 8.1 and later.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer 3gpp apn [ case-sensitive ]` *`operator value`*

`no`

Removes the specified rule definition.

`[ case-sensitive ]`

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`value`

The name of the matching APN in bearer flow.
`value` must be an alpha and/or numeric string of 1 through 62 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on APN of the bearer flow.

Example

The following command creates a rule definition to analyze user traffic for an APN named *apn12*:

```
bearer 3gpp apn = apn12
```

bearer 3gpp imsi

This command defines a rule definition to analyze and charge user traffic based on the International Mobile Station Identification number (IMSI) in bearer flow.

Important: This command is only available in StarOS 8.1 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp imsi { *operator imsi* | { !range | range } imsi-pool *imsi_pool* }

no

Removes the specified rule definition.

operator

Specifies how to logically match the IMSI.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the mobile station identifier.

{ !range | range } imsi-pool *imsi_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IMSI.

Example

The following command creates a rule definition to analyze user traffic for the IMSI number *9198838330912*:

```
bearer 3gpp imsi = 9198838330912
```

bearer 3gpp rat-type

This command defines a rule definition to analyze and charge user traffic based on the Radio Access Technology (RAT) in bearer flow.

Important: This command is only available in StarOS 8.1 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp rat-type *operator rat*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

rat

The rat type associated with the bearer flow.

- **geran**: GSM EDGE Radio Access Network type
- **utran**: UMTS Terrestrial Radio Access Network type
- **wlan**: Wireless LAN type

Usage

Use this command to specify a rule definition to analyze user traffic based on RAT type.

Example

The following command creates a rule definition for analyzing user traffic for the WLAN RAT type *wlan*:

```
bearer 3gpp rat-type = wlan
```

bearer 3gpp sgsn-address

This command defines a rule definition to analyze and charge user traffic based on SGSN address associated in 3gpp bearer flow.

Important: This command is only available in StarOS 8.1 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp sgsn-address *operator address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

address

Specifies IP address of the SGSN node.
address must be an SGSN IP address expressed in standard IPv4 or IPv6 dotted decimal notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP address of SGSN node. This command replaces the **bearer sgsn-address** command.

Example

The following command creates a rule definition for analyzing user traffic for an SGSN node with IP address of *19.88.3.8*:

bearer 3gpp sgsn-address = *19.88.3.8*

bearer 3gpp2 bsid

This command defines a rule definition to analyze and charge user traffic based on the 3GPP2 service Base Station Identifier (BSID) for bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp2 bsid [case-sensitive]*operator bs_id*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

bs_id

The name of the matching 3GPP2 service Base Station ID (BSID) in bearer flow.
bs_id must be an alpha and/or numeric string of 1 through 12 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on 3GPP2 service Base Station Identifier (BSID).

Example

The following command creates a rule definition for analyzing user traffic for a 3GPP2 BSID named *bs001_xyz*:

bearer 3gpp2 bsid = *bs001_xyz*

bearer 3gpp2 service-option

This command defines a rule definition to analyze and charge user traffic based on the 3GPP2 service with service options for bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp2 service-option*operator option_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: more than or equals

option_code

The code of the matching 3GPP2 service option in bearer flow.
option_code must be an integer from 0 through 1000.

Usage

Use this command to specify a rule definition to analyze user traffic based on 3GPP2 service's service option code.

Example

The following command creates a rule definition for analyzing user traffic for a 3GPP2 service's service option as = *1034*:

bearer 3gpp2 service-option = *1034*

bearer apn

This command defines a rule definition to analyze and charge user traffic based on APN bearer.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp apn command.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bearer apn [case-sensitive]*operator value*

no

Removes the specified rule definition.

[case-sensitive]

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

value

The name of the matching APN in bearer flow.
value must be an alpha and/or numeric string of 1 through 62 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on APN name.

Example

The following command creates a rule definition for analyzing user traffic for an APN name *apn12*:

```
bearer apn = apn12
```

bearer imsi

This command defines a rule definition to analyze and charge user traffic based on International Mobile Station Identification number (IMSI) in bearer flow.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp imsi command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer imsi { *operator imsi* | { !range | range } imsi-pool *imsi_pool* }

no

Removes the specified rule definition.

operator

Specifies how to logically match the IMSI.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

msid

Specifies the Mobile Station Identifier.

{ !range | range } imsi-pool *imsi_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IMSI number of mobile station.

Example

The following command creates a rule definition to analyze user traffic for an IMSI number *9198838330912*:

bearer imsi = *9198838330912*

bearer rat-type

This command defines a rule definition to analyze and charge user traffic based on the Radio Access Technology (RAT) in bearer flow.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp rat-type command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer rat-type*operator rat*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

rat

The rat type associated with the bearer flow.

- **geran**: GSM EDGE Radio Access Network type
- **utran**: UMTS Terrestrial Radio Access Network type
- **wlan**: Wireless LAN type

Usage

Use this command to specify a rule definition to analyze user traffic based on RAT type.

Example

The following command creates a rule definition for analyzing user traffic for the WLAN RAT type *wlan*:

```
bearer rat-type = wlan
```

bearer sgsn-address

This command defines a rule definition to analyze and charge user traffic based on SGSN address associated in bearer flow.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp sgsn-address command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer sgsn-address*operator address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

address

The IP address of SGSN node.
address must be an SGSN IP address expressed in standard IPv4 or IPv6 notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP address of SGSN node.

Example

The following command creates a rule definition for analyzing user traffic for an SGSN node with IP address of *19.88.3.8*:

```
bearer sgsn-address = 19.88.3.8
```

bearer traffic-group

This command defines a rule definition to analyze and charge user traffic based on the traffic group number associated to the bearer flow.

Important: This functionality is only available if the license for Content Access Control (P/N: 699-00-0011) has been purchased and installed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer traffic-group *operator grp_num*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

grp_num

Specifies the traffic group number.
grp_num must be an integer from 1 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on the traffic group value. See the **fa-ha-spi** command in the *HA Service Configuration Mode Commands* chapter for more information.

Example

The following command creates a rule definition for all traffic groups assigned a value greater or equal to *23*:

bearer traffic-group >= *23*

cca

The following commands define rules for packets based on Credit Control Application:

cca quota-state

This command specifies the quota state of a subscriber for prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cca quota-state operator { limit-reached | lower-bandwidth }
```

no

Disables the configured credit control quota state for this rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: lesser than equal
- **=**: equals
- **>=**: greater than equal

limit-reached

This state matches an affirmative end-of-quota indication for this rule definition from the prepay server.

lower-bandwidth

This state matches the lower-bandwidth quota state of a rating group.

Usage

This command supports URL redirection cases and creates a rule for subscriber prepaid quota state as exhausted or not exhausted.
If a subscriber has exhausted the quota but has not exhausted the qualified period, a different charging-action can applied based on the cca quota-state CLI.

Example

The following command creates a rule for subscriber to send end-of-quota indication when credit control prepay quota limit reached:

```
cca quota-state = limit-reached
```

cca redirect-indicator

This command configures the value of the redirect-indicator state of the credit control application.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] cca redirect-indicator *operatorindicator*

no

Disables the configured credit control redirect indicator for specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

indicator

Specifies the redirect indicator for AVP used for redirection of URL in RADIUS dictionary used for prepaid service.
indicator must be an integer from 0 through 4294967295.

Important: For the RADIUS server configured with different values to return for this AVP the ECS requires rule definitions to match the different values for system to associate with Charging Actions that have different redirect URLs configured.

Usage

This command is used to configure an AVP to be used from a dictionary that defines the AVP for the redirect-indicator.
For example, a RADIUS dictionary specifies the 3gpp2-release-indicator to be used for redirect indicator when RADIUS is used as the credit control application. In this case, the value for 3gpp2-release-indicator that is returned by the RADIUS prepaid server for a quota request for a given content-id is retained by system and associated with the flow.

Example

Following command specifies redirect indicator as *1234* for URL redirect AVP:

cca redirect-indicator = *1234*

copy-packet-to-log

This command prints every packet that hits this rule to a log statement.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] copy-packet-to-log
```

no

Disables the feature.

Usage

Use this command to print every packet that hits this rule to a log statement.

dns

The following commands define rules for packets based on the DNS:

dns answer-name

This command defines a rule definition to analyze and charge user traffic based on the DNS answer-name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] dns answer-name [ case-sensitive ]`*`operator value`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`value`

The value of the specified field.
`value` must be an alpha and/or numeric string of 1 through 255 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on answer name.

Example

The following command creates a rule definition for analyzing user traffic for a answer name of *`test`*:

dns answer-name *= test*

dns any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for DNS packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify an any match rule definition for analyzing user traffic for charging purposes.

Example

The following command defines an any match rule definition for analyzing DNS user traffic:

```
dns any-match = TRUE
```

dns previous-state

This command defines a rule definition to analyze and charge user traffic matching the previous state expressions for DNS packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns previous-state*operatordns_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

dns_state

dns_state must be one of the following:

- **dns-timeout**
- **init**
- **req-sent**
- **resp-error**
- **resp-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS previous state.

Example

The following command creates a rule definition for analyzing user traffic using a previous state of *req-sent*:

dns previous-state = *req-sent*

dns query-name

This command defines a rule definition to analyze and charge user traffic based on the DNS query-name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns query-name [case-sensitive]*operator value*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

value

The value of the specified field.
value must be an alpha and/or numeric string of 1 through 255 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS query name.

Example

The following command creates a rule definition for analyzing user traffic using a query name of *test*:

dns query-name = *test*

dns return-code

This command defines a rule definition to analyze and charge user traffic based on the DNS return-code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns return-code*operator dns_response*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

dns_response

dns_response must be one of the following:

- **format-error**
- **name-error**
- **no-error**
- **not-implemented**
- **refused**
- **server-failure**

Usage

Use this command to specify a rule definition to analyze user traffic based on a DNS return code.

Example

The following command creates a rule definition for analyzing user traffic using a DNS response of *refused*:

dns return-code = *refused*

dns state

This command defines a rule definition to analyze and charge user traffic based on the DNS state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns state*operatordns_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

dns_state

dns_state must be one of the following:

- **dns-timeout**
- **init**
- **req-sent**
- **resp-error**
- **resp-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on a DNS state.

Example

The following command creates a rule definition for analyzing user traffic using a DNS state of *req-sent*:

```
dns state = req-sent
```

dns tid

This command defines a rule definition to analyze and charge user traffic based on the DNS Transaction Identifier (TID).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns tid*operatortid_value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

tid_value

Specifies the DNS transaction identifier for this rule definition.
tid_value must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS TID.

Example

The following command creates a rule definition for analyzing user traffic using a DNS TID value of *test*:

dns tid = *test*

email

This command defines a rule definition to analyze and charge user traffic based on the conditions based on e-mail parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] email { cc | content { class | type } | from | size | subject | to } [case-sensitive]*operator value*

no

Removes the specified rule definition.

cc

Specifies to match on the information in the CC field of e-mail message.

content { class | type }

Specifies to match on the information in the “content-type” or “content-class” field of e-mail message.

from

Specifies to match on the information in the “from” field of e-mail message.

subject

Specifies to match on the information in the “subject” field of e-mail message.

to

Specifies to match on the information in the “to” field of e-mail message.

size

Specifies to match with the total size of e-mail message in bytes.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field of e-mail message.
operator must be one of the following except for **size**:

- **!=**: does not equal
- **!contains**: does not contain

- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

operator must be one of the following for **size**:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

value

The value of the specified field. *value* must be an alpha and/or numeric string (allows punctuation characters) as follows:

- **cc**: A string of 1 through 512 characters in length
- **content**: A string of 1 through 128 characters in length
- **from**: A string of 1 through 64 characters in length
- **size**: A range of bytes from 1 through 4000000000 bytes
- **subject**: A string of 1 through 128 characters in length
- **to**: A string of 1 through 512 characters in length

Usage

Use this command to specify a rule definition to analyze user traffic based on different fields and parameters of e-mail message.

Example

The following command creates an email rule definition for analyzing user traffic for the occurrence of triangular in the ‘cc’ field of e-mail message:

```
email cc contains triangular@xyz.com
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the Ruledef Configuration mode and returns to the Active Charging Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the Active Charging Configuration mode.

file-transfer

The following commands define rules for analyzing traffic based on file transfers:

file-transfer any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the file transfer any match status.

Example

The following command creates a file transfer rule definition for analyzing user traffic using a file transfer any match status of *FASLE*:

```
file-transfer any-match = FALSE
```

file-transfer chunk-number

This command defines a rule definition to analyze and charge user traffic based on number of chunks in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer chunk-number*operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

value

Specifies the number of chunks for this rule definition.
value must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the number of chunks in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using *150* number of chunks:

file-transfer chunk-number *= 150*

file-transfer current-chunk-length

This command defines a rule definition to analyze and charge user traffic based on length of current chunk in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer current-chunk-length*operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

value

Specifies the length in bytes of current chunk for this rule definition.
value must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the length of current chunk in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using current length of chunk as *1500000* bytes:

file-transfer current-chunk-length *= 1500000*

file-transfer declared-chunk-length

This command defines a rule definition to analyze and charge user traffic based on declared length of chunk in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer declared-chunk-length*operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

value

Specifies the declared length, in bytes, of chunk for this rule definition.
value must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the declared length of chunk in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using declared length of chunk as *2500000* bytes:

file-transfer declared-chunk-length *= 2500000*

file-transfer declared-file-size

This command defines a rule definition to analyze and charge user traffic based on declared size of file in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer declared-file-size*operator size*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

size

Specifies the declared size of file, in bytes, for this rule definition.
size must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the declared size of file in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using declared size of file as *2500000* bytes:

file-transfer declared-file-size *= 2500000*

file-transfer filename

This command defines a rule definition to analyze and charge user traffic based on declared name of the file in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer filename [case-sensitive]*operator size*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the declared name of file in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using declared name of file as *star1*:

file-transfer filename contains *star1*

file-transfer previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

previous_state must be one of the following:

- **init**: Specifies previous state as initialization.
- **request-sent**: Specifies previous state as request sent.
- **transfer-error**: Specifies previous state as transfer error.
- **transfer-ok**: Specifies previous state as transfer ok.

Usage

Use this command to specify a rule definition to analyze user traffic based on a previous state of file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using a previous file transfer state of *init*:

file-transfer previous-state *= init*

file-transfer state

This command defines a rule definition to analyze and charge user traffic based on the current state of file transfer Finite State Machine (FSM).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

state must be one of the following

- **init**: Specifies current state as initialization.
- **request-sent**: Specifies current state as request sent.
- **transfer-error**: Specifies current state as transfer error.
- **transfer-ok**: Specifies current state as transfer ok.

Usage

Use this command to specify a rule definition to analyze user traffic based on state of file transfer.
Following table describes the details of file transfer FSM states with event:

Event	init	request-sent	transfer-ok	transfer-err
FTP “RETR” command or HTTP “GET” request received with chunk encoding	request-sent	Discarded	Discarded	Discarded
HTTP 2xx response received	transfer-ok	Discarded	Discarded	Discarded
HTTP 4xx or HTTP 5xx response received	transfer-error	Discarded	Discarded	Discarded
FTP reply received with reply status as file transfer complete/successful	Discarded	transfer-ok	Discarded	Discarded
FTP reply received with reply status as file transfer unsuccessful	Discarded	transfer-error	Discarded	Discarded

Example

The following command creates a file transfer rule definition for analyzing user traffic using a file transfer state of *init*:

```
file-transfer state = init
```

file-transfer transferred-file-size

This command defines a rule definition to analyze and charge user traffic based on transferred size of file in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer transferred-file-size*operator size*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

size

Specifies the transferred size of file, in bytes, for this rule definition.
size must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the transferred size of file in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using transferred size of file as *2500*:

file-transfer transferred-file-size *= 2500*

ftp

The following commands define rules for analyzing traffic based on File Transfer Protocol (FTP):

ftp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for FTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the FTP any match status.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP any match status of *FALSE*:

```
ftp any-match = FALSE
```

ftp client-ip-address

This command defines a rule definition to analyze and charge user traffic based on FTP client IP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp client-ip-address*operatorip_address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

ip_address

ip_address must be the client's IP address expressed in IPv4 dotted decimal or IPv6 colon notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP client IP.

Example

The following command creates an FTP rule definition for analyzing user traffic using a client IP of *1.1.1.1*:

ftp client-ip = *1.1.1.1*

ftp client-port

This command defines a rule definition to analyze and charge user traffic based on FTP client port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp client-port*operatorport*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

port

Specifies the port number for this rule definition.
port must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP client port.

Example

The following command creates an FTP rule definition for analyzing user traffic using ftp client port *10*:

ftp client-port *= 10*

ftp command args

This command defines a rule definition to analyze and charge user traffic based on FTP command argument.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command args [case-sensitive]*operator argument*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- !**contains**: does not contains
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

argument

Specifies the argument for this rule definition.
argument must be a string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command argument.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP command argument of *test*:

ftp command args = *test*

ftp command id

This command defines a rule definition to analyze and charge user traffic based on FTP command ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command id*operator command_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

command_id

Specifies the command identifier for this rule definition.
In StarOS 9.0 and later, *command_id* must be an integer from 0 through 18.
In StarOS 8.3 and earlier, *command_id* must be an integer from 0 through 15.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command ID.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP command ID of *10*:

ftp command id = *10*

ftp command name

This command defines a rule definition to analyze and charge user traffic based on FTP command name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command name *operatorcommand_name*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

---

command_name

Specifies the command name for this rule definition.
command_name must be one of the following:

- **abor**: Abort command
- **cwd**: Current working directory command
- **eprt**: eprt command
- **epsv**: epsv command
- **list**: List command
- **mode**: Transfer mode command
- **pass**: Password command
- **pasv**: Passive command
- **port**: Port command
- **quit**: Quit command
- **rest**: Restore command
- **retr**: Retry command
- **stor**: Store command
- **stru**: file structure command
- **syst**: system command
- **type**: Type command
- **user**: user command

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command name.

Example

The following command creates an FTP rule definition for analyzing user traffic using the FTP command name of *list*:

```
ftp command name = list
```

ftp connection-type

This command defines a rule definition to analyze and charge user traffic based on FTP connection type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp connection-type*operatorconnection_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

connection_type

Specifies the connection type for this rule definition.
connection_type must be one of the following:

- **0**: unknown
- **1**: control connection
- **2**: data connection

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP connection type.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP connection type of *1*:

ftp connection-type = *1*

ftp data-any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for FTP data packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp data-any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the any match status for FTP data packets.

Example

The following command creates a rule definition for analyzing user traffic using data-any-match status for FTP data packet set as *FALSE*:

```
ftp data-any-match = FALSE
```

ftp filename

This command defines a rule definition to analyze and charge user traffic based on FTP file name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp filename [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition. *string* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP filename.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP filename of *test*:

ftp filename = *test*

ftp filename

ftp pdu-length

This command defines a rule definition to analyze and charge user traffic based on FTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp pdu-length*operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the FTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on FTP PDU length (header + payload) in bytes.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP pdu length of *9647* bytes:

ftp pdu-length *= 9647*

ftp pdu-type

This command defines a rule definition to analyze and charge user traffic based on FTP Protocol Data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp pdu-type*operator pdu_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_type

Specifies the PDU type for this rule definition.
pdu_type must be one of the following:

- **0**: unknown
- **1**: command
- **2**: reply

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP PDU type.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP PDU type of *0*:

ftp pdu-type *= 0*

ftp previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of FTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the previous state.
previous_state must be one of the following:

- **command-sent**
- **init**
- **response-error**
- **response-ok**

Usage

Use this command to specify a rule definition to analyze user traffic based on a previous state.

Example

The following command creates an FTP rule definition for analyzing user traffic using a previous FTP state of *init*:

ftp previous-state = *init*

ftp reply code

This command defines a rule definition to analyze and charge user traffic based on the FTP reply code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp reply code*operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

code

Specifies the code for this rule definition.
code must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP reply.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP reply code of *199*:

ftp reply code = *199*

ftp server-ip-address

This command defines a rule definition to analyze and charge user traffic based on the FTP server IP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp server-ip-address*operator ip_address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

ip_address

Specifies the server address for this rule definition.
ip_address must be expressed in IPv4 decimal notation or IPv6 colon notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP server IP address.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP server IP of *1.1.1.1*:

ftp server-ip-address = *1.1.1.1*

ftp server-port

This command defines a rule definition to analyze and charge user traffic based on the FTP server port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp server-port*operator port*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

port

Specifies the FTP server port.
port must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP server port.

Example

The following command creates an FTP rule definition for analyzing user traffic using ftp server port *25*:

ftp server-port = *25*

ftp session-length

This command defines a rule definition to analyze and charge user traffic based on the FTP session-length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp session-length*operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the FTP session length for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the FTP session's total length.

Example

The following command creates a rule definition for analyzing user traffic using an FTP session length of *40000*:

ftp session-length *= 40000*

ftp state

This command defines a rule definition to analyze and charge user traffic based on the FTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ftp stateoperator { close | command-sent | init | response-error |
response-ok }
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

close

Analyzes FTP transmissions that are in a closed state.

command-sent

Analyzes FTP transmissions that are in a command sent state.

init

Analyzes FTP transmissions that are in the initialized state.

response-error

Analyzes FTP transmissions that are in the response error state.

response-ok

Analyzes FTP transmissions that are in the response ok state.

Usage

Use this command to specify a rule definition to analyze user traffic based on the current ftp session state.

Example

The following command creates an FTP rule definition for analyzing user traffic using a current FTP state of *open*:

ftp state = *open*

ftp url

This command defines a rule definition to analyze and charge user traffic based on the FTP URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ftp url [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

A unique name that you specify for the FTP URL.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on FTP file location/path for transfer.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP URL string of *`ftp://rfc.ietf.org/rfc/rfc1738.txt`*:

ftp url = *ftp://rfc.ietf.org/rfc/rfc1738.txt*

ftp user

This command defines a rule definition to analyze and charge user traffic based on the FTP user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp user [case-sensitive]*operator ftp_user*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

ftp_user

A unique name that you specify for the FTP user. *ftp_user* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the FTP user.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP user of *user1*:

ftp user *= user1*

http

The following commands define rule for analyzing traffic based on Hypertext Transport Protocol (HTTP):

http attribute-in-data

This command enables configuring dynamic header field in application payload.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http attribute-in-data *field_name* **[case-sensitive]** *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

field_name

Specifies the name of the field.
field_name must be an alpha and/or numeric string of 1 through 31 characters in length.

string

Specifies value of the extension header.
field_name must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to configure dynamic header field in application payload.

http attribute-in-url

This command enables configuring dynamic header field in URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http attribute-in-url *field_name* **[case-sensitive]** *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

field_name

Specifies the name of the field.
field_name must be an alpha and/or numeric string of 1 through 31 characters in length.

string

Specifies value of the extension header.
field_name must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to configure dynamic header field in URL.

http any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for HTTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP any match status.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP any match status of *FALSE*:

```
http any-match = FALSE
```

http content disposition

This command defines a rule definition to analyze and charge user traffic based on the optional “content disposition” field of HTTP entity header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http content disposition [case-sensitive]*operator content_dispos*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

content_dispos

This field offers a mechanism for the sender to transmit presentational information to the recipient, allowing each component of a message to be tagged with an indication of its desired presentation semantics.
content_dispos must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP content type. This feature is to support RFC 2616 for HTTP and RFC 1806 for Content Disposition.

Example

The following command creates an HTTP rule definition for analyzing user traffic using content-disposition field in an HTTP entity header as *successful*:

```
http content disposition = successful
```

http content length

This command defines a rule definition to analyze and charge user traffic based on HTTP content length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http content length*operator content_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

content_length

Specifies the HTTP body length, in bytes, for this rule definition.
content_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP content length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP body length of *10000*:

```
http content length = 10000
```

http content type

This command defines a rule definition to analyze and charge user traffic on the basis of content-type field in HTTP entity header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http content type [case-sensitive]*operator content_type*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

content_type

A unique content type that you specify for the HTTP rule definition.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on content-type field in HTTP entity header.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP content type of *abc100*:

http content type = *abc100*

http error

This command defines a rule definition to analyze user traffic for invalid HTTP packets and other errors while parsing HTTP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http error *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define a rule definition to analyze user traffic for invalid HTTP packets and any other errors while parsing HTTP packets. For example, FSM error, invalid header field values, ACS memory and buffer limit, packet related errors.
ECS supports pipelining of up to 32 HTTP requests on the same TCP connection. Pipeline overflow requests are not analyzed. Such overflow requests are treated as http-error. The billing system, based on this information, decides to charge or not charge, or refund the subscriber accordingly.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP error status of *TRUE*:

```
http error = TRUE
```

http first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the HTTP first-request-packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http first-request-packet*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP first request packet.

Example

The following command creates an HTTP rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```
http first-request-packet = TRUE
```

http header-length

This command defines a rule definition to analyze and charge user traffic based on HTTP header length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http header-length*operator header_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

header_length

Specifies the HTTP header length, in bytes, for this rule definition.
header_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP header length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP header length of *10000*:

http header-length *= 10000*

http host

This command defines a rule definition to analyze and charge user traffic based on HTTP host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http host [ case-sensitive ]`*`operator host_name`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`host_name`

A unique name that you specify for the HTTP host.
`host_name` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP host name.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP host of *`host1`*:

http host *= host1*

http payload-length

This command defines a rule definition to analyze and charge user traffic based on HTTP payload length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http payload-length*operator payload_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

payload_length

Specifies the HTTP payload (content) length, in bytes, for this rule definition.
payload_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP payload length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP payload length of *10000* bytes:

http payload-length *= 10000*

http pdu-length

This command defines a rule definition to analyze and charge user traffic based on HTTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http pdu-length*operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the HTTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP PDU length (header + payload) in bytes.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP PDU length of *10000* bytes:

http pdu-length *= 10000*

http previous-state

This command defines a rule definition to analyze and charge user traffic based on HTTP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the HTTP previous state for this rule definition.
previous_state must be one of the following:

- **init**: init state
- **response-error**: response error state
- **response-ok**: response ok state
- **waiting-for-response**: waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP previous state.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP previous state of *response-ok*:

http previous-state = *response-ok*

http referer

This command defines a rule definition to analyze and charge user traffic based on HTTP referer link.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http referer [case-sensitive]*operator referer_name*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

referer_name

A unique name that you specify for the HTTP referer.
referer_name must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP referer name.
This feature provides the ability to operator to ECS collect or track all URLs visited during a particular subscriber session. These URLs would include the entire string of visited URLs including all referral links. This information output is used in an EDR format to use for reporting or billing functions.
For example; if subscriber begins a web session on his phone and click on the “Sports” link from his home deck and then choose ESPN and from ESPN move to an advertiser link, operator can capture all URLs for

that entire session. and during this period ECS collects the URLs for a particular subscriber session an be limited to time duration or number of URLs visited.
ECS supports EDRs for this and EDRs generated contains HTTP URL and the HTTP referer fields along with other fields.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP referer to *cricket.espn.com*:

```
http referer = cricket.espn.com
```

http reply code

This command defines a rule definition to analyze and charge user traffic based on HTTP reply.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http reply code*operator reply_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

reply_code

Specifies the HTTP response for this rule definition.
reply_code must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP reply code.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP reply code of *356*:

http reply code *= 356*

http request method

This command defines a rule definition to analyze and charge user traffic based on HTTP request method.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http request method*operator request*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

request

Specifies the HTTP request for this rule definition.
request must be one of the following requests:

- **connect**
- **delete**
- **get**
- **head**
- **options**
- **post**
- **put**
- **trace**

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP request method.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP request method of *connect*:

http request method = *connect*

http session-length

This command defines a rule definition to analyze and charge user traffic based on HTTP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http session-length*operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the HTTP total session length for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the total HTTP session length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using a total HTTP session length of *200000*:

http session-length *= 200000*

http state

This command defines a rule definition to analyze and charge user traffic based on HTTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the HTTP state for this rule definition.
state must be one of the following:

- **close**: closed state
- **response-error**: response error state
- **response-ok**: response ok state
- **waiting-for-response**: waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP state.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP state of *init*:

http state = *init*

http transaction-length

This command defines a rule definition to analyze and charge user traffic based on HTTP transaction length (combined length of one HTTP GET Request message and associated one or more response message).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http transaction-length {*operatortrans_length***| { { range | !range }***range_from***to***range_to***} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

trans_length

Specifies the HTTP transaction length, in bytes, for this rule definition.
trans_length must be an integer from 1 through 4000000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria for length of transaction.
range: Enables the range criteria for HTTP transaction length.
!range: Disables the range criteria for HTTP transaction length.
range_from: Specifies the start of range, in bytes, for HTTP transaction length.
range_to: Specifies the end of range, in bytes, for HTTP transaction length.

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP transaction length (one HTTP GET Request message + one or more associated response message/s) in bytes.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP transaction length of *10200* bytes:

http transaction-length = *10200*

http transfer-encoding

This command defines a rule definition to analyze and charge user traffic based on HTTP encoding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http transfer-encoding [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

A unique name that you specify for HTTP transfer encoding.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP transfer encoding string.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP transfer encoding string of *user1*:

http transfer-encoding = *user1*

http uri

This command defines a rule definition to analyze and charge user traffic based on HTTP uniform resource identifier (URI).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http uri [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

A unique name that you specify for the HTTP URI.
string must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP URI.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP URI string of *http://www.somehost.com*:

http uri = *http://www.somehost.com*

http url

This command defines a rule definition to analyze and charge user traffic based on HTTP URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http url [case-sensitive]*operator string*

---

no

Removes the specified rule definition.

---

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

---

string

A unique name that you specify for the HTTP URL.
string must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and includes "host + URI" for HTTP PDUs.
For example, in case of the URL "http://www.google.fr/", the host is "http://www.google.fr", and the URI is "/":

```
Hypertext Transfer Protocol GET / HTTP/1.1\r\n Request Method: GET
Request URI: / Request Version: HTTP/1.1 Accept: */*\r\n Accept-
Language: fr\r\n Accept-Encoding: gzip, deflate\r\n User-Agent:
Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1)\r\n Host:
www.google.fr\r\n Connection: Keep-Alive\r\n \r\n
```

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP URL.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP URL string of *http://rfc.ietf.org/rfc/rfc1738.txt*:

```
http url = http://rfc.ietf.org/rfc/rfc1738.txt
```

http user-agent

This command defines a rule definition to analyze and charge user traffic based on the user agent information in "user-agent" field of HTTP header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http user-agent [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

This matches the HTTP user agent information in HTTP header.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP "user-agent" field.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP user agent as *xyz.123*:

http user-agent = *xyz.123*

http version

This command defines a rule definition to analyze and charge user traffic based on HTTP version information in header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http version [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

This matches the HTTP version information in HTTP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP version.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP version of *http4.2*:

http version = *http4.2*

http x-header

This command configures and matches rules based on extension-headers (x-headers). All x-header fields must begin with "x-."

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http x-header*name***[case-sensitive]***operator string*

no

Removes the specified rule definition.

name

A unique value that you specify to use for the x-header.
name must be an alpha and/or numeric string of 1 through 31 characters in length.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

This matches the HTTP x-header information in HTTP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to configure and match rules based on extension-headers (x-headers). This allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields which are not specified in RFC.

Example

The following command creates a rule definition for analyzing user traffic containing extension-header of *test_field* and value of *test_string*:

http x-header *test_field = test_string*

icmp

The following commands define rules for analyzing traffic based on Internet Control Message Protocol (ICMP):

icmp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for ICMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the icmp analyzed state.

Example

The following command creates a icmp rule definition for analyzing user traffic using an ICMP any match state of *FALSE*:

```
icmp any-match = FALSE
```

icmp code

This command defines a rule definition to analyze and charge user traffic based on the ICMP code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp code*operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

code

Specifies the ICMP code is for this rule definition.
code must be an integer from 0 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMP code.

Example

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP code as *23*:

icmp code = *23*

icmp type

This command defines a rule definition to analyze and charge user traffic based on the ICMP type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp type*operator type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

type

Specifies the ICMP type for this rule definition.
type must be an integer from 0 through 255. For example, 0 for ECHO Reply, 3 for Destination Unreachable, and 5 for Redirect.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMP type.

Example

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP type as *123*:

icmp type = *123*

icmpv6

The following commands define rules for analyzing traffic based on Internet Control Message Protocol Version 6 (ICMPv6).

icmpv6 any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Internet Control Message Protocol Version 6 (ICMPv6).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 analyzed state.

Example

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 any match state of *FALSE*:

```
icmpv6 any-match = FALSE
```

icmpv6 code

This command defines a rule definition to analyze and charge user traffic based on the ICMPv6 code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 code*operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

code

Specifies the ICMPv6 code is for this rule definition.
code must be an integer from 0 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 code.

Example

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 code as *23*:

icmpv6 code = *23*

icmpv6 type

This command defines a rule definition to analyze and charge user traffic based on the ICMPv6 type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 type*operator type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

type

Specifies the ICMPv6 type for this rule definition.
type must be an integer from 0 through 255. For example, 0 for ECHO Reply, 3 for Destination Unreachable, and 5 for Redirect.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 type.

Example

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 type as *123*:

```
icmpv6 type = 123
```

if-protocol

This command allows different content IDs with certain protocols to be associated with the same.

Product

All

Privilege

Security Administrator, Administrator

Syntax

if-protocol [http | wsp-connection-less | wsp-connection-oriented] content-id*content_id*

no if-protocol [http | wsp-connection-less | wsp-connection-oriented]

no

Removes the specified rule definition.

http

Specifies HTTP protocol for the rule definition.

wsp-connection-less

This routes the packets to WSP connection less protocol.

wsp-connection-oriented

This routes the packets to WSP connection oriented protocol.

content-id *content_id*

Specifies content ID used to give to the rule definition.
content_id must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on if-protocol.

Example

The following command creates an if-protocol rule definition for analyzing user traffic using http and a content ID of *23*:

```
if-protocol http content-id 23
```

imap

The following commands define rules for analyzing traffic based on Internet Message Access Protocol (IMAP):

imap any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for IMAP message packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the any-match analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using an IMAP any match state of *FALSE*:

```
imap any-match = FALSE
```

imap cc

This command defines a rule definition to analyze and charge user traffic based on the recipient address in the Carbon Copy (cc) field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap cc [case-sensitive]*operatorcc_address*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

cc_address

Specifies the string for this rule definition.
cc_address must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the recipient address in the “cc” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using recipient address *triangular@xyz.com* in the “cc” field of e-mail in the IMAP message:

```
imap cc contains triangular@xyz.com
```

imap command

This command defines a rule definition to analyze and charge user traffic based on the embedded IMAP commands in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap command*operator commands*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

---

commands

Specifies the command for this rule definition.
commands must be one of the following:

- **append**
- **authenticate**
- **capability**
- **check**
- **close**
- **copy**
- **create**
- **delete**
- **examine**
- **expunge**
- **fetch**
- **list**
- **login**
- **logout**
- **lsub**
- **noop**

- **rename**
- **search**
- **select**
- **starttls**
- **status**
- **store**
- **subscribe**
- **uid-copy**
- **uid-fetch**
- **uid-search**
- **uid-store**
- **unsubscribe**

Usage

Use this command to specify a rule definition to analyze user traffic based on the embedded command in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using presence of *close* command in the IMAP message;

imap command = *close*

imap content class

This command defines a rule definition to analyze and charge user traffic based on the “content-class” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap content class [case-sensitive]*operatorcontent_class*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

content_class

Specifies the string for this rule definition.
content_class must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “content-class” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using content class as *javax.mail.internet.MimeMultipart* in the “content-class” field of e-mail in the IMAP message:

imap content class contains *javax.mail.internet.MimeMultipart*

imap content type

This command defines a rule definition to analyze and charge user traffic based on the “content-type” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap content type [ case-sensitive ]`*`operatorcontent_type`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`content_type`

Specifies the string for this rule definition.
`content_type` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “content-type” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using content type *TEXT/plain; charset=iso-8859-1* in the ‘content-type’ field of e-mail in the IMAP message:

```
imap content type contains TEXT/plain; charset=iso-8859-1
```

imap date

This command defines a rule definition to analyze and charge user traffic based on the “date” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap date [case-sensitive]*operatordate*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

date

Specifies the string for this rule definition.
date must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “date” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using date *Fri, 21 Nov 1997 11:00:00 -0600* in the "date" field of e-mail in the IMAP message:

```
imap date contains Fri, 21 Nov 1997 11:00:00 -0600
```

imap final-reply

This command defines a rule definition to analyze and charge user traffic based on the “final-reply” value of the last IMAP final-reply message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap final-reply*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the ‘final-reply’ condition value for the last IMAP final-reply message to match the information in the analyzed field.
condition must be one of the following:

- **bad**: final reply is invalid or bad.
- **no**: there is no final reply.
- **ok**: final reply is valid.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the final-reply value of the last IMAP final-reply message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the final-reply condition value as *bad* for the last IMAP final-reply message:

imap final-reply = *bad*

imap from

This command defines a rule definition to analyze and charge user traffic based on the “from” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap from [case-sensitive]*operatorfrom_string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

from_string

Specifies the string for this rule definition.
from_string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “from” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using occurrence of triangular in the “from” field of e-mail in the IMAP message;

imap from contains *triangular*

imap mail-size

This command defines a rule definition to analyze and charge user traffic based on the size of e-mail in retrieved by IMAP from server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap mail-size*operatormail_size*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

mail_size

Specifies the total size of mail in bytes retrieved by IMAP from server for this rule definition.
mail_size must be an integer from 0 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the size of e-mail in the IMAP message of analyzed state. This rule uses size of the given mail retrieved by IMAP from server.

Example

The following command creates IMAP rule definition for analyzing user traffic using size of e-mail as less than or equal to *23400* bytes in the IMAP message:

imap mail-size *<= 23400*

imap mailbox-size

This command defines a rule definition to analyze and charge user traffic based on the number of e-mail messages in a mailbox of an IMAP e-mail user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap mailbox-size*operatormail_qty*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

mail_qty

Specifies the total number of e-mail messages in a mailbox of the IMAP user for this rule definition.
mail_qty must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the size of mailbox of an IMAP message user of analyzed state. This rule uses number of E-mails messages contained in a mailbox.

Example

The following command creates IMAP rule definition for analyzing user traffic using number of e-mail messages in a mailbox to less than or equal to *1024*:

imap mailbox-size *<= 1024*

imap message-type

This command defines a rule definition to analyze and charge user traffic based on the type of message in IMAP packet header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap message-type*operator type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the message-type condition/value for the IMAP e-mail message to match the information in the analyzed field.
condition must be one of the following:

- **command-continuation-reply**: message with command-continuation-reply type.
- **final-reply**: message is of final reply type.
- **request**: there is of request type.
- **untagged-reply**: message of reply type, but without any tag.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the type of message in "message-type" filed of the last IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the message type as *request* for the IMAP message:

imap message-type = *request*

imap previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap previous-state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the previous state of the IMAP message to match the information in the analyzed field.
state must be one of the following:

- **init**: message in initialization state.
- **request-sent**: message in request-sent state.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the previous state of the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the previous state as *init* of the IMAP message which was in initialization state:

imap previous-state = *init*

imap session-length

This command defines a rule definition to analyze and charge user traffic based on the IMAP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-length*operatorsession_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the total length of IMAP session, in bytes, for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the length of IMAP session of the analyzed state.
The session length is calculated by adding together the IP payloads (i.e., starting after the IP header) of all relevant IMAP session packets.

Example

The following command creates IMAP rule definition for analyzing user traffic using session length as less than or equal to *4000* bytes for the IMAP session:

imap session-length *<= 4000*

imap session-previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of IMAP session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-previous-state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the previous state of the IMAP session to match the information in the analyzed field.
state must be one of the following:

- **authenticated**: session authenticated
- **connected**: session connected
- **init**: session initialized
- **mailbox-selected**: mailbox selected

Usage

Use this command to specify a rule definition to analyze user traffic based on using the previous state of the IMAP session of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the previous state as *init* of the IMAP session which was initialized:

imap session-previous-state = *init*

imap session-state

This command defines a rule definition to analyze and charge user traffic based on the current state of IMAP session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the current state of the IMAP session to match the information in the analyzed field.
state must be one of the following:

- **authenticated**: session authenticating.
- **connected**: session connecting.
- **logout**: session logged out.
- **mailbox-selected**: mailbox selecting.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the current state of the IMAP session of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the current state as *connected* of the IMAP session which is in connecting state:

```
imap session-state = connected
```

imap state

This command defines a rule definition to analyze and charge user traffic based on the current state of IMAP request message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the current state of the IMAP request message to match the information in the analyzed field.
state must be one of the following:

- **request-sent**: request message sent
- **response-fail**: request response failed
- **response-ok**: request response is good

Usage

Use this command to specify a rule definition to analyze user traffic based on using the current state of the IMAP request message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the current state as *response-fail* of the IMAP request message when request response is failed:

imap state = *response-fail*

imap subject

This command defines a rule definition to analyze and charge user traffic based on the ‘subject’ field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap subject [case-sensitive]*operatorsubject*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

subject

Specifies the string for this rule definition.
subject must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “subject” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using occurrence of *My test* in the "subject" field of e-mail in the IMAP message:

imap subject contains *My test*

imap to

This command defines a rule definition to analyze and charge user traffic based on the ‘to’ field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap to [case-sensitive]*operatorsubject*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

to

Specifies the string for this rule definition.
to must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “to” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using occurrence of *xyz.com* in the "to" field of e-mail in the IMAP message:

```
imap to contains xyz.com
```

ip

The following commands define rules for analyzing traffic based on Internet Protocol (IP):

ip any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for IP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip any-match*operatorcondition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP analyzed state.

Example

The following command creates IP rule definition for analyzing user traffic using an IP any match state of *FALSE*:

```
ip any-match = FALSE
```

ip downlink

This command defines a rule definition to analyze and charge user traffic matching the direction of IP packet to downlink (to subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip downlink*operatorcondition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP packet direction as downlink.

Example

The following command creates IP rule definition for analyzing user traffic using an IP packet direction to downlink (to subscriber):

```
ip downlink = TRUE
```

ip dst-address

This command defines a rule definition to analyze and charge user traffic based on IP destination address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip dst-address { *operator* { *ip_address*|*ip_address/mask* } | { !range | range } host-pool *host_pool* }

---

no

Removes the specified rule definition.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the IP destination address.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

ip_address: Specifies IP address of the destination node for outgoing traffic in IPv4 or IPv6 standard notation. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies IP address of the destination node for outgoing traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool* **}**

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP destination address.

Example

The following command creates IP rule definition for analyzing user traffic using an IP destination address of *1.1.1.1*:

```
ip dst-address = 1.1.1.1
```

ip error

This command defines a rule definition to analyze user traffic for invalid IP packets and other errors while parsing IP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip error *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define a rule definition to analyze user traffic for invalid IP packets and any other errors while parsing IP packets.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP error status of *TRUE*:

```
ip error = TRUE
```

ip protocol

This command defines a rule definition to analyze and charge user traffic based on the protocol being transported by IP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip protocol *operator***{***protocol_assignment***|***protocol* **}**

no

Removes the specified rule definition.

operator

Specifies how to logically match the IP protocol.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than equals—available only in StarOS 8.1 and later
- **=**: Equals
- **>=**: greater than equals—available only in StarOS 8.1 and later

protocol_assignment

Specifies the protocol by assignment number.
protocol_assignment must be an integer from 0 through 255.
For example, 1 for ICMP, 6 for TCP, and 17 for UDP.

protocol

Specifies the protocol by name. *protocol* must be one of the following:

- **ah**
- **esp**
- **gre**
- **icmp**
- **icmpv6**
- **tcp**
- **udp**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP protocol.

Example

The following command creates IP rule definition for analyzing user traffic using a protocol assignment of *1*:

```
ip protocol = 1
```

ip server-ip-address

This command defines a rule definition to analyze and charge user traffic matching the IP address of the destination, i.e. from the subscriber, of the connection.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip server-ip-address { *operator* { *ip_address* | *ip_address/mask* } | { !range | range } host-pool *host_pool* }

---

no

Removes the specified rule definition.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the server IP address. *operator* must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

ip_address: Specifies the server IP address in IPv4 or IPv6 standard notation. For uplink packets (from subscriber) this field matches the destination IP address in the IP header, and for downlink packets (to the subscriber) it matches the source IP address in IP header. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies the server IP address in IPv4 or IPv6 standard notation with subnet mask bit. For uplink packets (from subscriber) this field matches the destination IP address in the IP header, and for downlink packets (to the subscriber) it matches the source IP address in IP header. *ip_address/mask* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the server IP address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP server address of *1.10.1.1*:

```
ip server-ip-address = 1.10.1.1
```

ip src-address

This command defines a rule definition to analyze and charge user traffic based on IP source address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip src-address { *operator* **{** *ip_address* **|** *ip_address/mask* **} | { !range | range } host-pool** *host_pool* **}**

no

Removes the specified rule definition.

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the IP source address.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

ip_address: Specifies IP address of the source node for incoming traffic in IPv4 or IPv6 standard notation. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies IP address of the source node for incoming traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP source address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP source address of *1.1.1.1*:

ip src-address *= 1.1.1.1*

ip subscriber-ip-address

This command defines a rule definition to analyze and charge user traffic matching the IP address of the subscriber (either source address or destination address).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip subscriber-ip-address { *operator* { *ip_address* | *ip_address/mask* } | { !range | range } host-pool *host_pool* }

---

no

Removes the specified rule definition.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the subscriber IP address.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

ip_address: Specifies the subscriber IP address. Depending on the direction of packet this IP address will be either the IP source address or the IP destination address. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies the subscriber IP address with subnet mask bit. Depending on the direction of packet this IP address will either be the IP source address or the IP destination address.
ip_address/mask must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the subscriber IP address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP address of *161.10.1.1* for subscriber:

```
ip subscriber-ip-address = 161.10.1.1
```

ip total-length

This command defines a rule definition to analyze and charge user traffic based on IP total length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip total-length*operator total_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

total_length

Specifies the total length of the IP packet including payload that is for this rule definition.
total_length must be an integer from 0 through 4096.

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP total length.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP total length of *2000* bytes:

```
ip total-length = 2000
```

ip uplink

This command defines a rule definition to analyze and charge user traffic matching the direction of IP packet to uplink (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip uplink*operatorcondition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP packet direction as uplink.

Example

The following command creates IP rule definition for analyzing user traffic using an IP packet direction to uplink (from subscriber):

```
ip uplink = TRUE
```

ip version

This command defines a rule definition to analyze and charge user traffic based on the IP version.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip version *operator ip_version*

no

Removes the specified rule definition.

operator

Specifies how to logically match information in the analyzed field.
operator must be **=** (equals).

ip_version

Specifies the IP version. *ip_version* must be one of the following:

- **ipv4**
- **ipv6**

Usage

Use this command to define a rule definition to analyze and charge user traffic based on the IP version.

Example

The following command creates an IP rule definition to analyze user traffic for the IP version IPv6:

ip version = *ipv6*

mms

The following commands define rules for analyzing traffic based on Multimedia Messaging Service (MMS):

mms any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for MMS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the mms any match status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS any match status of *FALSE*:

```
mms any-match = FALSE
```

mms bcc

This command defines a rule definition to analyze and charge user traffic based on MMS Blind Carbon Copy (BCC).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms bcc [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS BCC value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS BCC value of *test1*:

mms bcc contains *test1*

mms cc

This command defines a rule definition to analyze and charge user traffic based on the Carbon Copy (cc) field of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms cc [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS cc value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS CC value of *test1*:

```
mms cc contains test1
```

mms content location

This command defines a rule definition to analyze and charge user traffic based on MMS content location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms content location [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length., and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS content location value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS content location value of *test1*:

```
mms content location contains test1
```

mms content type

This command defines a rule definition to analyze and charge user traffic based on MMS content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms content type [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS “content-type” field value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS content type as *`image`*:

mms content type contains *image*

mms downlink

This command defines the rule definition to analyze and charge user traffic based on MMS message downlink condition.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms downlink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS downlink status.

Example

The following command creates an MMS rule definition for analyzing user traffic with an MMS downlink value to *TRUE*:

```
mms downlink = TRUE
```

mms from

This command defines the rule definition to analyze and charge user traffic based on the from field in MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms from [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “from” field of an MMS message.

Example

The following command creates an MMS rule definition for analyzing user traffic containing *test1* in the "from" field of MMS message:

mms from contains *test1*

mms message-id

This command defines a rule definition to analyze and charge user traffic based on the “message-id” of an MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms message-id [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS message ID of *test1*:

mms message-id contains *test1*

mms pdu-type

This command defines a rule definition to analyze and charge user traffic based on the MMS Protocol Data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms pdu-type*operator pdu_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

pdu_type

Specifies the MMS PDU type used for this rule definition.
pdu_type must be one of the following:

- **mms-pdu-type-m-acknowledge-ind**
- **mms-pdu-type-m-delivery-ind**
- **mms-pdu-type-m-http-get**
- **mms-pdu-type-m-notification-ind**
- **mms-pdu-type-m-notify-rsp-ind**
- **mms-pdu-type-m-retrieve-conf**
- **mms-pdu-type-m-send-conf**
- **mms-pdu-type-m-send-request**
- **mms-pdu-type-m-wsp-get**
- **mms-pdu-type-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on type of an MMS PDU.

Example

The following command creates an MMS rule definition for analyzing user traffic for **mms-pdu-type-m-http-get** of MMS PDU:

```
mms pdu-type = mms-pdu-type-m-http-get
```

mms previous-state

This command defines a rule definition to analyze and charge user traffic based on MMS previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Analyzes the previous state of the MMS transmissions.
previous_state must be one of the following:

- **delayed-ack-pending**
- **delayed-m-notify-rsp-sent**
- **delayed-retrieval-pending**
- **immediate-retrieval-pending**
- **init**
- **m-send-conf-rcvd**
- **m-send-req-sent**
- **notification-ind-rcvd**
- **notify-rsp-sent**
- **retrieval-pending**
- **retrieve-conf-received**
- **send-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS previous state.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS previous state of **retrieval-pending**:

```
mms previous-state = retrieval-pending
```

mms response status

This command defines a rule definition to analyze and charge user traffic based on MMS response status code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms response status*operator status_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

status_code

Specifies the code for this rule definition.
status_code must be an integer from 128 through 136.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS response status.

Example

The following command creates an FTP rule definition for analyzing user traffic using an MMS response status code of *129*:

mms response status *!= 129*

mms state

This command defines a rule definition to analyze and charge user traffic based on the current state of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms state*operatormms_state*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

---

mms_state

Analyzes the state of the mms transmissions.
mms_state must be one of the following:

- **delayed-ack-pending**
- **delayed-m-notify-rsp-sent**
- **delayed-retrieval-pending**
- **delivery-failed**
- **delivery-success**
- **immediate-retrieval-pending**
- **m-send-conf-rcvd**
- **m-send-req-sent**
- **notification-ind-rcvd**
- **notify-rsp-sent**
- **retrieval-failed**
- **retrieval-pending**
- **retrieval-success**
- **retrieve-conf-received**
- **send-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on current state of MMS message.

Example

The following command creates an MMS rule definition for analyzing user traffic using current state of MMS message as **`retrieval-failed`**:

```
mms state = retrieval-failed
```

mms status

This command defines a rule definition to analyze and charge user traffic based on MMS status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms status*operator status*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

status

Specifies the status for this rule definition.
status must be an integer from 128 through 132.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS status of *130*:

mms status = *130*

mms subject

This command defines a rule definition to analyze and charge user traffic using “subject” field of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms subject [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on “subject” field of an MMS message.

Example

The following command creates an MMS rule definition for analyzing user traffic for occurrence of *test1* in "subject" field of MMS message:

mms subject contains *test1*

mms tid

This command defines a rule definition to analyze and charge user traffic based on MMS Transaction Identifier (tid).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms tid [case-sensitive]*operator tid_value*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

tid_value

The value of the specified field.
tid_value must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS TID.

Example

The following command creates a rule definition for analyzing user traffic using an MMS TID value of *test*:

mms tid = *test*

mms to

This command defines a rule definition to analyze and charge user traffic using “to” field of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms to[case-sensitive]*operator to_value*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

to_value

The value of the specified field.
to_value must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS to rule definition.

Example

The following command creates a rule definition for analyzing user traffic using an MMS to value of *test*:

mms to *= test*

mms uplink

This command defines a rule definition to analyze and charge user traffic based on MMS uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms uplink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the uplink (from the Mobile Node direction) status.

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the MMS uplink.

Example

The following command creates a rule definition for analyzing user traffic using an MMS uplink value of *TRUE*:

```
mms uplink = TRUE
```

mms version

This command defines a rule definition to analyze and charge user traffic based on MMS version.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms version*operatorversion*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

version

Specifies the version for this rule definition.
version must be an integer from 1 through 65535.

Important: MMS Protocol Analyzer supports decoding of MMS version 1.0 only.

Usage

Use this command to specify a rule definition to analyze user traffic based on the MMS version.

Example

The following command creates a rule definition for analyzing user traffic using an MMS version of *1.0*:

```
mms version = 1.0
```

multi-line-or all-lines

Defines whether to apply the OR operator to all lines in a rule definition.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] multi-line-or all-lines
```

no

Removes the previous configuration.

Usage

If multi-line-or is enabled for a rule definition, the logical OR operator to all the rule-lines in the rule definition is applied to decide if the rule definition matches or not. If multi-line-or is not configured, the logical AND operator is applied.

p2p

The following commands define rules for analyzing traffic based on Peer-to-Peer protocols:

p2p any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Peer to Peer (P2P).

Product

ECS

Privilege

Administrator, Config-administrator

Syntax

[no] p2p any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **TRUE**: The rule matches any P2P traffic.
- **FALSE**: The rule does not match any P2P traffic.

Usage

Use this command to specify a rule definition to analyze user traffic based on the P2P any match status.

Example

The following command creates a rule definition for analyzing user traffic using an P2P any match status of TRUE:

```
p2p any-match = TRUE
```

p2p protocol

This command configures the system to detect specific P2P protocols for charging purposes. This command is not used for detection purposes.

Product

ECS

Privilege

Administrator, Config-administrator

Syntax

[no] p2p protocol *operator protocol*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be **=** (equals).

protocol

Specifies the protocol for charging purposes.
protocol must be one of the following:

- **actsync**
- **aimini**
- **applejuice**
- **ares**
- **battlefld**
- **bittorrent**
- **ddlink**
- **directconnect**
- **edonkey**
- **fasttrack**
- **feidian**
- **filetopia**
- **freenet**
- **fring**
- **gadugadu**
- **gnutella**
- **gtalk**
- **halflife2**

- hamachivpn
- iax
- imesh
- iptv
- irc
- iskoot
- jabber
- manolito
- msn
- mute
- nimbuzz
- oovoo
- openft
- orb
- oscar
- paltalk
- pando
- pandora
- popo
- pplive
- ppstream
- qq
- qqgame
- qqlive
- quake
- rdp
- secondlife
- skinny
- skype
- slingbox
- sopcast
- soulseek
- steam
- tvants
- tvuplayer
- uusee
- vpnx

- **vtun**
- **warcft3**
- **winmx**
- **winny**
- **wofwarcraft**
- **xbox**
- **yahoo**
- **zattoo**

Usage

Use this command to configure detection of protocols for charging purposes. For detection purposes use the **p2p detection protocol** in the Active Charging Service Configuration Mode.

Example

The following command configures the system to detect orb protocol for charging purposes:

```
p2p protocol = orb
```

p2p traffic-type

This command defines a rule definition to analyze and charge user traffic based on the type of traffic, such as voice or non-voice.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] p2p traffic-type *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **voice**

Usage

Use this command to configure the system to detect voice or non-voice P2P traffic. When the detection of a protocol is enabled then the detection of sub-type is enabled by default.

Example

The following command configures the system to detect voice traffic:

```
p2p traffic-type = voice
```

pop3

The following commands define rules for analyzing traffic based on Post Office Protocol 3 (POP3):

pop3 any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for POP3.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the POP3 any match status.

Example

The following command creates an POP3 rule definition for analyzing user traffic using a POP3 any match status of *FALSE*:

```
pop3 any-match = FALSE
```

pop3 command args

This command defines a rule definition to analyze and charge user traffic based on the POP3 command arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 command args [ case-sensitive ]`*`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`argument`

A unique value that you specify to use for the command argument.
`argument` must be an alpha and/or numeric string of 1 through 40 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 command argument.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command argument of *`test`*:

pop3 command args = *test*

pop3 command id

This command defines a rule definition to analyze and charge user traffic based on the POP3 command ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 command id*operator command_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

command_id

A unique value that you specify to use for the command argument.
command_id must be an integer from 1 through 12.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 command ID.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command ID of *8*:

```
pop3 command id = 8
```

pop3 command name

This command defines a rule definition to analyze and charge user traffic based on the POP3 command name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 command name*operator command_name*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

command_name

command_name must be one of the following:

- **apop**
- **dele**
- **list**
- **noop**
- **pass**
- **quit**
- **retr**
- **reset**
- **stat**
- **top**
- **uidl**
- **user**

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 command name.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command name of *list*:

```
pop3 command name = list
```

pop3 mail-size

This command defines a rule definition to analyze and charge user traffic based on the POP3 mail size.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 mail-size {*operator mail_size* **| { { range | !range }***range_from* **to** *range_to***} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.
range: Enables the range criteria.
!range: Disables the range criteria.
range_from: specifies the start of range, and must be an integer from 1 through 4000000000.
range_to: Specifies the end range. *range_to* must be an integer from 1 through 4000000000, and must be greater than *range_from*.

mail_size

Specifies the mail size for this rule definition.
mail_size must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on POP3 mail size.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a mail size of *40000*:

pop3 mail-size *= 40000*

pop3 pdu-length

This command defines a rule definition to analyze and charge user traffic based on the POP3 Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 pdu-length {*operator pdu_length* **| { { range | !range }***range_from***to***range_to***} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.
range: Enables the range criteria.
!range: Disables the range criteria.
range_from: Specifies the start of range, and must be an integer from 0 through 65535.
range_to: Specifies the end range. *range_to* must be an integer from 0 through 65535, and must be greater than *range_from*.

pdu_length

Specifies the POP3 PDU length for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 PDU length (header + payload) in bytes.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a PDU length of *1000* bytes:

pop3 pdu-length = *1000*

pop3 pdu-type

This command defines a rule definition to analyze and charge user traffic based on the POP3 PDU type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 pdu-type*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the packet type for this rule definition.
condition must be one of the following:

- **command-packet**
- **data-packet**
- **relay-packet**

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 PDU type.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a PDU type of **relay-packet**:

```
pop3 pdu-type = relay-packet
```

pop3 previous-state

This command defines a rule definition to analyze and charge user traffic based on the POP3 previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 previous-state*operator previous-state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the previous state for this rule definition.
previous_state must be one of the following:

- **connected**: connected state
- **data transaction**: data transaction state
- **init**: initialized state
- **reply-error**: reply error state
- **reply-ok**: response ok state
- **waiting-for-reply**: waiting for reply state

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 previous state.

Example

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 previous state of *connected*:

pop3 previous-state = *connected*

pop3 reply args

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply args [case-sensitive]*operator argument*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

argument

A unique value that you specify to use for the reply argument.
argument must be an alpha and/or numeric string of 1 through 512 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply argument rule definition.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply argument of *test*:

pop3 reply args = *test*

pop3 reply id

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply id*operator reply_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

reply_id

Specifies the reply ID for this rule definition.
reply_id must be one of the following:

- **0**: Unknown reply
- **1**: +OK reply
- **2**: -ERR reply

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply ID.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply ID of *2*:

```
pop3 reply id = 2
```

pop3 reply status

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply status*operator reply_status*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

reply_status

Specifies the reply ID for this rule definition.
reply_status must be one of the following:

- **+OK**: reply OK
- **-ERR**: reply error

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply status.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply status of *+OK*:

pop3 reply status *= +ok*

pop3 session-length

This command defines a rule definition to analyze and charge user traffic based on the POP3 session-length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 session-length { *operator session_length* | { range | !range } *range_from* to *range_to* }

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the session length used for this rule definition.
session_length must be an integer from 1 through 4000000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria for PoP3 session length.
range: Enables the range criteria for Pop3 session length.
!range: Disables the range criteria for PoP3 session length.
range_from: Specifies the start of range of PoP3 session length, and must be an integer from 1 through 4000000000 but less than or equal to *range_to*.
range_to: Specifies the end of range of PoP3 session length, and must be an integer from 1 through 4000000000 but greater than or equal to *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on the POP3 session length.

Example

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 session length of *40000*:

pop3 session-length = *40000*

pop3 state

This command defines a rule definition to analyze and charge user traffic based on the POP3 state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the POP3 state for this rule definition.
state must be one of the following:

- **close**
- **connected**
- **data-transaction**
- **reply-error**
- **reply-ok**
- **waiting-for-reply**

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 state.

Example

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 state of *close*:

pop3 state = *close*

pop3 user-name

This command defines a rule definition to analyze and charge user traffic based on the POP3 user name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 user-name [case-sensitive]*operator user_name*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

user_name

A unique value that you specify to use for the user name.
user_name must be an alpha and/or numeric string of 1 through 64 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 username rule definition.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a user name of *test*:

```
pop3 user-name = test
```

rtcp

The following commands define rules for analyzing traffic based on the Real-time Transport Control Protocol (RTCP):

rtcp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTCP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **TRUE**: The rule matches any RTCP traffic
- **FALSE**: The rule does not match any RTCP traffic

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTCP any match status.

Example

The following command creates a rule definition for analyzing user traffic using an RTCP any match status of *TRUE*:

```
rtcp any-match = TRUE
```

rtcp jitter

This command defines a rule definition to analyze and charge user traffic based upon the amount of jitter in the RTCP protocol.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp jitter*operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

value

This value represents the amount of jitter to test against.
value must be an integer from 0 through 4294967295.

Usage

Use this command to set a rule based on the jitter in the RTCP protocol..

Example

The following command test for jitter greater than or equal to 12954:

rtcp jitter *>= 12954*

rtcp parent-proto

This command defines a rule definition to analyze and charge user traffic based on the parent protocol of the RTCP flow.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp parent-proto *operator parent_protocol*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

parent_protocol

Specifies the RTCP parent protocol for this rule definition.
parent_protocol must be one of the following:

- **rtsp**: Real Time Streaming Protocol
- **sip**: Session Initiation Protocol

Usage

Use this command to specify a rule definition to analyze and charge user traffic based on the parent protocol of the RTCP flow.

Example

The following command creates an RTCP rule definition to analyze user traffic based on the parent protocol of the RTCP flow being SIP:

```
rtcp parent-proto = sip
```

rtcp pdu-length

This command defines a rule definition to analyze and charge user traffic based upon the Real-time Transport Protocol (RTCP) Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp pdu-length*operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the RTCP length, in bytes, for this rule definition.
In StarOS 8.1 and later, *pdu_length* must be an integer from 1 through 65535. In StarOS 8.0, *pdu_length* must be an integer from 1 through 2000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTCP PDU length (header + payload) in bytes.

Example

The following command creates a rule definition for analyzing user traffic using an RTCP PDU length of *10000* bytes:

rtcp pdu-length *= 10000*

rtcp rtsp-id

This command defines a rule definition to definition to analyze and charge user traffic using a RTSP ID associated with Real-time Transport Control Protocol (RTCP).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp rtsp-id [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 32 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example

The following command creates an RTCP rule definition for analyzing user traffic containing an RTSP message ID of *test1*:

rtcp rtsp-id contains *test1*

rtcp session-length

This command defines a rule definition to analyze and charge user traffic based on the Real-time Transport Protocol (RTCP) session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp session-length*operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the RTCP total session length for this rule definition.
In StarOS 8.1 and later, *session_length* must be an integer from 1 through 4000000000. In StarOS 8.0, *session_length* must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTCP total session length.

Example

The following command creates an RTCP rule definition for analyzing user traffic using a total RTCP session length of *200000*:

rtcp session-length = *200000*

rtcp uri

This command defines a rule definition to definition to analyze and charge user traffic using uniform resource identifier (URI) associated withReal-time Transport Control Protocol (RTCP).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp uri [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTCP URI.

Example

The following command creates an RTP rule definition for analyzing user traffic using an RTCP URI string of *rtsp://www.example.org*:

rtcp uri = *rtsp://www.example.org*

rtp

The following commands define rules for analyzing traffic based on the Real-time Transport Protocol (RTP):

rtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTP any match status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an RTP any match status of *TRUE*:

```
rtp any-match = TRUE
```

rtp parent-proto

This command defines a rule definition to analyze and charge user traffic based on the parent protocol of the RTP flow.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtp parent-proto` *`operator parent_protocol`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`=`**: equals

`parent_protocol`

Specifies the RTP parent protocol for this rule definition.
`parent_protocol` must be one of the following:

- **`rtsp`**: Real Time Streaming Protocol
- **`sip`**: Session Initiation Protocol

Usage

Use this command to specify a rule definition to analyze and charge user traffic based on the parent protocol of the RTP flow.

Example

The following command creates an RTP rule definition to analyze user traffic based on the parent protocol of the RTP flow being SIP:

```
rtp parent-proto = sip
```

rtp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the RTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp pdu-length*operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the RTP PDU length, in bytes, for this rule definition.
In StarOS 8.1 and later, *pdu_length* must be an integer from 1 through 65535. In StarOS 8.0, *pdu_length* must be an integer from 1 through 2000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTP PDU length (header + payload) in bytes.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an RTP PDU length of *1000* bytes:

rtp pdu-length *= 1000*

rtp rtsp-id

This command defines a rule definition to analyze and charge user traffic based on the RTSP ID associated with RTP flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp rtsp-id [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 32 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example

The following command creates an RTP rule definition for analyzing user traffic containing an RTSP message ID of *test1*:

```
rtp rtsp-id contains test1
```

rtp session-length

This command defines a rule definition to analyze and charge user traffic based on RTP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp session-length*operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the RTP total session length for this rule definition.
In StarOS 8.1 and later, *session_length* must be an integer from 1 through 4000000000. In StarOS 8.0, *session_length* must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTP total session length.

Example

The following command creates an RTP rule definition for analyzing user traffic using a total RTP session length of *200000*:

rtp session-length = *200000*

rtp uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) associated with RTP flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtp uri [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

A unique name that you specify for the RTP URI.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length. *`string`* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTP URI.

Example

The following command creates an RTP rule definition for analyzing user traffic using an RTP URI string of *rtsp://www.example.org*:

rtp uri = *rtsp://www.example.org*

rtsp

The following commands define rule for analyzing traffic based on Real Time Streaming Protocol (RTSP):

rtsp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTSP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTSP any match status.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP any match status of *FALSE*:

rtsp any-match = *FLASE*

rtsp content length

This command defines a rule definition to analyze and charge user traffic based on RTSP content length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp content length*operator content_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

content_length

Specifies the RTSP body length, in bytes, for this rule definition.
content_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP content length.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP body length of *10000*:

rtsp content length *= 10000*

rtsp content type

This command defines a rule definition to analyze and charge user traffic based on RTSP content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp content type [case-sensitive]*operator content_type*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

content_type

A unique name that you specify for the RTSP content type.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP content type.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP content type of *abc100*:

rtsp content type = *abc100*

rtsp date

This command defines a rule definition to analyze and charge user traffic matching the ‘date’ field in the RTSP message type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp date [case-sensitive]*operator date_string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

date_string

A unique name that you specify for the date in RTSP header.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic matching date string in RTSP header.

Example

The following command creates an RTSP rule definition for analyzing user traffic using a match for date string of *12_04_2006* in RTSP message header:

```
rtsp date = 12_04_2006
```

rtsp previous-state

This command defines a rule definition to analyze and charge user traffic based on RTSP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the RTSP previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **open**
- **play**
- **ready**
- **record**

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP previous state.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP previous state of *ready*:

rtsp previous-state *= ready*

rtsp reply code

This command defines a rule definition to analyze and charge user traffic based on RTSP reply.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp reply code*operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

code

Specifies the RTSP response for this rule definition.
code must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP return code.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP return code of *356*:

rtsp reply code *= 356*

rtsp request method

This command defines a rule definition to analyze and charge user traffic based on RTSP method.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp request method*operator method*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

method

Specifies the RTSP method for this rule definition.
method must be one of the following requests:

- **announce**
- **describe**
- **get-parameter**
- **options**
- **pause**
- **play**
- **record**
- **redirect**
- **set-parameter**
- **setup**
- **teardown**

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP method.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP method of *announce*:

```
rtsp request method = announce
```

rtsp request packet

This command defines a rule definition to analyze and charge user traffic based on RTSP request packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp request packet*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **TRUE**: is request
- **FALSE**: is response

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP request packet.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP response packet:

```
rtsp request packet != FALSE
```

rtsp rtp-seq

This command defines a rule definition to analyze and charge user traffic based on sequence “seq” field in the RTP-Info header of the RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp rtp-seq*operator time_stamp*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

string

A unique name that you specify to match with the ‘seq’ field in RTP-Info header of the RTSP message.
string must be an alpha and/or numeric string of 0 through 65535 characters in Normal Play Time (NPT) time format.

Usage

Use this command to specify a rule definition to analyze user traffic matching the sequence ’seq’ field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-seq of *2348*:

rtsp rtp-seq *= 2348*

rtsp rtp-time

This command defines a rule definition to analyze and charge user traffic based on ‘time’ field in the RTP-Info header of the RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp rtp-time*operator time_stamp*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

string

A unique name that you specify to match with the ‘time’ field in RTP-Info header of the RTSP message.
string must be an alpha and/or numeric string of 1 through 2147483647 characters in Normal Play Time (NPT) time format.

Usage

Use this command to specify a rule definition to analyze user traffic matching the ‘time’ field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-Time-stamp of *19970123T153600Z*:

rtsp rtp-time *= 19970123T153600Z*

rtsp rtp-uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) field in the RTP-Info header of the RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp rtp-uri [ case-sensitive ]`*`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`string`

A unique name that you specify to match with the URI in RTP-Info header of the RTSP message.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length. *`string`* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic matching the “URI” field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-URI string of *rtsp://www.foo.com* in RTP-info header of RTSP packet:

rtsp rtp-uri = *rtsp://www.foo.com*

rtsp session-id

This command defines a rule definition to analyze and charge user traffic based on the RTSP session ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp session-id [case-sensitive]*operator session_id*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

session_id

An unique session Id for the RTSP user.
session_id must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP session ID.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP session ID of *0123abc100*:

rtsp session-id = *0123abc100*

rtsp session-length

This command defines a rule definition to analyze and charge user traffic based on the RTSP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp session-length*operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

session_length

Specifies the RTSP session length, in bytes, for this rule definition.
session_length must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze, compare, or match the total length of RTSP session. The session-length is calculated by adding together the IP payloads (i.e., starting after the IP header) of all relevant packets.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP session length of *3000* bytes:

rtsp session-length *= 3000*

rtsp state

This command defines a rule definition to analyze and charge user traffic based on RTSP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the RTSP state for this rule definition.
state must be one of the following:

- **end**
- **init**
- **open**
- **play**
- **ready**
- **record**

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP state.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP in state of *init*:

rtsp state = *init*

rtsp uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) in RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp uri [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

A unique name that you specify to match with the URI in RTSP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic based on a URI in RTSP header.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP URI string of *rtsp://www..example.com:554/twister/audiotrack*:

rtsp uri = *rtsp://www.example.com:554/twister/audiotrack*

rtsp uri sub-part

This command defines a rule definition to analyze and charge user traffic by parsing sub-parts of the URI in an RTSP request message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp uri sub-part { { absolute-path | host | query } [case-sensitive]*operator string* **| port {***port_operator port_value* **| { range | !range }***range_from***to***range_to***} }**

---

no

Removes the specified rule definition.

---

absolute-path

Specifies the absolute path matching criteria to RTSP URI in an RTSP request message.

---

host

Specifies the host name matching criteria to RTSP URI in an RTSP request message.

---

query

Specifies the query string matching criteria to RTSP URI in an RTSP request message.

---

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

A unique absolute path/host name or query string that you specify to match with the URI in RTSP header. *string* must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and it does not include the “host” portion.

port

Specifies the port related matching for RTSP URI in an RTSP request message.

port_operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

port_value

Specifies the RTSP port number used for matching with port rule in RTSP flow.
port_value must be an integer from 0 through 65535.

{ range | !range } *range_from* **to** *range_to* **}**

Enables or disables the range criteria for RTSP flow ports.
range: Enables the range criteria for RTSP flow ports.
!range: Disables the range criteria for RTSP flow ports.
range_from: Specifies the start of range of RTSP flow ports and value must be an integer from 0 through 65535 but less than or equal to *range_to*.
range_to: Specifies the end of range of RTSP flow ports and value must be an integer from 0 through 65535 but more than or equal to *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on a URI sub parts like host, absolute path, port, and query in RTSP request message.

Example

The following command creates an RTSP URI sub part rule definition to analyze user traffic using an RTSP URI port number between *1023* and *1068*:

```
rtsp uri sub-part port range 1023 to 1068
```

rtsp user-agent

This command defines a rule definition to analyze and charge user traffic matching ‘user-agent’ field in RTSP header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp user-agent [case-sensitive]*operator user_agent*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

user_agent

Specifies the user agent in RTSP header for this rule definition.
user_agent must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user agent field in RTSP header.

Example

The following command creates a rule definition for analyzing user traffic using content as *test* in “user-agent” field of RTSP header:

rtsp user-agent = *test*

rule-application

This command specifies the application rule for the rule definition.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
rule-application { charging | post-processing | routing }

no rule-application
```

no

Removes the previous rule application configuration.

routing

Default: Disabled
Specifies that this rule definition only be used for routing purposes.
Up to 256 rule definitions can be defined for routing in an Active Charging Service.

post-processing

Important: The **post-processing** keyword is only available in StarOS 8.3 and later.

Specifies that this rule definition only be used for post-processing purposes. This enables processing of packets even if the rule matching for them has been disabled.

charging

Default: Enabled
Specifies that this rule definition only be used for charging purposes.
Up to 2048 rule definitions can be defined for charging application in an Active Charging Service.

Usage

Use this command to assign a rule application to a rule definition.
If, when configuring a ruledef, the rule-application is not specified, by default the system configures the ruledef as a charging ruledef.

Example

The following command assigns a rule application of **charging** to the current rule definition:

```
rule-application charging
```

sdp

The following commands define rules for analyzing traffic based on Session Description Protocol (SDP):

sdp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SDP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the SDP any match status.

Example

The following command defines an any match rule definition for analyzing SDP user traffic as *TRUE*:

```
sdp any-match = TRUE
```

sdp connection-ip-address

This command defines a rule definition to analyze and charge user traffic based on SDP connection IP address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp connection-ip-address*operator ip_address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

ip_address

The connection IP address expressed in IPv4 dotted decimal notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on the SDP connection-ip-address.

Example

The following command defines a rule definition for analyzing sdp user traffic using an SDP connection-ip-address of *1.1.1.1*:

sdp connection-ip-address = *1.1.1.1*

sdp media-audio-port

This command defines a rule definition to analyze and charge user traffic based on SDP media-audio-port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp media-audio-port*operatorport*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

port

Specifies the port number for this rule definition.
port must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SDP media-audio-port.

Example

The following command creates an SDP rule definition for analyzing user traffic using SDP media audio port *10*:

sdp media-audio-port *= 10*

sdp media-video-port

This command defines a rule definition to analyze and charge user traffic based on SDP media-video-port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp media-video-port*operator port*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

port

Specifies the port number for this rule definition.
port must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SDP media-video-port.

Example

The following command creates an SDP rule definition for analyzing user traffic using SDP media video port *10*:

sdp media-video-port *= 10*

sdp uplink

This command defines a rule definition to analyze and charge user traffic based on SDP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp uplink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: is not uplink
- **TRUE**: is uplink

Usage

Use this command to specify a rule definition to analyze user traffic based on whether the SDP traffic is uplink or not uplink.

Example

The following command defines a rule definition for analyzing SDP user traffic using an SDP uplink status is not equal to *FALSE*:

```
sdp uplink != FALSE
```

secure-http

The following commands define rules for analyzing traffic based on Secure-HTTP:

secure-http any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Secure HTTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] secure-http any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP any match status.

Example

The following command creates an HTTPS rule definition for analyzing user traffic using an HTTPS any match status of *FALSE*:

```
secure-http any-match = FALSE
```

secure-http uplink

This command defines a rule definition to analyze and charge user traffic based on Secure-HTTP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] secure-http uplink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: is not uplink
- **TRUE**: is uplink

Usage

Use this command to specify a rule definition to analyze user traffic based on whether the HTTPS traffic is uplink or not uplink.

Example

The following command defines a rule definition for analyzing HTTPS user traffic using an HTTPS uplink status is not equal to *FALSE*:

```
secure-http uplink != FALSE
```

sip

The following commands define rules for analyzing traffic based on Session Initiation Protocol (SIP):

sip any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SIP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the SIP any match status.

Example

The following command defines an any match rule definition for analyzing SIP user traffic:

```
sip any-match = TRUE
```

sip call-id

This command defines a rule definition to analyze and charge user traffic based on the SIP call ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip call-id [case-sensitive]*operator call-id*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

call-id

call-id must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a SIP call ID rule definition to analyze user traffic based on a SIP call ID.

Example

The following command creates a rule definition for analyzing user traffic using a SIP call ID of *test*:

sip call-id = *test*

sip content length

This command defines a rule definition to analyze and charge user traffic based on the SIP content length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip content length*operator content_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

content_length

Specifies the SIP content length for this rule definition.
content_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP content length.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP content length of *10000*:

sip content length *= 10000*

sip content type

This command defines a rule definition to analyze and charge user traffic based on the SIP content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip content type [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies content type is used in this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP content type.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP content type as *download_string*:

sip content type = *download_string*

sip from

This command defines a rule definition to analyze and charge user traffic based on the SIP from.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip from [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the string for this rule definition. *string* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP from value.

Example

The following command creates a SIP rule definition for analyzing user traffic containing a SIP from value of *test1*:

sip from contains *test1*

sip previous-state

This command defines a rule definition to analyze and charge user traffic based on the SIP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the SIP previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **provisional-response**
- **request-sent**
- **response-fail**
- **response-ok**

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP previous state.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP previous state of *request-sent*:

sip previous-state = *request-sent*

sip reply code

This command defines a rule definition to analyze and charge user traffic based on the SIP reply code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip reply code*operator return_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

return_code

Specifies the SIP return code for this rule definition.
return_code must be an integer from 100 through 699.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP reply code.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP reply code of *150*:

sip reply code *= 150*

sip request method

This command defines a rule definition to analyze and charge user traffic based on the SIP request method.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip request method*operator method*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

method

Specifies the SIP method for this rule definition.
method must be one of the following:

- **ack**
- **bye**
- **cancel**
- **invite**
- **options**
- **register**

Usage

Use this command to specify a rule definition to analyze user traffic based on SIP method.

Example

The following command defines a rule definition for analyzing SIP user traffic using SIP request method *bye*:

sip request method = *bye*

sip request packet

This command defines a rule definition to analyze and charge user traffic based on the SIP request packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip request packet*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- =: equals
- !=: not equals

condition

The type of SIP packet is-request.
condition must be one of the following:

- **FALSE**: is a response
- **TRUE**: is a request

Usage

Use this command to specify a rule definition to analyze user traffic based on the SIP request packet.

Example

The following command defines a rule definition for analyzing SIP user traffic using a SIP request packet is equals to request:

```
sip request packet = TRUE
```

sip state

This command defines a rule definition to analyze and charge user traffic based on the SIP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the sip state for this rule definition.
state must be one of the following:

- **ack-received**
- **provisional-response**
- **request-sent**
- **response-fail**
- **response-ok**

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP state.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP state of *request-sent*:

sip state = *request-sent*

sip to

This command defines a rule definition to analyze and charge user traffic based on the “to” field of SIP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip to [case-sensitive]*operator sip_to_field*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

sip_to_field

Specifies the SIP to value for this rule definition.
sip_to_field must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP to value.

Example

The following command creates a SIP rule definition for analyzing user traffic containing a SIP to value of *test1*:

sip to contains *test1*

sip uri

This command defines a rule definition to analyze and charge user traffic based on the SIP URI.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip uri [sub-part { headers | host | parameters | port | userinfo }] [case-sensitive]*operator string*

---

no

Removes the specified rule definition.

---

sub-part { headers | host | parameters | port | userinfo }

This is an optional keyword that defines what sub-part of a SIP URI to check.
headers: Apply the rule to SIP URI header field.
host: Apply the rule the SIP URI host field.
parameters: Apply the rule to the SIP URI parameters field.
port: Apply the rule to the SIP URI port field.
userinfo: Apply the rule to the SIP URI userinfo field.

---

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

The string for sub-part keyword **port** must be an integer and requires different operators. Use the following operators with the **port** keyword:

- !=: does not equal
- <=: is less than

- =: equals
- >=: is greater than

string

A unique name that you specify for a SIP URI.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.
The string for sub-part keyword **port** must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP URI.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP URI string:

```
sip uri = sip:192.168.1.51:5060sip uri = sip:nnnnn@host:5060;user=phone
```

smtp

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.

smtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SMTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify an any match rule definition on analyzing user traffic based on the SMTP analyzed status.

Example

The following command defines an any match rule definition for analyzing SMTP user traffic:

```
smtp any-match = TRUE
```

smtp command arguments

This command defines a rule definition to analyze and charge user traffic based on the SMTP command arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp command arguments [ case-sensitive ]`*`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`argument`

A unique value that you specify to use for the command argument.
`argument` must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP command argument.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a command argument of *`test`*:

smtp command arguments = *test*

smtp command id

This command defines a rule definition to analyze and charge user traffic based on the SMTP command ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp command id*operator command_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

command_id

A unique value that you specify to use for the command argument.
command_id must be an integer from 0 through 10.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP command ID.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command ID of *8*:

smtp command id = *8*

smtp command name

This command defines a rule definition to analyze and charge user traffic based on the SMTP command name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp command name*operator command_name*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

command_name

command_name must be one of the following:

- **bdat**
- **data**
- **ehlo**
- **expn**
- **helo**
- **mail-from**
- **noop**
- **quit**
- **rcpt-to**
- **rset**
- **vrfy**

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP command name.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a command name of *data*:

smtp command name = *data*

smtp mail-size

This command defines a rule definition to analyze and charge user traffic based on the SMTP mail size.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp mail-size {*operator mail_size***| { { range | !range }***range_from***to***range_to***} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

mail_size

Specifies the mail size, in bytes, for this rule definition.
mail_size must be an integer from 1 through 40000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.
range: Enables the range criteria.
!range: Disables the range criteria.
range_from: Specifies the start of range, and must be an integer from 1 through 40000000.
range_to: Specifies the end range. *range_to* must be an integer from 1 through 40000000, and must be greater than *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on SMTP mail size.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a mail size of *40000*:

smtp mail-size = *40000*

smtp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the SMTP protocol data unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp pdu-length {*operator pdu_length* **| { { range | !range }** *range_from* **to** *range_to* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the SMTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.
range: Enables the range criteria.
!range: Disables the range criteria.
range_from: Specifies the start of range, and must be an integer from 1 through 65535.
range_to: Specifies the end range. *range_to* must be an integer from 1 through 65535, and must be greater than *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP packet length.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a PDU length of *1600* bytes:

smtp pdu-length *= 1600*

smtp previous-state

This command defines a rule definition to analyze and charge user traffic based on the SMTP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp previous-state*operator pre_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

pre_state

Specifies the previous state for this rule definition.
pre_state must be one of the following:

- **close**: closed state
- **init**: initialized state
- **response-error**: reply error state
- **response-ok**: response ok state
- **waiting-for-response**: waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP previous state.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP previous state of *closed*:

```
smtp previous-state = closed
```

smtp recipient

This command defines a rule definition to analyze and charge user traffic based on the SMTP recipient.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp recipient [case-sensitive]*operator argument*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

argument

A unique value that you specify to use for the response argument.
argument must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a recipient rule definition.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a recipient of *test*:

smtp recipient = *test*

smtp reply arguments

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply argument.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply arguments[case-sensitive]*operator argument*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

argument

Specifies the string for this rule definition.
argument must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply argument.

Example

The following command creates an SMTP reply argument rule definition for analyzing user traffic using a reply argument of *test*:

smtp reply arguments *= test*

smtp reply id

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply id *operator reply_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

reply_id

Specifies the reply ID for this rule definition.
reply_id must be one of the following:

- **0**: +NO reply
- **1**: +OK reply
- **2**: -ERR reply

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply ID.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a reply ID of *2*:

```
smtp reply id = 2
```

smtp reply status

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply status*operator reply_status*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

reply_status

Specifies the response ID for this rule definition.
reply_status must be one of the following:

- **+OK**: response OK
- **-ERR**: response error

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply status.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a reply status of *+OK*:

smtp reply status *= +OK*

smtp sender

This command defines a rule definition to analyze and charge user traffic based on the SMTP sender.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp sender[case-sensitive]*operator sender*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

sender

Specifies the session length used for this rule definition.
sender must be an alpha/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the SMTP session length.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP sender of *test*:

smtp sender *= test*

smtp session-length

This command defines a rule definition to analyze and charge user traffic based on the SMTP session-length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp session-length {*operator sess_length***| { range | !range }***range_from***to***range_to***}**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

sess_length

Specifies the session length for this rule definition.
sess_length must be an integer from 1 through 40000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.
range: Enables the range criteria.
!range: Disables the range criteria.
range_from: Specifies the start of range, and must be an integer from 1 through 40000000.
range_to: Specifies the end range. *range_to* must be an integer from 1 through 40000000, and must be greater than *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on the SMTP session length.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP session length of *4000000*:

smtp session-length = *4000000*

smtp state

This command defines a rule definition to analyze and charge user traffic using SMTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the SMTP state for this rule definition.
state must be one of the following:

- **close**: closed state
- **init**: initialized state
- **response-error**: response of error state
- **response-ok**: response of ok state
- **waiting-for-response**: waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on SMTP state.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP state of *close*:

```
smtp state = close
```

tcp

The following commands define rules for analyzing traffic based on Transmission Control Protocol (TCP):

tcp analyzed out-of-order

This command specifies counting/charging of all TCP out-of-order packets that are received and buffered at ACSMgr/SessMgr due to non receipt of earlier packet(s) in sequence.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp analyzed out-of-order*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: not analyzed
- **TRUE**: analyzed

Usage

This command is used to set the status flag to 'analyzed' or 'not analyzed' for all TCP packets received at the ACSMgr/SessMgr prior to their earlier packets.
When a packet reaches ACSMgr/SessMgr prior to earlier packet(s), particular packet with subsequent packets are buffered at ACSMgr/SessMgr as TCP out-of-order packets and ACSMgr/SessMgr waits for missing packet(s) till time-out duration expires. If the packet(s) with the missing sequence number(s) arrives with in time-out duration, all buffered packets with correct sequence will be presented to upper layers (HTTP etc.) for analysis; otherwise buffered TCP out-of-order packets will be sent to charging with analysis done flag at TCP/IP layer only.
If this command is enabled the TCP out-of-order packets marked and sent to TCP analyzer as analyzed for charging action otherwise discarded.

Example

The following command sets to analyze TCP out-of-order packets:

```
tcp analyzed out-of-order = TRUE
```

tcp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for TCP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: not analyzed
- **TRUE**: analyzed

Usage

Use this command to specify a rule definition to analyze user traffic based on the tcp any match status.

Example

The following command defines an any match rule definition for analyzing TCP user traffic:

```
tcp any-match = TRUE
```

tcp connection-initiator

This command defines a rule definition to analyze and charge user traffic based on the TCP connection initiator.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp connection-initiator*operator***subscriber**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

subscriber

Specifies that the connection is being initiated by the subscriber.

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP connection initiator and to allow the operator to differentiate between connection initiated by subscriber or the subscriber is acting as a TCS (Transaction Control Server) server.

Example

The following command creates TCP rule definition for analyzing user traffic using an TCP connection initiator as *subscriber*:

tcp connection-initiator = *subscriber*

tcp downlink

This command defines a rule definition to analyze and charge user traffic matching the direction of TCP packets to downlink (to subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp downlink*operatorcondition*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

---

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP packet direction as downlink.

Example

The following command creates TCP rule definition for analyzing user traffic using an TCP packet direction to downlink (to subscriber):

```
tcp downlink = TRUE
```

tcp dst-port

This command defines a rule definition to analyze and charge user traffic based on destination TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the range of destination TCP ports.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on destination TCP port.

Example

The following command creates a TCP rule definition for analyzing user traffic matching destination port for TCP as *10*:

```
tcp dst-port = 10
```

tcp duplicate

This command defines a rule definition to analyze and charge user traffic using duplicate TCP packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp duplicate*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: not duplicated/retransmitted
- **TRUE**: duplicated/retransmitted

Usage

Use this command to specify a duplicate rule definition for analyzing user traffic.

Example

The following command defines a duplicate rule definition with a value of *TRUE*:

```
tcp duplicate = TRUE
```

tcp either-port

This command defines a rule definition to analyze and charge user traffic using either (destination or source) TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp either-port { *operator port_number* | { !range | range } { *start_range* to *end_range* | port-map *port_map* } }

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on either TCP port.

Example

The following command creates a TCP rule definition for analyzing user traffic matching destination or source port for TCP as *10*:

```
tcp either-port = 10
```

tcp error

This command defines a rule definition to identify any erroneous TCP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp error*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to identify any erroneous TCP packets.

Example

The following command creates a TCP rule definition for identifying an erroneous TCP packet:

```
tcp error = TRUE
```

tcp flag

This command defines a rule definition to analyze and charge user traffic based on the TCP flag.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp flag*operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!contains**: does not contain
- **contains**: contains
- **!=**: does not equal
- **=**: equals

value

The value of the specified field.
value must be one of the following:

- **ack**: TCP FLAG ACK
- **fin**: TCP FLAG FIN
- **push**: TCP FLAG PUSH
- **reset**: TCP FLAG RESET
- **syn**: TCP FLAG SYN

Usage

Use this command to specify a flag rule definition for analyzing user traffic.

Example

The following command defines a flag rule definition with a value of *reset*:

tcp flag *= reset*

tcp initial-handshake-lost

This command defines a rule definition to identify a TCP flow where the initial handshake was not seen.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp initial-handshake-lost*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to identify a TCP flow where the initial handshake was not seen.

Example

The following command creates a TCP rule definition for identifying a TCP flow where the initial handshake was not seen:

```
tcp initial-handshake-lost = TRUE
```

tcp payload

This command defines a rule definition to analyze and charge user traffic based on Hex/ASCII string content in payload protocol-signature field of TCP payload.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp payload starts-with { hex-signature *hex_string* **| string-signature** *string* **}**

no

Removes the specified rule definition.

hex-signature *hex_string*

Specifies hexadecimal protocol signature in payload field.
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature *string*

Specifies protocol signature in payload field.
string must be a string of 1 through 32 characters in length.

Usage

Use this command to define a rule definition to analyze user traffic based on a match for Hex/ASCII string content in payload protocol-signature field.

Example

The following command creates a TCP rule definition to identify user traffic using TCP protocol signature as *tcp1*:

tcp payload starts-with string-signature *tcp1*

tcp payload-length

This command defines a rule definition to analyze and charge user traffic based on the TCP payload length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp payload-length*operator payload_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

payload_length

Specifies the tcp payload length for this rule definition.
payload_length must be an integer from 0 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on a TCP payload length.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP payload length of *10000*:

tcp payload-length *= 10000*

tcp previous-state

This command defines a rule definition to analyze and charge user traffic using previous state of TCP packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the TCP previous state for this rule definition.
previous_state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

Use this command to specify a rule definition to analyze user traffic based on a TCP previous state.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP previous state of time-wait:

tcp previous-state = *time-wait*

tcp session-length

This command defines a rule definition to analyze and charge user traffic using TCP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

sess_length

Specifies the TCP session length, in bytes, for this rule definition.
sess_length must be an integer from 0 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP session length.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP session length of *2000* bytes:

```
tcp session-length = 2000
```

tcp src-port

This command defines a rule definition to analyze and charge user traffic based on source TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp src-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: does not equal
- **<=**: Less than or equals
- **=**: equals
- **>=**: greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on source TCP port.

Example

The following command creates a TCP rule definition for analyzing user traffic matching source port for TCP as *10*:

```
tcp src-port = 10
```

tcp state

This command defines a rule definition to analyze and charge user traffic using current state of TCP packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the TCP state for this rule definition.
state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

Use this command to specify a rule definition to analyze user traffic based on a TCP state.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP state of *close*:

tcp state *= close*

tcp uplink

This command defines a rule definition to analyze and charge user traffic matching the direction of TCP packets to uplink (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp uplink*operatorcondition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP packet direction as uplink.

Example

The following command creates TCP rule definition for analyzing user traffic using an TCP packet direction to uplink (from subscriber):

```
tcp uplink = TRUE
```

udp

The following commands define rules for analyzing traffic based on User Datagram Protocol (UDP):

udp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for UDP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the UDP analyzed status.

Example

The following command defines an any match rule definition for analyzing UDP user traffic:

```
udp any-match = TRUE
```

udp downlink

This command defines a rule definition to analyze and charge user traffic based on the UDP downlink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp downlink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:
- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a UDP downlink condition.

Example

The following command creates a UDP rule definition for analyzing user traffic using UDP downlink condition *TRUE*:

```
udp downlink = TRUE
```

udp dst-port

This command defines a rule definition to analyze and charge user traffic based on destination UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on destination UDP port.

Example

The following command creates a UDP rule definition for analyzing user traffic matching destination port for UDP as *10*:

```
udp dst-port = 10
```

udp either-port

This command defines a rule definition to analyze and charge user traffic using either (destination or source) UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp either-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on either UDP port.

Example

The following command creates a UDP rule definition for analyzing user traffic matching destination or source port for UDP as *10*:

```
udp either-port = 10
```

udp payload

This command defines rule to analyze and charge user traffic based on the match for Hex/ASCII string content in payload protocol-signature field in UDP payload.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp payload starts-with { hex-signature*hex_string* **| string-signature** *string* **}**

no

Removes the specified rule definition.

hex-signature *hex_string*

Specifies hexadecimal protocol signature in payload field.
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature *string*

Specifies protocol signature in payload field.
string must be a string of 1 through 32 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on a match for Hex/ASCII string content in payload protocol-signature field.

Example

The following command creates a UDP rule definition for analyzing user traffic using a UDP protocol signature as *udp1*:

udp payload starts-with string-signature *udp1*

udp src-port

This command defines a rule definition to analyze and charge user traffic based on source UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp src-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on source UDP port.

Example

The following command creates a UDP rule definition for analyzing user traffic matching source port for UDP as *10*:

```
udp src-port = 10
```

udp uplink

This command defines a rule definition to analyze and charge user traffic based on the UDP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp uplink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:
- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a UDP uplink condition.

Example

The following command creates a UDP rule definition for analyzing user traffic using UDP uplink condition *TRUE*:

```
udp uplink = TRUE
```

wsp

The following commands define rules for analyzing traffic based on Wireless Session Protocol (WSP):

wsp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WSP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify an any match WSP rule definition on analyzing user traffic.

Example

The following command defines an any match rule definition for analyzing WSP user traffic:

```
wsp any-match = TRUE
```

wsp content type

This command defines a rule definition to analyze and charge user traffic based on the WSP content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp content type [case-sensitive]*operator content_type*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

content_type

content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP content type.

Example

The following command creates a SIP rule definition for analyzing user traffic using a WSP content of *test*:

wsp content type *= test*

wsp downlink

This command defines a rule definition to analyze and charge user traffic using WSP downlink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp downlink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP downlink condition.

Example

The following command defines a rule definition for analyzing WSP user traffic based on the WSP downlink condition of *TRUE*:

```
wsp downlink = TRUE
```

wsp first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the WSP first-request-packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp first-request-packet*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP first request packet.

Example

The following command creates an WSP rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```
wsp first-request-packet = TRUE
```

wsp host

This command defines a rule definition to analyze and charge user traffic using WSP host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] wsp host [ case-sensitive ]`*`operator host_name`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`host_name`

A unique name that you specify for the WSP host.
`host_name` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP host name.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP host of *`host1`*:

wsp host contains *host1*

wsp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the WSP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the WSP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP PDU length (header + payload) in bytes.

Example

The following command creates a WSP rule definition for analyzing user traffic using an WSP PDU length of *10000* bytes:

```
wsp pdu-length = 10000
```

wsp pdu-type

This command defines a rule definition to analyze and charge user traffic using WSP Protocol Data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp pdu-type*operator pdu_type*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

---

pdu_type

Specifies the WSP PDU type used for this rule definition.
pdu_type must be one of the following:

- **confirmed push**
- **connect-reply**
- **connect-request**
- **data-fragment**
- **delete**
- **disconnect**
- **get**
- **head**
- **options**
- **post**
- **push**
- **put**
- **redirect**
- **reply**
- **resume**
- **suspend**
- **trace**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP PDU type value.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP PDU type resume:

```
wsp pdu-type resume
```

wsp previous-state

This command defines a rule definition to analyze and charge user traffic using WSP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP previous state.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP previous state of *response-ok*:

wsp previous-state = *response-ok*

wsp reply code

This command defines a rule definition to analyze and charge user traffic based on the WSP reply code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

return_code

Specifies the WSP return code for this rule definition.
return_code must be an integer from 0 through 101.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP reply code.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP reply code of *50*:

```
wsp reply code = 50
```

wsp session-length

This command defines a rule definition to analyze and charge user traffic using WSP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than equals
- **=**: equals
- **>=**: greater than equals

sess_length

Specifies the WSP session length, in bytes, for this rule definition.
sess_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP session length.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP session length of *2000* bytes:

```
wsp session-length = 2000
```

wsp session-management

This command defines a rule definition to analyze and charge user traffic based on WSP session management information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp session-management { previous-state | state }*operator state*

---

no

Removes the specified rule definition.

---

previous-state

Specifies WSP previous state information.

---

state

Specifies WSP current state information.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

---

state

Specifies the WSP state.
For **previous-state**, *state* must be one of the following:

- **connected**
- **connecting**
- **init**
- **resuming**
- **suspended**

For **state**, *state* must be one of the following:

- **close**
- **connected**
- **connecting**
- **init**
- **resuming**

- **suspended**

Usage

Use this command to specify a rule definition to analyze user traffic based on WSP session management information.

Example

The following command creates a WSP rule definition for analyzing user traffic based on WSP session-management current state of *connecting*:

```
wsp session-management state = connecting
```

wsp state

This command defines a rule definition to analyze and charge user traffic using WSP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the WSP state for this rule definition.
state must be one of the following:

- **close**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP state.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP state of *connecting*:

wsp state = *connecting*

wsp tid

This command defines a rule definition to analyze and charge user traffic using WSP Transaction Identifier (TID).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp tid*operator tid_value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

tid_value

Specifies the transaction identifier for this rule definition.
tid_value must be an integer from 0 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP tid.

Example

The following command creates a rule definition for analyzing user traffic using a WSP TID value of *22*:

wsp tid = *22*

wsp total-length

This command defines a rule definition to analyze and charge user traffic using WSP total packet length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp total-length*operator total_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than equals
- **=**: equals
- **>=**: greater than equals

total_length

Specifies the total length of the WSP packet including payload for this rule definition.
total_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP total length.

Example

The following command creates a WSP rule definition for analyzing user traffic using an WSP total length of *2000* bytes:

wsp total-length *= 2000*

wsp transfer-encoding

This command defines a rule definition to analyze and charge user traffic using WSP transfer-encoding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp transfer-encoding [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

string must be of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on WSP transfer-encoding.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP transfer encoding that contains the number 7:

wsp transfer-encoding *contains 7*

wsp uplink

This command defines a rule definition to analyze and charge user traffic using WSP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the uplink (to the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP uplink status.

Example

The following command creates a rule definition for analyzing user traffic using a WSP uplink value of *TRUE*:

```
wsp uplink = TRUE
```

wsp url

This command defines a rule definition to analyze and charge user traffic using WSP URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] wsp url [ case-sensitive ]`*`operator url`*

`no`

Removes the specified rule definition.

`case-sensitive`

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field. *`operator`* must be one of the following:

- **`!=`**: does not equal
- **`!contains`**: does not contain
- **`!ends-with`**: does not end with
- **`!starts-with`**: does not start with
- **`=`**: equals
- **`contains`**: contains
- **`ends-with`**: ends with
- **`starts-with`**: starts with

`url`

`url` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP URL.

Example

The following command creates a rule definition for analyzing user traffic using a WSP URL of *`wsp://wiki.tcl.tk`*:

`wsp url` *`= wsp://wiki.tcl.tk`*

wsp user-agent

This command defines a rule definition to analyze and charge user traffic using WSP user agent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp user-agent [case sensitive]*operator user_agent*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

user_agent

Specifies the WSP user agent for this rule definition.
user_agent must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP user agent.

Example

The following command creates a rule definition for analyzing user traffic containing a WSP user agent of *test*:

wsp user-agent contains *test*

wsp x-header

This command defines a rule definition to analyze and charge user traffic based on WSP extension-headers (x-headers).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp x-header *name* **[case-sensitive]** *operator string*

no

Removes the specified rule definition.

name

A unique value that you specify to use for the x-header.
name must be an alpha and/or numeric string of 1 through 31 characters in length.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

Specifies the value of the extension header.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this CLI to configure any x-header field in WSP and parse it. The extension-header mechanism allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields that are not specified in RFC/standard.

Example

The following command creates a rule definition for analyzing user traffic containing WSP extension-header of *test_field* and value of *test_string*:

```
wsp x-header test_field = test_string
```

wtp

The following commands define rules for analyzing traffic based on Wireless Transaction Protocol (WTP):

wtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WTP any match status.

Example

The following command defines an any match rule definition for analyzing WTP user traffic:

```
wtp any-match = TRUE
```

wtp downlink

This command defines a rule definition to analyze and charge user traffic using WTP downlink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp downlink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP downlink condition.

Example

The following command defines a rule definition for analyzing WTP user traffic based on the WTP downlink condition of *TRUE*:

```
wtp downlink = TRUE
```

wtp gtr

This command defines a rule definition to analyze and charge user traffic based on the WTP Group Transmission Flag (GTR).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp gtr*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP GTR condition.

Example

The following command defines a rule definition for analyzing WTP user traffic based on the WTP GTR condition of *TRUE*:

```
wtp gtr = TRUE
```

wtp pdu-length

This command defines a rule definition to analyze and charge user traffic using WTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp pdu-type*operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

pdu_length

Specifies the WTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on WTP PDU length (header + payload) in bytes.

Example

The following command creates a WTP rule definition for analyzing user traffic using an WTP PDU length of *9647* bytes:

ftp pdu-length *= 9647*

wtp pdu-type

This command defines a rule definition to analyze and charge user traffic based on the WTP Protocol data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp pdu-type*operator pdu_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

pdu_type

Specifies the WTP PDU type used for this rule definition.
pdu_type must be one of the following:

- **abort**
- **ack**
- **invoke**
- **negative-ack**
- **result**
- **segment-invoke**
- **segment-result**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP PDU type value.

Example

The following command creates a WTP rule definition for analyzing user traffic containing a WTP PDU type **result**:

```
wtp pdu-type result
```

wtp previous-state

This command defines a rule definition to analyze and charge user traffic using WTP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the WTP previous state for this rule definition. *previous_state* must be one of the following:

- **ack-sent**
- **init**
- **invoke-sent**
- **rcvd**
- **result-rcvd**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP previous state.

Example

The following command creates a WTP rule definition for analyzing user traffic using a WTP previous state of *ack_sent*:

wtp previous-state *= ack-sent*

wtp rid

This command defines a rule definition to analyze and charge user traffic based on the WTP Re-transmission Indicator (RID) flag.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp rid*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP RID.

Example

The following command creates a rule definition for analyzing user traffic containing a WTP RID condition of *TRUE*:

```
wtp rid = TRUE
```

wtp state

This command defines a rule definition to analyze and charge user traffic using WTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the WTP state for this rule definition.
state must be one of the following:

- **ack-sent**
- **close**
- **init**
- **invoke-sent**
- **rcvd**
- **result-rcvd**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP state.

Example

The following command creates a WTP rule definition for analyzing user traffic using a WTP state of *close*:

wtp state = *close*

wtp tid

This command defines a rule definition to analyze and charge user traffic based on the WTP Transaction Identifier (tid).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp tid*operator tid_value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

tid_value

Specifies the transaction identifier for this rule definition.
tid_value must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP TID.

Example

The following command creates a rule definition for analyzing user traffic containing a WTP TID value of *22*:

wtp tid = *22*

wtp transaction class

This command defines a rule definition to analyze and charge user traffic based on the WTP Transaction Class (TCL) state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp transaction class*operator transaction_class*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- **!=**: does not equal
- **=**: equals

transaction_class

Specifies the WTP TCL for this rule definition.
transaction_class must be an integer from 0 through 2.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP transaction class.

Example

The following command creates a WTP rule definition for analyzing user traffic using a WTP transaction class of *2*:

wtp transaction class = *2*

wtp ttr

This command defines a rule definition to analyze and charge user traffic based on the WTP Trailer Transmission flag (TTR).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp ttr*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP TTR condition.

Example

The following command defines a rule definition for analyzing WTP user traffic based on the WTP TTR condition of *TRUE*:

```
wtp ttr = TRUE
```

wtp uplink

This command defines a rule definition to analyze and charge user traffic using WTP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp uplink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the uplink (to the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WTP uplink status.

Example

The following command creates a rule definition for analyzing user traffic using a WTP uplink value of *TRUE*:

```
wtp uplink = TRUE
```

WWW

The following commands define rules for analyzing traffic based on World Wide Web (WWW):

www any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WWW.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www any-match*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WWW any match status.

Example

The following command defines an any match rule definition for analyzing WWW user traffic:

```
www any-match = TRUE
```

www content type

This command defines a rule definition to analyze and charge user traffic based on the WWW content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www content type [case-sensitive]*operator content_type*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

content_type

content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW content type.

Example

The following command creates a SIP rule definition for analyzing user traffic using a WWW content of *test*:

www content type *= test*

www downlink

This command defines a rule definition to analyze and charge user traffic based on the WWW downlink conditions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www downlink*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW downlink condition.

Example

The following command defines a rule definition for analyzing WWW user traffic based on the WWW downlink condition of *TRUE*:

```
www downlink = TRUE
```

www first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the Wide Web (WWW) first-request-packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www first-request-packet*operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WWW first request packet.

Example

The following command creates an WW rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```
www first-request-packet = TRUE
```

www header-length

This command defines a rule definition to analyze and charge user traffic based on the WWW packet header length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www header-length*operator header_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

header_length

Specifies the WWW packet header length, in bytes, for this rule definition.
header_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW packet header length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an WWW packet header length of *10000*:

www header-length *= 10000*

www host

This command defines a rule definition to analyze and charge user traffic based on the WWW host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www host [case-sensitive]*operator host_name*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

host_name

A unique name that you specify for the WWW host.
host_name must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW host name.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW host of *host1*:

www host *= host1*

www payload-length

This command defines a rule definition to analyze and charge user traffic based on the WWW payload length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www payload-length*operator payload_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

payload_length

Specifies the WWW payload length for this rule definition.
payload_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW payload length.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW payload length of *10000*:

www payload-length *= 10000*

www pdu-length

This command defines a rule definition to analyze and charge user traffic based on the WWW Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www pdu-length*operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

pdu_length

Specifies the WWW PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on WWW PDU length (header + payload) in bytes.

Example

The following command creates an FTP rule definition for analyzing user traffic using a WWW PDU length of *9767* bytes:

www pdu-length = *9767*

www previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of WWW.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www previous-state*operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

previous_state

Specifies the WWW previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW previous state.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW previous state of *init*:

www previous-state *= init*

www reply code

This command defines a rule definition to analyze and charge user traffic based on the WWW reply code arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www reply code*operator response_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

response_code

A unique value that you specify to use for the response.
response must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze WWW user traffic based on a reply code rule definition.

Example

The following command defines a rule definition for analyzing WWW user traffic using a reply code of *110*:

www reply code = *110*

www state

This command defines a rule definition to analyze and charge user traffic based on the current state of WWW.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www state*operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

state

Specifies the WWW state for this rule definition.
state must be one of the following:

- **close**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW state.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW state of *close*:

www state = *close*

www transfer-encoding

This command defines a rule definition to analyze and charge user traffic based on the WWW transfer encoding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www transfer-encoding [case-sensitive]*operator string*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

string

A unique name that you specify for WWW transfer encoding.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW transfer encoding string.

Example

The following command creates an HTTP rule definition for analyzing user traffic using a WWW transfer encoding string of *user1*:

```
www transfer-encoding = user1
```

www url

This command defines a rule definition to analyze and charge user traffic based on the WWW URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www url [case-sensitive]*operator url*

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- **!=**: does not equal
- **!contains**: does not contain
- **!ends-with**: does not end with
- **!starts-with**: does not start with
- **=**: equals
- **contains**: contains
- **ends-with**: ends with
- **starts-with**: starts with

url

url must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WWW URL.

Example

The following command creates a rule definition for analyzing user traffic using the WWW URL *www.abc.com*:

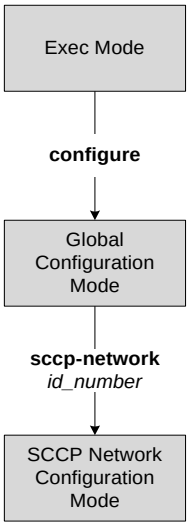
www url = *www.abc.com*

www url

Chapter 183
SCCP Network Configuration Mode Commands

The SCCP Network Configuration Mode is used to configure properties for Signaling Connection Control Part (SCCP) services for SS7.

Signaling Connection Control Part (SCCP) is a routing protocol in the SS7 protocol suite in layer 4, which provides end-to-end routing for TCAP messages to their proper database.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Associates an SS7 routing domain with the SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate ss7-routing-domain *rd_id*

no associate

no

Removes the association with the SS7 routing domain from the system configuration.

rd_id

This number identifies an already defined SS7 routing domain.
rd_id: enter an integer from 1 through 12.

Usage

Use this command to associate SS7 routing domain configurations with SCCP network configurations.

Example

The following command associates the SCCP network with SS7 routing domain 2:

associate ss7-routing-domain *2*

description

This command defines a string that describes the SCCP network. The description is used for operator reference.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

string

This is a string to describe the SCCP network.
string must be an alphanumeric string from 1 through 127 characters in length. If there are spaces in the string the string must be enclosed in double-quotes. For example; “This is a Description”.

no

Removes the description from the system configuration.

Usage

Use this command to configure a description of this SCCP service for operator reference.

Example

The following command sets the description to “This is the SCCP Service Number 1”:

description **"***This is the SCCP Service Number 1.***"**

destination

This command configures the SCCP network destination information. Use this command multiple times to set all of the destination information required.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

destination dpc *pt_code* **{ name** *route_name* **| next-hop | ssn** *subsys_num* **| version** *sccp_ver* **}**

no destination dpc*p_code***[name***route_name***| ssn***ssn_num***| version***sccp_ver***]**

---

no

Deletes the specified destination information from the SCCP network configuration.

---

dpc *pt_code*

Specifies the SCCP destination point code.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.

---

name *route_name*

The name of the SCCP destination route.
route_name: enter an alphanumeric string from 1 through 64 characters in length.

---

next-hop

Associates the next destination defined in the SS7 routing domain.

---

ssn *subsys_num*

The destination subsystem number.
subsys_num: enter an integer from 1 through 255.

---

version *sccp_ver*

sccp_ver: enter one of the following to select the SCCP variant:

- ANSI88
- ANSI92
- ANSI96
- BELL05
- GSM0806
- ITU88
- ITU92

- ITU96

Usage

Use this command to configure the destination information for the SCCP network.

Example

The following commands set the name of the destination route to default_route, the subsystem number to 1, and the variant version to ITU96, all with a destination point code of 1:

```
destination dpc 1 name default_routedestination dpc 1 ssn 1destination
dpc version ITU96
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

global-title-translation

This command associates a GTT address-map with this SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

global-title-translation address-map instance *instance*

no global-title-translation address-map instance *instance*

no

Deletes the GTT address-map instance associated with this SCCP network.

instance

This value uniquely identifies a specific previously defined instance of a GTT address-map.
instance: enter an integer from 1 to 4096.

Usage

Use this command to link a GTT address-map, configured with the GTT Address Map configuration mode, to a specific SCCP network configuration.

Example

```
global-title-translation address-map instance gtt-map1
```

hop-count

This command specifies the hop count for this SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hop-count *hop_cnt*

default hop-count

default

Resets the hop-count value to the system default of 5.

hop_cnt

The hop count to assign to this SCCP network.
hop_cnt: enter an integer from 1 to 5.

Usage

Use this command to define the hop count for this SCCP network.

Example

The following command sets the hop count to 3:

hop-count *3*

self-point-code

This command specifies the SS7 point code for this SCCP service.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point_code*

no self-point-code

no

Deletes the configured self point code.

point_code

Defines the point code to assign to this SCCP network service.
point_code: value entered must adhere to the point code variant selected when the SCCP network instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage

Use this command to assign the self point code to use for this SCCP service.

Example

The following command sets an ITU-based point code for this SCCP service:

self-pointcode *4.121.5*

The following command removes the configured self-point code:

```
no self-pointcode
```

timeout

This command configures the timeout parameters for this SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
timeout { attack-timer | congestion-timer | conn-est-timer | crd-timer | decay-
timer | iar-timer | ias-timer | interval-timer | reassembly-timer | release-
timer | repeat-release-timer | reset-timer | sst-timer } +

default timeout

no timeout timer
```

attack-timer *time*

Defines the time before the attack timer expires.
time: enter an integer between 1 and 10.

congestion-timer *time*

Defines the time before the congestion timer expires.
time: enter an integer between 1 and 10.

conn-est-timer *time*

Defines the time before the connection timer expires.
time: enter an integer between 6 and 12.

crd-timer *time*

Defines the time before the coordinated-state-change timer expires.
time: enter an integer between 60 and 120.

decay-timer *time*

Defines the time before the decay timer expires.
time: enter an integer between 1 and 10.

iar-timer *time*

Defines the time before the inactivity-receive timer expires.
time: enter an integer between 60 and 120.

ias-timer *time*

Defines the time before the inactivity-send timer expires.
time: enter an integer between 30 and 60.

interval-timer *time*

Defines the time before the interval timer expires.
time: enter an integer between 6 and 12

reassembly-timer *time*

Defines the time before the reassembly-timer expires.
time: enter an integer between 10 and 20.

release-timer *time*

Defines the time before the release-assembly timer expires.
time: enter an integer between 1 and 2.

repeat-release-timer *time*

Defines the time before repeat-release timer expires.
time: enter an integer between 1 and 2

reset-timer *time*

Defines the amount of time before the reset timer expires.
time: enter an integer between 1 and 2

sst-timer *time*

Defines the amount of time before the subsystem status test timer expires.
time: enter an integer between 5 and 1200.

default

Resets the timeout parameter to the system default.

no

Deletes the specified timer configuration.

Usage

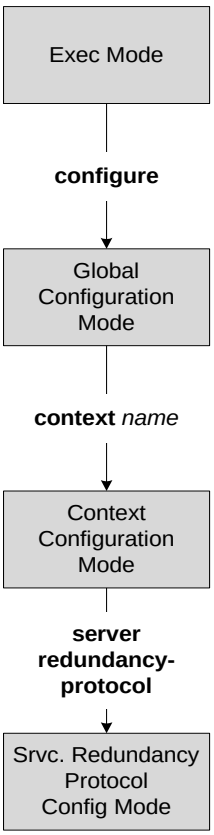
Use this command to assign timeout timers and timeout values for this SCCP service.

Example

```
timeout reset-timer 75
```

Chapter 184
Service Redundancy Protocol Configuration Mode Commands

The Service Redundancy Protocol Mode is used to configure properties for Interchassis Session Recovery services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind address

Binds the service to the IP address of the local chassis.

Product

HA, GGSN,

Privilege

Security Administrator, Administrator

Syntax

bind address {*IPv4 _address* **|** *IPv6_address***}**

no bind address

no

Removes the IP bind address.

IPv4 _address | IPv6_address

The system IP address.

Usage

Defines the IP address of the local chassis defined as part of the Interchassis Session Recovery configuration.

Example

bind address *1.1.1.1*

chassis-mode

Defines the chassis's operational mode - primary or backup - for Interchassis Session Recovery.

Product

HA, GGSN,

Privilege

Security Administrator, Administrator

Syntax

```
chassis-mode { primary | backup }

default chassis-mode
```

default

Resets the chassis mode to the default setting of backup.

primary

Configures the system as the primary chassis operating in active state.

backup

Configures the system as the backup chassis operating in standby state.

Usage

Sets the chassis mode (primary or backup) for the system within the framework of Interchassis Session Recovery.

Example

```
chassis-mode primary
```

checkpoint session duration

Configures check pointing for Interchassis Session Recovery.

Product

HA, GGSN,

Privilege

Security Administrator, Administrator

Syntax

checkpoint session duration *duration*

default checkpoint session duration

default

Resets the checkpoint session duration to the default setting of 60 seconds.

duration

The amount of time (in seconds) that a call must be active before it is check pointed. **duration** must be an integer from 1 through 65535.

Usage

Sets the amount of time the chassis waits before check pointing an existing call session.

Example

checkpoint session duration *6500*

configuration-interval

Defines the configuration validation interval.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

configuration-interval *interval*

default configuration-interval

default

Resets the configuration interval to the default setting of 3600 seconds.

interval

The amount of time (number of seconds) between one configuration validation and the next configuration validation. interval must be an integer from 1 through 65535.

Usage

This configures the interval between configuration validations of the primary and backup chassis.

Example

configuration-interval *34*

dead-interval

The timeout interval before a peer is determined to be down.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

dead-interval *interval*

default dead-interval

default

Resets the dead interval to the default setting of 30 seconds.

interval

The amount of time (in seconds) for the dead interval. interval must be an integer from 1 through 65535.

Usage

This command specifies the amount of time that one chassis waits to receive a communication from a peer before the listening chassis determines that the peer chassis is down.

Example

dead-interval *65*

delay-interval

Configure the delay time, for starting the dead timer, after configuration files are loaded.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

delay-interval*interval*

default delay-interval

default

Sets / Restores default value assigned for specified parameter.

interval

The amount of time (in seconds) for the delay interval. interval must be an integer from 1 through 65535.

Usage

This configures interval for starting the dead timer, after configuration files are loaded.

Example

delay interval *65*

end

Exits the service recovery mode and returns to the Exec mode.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the Context Configuration mode.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

hello-interval

Defines the lapse time between sending the hello message.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

hello-interval *interval*

default hello-interval

default

Resets the hello interval to the default setting of 10 seconds.

interval

The lapse time (in seconds) between sending the hello message. interval must be an integer from 1 through 65535.

Usage

This command configures the hello interval - the amount of time that lapses between the sending of each hello message. Each chassis sends the other chassis a hello message at the expiration of every hello interval.

Example

hello-interval *35*

monitor authentication probe

Enables the monitoring of the connection between the primary chassis and a specified RADIUS server.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] monitor authentication probe context *context_name* **{** *IPv4_address | IPv6_address* **} port** *port_number*

no

Turns off the monitoring.

context *context_name*

Identifies the context being used.

IPv4 _address | IPv6_address

Defines the IP address of the RADIUS server to be monitored.

port *port_number*

Identifies a specific port for the authentication probe. port_number must be the port for the AAA server.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified AAA server through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

Example

```
monitor authentication probe context test1 1.1.1.1 port 1025
```

monitor bgp

Enables monitoring of the connection between the specified BGP peer and the primary chassis.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] monitor BGP context *context_nameIPv4_address*

no

Disables monitoring.

context *context_name*

Identifies the context being used.

IPv4 _address | IPv6_address

Defines the IP address of the BGP peer to be monitored.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified BGP peer through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

Example

```
monitor bgp context test 125.2.1.56
```

peer-ip-address

Specifies the IP address for the peer chassis.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

peer-ip-address { *IPv4_address* | *IPv6_address* }

no peer-ip-address

no

Removes the peer IP address of the backup chassis.

IPv4_address | *IPv6_address*

The IP address of the backup chassis.

Usage

This command is used to identify the peer chassis in the Interchassis Session Recovery configuration. From the primary's perspective, the peer is the backup and from the backup's perspective, the peer is the primary.

Example

peer-ip-address *1.1.1.1*

priority

Sets the initial Interchassis Session Recovery priority of each peer chassis.

Important: **priority** takes affect only during simultaneous initializing of all chassis in an Interchassis Session Recovery configuration, and only if a misconfiguration has both chassis in the same mode (both Primary or both Backup).

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

priority *priority_value*

default priority

default

Resets the priority to the default setting of 125.

priority_value

The priority for the HA. *priority_value* must be an integer from 1 through 255.

Usage

This command determines which chassis transitions to the Active state when all chassis have the same mode configuration. **priority** acts as a tie breaker for the state determination only when all chassis initialize simultaneously. The chassis with the higher priority (higher number) becomes Active while the chassis with the lower priority (lower number) becomes Standby.
Once chassis become operational (after initialization), if there is an event requiring a chassis change of state, then each chassis returns to its previous state (Active or Standby) after both chassis recover.

Example

priority *5*

route-modifier

Sets the route modifier for the peer chassis.

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-modifier threshold *threshold_value*

default route-modifier

default

Resets the route modifier to the default setting of 16.

threshold_value

The value that causes the route-modifier counter to be reset to the initial value. *threshold_value* must be an integer from 2 through 32.

Usage

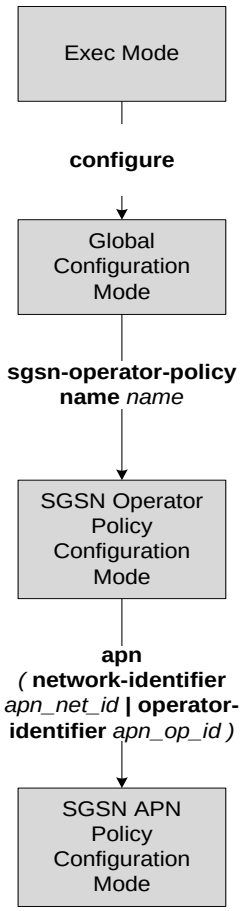
This command is used to determine when the route modifier should be reset to its initial value to avoid rollover.

Example

route-modifier threshold *10*

Chapter 185
SGSN APN Policy Configuration Mode Commands

The SGSN APN Policy configuration mode provides the commands to configure the access point name (APN) parameters specific to a particular SGSN operator policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

address-resolution-mode

Identify the address resolution mode for this SGSN APN policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

address-resolution-mode { **fallback-for-dns** | **local** }

default address-resolution-mode

default

Resets the configuration to the default value; i.e. fallback-for-dns.

fallback-for-dns

Default: Enabled
This keyword instructs the system to first attempt DNS resolution. If this fails, then the system is to use locally configured addresses, if available.

local

Default: Disabled
This keyword instructs the system not to use DNS query and to only use locally configured addresses.

Usage

Use this command to specify the DNS query or local address resolution for this SGSN APN policy.

Example

The following command sets the address resolution mode to attempt the DNS resolution first and if failed attempt to use available local address:

```
address-resolution-mode fallback-for-dns
```

cc

This command provides the configurables to define the charging characteristics for this SGSN APN policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc { local-value-for-scdrs behavior bit_value profile index_bit | prefer { hlr-value-for-scdrs | local-value-for-scdrs } }

remove cc { local-value-for-scdrs | prefer }
```

remove

Removes the charging characteristics configuration for this APN policy.

local-value-for-scdrs behavior *bit_value* **profile** *index_bit*

Defaults:*bit_value* = 0x0; *index_bit* = 8
This keyword sets the SGSN APN policy to configure the value of the behavior bits and profile index for the charging characteristics for S-CDRs locally, when the HLR does not provide values for this.
If the HLR provides the charging characteristics with behavior bits and profile index and operator want to ignore it, then specify **prefer local-value-for-scdrs** keyword with this command.
bit_value: Must be a hexadecimal value between 0x0 and 0xFFF.
index_bit: Must be an integer value from 1 to 15.
Some of the index values are predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

prefer { hlr-value-for-scdrs | local-value-for-scdrs }

Default: **hlr-value-for-scdrs**
Specifies preference for using charging characteristics settings received from HLR or set by SGSN locally.

- **hlr-value-for-scdrs**: Sets the operator policy to use charging characteristics settings received from HLR for S-CDRs. This is the default preference.
- **local-value-for-scdrs**: Sets the operator policy to use charging characteristics settings from SGSN only for S-CDRs..

Usage

Use this command to set the APN policy behavior in operator policy to use charging characteristic for S-CDRs either from HLR or locally from SGSN.
The charging characteristics parameters are configurable from SGSN Operator Policy Configuration mode too. For generation of M-CDRs the parameters configured in SGSN Operator Policy Configuration mode will

prevail but for generation of S-CDRs the parameters configured in this SGSN APN Policy Configuration mode will prevail.

Example

The following command configures the APN policy not to use charging characteristics setting received from HLR for S-CDR generation.

```
cc prefer hlr-value-for-scdrs
```

direct-tunnel

This command defines the permission for direct tunnel establishment by GGSNs resolved by this APN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel not-permitted-by-ggsn

remove direct-tunnel
```

remove

Removes the configured policy of not to permit direct tunnel by GGSNs resolved by this APN.

not-permitted-by-ggsn

Default: Disabled.
Specifies that a direct tunnel is not permitted by the GGSN resolved by this APN.

Usage

Use this command to enable/disable the permission for establishment of direct tunnels between RNC and GGSN.

Example

The following command configures the SGSN not to permit the direct tunnel with the GGSN which is resolved by this APN policy:

```
direct-tunnel not-permitted-by-ggsn
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

gateway-address

Configures the address of the gateway GPRS support node (GGSN) with priority to activate the GGSN. It also provides the load balancing through weight for specific GGSN address in this APN policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gateway-address *ip_address* { **priority** *priority* | **weight** *weight* }

no gateway-address *ip_address*

no

Removes the preconfigured/defined GGSN address from this APN policy.

ip_address

Specifies the IP address for the GGSN in standard IPv4 or IPv6 notation.

priority *priority*

Specify the priority for the configured GGSN address for SGSN address selection. If one GGSN fails to respond, the next priority level GGSN is selected.
priority is an integer from 1 to 100 to assign a priority to the GGSN IP address. Note that the lower the integer, the higher the priority so that 1 is the highest priority.

weight *weight*

Specifies the weight (importance) assigned to a GGSN for load balancing.
weight is an integer from 1 to 100 to give a weight to the GGSN IP address.
If a weight is assigned to an address for that APN, then load balancing (of primary CPC requests) depends on the weight value.
For example:

```
GGSN1 172.16.130.1 weight 30 and GGSN2 172.16.130.3 weight 70
```

With this configuration, 30% ot the activation requests for this APN will go to GGSN1 and 70% of the requests will go to GGSN2. Also note, the sum of the weights does not need to be 100. The calculation of weight percentiles is carried out proportionally; so the following configuration will also yeild the same 30% - 70% results:

```
GGSN1 172.16.130.1 weight 6 and GGSN2 172.16.130.3 weight 14
```

Usage

Use this command to provide a priority and load balancing in GGSN selection through APN policy. Note that keyword priority and weight can not be used simultaneously in one APN policy. A maximum of 16 GGSN address can be configured with this command in an APN policy..

Example

gateway-address *123.123.123.1* **priority** *2*

gtp

This command enables (by adding a configuration statement) or disables (by removing the configuration statement) the GTPC private extension. This command is available in releases 9.0 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtp  private-extension  loss-of-radio-coverage send-to-ggsn [  send-to-peer-sgsn
]

remove gtp  private-extension  loss-of-radio-coverage send-to-ggsn [ send-to-
peer-sgsn ]
```

remove

Including this keyword ,as part of the command, disables the inclusion of the GTPC private extension, thereby disabling the Overcharging Protection feature.

private-extension

This keyword is required as part of the **gtp** command to instruct the SGSN to set a proprietary GTPC private extension in the LORC Intimation IEs, in the event of loss of radio coverage (LORC). These private extension are only understood by a GGSN with an Overcharging Protection license.

loss-of-radio-coverage send-to-ggsn

This keyword set is required as part of the **gtp** command to instruct the SGSN to forward the private extension 'flag' to the GGSN in the event of loss of radio coverage (LORC).

send-to-peer-sgsn

This optional keyword instructs the SGSN to *also* forward the LORC private extension to the peer SGSN.

Usage

gtp private-extension is one of the two commands required to enable the Overcharging Protection feature. The second command sets the RANAP cause code in the Iu Release to enable the SGSN detect the LORC state of the MS/UE. This second command is configured in the IuPS service and is explained in the *IuPS Service Configuration Mode* chapter.

When there is a loss of coverage and the Overcharging Protection feature is enabled with the **gtp private-extension** command, then the SGSN includes the proprietary private extension in the GTP LORC Intimation IE messages. This LORC IE is also included in UPCQ, DPCQ, and SGSN Context Response GTP messages.

Refer to the *SGSN Overview* chapter of the *SGSN Administration Guide* for functional information regarding the Overcharging Protection feature.

Example

Use the following command to have the SGSN send the GGSN the GTPC private extension in the LORC Intimation IE:

```
gtp  private-extension  loss-of-radio-coverage send-to-ggsn
```

ip

Use this command to define the IP parameters for this APN policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip { qos-dscp { { downlink | uplink } { background | conversational |
interactive | streaming } + } | source-violation { deactivate [ all-pdp |
exclude-from accounting | linked-pdp | tolerance-limit } | discard  [ exclude-
from-accounting ] | ignore }

default ip { qos-dscp [ downlink | uplink ] | source-violation }no qos-dscp { {
downlink | uplink } { background | conversational | interactive | streaming } +
}
```

Important: All parameters not specifically configured will be included in the configuration with default values.

default

Resets the configuration to the default values.

qos-dscp

Configures the diffserv code point marking to be used for sending packets of a particular 3GPP QoS class. Defaults are **downlink** with:

- conversational - ef;
- streaming - af11;
- interactive 1 - ef;
- interactive 2 - af21;
- interactive 3 - af21;
- background - be

downlink | uplink

Configures the packets for either downlink or uplink direction. **downlink** and **uplink** configuration must include one or more of the following:

- **background** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP background class. Must be followed by a DSCP marking
- **conversational** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP conversational class. Must be followed by a DSCP marking
- **interactive** - Configures the DSCP marking to be used for packets of sessions subscribed to different traffic priorities in the 3GPP interactive class. Must be followed by a traffic handling priority: 1, 2, or 3.

- **streaming** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP streaming class. Must be followed by a DSCP marking

DSCP marking options

Downlink and uplink configuration options must include a DSCP marking, supported options include:

- af11 - Designates use of Assured Forwarding 11 PHB
- af12 - Designates use of Assured Forwarding 12 PHB
- af13 - Designates use of Assured Forwarding 13 PHB
- af21 - Designates use of Assured Forwarding 21 PHB
- af22 - Designates use of Assured Forwarding 22 PHB
- af23 - Designates use of Assured Forwarding 23 PHB
- af31 - Designates use of Assured Forwarding 31 PHB
- af32 - Designates use of Assured Forwarding 32 PHB
- af33 - Designates use of Assured Forwarding 33 PHB
- af41 - Designates use of Assured Forwarding 41 PHB
- af42 - Designates use of Assured Forwarding 42 PHB
- af43 - Designates use of Assured Forwarding 43 PHB
- be - Designates use of Best Effort forwarding PHB
- ef - Designates use of Expedited Forwarding PHB

source-violation

Configures settings related to IP source-violation detection with one of the following criteria:

- **deactivate** - deactive the PDP context with one of the following conditions:
- **all-pdp** - deactivates all PDP context of the MS/UE. Default is to deactivate errant PDP contexts.
- **exclude-from-accounting** - excludes packets having an invalid source IP address from the statistics used in the accounting records.
- **linked-pdp** - deactivate all associated pdp contexts (primary and secondary). Default is to deactivate errant pdp context.
- **tolerance-limit** - Configures maximum number of allowed ip source violations before the session is deactivated.
- **discard** - discard errant packets, can include the following option:
- **exclude-from-accounting** - excludes packets having an invalid source IP address from the statistics used in the accounting records.
- **ignore** - ignore checking of packets for MS/UE IP source violation.

Usage

This command is used to configure a range of IP functions to be associated with the APN policy; such as:

- SGSN action to detection of IP source violations,
- DSCP marking for downlink and uplink configuration per traffic class,
- QoS class diffserv code.

.

Example

Use the following command so the SGSN does not check incoming pacets for IP source violation information.

```
ip source-violation ignore
```

pdp-data-inactivity

Configures APN policy regarding PDP data inactivity.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pdp-data-inactivity { action { deactivate [ all-pdp | linked-pdp ] | detach-when
{ all-pdp-inactive | any-pdp-inactive } } | timeout minutes minutes }

default pdp-data-inactivity { action | timeout }

no pdp-data-inactivity
```

default

Resets the APN policy configuration to the default values for PDP data-inactivity.

no

Disables the PDP data-inactivity configuration defined for the APN policy.

action

Defines the action to be taken if PDP data-inactivity occurs:

- **deactivate** - defines which PDP context should be deactivated:
- **all-pdp** - deactivates all PDP contexts.
- **linked-pdp** - deactivates only linked PDP contexts.
- **detach-when** - defines the condition that warrants a detach:
- **all-pdp-inactive** - detach when all PDP contexts are inactive.
- **any-pdp-inactive** - detach when any PDP context is inactive.

timeout minutes *minutes*

minutes: Must be an integer from 1 to 1440. Note that even though the timeout is set for minutes, the configuration displays in seconds.

Usage

Use this command to define how the SGSN will handle a situation where the PDP is not fully active. Repeat the command, as needed, to configure more than one keyword-controlled function.

Example

Use the following command to have the SGSN deactivate all PDP contexts associated with the APN when it detects the PDP is inactive:

```
pdp-data-inactivity action deactivate all-pdp
```

Use the following command to have the SGSN wait 2 minutes after detecting PDP data inactivity:

```
pdp-data-inactivity timeout 2
```

qos class

This command configures Quality of Service (QoS) parameters for traffic class configured for this APN policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

qos class { **background** | **conversational** | **interactive** | **streaming** } [*qualif_option*]

default qos class { **background** | **conversational** | **interactive** | **streaming** } [*qualif_option*]

default

Sets the APN policy to default QoS parameters for the specified traffic class.

class

Defines the class of service for this APN policy. Configuration must include one of the following class options:

- **background** - selects background class of service and can include one of the qualifying options.
- **conversational** - selects conversational class of service and can include one of the qualifying options.
- **interactive** - selects interactive class of service and can include a qualifying option.
- **streaming** - selects streaming class of service and can include a qualifying option.

qualif_option

Qualifying options include:

- **gbr-down** - guaranteed bit rate downlink; Enter an integer from the range 1 to 256000 kbps.
- **gbr-up** - guaranteed bit rate uplink in kbps. Enter an integer from 1 to 256000 kbps.
- **mbr-down** - maximum bit rate downlink. Enter an integer from the range 1 to 256000 kbps.
- **mbr-up** - maximum bit rate uplink in kbps. Enter an integer from 1 to 256000 kbps.
- **min-transfer-delay** - minimum transfer delay in milliseconds. Enter an integer from 80 to 4000.
- **residual-bit-error-rate** -
  - background residual-bit-error-rate range is from 4*10^-4 to 6*10^-8. Enter on of the following integers, where:
    - **4** : represents 4*10^-3
    - **7** : represents 10^-5
    - **9** : represents 6*10^-8

- conversational residual-bit-error-rate range is from 5*10^-2 to 10^-6. Enter one of the following integers, where:
  - **1** : represents 5*10^-2
  - **2** : represents 10^-2
  - **3** : represents 5*10^-3
  - **5** : represents 10^-3
  - **6** : represents 10^-4
  - **7** : represents 10^-5
  - **8** : represents 10^-6
- interactive residual-bit-error-rate range is from 4*10^-4 to 6*10^-8. Enter one of the following integers, where:
  - **4** : represents 4*10^-3
  - **7** : represents 10^-5
  - **9** : represents 6*10^-8
- streaming residual-bit-error-rate range is from 5*10^-2 to 10^-6. Enter one of the following integers, where:
  - **1** : represents 5*10-2
  - **2** : represents 10^-2
  - **3** : represents 5*10^-3
  - **5** : represents 10^-3
  - **6** : represents 10^-4
  - **7** : represents 10^-5
  - **8** : represents 10^-6

- **sdu** - signalling data unit, must include one of the following options:
  - **delivery-order** : Enter one of the two following options:
    - **no** : without delivery order
    - **yes** : with delivery order
  - **erroneous:** Enter one of the two following options:
    - **no** : erroneous SDUs will not be delivered
    - **no-detect** : erroneous SDUs are not detected (‘-’)
    - **yes** : erroneous SDUs will be delivered
  - **error-ratio:** the SDU error-ratio range is from 10^-3 to 10^-6. Enter an integer from 1 to 6, where:
    - **3** : represents 10^-3
    - **4** : represents 10^-4
    - **6** : represents 10^-6

- **max-size:** defines the maximum number of octets (size) of the SDU. Enter an integer from 10 to 1502.

Usage

Use this command to define the qualifying options for each QoS class parameter defined for this APN policy. Repeat the command as often as needed with different keywords to define all required QoS criteria.

Example

Use the following command to define a background QoS class qualified with mbr-down.

```
qos class background mbr-down 5600
```

qos prefer-as-cap

This command specifies operational preferences for QoS parameters, specifically QoS bit rates.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos prefer-as-cap { both-hlr-and-local | hlr-subscription | local }

remove qos prefer-as-cap
```

Important: Command and keyword names have changed. **prefer** has become **prefer-as-cap** and **hlr** has become **hlr-subscription**. These changes will not impact configuration generated with earlier releases as the keywords are aliases for the previous names.

remove

Removes previous configuration changes and resets the default.

both-hlr-and-local

This keyword instructs the SGSN to use, as the capping value during session establishment, the *lower* of either the locally configured QoS bit rate or the HLR subscription.

hlr-subscription

Default.
Instructs the SGSN to take QoS bit rates from the HLR configuration and use HLR rate as the capping value for session establishment.

local

Instructs the SGSN to take QoS bit rate from the local configuration and use it for for session establishment.

Usage

Use this command to instruct the SGSN to take QoS configuration as the bit rate for session establishment.

Example

Following command specifies use of the bit rate in subscription at the HLR:

```
qos prefer-as-cap hlr-subscription hlr
```

Instruct the SGSN to cap the bit rate with the lower rate of the two configurations, HLR or local:

```
qos prefer-as-cap both-hlr-and-local
```

qos rate-limit direction

Configure the parameters and actions governing the subscriber traffic flow if it violates or exceeds configured peak or committed data rates.

This command can be entered multiple times to specify different combinations of traffic direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Additional information on the QoS traffic policing functionality is located in the System Enhanced Feature Configuration Guide.

Important: This command should be used in conjunction with the **max-contexts** command to limit the maximum possible bandwidth consumption by the APN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit direction { downlink | uplink } [ [ burst-size { auto-readjust [
durationseconds ] |bytes } ] [ class { background | conversational | interactive
traffic_priority } ] | exceed-action { drop | lower-ip-precedence | transmit } ]
[ violate-action { drop | lower-ip-precedence | transmit } ] +

remove qos rate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ]
```

remove

Disables the QoS data rate limit configuration for the APN policy.

Important: If no Qos Profile is configured, the system's default behavior is to use the information provided by the SGSN.

downlink | uplink

Apply the limits and actions configured with the other keywords to the selected link:
downlink - This is the direction from GGSN to MS. (from Gn to Iu/Gb).
uplink - This is the direction from MS to GGSN (from Iu/Gb to Gn).

burst-size [*bytes* | auto-readjust [duration *seconds*]]

Default: See the table of class default values in the Usage section below.
The peak burst size allowed. System measurements for this value exclude the GTP and outer packet headers.
Supported options include:

- *bytes* : Must be an integer from 1 through 6000000.

Important: It is recommended that the minimum value of this parameter be configured to the greater of the following two values: (1) 3 times greater than packet MTU for the subscriber connection, *or* (2) 3 seconds worth of token accumulation within the "bucket" for the configured peak-data-rate. In addition, if the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

- **auto-readjust** : This keyword enables dynamic burst-size calculation, for traffic policing, at the time PDP Activation/Modification is negotiated using QoS maximum bit-rates and guaranteed bit-rates.
- **duration** *seconds* : Must be an integer from 1 to 30. This keyword sets the number of seconds that the dynamic burst-size calculation will last. This allows the traffic to be throttled at the negotiated rates.

class { background | conversational | interactive *traffic_priority* **| streaming }**

Apply the specified limits and actions to PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background** : Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.
- **conversational** : Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.
- **interactive** *traffic_priority* : Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern. *traffic_priority* is the 3GPP traffic handling priority and can be an integer 1,2 or 3.
- **streaming** : Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

Important: If this keyword is omitted, the same values are used for all classes.

exceed-action { drop | lower-ip-precedence | transmit }

Default: See the table of class default values in the Usage section below.
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet

violate-action { drop | lower-ip-precedence | transmit }

Default: See the table of class default values in the Usage section below.
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop** : Drop the packet
- **lower-ip-precedence** : Transmit the packet after lowering the IP precedence

- **transmit** : Transmit the packet

+

This symbol indicates that the keywords can be entered multiple times within a single command.

Usage

This command configures the APN's quality of service (QoS) data rate shaping through traffic policing. Configured actions prevent subscriber flow exceeding or violating configured peak or committed data rate limits.

Important: If either **exceed action** or **violate action** is set to "lower-ip-precedence", this command may override the configuration of the **ip qos-dscp** command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service **ip qos-dscp** command configuration can override this APN setting for packets from the GGSN to the Internet.

Class: Background	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	

Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop

Important: If a subscribed traffic class is received, the system changes the class to background and sets the following parameters: The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the "Background" class. The received values are used for responses when traffic policing is disabled.

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-
buffer-full
```

ranap allocation-retention-priority-ie

This command configures the allocation/retention priority (ARP) IE for this APN policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ranap allocation-retention-priority-ie subscription-priority *priority* **class** { { **background** | **conversational** | **interactive** | **streaming** } { **not-pre-emptable** | **priority** | **queuing-not-allowed** | **shall-not-trigger-pre-emptable** } **+** }

Important: All parameters not specifically configured will be included in the configuration with default values.

[**default** | **remove** | **no**] **ranap allocation-retention-priority-ie** [**subscription-priority** *priority* **class** { **background** | **conversational** | **interactive** | **streaming** }]

default

Resets the configuration to the default values.

no

Disables the specified configuration

remove

Removes the specified configuration.

subscription-priority *priority*

This keyword sets the subscription priority. The lowest number means the highest priority. *priority* must be an integer from 1 to 3.

class

Configure allocation retention priority for specific QoS traffic classes. Include one or more of the following class options:

- **background** - background class of service
- **conversational** - conversational class of service
- **interactive** - interactive class of service
- **streaming** - streaming class of service

Default values will be included in the configuration for any class configuration not specified.

qualifying options

For each of the class options, the configuration must include one or more of the following qualifying options:

- **not-pre-emptable**
- **priority** - smallest number is the highest priority. Value must be an integer from 1 to 15
- **queuing-disallowed**
- **shall-not-trigger-pre-emptable**

When entering more than one option, we recommend that you do it in the order in which they are listed.

+

This symbol indicates that the keywords can be entered multiple times within a single command.

Usage

Use this command to configure values for the allocation/retention priority (ARP) IE in the radio access bearer (RAB) assignment request message for RANAP that occurs during RAB setup.
This command can be used multiple times to define multiple priorities, with different combinations of **subscription-priority** and **class**.
If the HLR returns a matching value for the subscribed ARP for the desired traffic class, then the SGSN includes the configured qualifying options for the ARP IE in the RANAP message.
If there is no matching configuration, the SGSN includes the following default values for the traffic class (tc) within the ARP IE:

- Default values for tc=background:
  priority-level = (subscribed-value * 3) + 3
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes
- Default values for tc=interactive:
  priority-level = (subscribed-value * 3) + 3
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes
- Default values for tc=conversational:
  priority-level = (subscribed-value * 3) + 2
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes
- Default values for tc=streaming:
  priority-level = (subscribed-value * 3) + 1
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes

Example

The following series of commands define the highest priority for conversational traffic class with priority level 1-10 (Subscribed priority 0-3), PCI of shall-not-trigger-pre-emption, PVI of not-pre-emptable with queuing-not-allowed:

```
ranap allocation-retention-priority-ie subscription-priority 0 priority
class conversational not-pre-emptable priority 1 shall-not-trigger-pre-
emptable

ranap allocation-retention-priority-ie subscription-priority 1 priority
class conversational not-pre-emptable priority 4  shall-not-trigger-pre-
emptable

ranap allocation-retention-priority-ie subscription-priority 2 priority
class conversational not-pre-emptable priority 7 shall-not-trigger-pre-
emptable

ranap allocation-retention-priority-ie subscription-priority 3 priority
class conversational not-pre-emptable priority 10  shall-not-trigger-pre-
emptable
```

restrict access-type

This command configures the activation restrictions of PDP context on the basis of the access type and QoS class.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
restrict access-type { { gprs | umts } [ qos-class { background | conversational
| interactive | streaming } ] }

no restrict access-type { gprs | umts } [ qos-class ]

default restrict access-type { gprs | umts }
```

no

Remove the restriction rules for PDP context activation configured in this APN policy.

default

Resets the restriction rules for PDP context activation to the default values to allow all access types and QoS class.

gprs

Configures the APN policy to restrict the PDP context activation from General Packet Radio Service (2.5G) network access.

umts

Configures the APN policy to restrict the PDP context activation from Universal Mobile Telecommunications Systems (3G) network access.

qos-class

Configures the APN policy to restrict the PDP context activation for type of traffic QoS class. It is optional and can be configured after selecting the network access type. Possible type of QoS for restrictions can be one of the following:

- **background** - Specifies the QoS class as background service session
- **conversational** - Specifies the QoS class as conversational service session
- **interactive** - Specifies the QoS class as interactive service session
- **streaming** - Specifies the QoS class as streaming service session

Usage

Use this command to configure the restriction rules in an APN policy for activation of PDP context on the basis of the access type. It also provides the facility to restrict type of traffic QoS class.

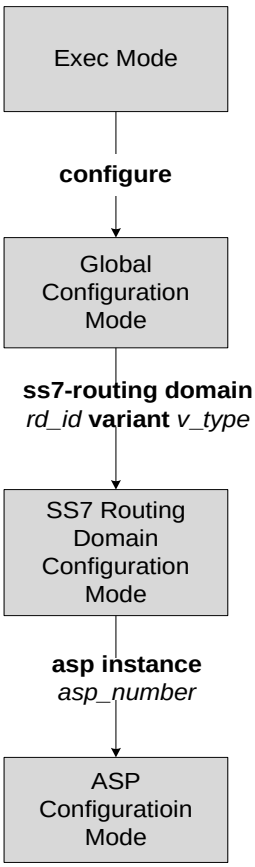
Example

The following command configures the APN policy to restrict all traffic from a GPRS network service having a QoS class of interactive:

```
restrict access-type grps qos-class interactive
```

Chapter 186
SGSN ASP Configuration Mode Commands

The ASP (application server process) Configuration Mode defines the M3UA end-point parameters for a specific SS7 routing domain instance. The ASP instance is generated originally with the SS7 routing domain configuration mode commands.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

end-point

This command defines or deletes the IP address and/or port number to be associated with the local SCTP end-point for this ASP. At least one address needs to be configured before the end-point can be activated.

When using the **bind** keyword, this command also activates the end-point once the address has been defined. Once bound, it cannot be reconfigured until it is unbound with the **no end-point bind** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end-point { address ip_address context context_id | bind | port port_number }

no end-point { address ip_address context context_id | bind }
```

address ip_address context context_id:

Specifies the IP address and the context associated with the address for this end-point.
ip_address**:** must be defined using the standard IPv4 dotted decimal notation or the colon notation of IPv6.
context context_id: a string of 1 to 79 alphanumeric characters to identify the specific context associated with the end-point address.

bind

Activates (binds) the end-point.

Important: Only use **bind** after you have configured other parameters.

port port_number

Identifies the M3UA's SCTP port associated with this end-point.
port_number: must be an integer fom 1 to 65535. Default is 2905.

no

Removes the end-point configuration or deactivates the end-point.

Caution: Entering this command will terminate all current subscriber sessions for associated peers.

Usage

Use this command to manage the ASP end-point. Once the ASP end-point is bound the end-point configuration can not be changed until it is unbound.

Example

Activate the end-point with the following command:

end-point bind

Deactivate or unbind the end-point with the following command:

no end-point bind

Set the end-point port to default for ASP 1 with the following command:

```
default asp instance 1 end-point port
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

Chapter 187
SGSN Operator Policy Configuration Mode Commands

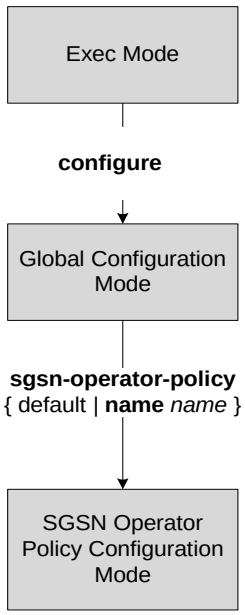
The SGSN Operator Policy configuration mode enables the operator to specify a single policy with rules governing the services, facilities, and privileges available to one, multiple, or all subscribers. These policies can override standard behaviors and provide mechanisms for an operator to *get around* the limitations of other infrastructure elements such as DNS servers and HLRs. By configuring an operator policy, the operator fine-tunes any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers within a defined IMSI range.

Important: To create and use an operator policy, you must first define the IMSI range using the **mcc** command. This does not apply to the default operator policy.

The system supports up to 1000 operator policies, including the single operator policy named *default*. This default operator policy must be configured by the user to define limitations to be applied to any IMSIs that are not covered by any other defined operator policy.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]asn5000(config-sgsn-op-policy-<pol_name>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

- exit

accounting context

This command defines the name of the accounting context and optionally associates a GTPP group with this SGSN operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

accounting context *ctxt_name* [**gtpp group** *grp_name*]

remove accounting context

remove

Removes the accounting configuration from this SGSN operator policy configuration.

context *ctxt_name*

Use this keyword to identify the accounting context.
ctxt_name: Enter a string of 1 to 79 alphanumeric characters.

gtpp group *grp_name*

This keyword set identifies the GTPP group, where the GTPP related parameters have been configured in the GTPP Group configuration mode, to associate with this SGSN operator policy.
grp_name: Enter a string of 1 to 63 alphanumeric characters to identify the GTPP group created with the **gtpp group** command in the Context configuration mode.

Usage

This command can be used to associate a predefined GTPP server group - including all its associated configuration - with a specific operator policy. The GTPP group would have been defined with the **gtpp group** command in the *Context Configuration Mode* chapter of the *CLI Reference Guide*.
If the GTPP group is not specified, then a default GTPP group in the accounting context will be used.
If this command is not specified, use the name of the accounting context configured in the SGSN service configuration mode (for 3G) or the GPRS service configuration mode (for 2G), either will automatically use a "default" GTPP group generated in that accounting context.
If the accounting context is specified in the GPRS service or SGSN service and in an SGSN operator policy, then priority is given to the accounting context of the operator policy.

Example

For this SGSN operator policy, the following command identifies an accounting context called *acctng1* and associates a GTPP server group named *roamers* with defined charging gateway accounting functionality.
accounting context *acctng1* gtpp group *roamers*

allocate-ptmsi-signature

This command enables the allocation of a P-TMSI signature.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
allocate-ptmsi-signature

no allocate-ptmsi-signature

default allocate-ptmsi-signature
```

no

Disables the allocation of the P-TMSI signature.

default

Resets the configuration value to the default: allocates the P-TMSI signature.

Usage

Enable the allocation of the P-TMSI signature.

Example

```
allocate-ptmsi-signature
```

apn

This command creates and associates an SGSN access point name (APN) configuration instance with the SGSN operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

apn { **network-identifier** *apn_net_id*| **operator-identifier** *apn_op_id*} +

no { **network-identifier** *apn_net_id* | **operator-identifier** *apn_op_id* }

default apn

no

Disables the specified APN policy.

default

Creates a default SGSN APN policy with default values for all parameters.

network-identifier *apn_net_id*

apn_net_id: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the GT-address network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

operator-identifier *apn_op_id*

apn_op_id: Enter a string of 1 to 18 alphanumeric characters including dots (.). The entry must be in the following format, where # represents a digit: : MNC###.MCC###.GPRS.

Usage

Use this command, to create an SGSN APN policy configuration or to access the SGSN APN configuration mode to update/modify the policy. Either of the two keywords can be used to identify the specific APN policy configuration.

Example

For this SGSN operator policy, create an APN configuration for network *cust1-net*:

apn network-identifier *cust1-net*

apn-restriction

DescriptionWith this command, this SGSN operator policy instructs the system to apply APN restrictions at the SGSN-level.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

apn-restriction update-policy deactivate *restriction*

default apn-restriction

default

Creates a default APN restriction configuration.

restriction

Select one of the two restrictions:

- **least-restrictive:** applies a lower APN restriction value.
- **most-restrictive:** applies a higher APN restriction value.

Usage

Configures the level of restrictions.

Example

Apply the lowest level of APN restrictions.

```
apn-restriction update-policy deactivate least-restrictive
```

apn-selection-default

This command enables/disables and configures the Default APN feature for use when the normal APN selection process fails. This command is available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

apn-selection-default network-identifier *apn_net_id* [**require-subscription-apn network-identifier** *apn_net_id*]

no apn-selection-default

no

Delete the configuration statement and disable the Default APN feature.

network-identifier*apn_net_id*

The network identier will be used as the default APN name.
apn_net_id: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the GT-address network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

require-subscription-apn network-identifier *apn_net_id*

If defined, this APN name must also be included in the subscription data for the Default APN feature to function.
apn_net_id: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the GT-address network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

Usage

The default APN will be used in error situations when the SGSN cannot select a valid APN via the normal APN selection process.
Within an operator policy, a default APN can be configured for the SGSN to:

- override a requested APN when the HLR does not have the requested APN in the subscription profile.
- provide a viable APN if APN selection fails because there was no "requested APN" and wildcard subscription was not an option.

In either of these instances, the SGSN can provide the default APN as an alternate behavior to ensure that PDP context activation is successful.

attach

This command defines attach-related configuration for this SGSN operator policy.

Important: Before using this command, ensure that the appropriate LAC information has been defined with the **location-area-list** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] attach allow access-type { gprs | umts } location-area-list *list_id*

[no] attach restrict access-type { gprs | umts } { all | location-area-list instance *list_id* **}**

[no] attach access-type { gprs | umts } { all | location-area-list *list_id* **} failure-code**

default attach { access-type { gprs | umts } { all failure-code | location-area-list instance *list_id* **} }**

no

Deletes the specified attach configuration that was previously defined with this command for this operator policy.

default

Restores the default values for the operator policy for the specified parameter.

allow

Allow re-enables attaches in the configuration after an **attach restrict** command has been used.

restrict

Restrict attaches (do not accept calls) of specified **access-type** and from specified location areas (defined using either the **all** or **location-area-list** keywords).

access-type *type*

Defines the type of access to be allowed or restricted.

- **gprs**
- **umts**

If this keyword is not included, then both access types are allowed by default.

all

Instructs the SGSN to apply the command action to all location areas.

location-area-list instance *list_id*

This keyword identifies a location area list already created with the **location-area-list** command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call. Using this keyword with either the **allow** or **restrict** keywords enables you to configure with more granularity.
list_id must be an integer between 1 and 5.

failure-code

Specify a GMM failure cause code to identify the reason an attach did not occur. This GMM cause code will be sent in the reject message to the MS.
fail-code must be an integer from 2 to 111. Default is 14. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived bythe network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented

- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

Usage

Once the IMSI of an incoming call is known and matched with a specific operator policy, according to the filter definition of the **mcc** command, then that specific operator policy is selected to determine how the incoming call is handled.
By default, all attaches are allowed. If no access limitations are needed, then do not use the **attach** command.

Important: Before using this command, ensure that the appropriate LAC information has been defined with the **location-area-list** command.

Use this command to define this operator policy's attach configuration.
Use this command to fine-tune the attach configuration specifying which calls/subscribers can attach and which calls are restricted from attaching.
Attachment restrictions can be based on any one or combination of the options, such as location area code or access type. It is even possible to restrict all attaches.
The command can be repeated using different keyword values to further fine-tune the attachment configuration.

Example

For calls under this operator policy, the following command restricts the attaches of **all** subscribers using the GPRS access type.

```
attach restrict access-type gprs all
```

Use the next command to reverse the previous attach restrict command:

```
attach allow access-type gprs all
```

Or, change the attach restriction to only restrict attaches of GPRS subscribers from specified LACs included in location area list #2 and include failure-code 45 as the reject cause. This configuration requires two CLI commands:

```
attach restrict access-type gprs location-area-list instance 2

attach access-type gprs location-area-list instance 2 failure-code 45
```

In the case of a dual-access SGSN, it is possible to also add a second definition to restrict attaches of UMTS subscribers within the LACs included in location area list #3.

```
attach restrict access-type UMTS location-area-list instance 3
```

Change the configuration to allow attaches for GPRS access for all previously restricted LACs - note that GPRS attaches would still be limited.

```
no attach restrict access-type gprs all
```

Restrict (deny) all GPRS attach requests (coming from any location area) and assign a single failure code for the reject messages. This is a two command process:

```
attach restrict access-type gprs all
```

```
attach access-type grps all failure-code 22
```

Remove the restrictions defined above - so that the access type is reset to the default (both types) and the failure code returns to the default value (14).

```
default attach access-type gprs all failure-code
```

authenticate

Product

This command enables/disables authentication for procedures like attach and service request.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
authenticate { activate | all-events | attach [ access-type | attach-type |
frequency | inter-rat ] | detach | rau | service-request }

no authenticate { activate | attach | detach | rau | service-request }

default authenticate { activate | attach | detach | rau | service-request }
```

no

Disables and removes the defined authentication configuration for this SGSN operator policy.

default

Resets all parameters to default values for the authentication process configured for this SGSN operator policy.

activate

This keyword enables/disables authentication for activate requests and allows one or more of the following options to the configuration:

- **access-type** *type* : Select one of the two options:
- **gprs**
- **umts**
- **first -** Enables/disables authentication for first activate .
- **frequency** *frequency* **-** Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

  frequency must be an integer from 1 to 16.
- **primary -** Enables/disables authentication for every primary activate request.

all-events

Specifies that procedures - attaches, service requests, RAUs, detaches, and activations - will be authenticated. This can be fine-tuned by adding either or both of the following parameters:

- **access-type** *type* must be one of the two:
- **gprs**

- **umts**
- **frequency** *frequency* **-** Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

  frequency must be an integer from 1 to 16.

---

attach

This keyword configures the Attach authentication parameters. It enables/disables authentication for an Attach with a local P-TMSI or Attaches with an IMSI will be authenticated to acquire the CK (cipher key) and the IK (integrity key) .

- **access-type** *type* : Must be one of the following options:
  - **gprs**
  - **umts**
- **attach-type***type* : Must be one of the following options:
  - **combined** : Authenticates combined GPRS/IMSI Attaches.
  - **gprs-only** : Authenticates GRPS Attaches only.
- **frequency** *frequency* **-** Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

  frequency must be an integer from 1 to 16.
- **inter-rat**: Enables authentication for Inter-RAT Attaches.

---

detach

This keyword enables/disables and configures the access-type authentication for detach.
access-type *type :* must be one of the two:

- **gprs**
- **umts**

---

rau

This keyword enables/disables and configures authentication for routing area updates (RAUs).

- **access-type** *type* : Must be one of the two options:
  - **gprs**
  - **umts**
- **frequency** *frequency* **-** Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

  frequency must be an integer from 1 to 16.
- **periodicity** *duration* : Defines the length of time (number of minutes) that authentication can be skipped.

  duration : Must be an integer from 1 to 10800.

- **update-type**: Defines the type of RAU Request. Select one of the following:
  - **combined-update** { **access-type** | **with inter-rat-local-ptmsi** }
  - **imsi-combined-update** { **access-type** | **with inter-rat-local-ptmsi** }
  - **periodic** { **access-type** | **frequency** | **periodicity** }
  - **ra-update** { **access-type** | **with inter-rat-local-ptmsi** }

service-request

This keyword enables/disables authentication for service request.

- **frequency** *frequency* **-** Defines 1-in-N selective authentication of subscriber events - where an event is an attach request, RAU, service request, activate-primary-PDP-context request, or detach request. If the frequency is set for 12, then the SGN skips authentication for the first 11 events and authenticates on the 12th event. *frequency* must be an integer from 1 to 16.
- **periodicity** *duration* : Defines the length of time (number of minutes) that authentication can be skipped.

  duration : Must be an integer from 1 to 10800.
- **service-type**: Defines the service request type. Options include:
- **data**
- **signalling**
- **paging response**

Usage

Use this command with the **frequency** keyword to determine the support for selective execution of the re-authentication and/or P-TMSI reallocation procedure in case of a 3G service request.

Example

Configure authentication to occur after every 10th event for GPRS access.

```
authenticate all-events frequency 9 access-type gprs
```

Disable authentication for Inter-RAT Attaches, use:

```
default authenticate attach inter-rat
```

Enable authentication for Inter-RAT RAU of the combined IMSI type:

```
authenticate rau update-type imsi-combined-update with inter-rat-local-
ptmsi
```

cc

DescriptionThis command defines the charging characteristics to be applied for CDR generation through SGSN operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cc { behavior-bit no-records*bit_value* | **local-value behavior** *bit_value* **profile** *index_bit* | **prefer { hlr-value | local-value } }**

no cc behavior-bit no-records

remove cc { behavior-bit no-records | local-value | prefer }

---

no

Disables the charging characteristics configuration of behavior bit from this SGSN operator policy.

---

remove

Removes the configured charging characteristics from this operator policy.

---

behavior-bit no-records *bit_value*

Default: Disabled
Specify that which behavior bit in charging characteristic is used to no accounting records will be generated. no-records to indicate which behavior bit in charging characteristics, means that no accounting records should be generated.
If we use a charging characteristics with the no-records bit set, then we won't generate any accounting records, regardless of what may be configured elsewhere. . Use "no" to indicate that there is no such bit.
bit_value must be an integer value from 1 through 12.

---

local-value behavior *bit_value* **profile** *index_bit*

Default: bit_value = 0x0
index_bit = 8
This keyword sets the SGSN operator policy to configure the value of the behavior bits and profile index for the charging characteristics when the HLR does not provide value for this.
If the HLR provides the charging characteristics with behavior bits and profile index and operator want to ignore it, then specify **prefer local-value** keyword with this command.
bit_value must be a hexadecimal value between 0x0 and 0xFFF.
index_bit must be an integer value from 1 through 15.
Some of the index values are predefined according to 3GPP standard:

- **1** for hot billing
- **2** for flat billing
- **4** for prepaid billing

- **8** for normal billing

prefer

Default: **hlr-value**

Specifies preference for using charging characteristics settings received from HLR or set by SGSN locally.

- **hlr-value**: Sets the operator policy to use charging characteristics settings received from HLR. This is the default preference.
- **local-value**: Sets the operator policy to use charging characteristics settings from SGSN only. If no charging characteristics received from HLR then local value will be applicable.

Usage

Use this command to set the SGSN operator policy behavior to use charging characteristic either from HLR or locally from SGSN.

These charging characteristics parameters are configurable from SGSN APN Policy Configuration mode too. For generation of M-CDRs the parameters configured in this mode of SGSN Operator Policy Configuration mode will prevail but for generation of S-CDRs the parameters configured in SGSN APN Policy Configuration mode will prevail.

The first four bits of charging characteristics (use keyword profile) is for the charging trigger profile index and is used to select different charging trigger profiles.

The 12 behavior bits (with keyword local-value behavior) can to enable or disable the CDR generation.

Example

The following command configures the SGSN operator policy not to use records for charging characteristics and to set behavior bit to *2*:

```
cc behavior-bit no-records 2
```

charging context

DescriptionThis command has been deprecated in favor of the **`accounting-context`** command for configuration of charging per SGSN operator policy.

description

Set to a relevant descriptive string.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *description*

no description

description

Enter an alphanumeric string of 1 to 100 alphanumeric characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotes (“).

no

Removes the description configuration from this SGSN operator policy.

Usage

Define information that identifies this particularly SGSN operator policy.

Example

description “*sgsn1 operator policy carrier1*”

direct-tunnel

This command allows direct tunneling if the direct tunneling is supported by destination node.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel attempt-when-permitted

remove direct-tunnel
```

remove

Removes the configured setting to permit direct tunneling in this operator policy.

attempt-when-permitted

Default: Disabled.
Enables direct tunneling if the destination node allows it.

Usage

Use this command to enable the direct-tunnel feature at the operator policy level.
To ensure that direct tunnel is supported, check the settings of the **direct-tunnel** commands in the SGSN APN policy configuration mode and the Radio Network Controller (release 8.0) or RNC (releases 8.1 or higher) configuration mode. Direct tunneling must be enabled at these two point to allow direct tunneling for the MS/UE.

Example

The following command sets the SGSN operator policy to attempt to setup a direct tunnel if permitted at the destination node:

```
direct-tunnel attempt-when-permitted
```

dns-ggsn

Define the context to be used to do DNS lookup.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dns-ggsn context *ctxt_name*

no dns-ggsn context *ctxt_name*

no

Removes the dns-ggsn configuration from this SGSN operator policy.

ctxt_name

Enter an alphanumeric string of 1 to 64 alphanumeric characters.

Usage

Use this command to define the context to be used to do DNS lookup to find the GGSN address.

Example

dns-ggsn context *sgsn1*

dns-sgsn

Identify the context to be used to do DNS to find the SGSN Address

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] dns-sgsn context *ctxt_name*

no

Removes the dns-sgsn configuration from this SGSN operator policy.

ctxt_name

Enter an alphanumeric string of 1 to 64 alphanumeric characters.

Usage

Use this command to configure the context ID for the SGSN address that will be used to do the DNS lookup.

Example

dns-sgsn context *sgsn1*

encryption-algorithm-umts

Defines the order of preference for the encryption algorithm. This feature is specific to a 3G configuration.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

encryption-algorithm-umts *type*

[default | no] encryption-algorithm-umts

default

Resets the encryption-algorithm definition with default values.

no

Disables the encryption-algorithm definition.

type

Enter your first choice, first. After entering the first choice, you are prompted to indicate another type as a second priority choice.

- **uea0** - No encryption algorithm
- **uea1** - uea1 Algorithm
- **uea2** - uea2 Algorithm

Usage

Use this command to determine which UMTS encryption algorithm is to be used first.

Example

encryption-algorithm-umts *uea1* **then-uea2**

end

Exits the configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

equivalent-plmn

Configures the definition for an equivalent PLMNID and the preferred radio access technology (RAT). This command can be entered multiple times

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

equivalent-plmn radio_access_technology { **2G** | **3g** | **any** } **plmnid** *mcc_number mnc_number* **priority** *priority*

no equivalent-plmn radio_access_technology { **2G** | **3g** | **any** } **plmnid** *mcc_number mnc_number*

no

Removes the equivalent-PLMN configuration from this SGSN operator policy.

radio_access_technology

Enter one of the following options:

- **2G** : 2nd generation
- **3G** : 3rd generation
- **any** : Any RAT

plmnid *mcc_number mnc_number*

- **mcc**: Specifies the mobile country code (MCC) portion of the PLMN's ID. The number can be any integer between 100 and 999.
- **mnc**: Specifies the mobile network code (MNC) portion of the PLMN's ID. The number can be any integer between 00 and 999.

priority *priority*

Select an integer between 1 and 15 with the highest priority assigned to the integer of the lower numeric value.

Usage

Use the priority option to define the preferred equivalent PLMN to be used.

Example

```
equivalent-plmn radio_access_technology any plmnid mcc 121 mnc 767 priority 2
```

exit

Exits the configuration mode and returns to the previous configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

gmm information-in-messages

This command provides the configuration to include the information in messages for the GPRS mobility management (GMM) parameters.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmm information-in-messages access-type { { gprs | umts } [ network-name { full-
text name | short-text  name } | [ send-after { attach | rau } ] }

[ default | no ] gmm { information-in-messages access-type { gprs | umts }
```

no

Disables the GMM configuration from this SGSN operator policy.

default

Sets up a GMM configuration with system default values.

access-type

Must select one of the following options:

- **gprs** - General Packet Radio Service network
- **umts** - Universal Mobile Telecommunications System network

After selecting the access-type, an additional parameter can be configured:

- **network-name**: identifies the network name in either short text or full text.
- **send-after**: configures the information in message to send after attachement or Routing Area Update (RAU).

network-name { full-text *name* | short-text *name* }

This keyword provides the option to add the network name to the message. The network name will in full text or short text. Possible options are:

- full-text *name*: Indicate the network name in full text
- short-text *name*: Indicate the network name in short text

send-after { attach | rau }

This keyword configures the information in message to send after attachment or RAU message. Possible options are:

- **attach**: Information sent after attachment
- **rau**: Information sent after routing area update

Usage

Use this command to configure identifying information about the network that will be included in GMM messages.

Example

default gmm information-in-messages access-type *gprs*

gmm retrieve-equipment-identity

This command configures the International Mobile Equipment Identity (IMEI) or software version (SV) retrieval and validation procedure for SGSN operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmm retrieve-equipment-identity { imei | imeisv [ unciphered ] [ then-imei ] } [
verify-equipment-identity [ deny-greylisted ] ]

[ no | default ] gmm retrieve-equipment-identity
```

no

Disables the equipment identity retrieval procedure configured for this SGSN operator policy.

default

Sets the default action of equipment identity retrieval (EIR) procedure configuration from this SGSN operator policy:

- **retrieve-equipment-identity** : Default action is disabled - no retrieval of IMEI/IMEI-SV
- **verify-equipment-identity** : Default action is disabled - no verification with Equipement Indentity Register (EIR)

equipment-identity-type

Default: disabled
Indicates the type of equipment identity to be configured for operator policy. The possible values are:

- **imei** : International Mobile Equipement Identity
- **imeisv** : International Mobile Equipement Identity - Software Version

imei

Indicates the equipment identity retrieval type to International Mobile equipment Identity (IMEI). IMEI is a unique 15 digit number consists of TAC (technical approval code), FAC (Final Assembly Code), SNR (Serial Number), and a check digit.

imeisv [unciphered] [then-imei]

Indicates the equipment identity retrieval type to IMEI with software version (SV). IMEI with SV becomes a unique 16 digit number consists of TAC (technical approval code), FAC (Final Assembly Code), SNR (Serial Number), and 2 digit software version number.

- **unciphered**: This optional keyword enables the unciphered retrieval of IMEI-SV. If this option is enabled the retrieval procedure will get IMEISV (if auth is still pending, get as part of Authentication and Ciphering Response otherwise, via explicit Identification Request after Security Mode Complete).

- **then-imei**: This otional keyword enables the retrieval of software version numbr before the IMEI. If this option is enabled the equipement identiry retrieval procedure will get IMEISV on secured link (after Security mode procedure via explicit Gmm Idenitification Request), and if MS is not having IMEISV(responded with NO Identity), SGSN will try to get IMEI.

If no other keyword is provided, imeisv will get IMEISV on secured link (after Security mode procedure via explicit Gmm Identification Request).

verify-equipment-identity [deny-greylisted]

Default: disabled

This keyword enables the equipment identity validation and validates the equipment identity against EIR.

- deny-greylisted: This keyword finetunes the configuration and enables the restriction to the user having mobile equipement with an IMEI in the EIR's grey list.

Usage

Use this command to enable and configure the procedures for mobile equipment identity retrieval and validation from the EIR identified in the MAP Service configuration mode.

Example

The following command enables the SGSN to send 'check IMEI' messages to the EIR:

```
gmm retrieve-equipment-identity imei verify-equipment-identity
```

gs-service

This command associates the context of a Gs service interface with an SGSN operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *gs_srvc_name* **context** *ctx_name*

no gs-service *svc_name*

no

Removes/disassociates the named Gs service from an SGSN operator policy.

gs_srvc_name

Specifies the name of a specific Gs service for which to display information.
gs_srvc_name is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

context *ctx_name*

Specifies the specific context name where Gs service is configured. If this keyword is omitted, the named Gs service must be exist in the same context as the GPRS/SGSN service.
ctx_name is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this GPRS service instance.

Important: A Gs service can be used with multiple SGSN and/or GPRS service.

Example

Following command associates a Gs service instance named *stargs1*, which is configured in context named *star_ctx*, with an SGSN operator policy:

gs-service *stargs1* **context** *star_ctx*

gtp send

This command configures which information elements (IE) this operator policy sends in GTP messages. These IEs are required by the GGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtp send { imeisv | ms-timezone | rat | uli }

remove gtp send { imeisv | ms-timezone | rat | uli }

no gtp send
```

remove

Removes the specified GTP send definition from the system configuration.

no

Disables the specified GTP send configuration.

imeisv

Instructs the SGSN to include the IMEISV (international mobile equipment identity (and software version) of the mobile when sending GTP messages of the type “Create PDP Context Request”.

ms-timezone

Instructs the SGSN to include this IE in GTP messages of the type “Create PDP Request” and “Update PDP Context Request”. This IE specifies the offset between universal time and local time, where the MS currently resides, in steps of 15 minutes.
This IE is sent by default.

rat

The RAT IE specifies which radio access technology (RAT) is being used by the MS (GERAN, UTRAN, or GAN). Including this keyword instructs the SGSN to include this IE when sending GTP messages of the type “Create PDP Request” and “Update PDP Context Request”.
This IE is sent by default.

uli

The ULI IE specifies the CGI (MCC, MNC, etc.) and SAI of the MS where it is registered. Including this keyword instructs the SGSN to include the IE when sending GTP messages of the type “Create PDP Request” and “Update PDP Context Request”.
This IE is not sent by default.

Usage

Use this command to define a preferred set of information to include when GTP messages are sent. Repeat this command multiple times to enable or disable multiple options. This instruction will be implemented when the specific operator policy is applied.

Example

Following command series instructs the SGSN to send ULI and RAT in the GTP messages.

```
gtp send uligtp send rat
```

gtpu fast-path

This command enables/disables the network processing unit (NPU) Fast Path support for NPU processing of GTP-U packets of user sessions at the NPU.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] gtpu fast-path
```

remove

Removes the NPU fast path functionality from an operator policy.

Usage

Use this command to enable/disable the NPU processed fast-path feature for processing of GTP-U data packets received from GGSN/RNC. This feature enhances the GTP-U packet processing by adding the ability to fully process and forward the packets through the NPU itself.

Important: When enabled/disabled, fast-path processing will be applicable only to new subscriber who establishes a PDP context after issuing this command (enabling GTP-U fast path). No existing subscriber session will be affected by this command.

Example

Following command enables the NPU fast path processing for all new subscribers' session established with this operator policy:

```
gtpu fast-path
```

integrity-algorithm-umts

This command configures the order of preference for the Integrity Algorithm used for 3G.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

integrity-algorithm-umts *type* **then**_*type*

default integrity-algorithm-umts

default

Creates a configuration defining an order of preference based on system defaults.

type

Enter one or more of the following options in the order of preference:

- **uia1** - uia1 Algorithm
- **uia2** - uia2 Algorithm

Usage

Use this command to determine which integrity algorithm is preferred 3G. This command is configured in tandem with the algorithm type for **encryption-algorithm-umts** command.

Example

```
default integrity-algorithm-umts
```

location-area-list

Define the location area list to allow or restrict services in the specified location areas identified by location area code (LAC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

location-area-list instance *instance***area-code** *area_code* [*area_code *]*

no location-area-list instance *instance* [**area-code** *area_code*]

no

If the **area-code** keyword is included in the command, then only the specified area code is removed from the identified list. If the **area-code** keyword is not included with the command then the entire list of LACs is removed from this operator policy.

instance *instance*

Specifies an identification for the specific location area list.
instance must be an integer between 1 and 5.

area-code *area_code **

This keyword defines the location area codes (LACs) to be used by this operator policy as a determining factor in the handling of incoming calls. Multiple LACs can be defined in a single location-area-list.
area_code must be an integer between 1 and 65535.
* If desired, enter multiple LACs separated by a single blank space.

Usage

Use the command multiple times to configure multiple LAC lists or to modify the a list.

Example

The following command creates a location area list for a single area code:

```
location-area-list instance 1 area-code 514
```

This command creates a second location area list for with multiple area codes - all separated by a single blank space:

```
location-area-list instance 2 area-code 514 62552 32 1513
```

The next command corrects an area code mistake (327 not 32) made in the previous configuration :

```
location-area-list instance 1 area-code 514 62552 327 1513
```

map

Use this command to configure the optional extensions to MAP messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[remove] map message update-gprs-location [imeisv | private-extension access-type]

remove

IMEI-SV is not included in the GLU request -- this is the default behavior.

update-gprs-location

Includes an GLU message. This keyword-set is required.

imeisv

Default: disabled
Specifies the International Mobile equipment Identity-Software Version (IMEI-SV) information to include in GPRS Location Update (GLU) request message. SGSN will include IMEI-SV if available in message.

private-extension access-type

Include specific access-type private extension in the message.

Usage

This command configures optional extensions to MAP messages. The HLR should ignore these extensions if not supported by the HLR.

Example

map message update-gprs-location private-extension access-type

map-service

This command identifies a MAP service to associate with the operator policy and the context in which the service is configured.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

map-service context *ctxt_name* **service** *map_srvc_name*

no map-service context

no

Disables use of MAP service with this operator policy.

ctxt_name

Enter an alphanumeric string of 1 to 64 alphanumeric characters.

map_srvc_name

Enter an alphanumeric string of 1 to 64 alphanumeric characters.

Usage

Use this command to enable or disable MAP service with this operator policy.

Example

```
no map-service context
```

max-attached-subscribers

Defines the maximum number of subscribers allowed to attach at one time.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-attached-subscribers *number*

default max-attached-subscribers

default

Creates a configuration based on a system default.

number

Enter an integer from 1 to 4294967295.

Usage

Use this command to limit the number of simultaneous subscriber sessions.

Example

max-attached-subscribers *1231231234*

mcc

This command defines a range of IMSI (the international mobile subscriber identity) numbers upon which an operator policy is based. Specifically, this command identifies: the mobile country code (MCC), and the mobile network code (MNC).

Optionally, the command can define, either or both, the mobile subscriber international number (MSIN - the last portion of the IMSI) and the public land mobile network ID (PLMNID).

Important: This command is mandatory if an operator policy is to be used. However, you do not need to complete this command if you are using the default operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mcc *mcc_num* **mnc** *mnc_num* [**msin first** *start_num* **last** *stop_num* | **plmnid** *id*] **+**

mcc *mcc_num*

mcc defines the mobile country code (MCC) of an IMSI.
mcc_num: Enter a 3-digit number from 100 to 999 - 000 to 099 are reserved.

mnc *mnc_num*

mnc defines the mobile network code (MNC) of an IMSI.
mnc_num: Enter a 2 or 3-digit number from 00 to 999.

msin

MSIN (mobile subscriber international number) portion of the IMSI.
first *start_num*: Defines first MSIN prefix number in a range
last *stop_num*: Defines the last or final MSIN prefix number in a range.

plmnid

PLMN-ID consists of the MCC (mobile country code) plus the MNC (mobile network code) to identify the public land mobile network (PLMN) for a specific operator. This keyword associates a specific PLMN with this specific SGSN operator policy.

+

This symbol indicates that command can be repeated to create repeated definitions.

Usage

An IMSI = maximum of 15 digits. An IMSI consists of the MCC (3 digits) + the MNC (2 or 3 digits) + the MSIN (the remaining 10 or 9 digits depending on the length of the MNC).

MCC and MNC are the minimum amount of information required to identify a unique operator policy with IMSI filtering. The MCC and MNC combine uniquely to identify the country and the network operator, for example: Cingular Wireless in the United States = **mcc** *311* **mnc** *180*
To improve the granularity of call handling, an operator policy with additional IMSI filtering parameters can be defined, to include filtering based on the MSIN, by defining a MSIN range - first (or start-of-range) MSIN and last (or end-of-range) MSIN. The range numbers do not include the maximum allowed for the MSIN but should include a sufficient number to enable the operator policy to filter effectively.
For the most efficient IMSI filter, the operator policy should include all of the above parameters and the PLMN ID which defines the current location of the MS -- this parameter is particularly useful for highlighting which calls are roaming.
And if none of the operator policies contain useful filtering information, then the default operator policy will be applied as the information in this command is never defined for the default operator policy.
The following table will illustrate how these filtering parameters determine which operator policy will govern a call:

Operator Policy ID	MCC	MNC	MSINfirst	MSINlast	PLMN ID
OpPol-1	123	45	67890	67898	
OpPol-2	123	45			
OpPol-3	123	45	67890	67898	23232
OpPol-4	123	45			23232
OpPol-5	123	45	6789012	6789019	
OpPol-6	123	45	6789012	6789019	23232
default					

The filtering selects which operator policy will be used to determine how a call is handled - the operator policy that best matches the IMSI. So, a call with IMSI 123456789012345 PLMNID 23232 is best matched with OpPol-6.
In most cases, the operator policy with the most information defined will be used as a combination of PLMNID and IMSI provides the best match. But OpPol-6 won't always be the best match. Using the table above:
OpPol-1 is the best match for IMSI 123456789011111.
OpPol-2 is the best match for IMSI 123456789099999
OpPol-5 is the best match for IMSI 123456789012345 if the PLMNID is 12344

Example
The following defines an operator policy with country code 310, mobile network code of 33, and PLMN ID of 42244.

```
mcc 310 mnc 33 plmnid 42244
```

network-initiated-pdp-activation

This command configures the Operator Policy to support activation of network-initiated PDP contexts and defines any desired activation restrictions.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-initiated-pdp-activation { allow | primary | restrict | secondary } +
```

allow

Allows either or both primary and secondary network-initiated PDP context activation.

primary

Specifies that only network-initiated primary PDP context activation is to be allowed.

restrict

Restricts network-initiated PDP context activation to either primary or secondary PDP contexts.

secondary

Specifies that only network-initiated secondary PDP context activation is to be allowed.

Usage

Use this command to define activation restrictions for network-initiated PDP contexts.

Example

```
network-initiated-pdp-activation allow
```

nri

This command specifies the network resource identifier (NRI) stored in bit 17 to bit 23 of Packet-temporary mobile subscriber identity (P-TMSI) to be retrieved by SGSN operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nri length *length* [**value** *value*]

no nri [**value**]

no

Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.

length *length*

Specifies the length of bits to be used in the P-TMSI to retrieve NRI information. This starts from bit 23 of the P-TMSI.
length must be an integer from 1 to 6.

value *value*

Specifies the value of the NRI to be retrieved from the P-TMSI. This value should not exceed the maximum possible value for the specified length.
value must be an integer from 0 to 63.

Usage

Use this command to retrieve the NRI stored in in bit 17 to bit 23 of the packet-temporary mobile subscriber identity (P-TMSI) .

Example

The following command specifies the length of NRI information to 5 bit and length of the NRI information to 23:

```
nri length 5 value 23
```

pdp-activate access-type

This command configures the PDP context activation option based on operator's policy for type of access technology.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pdp-activate access-type { grps | umts } { all | location-area-list instance
instance } failure-code failure_code

default pdp-activate access-type { grps | umts } { all | location-area-list
instance instance } failure-code code
```

default

Resets the configuration to system default values for PDP context activation request.

access-type { grps | umts }

Specifies the access technology type for PDP context activation.

- **gprs**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

all

Default: allow
Configures the system to allow to create all PDP context activation request from MS.

location-area-list instance *instance*

Specifies the location area instance to create PDP context.
instance must be an integer from 1 through 5. The value must be an already defined instance of a LAC list created with the **location-area-list** command.

failure-code *code*

Default: 8
Specifies the failure code for PDP context activation.
code must be an integer from 8 through 112.

Usage

Use this command to configure this policy to allow GPRS/UMTS access through PDP context activation request from MS.

Example

Following command configures the system to create the PDP context for request from MS for GPRS access type with location area list instance *2* and failure-code *45*.

pdp-activate access-type gprs location-area-list *2* **failure-code** *45*

pdp-activate allow

This command configures the system to allow the PDP context activation based on operator's policy for type of access technology.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] pdp-activate allow access-type { grps | umts } location-area-list
instance instance
```

no

Removes the configured permission to create PDP context on request of PDP context activation from MS for an access type.

access-type { grps | umts }

Specifies the access technology type for PDP context activation.

- **gprs**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

location-area-list instance *instance*

Specifies the location area instance to create PDP context.
instance must be an integer from 1 through 5. The value must be an already defined instance of a LAC list created with the **location-area-list** command.

Usage

Use this command to configure this policy to allow GPRS/UMTS access through PDP context activation request from MS.

Example

Following command configures the system to allow the PDP context activation for GPRS access type with location area list instance *2*.

```
pdp-activate allow access-type gprs location-area-list instance 2
```

pdp-activate restrict

This command configures the system to restrict the PDP context activation based on operator's policy for type of access technology.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] pdp-activate restrict { access-type { grps | umts } { all | location-
area-list instance instance } | secondary-activation }
```

no

Removes the configured restriction on PDP context activation through this command.

access-type { grps | umts }

Specifies the access technology type to restrict PDP context activation.

- **gprs**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

all

Default: allow
Configures the system to restrict all PDP context activation request from MS.

location-area-list instance *instance*

Specifies the location area instance to restrict PDP context activation.
list_id must be an integer from 1 through 5. The value must be an already defined instance of a LAC list created with the **location-area-list** command.

secondary-activation

Specifies the type of PDP context to restrict for secondary activation. This keyword restricts the system to create the secondary PDP context on receiving the PDP Context Activation Request from the MS.

Usage

Use this command to configure this policy to restrict GPRS/UMTS access through PDP context activation request from MS.

Example

Following command configures the system to restrict the PDP context activation for request from MS to access GPRS service with location area list instance *2*.

```
pdp-activate restrict access-type gprs location-area-lis instance 2
```

ptmsi-reallocate

Define P-TMSI reallocation for attach or RAU or service requests.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ptmsi-reallocate { attach | frequency frequency | interval minutes | routing-area-update | service-request } access-type { gprs | umts }

[ no | default ] ptmsi-reallocate { attach | frequency | interval | routing-area-update | service-request } access-type { gprs | umts }
```

access-type

One of the following options must be used to identify the access-type extension.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

no

Disables the definition in the configuration.

default

Resets the configuration with system defaults.

attach

Enables/disables P-TMSI reallocation for attach with local P-TMSI. IMSI or inter-SGSN attach will always be reallocated.

frequency *frequency*

Enter an integer from 1 to 50 to define how many times a particular message can be skipped.

interval *minutes*

Enter an integer between 60 and 1440 to define the time interval (in minutes) for skipping the service/RAU/attach request message procedure.

routing-area-update

Enables/disables P-TMSI -reallocation for RAU (routing area update) with local P-TMSI. Inter-SGSN RAU will always be reallocated.

service-request

Enables/disables P-TMSI reallocation for service request.

Usage

Use this command to enable the various parameters that will determine the operation of P-TMSI reallocation.

Example

```
no ptmsi-reallocate attach access-type gprs
```

rau-inter

Define acceptable procedure for inter-SGSN routing area updates.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
rau-inter { access-type | allow access-type | restrict access-type } { [ all ]
failure-code fail_code |  location-area-list instance instance } }

no rau-inter { allow access-type | restrict access-type } { [ all ] failure-code
fail_code |  location-area-list instance instance }

default rau-inter { allow access-type | restrict access-type } { [ all ]
failure-code fail_code | location-area-list instance instance } }
```

no

Including 'no' as part of the command structure disables the values already configured for parameters specified in the command.

default

Resets the configuration of specified parameters to system default values.

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the inter-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

location-area-list instance *instance*

list_id must be an integer between 1 and 5. The value must be an already defined instance of a LAC list created with the **location-area-list** command.

[all] failure-code *fail-code*

Specify a GMM failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.

all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.
fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived bythe network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

Usage

Use this command to configure the restrictions and function of the inter-RAU procedure.

Example

default rau-inter allow access-type *gprs* **location-area-list instance** *1*

rau-intra

Define acceptable procedure for intra-SGSN Routing Area Updates

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
rau-intra { access-type | allow access-type | restrict access-type } { [ all ]
failure-code fail_code |  location-area-list instance instance } }

no rau-intra { allow access-type | restrict access-type } { [ all ] failure-code
fail_code |  location-area-list instance instance }

default rau-intra { allow access-type | restrict access-type } { [ all ]
failure-code fail_code | location-area-list instance instance } }
```

no

Including 'no' as part of the command structure disables the values already configured for parameters specified in the command.

default

Resets the configuration of specified parameters to system default values.

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

location-area-list instance *instance*

list_id must be an integer between 1 and 5. The value must be an already defined instance of a LAC list created with the **location-area-list** command.

[all] failure-code *fail-code*

Specify a GMM failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.

all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.
fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived bythe network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

Usage

Use this command to configure the restrictions and function of the intra-RAU procedure.

Example

default rau-intra allow access-type *gprs* **location-area-list instance** *1*

re-authenticate

Enable or disable the re-authentication feature. This command is available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
re-authenticate [ access-type { gprs | umts } ]
remove re-authenticate
```

remove

Including this keyword with the command disables the feaure. The feature is disabled by default.

access-type

Defines the type of access to be allowed or restricted.

- **gprs**
- **umts**

If this keyword is not included, then both access types are allowed by default.

Usage

Use this command to enable or disable the re-authentication feature, which instructs the SGSN to retry authentication with another RAND in situations where failure of the first authentication has occurred. To address the introduction of new SIM cards, for security reasons a systematic "last chance" authentication retry with a fresh Authentication Vector is needed, particularly in cases where there is an SRES mismatch at authentication.

Example

```
re-authenticate
```

reuse-authentication-triplets

Creates an Operator Policy configuration entry to enable or disable the reuse of authentication triplets in the event of a failure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | remove } reuse-authentication-triplets no-limit
```

no

This keyword disables the SGSN Operator Policy from reusing triplets.

remove

This keyword causes the reuse configuration to be deleted from the Operator Policy configuration. This is the default behavior. Triplets are reused.

no-limit

This keyword enables the SGSN Operator Policy to reuse triplets as needed.

Usage

Use this command to enable reuse of authentication triplets.

Example

```
reuse-authentication-triplets no limit
```

sgsn-address

Use this command to define the SGSN addresses for the static SGSN address table for peer SGSNs.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-address rac *rac-id* **lac** *lac_id* [**nri** *nri*] **prefer** { **fallback-for-dns address** { **ipv4** *ip_address* | **ipv6** *ip_addess* } | **local address** { **ipv4** *ip_address* | **ipv6** *ip_address* } }

no sgsn-address { **ipv4** *ip_address* | **ipv6** *ip_addess* } **rac** *rac_id* **lac** *lac_id*

no

Disables the SGSN address configuration for the designated IP address.

rac *rac_id*

rac_id identifies foreign RAC of the peer SGSN address to be configured in the static peer SGSN address table.
rac_id must be an integer from 1 to 255.

lac *lac_id*

lac_id identifies foreign LAC of the peer SGSN address to be configured in the static peer SGSN address table.
lac_id must be an integer from 1 to 65535.

nri *nri*

nri identifies the network resource identifier stored in PTMSI (bit 17 to bit 23).
nri must be an integer from 0 to 63.

prefer

Indicate the preferred source of the address to be used.
fallback-for-dns - instructs the SGSN to do a DNS query to get the address.
local - instructs the system to use the local address present in the configuration.

address *ip_address*

- **ipv4** - enter a valid address in IPv4 standard notation.
- **ipv6** - enter a valid address in IPv6 standard notation.

sgsn-number

Define the SGSN's E.164 number to be used for interactions via the MAP protocol.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E164_number*

no sgsn-number

no

Disables the use of this configuration definition.

E164_number

Enter a string of 1 to 16 digits to identify the SGSN's E.164 identification.

sgtp-service

Identifies the SGTP service configuration to be used for this operator policy.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp-service context *ctxt_name* **service** *sgtp_service_name*

no sgtp-service context

ctxt_name

Enter an alphanumeric string of 1 to 64 alphanumeric characters.

sgtp_service_name

Enter an alphanumeric string of 1 to 64 alphanumeric characters.

no

Disables use of SGTP service with this operator policy.

Usage

Use this command to enable or disable SGTP service with this operator policy.

Example

sgtp-service context *ctxt_name* **service** *sgtp_service_name*

sms-mo

This command configures the operator policy dictating how mobile-originated SMS messages are handled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ]sms-mo { { access-type { gprs | umts } { all-location-areas |
location-area-list } | allow access-type { gprs | umts } | restrict access-type
{ gprs | umts } }
```

remove

Deletes the specified configuration.

access-type *type*

Access by SMS will be limited to SMS coming from this network type :

- **gprs**
- **umts**

allow

Allow either GPRS or UMTS type access for SMS.

restrict

Restrict either GPRS or UMTS type access for SMS.

location-area-list instance *instance*

instance must be an integer between 1 and 5. The value must identify an already defined LAC list created with the **location-area-list** command.

failure-code *code*

code : Must be an integer from 2 to 111.

Usage

Configure filtering for SMS-MO messaging.

Example

sms-mo access-type *gprs* **all-location-areas failure-code** *code*

sms-mt

This command configures the operator policy dictating how mobile-terminated SMS messages are handled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ]sms-mt { { access-type { gprs | umts } { all-location-areas |
location-area-list } | allow access-type { gprs | umts } | restrict access-type
{ gprs | umts } }
```

remove

Deletes the specified configuration.

access-type *type*

Access by SMS will be limited to SMS coming from this network type :

- **gprs**
- **umts**

allow

Allow either GPRS or UMTS type access for SMS.

restrict

Restrict either GPRS or UMTS type access for SMS.

location-area-list instance *instance*

instance must be an integer between 1 and 5. The value must identify an already defined LAC list created with the **location-area-list** command.

failure-code *code*

code : Must be an integer from 2 to 111.

Usage

Configure filtering for SMS-MT messaging.

Example

sms-mt access-type *gprs* **all-location-areas failure-code** *code*

srns-inter

Inter-SRNS (Serving Radio Network Subsystem) relocation.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

srns-inter (**all failure-code** | **allow location-area-list instance** *instance* | **location-area-list instance** *instance* **failure-code** *code* | **restrict location-area-list instance** *instance* }

no srns-inter { **allowlocation-area-list instance** *instance* | **restrictlocation-area-list instance** *instance* }

default srns-inter { **all** | **location-area-list-instance** *instance* }

no

Deletes the inter-SRNS relocation configuration.

default

Resets the configuration to default values.

all failure-code *code*

Define the failure code that will apply to all inter-SRNS relocations.
code : Must be an integer from 2 to 111.

allow location-area-list instance *instance*

Identify the location area list Id (LAC Id) that will allow services in the defined location area.

location-area-list instance *instance*

instance : Must be an integer between 1 and 5 that identifies the previously defined location area list created with the **location-area-list** command.

restrict location-area-list instance *instance*

Identify the location area list Id (LAC Id) that indicates the location areas where services will be restricted.

Usage

This command defines the operational parameters for inter-SRNS relocation.

Example

Use the following command to allow services in areas listed in LAC list #3:

srns-inter allow location-area-list instance *3*

srns-intra

Intra-SRNS (Serving Radio Network Subsystem) relocation.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

srns-intra (**all failure-code** | **allow location-area-list instance** *instance* | **location-area-list instance** *instance* **failure-code** *code* | **restrict location-area-list instance** *instance* }

no srns-intra { **allowlocation-area-list instance** *instance* | **restrictlocation-area-list instance** *instance* }

default srns-intra { **all** | **location-area-list-instance** *instance* }

no

Deletes the intra-SRNS relocation configuration.

default

Resets the configuration to default values.

all failure-code *code*

Define the failure code that will apply to all intra-SRNS relocations.
code : Must be an integer from 2 to 111.

allow location-area-list instance *instance*

Identify the location area list Id (LAC Id) that will allow services in the defined location area.

location-area-list instance *instance*

instance : Must be an integer between 1 and 5 that identifies the previously defined location area list created with the **location-area-list** command.

restrict location-area-list instance *instance*

Identify the location area list Id (LAC Id) that indicates the location areas where services will be restricted.

Usage

This command defines the operational parameters for intra-SRNS relocation.

Example

Use the following command to restrict service in areas listed in the LAC list 1:

srns-intra restrict location-area-list instance *1*

subscriber-control-inactivity

This command defines the time for the subscriber-control inactivity timer. The system seeks to detect inactivity where no PDP context is activated and then starts the timer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

subscriber-control-inactivity timeout minutes *time*

{ **no** | **default** } **subscriber-control-inactivity**

no

Deletes the timer configuration.

default

Resets the timer configuration to the default value of 7 days (10080 minutes).

time

This timer is measured in minutes.
time : Enter an integer from 1 to 20160 (two weeks).

Usage

Use this command to configure the timeout timer. After this timer times out the subscriber is detached from the SGSN.

Example

subscriber-control-inactivity timeout minutes *360*

super-charger

This command enables/disables the SGSN to work with a super-charged network.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
super-charger

remove super-charger
```

remove

Disables the super-charger functionality for an operator policy.

Usage

By enabling the super charger functionality for 2G or 3G connections controlled by an operator polilcy, the SGSN changes the hand-off and location update procedures to reduce signalling traffic management.

Example

Enable the feature with the following command:

```
super-charger
```

wildcard-apn

Define the APN to be used in case a wildcard APN is included in the subscriber record.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

wildcard-apn pdp-type *pdp-type* **apn-network-identifier** *apn_net_id*

no wildcard-apn pdp-type *pdp-type*

no

Removes the wildcard-apn definition from the configuration.

pdp-type *pdp-type*

pdp-type can be one of the following options:

- **ipv4** - for an ipv4 context
- **ipv6** - for an ipv6 context
- **ppp** - for a PPP context

apn-network-identifier *apn_net_id*

apn_net_id : Must be one of the APN network Ids defined with the **apn** command in this SGSN operator policy configuration mode.
apn_net_id : Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

Usage

This command is used to define a wildcard APN with the type of PDP context and the APN's network ID. This wildcard APN would be used when an APN is not identified.

Example

Use this command to create an APN wildcard:

wildcard-apn -pdp-type *ipv4* **apn-network-identifier** *homer1*

zone-code

Create a zone code and define one or more LAC Ids to specify service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] zone-code *zc_id* **lac** *lac_id*

no

Removes either a specific LAC Id from the zone-code definition or if *lac_id* is not included in the command then the entire zone-code definition is removed from configuration.

zc_id

Must be an integer from 1 to 65535.

lac_id

This keyword identifies a location area-code list previously defined with the **location-area-list** command of this SGSN operator policy configuration mode.
*lac_id m*ust be an integer from 1 to 65535.

Usage

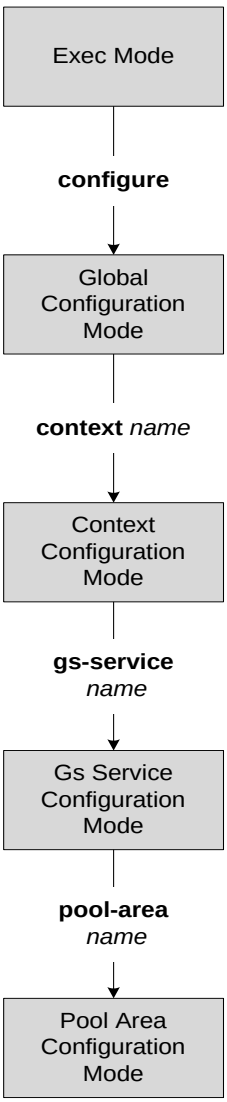
Repeat this command to include multiple LAC Ids in the service definition.

Example

zone-code *1* **lac** *4132***zone-code** *1* **lac** *1234***zone-code** *1* **lac** *64321*

Chapter 188
SGSN Pool Area Configuration Mode Commands

The Pool Area configuration mode configures the parameters used to setup the VLRs to use with a pool area in a Gs service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous configuration mode.

hash-value

This command configures the load distribution for the VLRs that service this pool area.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

hash-value { *hash_value* | range *start_value* to *end_value* | non-configured-values } use-vlr *vlr_name*

no hash-value { *hash_value* | range *start_value* to *end_value* | non-configured-values }

no

Removes the configured Gs procedures from this Gs service.

hash_value

Specifies the specific hash value for VLR(s).
hash_value must be an integer value from 0 through 999.

range *start_value* **to** *end_value*

Specifies the range of hash values for a VLR.
start_value specifies the start value for range of hash and is an integer value from 0 through 999.
start_value must be lower than *end_value.*
end_value specifies the end value for range of hash and is an integer value from 0 through 999.
end_value must be higher than *start_value*.

non-configured-values

This keyword assign all non-configured hash values to use the named VLR.

use-vlr *vlr_name*

Specifies the name of the VLR to be associated with this pool area.
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

Usage

Use this command to command configures the load distribution for the VLRs that service this pool area as defined in TS 23.236.
The algorithm for selection of VLR from a pool area is based on the hash value computed on the IMSI digits. The SGSN derives a hash value (V) using procedure as defined in TS 23.236. Every hash value from the range 0 to 999 corresponds to a single MSC/VLR node. Typically many hash values may point to the same MSC/VLR node.
This command can be entered multiple times for different hash value.

Example

Following command configure the all non configured hash values to use VLR named *starvlr1* in this pool area:

```
hash-value non-configured-values use-vlr starvlr1
```

lac

This command defines a set of location area code (LAC) values for a pool area.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lac *lac_id* **+**

no lac *lac_id*

no

Removes the configured LAC value from this pool area configuration.

lac *lac_id*

Specifies the subscribers' location area code (LAC) to be associated with this pool area and a specific VLR. This LAC is obtained from the radio area indicator (RAI).
lac_id: Must be an integer from 1 through 65535.

+

More than one *lac_id*, separated by a space, can be entered within a single command.

Usage

Use this command to specify a set of LACs to use for a pool area.
This command can be entered multiple times, subject to a limit of 32 LAC definitions (total for **non-pool-area** and **pool-area** configuration) per Gs service.

Important: LAC values across multiple pool areas and non-pool-areas must be unique within the Gs service.

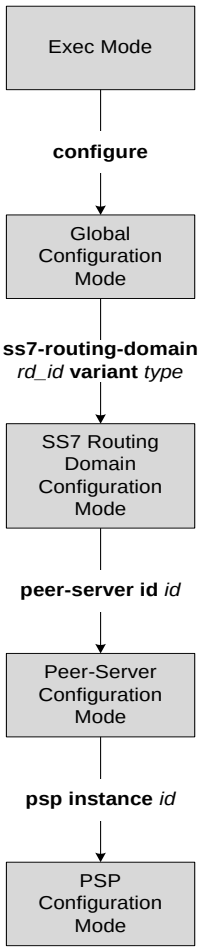
Example

The following command configures LACs *101, 301,* and *222* for the pool area.

lac *101 301 222*

Chapter 189
SGSN PSP Configuration Mode Commands

The Peer-Server Process (PSP) configuration mode provides the commands to create, configure, bind, and manage a specific PSP instance for a SS7 Routing Domain.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Defines an association between the PSP instance and an application server process (ASP) instance.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate asp instance *asp_num*

no associate

no

Removes the association between the PSP and the ASP from the routing domain configuration.

Important: Using this command will probably result in the termination of all current subscriber sessions active through the peer-server.

asp_num

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
asp_num must be an integer from 1 through 4.

Usage

Create an association between a specific peer-server process (PSP) and a specific application server process (ASP) instance. The M3UA end-point of the ASP must be configured prior to configuring the PSP-ASP association. Use the commands defined in the ASP Configuration Mode chapter of the Command Line Interface Reference.

Example

associate asp instance *2*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

end-point

This command defines or deletes the IP address to be associated with the local SCTP end-point for the application server process (ASP).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end-point { address ip_address | port port_number }
no end-point [ address ip_address ]
```

port *port_number*

Identifies the M3UA's SCTP port associated with this end-point.
port_number: must be an integer from 1 to 65535.
Removes the end-point configuration.

no

Removes the ASP end-point association from the PSP configuration.

Important: This command can not be used as long as the PSP and the ASP are associated.

Usage

Use this command to manage the ASP end-point. At least one address needs to be configured for the ASP before the end-point can be associated with the PSP.

Example

Set the end-point to IP address 192.168.1.1 with the following command:

```
end-point address 192.168.1.1
```

exchange-mode

Configures the exchange-mode for the peer-server process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exchange-mode [ double-ended | single-ended ]
```

Usage

Use this command to toggle the exchange modes for the peer-server process. The default (initial configuration) mode is double-ended.

Example

```
exchange-mode double-ended
```

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

psp-mode

Configures the peer-server process (PSP) operational mode as either client or server mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

psp-mode { **client** | **server** }

client

The PSP operates as a client.

server

The PSP operates as a server.

Usage

Instruct the peer-server process to operator in either client or server mode.

Example

psp-mode *server*

routing-context

Configures the behavior of the routing context in M3UA messages.

Important: This keyword function is only available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
routing-context { discard-inbound | process-inbound { insert-outbound |
suppress-outbound }

default routing-context
```

default

Include this keyword with the command, to reset the configuration to the system default for routing-context which is a combination of process-inbound and insert-outbound.

discard-inbound

Sets the routing context received in M3UA messages to be discarded.

process-inbound

Sets the routing context received in M3UA messages to be processed.

insert-outbound

Sets the routing context so that it is added in the M3UA messages.

suppress-outbound

Sets the routing context so that it is suppressed in the M3UA messages.

Usage

In PSP (singled-ended) configuration mode, the settings for both the local routing context (the SGSN's routing context) and the peer routing context (the RNC's routing context) should be the same. If the routing contexts created at the SGSN and on the peer are different then this can cause the M3UA link to fail. Routing context is an optional parameter when an M3UA association has only one associated peer-server.

Example

```
routing-context discard-inbound insert-outbound
```

sctp-alpha

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines a retransmission timeout value.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-alpha *value*

default sctp-alpha

value

Defines a percentage (%) that represents the RTO portion of the RTT calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the **sctp-alpha** to the default value of 5%.

Usage

sctp-alpha is used in conjunction with other commands, such as the **sctp-beta** command, to determine the round-trip time (RTT) calculations. The Alpha parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Example

sctp-alpha *256*

sctp-beta

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines a retransmission timeout value.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-beta *value*

default sctp-beta

value

Defines a percentage (%) that represents the RTO portion of the RTT calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the **sctp-beta** to the default value of 10%.

Usage

Use this command in conjunction with other commands, such as the **sctp-alpha** command, to determine the round-trip time (RTT) calculations. The Beta parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Example

sctp-beta *512*

sctp-checksum-type

This command selects the type of checksum algorithm to be used.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-checksum-type { **adler32** | **crc32** }

default sctp-checksum-type

adler32

Selects the Adler-32 type of algorithm as a faster checksum function.

crc32

Selects the CRC-32, a slower but more reliable 32-bit cyclic redundancy check.

default

Resets the **sctp-checksum-type** to the default of CRC-32.

Usage

Use this command to set which type of checksum algorithm the SGSN is to use to validate SCTP packets.

Example

sctp-checksum-type *crc32*

sctp-cookie-life

This command sets the valid life for the SCTP cookie.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-cookie-life *value*

default sctp-cookie-life

value

Sets the cookie life value in increments of 100 milliseconds. The range is 50 to 1200 .

default

Resets the **sctp-cookie-life** value to the default, 600 (= 60 seconds).

Usage

Use this command to set the SCTP cookie life.

Example

sctp-cookie-life *60*

sctp-max-assoc-retx

This command sets the maximum number of datagram retransmissions to be associated with this peer server configuration.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-assoc-retx *value*

default sctp-max-assoc-retx

value

Defines the maximum number of datagram retransmissions for an association. The value must be an integer between 0 and 255.

default

Resets the default for **sctp-max-assoc-retx** to 10.

Usage

Use this command to configure the maximum number of datagram retransmissions for an association. The endpoint will be declared unreachable after **sctp-max-assoc-retx** number of consecutive retransmissions to an endpoint on any transport address.

Example

sctp-max-assoc-retx *3*

sctp-max-init-retx

This command sets the maximum number of retries to send the INIT datagram.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-init-retx *value*

default sctp-max-init-retx

value

Sets the maximum number of retries. This value must be an integer between 0 and 255.

default

Resets the default for **sctp-max-init-retx** to 5.

Usage

Use this command to set the maximum number retries the SCTP layer should make to send the INIT datagram to the peer to open an association.

Example

sctp-max-init-retx *3*

sctp-max-mtu size

This command sets the number of bytes that comprise the maximum MTU size.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-mtu-size *value*

default sctp-max-mtu-size

value

Sets the maximum number of bytes for the SCTP MTU size. This value must be an integer between 508 and 65535.

default

Resets the default for **sctp-max-mtu-size** to 1500.

Usage

Use this command to configure the size of the MTU.

Example

sctp-max-mtu-size *1024*

sctp-max-out-strms

This command sets the maximum number of outgoing streams through the PSP going towards the peer server.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-out-strms *max#_out_streams*

default sctp-max-out-strms

default

Resets the SGSN's **sctp-max-out-strms** value to the default of 16.

max#_out_streams

The value must be an integer between 1and 65535. The value should match the peer node's (STP/SG/RNC/HLR) number of in-bound streams.

Usage

Use this command to balance the stream throughput from the PSP to the peer server. The value for this command is used to validate the incoming packets in the SCTP layer.

Example

sctp-max-out-strms *3500*

sctp-max-path-retx

This command sets the maximum number of datagram retransmissions for this path.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-path-retx *value*

default sctp-max-path-retx

value

Sets the maximum number of datagram retransmission to a destination transport address. This value must be an integer from 0 to 255.

default

Resets the **sctp-max-path-retx** default to 5.

Usage

Use this command to set the maximum number of datagram retransmissions to a destination transport address. The destination transport address will be declared unreachable after the SGSN exhausts the **sctp-max-path-retx** number of consecutive retransmissions to a destination transport address.

Example

sctp-max-path-retx *10*

sctp-rto-initial

This command sets the initial retransmission timeout for the SCTP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-initial *value*

default sctp-rto-initial

value

Sets the timeout in increments of 100 milliseconds. The value must be an integer between 10 and 1200.

default

Resets the system to the **sctp-rto-initial** default of 30 (3 seconds).

Usage

Use this command to define the initial retransmission timer.

Example

sctp-rto-initial *240*

sctp-rto-max

This command sets the maximum retransmission timeout value for the SCTP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-max *value*

default sctp-rto-max

default

Resets the system to the **sctp-rto-max** default of 600 (60 seconds).

value

Set the maximum retransmission timeout value in increments of 100 milliseconds and the value must be an integer between 5 and 1200.

Usage

Use this command to configure the maximum time for retransmissions.

Example

The following sets the timeout for 45 seconds:

sctp-rto-max *450*

sctp-rto-min

This command sets the minimum retransmission timeout (RTO) value for the SCTP.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-min *value*

default sctp-rto-min

default

Resets the **sctp-rto-min** to the default of 10 (1 second).

value

Sets the minimum retransmission timeout in increments of 100 milliseconds. The value must be an integer from 1 to 50.

Usage

Use this command to set the minimum time for retransmission before timeout.

Example

The following sets the timeout for 2 seconds:

sctp-rto-min *20*

sctp-sack-frequency

This command sets the frequency of transmission of SCTP selective acknowledgements (SACK).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-sack-frequency *value*

default sack-frequency

value

Sets the maximum number of datagrams to be received prior to sending a SACK to the peer. The value must be an integer between 1 and 5.

default

Resets the **sctp-sack-frequency** default value of 2.

Usage

Use this command to set the maximum number of datagrams to be received before a SACK must be sent to the peer. The **sctp-sack-frequency** is used in conjunction with the **sctp-sack-period** to control the generation of SACK, depending on which one occurs first.

Example

sctp-sack-frequency *3*

sctp-sack-period

This command sets the delay before sending an SCTP selective acknowledgement (SACK).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-sack-period *value*

default sack-period

value

Sets the maximum time, in increments of 100 milliseconds, before the system must send a SACK to the peer. The value must be an integer from 0 to 5.

default

Resets the system to the **sctp-sack-period** default value, 2 (=200 milliseconds).

Usage

Use this command to set the time the SCTP waits to send a SACK.

Example

sctp-sack-period *120*

sctp-suppress-alarm

This command enables/disables the suppression of alarms for SCTP path failure between two peer endpoints.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no]sctp-suppress-alarm path-failure self-end-point-address *orig_ipv4_address* **peer-end-point-address** *peer_ipv4_address*

no

Disables the pre-configured alarm suppression for SCTP path failure.

path-failure

This keyword specifies that the alarm suppression is for SCTP path failure between two peer nodes.

self-end-point-address *orig_ipv4_address*

This keyword specifies the IP address of the originating endpoint.
orig_ipv4_address is the IP address of originating endpoint in IPv4 dotted decimal notation.

peer-end-point-address *peer_ipv4_address*

This keyword specifies the IP address of the peer endpoint.
peer_ipv4_address is the IP address of peer endpoint in IPv4 dotted decimal notation.

Usage

Use this command to configure the path failure alarm suppression. This command ignores the alarms generated on SCTP path failure.

Example

The following command suppresses the path failure alarms occurred in SCTP path between originating peer address *1.2.3.4* and peer endpoint *6.7.8.9*:

sctp-suppress-alarm path-failure self-end-point-address *1.2.3.4* **peer-end-point-address** *6.7.8.9*

timeout

This command sets the times for various timeout timers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { m3ua-periodic-dest-audit *dest_timeout* | **sctp-bundle** *bundle_time* | **sctp-heart-beat** *hrt_bt_timeout* **}**

default timeout sctp-heart-beat

default

Resets the system to the default values.

m3ua-periodic-dest-audit *dest_timeout*

Sets the period (in increments of seconds) between the DAUD messages while auditing a destination state.
dest_timeout: Must be an integer from 1 to 65535. Default is 2.

sctp-bundle

Sets the SCTP bundle timeout value in incremenets of 100 milliseconds, with a range of 1 to 65535. By default, SCTP bundling is disabled.

sctp-heart-beat *hrt_bt_timeout*

Sets the number of seconds in the SCTP heart-beat timer
hrt_bt_timeout: This value is an integer between 1 and 300. Default is 30.

Usage

Use this command to configure timers. Repeat the command with each of the keywords to set values for each.

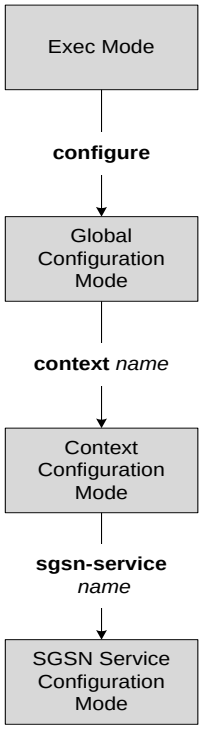
Example

timeout m3ua-periodic-dest-audit *120*

Chapter 190
SGSN Service Configuration Mode Commands

The SGSN Service configuration mode is used within the global configuration mode to specify the 3G operations of the SGSN and the available SGSN services for a specific context.

SGSN Service works with MAP Service, SGTP Service, GTPP Group, and IuPS Service. All five of these services must be configured to enable a 3G SGSN to communicate with other elements within a UMTS network.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

This command defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

accounting (**cdr-types** { **mcdr** | **scdr** | **sms** { **mo-cdr** | **mt-cdr** } } **+** | **context** *cntx_name* }

default accounting cdr-types

no accounting (**cdr-types** | **context** }

---

default

Returns the system to default settings for the selected type of CDR.

---

no

Removes the pre-configured type of CDR generation for accounting from the SGSN service.

---

cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } +

Default: enabled
Defines the types of CDRs to be generate:d within the specified SGSN service for accounting:

- **mcdr** Enables generation of M-CDRs.
- **scdr** : Enables generation of S-CDRs.
- **sms** : Enables generation of SMS-type CDRs based on one of the following:
- **mo-cd:** : SMS CDRs orignates from the mobile.
- **mt-cdr** : SMS CDRs terminates at the mobile.

+

Specifies that the specified keywords with in the group can be entered multiple times with a single command.

---

context *cntx_name*

Specifies an accounting context to be associated with the SGSN service.
cntx_name: Define a string of 1 to 79 alphanumeric characters.

Usage

Use this command to define the type of CDRs to generate for SGSN service. By default all type of CDRs are generated. Note that change of this configuration will be applied to new call and/or to new PDP contexts only.

By default, generation of the S-CDR, M-CDR, SMS-MT-CDR, and SMS MO-CDR types is enabled.

Example

The following command configures the system to generate CDRs of M-CDR type for accounting in the current SGSN service:

```
accounting cdr-types mcdr
```

cc profile

Configures the charging characteristic (CC) profile with the triggers for generating various types of CDR as defined with the **accounting** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cc profile *profile_bits* [**buckets** *number* | **interval** *time* | **tariff time1** *mins hours* [**time2** *mins hours*] [**time3** *mins hours*] [**time4** *mins hours*] | **volume** { **downlink** *down_vol* **uplink** *up_vol* | **total** *total_vol* }] **+**

[**no** | **default**] **cc profile** *profile_bits* [**buckets** | **interval** | **tariff** | **volumne**]

no

Removes a previously configured CC profile.

default

Returns the specified CC profile to the original default system settings.

profile_bits

Defines the value of the profile bits for the SGSN service.
index can be configured to any integer value from 0 to 15. Some of the values have been predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

buckets *number*

Specifies the number of statistics container changes in the CDR due to QoS changes or tariff times that can occur before an accounting record (CDR) is closed
Default: 4
number : Must be integer from 1 to 4.

interval *time*

Specifies the normal time duration (in seconds) that must elapse before closing an accounting record (CDR) provided that any or all of the following conditions occur:
time : Enter any integer from 60 to 40000000.

tariff time1 *mins hours* **[time2** *mins hours* **time3** *mins hours* **time4** *mins hours* **]**

Specifies the time-of-day (based on a 24-hour clock) to close the current statistics container in the CDR, but not necessarily the CDR itself. One tariff time must be defined and up to four tariff times can be specified.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

- *mins*: The minutes of the hour. Enter an integer from 0 to 59.
- *hours*: The hour of the day. Enter an integer from 0 to 23.

volume { downlink *down_vol* **uplink** *up_vol* **| total** *total_vol* **}**

Specifies the downlink, uplink, and total volumes octet counts that must be met for the closure of the CDR.
down_vol : Enter any integer from 100000 to 1345294336.
up_vol : Enter any integer from 100000 to 400000000.
total_vol : Enter any integer from 100000 to 400000000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures the profile index for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes.

Example

The following command configures a profile index of 10 with tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10  tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

check-imei-timeout-action

This command configures the action to be taken if a Check-IMEI fails due to a timeout. This command is available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
check-imei-timeout-action [ continue | reject ]

default check-imei-timeout-action
```

default

Rejects the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

continue

Instructs the SGSN to continue the Attach or ISRAU procedure if a Check-IMEI timeout occurs because the EIR is not reachable. This functionality matches standard call flow.

reject

Instructs the SGSN to reject the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

Usage

Use this command only if the Gf interface (EIR) is available in the network. This command controls the SGSN reaction if the Check-IMEI procedure fails due to a timeout.
The **continue** option allows the SGSN to go forward with the MS Attach or RAU, if the first Check-IMEI fails to reach the EIR due to a timeout. Any subsequent activity (such as a RAU or Service Request would force another Check-IMEI towards the EIR. If this subsequent MAP Check-IMEI should fail, then the same policy of continuing the procedure would apply.

Example

```
check-imei-timeout-action continue
```

core-network

This command specifies the numeric ID for a core network to identify which CN is to be used by the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

core-network id *cn_id*

no core-network id

no

Removes the currently configured core network ID from the current SGSN configuration.

id *cn_id*

This number identifies the core network to connect the SGSN service.
cn_id: Must be an integer from 0 through 65535.

Usage

Use this command to set a global ID to identify this SGSN in the core network.

Example

The following command sets the core network ID for the current SGSN service to 127:

core-network id *127*

disable/enable super-charger

This command has been deprecated and replaced by the **super-charger** command. For the commands to configure the SuperCharger feature are explained the *SGSN Operator Policy Configuration Mode* chapter.

Product

SSGN

dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query which is sent during the ISRAU.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dns israu-mcc-mnc-encoding { decimal | hexidecimal }

default dns israu-mcc-mnc-encoding
```

default

Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal

Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal

Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query sent during the inter-SGSN RAU (ISRAU). The choice must match the format of the DNS server. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

Example

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

gmm

This command defines the GPRS mobility management parameters for the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gmm { **T3302-timeout** *t3302_dur* | **T3312-timeout** *t3312_dur* | **T3313-timeout initial** *t3313_init* [**decrease** *t3313_decrement* | **increase** *t3313_increment*] | **T3322-timeout** *t3322_dur* | **T3350-timeout** *t3350_dur* | **T3360-timeout** *t3360_dur* | **T3370-timeout** *t3370_dur* | **implicit-detach-timeout** *impli_detach_dur* | **max-auth-retransmission** *auth_retrans* | **max-identity-retransmission** *id_retrans* | **max-page-retransmission** *page_retrans* | **max-ptmsi-reloc-retransmission** *ptmsi_reloc_retrans* | **mobile-reachable-timeout** *ms_reach_dur* | **perform-identity-on-auth-failure** | **purge-timeout** *purge_dur* | **trau-timeout** *trau_dur*}

default gmm { **T3302-timeout** | **T3312-timeout** | **T3313-timeout** | **T3322-timeout** | **T3350-timeout** | **T3360-timeout** | **T3370-timeout** | **implicit-detach-timeout** | **max-auth-retransmission** |**max-identity-retransmission** | **max-page-retransmission** | **max-ptmsi-reloc-retransmission** | **mobile-reachable-timeout** | **perform-identity-on-auth-failure** | **purge-timeout** | **trau-timeout** }

no gmm { **implicit-detach-timeout** | **max-auth-retransmission** | **max-identity-retransmission** | **perform-identity-on-auth-failure** }

---

default

Sets the default value for the specified parameter.

T3302-timeout *t3302_dur*

Default: 10
Specifies the retransmission timer value to guard the GPRS attach or RAU procedure on MS side.
t3302_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3312-timeout *t3312_dur*

Default: 54
Specifies the retransmission timer value to guard the RAU procedure initiation on network side.
t3312_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3313-timeout initial *t3313_init* **[decrease** *t3313_decrement* **| increase** *t3313_increment* **]**

Default: 5
Specifies the retransmission timer value to guard the for paging request procedure initiation on network side.

initial *t3313_init* is the initial wating duration in seconds before retransmitting the specific message. *t3313_init* must be an integer from 1 through 60.
decrease *t3313_decrement*. specifies the decrement of the initial timer value in seconds. *t3313_decrement* must be an integer from 1 through 5.
increase *t3313_increment*. specifies the increment of the initial timer value in seconds. *t3313_decrement* must be an integer from 1 through 5.

T3322-timeout *t3322_dur*

Default: 6
Specifies the retransmission timer value to guard the GPRS detach request procedure on network side. *t3322_dur* is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3350-timeout *t3350_dur*

Default: 6
Specifies the retransmission timer value to guard the GPRS attach accept/RAU accept/realloc request procedure sent with P-TMSI and/or TMSI on network side.
t3350_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3360-timeout *t3360_dur*

Default: 6
Specifies the retransmission timer value to guard the authentication and cipher request procedure on network side.
t3360_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3370-timeout *t3370_dur*

Default: 6
Specifies the retransmission timer value to guard the identity request procedure on network side.
t3370_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

implicit-detach-timeout *impli_detach_dur*

Default: 3600
Specifies the retransmission timer value to guard the implicit detach procedure on network side.
impli_detach_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 3600.

max-auth-retransmission *auth_retrans*

Default: 4
Specifies the maximum retransmission of authentication requests allowed.
auth_retrans is the number of retries before declaring the authentication failure and must be an integer from 1 through 10.

max-identity-retransmission *id_retrans*

Default: 4
Specifies the maximum retransmission of identity requests allowed.

id_retrans is the number of retries before declaring the identity failure and must be an integer from 1 through 10.

max-page-retransmission *page_retrans*

Default: 5
Specifies the maximum retransmission of page requests allowed.
id_retrans is the number of retries before declaring the paging request failure and must be an integer from 1 through 5.

max-ptmsi-reloc-retransmission *ptmsi_reloc_retrans*

Default: 5
Specifies the maximum retransmission for P-TMSI relocation procedure allowed.
id_retrans is the number of retries before declaring the P-TMSI relocation procedure failure and must be an integer from 1 through 5.

mobile-reachable-timeout *ms_reach_dur*

Default: 58
Specifies the retransmission timer value to guard the mobile reachability procedure on network side.
impli_detach_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 1440.

perform-identity-on-auth-failure

Default: Enabled
Configures the SGSN service to perform an identity check to ascertain the IMSI after an authentication failure on a PTMSI-based message.

purge-timeout *purge_dur*

Default: 10080 (7 days)
Specifies the timer value to guard the detach of MM context procedure on network side.
impli_detach_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 20160.
Define the purge timer to hold detached mm-contexts. Default is 10080 mins (7 days).

trau-timeout *trau_dur*

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.
trau_dur : Must be an integer from 5 to 60.

Usage

Repeat this command as needed to configure multiple parameters for GPRS mobility management in a UMTS network. This command provides the configuration of timers for mobility procedures and retries for different messages. GMM layer is defined in the 3GPP TS 24.008 (Release 7).

Example

Following command configures the timer to wait for *5* mins before retransmitting the message for GPRS attach or RAU procedure on MS side with maximum number of retries as *6* for authentication:

```
gmm T3302-timeout 5 max-auth-retransmission 6
```

gs-service

This command associates a previously defined Gs service interface to MSC/VLR along with its associated context with an SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *gs_srvc_name* **context** *ctx_name*

no gs-service *gs_srvc_name*

no

Removes/disassociates the named Gs service from this SGSN service.

gs_srvc_name

Specifies the name of a specific Gs service for which to display information.
svc_name is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

context *ctx_name*

Specifies the specific context name where Gs service is configured. If this keywork is omitted, the named Gs service must be exist in the same context as the SGSN service.
ctx_name is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this SGSN service instance.

Important: A single Gs service can be used with multiple SGSN and/or GPRS service.

Example

Following command associates a Gs service instance named *stargs1*, which is configured in context named *star_ctx*, with an SGSN service:

gs-service *stargs1* **context** *star_ctx*

lac

This command defines the location area code (LAC in hexidcimal format.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lac *hex*

no lac

no

Erases the **lac** configuration statement.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF

max-pdp-contexts

Configures the maximum number of PDP contexts for a MS (mobile station) that will be supported on this SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-pdp-contexts per-ms number

default max-pdp-contexts per-ms

default

Resets the maximum number of PDP contexts per mobile station to the default of 11 for the Gs service configuration

per-ms *number*

Default: 11
Defines the combined total number of primary and secondary PDP contexts for the SGSN service.
number can be an integer from 2 to 11.

Usage

The following example defines 5 as the maximum number of primary and secondary PDP contexts that this SGSN will support for any connected MS.

Example

max-pdp-contexts per-ms *5*

mobile-application-part

This command identifies an already defined MAP service (Mobile Application Part service) to associate with the SGSN service. Although the MAP service does not need to be defined in the same context as the SGSN service, there is a one-to-one relationship between a MAP service and an SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mobile-application-part service *map_srvc* [**context** *ctx_name*]

no mobile-application-part service

no

Remove the MAP service association from the SGSN service configuration.

service *map_srvc*

Specifies the name of the MAP service to be associated with this SGSN service.
map_srvc must be the name of a MAP service previously configured on the system.

context *ctx_name*

Specifies the name of the context where the MAP service is configured. If the MAP service is not configured in the current context, then the context where it is configured must be specified to enable the SGSN to reach the MAP service.
If this keyword is not specified, the current context is used.
ctxt_name: Must be the name of the context where the specified MAP service is configured.

Usage

Use this command to identify the MAP service configuration to be used by the SGSN service configuration. Also use this command to specify the context in which the MAP service configuration was created.
If the MAP service is not identified or if the correct context is not identified, then the SGSN service will not START.

Example

The following command specifies a MAP service named map1 that is configured in the same context as the current SGSN service:

mobile-application-part service *map1*

network-sharing cs-ps-coordination

Enables/disables the SGSN service to perform a CS-PS coordination check.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-sharing cs-ps-coordination

default network-sharing cs-ps-coordination

no network-sharing cs-ps-coordination
```

default

Including this keyword resets the SGSN service to allow the check to be performed.

no

Disables this feature for the SGSN service.

Usage

Use this command to facilitate the network sharing functionality. With this command, the SGSN can be instructed to perform a check to determine if CS-PS coordination is needed.
3GPP TS 25.231 section 4.2.5 describes the functionality of the SGSN to handle CS-PS (circuit-switching/packet-switching) coordination for attached networks not having a Gs-interface. In compliance with the standard, the SGSN rejects an Attach in a MOCN configuration with cause 'CS-PS coordination required', after learning the IMSI, to facilitate the RNC choosing the same operator for both CS and PS domains.

Example

Use the following syntax to disable the CS-PS coordination check:

```
no network-sharing cs-ps-coordination
```

nri length

This command defines the Network Resource Identifier (NRI) of the SGSN that is stored in the P-TMSI (bits 23 to 18).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nri length *nri_length* { **nri-value** *nri_value* | **null-nri-value** *null_nri_value* **non-broadcast mcc** *mcc* **mnc** *mnc* **lac** *lac_id* **rac** *rac_id* [**nri-value***value* }

no nri

---

no

Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.

---

nri length *nri_length*

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18. to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length : Must be an integer from 1 to 6 to identify the number of bits.

---

null-nri-value *null_nri_value*

This keyword is only available in releases 8.1 and higher.
Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the **sgsn offloading** command, see the Exec Mode chapter).
null_nri_value : 0 (zero) indicates the keyword is not to be used and 1 to 63 are used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

---

non-broadcast mcc *mcc* **mnc** *mnc* **lac** *lac_id* **rac** *rac_id*

This keyword set is only available in releases 8.1 and higher.
Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure. Including the MCC and MNC to specify the PLMN because the Iu-Flex feature supports multiple IuPS Services.
mcc identifies the mobile country code, the first part of the PLMN ID. Must be an integer between 100 and 999.
mnc identifies the mobile network code portion of the PLMN ID. Must be a 2- or 3-digit integer between 01 and 999.
lac_id defines a location area code associated with an RNC. Must be an integer between 1 and 65535.
rac_id defines the remote area code to be associated with an RNC. Must be an integer between 1 and 255.

nri-value *nri_value*

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.
nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.
Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: **nri length** *6* **nri-value** *29 43 61*

Usage

Use this command to identify the SGSN identified with the NRI in the MS generated P-TMSI.
This command adds or removes the Iu Flex configuration for this SGSN service. When using Iu Flex, all keywords must be defined. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.
Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.
When using MOCN mode for network sharing without SGSN pooling, the NRI length and the NRI value should both be used.

Example

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6
41
```

override-lac-li

This command defines the override location area code (LAC) needed for the function of the lawful intercept feature.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

override-lac-li *hex*

no override-lac-li

no

Erases the override location area code for this GGSN service from the configuration.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF

override-rac-li

This command defines the override routing area code needed for the lawful intercept function.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

override-rac-li hex

no override-rac-li

no

Erases the override routing area code for this GGSN service from the configuration.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF

rac

This command defines the override routing area code needed for the lawful intercept function.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rac *hex*

no rac

no

Erases the routing area code configuration statement.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF

ran-protocol

This command specifies the IuPS service for the SGSN service to use for communication with the RAN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ran-protocol iups-service *iups_srvc* [**context** *ctx_name*]

no ran-protocol iups-service

no

Removes the IuPS service information from the SGSN service configuration.

iups-service *iups_srvc*

Specifies the name of an IuPS service already configured on the system.
iups_srvc : Enter an alphanumeric string of 1 to 63 characters.

ctx_name

ctx_name : Enter the name of the IuPS context, an alphanumeric string of 1 to 63 characters.

Usage

Use this command to configure the IuPS service context that the current SGSN service will use to communicate with the RAN. Up to 8 definitions can be defined for a single SGSN service to allow for multiple PLMNs support.

Example

The following command configures the SGSN service to use an IuPS service named **iups1** that has been configured. in the same context as the SGSN service:

ran-protocol iups-service *iups1*

sgsn-number

This command defines the E.164 number that identifies this particular SGSN service context.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E.164_number*

no sgsn-number

no

Removes the SGSN number configuration from the SGSN service configuration.

E.164_number

Enter a maximum of 15 digits to define this 'phone' number associated with this SGSN service context.

Usage

To delete the sgsn-number associated with this SGSN service context, enter:

Example

no sgsn-number

sgtp-service

This command creates an instance of an SGTP service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp-service *sgtp_srvc_name*

no sgtp-service

sgtp_srvc_name

Enter the name of an SGTP service that will be used by this SGSN service
sgtp_srvc_name : Enter a string of 1 to 63 alphanumeric characters.

Usage

Use this command to access the SGTP Service configuration mode to configure SGTP parameters.

Example

sgtp-service *sgtp1*

sm

This command configures session management parameters for this SGSN service. This command can be repeated multiple times to configure each parameter individually.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sm { **T3385-timeout** *time* | **T3386-timeout** *time* | **T3395-timeout***time* | **max-actv-retransmission** *number* | **max-deactv-retransmission** *number* | **max-modf-retransmission** *number* | **rab-ass-timeout***time* | **session-inactivity** | **rns-ctxt-rsp-timeout** }

default sm *timer*

default

Resets the selected timer to the system default value.

T3385-timeout

Retransmission timer for network-initiated Activate Request. Default is 8 sec

T3386-timeout

Retransmission timer for network-initiated Modify Request. Default is 8 sec

T3395-timeout

Retransmission timer for network-initiated Deactivate Request. Default is 8 sec

max-actv-retransmission

Configures maximum retries for activate PDP ctxt request. Default is 4

max-deactv-retransmission

Configures maximum retries for deactivate PDP ctxt request. Default is 4

max-modf-retransmission

Configures maximum retries for modify PDP ctxt request. Default is 4

Usage

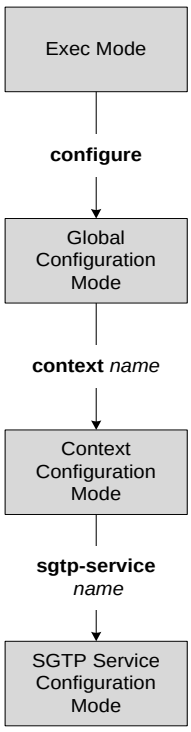
Repeat the command to configure multiple session management parameters for the SGSN service.

Example

```
sm T3385-timeout 5
```

Chapter 191
SGTP Service Configuration Mode Commands

The SGSN GPRS Tunneling Protocol (SGTP) Service configuration mode provides the configuration of GTP-C and GTP-U related parameters for the SGSN.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) settings for the SGTP service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc { **bind address** *ip_address* | **dns-sgsn context** *cntxt_name* | **echo-interval** *seconds* | **guard-interval** *seconds* | **ignore response-port-validation** | **max-retransmissions** *num* | **retransmission-timeout** *seconds* | **send** { **common flags** | **rab-context** } }

no gtpc { **bind address** *ip_address* | **dns-sgsn context** *cntxt_name* | **echo-interval** *seconds* | **send** { **common flags** | **rab-context** } }

default gtpc { **echo-interval** | **guard-interval** | **ignore response-port-validation** | **max-retransmissions** | **retransmission-timeout** | **send** { **common flags** | **rab-context** } }

no

Disables the configured GTPC setting.

default

Resets the specified parameter to its default value.

bind address *ip_address*

Binds SGTP service to the IP address of the interface. Enter a standard dotted-quad IPv4 address.
The bind address for the **gtpc** and **gtpu** commands should be the same.

dns-sgsn context *cntxt_name*

Enter a string of 1 to 79 alphanumeric characters to identify the context name.

echo-interval *seconds*

Default: 60
seconds must be an integer from 0 through 3600. Configures the duration between echos.

guard-interval *seconds*

Default: 100
Configures the interval (in seconds) for which the SGTP maintains responses sent to SGSN. This optimizes the handling of retransmitted messages. This value should be configured to be greater than the SGSN's configuration for max-retries multiple by retry-interval.
seconds : Must be an integer from 10 to 3600.

ignore response-port-validation

This keyword is available in releases 8.1 and higher.
Default: disabled. To reset the default for *this* parameter, you must enter the following command: **no gtpc ignore response-port-validation**.
This keyword instructs the SGSN to ignore the response port validation.
For the SGSN to process incoming GTP responses to an *incorrect* port,

- this keyword must be entered, and
- the same **bind address** must be configured for GTPC and GTPU in the SGTP service.

max-retransmissions *num*

Default: 4
Configures the maximum number of retries for packets.
num : Must be an integer from 0 to 15.

retransmission-timeout *seconds*

Default: 5
Configures the control packet retransmission timeout in GTP, in seconds.
seconds must be an integer value from 1 through 20.

send { common-flags | rab-context }

common-flags : This option configures the SGTP service to include or exclude the common flags IE during an Inter-SGSN RAU. When selected, the default is to send the common flags IE.
rab-context : This option configures the SGTP service to include/exclude the radio access bearer (RAB) context IE in SGSN 'context response' message during Inter-SGSN Routing Area Update procedure. Default is to send the RAB context IE.

Usage

Use this command to configure GTP-C settings for the current SGTP service.

Example

Following command excludes the radio access bearer (RAB) context IE in the SGSN Context Response message during the inter-SGSN RAU procedure:

```
no gtpc send rab-context
```

gtpu

This command configures the GPRS Tunneling Protocol user data plane parameters (GTP-U) for this SGTP service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpu { bind address ip_address | echo-interval | max-retransmissions |
retransmission-timeout } +

no gtpu { bind | echo-interval }

default gtpu { echo-interval | max-retransmissions | retransmission-timeout }
```

no

Removes the configuration for the specified parameter from the current SGTP service configuration.

default

Resets the specified GTP-U parameter to its factory default.

bind address *ip_address*

Defines the GTP-U Gn interface IP address that binds to this SGTP service.
The **gtpu** and the **gtpc** commands should be configured with the same bind address.

echo-interval *seconds*

Default: 60
Configures the echo interval.
seconds : Must be an integer from 60 through 3600.

max-retransmissions *num*

Default: 4
Configures the maximum number of retries for packets.
num : Must be an integer from 0 through 15.

retransmission-timeout *seconds*

Default: 5
Configures the retransmission timeout of packets, in seconds.
seconds : Must be an integer from 1 through 20.

Usage

Use this command to configure the GTP-U settings for the SGTP service.

Example

```
gtpu echo-interval 5
```

path-failure

This command specifies the method for determining if path failure has occurred.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

path-failure detection-policy gtp type

no path-failure detection-policy

no

Deletes the path-failure definition from the configuration.

detection-policy gtp type

Default: echo (for both GTPC and GTPU)
Specifies the policy to be used, value options include:

- *echo* - When set to 'echo', path failure is detected when the retries of echo messages time out.
- *non-echo* - When set to 'non-echo', path failure is detected when the retries of non-echo messages time out.

Usage

Use this command to define the policy to detect gtp path failure.

Example

path-failure detection-policy gtp *echo*

pool

This command enables the default SGSN functionality for (flex) pooling and enables inclusion of the configured pool hop-counter count in new SGSN context/identify request messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pool { default-sgsn | hop-counter count }

default pool hop-counter

no pool { default-sgsn | hop-counter }
```

default

Removes the SGSN pool hop-counter IE from the GTP Identity/context requests..

no

Disables the default SGSN pooling functionality or removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default-sgsn

Enables default SGSN pooling functionality for this SGSN.

hop-counter *count*

Default: 4
Enables and configures the SGSN pool hop-counter to set the number of hops and to include the configured count in the **new** SGSN Context Requests or the **new** SGSN Identify Requests.
If **default-sgsn** is enabled, then any messages relayed will have the default value of 4 for the counter if the message does not include this hop-counter ID.
count : Must be an integer from 1 to 255.

Usage

Use this command to enable the default flex functionality without exposing the pool (flex) structure. This functionality provides a means for SGSNs outside of the pool to reach a pooled SGSN on the basis of its NRI. Once the pooling has been enabled. Repeat the command using the **hop-counter** keyword to enable inclusion of the hop-counter IE in SGSN context/identify request messages and to configure the count for the pooling hop-counter. If the SGSN is behaving as the 'default SGSN', this SGSN will forward (relay) requests with the hop-count included to the target SGSN.

Example

Enable the default pooling functionality which allows an outside SGSN to reach a pooled SGSN:

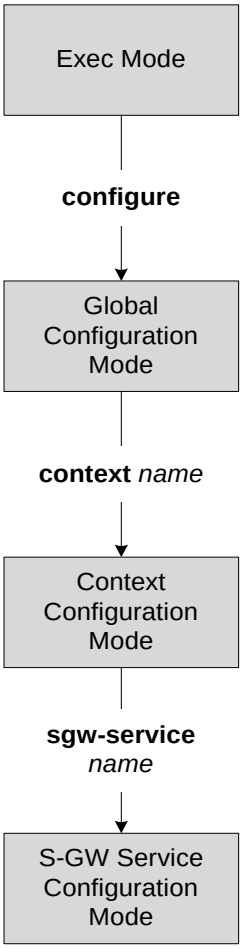
```
pool default-sgsn
```

Set the hop-count to be included in messages to 25:

```
pool hop-count 25
```

Chapter 192
S-GW Service Configuration Mode Commands

The S-GW (Serving Gateway) Service Configuration Mode is used to create and manage the relationship between an eGTP service used for either ingress or egress control plane and user data plane network traffic.



accounting context

Configures the GTPP accounting context and group selection for S-GW service.

Product

S-GW

Privilege

Administrator

Syntax

accounting context *name* **[gtpp group** *name* **]**

no accounting context

no

Removes the configured accounting context from this service.

context *name*

Specifies the context where GTPP accounting is performed. *name* must be an existing context configured on the system and be from 1 to 79 alpha and/or numeric characters.
If an accounting context name is not configured in the S-GW service, the context where the S-GW service resides is considered the accounting context and the default GTPP group is used.

gtpp group *name*

Specifies a GTPP group used to perform GTPP accounting. *name* must be an existing GTPP group configured on the system and be from 1 to 79 alpha and/or numeric characters.
If a GTPP group is not configured, the system will use the default GTPP group in the specified accounting context. If the accounting context is not specified, the system will use default GTPP group in the context where the S-GW service resides.

Usage

Use this command to specify the accounting context and/or GTPP accounting group the S-GW service will use to perform GTPP accounting.

Example

The following command specifies a GTPP accounting context named *acct-2* and a GTPP accounting group named *gtpp-grp-3* as the context and group the S-GW service will use:

```
accounting context acct-2 gtpp group gtpp-grp-3
```

associate

Associates the S-GW service with QoS and policy control and charging configurations.

Product

S-GW

Privilege

Administrator

Syntax

associate { accounting-policy *name* **| egress-proto { gtp | gtp-pmip | pmip } [egress-context** *name* **[egtp-service** *name* **] [mag-service** *name* **]] | ims-auth-service** *name* **| ingress egtp-service** *name* **| qci-qos-mapping** *name* **}**

no associate { accounting-policy *name* **| egress-proto [egress-context [egtp-service] [mag-service]] | ims-auth-service** *name* **| ingress egtp-service | qci-qos-mapping** *name* **| }**

no

Removes the specified association form the S-GW service.

accounting-policy *name*

Associates the S-GW service with an accounting policy configured in the same context. *name* must be an existing accounting policy and be from 1 to 63 alpha and/or numeric characters.
Accounting policies are configured through the **policy accounting** command in the Context Configuration Mode.

egress-proto { gtp | gtp-pmip | pmip } [egress-context *name* **[egtp-service** *name* **] [mag-service** *name* **]]**

Associates and configures the egress protocol for this S-GW service.
gtp: Specifies that GTP is to be used for the S-GW service egress.
gtp-pmip: Specifies that either GTP or PMIP is to be used for the S-GW service egress.
pmip: Specifies that PMIP is to be used for the S-GW service egress.
egress-context *name*: Specifies that the context in this keyword is to be used for the S-GW service egress. *name* must be an existing context on this system and be from 1 to 63 alpha and/or numeric characters.
egtp-service *name*: Specifies that the service in this keyword is to be used for the S-GW service egress. *name* must be an existing eGTP service on this system and be from 1 to 63 alpha and/or numeric characters.
mag-service *name*: Specifies that the service in this keyword is to be used for the S-GW service egress. *name* must be an existing MAG service on this system and be from 1 to 63 alpha and/or numeric characters.

ims-auth-service *name*

Associates the S-GW service with an IMS authorization service configured in the same context. *name* must be an existing IMS auth service and be from 1 to 63 alpha and/or numeric characters.
IMS authorization services are configured through the **ims-auth-service** command in the Context Configuration Mode.

ingress egtp-service *name*

Associates and configures the eGTP service ingress for this S-GW service. *name* must be an existing eGTP service on this system and be from 1 to 63 alpha and/or numeric characters.

qci-qos-mapping *name*

Associates the S-GW service with QCI to QoS mapping parameters. *name* must be an existing QCI-QoS mapping configuration and be from 1 to 63 alpha and/or numeric characters.
QCI-QoS mapping is configured through the **qci-qos-mapping** command in the Global Configuration Mode.

Usage

Use this command to select a pre-configured QoS mapping and/or policy control and charging configuration to be used by the S-GW service.

Example

The following command associates the S-GW service with an IMS authorization service named *ims-23*:

```
associate ims-auth-service ims-23
```

egtp-service

Configures an eGTP service to use as either an ingress (S1-U) or egress (S5/S8) service for the S-GW.

Product

S-GW

Privilege

Administrator

Syntax

egtp-service { egress { context *name* **| service** *name* **} | ingress service** *name* **}**

no egtp-service { egress { context | service } | ingress service }

no

Removes the selected EGTP service from this service.

egress { context *name* **| service** *name* **}**

Specifies the egtp-service to be used as the egress eGTP service on a GTP based S5/S8 interface.
context *name*: Specifies the name of the context where the eGTP service resides. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing context name where an eGTP service resides.

Caution: **context** *name* is not supported in this release.

service *name*: Specifies the name of the egress eGTP service. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing eGTP service name.

ingress service *name*

Specifies the egtp-service to be used as the ingress eGTP service on the S11 interface. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing eGTP service name.

Usage

Use this command to configure the eGTP service to use with this S-GW service. The eGTP service must be existing and be configured with the appropriate parameters supporting the intended service type.

Example

The following command configures the S-GW service to use an eGTP service named *s1u-egtp* as it's ingress service:

```
egtp-service ingress service s1u-egtp
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

gtpu-error-ind

Configures the actions to be taken upon receiving a GTP-U error indication from an eNodeB or P-GW.

Product

S-GW

Privilege

Administrator

Syntax

```
gtpu-error-ind { s1u { local-purge | page-ue [ custom1-behavior ] } | s5u {
local-purge | signal-peer } }

default gtpu-error-ind { s1u | s5u }
```

default

Rests the command to the default action for the specified interface. For S1-U, **page-ue** is the default action. For S5-U, **local-purge** is the default action.

s1u { local-purge | page-ue [custom1-behavior] }

Specifies the action to take when a GTP-U error indication is received from an eNodeB over the S1-U interface.
local-purge: The S-GW clears the affected bearer (or PDN if error-ind is received on default bearer) locally without informing peer.
page-ue [custom1-behavior]: The S-GW moves the complete UE state to S1-Idle and starts paging for this UE. If the custom1-behavior option is specified, the S-GW will guard the paging attempt with a timer of 60 seconds. Within this time the bearer must have the eNodeB TEID refreshed by an MME. Otherwise, the S-GW will clear the affected bearer with signaling. This is the default action for GTP-U error indication messages received on the S1-U interface.

s5u { local-purge | signal-peer }

Specifies the action to take when a GTP-U error indication is received from a P-GW over the S5-U interface.
local-purge: The S-GW clears the affected bearer (or PDN if error-ind is received on a default bearer) locally without informing the peer. This is the default action for GTP-U error indication messages received on the S5-U interface.
signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the action to taken upon receiving a GTP-U error indication from either an eNodeB across an S1-U interface or from a P-GW across an S5-U interface.

Example

The following command sets the action to take upon receipt of a GTP-U error indication from the eNodeB to clear affected bearer:

```
gtpu-error-ind s1u local-purge
```

mag-service

Identifies the Mobile Access Gateway (MAG) egress service through which calls are to be routed for this S-GW service.

Product

S-GW

Privilege

Administrator

Syntax

mag-service egress service *name*

no mag-service egress service

no

Removes the configured MAG egress service from this service.

egress service *name*

Specifies the MAG service name to be used as the egress MAG service on a PMIP based S5/S8 interface. *name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to specify the name of the MAG service where calls are to be routed.

Example

The following command specifies that an existing MAG service named *mag3* is to be used to route call through for this S-GW service:

```
mag-service egress service mag3
```

path-failure

Configures the action to take upon the occurrence of a path failure between the S-GW and the MME, P-GW, or eNodeB.

Product

S-GW

Privilege

Administrator

Syntax

```
path-failure { s11 | s1u | s5 | s5u } ( local-purge | signal-peer }
default path-failure { s11 | s1u | s5 | s5u }
```

default

Returns the command to the default setting of "local purge" for the selected interface.

{ s11 | s1u | s5 | s5u }

Specifies the interface to which the action will be applied.
s11: Indicates that the path failure action is to be applied to the S11 interface between the S-GW and the MME.
s1u: Indicates that the path failure action is to be applied to the S1-U interface between the S-GW and the eNodeB.
s5: Indicates that the path failure action is to be applied to the S5 interface between the S-GW and the P-GW.
s5u: Indicates that the path failure action is to be applied to the S5-U interface between the S-GW and the P-GW.

(local-purge | signal-peer }

Specifies the action to apply to the selected interface.
local-purge: The S-GW clears the affected bearer (or PDN if path failure is received on a default bearer) locally without informing the peer. This is the default action for all interface.
signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the type of action to take when a path failure occurs on one of the supported interfaces.

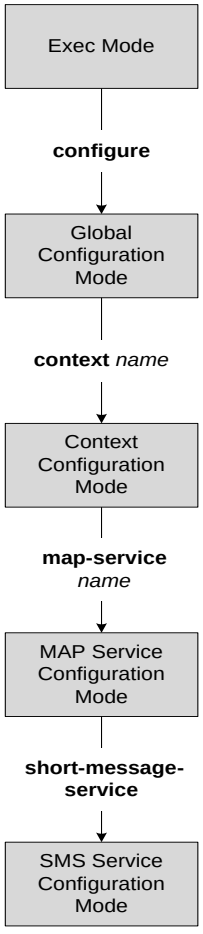
Example

The following command sets the path failure action for the S5 interface to “signal peer”:

```
path-failure s5 signal-peer
```

Chapter 193
SMS Service Configuration Mode Commands

The SMS (short message service) Service configuration mode is used to configure properties of the SMS Service component. The SGSN uses the SMS Service component to communicate via the Gd interface with a gateway message service controller (GMSC) to send short text messages (up to 140 octets in length) to a mobile (SMS-MT) and/or receive messages from a mobile (SMS-MO) .



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cp-data

Enables the SGSN to send and/or receive cp-data (text messages).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cp-data max-retransmission *retries_num*

default cp-data max-retransmissions

default

This keyword resets the SGSN's max-retransmission to the default number of retries.

max-retransmission *retries_num*

retries_num: enter an integer from 1 to 3.

Usage

Use this command to configure the number of times the SGSN will attempt to retransmit a message.

Example

cp-data max-retransmission *2*

mo-message-forwarding-destination

This command defines the SGSN's handling policy for MO (mobile originating) message.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] mo-message-forwarding-destination { gmsc-selected-from-imsi | smsc-supplied-by-subscriber }

default

Resets the SMS service configuration to the default message forwarding technique.

gmsc-selected-from-imsi

Entering this keyword enables SMS-MO messages to be forwarded on the basis of their IMSI prefix.

smsc-supplied-by-subscriber

Entering this keyword enables SMS-MO messages to be forwarded on the basis of the SMSC (SMS controller) address provided by the subscriber.

Usage

Use this command to define how the mobile originated SMS are to be routed.

Example

mo-message-forwarding-destination gmsc-selected-from-imsi

smsc-routing

This command configures the routing to the SMSC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] smsc-routing { { any | imsi-starts-with | msisdn-starts-with } { isdn
isdn_number | mobile-global-title mgt_number | point-code pt_code } }
```

any

Configures routing according to any IMSI prefix.

imsi-starts-with *IMSI_prefix*

Defines the IMSI prefix. Enter a string of up to 15 integers.

msisdn-starts-with *msisdn_prefix*

Defines the MSISDN prefix. Enter a string of up to 15 integers.

isdn *isdn_number*

Defines the ISDN E.164 number of the SMSC.

mobile-global-title *mgt_number*

Defines the mobile global title for conversion

point-code *pt_code*

Defines the point code for the SMSC. Enter a string of up to 11 digits in SS7 dotted decimal or decimal format

Usage

Use this command to define routing to the SMSC based on any point code.

Example

```
smsc-routing any point-code 1.222.1
```

timeout

This command defines the SMS service timers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { **tc1n-timer***time* | **tr1n-timer** *time* | **tr2n timer** *time* }

default timeout { **tc1n-timer** | **tr1n-timer** | **tr2n timer** }

default

Resets the configuration to the default value for the specified timer.

tc1n-timer *time*

Configures the TC1N timer in seconds.
time: Must an integer from 1 to 255. The default is 5 seconds.

tr1n-timer *time*

Configures the TR1N timer in seconds.
time: Must an integer from 1 to 255. The default is 30 seconds.

tr2n-timer *time*

Configures the TR2N timer in seconds.
time: Must an integer from 1 to 255. The default is 30 seconds.

Usage

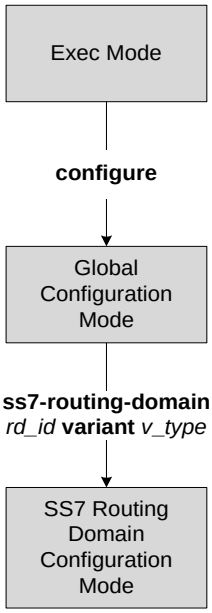
Use this command to set SMS service timers. The command can be repeated to set all of the timers, one-at-a-time.

Example

tr1n-timer ***25***

Chapter 194
SS7 Routing Domain Configuration Mode Commands

The SS7 Routing Domain configuration mode is used to configure Signaling System 7 (SS7) parameters. For convenience in configuration management, all SS7 parameters have been collected into a proprietary grouping called an *SS7 routing domains*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

asp

This command creates or removes an M3UA Application Server Process (ASP) instance and enters the ASP configuration mode. See the *SGSN ASP Configuration Mode* chapter in the *Command Line Interface Reference* for command details.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

asp instance *asp_inst*

no asp instance *asp_inst*

default asp instance *asp_inst* **end-point port**

no

Deletes the ASP instance for the SS7 routing domain configuration.

default

Sets the ASP instance parameters to the end-point port value of 2905.

instance *asp_inst*

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
asp_inst : Must be an integer from 1 through 4.

Usage

Use this command to create an ASP instance or enter the ASP configuration mode.

Example

The following command enters the ASP configuration mode for a specific ASP.

asp instance *1*

description

This command defines an alphanumeric string that describes the current SS7 routing domain. This is used for operator reference only.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current SS7 routing domain configuration.

string

Specifies the alphanumeric string that is stored. Strings with spaces must be enclosed in double-quotes (see the example below).
string : Must be from 1 to 255 alphanumeric characters.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

description *"National Service Routing Domain"*

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Exec mode from any configuration mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

inbound-asp-identifier validate

This command enables validation of ASP identifiers inbound to the SGSN via routes defined with this SS7 routing domain.

Important: This command is only available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
inbound-asp-identifier validate

[ default | no ] inbound-asp-identifier validate
```

default

Validates the inbound ASP Id.

no

Disables validation of the inbound ASP Id.

Usage

The standard is to validate the ASP Id. However, in some circumstances it is necessary to skip such validation. For example, if the same ASP Id is assigned to more than one RNC (peer-server).

Example

Use the following command to skip validation of inbound ASP Ids:

```
no inbound-asp-identifier validate
```

Use either of the following commands to enable validation if it has been disabled:

```
default inbound-asp-identifier validate

inbound-asp-identifier validate
```

linkset

This command creates an instance of an MTP3 linkset and enters the linkset configuration mode. See the *Linkset Configuration Mode* chapter in *Command Line Interface Reference* for the commands to configure the linkset.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

linkset id *id*

no linkset id *id*

no

Removes the identified linkset definition from the system configuration.

id

This value uniquely identifies a linkset for the specific SS7 routing domain.
id: Must be an integer of 1 to 49.

Usage

This command creates instances of linkset configurations and provides access to the linkset configuration mode.

Example

Use the following command to create the 12th linkset:

linkset id *12*

MTU-size

This command has been deprecated.

peer-server

This command creates a peer-server instance to setup a SIGTRAN peer for sending and receiving M3UA traffic. Completing the command automatically enters the peer- server configuration mode. To define 1 or more (up to 145) peer servers, use the commands documented in the *Peer-Server Configuration Mode* chapter in this reference.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

peer-server id *srvr_id*

no peer-server id *srvr_id*

no

Removes the identified peer-server definition from the system configuration.

srvr_id

srvr_id uniquely identifies a peer-server. The id must be an integer from 1 to 49.

Usage

Use the following command to create a definition for peer-server 2 and enter the configuration mode to configure the communication parameters for peer-server 12.

Example

peer-server id *12*

route

This command configures SS7 routes for the current SS7 routing domain.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

route destination-point-code *dp_code* { **linkset id** *id* [**priority** *pri_value*] | **peer-server-id** *srvr_id* }

no route destination-point-code *dp_code* { **linkset id** *id* | **peer-server-id** *srvr_id* }

no

Removes the SS7 route from the current SS7 routing domain configuration.

destination-point-code *dp_code*

Specifies the SS7 destination point code for this route.
Reminder: the point-code structure must match the variant defined for the SS7 routing domain when the SS7RD was configured in the global configuration mode.

linkset id *id*

This keyword identifies a linkset instance, created and configured with the **linkset** command.
This keyword identifies a linkset instance, created and configured with the **linkset** command.
id : Must be an integer from 1 to 49.

peer-server-id *srvr_id*

This keyword identifies a peer-server configuration instance, created and configured with the **peer-server** command.
srvr_id must be an integer from 1 to 49.

Usage

This command associates the previoiusly configured linksets and peer servers and the destination point codes with a specified SS7 route.

Example

Define a route setting an ITU-type destination point-code address for the linkset Id 12:

route destination-point-code *6.211.6* **linkset id** *12*

routing-context

Identifies the routing context for this SS7 routing domain.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

routing-context *value*

default routing-context

default

Resets the local routing context value to the index (instance ID) for this SS7 routing domain.

value

An integer that uniquely identifies the routing context for this SS7 routing domain.
value : Must be integers from 1 to 65535 (for releases 8.0) or 1 to 4294967295 (for releases 8.1 and higher)
.

Usage

Use this command to set the routing context IDs for a specific SS7 routing domain configuration.

Example

routing-context *2355*

ssf

This command sets the network indicator in the subservice field for SS7 message signal units (MSUs).

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ssf { **international** | **national** | **reserved** | **spare** }

international

The network indicator identifies the message as international with a point code structure that does not match the national point code structure,

national

The network indicator identifies the messages as having a national point code structure.

reserved

Provides an alternate network indicator for national messages.

spare

Provides an alternate network indicator for international messages.

Usage

In SS7 signaling, the Message Transfer Part (MTP) Level 2 message signal units (MSUs) contain a service information octet (SIO). The SIO field in an MSU contains a 4-bit subservice field (SSF) followed by a 4-bit service indicator. The indicator carried in the message's routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the nation - international. As well, the 4-bit SSF determines the point code structure of the messages transmitted from the SGSN.

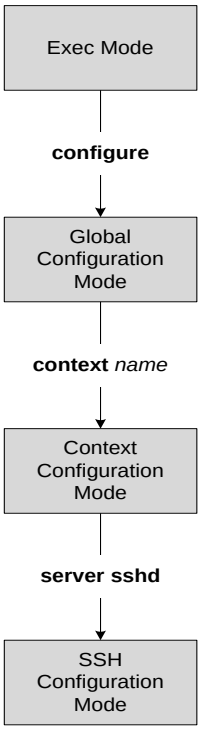
Example

For messages being transmitted within a country, set the indicator to national with the following command.

ssf *national*

Chapter 195
SSH Configuration Mode Commands

The Secure Shell Configuration Mode is used to manage the SSH server options for the current context.



end

Exits the SSH server configuration mode and returns to the Exec mode.

Product

All

Privilege

Administrator, Config-administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the secure shell server configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

listen

This command configures the SSH server in the current context to only listen for connections from the interface with the specified IP address. The default behavior is to listen on all interfaces.

Product

All

Privilege

Security Administrator, Administrator

Syntax

listen *ip_address*

no listen

no

Disable listening for a specific interface address and enable listening on all interfaces.

Usage

Use this command to configure the SSH server for the current context to only listen for connections from the interface with the specified IP address. Only one IP address may be set for listening.

Example

The following command specifies that the Server should only listen for connections in the interface with the IP address of 192.168.0.10:

listen *192.168.0.10*

max servers

Configures the maximum number of SSH servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *number*

number

Default: 40
Specifies the maximum number of servers that can be spawned in any 60 second interval. number must be a value in the range from 1 to 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

```
max servers 50
```

subsystem

Configures the system to perform file transfers using secure ftp (sftp) over ssh v2. Administrator users must be configured with the ftp attribute privilege to issue this command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
subsystem { cli | sftp }

no subsystem { cli | sftp }
```

no

Disables either the sftp ssh file transfer method or disables access to the CLI over ssh.

cli

Default: Enabled
Configures the SSH system for the current context to allow access to the CLI.

sftp

Default: Disabled
Enables the SSH system for the current context to perform file transfers using secure ftp (sftp) over ssh v2.

Usage

Use this command to enable or disable file transfers using secure ftp over an ssh v2 tunnel.
Also use this command to enable or disable access to the CLI over an SSH connection.

Example

The following command enables SFTP for the current context:

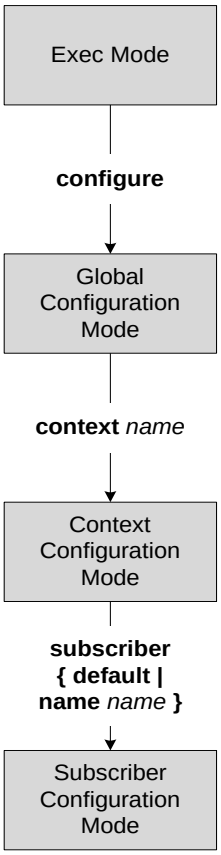
```
subsystem sftp
```

The following command disables access to the CLI through an SSH session for the current context:

```
no subsystem cli
```

Chapter 196
Subscriber Configuration Mode Commands

The Subscriber Configuration Mode is used to create local subscribers as well as to set default subscriber options for the current context.



aaa group

Configures a AAA server group for AAA functionality at the subscriber level.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] aaa group *group_name*

default aaa group

group_name

The AAA group to configure for authentication and/or accounting for the specific subscriber. *group_name* must be a string of length between one to 63 characters.

no

Disables the specified AAA group for the specific subscriber.

default

Sets/restores default AAA group specified at the context level or default subscriber profile.

Usage

Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for subscribers in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).

Example

The following command applies the AAA server group *star1* to a subscriber within the specific context:

aaa group *star1*

The following command disables the AAA group for the specific subscriber:

no aaa group *group_name*

access-link ip-fragmentation

Configures IP fragmentation processing over the Access-link (\, GTP etc).

Product

All

Privilege

Security Administrator, Administrator

Syntax

access-link ip-fragmentation { **normal** | **df-ignore** | **df-fragment-and-icmp-notify** }

df-ignore

Default: Enabled
Ignore the DF bit setting. Fragment and forward the packet over the access link.

df-fragment-and-icmp-notify

Default: Disabled
Partially ignore the DF bit. Fragment and forward the packet, but also return an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to 1 ICMP error packet per second per session.

normal

Default: Disabled
Normal processing. Drop the packet and send an ICMP unreachable message to the source of packet. This is the default behavior.

Usage

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.

Example

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:
access-link ip-fragmentation df-ignore

accounting-mode

This command sets the accounting mode for the current local subscriber configuration.

Product

PDSN, HA, ASN GW, S-GW

Privilege

Administrator

Syntax

```
accounting-mode { flow-based | gtpp [ radius-diameter ] | none | radius-diameter
[ gtpp ] | rf-style }

default accounting-mode
```

default

Sets the type of accounting to be performed for the current local subscriber to the default setting.
Default: radius-diameter

flow-based

Diameter flow-based accounting is enabled for the current local subscriber.

gtpp [radius-diameter]

GTPP CDR RADIUS accounting is enabled for the current local subscriber. The **radius-diameter** keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

none

Accounting is disabled for the current local subscriber and no charging records will be generated.

radius-diameter [gtpp]

RADIUS-Diameter accounting is enabled for the current local subscriber. The **gtpp** keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

rf-style

Diameter Rf interface accounting is enabled for the current local subscriber.

Usage

This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.
Use this command to enable or disable RADIUS/Diameter accounting for any subscribers that use the current local subscriber configuration.
If the **gtpp** option is used, then GTPP RADIUS is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode and GTPP charging records will be enabled.
If the **radius-diameter** option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.

RADIUS accounting can also be enabled and disabled at the context level with the **aaa accounting** command in the Context Configuration Mode. If RADIUS accounting is enabled at the context level, the accounting-mode command can be used to disable RADIUS accounting for individual local subscriber configurations.
If the accounting mode is set to **rf-style**, then BM will generate accounting records corresponding to AIMS RF.

Example
To disable accounting for the current subscriber, enter the following command:

```
accounting-mode none
```

active-charging bandwidth-policy

This command configures the bandwidth policy to be used for the subscriber.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

active-charging bandwidth-policy *bandwidth_policy*

`{ default | no } active-charging bandwidth-policy`

default

Specifies that the default bandwidth policy configured in the rulebase be used for this subscriber.

no

Disables bandwidth control for this subscriber.

bandwidth_policy

Specifies the bandwidth policy name.
bandwidth_policy must be an alpha and/or numeric string from 1 through 63 characters in length.

Usage

Use this command to configure bandwidth policy to be used for subscribers.

Example

The following command configures a bandwidth policy named *standard* for the subscriber:

```
active-charging bandwidth-policy standard
```

active-charging rulebase

This command specifies the name of the rulebase to be used for this subscriber.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

active-charging rulebase *rulebase_name*

no active-charging rulebase

no

Removes the previously specified rulebase for the subscriber.

rulebase_name

Name of the specific active charging service rulebase.
rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

This command specifies the name of the rulebase for specific subscriber (reals).
If the specified rulebase does not exist in the Active Charging service, the call will be rejected.

Example

Following command specifies the active charging rulebase rule1 for specified subscriber.

active-charging rulebase *rule1*

always-on

Once the idle timeout limit is reached, keep the current subscriber session connected as long as the subscriber is reachable.

Caution: When always-on is enabled, the subscriber must have an idle time-out period configured (default is 0, no time-out). Failure to configure an idle time-out results in a subscriber session that is indefinite in length.

Two timers and a counter are associated with this feature. Refer to the **timeout** command in this chapter and the **ppp echo-retransmit-timeout msec** and **ppp echo-max-retransmissions num_retries** commands.

Default: Disabled.

Product

PDSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
always-on
no always-on
```

no

Disables **always-on**. The user is disconnected after the idle time expires.

Usage

If this parameter is enabled for a subscriber, when the idle time-out limit is reached the subscribers IP/PPP session remains connected as long as the subscriber is reachable. This is true even if the airlink between the mobile device and the RN (Radio Node) is moved from active to dormant (inactive) status. When the idle timeout limit is reached, the PDSN determines availability using LCP keepalive messages. A response to these messages indicates that the "always-on" status should be maintained. Failure to respond to a predetermined number of LCP keepalive messages causes the PDSN to tear-down (disconnect) the subscriber session.

Example

Enable always on for the current subscriber by entering the following command:

```
always-on
```

asn-pdfid

This command configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] asn-pdfid *pdf_id* **asn-service-profile-id** *svc_profile_id* **asn-sdfid** *sdf_id*

no

Removes/disables the configured identifiers for this subscriber in ASN-GW service.

asn-pdfid *pdf_id*

Specifies the an unique ASN Packet Data Flow identifier for this subscriber.
pdf_id must be an integer between 1 and 65535.

asn-service-profile-id *svc_profile_id*

Specifies an unique ASN Service Profile Identifier for this subscriber.
svc_profile_id is a preconfigured Service Profile Identifier configured in the Context Configuration Mode.

asn-sdfid *sdf_id*

Specifies the an unique ASN Service Data Flow identifier for this subscriber.
sdf_id must be an integer between 1 and 65535.

Usage

Use this command to configure subscriber profile for QoS parameters in an ASN-GW service.
A maximum of 4 QoS profiles can be configured for a subscriber.

Example

The following command configures the QoS profile for a subscriber as PDF id 1, Service Profile id 3, and Service Data Flow id 2:
asn-pdfid *1* **asn-service-profile-id** *3* **asn-sdfid** *2*

asn-policy

This command configures the identifiers for packet data flow, service data flow, and service profile in an ASN GW service.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
asn-policy {classifiers downlink {strict | loose} | idle-mode {allow |
disallow}}

[no | default] asn-policy idle-mode

[default] asn-policy classifiers downlink
```

no

Removes/disables the configured policy for this subscriber in ASN GW service.

default

Sets the ASN policy to default for this subscriber.
For downlink traffic classifier default policy is “loos” and for idle mode policy the default action is to allow idle mode operation in an ASN GW service.

idle-mode

Sets the idle mode policy for this subscriber in an ASN GW service.

allow

Default: enabled
Enables the policy for this subscriber to allow idle mode operation in an ASN GW service.

disallow

Default: disabled
Enable the policy for this subscriber to disallow idle mode operation in an ASN GW service.

classifiers downlink

Sets the classifier policy for all service flows coming from HA to FA for this subscriber’s matching classifier.

strict

Default: disabled
This option discards all the service flows coming from HA to FA and any other packets not matching to any of the classifiers set for this subscriber.

loose

Default: enabled
This option allows all the service flows coming from HA to FA and any other packet does not matching to any of the classifiers set for this subscriber and sent to the BS/MS over downlink flow

Usage

Use this command to configure subscriber policy to allow/disallow the idle mode operation or the downlink traffic flow for a subscriber in an ASN GW service.
This command allows MS to transition to idle mode with an ASN GW.

Example

The following command configures the policy to allow the idle mode for an MS with an ASN GW:

```
default asn-policy idle-mode
```

authorized-flow-profile-id

When a profile ID is requested by the Mobile Node (MN), this command sets the value that is authorized by the AGW.

Product

PDSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

authorized-flow-profile-id *profile_id* **direction { bidirectional | forward | reverse }**

no authorized-flow-profile-id *profile_id*

no

Remove the existing profile ID setting specified by *profile_id*. *profile_id* must be an integer from 0 through 65535.

profile_id

The profile ID number that is authorized for the current subscriber. *profile_id* must be an integer from 0 through 65535.

direction { bidirectional | forward | reverse }

This specifies in which data direction the profile ID should be applied.

- bidirectional: This profile ID pertains to both the forward and reverse directions.
- forward: This profile ID pertains to data going to the MN.
- reverse: This profile ID pertains to data coming from the MN.

Usage

Use this command to set the profile ID that the AGW will authorize for a subscriber.

Example

Set the profile ID for both directions to 3 for the current subscriber by entering the following command
authorized-flow-profile-id 3 direction bidirectional

content-filtering category

This command enables/disables the specified preconfigured Category Policy Identifier for policy based Content Filtering support to the subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id

no

Disables the configured category policy identifier for Content Filtering support to the subscriber. This is the default setting.

category policy-id *cf_policy_id*

This command applies the content filtering category policy ID, configured in Active Charging Configuration mode, to this subscriber.
cf_policy_id must be a preconfigured category policy id in Active Charging Configuration Mode.
In case category policy identifier *cf_policy_id* used here is not configured in Active Charging Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

Important: Category Policy Id configured through this mode overrides the Category Policy id configured through **content-filtering category policy-id** command in Rulebase Configuration Mode of Active Charging Service Configuration mode.

Usage

Use this command to enter the Content Filtering Policy Configuration mode and to enable or disable the Content Filtering Category Policy ID for a Subscriber.

Important: If Content Filtering Category Policy ID is not specified here the similar command in Rulebase Configuration Mode of Active Charging Configuration Mode determines the policy.

Up to 64 different policy identifier can be defined in a Content Filtering support service.

Example

Following command enters the Content filtering Policy Configuration mode and enables the Category Policy Id *101* for Content Filtering support.

```
content-filtering category policy-id 101
```

cscf core-service

CSCF/A-BG core service that maps to the current domain.

Product

SCM (CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

cscf core-service name *name*

no cscf core-service

cscf core-service name *name*

Specifies the name of the CSCF/A-BG core service.
name must be from 1 to 63 alpha and/or numeric characters.

no cscf core-service

Removes the CSCF/A-BG core service from the domain.

Usage

Use this command to map a CSCF/A-BG core service to the current domain.

Example

The following command creates a CSCF core service named *cs1*:

cscf core-service name *cs1*

The following command removes the CSCF core service from this domain:
no cscf core-service

cscf county-name

Assigns a Last Routing Option (LRO) profile county name to the subscriber for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Product

SCM (S-CSCF)

Privilege

Security Administrator, Administrator

Syntax

[no] cscf county-name *name*

cscf county-name *name*

Specifies the LRO profile county name of the subscriber.
name must be an existing LRO profile county name and be from 1 to 127 alpha and/or numeric characters.

no

Removes the LRO profile county name from the subscriber.

Usage

Use this command to assign an LRO profile county name to the subscriber.

Example

The following command assigns county name *norfolk* to the subscriber:

cscf county-name *norfolk*

The following command removes county name *norfolk* from the subscriber:
no cscf county-name *norfolk*

cscf nat-applicable

Indicates if NAT (Network Address Translation) processing is required for this domain.

Product

SCM (CSCF/A-SBC)

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cscf nat-applicable
```

no

Disables NAT processing for this domain.

Usage

Use this command to indicate whether NAT processing is required for this domain.

Example

The following command indicates NAT processing is required for this domain:

```
cscf nat-applicable
```

The following command disables NAT processing for this domain:

```
no cscf nat-applicable
```

cscf private-user-id

Assigns a private user identity to the subscriber.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Security Administrator, Administrator

Syntax

[no] cscf private-user-id *user_id*

no

Removed the private user identity of the subscriber.

cscf private-user-id *user_id*

Specifies the private user identity of the subscriber.
user_id must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to assign a private user identity to the subscriber.

Example

The following command assigns a private user identity named *user007* to the subscriber:

cscf private-user-id *user007*

The following command removes private user identity named *user007* from the subscriber:
no cscf private-user-id *user007*

cscf session-template

Assigns a CSCF session template to the subscriber profile.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Security Administrator, Administrator

Syntax

cscf session-template name *name*

no cscf session-template

cscf session-template name *name*

Specifies the name of the CSCF session template.
name must be an existing CSCF session template name and be from 1 to 79 alpha and/or numeric characters.

no cscf session-template

Removes the assignment of a session template to the subscriber profile.

Usage

Use this command to bind a CSCF session template to a subscriber profile.

Example

The following command assigns a CSCF session template named *template4* to the subscriber profile:

cscf session-template name *template4*

The following command removes the assignment of a session template to the subscriber profile:
no cscf session-template

data-tunneling ignore df-bit

This command controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for GRE, IP-in-IP tunneling used for the MIP data path. If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header. Default is enabled.

Product

PDSN, HA, FA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
data-tunneling ignore df-bit
no data-tunneling ignore df-bit
```

no

Disable this option. The DF bit in the tunneled IP packet header is not ignored during tunneling.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is not ignored and packets are not fragmented.

Example

To disable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

```
no data-tunneling ignore df-bit
```

dcca origin host

Important: This command has been deprecated, and is replaced by the dcca origin endpoint command.

dcca origin endpoint

Important: This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration mode, use the **`diameter origin endpoint`** command.

dcca peer-select

Specifies the Diameter credit control primary and secondary peer for credit control.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
dcca peer-select peer host_name [ realm realm_name ] [ secondary-peer
host_name [ realm realm_name ] ]
no dcca peer-select
```

no

Removes the previously configured Diameter credit control peer selection.

peer *host_name*

A unique name that you specify for the peer.
peer_name must be an alpha and/or numeric string of from 1 through 127 characters. *peer_name* allows punctuation marks.

secondary-peer *host_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route the secondary host performs a fail-over processing.

realm *realm_name*

The *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length. The realm may typically be a company or service name. *realm_name* allows punctuation characters.

Usage

Use this command to select a Diameter credit control peer and realm.

WARNING: This configuration completely overrides all instances of **diameter peer-select** that have been configured with in the Credit Control Configuration Mode for an Active Charging service.

Example

The following command selects a Diameter credit control peer named *test* and a realm of *companyx*:

```
dcca peer-select peer test realm companyx
```

default

Restores the default value for the option specified for the current subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { **access-link ip-fragmentation** | **accounting-mode** | **data-tunneling ignore df-bit** | idle-timeout-activity dormant-downlink-data | **inter-pdsn-handoff** | **ip** { **alloc-method** | **allowed-dscp** | **header-compression** | **hide-service-address** | **multicast discard** | **qos-dscp** | **source-validation** } | **loadbalanace-tunnel-peers** | **long-duration-action** | **mobile-ip** { **home-agent** | **mn-aaa-removal-indication** | **mn-ha-hash-algorithm** | **reverse-tunnel** | **security-level** | **send** { **dns-address** | **terminal-verification** } } | **permission** | **ppp** { **always-on-vse-packet** | **data-compression** { **mode** | **protocols** } | **keepalive** | **min-compression-size** | **mtu** } | **radius accounting interim interval-timeout** | **timeout** { **absolute** | **idle** } }

access-link ip-fragmentation

Sets the method for fragmenting packets over the MN access link to its default of normal. Drop the packet and send ICMP unreachable to the source of packet.

accounting-mode

Enables Radius accounting for the current local subscriber configuration.

data-tunneling ignore df-bit

Sets this option to the default behavior, which is to send an *ICMP unreachable - need to frag* message back to the sender and drop the packet, in the case that fragmentation is required but the DF bit is set.

idle-timeout-activity dormant-downlink-data

Sets this option to the default behavior. When downlink data packets are transmitted to the Mobile node and the session is in dormant mode the session idle timer is reset.

inter-pdsn-handoff

During a handoff from one PDSN to another, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address the PDSN will not disconnect the session immediately. The PDSN tries to assign the proposed address of the session in the IPCP configuration NAK.

ip { | allowed-dscp | header-compression | hide-service-address | multicast discard | qos-dscp | source-validation | user-datagram-tos copy }

allowed-dscp: resets the allowed DSCP parameters to the system defaults: class none, max-class be.
hide-service-address: specifies the default setting for hide the ip-address of the service from the subscriber. Default is Disabled

multicast discard: configures the default multicast settings which is to discard PDUs
qos-dscp: sets the quality of service setting to the system default.
source-validation: Specifies the default IP source validation. Default is Enabled.
user-datagram-tos copy: Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

---

loadbalance-tunnel-peers

Sets the tunnel load balancing algorithm to the system default.

---

long-duration-action

Sets the action that is taken when the long duration timer expires to the default: detection.

---

mobile-ip { home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel | security-level | send { dns-address | terminal-verification } }

allow-aaa-address-assignment: Disables the FA from accepting a home address assigned by an AAA server.
home-agent:Sets home agent IP address to its default of 0.0.0.0.
match-aaa-assigned-address: Disables the FA validating the home address in the RRQ against the one assigned by AAA server.
mn-aaa-removal-indication:Sets this parameter to its default of disabled.
mn-ha-hash-algorithm: Sets the encryption algorithm to the default of hmac-md5.
reverse-tunnel:Sets this parameter to its default of enabled.
security-level:Sets this parameter to its default of none.
send dns-address: Disables the HA from sending the DNS address NVSE in the RRP.
send terminal-verification: Disables the FA from sending the terminal verification NVSE in the RRQ.

---

permission

Restores the subscriber's service usage defaults.

---

ppp { always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation | keepalive | min-compression-size | mtu }

Sets the point-to-point protocol option defaults.
always-on-vse-packet: Re-enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value for always on sessions. This configuration is applicable only for PDSNsessions.
data-compression { **mode** | **protocols** }: restores the default value for either the data compression **mode** or compression **protocols** as follows:

- mode stateless
- all protocols enabled

ip-header-compression negotiation: sets the IP header compressions negotiation to the system default: force.
keepalive: sets the subscriber's PPP keep alive option to the system default: 30 seconds.
min-compression-size: restores the PPP minimum packet size for compression: 128 octets.
mtu: sets the maximum message transfer unit packet size to the system default: 1500 octets.

radius accounting interim interval-timeout

Disables the RADIUS accounting interim interval for the current subscriber.

timeout [absolute | idle | long-duration]

When a keyword is entered, this command resets the specified timeout to the system default: 0. When no keyword is specified, all timeouts are reset to the system defaults: 0.

Usage

Reset subscriber data to the system defaults. This is useful in setting the subscriber back to the basic values to possibly aid in trouble shooting or tuning a subscriber's access and options.

Example

```
default ip qos-dscp
default permission
default data-compression mode
```

dns

Configures the domain name servers for the current subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns { **primary** | **secondary** } *ip_address*

no

Indicates the IP address is to be removed as either a primary or secondary domain name server.

primary | secondary

primary: Indicates the primary domain name server for the subscriber is to be updated.
secondary: Indicates the secondary domain name server for the subscriber is to be updated.

ip_address

Specifies the IP address of the domain name server.

Usage

Set the subscriber DNS server lists as not all users will have the same set of servers.

Example

dns primary *1.2.3.4*
no dns primary *1.2.3.4*
dns secondary *1.2.5.6*
no dns secondary *1.2.5.6*

eap

This command specifies the lifetime for a master session key (MSK) for extensible authentication protocol (EAP) authentication.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

[default] eap msk-lifetime *dur*

default

Sets the lifetime duration to default value of 3600 seconds for master session key.

msk-lifetime *dur*

Specifies the lifetime duration on Master session key (MSK) in seconds for a WiMAX subscriber EAP authentication.
dur is the lifetime value in seconds and must be an integer from 60 through 65535.

Usage

This command is used to set the lifetime for MSK in EAP authentication for WiMAX subscriber.

Example

The following command sets the lifetime for MSK key to *4800* seconds for a WiMAX subscriber through EAP authentication:
eap msk-lifetime *4800*

encrypted password

Designates use of password encryption.

Product

All

Privilege

Security Administrator, Administrator

Syntax

encrypted password *password*

password

password is the encrypted password and must be an alpha and/or numeric string of from 1 to 63 characters.

Usage

This command is normally used only inside configuration files.

Example

The following command sets an encrypted password of *qsdf12d4*:
encrypted password *qsdf12d4*

end

Exits the subscriber configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the subscriber configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

external-inline-server

This is a restricted command.

firewall policy

Important: This command is only available in StarOS 8.0. In StarOS 8.1 and later, this configuration is available in the Rulebase Configuration Mode.

This command enables/disables Stateful Firewall support for the subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

no

Disables Stateful Firewall support for this subscriber.

default

Configures the default setting for Stateful Firewall support.
Default: Disabled

firewall-required

Enables Stateful Firewall support for this subscriber.

Usage

Use this command to enable or disable Stateful Firewall support for this subscriber.

Important: Unless Stateful Firewall support for this subscriber is enabled using this command, firewall processing for this subscriber is disabled.

Important: If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

Example

The following command enables Stateful Firewall support for this subscriber:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for this subscriber:

```
no firewall policy
```

fw-and-nat policy

Important: This command is customer-specific and is only available in StarOS 8.1. This command must be used to configure the Policy-based Firewall-and-NAT feature.

This command configures the Firewall-and-NAT policy for the subscriber.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *fw_nat_policy*

{ default | no } fw-and-nat policy

default

Specifies that the default Firewall-and-NAT policy configured in the rulebase be used for the subscriber.

no

Disables Firewall and NAT processing for the subscriber.

fw_nat_policy

Specifies the Firewall-and-NAT policy for the subscriber.
fw_nat_policy must be an alpha and/or numeric string of 1 through 63 characters in length. Note that this policy will override the **default Firewall-and-NAT policy** configured in the ACS rulebase.

Usage

Use this command to configure the Firewall-and-NAT policy for subscribers. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be applied.

Example

The following command configures a Firewall-and-NAT policy named *standard* for the subscriber:

fw-and-nat policy *standard*

idle-timeout-activity

Defines whether downlink (towards Mobile Node) data packets transmitted when the session is dormant is treated as activity for the idle-timer (inactivity timer).

By default, downlink data transmitted over a dormant session restarts the idle-timer for that session (it is treated as activity for the session).

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] idle-timeout-activity dormant-downlink-data
```

no

Dormant mode downlink data is not treated as activity for the session idle-timer. The session idle timer is not reset.

Usage

Use this command to disable or re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode.

Example

Use the following command to disable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

```
idle-timeout-activity dormant-downlink-data
```

Use the following command to re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

```
no idle-timeout-activity dormant-downlink-data
```

ims application-manager

Specifies the application manager for the subscriber.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no] ims application-manager { domain-name *domain-name* **| ipv4-address** *ipv4-address* **}**

no

Disables the IMS application manager for this subscriber.

domain-name *domain-name*

Specifies the domain name of the application manager.
domain-name must be from 1 to 63 alpha and/or numeric characters.

ipv4-address *ipv4-address*

Specifies the IPv4/IPv6 address of the application manager.

Usage

The ims application manager address is returned by HA to MN in DHCP Ack when it receives the DHCP inform from an AIMS subscriber.

Example

`ims application-manager domain-name` *`domain23`*`ims application-manager ipv4-address` *`192.168.23.1`*

ims-auth-service

It applies an IMS authorization service to a subscriber in a network access service (PDSN or GGSN service) for Gx/Ty interface support and functionality.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

[**default** | **no**] **ims-auth-service** *auth_svc_name*

default

Sets / Restores default state of IMS authorization service, disabled or as specified at the context or network access service level or in subscriber template.

no

Disables the applied IMS authorization service for specific subscriber.

auth_svc_name

Specifies the name of IMS authorization service name that is used for Ty interface support for specific subscriber.
auth_svc_name must be from 1 to 63 alpha and/or numeric characters preconfigured within the same context of this subscriber.

Usage

This feature provides the IMS authorization service configuration for Gx/Ty interface in IMS service node.

Example

Following command applies a previously configured IMS authorization service named *ims_interface1* to a subscriber within the specific context.

ims-auth-service *ims_interface1*

inter-pdsn-handoff

Configure the system to enforce the MN's use of its assigned IP address during IPCP negotiations resulting from inter-PDSN handoffs.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] inter-pdsn-handoff require ip-address
```

no

Disables the rejecting of sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

Usage

This command is used to configure the system to reject sessions that are re-negotiating IPCP after an inter-PDSN handoff if the IP address they propose does not match the one initially provided by the PDSN. The session would be rejected even if the proposed address was 0.0.0.0.
If this parameter is disabled, the PDSN will attempt to re-assign the IP address initially provided.

Example

To set the PDSN to not allow a mismatched IP address during a PDSN to PDSN handoff of a MIP call, use the following command:

```
inter-pdsn-handoff require ip-address
```

To set the PDSN so that it will not disconnect the session immediately, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address after inter-pdsn handoff, use the following command:

```
no inter-pdsn-handoff require ip-address
```

ip access-group

Configures IP access group for the current subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip access-group *group_name* **[in | out]**

no

Indicates the access group specified is to be cleared from the subscribers configuration.

group_name

Specifies the name of the IPv4/IPv6 access group. *acl_group_name* is a configured ACL group and must be an alpha and/or numeric string of 1 to 79 characters.

in | out

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively. If neither of these key words is specified, the command associates the *group_name* access group with the current subscriber for both inbound and outbound access.

Usage

Set the subscriber access group to manage the access control for subscribers as a logical group.

Example

The following command associates the *sampleGroup* access group with the current subscriber for both inbound and outbound access:
ip access-group *sampleGroup*
The following removes the outbound access group flag for *sampleGroup*:
no ip access-group sampleGroup out

ip address

Configures a static IP address for use by the subscriber.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip address` *`ip_address netmask`*

`no`

Removes a previously configured IP address assignment.

`ip_address`

The IP address assigned to the subscriber.

`netmask`

The subnet mask that corresponds to the assigned IP address.

Usage

Use this command to assign a static IP address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example

The following command configures a static IP address of *`192.168.1.15`* with a subnet mask of *`255.255.255.0`* to the subscriber:

`ip address` *`192.168.1.15 255.255.255.0`*

ip address pool

Configures IP address pool properties for the subscriber.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address pool name *pool_name*

no

Removes a previously configured static address.

name *pool_name*

Specifies the IP address pool or IP address pool group from which the subscribers IP address is assigned. *pool_name* must be the name of an existing IP pool or IP pool group and from 1 to 31 alpha and/or numeric characters.

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to sessions from this subscriber.
This command can be issued multiple times to specify multiple address pools for the subscriber. If multiple pools are specified, addresses are assigned for subscriber sessions from the pools based on the order in which the pools were configured.
If an address can not be provided from the first-specified pool for whatever reason, the system attempts to assign an address from the second-specified pool, and so on. This operation is independent of the priorities configured for the pools. For example, if pool1 was specified for the subscriber first, and pool2 second, the system always attempts to assign addresses from pool1. If an address can not be assigned from pool1 (i.e. all addresses are in use), the system then attempts to assign an address from pool2.

Example

The following command configures the subscriber to receive IP addresses from an IP address pool named *public1*:
ip address pool name *public1*

ip address secondary-pool

Configures secondary IP address pool properties for the subscriber to provide multiple IP host configuration behind one WiMAX CPE.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

ip address secondary-pool name*aux_pool_name*

no ip address secondary-pool name*aux_pool_name*

no

Removes a previously configured auxiliary pool named *aux_pool_name* for multiple host support in ASN GW service.

name *aux_pool_name*

Specifies the secondary/auxiliary IP address pool or IP address pool group from which the IP address is assigned to host behind a WiMAX CPE having primary IP address.
pool_name must be the name of an existing IP pool or IP pool group and from 1 to 31 alpha and/or numeric characters.

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to host behind a WiMAX CPE for multiple host session support. This command designates the IP address to secondary hosts from locally configured secondary IP address pool. To enable multiple host support behind a WiMAX CPE and configure maximum number of supported hosts use **secondary-ip-host** command in ASN Gateway Service Configuration mode.

Example

The following command configures the subscriber to receive IP addresses from a secondary IP address pool named *auxiliary1* for secondary hosts behind the WiMAX CPE:
ip address secondary-pool name *auxiliary*

ip allowed-dscp

This command sets the Quality of Service (QoS) Differentiated Services (DiffServ) marking that a subscriber session is allowed. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip allowed-dscp class *class* **max-class** *maxclass* [**rt-marking** *marking*]
no ip allowed-dscp class

---

no ip allowed-dscp class

Resets the parameters to the defaults: class none, max-class **be**. This indicates that all packets are let through without any dscp checking

---

class *class*

This parameter specifies the Differentiated Services Codepoint (DSCP) class that the subscriber session may mark its packets with. If the subscriber sessions packets request a code point class higher than the code point class specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the **ip qos-dscp** command.
Default: none
class must be one of the following;
a: packets with AF DSCPs are allowed
e: packets with EF DSCP are allowed
o: packets for experimental or local use are allowed
ae: packets with AF and EF DSCPs are allowed
ao: packets with AF DSCPs or packets for experimental or local use are allowed
eo: packets with EF DSCPs or packets for experimental or local use are allowed
aeo: packets with AF or EF DSCPs or packets for experimental or local use are allowed
none: only the **be** and **sc1** through **sc7** code points are allowed

---

max-class *maxclass*

This parameter specifies the maximum code point that a subscriber session may mark its packets with. The subscriber sessions packets must be marked with a code point equal to or less than the code point specified. If the subscriber sessions packets request a code point higher than the code point specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the max-class and the **ip qos-dscp** command.
The list below lists the code points from lowest to highest precedence. For example, if the **maxclass** is set to af22, that becomes the maximum code point that the subscriber session may mark it's packets with and only **be, af13, af12, af11,af23**, and **af22** are allowed. If a subscriber session marks its packets with anything after af22 in this list, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the maxclass and the **ip qos-dscp** command.
If class is set to none only the be and sc1 through sc7 codepoints are allowed. For example; if **class** is set to none and you set **max-class** to **sc1**, only the **sc1** and **be** codepoints are allowed.
Default: **be**
maxclass must be one of the following;

be: best effort forwarding
af13: assured Forwarding 13
af12: assured Forwarding 12
af11: assured Forwarding 11
af23: assured Forwarding 23
af22: assured Forwarding 22
af21: assured Forwarding 21
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6
sc7: selector class 7

---

rt-marking *marking*

This parameter is used for Mobile IP (MIP) reverse tunnels. When a MIP sessions packets do not have a DSCP marking, the Foreign Agent (FA) marks the packets with the value specified by **rt-marking** *marking*.
If the MIP sessions packets have a DSCP marking, the marking is subjected to the conformance rules for the values of class and max-class, then the final DSCP marking is copied from the inner IP header to the outer IP header.
Default: **be**
marking must be one of the following;
be: best effort forwarding
af11: assured Forwarding 11
af12: assured Forwarding 12
af13: assured Forwarding 13
af21: assured Forwarding 21
af22: assured Forwarding 22
af23: assured Forwarding 23
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6

sc7: selector class 7

Usage

Use this command to configure Quality of Service (QoS) for a subscriber session to allow a Differentiated Services (DiffServ) Code Point (DSCP) marker in the header of each IP packet that prompts network routers to apply differentiated grades of service to various packet streams.
This command uses **class** and type of marker (**rt-marking** for reverse tunnels) for configuration with **max-class** maximum code point that a subscriber session may mark its packets with.

Example

The following command will allow *o* packets for experimental or local use with best effort forwarding *be*:
ip allowed-dscp class *o* **max-class** *be*

ip context-name

Configures context to assign the subscriber to upon authentication. The context assigned to is considered the destination context which provides the configuration options for the services the subscriber is allowed to access.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip context-name *name*

no

Removes the current assigned context from the subscriber's data.

name

Specifies the name of the context to assign the subscriber to once authenticated. *name* must be from 1 to 79 alpha and/or numeric characters.

Usage

Set the subscriber IP context to a common context when all subscribers from one or more contexts will use the same egress context.

Example

ip context-name *sampleName*
no ip context-name *sampleName*

ip header-compression

Configures the IP packet header compression options for the current subscriber. Although this command configures IP header compression algorithms, the IPCP negotiations determine when the header compression algorithm is applied.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression { rohc [ any [ mode { optimistic | reliable |
unidirectional } ] | cid-mode { { large | small } [ marked-flows-only |
max-cid | max-hdr value | mrru value ] } | marked flows-only | max-hdr value
| mrru value | downlink | uplink ] | vj }+
[ default | no ] ip header-compression
```

default

Restores this command's default setting to the Van Jacobsen (VJ) header compression algorithm.

no

Disables all IP header compression.

rohc [any [mode { optimistic | reliable | unidirectional }] | cid-mode { { large | small } [marked-flows-only | max-cid | max-hdr *value* | mrru *value*] } } | marked flows-only | max-hdr *value* | mrru *value* | downlink | uplink]

Specifies that the Robust Header Compression (ROHC) algorithms is used for data.

Important: ROHC is only supported for use with the PDSN.

any: Apply ROHC header compression in both the uplink and downlink directions.
mode { optimistic | reliable | unidirectional }:

- **optimistic**: Sets the ROHC mode to Bidirectional Optimistic mode (O-mode). In this mode packets are sent in both directions. A feedback channel is used to send error recovery requests and (optionally) acknowledgments of significant context updates from decompressor to compressor. Periodic refreshes are not used in the Bidirectional Optimistic mode.
- **reliable**: Sets the ROHC mode to Bidirectional Reliable mode (R-mode). This mode applies an intensive usage of a feedback channel and a strict logic at both the compressor and the decompressor that prevents loss of context synchronization between the compressor and the decompressor. Feedback is sent to acknowledge all context updates, including updates of the sequence number field.
- **unidirectional**: Sets the ROHC mode to Unidirectional mode (U-mode). With this mode packets are sent in one direction only, from the compressor to the decompressor. This mode therefore makes ROHC usable over links where a return path from the decompressor to the compressor is unavailable or undesirable.

cid-mode { { large | small } [marked-flows-only | dm | max-hdr *value* **| mrru** *value* **] }**: Specifies the ROHC packet type to be used.

- **large | small [marked-flows-only | max-cid | max-hdr** *value* **| mrru** *value* **]**: Defines the ROHC packet type as large or small and optionally sets the following parameters for the packet type selected:
- **marked-flows-only**: Specifies that ROHC is to be applied only to marked flows.
- **max-cid** *integer*: Default: 0 The highest context ID number to be used by the compressor. *integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.
- **max-hdr** *value*: Specifies the maximum header size to use. Default: 168. *value* must be an Integer from 0 through 65535.
- **mrru** *value*: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an Integer from 0 through 65535.

marked-flows-only: Specifies that ROHC is to be applied only to marked flows.
max-hdr *value*: Specifies the maximum header size to use. Default: 168. *value* must be an Integer from 0 through 65535.
mrru *value*: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an Integer from 0 through 65535.
downlink: Apply the ROHC algorithm only in the downlink direction.
uplink: Apply the ROHC algorithm only in the uplink direction.

Important: When ROHC is enabled for downlink or uplink only the operational mode is Unidirectional.

vj

Specifies that the VJ algorithm is used for header compression.

+

Either one or both of the keywords may be entered in a single command.
If both **vj** and **rohc** are specified, **vj** must be specified first.

Important: If both VJ and ROHC header compression are specified, the optimum header compression algorithm for the type of data being transferred is used for data in the downlink direction.

Usage

Header compression can be used to provide a higher level of security in IP traffic enhance bandwidth usage and lower bit errors.
By default the header compression algorithm is set to **vj**.

Example

The following command disables all IP packet header compression:
no ip header-compression
The following command sets IP header compression to default vj algorithm:
default ip header-compression
The following command also sets the IP header compression to the vj algorithm:
ip header-compression vj

The following command enables the Internet Protocol Control Protocol (IPCP) to determine which protocol is the optimum algorithm for data in the downlink direction and use either VJ or ROHC as needed:

```
ip header-compression vj rohc
```

The following command enables ROHC for the downlink direction only:

```
ip header-compression rohc downlink
```

The following command enables ROHC in any direction using Bidirectional Optimistic mode:

```
ip header-compression rohc any mode Optimistic
```

ip hide-service-address

Hide the IP address of the service from the subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip hide-service-address
```

no

Disable this commands function. This is the default behavior.

Usage

Use this command to prevent subscribers from using traceroute to discover the network addresses that are in the public domain and configured on services. This prevent users from pinging such addresses.

Example

To prevent subscribers from discovering IP addresses, enter the following command:

ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip local-address ip_address
no ip local-address
```

no

Removes a previously configured IP local-address.

ip_address

Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed.

Usage

This parameter specifies the IP address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an "unnumbered" scheme for local-side addresses.

Example

The following command configures a local address of 192.168.1.23 for the MS:

```
local-address 192.168.1.23
```

ip multicast discard

Configures the IP multicast discard packet behavior.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip multicast discard
```

no

Removes a previously configured IP multicast discard.

Usage

This command specifies if IP multicast discard is enabled or disabled.

Example

The following command enables IP multicast discard for an APN:

```
ip multicast discard
```

ip qos-dscp

Configures quality of service options for the current subscriber using the differentiated services code point method. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp option
no ip qos-dscp
```

no

Sets the quality of service option to its default value.

option

Default: be
Specifies the subscriber's per hop quality of service setting as one of:

- af11 (assured Forwarding 11)
- af12 (assured Forwarding 12)
- af13 (assured Forwarding 13)
- af21 (assured Forwarding 21)
- af22 (assured Forwarding 22)
- af23 (assured Forwarding 23)
- af31 (assured Forwarding 31)
- af32 (assured Forwarding 32)
- af33 (assured Forwarding 33)
- af41 (assured Forwarding 41)
- af42 (assured Forwarding 42)
- af43 (assured Forwarding 43)
- be (best effort forwarding)
- ef (expedited forwarding)

Usage

Set the quality of service for a subscriber based upon the service level agreements.

Example

```
ip qos-dscp ef
no ip qos-dscp
```

ip route

Configures the static route to use to reach the subscriber's network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip route *ip_address ip_mask* [*gateway_address*]

---

no

Removes the configured route information from the subscriber data.

---

ip_address

Specifies the target IP address for which the route information applies.

---

ip_mask

Specifies the networking mask for the route.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask were specified as 172.168.10.0 and 255.255.255.224, respectively, the network mask will be 172.168.0.0 (obtained by logically ANDing the IP address with the IP mask).

---

gateway_address

Default: assigned remote IP address will be used as the gateway address.
Specifies the IP address of the next hop gateway for the route.

Usage

The static routes are also known as framed IP routes for subscribers. Static routes are typically applicable for subscribers connecting via other networks or when the mobile device acts as a gateway to a network on the far side of the device.
For example, if the mobile device is assigned IP address 1.2.3.4 and it acts as a gateway for the network 10.2.3.0 (with a network mask of 255.255.255.0) a static route would be configured with the *ip_address* being 10.2.3.0, *ip_mask* being 255.255.255.0, and *gateway_address* being 1.2.3.4.

Example

no ip route *1.2.3.4 1.2.0.0*
no ip route *1.2.3.4 1.2.0.0 1.2.255.254*

ip source-validation

Enables/disables packet source validation for the current subscriber. Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

If an incorrect source address is received from the mobile node, the system attempts to renegotiate the PPP session. The parameters for IPsource validation can be set by the **ip source-violation** command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip source-validation
```

no

Disables source validation.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Example

The following command enables IP source validation:

```
ip source-validation
```

The following command disables IP source validation:

```
no ip source-validation
```

ip user-datagram-tos copy

This CLI controls copying of IP TOS octet value from IPv4/IPv6 datagrams to the IP header in tunnel encapsulation. This is disabled by default.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
ip user-datagram-tos copy [access-link-tunnel | both | data-tunnel]
no ip user-datagram-tos copy
```

no

Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

access-link-tunnel

Copy the IP TOS octet value to the tunnel encapsulation IP header on the access side (RP) tunnel.

both

Use both access-link-tunnel and data-tunnel.

data-tunnel

Copy the IP TOS octet value to the tunnel encapsulation IP header on the MIP data tunnel or L3 tunnel (IP-in-IP, GRE).

Usage

Use this command to enable the copying of the IP TOS octet value to the tunnel encapsulation IP header. This functionality will enable PCF to detect special TOS marking in the outer IP header of A11 packets and to identify certain packets as QChat control messages. The BSC/PCF must give higher priority to QChat control messages.

Example

Enable copying of the IP TOS octet value to the tunnel encapsulation IP header for the access side tunnel by entering the following command;

```
ip user-datagram-tos copy access-link-tunnel
```

Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers by entering the following command;

```
no ip user-datagram-tos copy
```

ip vlan

Configures subscriber-to-Virtual LAN (VLAN) associations.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
ip vlan vlan-id
[ default | no ] ip vlan
```

default

Resets the vlan ID to the default setting.

no

Disables the vlan ID for the subscriber.

vlan-id

Is the vlan ID that is associated with the IP address for that session. *vlan-id* is an integer between 1 and 4094.

Usage

This command configures the subscriber vlan ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a vlan ID, then this subscriber configured vlan ID overrides it.
Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example

Set the vlan ID to the default setting by entering the following command;

```
default ip vlan
```

ipv6 access-group

Configures the IPv6 access group for a subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 access-group *name* **[in | out]**

in

Defines the access group as inbound.

out

Defines the access group as outbound.

Usage

Used to create an access group for a subscriber.

Example

The following command provides an example of an IPv6 access group with the name *list_1*:

ipv6 access-group *list_1*

ipv6 address

Configures a static IP address for use by the subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 address { prefix *address* **| prefix-pool** *name* **}**

no

Deletes a previously configured ipv6 address.

prefix

Specifies a static IPv6 address.

prefix-pool

Specifies an IPv6 prefix pool name.

Usage

Use this command to assign a static IPv6 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example

The following command configures a static IP address of 1:1:1:1:1:1:1:1 with a length of 24 to the subscriber:
ipv6 address *1:1:1:1:1:1:1:1/24*

ipv6 dns

Configures the IPv6 Domain Name Service (DNS) servers.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ipv6 dns { primary | secondary } {` *`ipv6_dns_address`* **`}`**

`no`

Deletes a previously configured DNS server.

`primary`

Configures the primary DNS server for the subscriber.

`secondary`

Configures the secondary DNS server for the subscriber. Only one secondary DNS server can be configured.

`ipv6_dns_address`

Configures the IP address of the DNS server.

Usage

DNS servers are configured on a per subscriber basis. This allows each subscriber to use specific servers.

Example

The following command provides an example of setting the primary IPv6 DNS server:

`ipv6 dns primary` *`1:1:1:1:1:1:1:1`*

ipv6 dns-proxy

Configures the domain name server proxy for the current subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ipv6 dns-proxy
```

default

Disables the IPv6 DNs proxy functionality for a subscriber.

no

Removes the pre-enabled functionality of IPv6 DNS proxy for subscriber.

dns-proxy

Enables IPv6 DNS proxy functionality for a subscriber. If the functionality enabled, PDSN will act as a proxy DNS server.
Default: disabled.

Usage

Used to enable/disable IPv6 DNS proxy for the subscriber. When enabled, the PDSN acts as a proxy DNS server for DNS IPv6 queries coming from the mobile station to the PDSN's local PPP link address.

Example

The following command provides an example of disabling an IPv6 DNS proxy for the subscriber:

```
no ipv6 dns-proxy
```

ipv6 egress-address-filtering

Configures the egress address filtering for the subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 egress-address-filtering
```

no

Disables IPv6 egress address filtering.

ipv6 egress-address-filtering

Enables IPv6 egress address filtering.

Usage

Used to filter packets that arrive from the internet to a particular site.

Example

The following command provides an example disabling egress address filtering:

```
no ipv6 egress-address-filtering
```

ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
ipv6 initial-router-advt { interval value | num-advts value }
default ipv6 initial-router-advt { interval | num-advts }
```

default

Resets interval or num-advts to their default setting.

interval value

Default: 3000ms
The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.
value is an integer between 100 and 16000 milliseconds.

num-advts value

Default: 3
The number of initial IPv6 router advertisements sent to the mobile node.
value is an integer between 1 to 16.

Usage

This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

Example

The following command specifies the initial ipv6 router interval to be 2000ms:
ipv6 initial-router-advt interval *2000*

ipv6 interface-id

Provides an IPv6 interface ID for the subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 interface-id *ifid*
[default | no] ipv6 interface-id

default

No interface id set for IPv6CP negotiation to subscriber.

no

Deletes a previously configured ipv6 interface id.

interface-id *ifid*

It is a interface ID assigned to the Mobile during IPv6CP negotiation.
ifid is a 64 bit unsigned integer.

Usage

Used to provide a IPv6 ifid for the subscriber when using 6to4 routing.

Example

The following command provides an example of assigning an IPv6 interface ID of *00-00-00-05-47-00-37-44* to the subscriber:
ipv6 interface-id *00-00-00-05-47-00-37-44*

ipv6 minimum-link-mtu

Configures the IPv6 minimum-link-MTU value.

Product

PDSN, GGSN, ASN GW

Privilege

.Security Administrator, Administrator

Syntax

ipv6 minimum-link-mtu *value*
default ipv6 minimum-link-mtu

default

Resets minimum lint MTU to their default setting.
Default : 1280

value

Default: 1280
value is an integer between 100 and 2000 MTUs.

Usage

Used to override the IPv6 minimum link MTU values recommended by the standard.

Example

The following command provides an example of assigning an IPv6 minimum link MTU to *1580* to the subscriber:
ipv6 minimum-link-mtu *1580*

ipv6 secondary-address

Configures additional IPv6 4-bit prefixes to the subscriber session.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 secondary-address { prefix *ipv6_address_prefix* **| prefix-pool** *pool_name* **}**

no

Deletes a previously configured ipv6 secondary address.

ipv6_address_prefix

The IPv6 secondary address and must be specified using colon notation.

pool_name

The name given to the secondary address prefix pool (a string size from 1 to 31 characters).

Usage

An IPv6 prefix pool name may be configured for a dynamic prefix, while the prefix is static. This command may be executed multiple times to configure multiple prefixes.

Example

The following command provides an example of assigning an IPv6 secondary address prefix-pool name of *eastcoast* to the subscriber:

ipv6 secondary-address prefix-pool *eastcoast*

l2tp send accounting-correlation-info

This command enables the L2TP LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS.

Product

PDSN, LNS, LAC

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] l2tp send accounting-correlation-info
```

no

Disbales the command and sets the setting to default mode for this subscriber.

default

Sets the setting to default mode of disbale.

Usage

Use this command to enable the L2TP LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS for this subscriber. LNS can be configured to include this information in ECS billing records, so that billing servers can easily correlate accounting records from PDSN/LAC and LNS.
By default, this mode is disbled.

Example

Following command disbales the inclusion of accounting correlation informaiton in control messages during session setup to LNS for a subsciber:

```
default l2tp send accounting-correlation-info
```

l3-to-l2-tunnel address-policy

Configure the subscriber address allocation/validation policy, when subscriber L3 (IPV4) sessions are tunneled using an L2 tunneling protocol (e.g. L2TP).

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate
}

default l3-to-l2-tunnel address-policy
```

default

Restores the default value for l3-tol2-tunnel address-policy.

alloc-only

Only allocate an address in the case of dynamic address assignment. Do not validate static addresses.

alloc-validate

Locally allocate and validate subscriber addresses.

no-alloc-validate

Do not allocate or validate subscriber addresses locally in the system for the current subscribers sessions. Pass the address between the remote tunnel terminator and the Mobile Node. This is the default behavior.

Usage

Use this command to configure the L3 to L2 tunnel address policy for MIP HA sessions tunneled from the system using L2TP tunnels or for GGSN IP Context sessions tunneled using L2TP to a remote LNS. Also refer to the *resource* keyword of the context configuration mode **ip pool** command.

Example

To set the L3 to L2 tunnel address policy so that the current subscriber must have IP addresses allocated and validated locally on the system, enter the following command:

```
l3-to-l2-tunnel address-policy alloc-validate
```

loadbalance-tunnel-peers

Configures the load balancing of traffic bound for L2TP tunnels configured on the system for the selected subscriber.

Product

L2TP

Privilege

Security Administrator, Administrator

Syntax

loadbalance-tunnel-peers { **balanced** | **prioritized** | **random** }

balanced

Enables the equal use of all configured tunnel peers (LNSs) for the selected subscriber.

prioritized

Enables the use of all configured tunnel peers (LNSs) for the selected subscriber based on the preference number assigned to the peer address.

random

Default: Enabled
Enables the random use of all configured tunnel peers (LNSs) for the selected subscriber.

Usage

Use to manage traffic loads on LAC ports and their respective L2TP Network Servers.

Example

Use the following command to randomly use all configured tunnel peers (LNSs):
loadbalance-tunnel peers random

long-duration-action

This command specifies what action is taken when the long duration timer expires.

Product

All

Privilege

Administrator

Syntax

```
long-duration-action { detection | disconnection [ dormant-only ] [ suppress-notification ] }
```

detection

Default: Enabled
Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior. Use this command to detect a session exceeding the limit set by the long duration timer.

disconnection [dormant-only] [suppress-notification]

Default: Disabled
Detects a long duration session and disconnects the session after sending SNMP TRAP and CORBA notification.
suppress-notifiaction: Suppress the SNMP TRAP and CORBA notification after detecting and disconnecting a long duration session. Default: Disabled
dormant only: Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. If the long duration timeout is fired and the call is not dormant, the call is disconnected when the call later moves to dormancy.

Important: For HA calls, the inactivity-time is considered as gauge for dormancy.

It sends the SNMP TRAP and CORBA notification after disconnecting a long duration session. Default: Disabled

Usage

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.

Example

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP TRAP and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that is in dormant and exceed the long duration timer and send SNMP TRAP and CORBA notification:

```
long-duration-action disconnection dormant-only
```

Note that in case of HA calls, the inactivity-time is considered as gauge for dormancy.

mobile-ip

Enables/disables the subscriber for mobile IP services and access.

Product

HA, FA

Privilege

Security Administrator, Administrator

Syntax

```
[no] mobile-ip { allow-aaa-address-assignment | dns-address source-priority {
aaa | home-agent } | gratuitous-arp aggressive | home-agentip_address[alternate]
| match-aaa-assigned-address | mn-aaa-removal-indication | mn-ha-hash-algorithm
{ hmac-md5 | md5 | rfc2002-md5 } | mn-ha-shared-keykey | mn-ha-spispi_num |
reverse-tunnel | security-level { ipsec | none } | send { accounting-
correlation-info | dns-address | imsi | terminal-verification } }
```

no

Disables the mobile IP option specified.

allow-aaa-address-assignment

Default: Disabled.
Enables the FA to accept a home address assigned by an AAA server. This should only be configured on the FA side.

dns-address source-priority { aaa | home-agent }

Sets the priority behavior on the FA to use either the DNS IP address information from the HA or the AAA server to include in the the RRP to the MN.
When the **no** keyword is used in conjunction with the **dns-address** keyword, information received from both the home-agent and the AAA server is sent if available.
DNS IP address information from the HA comes from the DNS NVSE in the RRP.
DNS IP address information from the AAA server is in the access accept message.
home-agent: If the DNS address is received from the home-agent only that information is sent to the MN. Otherwise the DNS address received from the AAA server is sent.
aaa: If the DNS address is received from the AAA server only that information is sent to MN. Otherwise the DNS address received from the home-agent issent.

gratuitous-arp aggressive

Default: Disabled.
When enabled, this mode will cause the HA to send out gratuitous ARP messages for all Mobile IP (MIP) registration renewals and handoffs.
To disable this mode, use the **no** form of this command.

Important: This mode will only work for IP addresses that have been assigned from a static IP address pool.

home-agent *ip_address* **[alternate]**

Specifies the IP address of the mobile IP user's home agent. *ip_address* must be a an IPv4/IPv6 address.
alternate - Specifies the secondary, or alternate, Home Agent to use when Proxy Mobile IP HA Failover is enabled.

match-aaa-assigned-address

Default: Disabled.
Enables the FA to validate the home address in the RRQ against the one assigned by AAA server. This should only be configured on the FA side.

mn-aaa-removal-indication

Default: Disabled.
When enabled, the MN-FA challenge and MN-AAA Authentication extensions are removed when relaying a Registration Request (RRQ) to the Home Agent (HA)

mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Speechifies the encryption algorithm to use.
Default: **hmac-md5**
hmac-md5: Use HMAC-MD5 hash algorithm, as defined in RFC-2002bis. This is the default algorithm.
md5: Use the MD-5 hash algorithm.
rfc2002-md5: Use the MD-5 hash algorithm variant as defined in RFC-2002.

mn-ha-shared-key *key*

This is the used to verify the MN-HA Authentication for a local subscriber in the current context. A string or a Hexadecimal number beginning with "0x" up to 127 bytes

mn-ha-spi *spi_num*

Specifies the SPI number. *spi_num* must be an integer from 256 through 4294967295.

reverse-tunnel

Default: enabled.
Enables the mobile IP user's for reverse IP tunnels. The **no** keyword is used to disable this option.

security-level { ipsec | none }

Default: none
The security-level option configures the security level needed for the subscriber's traffic.
ipsec: both MIP control and data traffic are secured with IPSEC
none: none of the traffic is secured

Important: This keyword corresponds to the 3GPP2-Security-Level RADIUS attribute. This attribute indicates the type of security that the home network mandates on the visited network.

Important: For this attribute, integer value: 3 : Enables IPSec for tunnels and registration messages 4 : Disables IPSec

send { accounting-correlation-info | dns-address | imsi | terminal-verification }

accounting-correlation-info: Configures whether the FA sends the correlation info to the NVSE in the RRQ. Default is disabled.
dns-address: Enables the HA to send the DNS address NVSE in the RRP. Default is disabled. This should only be enabled on the HA side.
imsi: Configures sending the IMSI NVSE in the RRQ. Default is sending IMSI in custom-1 format.
terminal-verification: Enables the FA to send the terminal verification NVSE in the RRQ. Default is disabled. This should only be enabled on the FA side.

Important: send dns-address is a proprietary feature developed for a specific purpose and requires the MN to be able to renegotiate IPCP for DNS addresses and reregister MIP if necessary. Since this feature needs the MN to support certain PPP/MIP behavior, and not all MNs may support that particular behavior, send dns-address**s** should be enabled only after careful consideration.

Usage

Use as subscriber service contracts change.

Example

```
mobile-ip home-agent 1.2.3.4
no mobile-ip reverse-tunnel
```

mobile-ip ha

Accommodates two MIP HA options in subscriber mode.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

[no] mobile-ip ha { assignment-table*name* **| ignore-unknown-ha-addr-error }**

no

Disables the mobile IP HA option specified.

assignment-table *name*

The name of an existing MIP HA Assignment table.
name must be a string of alphanumeric characters from 1 through 63 characters in length.

ignore-unknown-ha-addr-error

Default is disabled.
Enables or disables the HA to accept or reject the RRQ from a particular subscriber.

Usage

Use this command to assign a MIP HA Assignment table to the current subscriber.
Use this command to disable or enable the HA to accept or reject the RRQ from a particular subscriber when the HA address in the incoming MIP RRQ is not the same as the HA service address. The feature is off by default which causes the RRQ to be rejected with the error code UNKNOWN_HOME_AGENT.

Example

The following command assigns the MIP HA Assignment table named *Atable1* to the current subscriber:
mobile-ip ha assignment-table *Atable1*
The following command sets ignore-unknown-ha-addr-error to its default disabled state:
no mobile-ip ha ignore-unknown-ha-addr-error.

mobile-ip reg-lifetime-override

This command overrides the mobile IP registration lifetime from HA with value configured for subscriber.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip reg-lifetime-override [*dur***| infinite]**

[default | no] mobile-ip reg-lifetime-override

dur

Default: 100 secs.
This the configurable value in seconds.
dur must be an integer from 1 through 65534.

infinite

Sets the mobile IP registration lifetime override value to infinite for a particular subscriber.

default

Sets the value of mobile IP registration lifetime override option to 100 seconds.

no

Disables the mobile IP registration lifetime override option specified.

Usage

Use this command to configure MIP registration-lifetime per realm/domain. This value overrides the default lifetime configured under HA service.

Example

The following command overrides the mobile IP registration lifetime value from HA service and assigns the MIP registration lifetime to 100 seconds for the current subscriber:

default mobile-ip reg-lifetime-override

mobile-ip send accounting-correlation-info

Enables the sending call correlation information NVSE's to the HA in MIP RRQ.

Product

PDSN, HA, ECS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ip send accounting-correlation-info
```

default

Disables the support for sending call correlation information NCSE's to the HA in MIP RRQ. This is the default mode.

no

Removes the configured support for sending call correlation information.

Usage

Use this command to support PDSN-Correlation-ID VSE and send the call correlation information.

Example

The following command enables sending call correlation information NVSE's to the HA in MIP RRQ

```
mobile-ip send accounting-correlation-info
```

mobile-ipv6

Configures Mobile IPv6 related parameters for a subscriber.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[default | no] mobile-ipv6 { home-address *ipv6_address* **| home-agent** *ipv6_address* **| home-link-prefix** *ipv6_address* **| tunnel mtu** *value* **}**

default

Disables the support for sending call correlation information NCSE's to the HA in MIP RRQ. This is the default mode.

no

Removes the configured support for sending call correlation information.

home-address *ipv6_address*

Specifies the home address for the subscriber. *ipv6_address* must be a an IPv6 address in colon notation.

home-agent *ipv6_address*

Specifies the IPv6 address of the mobile IP user's home agent. *ipv6_address* must be a an IPv6 address in colon notation.

home-link-prefix *ipv6_address*

Specifies the IPv6 address of the mobile IP user's home link. *ipv6_address* must be a an IPv6 address in colon notation.

tunnel mtu *value*

Configures the tunnel MTU for the IPv6 tunnel between the HA and the mobile node. *value* must be an integer between 1024 and 2000. The default is 1500.

Usage

This command sets the mobile-ipv6 parameters for a subscriber. Use this command to set the home-address, home-agent, and home-link prefix

Example

Use the following command to set the tunnel value to 1800:
mobile-ipv6 tunnel mtu 1800

nai-construction-domain

After authentication, the domain name set by this command replaces the NAI constructed domain for subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

nai-construction-domain *domain_name*
no nai-construction-domain

domain_name

Defines the domain name to use to replace the NAI constructed domain name. This must be a string of 1 to 79 characters.

no

Deletes the defined domain name.

Usage

Define or delete a domain name to use to replace the NAI constructed domain name after authentication.

Example

To set the domain name to *private1* use the following command:

```
nai-construction-domain private1
```

To delete the previously configured domain name, use the following command:

```
no nai-construction-domain
```

nbns

Configures and Enables use of NetBios Name Service for the subscriber.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
nbns { primary IPv4-address | secondary IPv4-address }
no nbns { primary [ IPv4-address ] | secondary [ IPv4-address ] }
```

primary

Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

secondary

Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

IPv4-address

Specifies the IPv4 address used for this service.

no

Removes/disables use of a previously configured NetBios Name Service.

Usage

This command specifies NBNS parameters. The NBNS option is present for both pdp type IP and pdp type PPP for GGSN.
The system can be configured to use of NetBios Name Service for the APN.

Example

The following command configures the subscriber's NetBios Name Service to primary IP *192.168.1.15*:
nbns primary *192.168.1.15*

nexthop-forwarding-address

Configures the next hop forwarding address for the subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ip_address*
no nexthop-forwarding-address

ip_address

Configures the IP address of the nexthop forwarding address.

no

Disables this function. This is the default setting.

Usage

Use this command to configure the next hop forwarding address for the subscriber.

Example

The following command configures the next hop forwarding address to *1.1.1.1*using IPv4:

```
nexthop-forwarding-address 1.1.1.1
```

npu qos

Configures an NPU QoS priority queue for packets from the subscriber.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp
| gold | silver }
```

best-effort

Assigns the best-effort queue priority. This is the lowest priority.

bronze

Assigns the bronze queue priority. This is the third-highest priority.

derive-from-packet-dscp

Default: Enabled
Specifies that the priority is to be determined from the DS field in the packet's TOS octet.

gold

Assigns the gold queue priority. This is the highest priority.

silver

Assigns the silver queue priority. This is the second-highest priority.

Usage

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of thesubscriber, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).
Refer to the System Administration and Configuration Guide for additional information on NPU QoS functionality.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures the subscriber's priority queue to be gold:

```
npu qos traffic priority gold
```

nw-reachability-server

Bind the name of a configured network reachability server to the current subscriber and enable network reachability detection.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

nw-reachability server *server_name*
no nw-reachability server

server_name

The name of a network reachability server that has been defined in the current context. This is a string of from 1 through 16 characters.

no nw-reachability server

Delete the name of the network reachability server from the current subscribers configuration and disable network reachability failure detection for the current subscriber.

Usage

Use this command to define the network reachability server for the current subscriber and enable network reachability failure detection for the current subscriber. If a network reachability server is defined in an IP pool, that setting takes precedence over this command.

Important: Refer to the HA configuration mode command **policy nw-reachability-fail** to configure the action that should be taken when network reachability fails.

Important: Refer to the context configuration mode command **nw-reachability server** to configure network reachability servers.

Important: Refer to the *nw-reachability server server_name* keyword of the **ip pool** command in the context configuration mode chapter to bind the network reachability server to an IP pool.

Example

To bind a network reachability server named *InternetDevice* to the current subscriber, enter the following command:
nw-reachability server *InternetDevice*

outbound

Configures the subscriber host password for use in authentication of PPP sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

outbound [**encrypted**] **password** *pwd*
no outbound password

[encrypted] password *pwd*

Specifies the password to use for point-to-point protocol session host authentication. The **encrypted** keyword indicates the password specified uses encryption.
The password specified as *pwd* must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

---

no outbound password

Used to clear the outbound password configuration from the subscriber data.

Usage

Set the outbound (egress) password for increased security.

Example

```
outbound password secretPwdoutbound encrypted password scrambledPwdno outbound
password
```

overload-disconnect

Sets the threshold parameter for overload disconnect.

Product

ASN GW, HA,PDIF, PDSN,PHS GWPDG/TTG

Privilege

Security Administrator, Administrator

Syntax

overload-disconnect [threshold { inactivity-time *inactivity_time_threshold* **|**
connect-time *connect_time_threshold* **}]**

```
[ default | no ] overload-disconnect [threshold { inactivity-time | threshhold
connect-time } ]
```

threshold inactivity-time *inactivity_time_threshold*

Sets the inactivity time threshold in seconds. This value must be from 0 to 4294967295. The default value of zero disables this feature. If *inactivity-time* for the subscriber's session is greater than *inactivity_time_threshold*, the session becomes a candidate for disconnection.

threshold connect-time *connect_time_threshold*

Sets the connection time threshold in seconds. This value must be from 0 to 4294967295. A value of zero disables this feature. If connect-time for the subscriber's session is greater than *connect_time_threshold*, the session becomes a candidate for disconnection.

default

This command enables the default condition for this subscriber.

no

Disables the overload disconnect feature for this subscriber. This is the default condition for PDIF.

Usage

Set a subscriber's overload disconnect threshold in seconds, based on either inactivity or connection time. When this threshold is exceeded during a session, the subscriber's session becomes a candidate for disconnection. To set overload-disconnect policies for the entire chassis, see **congestion-control overload-disconnect** in Global Configuration Mode Commands.

Example

```
overload-disconnect threshold inactivity-time inactivity_time_thresholddefault
overload disconnect threshold connect-timeno overload-disconnect threshold
connect-timeno overload disconnect
```

password

Configures the subscribers password for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[encrypted] password*pwd*

no password

encrypted

Indicates the password provided is encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pwd

Specifies the users password for authentication. *pwd* must be from 1 to 63 alpha and/or numeric characters or from 1 to 127 characters if the **encrypted** keyword was specified. A “null” password is allowed and is entered as consecutive quotes (""). See Example(s) for correct syntax.

Important: Subscribers configured with a null password will be authenticated using PAP and CHAP (MD5) only. Subscribers configured without a password (**no password**) will only be able to access services if the service is configured to allow no authentication.

no

Used to clear the subscriber password configuration from the subscriber data.

Important: Subscribers with no password will only be able to access services if the service is configured to allow no authentication.

Usage

Password management is critical to system security and all precautions should be taken to ensure passwords are not shared or to easily deciphered.

Example

```
password secretPwdpassword ""no password
```

pdif mobile-ip

Configures PDIF subscriber call setup parameters.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] pdif mobile-ip { release-tia | required | simple-ip-fallback }
```

`[ default | no ]`

Disables the option specified.

`release-tia`

Specifies that after subscriber call setup is complete, the tunnel inner address (TIA) is released. If SImple IP is enabled, the TIA becomes the principal communications tunnel and the restriction that it is only to be used to set up a Mobile-IP call is lifted. This parameter is disabled by default.

`required`

Specifies that Mobile IP is required for this subscriber whenever a call is set up. This parameter is disabled by default.

`simple-ip-fallback`

Specifies that Simple IP should be used when Mobile IP could not be established. This parameter is disabled by default.

Usage

Use this command to configure specific behavior for the PDIF subscriber during call setup.

Example

The following command enables the system to fall back to Simple IP when Mobile IP fails for this subscriber during call setup:

```
pdif mobile-ip simple-ip-fallback
```

permission

Enables/disables the ability to access wireless data services for the current subscriber.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

[no] permission { ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip }

no

Disables the usage of the specified service.

ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip

ha-mobile-ip: enable/disable the home agent support for mobile IP service.
pdsn-mobile-ip: enable/disable the packet data and foreign agent support for mobile IP service.
pdsn-simple-ip: enable/disable the packet data support for simple IP service.

Usage

This is necessary per the services the subscriber is allowed to access in the current context.

Example

```
permission pdsn-mobile-ipno permission ha-mobile-ip
```

policy ipv6 tunnel

Tunnel MTU for IPv6 Tunnel between HA and Mobile Node.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
policy ipv6 tunnel mtu exceed { fragment | notify-sender }
```

mtu exceed {fragment | notify-sender }

fragment: Adjust Tunnel MTU and Fragment Packets
notfiy-sender: Send a ICMPv6 Packet Too Big the original sender

Usage

Use this command to configure Tunnel MTU for IPv6 Tunnel between HA and Mobile Node.

Example

policy ipv6 tunnel mtu exceed fragment

policy-group

This command assigns/removes a flow-based traffic policy group to a subscriber.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-group *policy_group_name* **direction { in | out }**

no

Removes assigned policy group from a subscriber configuration.

policy_group_name

Specifies the traffic policy group name for a subscriber session flow pre-configured within a destination context .
policy_group_name consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

direction { in | out }

Specifies the direction of flow in which the traffic policies need to be applied.

- **in**: specifies the incoming traffic
- **out**: specifies the outgoing traffic

Usage

Use this command to assign traffic policy group to a subscriber for traffic policing.

Example

```
policy-group traffic_policy_group1 direction in
```

ppp

Configures the point-to-point protocol options for the current subscriber.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ppp { accept-peer-ipv6-ifid| always-on-vse-packet | data-compression { mode { normal | stateless } | protocols {*protocols*[*protocols*] } | ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } } | ipv4 { disable | enable | passive } | ipv6 { disable | enable | passive } | keepalive*seconds*| min-compression-size*min_octets*| mtu*max_octets*| remote-renegotiation disconnect { always | nai-prefix-msid-mismatch } }

default ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation [vj compress-slot-id] | ipv4 | ipv6 | keepalive | min-compression-size | mtu | remote-renegotiation disconnect }

no ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression protocols | ipv4 | ipv6 | keepalive | mtu | remote-renegotiation disconnect }

default

Restores the default value for the option specified.

no

Resets the option specified to its default.

always-on-vse-packet

Default: Enabled
If the always-on feature is enabled for a session, this keyword enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value. This configuration is applicable only for PDSNsessions.

accept-ipv6-peer-ifield

Default: None
This is used to configure a 6to4 tunnel. It controls the behavior of IPv6CP negotiation for Interface ID.
If enabled, PDSN will accept a valid interface-id proposed by the peer.

data-compression { mode { normal | stateless } | protocols { *protocols* [*protocols*] }

Default: all protocols enabled.
Specifies the subscribers mode of data compression or the compression protocol to use.
mode: sets the mode of compression where *modes* must be one of:

- normal (packets are compressed using the packet history for automatic adjustment for best compression)
- stateless (each packet compressed individually)

protocols *protocols*: sets the compression protocol where *protocols* must be one of:
- deflate (DEFLATE algorithm)
- mppc (Microsoft PPP algorithm)
- stac (STAC algorithm)

---

ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } }

Default: **force**
PPP IP compression Van Jacobson (VJ) negotiation scheme. This command is applicable only if IP header compression is enabled for the subscriber.
detect: The local side does not include the VJ Compression option in its IPCP configuration request unless the peer sends an IPCP NAK including a VJ compression option. If the peer requests the VJ compression option in its IPCP request the local side will ACK/NAK.
force: The IP header compression negotiation in IPCP happens normally. The local side requests the VJ compression option in its IPCP configure request. If the peer side requests VJ compression in its IPCP request, the local side will ACK/NAK the option.
vj compress-slot-id [both | none | receive | transmit]: This keyword configures the direction in which VJ slotid compression should be negotiated.
- **both** - If the client proposes VJ slotid compression, accept it and propose slotid compression for downlink and uplink.
- **none** - If the client proposes VJ slotid compression, NAK the offer,do not propose slotid compression for downlink.
- **receive** - (Default) If the client proposes VJ slotid compression in the uplink direction accept the configuration.
- **transmit** - Propose VJ slotid compression for uplink.

---

ipv4 { disable | enable | passive }

Default: enable
Controls IPCP negotiation during PPP negotiation.
disable: The PDSN does not negotiate IPCP with the mobile.
enable: The PDSN negotiates IPCP with the mobile.
passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

---

ipv6 { disable | enable | passive }

Default: enable
Controls IPv6CP negotiation during PPP negotiation.
disable: The PDSN does not negotiate IPCP with the mobile.
enable: The PDSN negotiates IPCP with the mobile.
passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

---

keepalive *seconds*

Default: 30
Specifies the frequency of sending the Link Control Protocol keep alive messages. *seconds* must be either 0 or in the range from 5 to 14400.

The special value 0 disables the keep alive messages entirely.

min-compression-size *min_octets*

Default: 128
Specifies the smallest packet to which compression may be applied. *min_octets* must be a value in the range from 0 to 2000.

mtu *max_octets*

Default: 1500
Specifies the maximum size in octets the message transfer unit packets can reach. *max_octets* must be a value in the range from 100 to 2000.

remote-renegotiation disconnect { always | nai-prefix-msid-mismatch }

Default: Disabled
Terminates the already established PPP sessions if they are renegotiated by the remote side by sending LCP Conf-req/nak/ack. The following termination conditions are available:

- **always**: The session is automatically disconnected.
- **nai-prefix-msid-mismatch**: The session is disconnected only if the MSID of the session does not match NAI-Prefix (prefix before "@" for the NAI). The configuration of the renegotiated (new) NAI is used for the matching process.

Usage

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

Example

```
ppp data-compression protocols mode statelessppp mtu 500no ppp data-compression
protocolsno ppp keepalive
```

prepaid 3gpp2

Enables 3GPP2 compliant prepaid billing support for a subscriber to be configured by 3GPP2 attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored.

Product

HA, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
prepaid3gpp2 { accounting [ no-final-access-request ] | duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time } | preference { duration | volume } }

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

noprepaid3gpp2accounting
```

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

Sets the 3GPP2 Pre-paid settings to the default values.
duration-quota final-duration-algorithm: Reset the end of billing duration quota algorithm to the default of current-time.
preference: Reset the preference to duration, If both duration and volume attributes are present.

no prepaid 3gpp2 accounting

Disables 3GPP2 prepaid accounting. All 3GPP2 Prepaid attributes received from a RADIUS server are ignored.

accounting [no-final-access-request]

Default: Disabled
Enabled 3GPP2 prepaid accounting behavior.
Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 to 99.
no-final-access-request: Stops sending final online access-request on termination of 3GPP2 prepaid sessions. By default, this option is disabled.

duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }

Define what behavior specifies the end of the billing duration for duration-based quota usage accounting. The default behavior is the duration quota algorithm set to current-time.
Default: current-time
current-time: Selects the duration quota as the difference between the session termination timestamp and the session setup timestamp.
last-airlink-activity-time: Selects the duration quota as the difference between the last-user-activity timestamp (G17) and the session setup timestamp.

last-user-layer3-activity-time: Selects the duration quota as the difference between the timestamp of the last layer-3 packet sent to or received from the user and the session setup timestamp.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables 3GPP2 prepaid support for the default user:
prepaid 3gpp2 accounting

prepaid custom

Enables custom prepaid billing support for a subscriber to be configured by attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored. The keywords are to set prepaid values that are used if the corresponding RADIUS attribute is not present. If the RADIUS attribute is present it takes precedence over these values.

Product

HA, PDSN

Privilege

Security Administrator, Administrator

Syntax

prepaidcustom { accounting | byte-count compressed | low-watermarkpercent*percentage* **| renewalinterval***seconds* **} | preference { duration | volume }**

defaultprepaidcustom { byte-count | low-watermark }

noprepaidcustom { accounting | byte-count compressed | low-watermark | renewal }

---

default prepaid custom { byte-count | low-watermark }

Resets custom prepaid settings to the default values.
byte-count: Reset to the default of basing the prepaid byte credits on the flow of uncompressed traffic.
low-watermark: Disable sending an access request to retrieve more credits when a low watermark is reached.

---

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal}

byte-count compressed: The prepaid byte credits are based on the flow of uncompressed traffic. This is the default.
low-watermark: Disables the low watermark feature. An access-request isn't sent to the RADIUS server until the credits granted for the subscriber session are depleted.
renewal: Disables time-based renewals for prepaid accounting.

---

accounting

Default: Disabled
Enabled custom prepaid accounting behavior.

---

byte-count compressed

Default: uncompressed.
When compression is used, the prepaid byte credits are based on the flow of compressed traffic. The default is to base the prepaid byte credits on the flow of uncompressed traffic.

---

low-watermark percent *percentage*

Default: Disabled.

Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 to 99.

renewal interval *seconds*

Default:
The time in seconds to wait before sending a new RADIUS access-request to the RADIUS server to retrieve more credits. *seconds* must be an integer from 60 through 65535.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables custom prepaid support for the default user:

```
prepaid custom accounting
```

prepaid unclassify

This command provides customer specific functionality.

prepaid voice-push

This command provides customer specific functionality.

prepaid wimax

Enables WiMAX prepaid accounting for this subscriber. This feature is disabled by default.

Product

ASN GW

Privilege

Administrator

Syntax

```
[ no ] prepaid wimax accounting
```

no

Disables WiMAX prepaid accounting for this subscriber.

Usage

Use this command to enable WiMAX prepaid accounting for this subscriber.

proxy-dns intercept list-name

Identifies a proxy DNS intercept rules list for the selected subscriber.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] proxy-dns intercept list-name` *`name`*

`no`

Remove the intercept list from the subscribers profile.

`proxy-dns intercept list-name` *`name`*

Specifies a name of a proxy DNS intercept list used for the selected subscriber.
`name` is the name of the intercept list and must be a string from 1 to 63 characters in length.

Usage

Use this command to identify a proxy DNS rules list for the selected subscriber. For a more detailed explanation of the HA Proxy DNS Intercept feature, see the **`proxy-dns intercept-list`** command in the *Context Configuration Mode Commands* chapter.

proxy-mip

Configures support for Proxy Mobile IP for the subscriber.

Product

PDSN, GGSN, ASN GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] proxy-mip required
```

no

Disables support for Proxy Mobile IP.

required

Enables support for Proxy Mobile IP.

Usage

When enabled through the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP. For subscriber sessions using Proxy Mobile IP, R-P and PPP sessions get established as they would for a Simple IP session. However, the AGW/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber's profile) on behalf of the MN while the MN performs only Simple IP processes.

Example

The following command enables proxy mobile IP for the current subscriber:

```
proxy-mip required
```

qos rate-limit

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing functionality. When configured, the PDG/TTG performs traffic policing for the subscriber session. If the GGSN changes the QoS via an Update PDP Context Request, the PDG/TTG uses the new QoS values for traffic policing.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

qos rate-limit direction { downlink | uplink } [class { background | conversational | interactive *traffic_priority*| **streaming }] [exceed-action { drop | lower-ip-precedence | transmit }][violate-action { drop | lower-ip-precedence | transmit }]**
noqosrate-limit direction{ downlink | uplink } [class { background | conversational | interactive*traffic_priority*| **streaming }]**

---

no

Disables the QoS data rate limit configuration for the APN.

---

downlink

Apply the specified limits and actions to the downlink (to the data coming from the GGSN over the Gn' interface).

---

uplink

Apply the specified limits and actions to the uplink (to the data coming from the UE over the IPSec tunnel).

---

class { background | conversational | interactive *traffic_priority* **| streaming }**

Apply the specified limits and actions to the PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background**: Specifies the QoS for traffic patterns in which the data transfer is not time-critical (for example, e-mail exchanges). This traffic pattern should be the lowest QoS.
- **conversational**: Specifies the QoS for traffic patterns in which there is a constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QoS.
- **interactive** *traffic_priority*: Specifies the QoS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QoS than the background pattern, but not as high as that for the streaming pattern. *traffic_priority* is the 3GPP traffic handling priority and can be the integers 1,2, or 3.
- **streaming**: Specifies the QoS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QoS than the interactive pattern, but not as high as that for the conversational pattern.

Important: If this keyword is omitted, the same values are used for all classes.

exceed-action { drop | lower-ip-precedence | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet.
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence.
- **transmit**: Transmit the packet.

violate-action { drop | lower-ip-precedence | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet.
- **lower-ip-precedence**: Transmit the packet after lowering the IP precedence.
- **transmit**: Transmit the packet.

Usage

This command configures the APN's quality of service (QoS) data rate shaping through traffic policing. This command enables the actions on subscriber flow exceeding or violating peak/committed data rate allowed. The shaping function also provides an enhanced function to buffer the exceeded user packets in a buffer memory and sends them to the subscriber when subscriber traffic goes below the committed or peak data rate limit.

Important: The user packet buffer function in traffic shaping is not applicable for real-time traffic.

Important: If the exceed/violate action is set to "lower-ip-precedence", this command may override the configuration of the **ip qos-dscp** command in the GGSN service configuration mode for packets from the GGSN to the PDG/TTG. In addition, the GGSN service **ip qos-dscp** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the PDG/TTG (i.e., it accepts all of the PDG/TTG-provided values for the PDP context.

Important: This command should be used in conjunction with the max-contexts command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping and policing functionality is located in the *System Enhanced Feature Configuration Guide.*
Default values:
The following table displays the default values for each of the traffic classes:

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate(in bps): 16000000 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): 16000000 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Background	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Exceed Action: n/a Violate Action: drop

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

qos traffic-police

Enables and configures traffic policing through the bandwidth limits and action for the subscriber traffic if it exceeds/violates the peak or committed data rate. Uplink and downlink limits are configured separately.

Product

PDSN, HA, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

qos traffic-police direction { **downlink** | **uplink** } [**burst-size** *bytes*] [**committed-data-rate** *bps*] [**exceed-action** { **drop** | **lower-ip-precedence** | **transmit** }] [**peak-data-rate** *bps*] [**violate-action** { **drop** | **lower-ip-precedence** | **transmit** }]
no qos traffic-police direction { **downlink** | **uplink** }

downlink

Apply the specified limits and actions to the downlink (data to the subscriber).

uplink

Apply the specified limits and actions to the uplink (data from the subscriber).

burst-size *bytes*

Default: 3000
The peak burst size allowed, in bytes.
bytes must be an integer from 0 through 4294967295.

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

committed-data-rate *bps*

Default: 144000
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | transmit }

Default: lower-ip-precedence
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate.
The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the ip-precedence
transmit: Transmit the packet

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 0 through 4294967295).

violate-action { drop | lower-ip-precedence | transmit }

Default: drop
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the IP precedence
transmit: Transmit the packet

no

Disable traffic policing for the specified direction for the current subscriber.

Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the "lower-ip-precedence" option may also override the configuration of the **ip qos-dscp** command. Therefore, it is recommended that command not be used when specifying this option.

Details on the QoS traffic policing functionality is located in the System Enhanced Feature Configuration Guide.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction uplink peak-data-rate 128000 violate-action lower-ip-precedence
```

The following command sets a downlink peak data rate of *256000* bps and drops packets when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction downlink peak-data-rate 256000 violate-action drop
```

qos traffic-shape

Enables and configures traffic shaping functionality to provide the traffic shaping by means of buffering the data packets during congestion or when subscriber exceeds the configured peak or committed data rate limit. It buffers the data packets instead of discarding instantaneous burst and deliver it to subscriber when traffic flow is below the peak or committed data rate. Uplink and downlink traffic shaping are configured separately.

Important: This feature is NOT supported for real-time traffic.

Product

PDSN, HA, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
qos traffic-shape direction { downlink | uplink } [ burst-size bytes ] [
committed-data-rate bps ] [ exceed-action { drop | lower-ip-precedence |
transmit } ] [ peak-data-rate bps ] [ violate-action { drop | lower-ip-
precedence | buffer [transmit-when-buffer-full] | transmit } ] +
no qos traffic-shape direction { downlink | uplink }
```

downlink

Apply the specified limits and actions to the downlink (data to the subscriber).

uplink

Apply the specified limits and actions to the uplink (data from the subscriber).

burst-size *bytes*

Default: 3000
The peak burst size allowed, in bytes.
bytes must be an integer from 0 through 4294967295.

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

committed-data-rate *bps*

Default: 144000
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | transmit }

Default: lower-ip-precedence

The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the ip-precedence
transmit: Transmit the packet

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 0 through 4294967295).

violate-action { drop | lower-ip-precedence | buffer [transmit-when-buffer-full] | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the IP precedence
buffer [transmit-when-buffer-full]: Enables the traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packet to be transimitted when buffer memory is full.
transmit: Transmit the packet

+

More than one of the above keywords can be entered within a single command.

no

Disable traffic policing for the specified direction for the current subscriber.

Usage

Use this command to provide the traffic shaping function to a subscriber in the uplink and downlink directions. This feature is providing a traffic flow control different to QoS traffic policing. When a subscriber violates or exceeds the peak data rate instead of dropping the packets, as in QoS traffic policing, this feature provides the buffering facility of subscriber data packets and it sends the buffered data when the traffic flow is low or not in congestion state.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the "lower-ip-precedence" option may also override the configuration of the **ip qos-dscp** command. Therefore, it is recommended that command not be used when specifying this option.

Details on the QoS traffic policing functionality is located in the System Enhanced Feature Configuration Guide.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

qos traffic-shape direction uplink peak-data-rate 128000 violate-action lower-ip-precedence

The following command buffers the excess user packets when the subscriber traffic violates the configured peak-data-rate *256000* bps in downlink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

qos traffic-shape direction downlink peak-data-rate 256000 violate-action buffer transmit-when-buffer-full

radius accounting

Sets the RADIUS accounting parameters for the subscriber or domain. This command takes precedence over the similar context configuration command. This command is disabled by default.

Product

All

Privilege

Administrator

Syntax

radiusaccounting { interim { interval-timeout*timeout***| normal | suppress } | ip remote-address list-id** *list_id***| mode { session-based | access-flow-based { none |auxillary-flows |all-flows| main-a10-only} } | start { normal | suppress } | stop { normal | suppress } }**

no radius accounting { ip remote-address list-id *list_id* **| interim [interval-timeout] }**

interim { interval-timeout *timeout* **| normal | suppress }**

interval-timeout *timeout*: Indicates the time (in seconds) between updates to session counters (log file on RADIUS or AAA event log) during the session. *timeout* must be an integer from 50 to 40000000.

Caution: Interim interval settings received from the RADIUS server take precedence over this setting on the system. While the low limit of this setting on the system is a minimum of 50 seconds, the low limit setting on the RADIUS server can be as little as 1 second. To avoid increasing network traffic unnecessarily and potentially reducing network and system performance, do not set this parameter to a value less than 50 on the RADIUS server.

normal: If RADIUS accounting is enabled, send this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppress the sending of this Acct-Status-Type message.

ip remote-address list-id *list_id*

Specifies the identification number of the IP address list to use for the subscriber for remote address-based accounting.
list_id: Specifies the RADIUS accounting remote IP address list identifier for remote-address accounting for the subscriber. *list_id* must be an integer from 1 through 65535.
This command is used as part of the Remote Address-based accounting feature and associates the subscriber with a list of remote addresses. Remote address accounting data is collected each time the subscriber communicates with any of the addresses specified in the list.
Remote address lists are configured using the **list** keyword in the **radius accounting ip remote-address** command in the Context Configuration mode.

mode { session-based | access-flow-based { none | auxillary-flows **| all-flows** | main-a10-only **} }**

Default: session-based
Specifies if the radius accounting mode is either session-based or access-flow-based.

session-based: configures session-based RADIUS accounting behavior for the subscriber - which means a single radius accounting message generated for the subscriber session not separate accounting messages for individual A10 connections or flows.
access-flow-based: configures access-flow-based RADIUS accounting behavior for the subscriber. This offers flexibility by generating separate accounting messages for flows and A10 sessions.

- **all-flows**: Generates separate RADIUS accounting messages per access flow. Separate accounting messages are not generated for data path connections. (For example, separate messages are not sent for the main A10 or auxilliary connections.).
- **auxillary-flows**: Generates RADIUS accounting records for the main data path connection and for access-flows for all auxiliary data connections. (For example, separate RADIUS accounting messages are generated for the main A10 session and for access-flows within auxiliary A10 connections. The main A10 session accounting does not include octets or other accounting information from the auxiliary flows.)
- main-a10-only: Configures access-flow-based single accounting messages (for example only single start/interim/stop) are generated for the main A-10 flows only.
- **none**: Separate RADIUS accounting messages are generated for all data path connections (for example, PDSN main or auxiliary A10 connections) but not for individual access-flows. This is essentially A10 connection-based accounting.

start { normal | suppress }

normal: If RADIUS accounting is enabled, send this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppress the sending of this Acct-Status-Type message.

stop { normal | suppress }

normal: If RADIUS accounting is enabled, send this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppress the sending of this Acct-Status-Type message.

no

ip remote-address list-id *list_id*: Deletes the entry for the specified *list_id*.
interim [interval-timeout]: Disables the interim interval setting.

Usage

Use this command to allow a per-domain setting for the RADIUS accounting.

Example

Set the accounting interim interval to one minute (*60* seconds) for all sessions that use the current subscriber configuration:

```
radius accounting interim interval-timeout 60
```

Do not send RADIUS interim accounting messages:

```
radius accounting interim suppress
```

Sets the accounting message start normal for main A-10 flows only.

```
radius accounting mode main-a10-only start normal
```

radius group

It applies a RADIUS server group at the subscriber level for AAA functionality.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius group *group_name*

[default| no] radius group

group_name

Specifies the name of the server group that is used for authentication and/or accounting for the specific subscriber.
group_name must be a string of size 1 to 63 character. It must be the same as configured earlier within the same context of subscriber.

default

Sets / Restores default RADIUS server group specified at the context level or default subscriber profile.

no

Disables the applied RADIUS group for specific subscriber.

Usage

This feature provides the RADIUS configurables under radius group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual RADIUs server group for subscriber in that context. Each server group consists of a list of AAA servers.
In case no RADIUS group is applied for the said subscriber or default subscriber profile, then the default server group available at context level is applicable for accounting and authentication of specific subscriber.

Example

Following command applies a previously configured RADIUS server group named *star1* to a subscriber within the specific context:

radius group *star1*

Following command disables the applied RADIUS server group for the specific subscriber.

no radius group

radius returned-framed-ip-address

Sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-framed-ip-address 255.255.255.255-policy {accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied}

default radius returned-framed-ip-address 255.255.255.255-policy
```

accept-call-when-ms-ip-not-supplied

Accept calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

reject-call-when-ms-ip-not-supplied

Reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

default

Set the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

Usage

Use this command to set the behavior for the current subscriber when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example

Use the following command to set the subscriber profile to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```

rohc-profile-name

Identifies the RoHC profile configuration to be applied to bearer sessions belonging to this subscriber.

Product

HSGW,PDSN

Privilege

Administrator

Syntax

rohc-profile-name *name*

name

Specifies the name of the RoHC profile this subscriber will use to apply header compression and decompression parameters to bearer session data. *name* must be an existing RoHC profile and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to specify a RoHC configuration profile to be applied to bearer sessions belonging to this subscriber. RoHC profiles are configured through the Global Configuration Mode using the **rohc-profile** command.

Example

The following command specifies that the RoHC profile named *rohc-cfg1* is to be applied to all bearer sessions belonging to this subscriber:

```
rohc-profile-name rohc-cfg1
```

secondary ip pool

This command specifies a secondary IP pool to be used as backup pool for NAT.

Important: This command is license dependent, requiring the 600-00-7871 NAT Bypass license. Please contact your local sales representative for more information.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

secondary ip pool *pool_name*

no secondary ip pool

no

Removes the previous secondary IP pool configuration.

pool_name

Specifies the secondary IP pool name.
pool_name must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool configured will be appended to the RADIUS supplied IP pool list / subscriber template provided IP pool list whichever is applicable during call setup.

Example

The following command configures a secondary IP pool named *test123*:

```
secondary ip pool test123
```

simultaneous

Enables/disables the simultaneous use of both Mobile and Simple IP services.

Product

PDSN, FA, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] simultaneous simple-and-mobile-ip
```

no

Disables the simultaneous use.

Usage

Subscribers with mobile devices supporting mobile and simple IP services concurrently require this option to be set.

Example

```
no simultaneous simple-and-mobile-ip
simultaneous simple-and-mobile-ip
```

timeout

Configures the subscriber session timeouts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout { absolute | idle } *seconds*

no timeout [absolute | idle]

absolute

Default: 0
The absolute maximum time a session may exist in any state (active or dormant).

idle

Default: 0
The maximum duration of the session, in seconds, before the system automatically terminates the session due to inactivity.

seconds

Specifies the maximum amount of time, in seconds, before the specified timeout action is activated.
seconds must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

Usage

Reduce the idle timeout to free session resources faster for use by new requests.

Example

timeout absolute *1800*
no timeout

timeout idle-time

This command configures the idle timeout configuration timer for subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeoutidle-time*idle_timeout*

no timeout idle-time

idle_timeout

Default: 0
Designates the maximum duration of the session, in seconds, after the expiry of which the system disconnects the subscriber.
idle_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

Usage

Use this command to set the idle time after which the call has to be disconnected.

Example

Following command sets the idle timeout duration to 450 seconds.

```
timeout idle-timeout 450
```

timeout long-duration

Configures the long duration timeout and optionally the inactivity duration of HA subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeoutlong-duration*ldt_timeout***[inactivity-time***inact_timeout***]**

[no | default]timeoutlong-duration

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

long-duration *ldt_timeout*

Default: 0
Designates the maximum duration of the session, in seconds, before the system automatically reports/terminates the session.
ldt_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the timer.

inactivity-time *inact_timeout*

Specifies the maximum amount of time, in seconds, before the specified session is marked as dormant.
inact_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the inactivity time specified.

Usage

Use this command to set the long duration timeout period and inactivity timer for subscriber sessions. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the *long-duration-action detection* and *long-duration-action disconnection* section for more information.

Example

Following command sets the long duration timeout duration to 300 seconds and inactivity timer for subscriber session to 45 seconds.
timeout long-duration *300* **inactivity-time** *45*

tunnel address-policy

This command specifies the policy for address allocation and validation for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. This means that GGSN IP address validation could be disabled for specified incoming calls.

For GGSN systems, this command can also be specified in the APN Configuration mode (**tunnel address-policy**) which would mean the system defers to the old **l3-to-l2-tunnel address policy** command for calls coming through L2TP tunnels.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy
```

alloc-only

IP addresses are allocated locally and no validation is done.

alloc-validate

Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate

No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This allows for the greatest flexibility.

default

Resets the tunnel address-policy to alloc-validate.

Usage

This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignment. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.

Example

Use the following command to reset the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

Use the following command to disable all IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```

tunnel gre

Configures Generic Routing Encapsulation (GRE) tunnel parameters for the current subscriber.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel gre peer-address*peer_address***local-address***local_addr*

no tunnel gre peer-address*peer_address*

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the GRE tunnel.

local-address *local_addr*

Specifies the IP address of the interface in the destination context originating the GRE tunnel.

no

Disables GRE tunneling for the current subscriber.

Usage

Subscriber IP payloads are encapsulated with IP/GRE headers and tunneled by the AGW to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using GRE and tunnel it from a local address of *192.168.1.100* to a gateway with an IP address of *192.168.1.225*:

tunnel gre peer-address *192.168.1.225* **local-address** *192.168.1.100*

tunnel ipip

Configures IP-in-IP tunnelling parameters for the current subscriber.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

tunnel ipip peer-address*peer_address***local-address***local_addr***]**

no tunnel ipip

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.

local-address *local_addr*

Specifies the IP address of the interface in the destination context originating the IP-in-IP tunnel.

no

Disables IP-in-IP tunneling for the current subscriber.

Usage

Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN or PDSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of *192.168.1.100* to a gateway with an IP address of *192.168.1.225*:

tunnel ipip peer-address *192.168.1.225*
local-address *192.168.1.100*

tunnel ipsec

This command configures sessions for the current subscriber to use an IPSEC tunnel based on the IP pool corresponding to the subscribers assigned ip address.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel ipsec use-policy-matching-ip-pooler-address

no tunnel ipsec [ use-policy-matching-ip-pooler-address ]
```

no

Disables the use of the IPSEC policy that matches the IP pool that the assigned IP address relates to.

Usage

Use this command to set the current subscribers sessions to use an IPSEC policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example

The following command enables the use of the policy that matches the IP pool address:

```
tunnel ipsec use-policy-matching-ip-pooler-address
```

tunnel l2tp

Configures the L2TP tunnel for the subscriber.

Product

L2TP

Privilege

Security Administrator, Administrator

Syntax

```
tunnell2tp [ peer-addressip address [ [ encrypted ] [secretsecret] ] [
preferencenumber] [ tunnel-contextcontext ] [ local-addressip_address ] [
crypto-mapmap_name { [ encrypted ] isakmp-secretsecret } ] ]

no tunnel l2tp [ peer-address ip_address ]
```

peer-address *ip_address*

A peer L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). ip_address must be an IP address in IPv4/IPv6 format.

[encrypted] secret *secret*

The shared key (secret) between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be between 1 and 63 alpha and/or numeric characters and is case sensitive.
encrypted: The encrypted shared key between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be between 1 and 128 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

preference *number*

Default: 1
The order in which a group of tunnels configured for this subscriber will be tried. number must be an integer between 1 and 65535.

tunnel-context *context*

The name of the context containing ports through which this subscriber's data traffic is to be communicated between this LAC and the LNS. context must be between 1 and 79 alpha and/or numeric characters.

local-address *ip_address*

A LAC service bind address which is given as a hint used to select a particular LAC service. ip_address must be an IP address in IPv4/IPv6 format.

crypto-map *map_name* **{ [encrypted] isakmp-secret** *secret* **}**

map_name is the name of a crypto map that has been configured in the current context. *map_name* must be a string from 1 to 127 alphanumeric characters.
isakmp-secret *secret*: The pre-shared key for IKE. *secret* must be a string from 1 to 127 alphanumeric characters.
encrypted isakmp-secret *secret*: The pre-shared key for IKE. Encryption must be used when sending the key. *secret* must be a string from 1 to 127 alphanumeric characters.

no

Disables tunneling for the current subscriber. When peer-address is included, the tunneling for that specific L2TP Network Server (LNS) is disabled but tunneling to other configured LNSs is still enabled.

Usage

Use this command to configure specific L2TP tunneling parameters for the current subscriber.

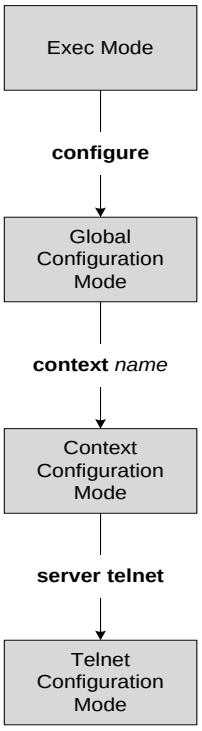
Example

To specify L2tp tunneling to the LNS peer at the IP address *198.162.10.100* with a shared secret of *bigco* and preference of *1*, enter the following command:

```
tunnel l2tp peer-address 198.162.10.100 secret bigco preference 1
```

Chapter 197
Telnet Configuration Mode Commands

The Telnet Configuration Mode is used to manage the Telnet server options for the current context.



end

Exits the telnet server configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the telnet server configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

max servers

Configures the maximum number of telnet servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 60 second interval. count must be a value in the range from 1 to 100.

Usage

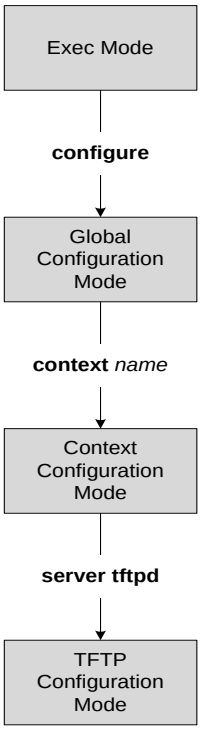
Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

max servers *50*

Chapter 198
TFTP Configuration Mode Commands

The TFTP configuration mode is used to manage the TFTP servers for the current context.



end

Exits the TFTP server configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the TFTP server configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

max servers

Configures the maximum number of TFTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 60 second interval. count must be a value in the range from 1 to 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that TFTP services do not cause excessive system impact to other services.

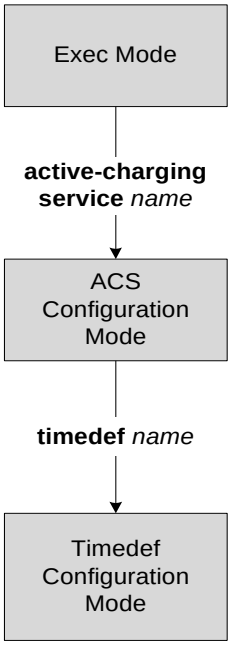
Example

max servers *50*

Chapter 199
Timedef Configuration Mode Commands

The Timedef Configuration Mode enables configuring the Time-of-Day Activation/Deactivation feature.

Important: This configuration mode is only available in StarOS 8.1 and StarOS 9.0 and later releases.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

start

This command configures timeslots in the current timedef.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Important: A maximum of 24 timeslots can be specified within a timedef.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time` *`hh mm ss`* **`end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time`** *`hh mm ss`*

`[ no ] start time` *`hh mm ss`* **`end time`** *`hh mm ss`*

`no`

Removes the specified timeslot.

`start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time` *`hh mm ss`* **`end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time`** *`hh mm ss`*

Specifies a timeslot with a start day and time, and an end day and time.
`start day`: Specifies the start day and start time.
`end day`: Specifies the end day and end time.
`time` *`hh mm ss`*: Specifies the start/end time:

- *`hh`*: Specifies the start/end hour, and must be an integer from 0 through 23.
- *`mm`*: Specifies the start/end minute, and must be an integer from 0 through 59.
- *`ss`*: Specifies the start/end second, and must be an integer from 0 through 59.

`start time` *`hh mm ss`* **`end time`** *`hh mm ss`*

Specifies a timeslot with a start time and an end time to be applicable for all days of the week.
In specifying the start/end time:

- *`hh`*: Specifies the start/end hour, and must be an integer from 0 through 23.
- *`mm`*: Specifies the start/end minute, and must be an integer from 0 through 59.
- *`ss`*: Specifies the start/end second, and must be an integer from 0 through 59.

Usage

Use this command to create timeslots in a timedef during which rules have to be active. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.
When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

Important: The time considered for timedef matching is the system's local time.

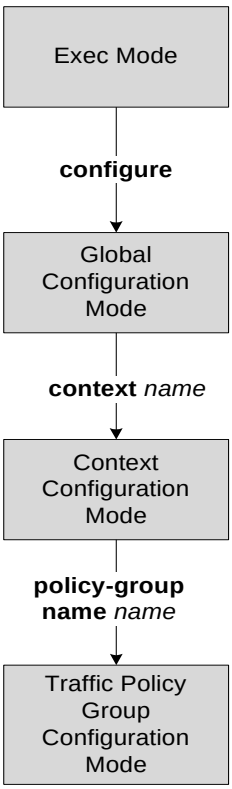
This release does not support configuring a timeslot for a specific date.
If, in a timeslot, only the time is specified, that timeslot will be applicable for all days.
If for a timeslot, "start time" > "end time", that rule will span the midnight. I.e. that rule is considered to be active from the current day till the next day.
If for a timeslot, "start day" > "end day", that rule will span over the current week till the end day in the next week.
In the following cases a rule will be active all the time:

- a timedef is not configured in an action priority
- a timedef is configured in an action priority, but the named timedef is not defined
- a timedef is defined but with no timeslots

Example
The following example specifies a timeslot that starts on Tuesday at 09:00:00 and ends on Friday 21:30:00:
start day *tuesday* time *9 0 0* end day *friday* time *21 30 0*
The following example specifies a timeslot that starts at 15:00:00 and ends at 17:00:00 on all days of the week:
start time *15 0 0* end time *17 0 0*
The following example specifies a timeslot that starts on Friday at 22:00:00 and ends on Tuesday at 08:00:00. This timeslot spans the complete week until the end day, i.e. up to Tuesday.
start day *friday* time *22 0 0* end day *tuesday* time *8 0 0*
The following example specifies a timeslot that starts at 16:00:00 and ends at 09:00:00 on all days of the week. Also, as start time > end time, this timeslot spans the midnight too. I.e., from 16:00:00 to 23:59:59 and from 00:00:00 to 09:00:00.
start time *16 0 0* end time *9 0 0*

Chapter 200
Traffic Policy Group Configuration Mode Commands

Policy-Group is used to form a set of configured Policy-Maps for Traffic Policy feature. It applies multiple policies for a subscriber session flow within a destination context.



end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

policy

This command assigns the traffic policies, pre-configured in Policy-Map configuration mode, to a Policy Group for flow-based traffic policing to a subscriber session flow.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] policy` *`policy_map_name`* **`precedence`** *`value`* **`direction [ in | out ]`**

`no`

Disables/removes configured policy for traffic policing.

`direction [ in | out ]`

Specifies the direction in which the policies need to be applied.

`policy_map_name`

Specifies the name of Policy-Map configured within a context to this policy group.
A maximum of 16 policies can be assigned in a policy group.

`precedence` *`value`*

Specifies the precedence of traffic policies to resolve.
`value` is an integer in the range from 1 through 16. If a session flow matches multiple policies this keyword resolves them.

Usage

Use this command to form a policy-group with a set of pre-configured Policy-Maps.

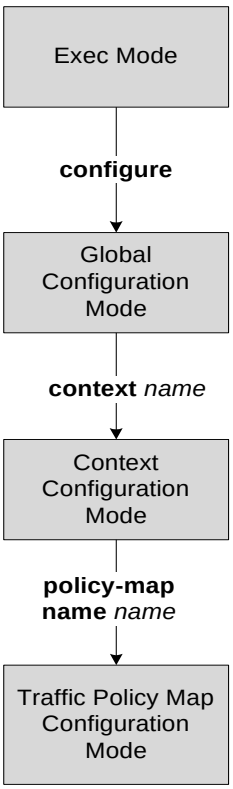
Example

The following commands assigns the traffic policy policymap1 with precedence 2.

```
policy policymap1 precedence 2
```

Chapter 201
Traffic Policy-Map Configuration Mode Commands

Policy-Map is used to configure a flow-based traffic policy for Traffic Policy feature within a destination context. It designates the flow treatment based on the classification rules configured in Class-Map mode for a subscriber session flow.



3gpp2 data-over-signaling

This command configures 3GPP2 related flow treatment policy for the flow-based traffic policing to subscriber session.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] 3gpp2 data-over-signaling marking
```

no

Disables configured 3GPP2 related flow treatment policy.

marking

Indicates 3GPP2 related traffic flow for data over signaling channel.

Usage

Use this command to mark traffic flows for 3GPP2 related policy.

Example

```
3gpp2 data-over-signaling marking
```

access-control

This command configures the access control action for traffic flow matching with Class-Map rules.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
access-control { allow | discard }
```

allow

This option allows the packets, if policy matches with the criteria defined in Class-Map assigned to the specific traffic policy.

discard

This option discards the packets, if policy matches with the criteria defined in Class-Map assigned to the specific traffic policy.

Usage

Configures the action or treatment for traffic flows matching with criteria specified in assigned Class-Map.

Example

The following command allows the packets or traffic flow on matching with criteria specified in assigned Class-Map for specific traffic policy.

```
access-control allow
```

accounting suppress

This command suppresses accounting action on traffic flow matching the policy map.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] accounting suppress
```

no

Removes the suppression of accounting for traffic flow matching this policy map.

Usage

Use this command to suppress accounting action on traffic flow matching this policy map.
Policy maps configured for accounting suppression are used to implement the QChat Billing Suppression feature to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. See the **accounting trigger** command.

Example

The following command configures suppression of accounting on traffic flows matching this policy map:

```
accounting suppress
```

accounting trigger

This command configures an accounting trigger policy map to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting to support the QCHAT Billing Suppression feature.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] accounting trigger { inactivity-timeout | interesting-traffic |
intra-service-handoff }
```

default

Sets / Restores default value assigned for specified parameter.

no

Disables previously configured triggers.

inactivity-timeout

Generates an accounting stop message if there has been no data activity on the session for the interim accounting timeout interval.
Default: disabled

interesting-traffic

Generates an accounting start message upon arrival of interesting traffic.
Default: disabled

intra-service-handoff

Generates accounting start and stop messages during intra service handoffs within the same service.
Default: enabled
If this is disabled, the messages are suppressed during the handoffs. The current accounting session continues and no stop or start messages are generated during the intra service handoff.

Usage

Use this command to configure an accounting trigger policy map (ATPM) to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting to support the QChat Billing Suppression feature.
Interesting traffic is identified as traffic that does not match any of the other Accounting Policy Maps (APMs) configured for accounting suppression. See the **accounting suppress** command.
An ATPM is similar to an APM, but without the class map rules. The ATPM is configured as of type accounting using the **type accounting** command.

In the ATPM, the trigger to start accounting for interesting traffic is configured using the **accounting trigger interesting-traffic** command. Accounting Start is triggered on arrival of interesting traffic, or change in airlink parameters conveyed through active-start airlink record. If an active-start record was included in the initial connection setup, Accounting Start is not triggered. But if the active-start comes separately and is the first one for the session, it is treated as airlink change and an Accounting Start is sent. Optionally, timeout can be triggered when there is no data traffic for the interim accounting timeout interval using the **accounting trigger inactivity-timeout stop** command. On timeout, the accounting session is terminated and an Accounting Stop message is sent. A new accounting session is created if interesting traffic resumes.
The ATPM should have the lowest precedence among the APMs.
As the airlink events are generated on the ingress side, the ATPM must be included in a policy group that is applied to the ingress direction in the subscriber profile. The configuration is applicable only for standard trigger policy and session based accounting mode.

Example
The following command sets the trigger to generate accounting start message upon arrival of interesting traffic:
accounting trigger interesting-traffic

class-map

This command assigns a traffic classification rule (Class-Map) to the policy map.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

class-map *name*

name

Specifies the name of the class map assigned for this policy map. The class map should be one that was configured in the Class Map Configuration Mode.
name must be the name of a class map, and must be a string of 1 through 15 characters in length.

Usage

Use this command to assigns a class map to the policy map for traffic policing. The class map is configured in the Class Map Configuration Mode.

Example

The following command assigns the class map classification1 to the current policy map:
class *classification1*

end

This command exits the current mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the current mode and returns to the parent mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent mode.

flow-tp-trigger

This command specifies that the traffic volume will be calculated based on the traffic on the flow.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

flow-tp-trigger *volume*

no flow-tp-trigger *volume*

volume

Specifies the volume threshold to trigger traffic policing.
volume is the value in bytes, and must be an integer from 1 through 4294967295.

Usage

This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to calculate the traffic volume based on the traffic on the flow.

Example

flow-tp-trigger *500*

ip header-compression

Enables the system to mark IP flows for RObust Header Compression.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip header-compression rohc flow-marking
```

no

Disables the setting.

rohc flow-marking

Marks the IP flow for SO67 and PPP ROHC.

Usage

Use this command to mark IP flows for SO67 and PPP ROHC.

Example

```
ip header-compression rohc flow-marking
```

qos encaps-header

Enables and configures Quality of Service (QoS) policy to use Differentiated Service Code Point (DSCP) marking in IP header field for the flow-based traffic policing to subscriber session flow.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
qos encaps-header dscp-marking { dscp_code | copy-from-user-datagram [
ignore-pcf-signaled-dscp ] | user-datagram }
```

dscp_code

Specifies the DSCP code value marked in IP header of packet/flow to determine the QoS for traffic policing. The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

copy-from-user-datagram

Specifies to use DSCP code value from user datagram (UDP header) to determine the QoS for traffic policing.

ignore-pcf-signaled-dscp

Specifies to override the highest priority DSCP value signaled by the PCF.

user-datagram

Specifies to use the DSCP value copied from the user datagram.

Usage

Use this command to apply the QoS policy based on DSCP code value encapsulated in IP packet header or User datagram packet to subscriber session flow for flow-based traffic policing.

Important: Details on the QoS traffic policing functionality is located in the System Administration and Configuration Guide.

Example

The following command sets QoS policy with DSCP code value to 0x0C for Class 1, silver (AF12):

```
qos encaps-header dscp-marking 0x0C
```

qos traffic-police

Enables and configures Quality of Service (QoS) policy for the flow-based traffic policing to subscriber session flow on per-flow basis.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

qos traffic-police committed *bps* **peak** *bps* **burst-size** *byte* **exceed-action { drop | lower-ip-precedence | allow } violate-action { drop | lower-ip-precedence | allow }**

burst-size *bytes*

Default: 3000
The peak burst size allowed, in bytes.
bytes must be an integer from 0 through 4294967295.

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

committed *bps*

Default: 144000
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | allow }

Default: lower-ip-precedence
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate.
The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the ip-precedence
allow: Transmit the packet

peak *bps*

Default: 256000
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 0 through 4294967295.

violate-action { drop | lower-ip-precedence | allow }

Default: drop
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet

`lower-ip-precedence`: Transmit the packet after lowering the IP precedence
`allow`: Transmit the packet

Usage

Use this command to apply the QoS policy to subscriber session flow for flow-based traffic policing.

Important: Details on the QoS traffic policing functionality are located in the System Administration.

Example

The following command sets committed data rate of 102400 bps with peak data rate of 128000 bps and burst size 2048 bytes. This lowers the IP precedence when the committed-data-rate exceeded and drops the packets when peak-data-rate are violated:

```
qos traffic-police commited 102400 peak-data-rate 128000 burst-size 2048 exceed-action lower-ip-precedence violate-action drop
```

qos user-datagram dscp-marking

Enables and configures Quality of Service (QoS) policy related to differentiated service code point (DSCP) marking in user datagram of subscriber session flow on per-flow basis.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

qos user-datagram dscp-marking*dscp_code*

dscp_code

Specifies the DSCP code value marked in IP header of packet/flow to determine the QoS for traffic policing. The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

Usage

Use this command to apply the QoS policy to subscriber session flow by DSCP marking in user datagram.

Example

The following command sets DSCP marking for user datagram as 0x01 for QoS to subscriber session flow:
qos user-datagram dscp-marking *0x01*

sess-tp-trigger

This command configures the trigger traffic control based on traffic volume on a session.

Product

PDSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

sess-tp-trigger *volume*

no sess-tp-trigger *volume*

volume

Specifies the traffic volume threshold to trigger traffic control. *volume* is a value in bytes from 1 to 4294967295.

Usage

This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to configure the trigger traffic control based on traffic volume on a session.

Example

sess-tp-trigger *500*

type

This command specifies the type of traffic policy within specific Policy-Map.

Product

PDSN, HA, ASN GW

Privilege

Administrator

Syntax

type { accounting | dynamic { three-gpp2 rev-A profile-id { any | id *profile_id* **| range** *low_value* **to** *high_value* **} flow-id { any | id** *flow_id* **| range** *low_value* **to** *high_value* **} | pre-provisioned wimax asn-service-profile-id { any | id** *service_id* **} asn-pdfid { any | id** *pdf_id* **} | static | template }**

accounting

Specifies the type of traffic policing as accounting for this specific policy map. This configuration is used for enabling/disabling the accounting of different flows matching with conditions within this Policy-Map.

dynamic

Identifies the type of policy map as dynamic.

three-gpp2 rev-A

Configures dynamic policy map type for CDMA2000-3GPP2 RevA service.

profile-id { any | id *profile_id* **| range** *low_hex* **to** *high_hex* **}**

Specifies the profile id matching in this policy map.
any allows any profile identifier matching with in this policy map.
id *profile_id* allows specific profile identifier matching with in this policy map. *profile_id* must be either a value in hexidecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.
range *low_value* **to** *high_value*: identifies a range in which a profile identifier must fall within to be considered a match. *low_value* and *high_value* must be either a value in hexidecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.

flow-id { any | id *flow_id* **| range** *low_hex* **to** *high_hex* **}**

Specifies the flow id matching in this policy map.
any allows any flow identifier matching with in this policy map.
id *flow_id* allows specific flow identifier matching with in this policy map. *flow_id* must be either a value in hexidecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.
range *low_value* **to** *high_value*: identifies a range in which a flow identifier must fall within to be considered a match. *low_value* and *high_value* must be either a value in hexidecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.

pre-provisioned

Identifies the type of policy map as pre-provisioned.

wimax

Configures WiMAX service policy map in an ASN-GW service.

asn-service-profile { any | id *service_id* **}**

Specifies the ASN Service profile identifier to match with in this policy map.
any: Allows any ASN Service Profile Identifier matching within this policy map.
id *service_id*: Allows specific Service Profile matching to a specified identifier. *service_id* must be an integer from 1 to 65535 and must match a service ID that was configured in the Subscriber Configuration Mode.

asn-pdfid { any | id *pdf_id* **}**

Specifies the ASN Packet Data Flow Identifier to match with in this policy map.
any: Allows any ASN Packet Data Flow Identifier matching within this policy map.
id *pdf_id*: Allows specific Packet Data Flow matching to a specified identifier. *pdf_id* must be an integer from 1 to 255 and must match a PDF ID that was configured in the Subscriber Configuration Mode.

static

Specifies the type of traffic policing as static for this specific Policy Map. In this type of policy, the traffic flow classification and flow treatment is pre-defined with classification rules through Class-Map configuration.
This is the detailed type of policy map.

template

Specifies the type of traffic policy to as a template to all subscribers associated with this policy map.

Usage

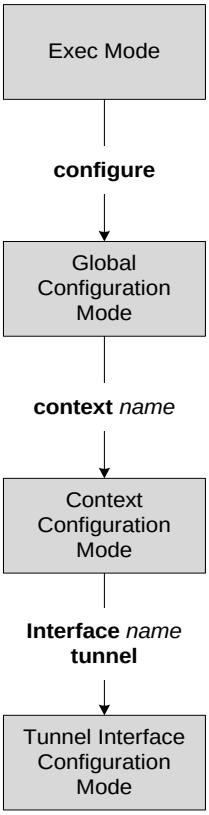
Specifies the type of traffic policy within the specific Policy-Map.

Example

The following commands configures the traffic policy for this Policy-Map as static:
type static
The following commands configures the traffic policy for this Policy-Map as pre-provisioned for WiMAX service requiring a match of any service profile and PDF id of *3*:
type pre-provisioned wimax asn-service-profile any asn-pdfid id *3*

Chapter 202
Tunnel Interface Configuration Mode Commands

The Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for various type of tunnels and its parameters like addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Configures the description text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`description`*`text`*

`no description`

`no`

Clears the description for the interface.

`text`

Specifies the descriptive text to use. *`text`* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters. The interface description is case sensitive.

Usage

Set the description to provide useful information on the interface's primary function, services, end users, etc. Any information useful may be provided.

Example

Following command sets the description about this interface:

`description` *`sampleInterfaceDescriptiveText`*

end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the Interface Configuration Mode and returns to the Context Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

ip address

This command configures the IPv4 address for the specific tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`ip address [ip_address/ip_mask | ip_address ip_mask]`

`no ip address ip_address`

no

Removes the configured IPv4 address bound to a tunnel interface.

ip_address/ip_mask | ip_address ip_mask

Specifies a destination IP address or group of addresses that will use this route.
ip_address/ip_mask: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ip_address/ip_mask* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.
ip_address ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. *ip_address* must be specified using the standard IPv4 dotted decimal notation. *ip_mask* must be specified using the standard IPv4 dotted decimal notation as network mask for subnets.
The mask as specified by *ip_mask* or resulting from *ip_address/ip_mask* is used to determine the network for packet routing.
0's in the resulting mask indicate the corresponding bit in the IP address is not significant in determining the network for packet routing.
1's in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.

Usage

Use this command to bind the IPv4 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the *1.2.3.4* as IPv4 address to this tunnel interface:

ip address *1.2.3.4*

ipv6 address

This command configures the IPv6 address for the specific tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ipv6 address ipv6_address/ipv6_mask
```

```
no ipv6 address ipv6_address
```

no

Removes the configured IPv6 address bound to a tunnel interface.

ipv6_address/ipv6_mask

Specifies a destination IP address or group of addresses that will use this route.
ipv6_address/ipv6_mask: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ipv6_address/ipv6_mask* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

Usage

Use this command to bind the IPv6 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the *1001::2:010:1234* as IPv4 address to this tunnel interface:

```
ipv6 address 1001::2:010:1234
```

tunnel-mode

This command configures the tunnel mode type for specific tunnel interface. It also creates the specific tunnel configuration mode if required.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
tunnel-mode {gre | ipv6ip}

defualt tunnel-mode
```

default

Sets the default tunnel mode for this interface. By default tunnel mode is set to IPv6-to-IPv4 type.

gre

Default: Disabled
This keyword sets the tunnel interface mode to GRE type and creates the GRE tunnel Configuration mode if required.

ipv6ip

Default: Enabled
This keyword sets the tunnel interface mode to IPv6-to-IPv4 type and creates the IPv6-to-IPv4 Tunnel Configuration mode, if required.

Usage

Use this command to set the tunnel mode type of GRE or IPv6-to-IPv4 for tunneling interface.

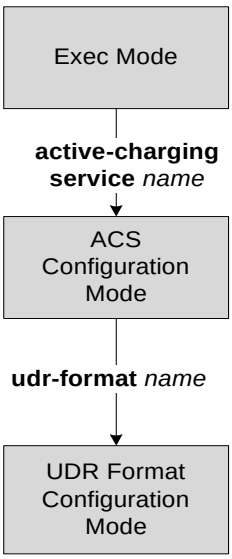
Example

The following command sets the tunnel mode to GRE for specific interface:

```
tunnel-mode gre
```

Chapter 203
UDR Format Configuration Mode Commands

The UDR Configuration Mode enables configuring User Detail Record (UDR) formats. UDR file formats are represented in Comma Separated Value (CSV).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

attribute

This command specifies the order of fields in the UDR.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
attribute attribute { [ format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS |
YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds } [ localtime ] | [ { bytes |
pkts } { downlink | uplink } ] ] priority priority }

no attribute attribute [ priority priority ]
```

no

Removes the specified attribute configuration.

attribute

Specifies the attribute.
attribute must be one of the following:

Attribute	Description
diameter-session-id	Unique Diameter session identifier. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.
radius-called-station-id	Called Station ID of the mobile handling the flow.
radius-calling-station-id	Calling Station ID of the mobile handling the flow.
radius-fa-nas-identifier	RADIUS NAS identifier of Foreign Agent (FA).
radius-fa-nas-ip-address	RADIUS IP address of Foreign Agent (FA).
radius-nas-identifier	RADIUS NAS identifier.
radius-nas-ip-address	RADIUS NAS IP address.
radius-user-name	User name associated with the flow.
sn-3gpp2-bsid	This option is obsolete. To configure this attribute see the rule-variable command.

Attribute	Description
sn-3gpp2-carrier-id	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-esn	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-meid	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-service-option	This option is obsolete. To configure this attribute see the rule-variable command.
sn-acct-beginning-session	Session beginning information. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.
sn-acct-session-continue	Session continue information. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.
sn-acct-session-id	Indicator for the accounting session Identifier.
sn-acct-session-time	Duration from acct-status-type:start to acct-status-type:stop. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.
sn-acct-status-type	Accounting status identifier. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.

Attribute	Description
sn-charging-type	Charging type: • offline • online **Important:** This attribute is customer specific, and is only available in Release 8.3 and later releases.
sn-closure-reason	Includes reason for the termination of the flow/UDR: • 0: normal, i.e., subscriber session ended • 1: handoff control processing specified • 2: subscriber session terminated • 3: flow timeout
sn-content-id	Unique identifier for the content-id.
sn-content-label	Identifier for text label for content-id.
sn-content-vol	Identifier for content volume.
sn-correlation-id	RADIUS correlation identifier.
sn-duration	Duration between the last and first packet for the record.
sn-end-time [format format]	Timestamp for last packet of flow in UTC.
sn-fa-correlation-id	RADIUS Correlation Identifier of the Foreign Agent (FA).
sn-fa-ip-address	FA IP address.
sn-filler-blank	Keeps attributes place blank and generates an empty UDR field.
sn-filler-zero	Fills ‘0’ for this attribute place in the EDR/UDR.
sn-format-name	Indicates the name of the UDR/EDR format used.
sn-group-id	Indicates the sequence group identifier for the records.
sn-ha-ip-address	Home Agent IP address. **Important:** This attribute is customer specific, and is only available in ‘ 8.3 and later releases.
sn-local-seq-no	Unique local sequence number of UDR identifier per ACSMgr and linearly increasing in UDR file.

Attribute	Description
sn-ocs-ip-address	Online Charging Server's IP address. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.
sn-rulebase	Indicates the name of the ACS rulebase used.
sn-sequence-no	Unique sequence number (per **sn-sequence -group** and **radius-nas-ip-address**) of UDR identifier and linearly increasing in UDR file.
sn-served-bsa-addr	Indicator for address of Base Station Area being served.
sn-service-name	Indicator for ACS service name.
sn-st16-ip-addr	IP address of the chassis handling this flow. ***Important:*** This attribute is interchangeable with **radius-nas-ip-address** for other systems.
sn-start-time [format format]	Timestamp for first packet of flow in UTC.
sn-stream-number	Unique UDR billing record identifier. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.
sn-subscriber-id	Indicator for subscriber ID.
sn-subscriber-nat-flow-ip	NAT IP address(es) of NAT-enabled subscriber.
sn-timestamp	Timestamp when the UDR is actually generated. ***Important:*** This attribute is customer specific, and is only available in Release 8.3 and later releases.

format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds }

Specifies the timestamp format.

localtime

Specifies the local time. By default, timestamps are displayed in GMT.

{ bytes | pkts } { downlink | uplink }

Specifies bytes/packets sent/received from/by mobile.

priority *priority*

Specifies the position priority of the value within the UDR. Lower numbered priorities (across all **attribute**, **event-label**, and **rule-variable**) occur first.
priority must be an integer from 1 through 65535. Up to 50 position priorities (across all **attribute**, **event-label**, and **rule-variable**) can be configured.

Usage

Use this command to set the attributes and priority for UDR file format.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the **no attribute** command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

Example

attribute radius-user-name priority *12*

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

event-label

This command configures an optional event ID to use in generated billing records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-label *label* **priority** *priority*

no event-label

no

Removes the previously configured event label for UDR attribute.

label

Specifies event label for attribute to be used for UDR format.
label must be an alpha and/or numeric string of 1 through 63 characters in length.

priority *priority*

Specifies the CSV position of event ID in UDR.
priority must be an integer from 1 through 65535.

Usage

Use this command to set the event ID and its position in UDR file format.

Example

event-label *radius_csv1* **priority** *23*

exit

This command exits the UDR Format Configuration Mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

rule-variable

This command specifies the order of fields in the UDR.

Product

All

Privilege

Security Administrator, Administrator

Syntax

rule-variable *protocol rule* **priority** *priority*

no rule-variable [priority *priority* **]** *protocol rule*

no

Removes the rule-variable protocol configuration.

protocol rule

Specifies the rule variable for UDR format.
protocol must be one of the following with specified rule:

- **bearer 3gpp2**: Bearer-related configuration:
  - **always-on**
  - **bsid**
  - **carrier-id**
  - **esn**
  - **ip-qos**
  - **ip-technology**
  - **meid**
  - **release-indicator**
  - **serv-MDN**
  - **service-option**
  - **session-begin**
  - **session-continue**

Important: For more information on protocol-based rules see the *Ruledef Configuration Mode Commands* chapter.

priority *priority*

Specifies the CSV position of the value in the UDR.
priority must be an integer from 1 through 65535.

Usage

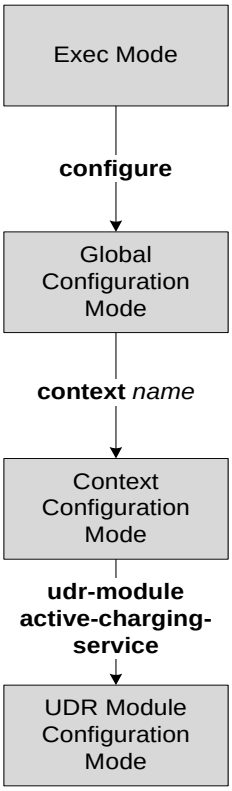
Use this command to set the rule variables priority for UDR file format.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the **no rule-variable** command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional priority keyword.

Example

```
rule-variable bearer 3gpp2 bsid priority 36
```

Chapter 204
UDR Module Configuration Mode Commands

To access the UDR Module Configuration Mode, in the Context Configuration Mode, enter the udr-module active-charging-service command.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cdr

This command configures the EDR/UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cdr [ push-interval value ] [ push-trigger space-usage-percent
trigger_percentage ] [ remove-file-after-transfer ] [ transfer-mode { pull |
push primary { encrypted-url enc_url | url url } [ via local-context ] [
secondary { encrypted-secondary-url enc_sec_url | url sec_url } ] } ] + | use-
harddisk ]

no cdr [ remove-file-after-transfer | use-harddisk ] +

default cdr [ push-interval | push-trigger space-usage-percent | remove-file-
after-transfer | transfer-mode [ push via ] | use-harddisk ] +
```

no

Disables the configured CDR storage and CDR file processing in this mode:

- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC harddisk.

Important: **use-harddisk** keyword is available only on the ASR 5000 chassis.

default

Configures the default settings:

- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: LC is used for push
- **use-harddisk**: Disabled

Important: **use-harddisk** keyword is only available on ASR 5000 chassis.

push-interval *value*

Default: 300
Specifies the transfer interval, in seconds, to push EDR and UDR files to an external file server.

value must be an integer from 60 through 3600.

push-trigger space-usage-percent *trigger_percentage*

Default: 80%
Specifies the EDR/UDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.
trigger_percentage specifies the EDR/UDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.

remove-file-after-transfer

Default: Disabled
Specifies that the system must delete EDR/UDR files after they are transferred to the external file server.

transfer-mode { pull | push primary { encrypted-url *enc_url* **| url** *url* **} [via local-context] [secondary { encrypted-secondary-url** *enc_sec_url* **| secondary-url** *sec_url* **}] }**

Specifies the EDR/UDR file transfer mode.

- **pull**: Specifies that the L-ESS is to pull the CDR files.
- **push**: Specifies that the system is to push CDR files to the configured L-ESS.
- **primary encrypted-url** *enc_url*: Specifies the primary URL location in encrypted format to which the system pushes the CDR files. *enc_url* must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **primary url** *url*: Specifies the primary URL location to which the system pushes the CDR files. *url* must be an alpha and/or numeric string of 1 through 1024 characters in the //user:password@host:[port]/directory format.
- **via local-context**: Configuration to select LC/SPIO for transfer of CDRs. The system pushes the UDR files via SPIO in the local context.
- **encrypted-secondary-url** *enc_sec_url*: Specifies the secondary URL location in encrypted format to which the system pushes the CDR files when the primary location is unreachable or fails. *enc_sec_url* must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **secondary-url** *sec_url*: Specifies the secondary URL location to which the system pushes the CDR files when the primary location is unreachable or fails. *sec_url* must be an alpha and/or numeric string of 1 through 1024 characters in //user:password@host:[port]/directory format.

use-harddisk

Default: Disabled
Specifies that on ASR 5000 chassis the hard disk on the SMC be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from RAMFS on the PSC to the hard disk on the SMC.

Important: **use-harddisk** keyword is available only on the ASR 5000 chassis.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure how charging data records (CDR) are moved and stored.
On the ASR 5000 chassis, run this command only from the local context. Running in any other context would fail and deliver an error message.
The **use-harddisk** keyword is only available on the ASR 5000 system. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message "Failure: Please Check if CDRMOD is running in this context or not."
This config can be applied either in the EDR/UDR module, but will be applicable both to the EDR and UDR modules. Configuring in one of the modules prevents the configuration to be done in the other module.
If PUSH transfer mode is selected, the L-ESS server URL to which the CDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing **transfer-mode** from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.
When changing **transfer-mode** from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

Example

The following command configures the system to retain a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

This command sets UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default file [ charging-service-name ] [ compression ] [ current-prefix ] [
delete-timeout ] [ directory ] [ field-separator ] [ file-sequence-number ] [
headers ] [ name ] [ reset-indicator ] [ rotation { num-records | time | volume
} ] [ sequence-number ] [ storage-limit ] [ time-stamp ] [ trailing-text ] [
udr-seq-num ]
```

default

Using default file will reset some but not all keyword parameters to their default values. To ensure that the default is reset for a specific parameter, include the keyword in the default file syntax.

charging-service-name { include | omit }

Configures the inclusion and exclusion of charging service name in the file name.
Default: include

- **include**: Sets this command to include the Charging service name in UDR file name.
- **omit**: Sets this command to exclude or omit the Charging service name from UDR file name.

compression { gzip | none }

Configures the compression of the UDR file.
Default: none

- **gzip**: Enables GNU zip compression of the UDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

current-prefix *string*

Default: curr
Specifies a string to add to the beginning of the UDR file that is currently being used to store UDR records. *string* must be an alpha and/or numeric string of 1 through 31 characters in length.

delete-timeout *seconds*

Default: Disabled
Specifies a time period, in seconds, when completed UDR files are deleted. By default, files are never deleted. *seconds* must be an integer from 3600 through 31536000.

directory *dir_name*

Default: /records/udr

Specifies a subdirectory in the default directory in which to store UDR files. *dir_name* must be an alpha and/or numeric string of 1 through 191 characters in length.

exclude-checksum-record

Default: Disabled, inserts checksum record into the UDR file header.
When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic redundancy check (CRC) of all preceding records from the UDR file.

field-separator { hyphen | omit | underscore }

Specifies the field separators between two fields of UDR file name.
Default: underscore

- **hyphen**: specifies the field separator as '-' (hyphen) symbol between two fields.
- **omit**: removes or omits the field separator between two fields.
- **underscore**: specifies the field separator as '_' (underscore) symbol between two fields.

file-sequence-number rulebase-seq-num

Generates unique file sequence numbers for different rulebase-formatname combinations.

headers

Includes a file header summarizing the record layout.

name *file_name*

Default: udr
Specifies a string to use as the base file name for UDR files.
file_name must be an alpha and/or numeric string of 1 through 31 characters in length. The file name format is as follows:
base_rulebase_format_sequencenum_timestamp

- base: Specifies type of record in file or contains the operator-specified string. Default is **udr**.
- rulebase: Specifies the name of the Rulebase. UDRs from different Rulebases go into different UDR files.
- format: Specifies the name of the UDR format if **single-udr-format** is specified else the format field (and the trailing underscore) is omitted from the file name.
- sequencenum: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all UDR files on the system.
- timestamp: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.

UDR files that have not been closed have a string added to the beginning of their file names.
File name for a UDR file in CSV format that contains information for rule base named rulebase1 and a UDR schema named udr_schema1 appears as follows:
udr_rulebase1_udr_schema1_00005_01302006143409
If file name is not configured it creates files for EDRs/UDRs/FDRs (xDRs) having following name template with limits to 256 characters:
basename_ChargSvcName_ timestamp_SeqNumResetIndicator_FileSeqNumber

- basename: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ECS

- ChargSvcName: A system context-based configurable text string that uniquely identifies a specific context-based charging service
- timestamp: Date and time at the instance of file creation. Date and time in the form of "MMDDYYYYHHmmSS" where HH is a 24-hour value from 00-23
- SeqNumResetIndicator: A one byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 through 255 which is incremented by a value of 1 for the following conditions:
- Failure of an ECS software process on an individual PSC
- Failure of the system such that a second system takes over (for example, a standby or backup chassis put in place according to Inter-chassis Session Recovery)
- File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- FileSeqNumber: unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each chassis system.

File name for a closed xDR file in CSV format that contains information for ECS system *xyz_city1* and charging service name *preapaid2* with timestamp 12311969190000, and file sequence number counter reset indicator to *002* for file sequence number *034939002* appears as follows:
xyz_city1_preapaid2_12311969190000_002_034939002
File name for a running xDR file in CSV format that contains information for the same parameters for file sequence number *034939003* prefixed with curr_ and appears as follows:
curr_xyz_city1_preapaid2_12311969190000_002_034939002

---

reset-indicator

This option includes the reset indicator counter value from 0 to 255 in UDR file name and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr process fails
- A peer chassis has taken over in compliance with our Inter-chassis Session Recovery feature
- The sequence number in sequence-number keyword has rolled over to zero

---

rotation { num-records *records* **| time** *seconds* **| volume** *bytes* **}**

Defaults: **num-records**: 1024
time: 3600 seconds
volume: 102400 bytes
Specifies when to close a UDR file and create a new one.
num-records *records*: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete. *records* must be an integer from 100 through 10240.
time *seconds*: Specifies the period of time to wait before closing the UDR file and creating a new one. *seconds* must be an integer from 30 through 86400.
volume *bytes*: Specifies the maximum size of the UDR file before closing it and creating a new one. *bytes* must be an integer from 51200 through 62914560. Note: Higher sets may provide the best compression ratio when the **compression** keyword is set to *gzip*.

---

sequence-number { length *length* **| omit | padded | padded-six-length | unpadded }**

Default: **padded**
Specifies including/excluding sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length. *length* must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

Important: The **length** configuration is applicable in both EDR and UDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both the modules. With the **file udr-seq-num** config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

storage-limit *limit*

Default: 33554432
Specifies deleting files when the specified amount of space, in bytes, is used up for UDR/EDR file storage on the PSCs RAM.
On ASR 5000 chassis, *limit* is an integer from 10485760 through 536870912.

Important: On ASR 5000 chassis, the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

time-stamp { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of *x.y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

trailing-text *string*

Specifies the inclusion of arbitrary text string in the file name.
string must be an alpha and/or numeric string of 1 through 30 characters in length.

trap-on-file-delete

Default: Disabled
This keyword instructs the system to send an SNMP notification (trap) when an EDR/UDR file is deleted due to lack of space.

udr-seq-num

Default: Disabled
Specifies that the file sequence numbers that are part of the UDR file names be independently generated. If disabled, a single set of sequence numbers are shared by both EDR files and UDRs.

xor-final-record

Default: Disabled
Specifies inserting an xor checksum (in place of the CRC checksum) into the UDR file header if the **exclude-checksum-record** keyword is left at its default setting.

+

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure UDR file characteristics.

Example

The following command sets the prefix of the current active UDR file to *current*:

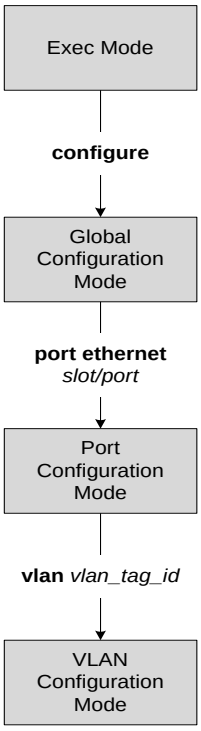
```
file current-prefix current
```

The following command sets the base file name to *UDRfile*:

```
file name UDRfile
```

Chapter 205
VLAN Configuration Mode Commands

The VLAN Configuration Mode is used to create and manage Virtual LANs and their bindings between contexts.



bind interface

Configures a virtual interface to context association for the current VLAN.

Product

PDSN, HA, SGSN

Privilege

Security Administrator, Administrator

Syntax

bind interface *interface_name context_name*
no bind interface *interface_name context_name*

---

no

Indicates the binding between the virtual interface specified and the context specified is to be unbound for the current VLAN.

---

interface_name

Specifies the name of the virtual interface to be bound to the context. *interface_name* must be from 1 to 79 alpha and/or numeric characters.

---

context_name

Specifies the name of the context to be bound to the virtual interface. *context_name* must refer to a previously configured context.

Usage

Bind a virtual interface and context to allow the VLAN to provide service.

Example

bind interface *sampleVirtual sampleContext*
no bind interface *sampleVirtual sampleContext*

end

Exits the port configuration mode and returns to the Exec mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the VLAN configuration mode and returns to the port configuration mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the port configuration mode.

ingress-mode

This command toggles between enabling and disabling the port ingress mode.

Product

PDSN, HA, SGSN

Privilege

Security Administrator, Administrator

Syntax

ingress-mode

Usage

Use this command to enable or disable the ingress mode for the port.

Example

```
ingress-mode
```

shutdown

Disables/enables traffic over the current VLAN.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
shutdown
no shutdown
```

no

Enables the VLAN. When omitted the VLAN is shutdown.

Usage

Shut down a VLAN.
This command is necessary to bring a VLAN into service by enabling it via the **no** keyword.

Example

To disable a VLAN from sending or receiving network traffic use the following command:
shutdown
To enable a VLAN use the following command:
no shutdown

vlan-map

This command sets a single next-hop IP address so that multiple vlans can use a single next-hop gateway. **vlan-map** is associated with a specific interface.

Product

PDSN, HA, SGSN

Privilege

Security Administrator, Administrator

```
vlan-map next-hop ip_address
```

next-hop *ip_address*

This keyword defines an IP address for the next-hop gateway.
ip_address: Can be either an IPv4 or IPv6 address in standard format.

Usage

Use vlan-map to combine multiple vlan links to go through a single IP address. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.
After configuring the vlan-map, move to the Port Ethernet configuration mode to attach the vlan-map to a specific vlan.

Example

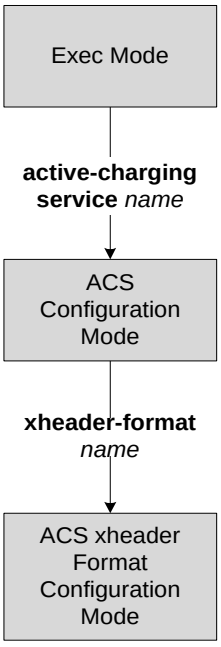
The following command sets an IPv4 for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```

Chapter 206
x-header Format Configuration Mode Commands

The x-header Format Configuration Mode is used to create and configure extension-header (x-header) formats.

Important: This feature is license dependent. Please contact your local sales representative for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns the CLI prompt to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to change to the parent configuration mode.

insert

This command configures the x-header fields to be inserted in HTTP/WSP GET and POST request packets.

Important: This command is license dependent. Please contact your local sales representative for more information.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.0:

insert *xheader_field_name* **{ string-constant** *xheader_field_value* **| variable { bearer { 3gpp charging-id | ggsn-address | imsi | radius-calling-station-id | sgsn-address | sn-rulebase | subscriber-ip-address } | http { host | url } }**

no insert *xheader_field_name*

In StarOS 8.1, StarOS 9.0 and later releases:

insert *xheader_field_name* **{ string-constant** *xheader_field_value* **| variable { bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | rat-type | sgsn-address } | acr | customer-id | ggsn-address | mdn | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } [encrypt] | http { host | url } }**

no insert *xheader_field_name*

no

Removes the specified x-header field configuration.

xheader_field_name

Specifies the x-header field name to be inserted in the packets.
xheader_field_name must be an alpha and/or numeric string of 1 through 31 characters in length.
Up to 10 fields can be inserted in each x-header format.

string-constant *xheader_field_value*

Specifies constant string value for x-header field to be inserted in the packets.
xheader_field_value must be the x-header field value, and must be an alpha and/or numeric string of 1 through 63 characters in length.

variable

Specifies name of the x-header field whose value must be inserted in the packets.

bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | rat-type | sgsn-address } | acr | customer-id | ggsn-address | mdn | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } [encrypt]

Specifies value of x-header field to be inserted:

- **3gpp**: 3GPP service
  - **apn**: APN of the bearer flow. This field is deprecated from under **bearer apn** and has been added within **bearer 3gpp apn**
  - **charging-characteristics**: Charging characteristics of the bearer flow
  - **charging-id**: Charging ID of the bearer flow
  - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow
  - **imsi**: Specific Mobile Station Identification number.
  - **rat-type**: This field is deprecated from under **bearer rat-type** and has been added within **bearer 3gpp rat-type**
  - **sgsn-address**: SGSN associated with the bearer flow
- **acr**: Anonymous Customer Reference. Only MSISDN part of this is encrypted, if encrypt flag is set.
- **customer-id**: Customer ID of the bearer
- **ggsn-address**: GGSN IP address field
- **imsi**: This field is deprecated from within **bearer imsi** and has been moved within **bearer 3gpp imsi**
- **mdn**: MDN of the bearer flow
- **radius-calling-station-id**: Calling Station ID of the mobile handling the flow
- **session-id**: Accounting session ID of the bearer flow
- **sn-rulebase**: Name of the ECS rulebase
- **sgsn-address**: This field is deprecated from under **bearer sgsn-address** and has been moved within **bearer 3gpp sgsn-address**
- **subscriber-ip-address**: Subscriber IP address
- **username**: User name of the bearer flow

encrypt: Specifies encryption of x-header field configuration. This option must only be configured in the case of x-header encryption feature.

http { host | url }

Specifies value of the x-header field to be inserted:

- **host**: Host
- **url**: Uniform Resource Locator

Usage

Use this command to configure the x-header fields to be inserted in HTTP/WSP GET and POST request packets. The x-headers would be inserted at the end of HTTP/WSP header. This CLI command may be used up to 10 times. There is no control over the order of the fields that are to be inserted. Any of the indicated

ruledef variables may be inserted using the variable option, or a static string may be inserted using the string-constant option.
Operators may insert x-headers in some HTTP/WSP packets, for which some rules will be configured. The charging-action associated with these rules will contain the list of x-headers to be inserted in the packets.

Example
The following command configures an x-header field named *test12* with a constant string value of *testing* to be inserted in HTTP/WSP GET and POST request packets:
insert *test12* string-constant *testing*
